McKay Point Reservoir Project

DRAFT ENVIRONMENTAL IMPACT REPORT

SCH# 2014011078

March 2024

Prepared by:
Sespe Consulting, Inc.
374 Poli Street, Suite 200
Ventura, California 93001
Contact Person: Graham Stephens
Phone: (805) 275-1515

Lead Agency Contact:
Tulare Irrigation District
6826 Avenue 240
Tulare, California 93274
Contact: Aaron Fukuda, General Manager
Phone: (559) 686-3425

TABLE OF CONTENTS

ES.0 EXECUTIVE SUMMARY 1

ES.1 PROJECT UNDER REVIEW 1
ES.1.1 Project Summary 1
ES.1.2 Project Objectives and Benefits 5
ES.2 CEQA PROCESS 6
ES.2.1 Lead Agencies 7
ES.2.2 Responsible and Trustee Agencies 7
ES.2.3 Initial Study, Notice of Preparation and Scoping Process 7
ES.2.4 Notice of Completion and DEIR Review Process 8
ES.2.5 Response to Comments, Final EIR, Certification, Findings and Notice of Determination 9
ES.2.6 Mitigation Monitoring and Reporting 9
ES.3 SUMMARY OF ENVIRONMENTAL IMPACTS 9
ES.4 SUMMARY OF ENVIRONMENTAL IMPACTS ANALYSIS 10
ES.4.1 Findings of No Impact or Less than Significant Impacts 10
ES.4.2 Findings of Less than Significant Impacts after Mitigation Measures Have Been Implemented 11
ES.4.2 Findings of Significant Impacts after Mitigation Measures Have Been Implemented 11
ES.4.4 Findings of Cumulative Impacts 11
ES.5 SUMMARY OF ALTERNATIVES 11
ES.5.1 Alternatives not Considered for Analysis 12
ES.5.2 Alternatives Considered for Analysis 12

1.0 INTRODUCTION 1-1

1.1 Project Summary 1-1
1.2 Project Objectives and Benefits 1-2
1.3 CEQA Process 1-7
1.3.1 Initial Study, Notice of Preparation and Scoping Process 1-8
1.3.2 Notice of Completion and DEIR Review Process 1-9
1.3.3 Response to Comments, Final EIR, Certification, Findings and Notice of Determination 1-10
1.4 Mitigation Monitoring and Reporting 1-10
1.5 Agency Involvement 1-11
1.5.1 Lead Agency 1-11
1.5.2 Trustee and Responsible Agencies 1-11
1.6 Permits, Approvals and Other Requirements 1-12
1.7 Project Baseline 1-13
1.8 Environmental Issues Not Requiring Further Detailed Evaluation in the Draft EIR 1-13

1.8.1 Aesthetics 1-14
1.8.2 Agriculture and Forestry Resources 1-15
1.8.3 Energy 1-15
1.8.4 Mineral Resources 1-16
1.8.5 Population and Housing 1-17
1.8.6 Public Services 1-17
1.8.7 Recreation 1-18
1.8.8 Transportation 1-18
1.8.9 Utilities and Service Systems 1-19
1.9 Potentially Significant Issues Analyzed in the Draft EIR 1-20
1.10 Project Alternatives 1-20
1.11 Environmentally Superior Alternative 1-22
1.12 Organization of the EIR 1-22
2.0 PROJECT DESCRIPTION 2-1
2.1 Project Overview 2-1
2.2 Project Objectives 2-5
2.3 Environmental Setting 2-6
2.3.1 Regional Setting 2-6
2.3.2 Project Site Setting 2-7
2.4 Regulatory Setting 2-11
2.5 Reservoir Operations 2-11
2.5.1 Overview 2-11
2.6 Project Phases 2-17
2.6.1 Reservoir Excavation 2-18
2.6.2 Reservoir Facility Construction 2-24
2.7 Reclamation Plan 2-26
3.1 AESTHETICS 3.1-1
3.1.1 Introduction 3.1-1
3.1.2 Environmental Setting 3.1-1
3.1.3 Regulatory Setting 3.1-1
3.1.4 Significance Thresholds 3.1-4
3.1.5 Methodology of Analysis 3.1-4
3.1.6 Project-Level Impacts and Mitigation Measures 3.1-5
3.1.7 Cumulative-Level Impacts and Mitigation Measures 3.1-7
3.2 AGRICULTURE AND FORESTRY RESOURCES 3.2-1
3.2.1 Introduction 3.2-1
3.2.2 Environmental Setting 3.2-1
3.2.3 Regulatory Setting 3.2-1
3.2.4 Significance Thresholds 3.2-4
3.2.5 Methodology of Analysis 3.2-4
3.2.6 Project-Level Impacts and Mitigation Measures 3.2-5

3.2.7 Cumulative-Level Impacts and Mitigation Measures 3.2-9
3.3 AIR QUALITY 3.3-1
3.3.1 Introduction 3.3-1
3.3.2 Environmental Setting 3.3-1
3.3.3 Regulatory Setting 3.3-5
3.3.4 Significance Thresholds 3.3-20
3.3.5 Methodology of Analysis 3.3-25
3.3.6 Project-Level Impacts and Mitigation Measures 3.3-55
3.3.7 Cumulative-Level Impacts and Mitigation Measures 3.3-62
3.4 BIOLOGICAL RESOURCES 3.4-1
3.4.1 Introduction 3.4-1
3.4.2 Environmental Setting 3.4-1
3.4.3 Regulatory Setting 3.4-19
3.4.4 Significance Thresholds 3.4-27
3.4.5 Methodology of Analysis 3.4-28
3.4.6 Project-Level Impacts and Mitigation Measures 3.4-31
3.4.7 Cumulative-Level Impacts and Mitigation Measures 3.4-43
3.5 CULTURAL RESOURCES 3.5-1
3.5.1 Introduction 3.5-1
3.5.2 Environmental Setting 3.5-1
3.5.3 Regulatory Setting 3.5-15
3.5.4 Significance Thresholds 3.5-20
3.5.5 Methodology of Analysis 3.5-21
3.5.6 Project-Level Impacts and Mitigation Measures 3.5-25
3.5.7 Cumulative-Level Impacts and Mitigation Measures 3.5-28
3.6 ENERGY 3.6-1
3.6.1 Introduction 3.6-1
3.6.2 Environmental Setting 3.6-1
3.6.3 Regulatory Setting 3.6-1
3.6.4 Significance Thresholds 3.6-5
3.6.5 Methodology of Analysis 3.6-5
3.6.6 Project-Level Impacts and Mitigation Measures 3.6-6
3.6.7 Cumulative-Level Impacts and Mitigation Measures 3.6-7
3.7 GEOLOGY AND SOILS 3.7-1
3.7.1 Introduction 3.7-1
3.7.2 Environmental Setting 3.7-1
3.7.3 Regulatory Setting 3.7-5
3.7.4 Significance Thresholds 3.7-8
3.7.5 Methodology of Analysis 3.7-9
3.7.6 Project-Level Impacts and Mitigation Measures 3.7-15
3.7.7 Cumulative-Level Impacts and Mitigation Measures 3.7-23
3.8 GREENHOUSE GASES 3.8-1

3.8.1 Introduction 3.8-1
3.8.2 Environmental Setting 3.8-1
3.8.3 Regulatory Setting 3.8-1
3.8.4 Significance Thresholds 3.8-11
3.8.5 Methodology of Analysis 3.8-12
3.8.6 Project-Level Impacts and Mitigation Measures 3.8-14
3.8.7 Cumulative-Level Impacts and Mitigation Measures 3.8-16
3.9 HAZARDS AND HAZARDOUS MATERIALS 3.9-1
3.9.1 Introduction 3.9-1
3.9.2 Environmental Setting 3.9-1
3.9.3 Regulatory Setting 3.9-2
3.9.4 Significance Thresholds 3.9-8
3.9.5 Methodology of Analysis 3.9-8
3.9.6 Project-Level Impacts and Mitigation Measures 3.9-11
3.9.7 Cumulative-Level Impacts and Mitigation Measures 3.9-20
3.10 HYDROLOGY AND WATER QUALITY 3.10-1
3.10.1 Introduction 3.10-1
3.10.2 Environmental Setting 3.10-1
3.10.3 Regulatory Setting 3.10-13
3.10.4 Significance Thresholds 3.10-19
3.10.5 Methodology of Analysis 3.10-20
3.10.6 Reservoir Operations 3.10-43
3.10.7 Reservoir Objectives and Benefits 3.10-43
3.10.8 Reservoir Construction 3.10-44
3.10.9 Design 3.10-59
3.10.10 Water Balance 3.10-60
3.10.11 Anticipated Resource Operations 3.10-61
3.10.12 Project-Level Impacts and Mitigation Measures 3.10-81
3.10.13 Cumulative-Level Impacts and Mitigation Measures 3.10-95
3.11 LAND USE AND PLANNING 3.11-1
3.11.1 Introduction 3.11-1
3.11.2 Environmental Setting 3.11-1
3.11.3 Regulatory Setting 3.11-2
3.11.4 Significance Thresholds 3.11-4
3.11.5 Methodology of Analysis 3.11-4
3.11.6 Project-Level Impacts and Mitigation Measures 3.11-5
3.11.7 Cumulative-Level Impacts and Mitigation Measures 3.11-37
3.12 MINERAL RESOURCES 3.12-1
3.12.1 Introduction 3.12-1
3.12.2 Environmental Setting 3.12-1
3.12.3 Regulatory Setting 3.12-1
3.12.4 Significance Thresholds 3.12-3

3.12.5 Methodology of Analysis 3.12-3
3.12.6 Project-Level Impacts and Mitigation Measures 3.12-4
3.12.7 Cumulative-Level Impacts and Mitigation Measures 3.12-6
3.13 NOISE 3.13-1
3.13.1 Introduction 3.13-1
3.13.2 Environmental Setting 3.13-4
3.13.3 Regulatory Setting 3.13-12
3.13.4 Significance Thresholds 3.13-17
3.13.5 Methodology of Analysis 3.13-18
3.13.6 Project-Level Impacts and Mitigation Measures 3.13-22
3.13.7 Cumulative-Level Impacts and Mitigation Measures 3.13-29
3.14 POPULATION AND HOUSING 3.14-1
3.14.1 Introduction 3.14-1
3.14.2 Environmental Setting 3.14-1
3.14.3 Regulatory Setting 3.14-1
3.14.4 Significance Thresholds 3.14-5
3.14.5 Methodology of Analysis 3.14-6
3.14.6 Project-Level Impacts and Mitigation Measures 3.14-6
3.14.7 Cumulative-Level Impacts and Mitigation Measures 3.14-7
3.15 PUBLIC SERVICE 3.15-1
3.15.1 Introduction 3.15-1
3.15.2 Environmental Setting 3.15-1
3.15.3 Regulatory Setting 3.15-1
3.15.4 Significance Thresholds 3.15-2
3.15.5 Methodology of Analysis 3.15-3
3.15.6 Project-Level Impacts and Mitigation Measures 3.15-3
3.15.7 Cumulative-Level Impacts and Mitigation Measures 3.15-4
3.16 RECREATION 3.16-1
3.16.1 Introduction 3.16-1
3.16.2 Environmental Setting 3.16-1
3.16.3 Regulatory Setting 3.16-1
3.16.4 Significance Thresholds 3.16-3
3.16.5 Methodology of Analysis 3.16-3
3.16.6 Project-Level Impacts and Mitigation Measures 3.16-4
3.16.7 Cumulative-Level Impacts and Mitigation Measures 3.16-5
3.17 TRANSPORTATION 3.17-1
3.17.1 Introduction 3.17-1
3.17.2 Environmental Setting 3.17-1
3.17.3 Regulatory Setting 3.17-2
3.17.4 Significance Thresholds 3.17-6
3.17.5 Methodology of Analysis 3.17-6
3.17.6 Project-Level Impacts and Mitigation Measures 3.17-7

3.17.7 Cumulative-Level Impacts and Mitigation Measures 3.17-11
3.18 TRIBAL CULTURAL RESOURCES 3.18-1
3.18.1 Introduction 3.18-1
3.18.2 Environmental Setting 3.18-1
3.18.3 Regulatory Setting 3.18-4
3.18.4 Significance Thresholds 3.18-10
3.18.5 Methodology of Analysis 3.18-10
3.18.6 Project-Level Impacts and Mitigation Measures 3.18-14
3.18.7 Cumulative-Level Impacts and Mitigation Measures 3.18-15
3.19 UTILITIES AND SERVICE SYSTEMS 3.19-1
3.19.1 Introduction 3.19-1
3.19.2 Environmental Setting 3.19-1
3.19.3 Regulatory Setting 3.19-1
3.19.4 Significance Thresholds 3.19-5
3.19.5 Methodology of Analysis 3.19-5
3.19.6 Project-Level Impacts and Mitigation Measures 3.19-6
3.19.7 Cumulative-Level Impacts and Mitigation Measures 3.19-10
3.20 WILDFIRE 3.20-1
3.20.1 Introduction 3.20-1
3.20.2 Environmental Setting 3.20-1
3.20.3 Regulatory Setting 3.20-3
3.20.4 Significance Thresholds 3.20-8
3.20.5 Methodology of Analysis 3.20-9
3.20.6 Project-Level Impacts and Mitigation Measures 3.20-12
3.20.7 Cumulative-Level Impacts and Mitigation Measures 3.20-18
4.0 ALTERNATIVES 4-1
4.1 CEQA Requirements for Analysis of Alternatives 4-1
4.2 Project Objectives 4-1
4.3 Alternatives Considered and Rejected from Further Analysis 4-3
4.3.1 Alternative Location 4-3
4.3.2 Reduced Reservoir Depth Alternative 4-3
4.3.3 Reduced Reservoir Size Alternative 4-4
4.4 Alternatives Considered for Evaluation 4-5
4.4.1 Mitigation Measures Common to Project Alternatives 4-5
4.5 Analysis of the Project Alternatives 4-5
4.5.1 No Project Alternative 4-5
4.5.2 Wet Excavation Method Alternative 4-7
4.5.3 Clay Liner Installation Alternative 4-11
4.5.4 Summary of the Alternatives Analyzed 4-14
4.6 Environmentally Superior Alternative 4-14
5.0 OTHER CEQA REQUIRED IMPACT ANALYSIS 5-1

5.1 Cumulative Impacts 5-1
5.1.1 CEQA Analysis Requirements 5-1
5.1.2 Geographic Scope 5-2
5.1.3 Project Timing 5-2
5.1.4 Threshold of Significance 5-3
5.1.5 Description of Cumulative Projects and Cumulative Impacts 5-3
5.2 Growth-Inducing Impacts 5-4
5.3 Summary of Impacts Including Significant and Unavoidable Impacts 5-5
5.4 Significant Irreversible Environmental Changes 5-14
6.0 REPORT PREPARATION RESOURCES, ORGANIZATIONS & PERSONS CONSULTED 6-1
6.1 Draft EIR Prepared For 6-1
6.2 Draft EIR Prepared By 6-1
6.3 Technical Sub-Consultants 6-1
6.4 Organizations and Persons Consulted 6-2

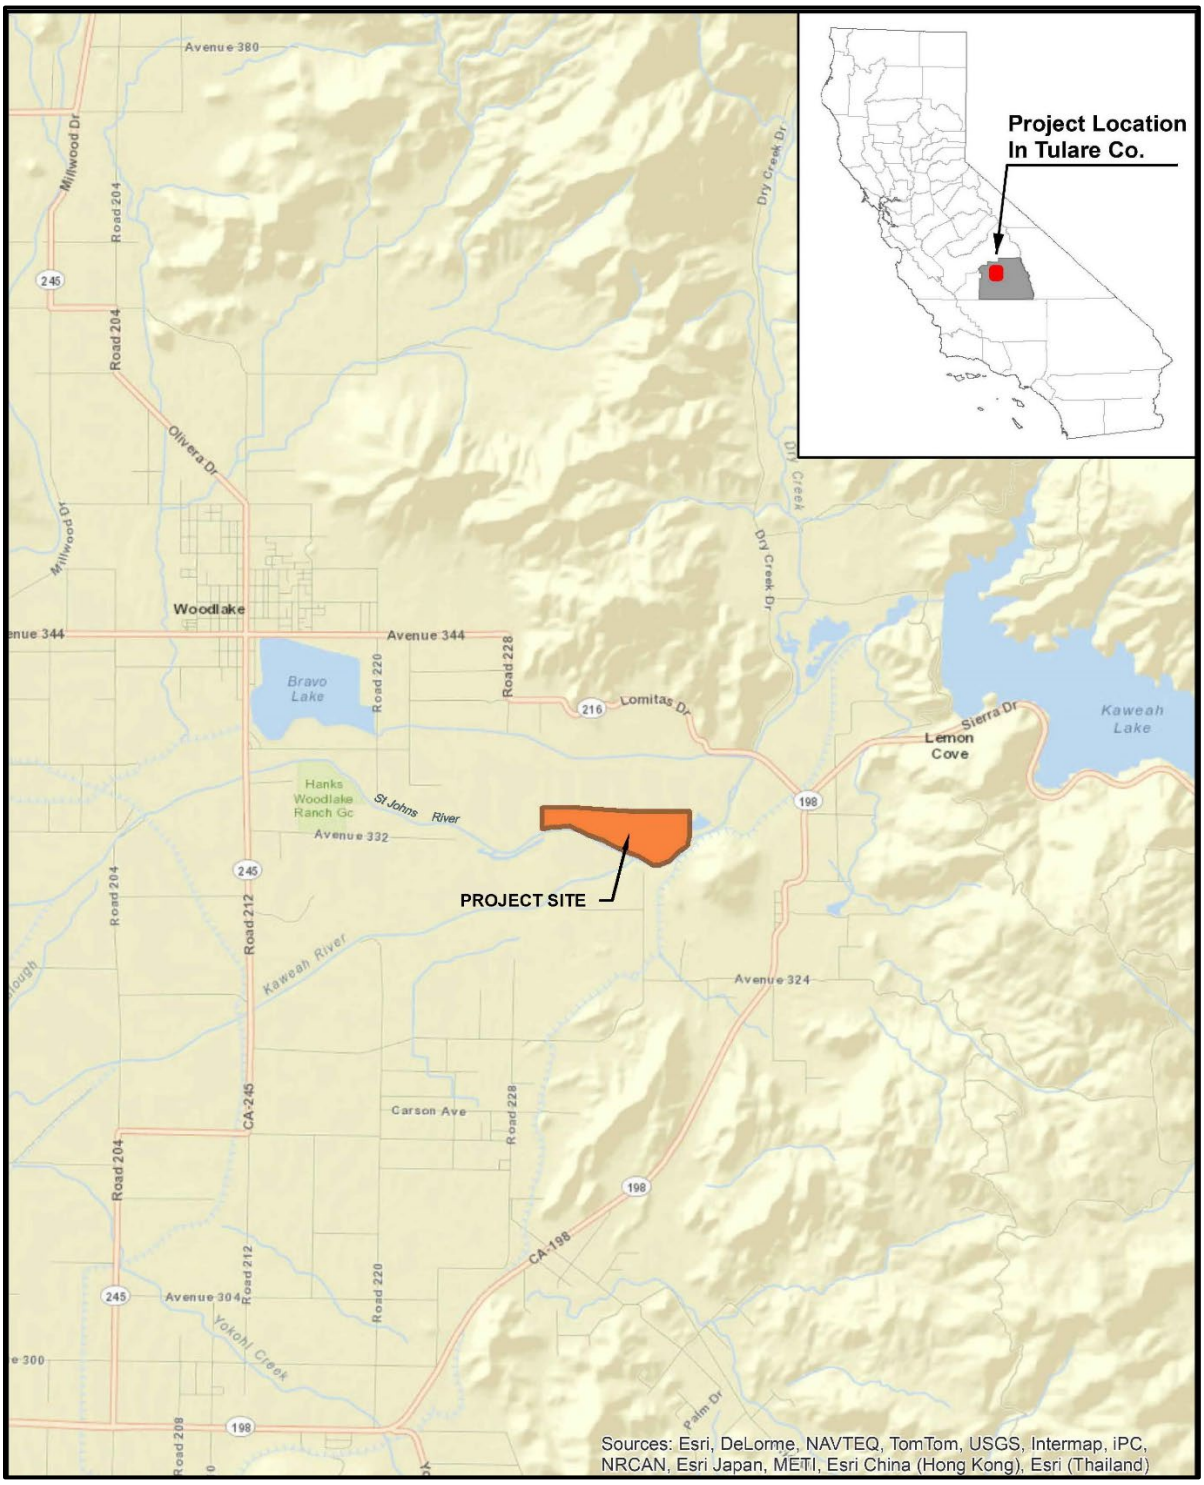
ES.0 EXECUTIVE SUMMARY

ES.1 PROJECT UNDER REVIEW

The Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC) and the Visalia & Kaweah Water Company (VKWC) are joint owners (Owners) of approximately 500 acres of land adjacent to the Lower Kaweah River and St. Johns River in Tulare County, California. This area is commonly referred to as the McKay Point property. The Owners propose to construct and operate a surface water storage and re-regulation reservoir, the McKay Point Reservoir, on the property. The construction and operation of this reservoir is the Project under review.

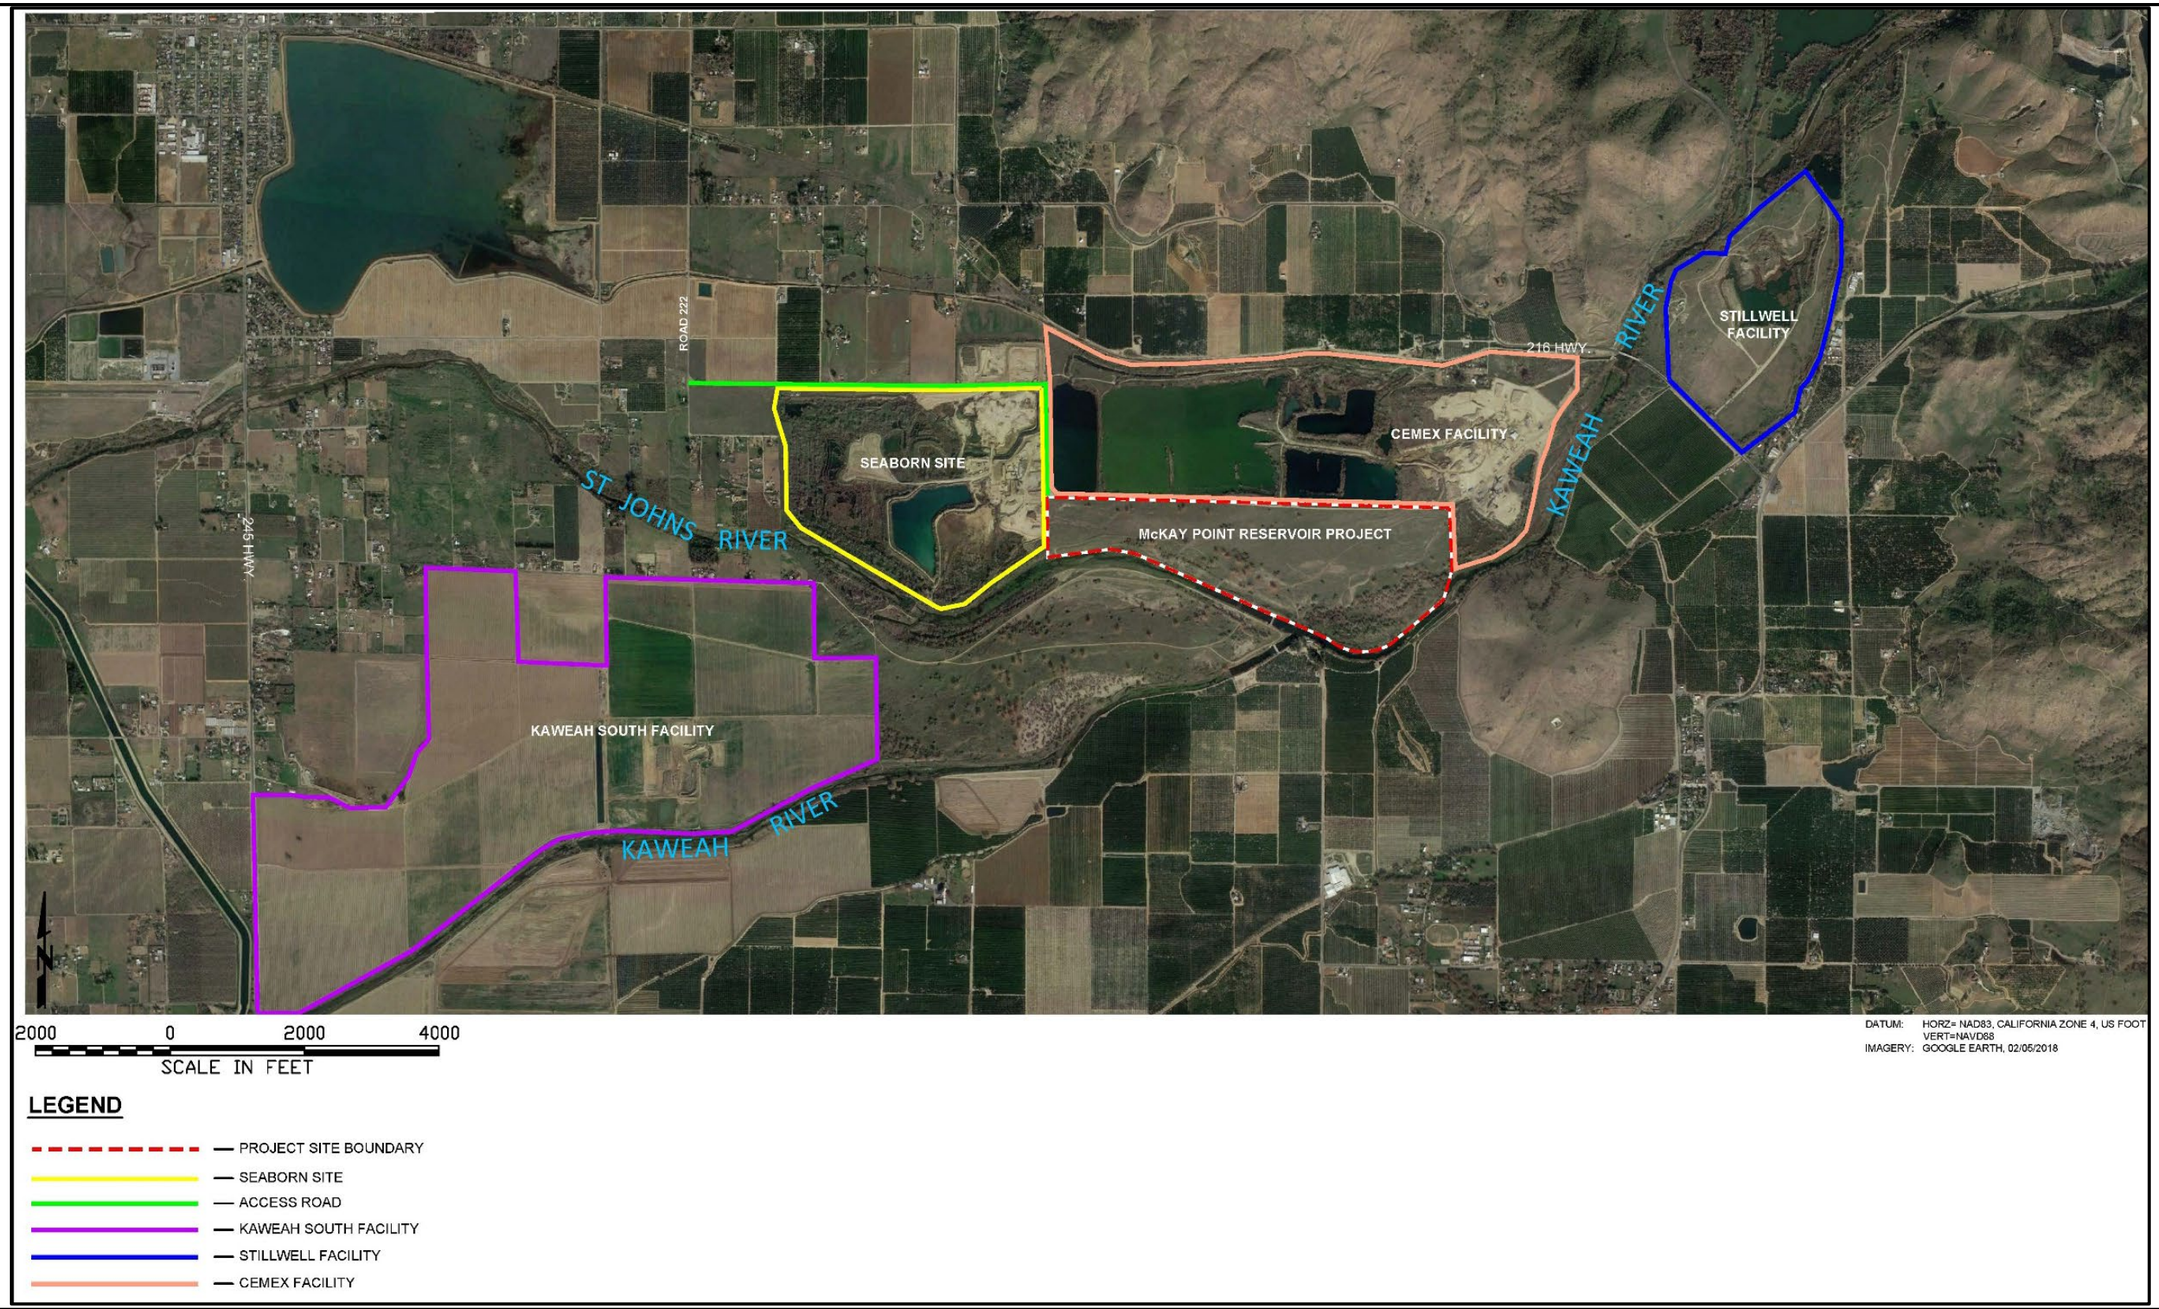
TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah and St. Johns River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code.



Implementation of the Project requires discretionary approvals from TID for the construction and operation of the reservoir and from the Tulare County (County), under the California Surface Mining and Reclamation Act (SMARA), for the excavation of approximately 110 acres needed to create the reservoir. TID is the lead agency for the purposes of administering the requirements of the California Environmental Quality Act (CEQA) and for preparing this Draft Environmental Impact Report (DEIR). TID is also the Project applicant on behalf of the Owners.

ES.1.1 Project Summary

The Project is located between and south of Lake Kaweah/Terminus Hydropower Plant (2.5 miles northeast of the site) and Bravo Lake (1.5 miles northwest of the site), approximately 1.0 mile northwest of the community of Lemon Cove and 2.5 miles southeast of the community of Woodlake (Figure ES-1 – Location Map). The Project area has historically been and continues to be used for agriculture, cattle grazing, and aggregate mining as shown in Figure ES-2 – Project Site and Surrounding Land Use.



The Project is the construction and operation of a surface water storage reservoir (reservoir). The reservoir would allow for better management of surface water by providing 4,600 acre-feet of water storage capacity to support water demands during dry seasons, additional flood control and storm water management during the wet season.

The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and, operation of the reservoir. The Owners intend to enter into a lease agreement with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir would be used as a surface water storage/re-regulation reservoir. The reservoir would also be used to optimize groundwater recharge within the Owners service areas.

THIS PAGE IS INTENTIONALLY BLANK

ES.1.2 Project Objectives and Benefits

The Owners' objectives in proposing the Project include:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners at the proposed Project site.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners at the proposed Project site.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water right interests at the proposed Project site.
- Constructing the reservoir at the proposed Project site in such a way that revenue can be obtained to offset a portion of the construction and development costs.
- Locating the reservoir adjacent to and north of the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines as part of the proposed Project.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet as part of the proposed Project.
- Deliver water to the Lower Kaweah River or the St. Johns River using an electrically operated weir channel and pump(s), as needed.
- Provide additional storage capacity at the proposed Project site for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Water Conservation District and the Kaweah and St. Johns River Association.
- Enter into a lease agreement with WCSG to excavate at the proposed Project site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset a portion of the reservoir construction and development costs.

Once the reservoir is constructed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies and groundwater recharge supplies via water re-regulation. As a result, the Project would provide multiple benefits, including:

- Flow re-regulation for better surface water utilization.
- New water yield for irrigation purposes by capturing damaging and unutilized floodwater and returning it to the rivers to be used by water users served by the Owners or other Kaweah and St. Johns River Association Units. This includes the ability to increase groundwater recharge efforts.
- Flood control by capturing and temporarily holding damaging floodwater at times when downstream interests, including the City of Visalia, may otherwise see damaging flood flows.

ES.2 CEQA PROCESS

CEQA is a California statute passed in 1970 to institute a statewide policy of environmental protection. CEQA does not directly regulate land uses, but instead requires State and local agencies within California to follow a protocol of analysis and public disclosure of environmental impacts of proposed projects and adopt all feasible measures to mitigate those impacts.

The CEQA Guidelines are State regulations that were developed to explain and interpret the law for both the public agencies required to administer CEQA and for the public generally. The CEQA Guidelines provide objectives, criteria and procedures for the orderly evaluation of projects and the preparation of environmental documents. The fundamental purpose of the Guidelines is to make the CEQA process comprehensible to those who administer it, to those subject to it, and to those for whose benefit it exists. To that end, the Guidelines are more than mere regulations which implement CEQA, as they incorporate and interpret both the statutory mandates of CEQA and the principles advanced by judicial decisions.

In general, the CEQA process for an EIR involves the following steps:

- Lead Agency preparation of an Initial Study and/or determination for the need of an EIR;
- Notice of Preparation (NOP);
- Scoping process;
- Preparation of a DEIR;
- Notice of Completion (NOC), DEIR public and agency review process;
- Response to comments;
- Preparation of Final EIR (FEIR); and
- Notice of Determination (NOD).

The involvement of the public during the CEQA process is an integral part of the environmental analysis. Public involvement helps to refine the proposed action, identify issues, explore possible alternatives and identify interested and affected persons. The sections below describe the activities taken to ensure that the public has been, and will be appropriately involved in this process.

ES.2.1 Lead Agencies

ES.2.1.1 CEQA Lead Agency

TID is the Project Lead Agency as defined in Section 15051(a) of the Guidelines for implementing CEQA (CEQA Guidelines), which states: "*If the project will be carried out by a public agency, that agency shall be the Lead Agency even if the project would be located within the jurisdiction of another public agency*."

ES.2.1.2 SMARA Lead Agency

The excavation portion of the Project is considered "surface mining" by the County, which is subject to the requirements of SMARA. The County is the Lead Agency for purposes of administering the SMARA requirements. As such, the County is responsible for the review and approval of a Surface Mining Permit, a SMARA-compliant Reclamation Plan, and a Financial Assurance Cost Estimate (FACE) (Pub. Res. Code § 2770(a)). The County is required to submit the Reclamation Plan and FACE to the Department of Conservation (DOC), Division of Mine Reclamation (DMR) for review and comment prior to approving these documents.

ES.2.2 Responsible and Trustee Agencies

A Responsible Agency under CEQA is a public agency, other than the Lead Agency, which has permitting authority or approval power over some aspect of the overall Project (CEQA Guidelines Section 15381). The Responsible Agencies for this Project are: Tulare County; the Army Corps of Engineers (Army Corp); California Department of Fish and Wildlife (CDFW); Department of Conservation (DOC), Division of Mine Reclamation (DMR); California Central Valley Regional Water Quality Control Board (RWQCB); the U.S. Fish and Wildlife Service (USFWS); and San Joaquin Valley Unified Air Pollution Control District (SJVAPCD).

A Trustee Agency is "a state agency having jurisdiction by law over natural resources affected by a project which are held in trust for the people of the State of California" (CEQA Guidelines Section 15386). The Trustee Agencies for the Project are: the CDFW, USFWS, US Army Corp, DOC and DMR, and CVRWQCB are potential Trustee Agencies for this Project.

ES.2.3 Initial Study, Notice of Preparation and Scoping Process

In accordance with CEQA Guidelines Section 15063, an Initial Study should be conducted to determine if a proposed project may have a significant effect on the environment. If the CEQA Lead Agency can determine that an EIR will clearly be required for a proposed project, an Initial Study is not required. TID, acting in its capacity as Lead Agency, determined an EIR would be required for this Project; therefore, an Initial Study was not prepared.

After deciding that an EIR is required for a project, the Lead Agency shall send to the Office of Planning and Research (OPR) and each responsible and trustee agency a Notice of Preparation (NOP) stating that an EIR will be prepared.

The public scoping process provides a mechanism for focusing and clarifying the issues to be addressed in the DEIR, by actively obtaining input from the public and interested federal, state, tribal, and local

agencies. Information received during the scoping assists the Lead Agency in identifying potential environmental issues, impacts, project alternatives, and mitigation measures associated with the Project.

TID submitted the NOP for this Project to OPR on October 2, 2020. The scoping period ended on November 4, 2020. The State Clearinghouse assigned the Project the following identification number: 2014011078. The NOP was made available on the TID website at: https://tulareid.org/engineering-capital-projects or www.mckaypoint.com. The notice was also posted in the outside noticing box located in front of the Tulare Irrigation District office at the following address: 6826 Avenue 240 – Tulare, CA 93274. A copy of the NOP is in Appendix A of this DEIR.

TID held two scoping meetings to receive comments on the proposed Project and potential environmental impacts. In accordance with the Governor's Executive Order (N-29-20) and the declared State of Emergency, including social distancing directives as a result of the COVID-19 virus, this Scoping Meeting was held remotely. There was not a physical location for this meeting. The public scoping meetings were held remotely via WebEX on October 15, 2020 at 5:30 p.m. and October 16, 2020 at 9:00 a.m.

Written comments were received during the scoping period. Copies of these letters and emails, the list of those who provided comments and a copy of the presentations provided during the meeting are located in the Scoping Report (Appendix A) of this DEIR.

Table ES-1 provides a brief summary of the areas of concern received during the scoping process and where they are addressed in the DEIR. In order to fully identify the issues raised, copies of the letters/emails are provided in the Scoping Report (Appendix A of this DEIR). These comments will be incorporated into the EIR Administrative Record for the Project and are addressed in this DEIR, as appropriate.

Table ES-1 Issues Raised During Scoping Period

Impacts to local groundwater wells.	Section 3.7 – Hydrology and Water Quality

ES.2.4 Notice of Completion and DEIR Review Process

The Notice of Availability (NOA)/Notice of Completion (NOC) was filed on March 1, 2024, and distributed to public agencies, other affected agencies, adjacent cities, and counties, members of the public, and any

parties who have submitted a written request for a copy of the DEIR. It was also posted in the Visalia Times-Delta newspaper on March 1, 2024, and on the outside noticing box located in front of the Tulare Irrigation District office at the following address: 6826 Avenue 240 – Tulare, California 93274. A copy of the NOA/NOC is provided in Appendix A of this DEIR. The 45-day public review period for the DEIR started on March 1, 2024, and a copy of the DEIR is available for public review on the TID webpage: http://www.tulareid.org.

Written comments on the DEIR must be mailed or emailed to the following TID contact no later than April 15, 2024:

Graham Stephens
Sespe Consulting, Inc.
374 Poli Street, Suite 200
Ventura, California 93003
Phone: (805) 275-1515
Email: gstephens@sespe.com

ES.2.5 Response to Comments, Final EIR, Certification, Findings and Notice of Determination

Following the close of the public review period, written comments on a project will be compiled and responses will be generated in conjunction with the preparation of the Final EIR (FEIR). The FEIR will consist of a list of all persons, organizations, and public agencies commenting on the DEIR; copies of the comments received on the DEIR; responses to comments; and any other pertinent information added by the lead agency. Prior to approving a project, the Lead Agency shall certify that the FEIR has been completed in compliance with CEQA and that it reflects the agency's independent judgment and analysis.

The Lead Agency shall file a Notice of Determination (NOD), and the FEIR will serve as the CEQA compliance document for the decision-making agency (in this case TID) and any other agencies that may be responsible for review of a project and issuance of required permits and approvals.

ES.2.6 Mitigation Monitoring and Reporting

CEQA requires adoption of a reporting and monitoring program referred to as the Mitigation Monitoring and Reporting Program (MMRP) for those measures or conditions placed on a project to mitigate or avoid adverse effects on the environment. A final MMRP shall be adopted for this Project by TID upon certification of the FEIR.

ES.3 SUMMARY OF ENVIRONMENTAL IMPACTS

The following environmental issues have been identified as areas where the Project could result in a potentially significant impact and were therefore evaluated in the DEIR. The DEIR section number of each is identified in parentheses.

- Air Quality (3.3)
- Biological Resources (3.4)
- Cultural Resources (3.5)
- Hydrology and Water Quality (3.10)
- Land Use and Planning (3.11)
- Noise (3.13)

- Geology and Soils (3.7)
- Greenhouse Gases Emissions (3.8)
- Hazards and Hazardous Materials (3.9)
- Tribal Cultural Resources (3.18)
- Wildfire (3.20)

Based on the CEQA Guidelines thresholds of significance, the following environmental resources areas were determined not to be significantly affected by the implementation of the Project; therefore, these resource areas do not require further detailed analysis in this DEIR (Guidelines Section 15128). Nonetheless, these environmental resources are discussed within the following DEIR sections:

- Aesthetics (3.1);
- Agriculture and Forestry Resources (3.2);
- Energy (3.6);
- Mineral Resources (3.12);
- Population and Housing (3.14);
- Public Services (3.15);
- Recreation (3.16);
- Transportation (3.17); and
- Utilities/Service Systems (3.19).

Each chapter of this DEIR describes the threshold criteria used to evaluate potentially significant effects of the Project (the threshold of significance), the mitigation measures proposed to reduce or eliminate impacts found to be potentially significant, and an evaluation of the subsequent significance level of the impact after mitigation measures have been implemented. Table ES-2 provides a summary of the potentially significant impacts, applicable mitigation measures, and the level of significance after mitigation.

ES.4 SUMMARY OF ENVIRONMENTAL IMPACTS ANALYSIS

The following summarizes information presented in detail in Chapter 3.0 – Environmental Impact Analysis.

ES.4.1 Findings of No Impact or Less than Significant Impacts

After evaluation in the DEIR, it has been determined the Project would have No Impacts or Less than Significant Impacts in the following areas:

- Aesthetics;
- Agriculture and Forestry Resources;
- Energy;
- Geology and Soils;
- Greenhouse Gases;
- Hazards and Hazardous Materials;
- Hydrology and Water Quality;
- Land Use and Planning;
- Mineral Resources;

- Population and Housing;
- Public Services;
- Recreation;
- Transportation;
- Tribal Cultural Resources;
- Utilities and Services; and
- Wildfire.

ES.4.2 Findings of Less than Significant Impacts after Mitigation Measures Have Been Implemented

After a detailed evaluation in the DEIR, it has been determined the Project would have, after the implementation of mitigation measures, a less than significant impacts in the following areas:

- Air Quality;
- Biological Resources;
- Cultural Resources;
- Geology and Soils; and
- Noise.

ES.4.2 Findings of Significant Impacts after Mitigation Measures Have Been Implemented

It was determined that all potentially significant impacts caused by the Project can be mitigated to levels considered less than significant upon implementation of the mitigation measures summarized in Table ES-2 and described in more detail throughout Section 3.0.

ES.4.4 Findings of Cumulative Impacts

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and probable future projects within the vicinity of the proposed project. Cumulative projects consisting of approved, pending, and recorded projects in the vicinity of the Project were obtained from the Tulare County's and City of Woodlake's websites. In addition, the existing and recently approved mining projects in the immediate vicinity of the Project were considered in the cumulative analysis. The cumulative impacts are discussed for each of the resource topics evaluated in Sections 3.0 and 5.0, and it was determined that the Project's contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts associated with the resource areas evaluated in this DEIR. Table 3-1- summarizes the cumulative projects included in the cumulative impact analysis and Figure 3-1, shows the locations of the projects.

ES.5 SUMMARY OF ALTERNATIVES

CEQA Guidelines Section 15126.6 provides a framework for the formulation and analysis of alternatives in an EIR. This Section states, "*An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but*

would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives" (CEQA Guidelines Section 15126.6(a)).

ES.5.1 Alternatives not Considered for Analysis

ES.5.1.1 Alternative Location

In order to meet the Project objectives, the Project needs to be located in immediate proximity to the McKay Point Check Structures and where the Kaweah River diverges into the Lower Kaweah River and St. Johns River. Alternative locations are considered infeasible and were not considered further.

ES.5.1.2 Alternative Depth

Reducing the depth of the reservoir is not a feasible alternative because the full depth is needed to effectively capture the flood flows during the wet season. In addition, the full depth is needed in order to obtain sufficient royalties from the aggregate that would fund the Project.

ES.5.1.3 Alternative Size

Size is also an important consideration as the resulting storage capacity corresponds to the potential to sufficiently capture flood flows. As such, a reduced size would not provide sufficient storage to realize Project objectives. In addition, the full size is needed in order to obtain sufficient royalties from the aggregate that would fund the Project. Alternative size is considered infeasible and was not considered further.

ES.5.2 Alternatives Considered for Analysis

ES.5.2.1 No Project Alternative

Under the No Project Alternative, the site would remain in its relatively undisturbed condition. The No Project Alternative would be considered environmentally superior because it would have no site impacts to Air Quality; Biological Resources; Cultural Resources; Geology and Soils; and Noise. However, the No Project Alternative, by definition, would not meet the Owners' Project objectives.

ES.5.2.2 Wet Excavation Method Alternative

Under the Wet Excavation Alternative, the slurry wall installation would be deferred until the majority of the excavation is completed. This would allow groundwater seepage to flow into the pit which would require the use of “wet excavation” methods. Draglines would most likely be used to remove the aggregate from the pit. Additionally, material processing (i.e., processing/wash plant and portable crush/recycle plant) directly within the excavation pit would no longer be feasible, and excavated material would have to be transported offsite for processing.

Key differences under the Wet Excavation Method Alternative as compared to the Project include:

- Slurry wall installation would be deferred until the majority of the excavation had been completed.

- Seepage would be allowed to flow into the excavation until equilibrium is reached with the surrounding aquifer.
- Excavation would occur below the water elevation using "wet excavation" equipment and techniques (i.e., underwater dredging using draglines).
- Excavated material would have to be transported offsite for processing
- No dewatering would be conducted until wet excavation is completed.
- Upon completing wet excavation, dewatering would be implemented to create the conditions needed to complete reservoir excavation by conventional methods.
- Dewatering would involve the pumping of approximately 3,500 acre-feet back into the aquifer via one of the following measures:
    - A series of onsite infiltration gallery consisting of onsite ditches located on the Project site that would be covered with granular materials to minimize evaporation;
    - Infiltration at one or more of the immediately adjacent ponds and/or infiltration galleries on the CEMEX facility (north of the Project site); and/or
    - Infiltration one or more of the immediately adjacent ponds on the Seaborn Facility (west of the Project site).
- After dewatering, the slurry wall would be installed and seepage would be the same as described for the Project.

ES.5.2.3 Clay Liner Installation Alternative

Under the Clay Liner Installation Alternative, the site would be developed in the same manner as the Project with one notable change. Specifically, under this alternative, early as feasible in the excavation phase, clay liners would be installed in lieu of the slurry walls around the perimeter of the excavation pit/reservoir to minimize groundwater seepage into/out of the reservoir and to maintain conditions dry enough to continue excavation activities. Due to the nature of the clay material present at the Project site, a clay liner could feasibly be used as an alternative to a slurry wall and is expected to keep the infiltration rate below the required 500 gallons per minute (gpm). As with the slurry walls, the clay liner would consist of below-grade barriers that restrict groundwater flow or support excavations and structures, using bentonite clay generated by excavation operations and collected onsite.

As with the slurry wall, clay liner construction would require clearing and grubbing of approximately 26 acres, and excavating approximately 109,000 cubic yards of native soil to form the trench where the clay liner would be installed. However, rather than importing bentonite and other silty/clay materials to the project site, as is proposed with the slurry wall, these materials would be generated onsite to construct the clay liner. Specifically, excavated soils would be screened and mix onsite for use in the clay liner, to generate the appropriate mixture of bentonite, silty/clay fines and native soil needed to construct the appropriate clay liner. The clay liner material would be placed into the trench. A final native soil cap consisting of approximately 10,000 cubic yards would be placed on top of the clay liner.

Key construction/design differences under the Clay Liner Installation Alternative as compared to the Project include the following:

- Bentonite, silty/clay fines and native soil would be generated onsite to construct the clay liner. No material would need to be imported/delivered to the Project site.
- Depending on the quantity of bentonite and silty/clay generated during reservoir excavation, timing of the installation of the clay liner would potentially be deferred when compared to the slurry wall.
    - The clay liner could not be fully constructed until a sufficient quantity of material is extracted and processed onsite.
    - This might necessitate the use of supplemental dewatering techniques (e.g., pumping, infiltration galleries/ponds, etc.) and/or the use if wet excavation equipment and techniques (i.e., underwater dredging) until the clay liner is complete.
- Depending on the properties of the excavated material/soil used to construct the clay liner, additional slope stability measures, such as the use of soil amendments and/or other reinforcing structures, may be required.

Table ES-2 Summary of Significant Environmental Impacts and Mitigation Measures

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
Air Quality (Impact AQ-2) – Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.	**Mitigation Measure AQ-1** • Roads upon which material is hauled to the on-site plant for processing shall be controlled by methods that will achieve 90% reduction of fugitive dust. This can be achieved by frequent watering, use of chemical dust suppressants, or a combination of watering and chemical dust suppressants. Other methods which achieve 90% reduction of fugitive dust may be acceptable with Lead Agency approval.	**Less than Significant**
Biological Resources (Impact BIO-1) – Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.	**Mitigation Measure BIO-1** • The following avoidance and minimization efforts shall be used as methods to avoid accidental take of all native nesting birds as a result of the Project. During all Project activities, the Owners shall use the following Mitigation Measures to minimize impacts to all native nesting birds: 1. The Owners shall rough grade all annual grassland and elderberry savannah within the construction footprint of the Project during the end of the non-nesting season (January 1 through February 15) of the year in which construction starts to ensure that there is no available nesting habitat for birds in these onsite habitats. 2. If construction is initiated during the nesting season (February 15 through August 15), the Owner's shall conduct a pre-construction nesting bird survey by a qualified wildlife biologist (approved by CDFW and TID) prior to any site preparation activities in association with any phase. The surveys shall be conducted 30 days prior any site preparation activities (vegetation clearing) and again no later than three days prior to any site preparation activities (vegetation clearing). The survey shall be conducted within all onsite habitats that could support nests and are within 120 feet or less of proposed construction activities. All active nests that are found during the survey will be geo-referenced	**Less than Significant**

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
	with a global positioning system (GPS) unit and mapped on an appropriate scale map of the Project site (no smaller than 1 inch = 40 feet). Data will be collected for each active nest site and at a minimum will include: (1) identification of nesting species; (2) description of nest site; (3) estimated nesting cycle status (i.e., time to nest completion, egg-laying, fledging, etc.); and (4) likelihood of nest failure from adjacent project-related activities. Results of surveys, including negative findings, shall be submitted to CDFW within three days of their conclusion. If any special-status species are present onsite, the Owners shall develop and implement a plan for the protection of these species, to be approved by CDFW in a timely manner. The results of any protective measures instituted as a part of the protection and monitoring plan shall be provided to CDFW in electronic format within one week of implementation. The Owners shall be responsible for reporting all observations of special-status species to CNDDB within ten (10) days of sighting. 3. All active nests found during the preconstruction survey will be monitored at least twice per week to assess whether adjacent project-related activities are adversely affecting the nest. If adverse effects are observed, all Project-related activities within 120 feet of the nest will be temporarily halted until fledging occurs (i.e., the juveniles are no longer dependent upon the nest). 4. No preconstruction nesting bird survey is required in areas within 120 feet of construction activities, if construction is initiated in the non-nesting season (August 15 to February 15). **Mitigation Measure BIO-2** The following measures shall be used to avoid or minimize indirect effects to nesting raptors as a result of the Project:	

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
	• If construction is initiated during the nesting season (between February 15 and August 15), the Owners shall conduct a pre-construction nesting raptor survey by a qualified wildlife biologist (approved by CDFW and TID) prior to any site preparation activities in association with any phase. The surveys shall be conducted 30 days prior any site preparation activities (vegetation clearing) and again no later than three days prior to any site preparation activities (vegetation clearing). The survey shall be conducted within all onsite areas that could support nests and are within 300-feet or less of proposed construction activities. All active nests that are found during the survey will be geo-referenced with a global positioning system (GPS) unit and mapped on an appropriate scale map of the Project site (no smaller than 1 inch = 100 feet). Data will be collected for each active nest site and at a minimum will include: (1) identification of nesting species; (2) description of nest site; (3) estimated nesting cycle status (i.e., time to nest completion, egg-laying, fledging, etc.); and (4) likelihood of nest failure from adjacent project-related activities. Results of surveys, including negative findings, shall be submitted to CDFW within three days of their conclusion. If any sensitive species are present onsite, the Owners shall develop and implement a plan for the protection of these species, to be approved by CDFW in a timely manner. The results of any protective measures instituted as a part of the protection and monitoring plan shall be provided to CDFW in electronic format within one week of implementation. The Owners shall be responsible for reporting all observations of special-status species to the CNDDB within ten (10) days of sighting. • All active raptor nests found during the preconstruction survey will be monitored at least twice per week to assess whether adjacent project-related activities are adversely affecting the nest. If adverse effects are observed, all Project-related activities within 300-feet of the nest will be temporarily halted until fledging occurs (i.e., the juveniles are no longer dependent upon the nest).	

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
	• No preconstruction nesting raptor survey is required in areas within 300-feet of construction activities, if construction is initiated in the non-nesting season (August 15 to February 15). **Mitigation Measure BIO-3** • The following measures shall be used to avoid or minimize direct effects to western pond turtle as a result of the Project: 1. The Owners shall conduct a preconstruction survey for western pond turtle by a qualified wildlife biologist (approved by CDFW and TID) along the adjacent reaches of the Lower Kaweah River and St. Johns River. The survey shall be conducted by a qualified biologist within three days of the initiation of construction on those portions of the Project that occur in the rivers, or on their adjacent banks (if there is flowing or standing water in these reaches). If turtles are observed during the preconstruction survey, and a qualified biologist determines construction activities could harm the turtles, the qualified biologist shall conduct the salvage and relocation of turtles downstream to the nearest appropriate aquatic habitat during the same day of their capture. The aquatic habitat to which the turtles are being relocated shall be less than one (1) mile downstream of the Project. 2. All construction staff shall be aware of the potential to uncover western pond turtle nests or during grading and earthmoving activities involving the top 12 inches of soil. Construction staff shall be advised, if turtle eggs are discovered during such activities, construction shall be temporarily halted until a qualified biologist can evaluate the site and egg scatter. Construction staff shall be responsible for covering the eggs with a small layer of sand or soil (to prevent damage or overheating) prior to the arrival of the qualified biologist. The qualified biologist will then salvage the eggs and transport them to a nearby wildlife rehabilitation center that has been approved in advance by the CDFW. Release of any hatchling turtles from the wildlife rehabilitation	

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
	center shall occur in either the Kaweah or St. Johns rivers in appropriate aquatic habitat. 3. All construction staff shall be aware of the potential to uncover Northern California legless lizards during grading and earthmoving activities involving the top 12 inches of soil. Therefore, monitoring for Northern California legless lizards shall be conducted concurrently with monitoring for western pond turtle nests. Construction staff shall be advised, if Northern California legless lizards are discovered during such activities, construction shall be temporarily halted until the individual can be captured by hand and placed in a lidded two-gallon bucket containing no less than three inches of moist soil from the location of capture. Construction staff shall be responsible for placing the bucket in a continuously cool, shaded, and protected location until the arrival of a qualified biologist. The qualified biologist will then relocate the individual(s) to an adjacent location at least 100 feet beyond the boundaries of the Project that has been approved in advance by the CDFW. **Mitigation Measure BIO-4** • The following measures shall be used to compensate for direct and indirect effects to Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, or Tulare cuckoo wasp as a result of the Project: 1. The Owners shall conduct preconstruction surveys for Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, and Tulare cuckoo wasp during the known active season of each of these species prior to the commencement of construction activities. The survey shall be conducted by a qualified biologist within all onsite habitats that could support these species. 2. If individuals of Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, or Tulare cuckoo wasp are found during the preconstruction survey, pertinent data regarding the associated habitat	

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
	(e.g., vegetation communities, soils, associated invertebrate species, etc.) shall be collected to better understand the ecology of the species. 3. All pertinent data collected during the preconstruction survey shall be included in the information submitted to the California Natural Diversity Data Base (CNDDB) along with the new occurrence record. Results of surveys, including negative findings, shall be submitted to CDFW within three days of their conclusion. If any of these special-status invertebrates are found to be present onsite, the Owners shall develop and implement a plan for the protection of the species, to be approved by CDFW in a timely manner. The results of any protective measures instituted as a part of the protection and monitoring plan shall be provided to CDFW in electronic format within one week of implementation. The Owners shall be responsible for reporting all observations of special-status species to the CNDDB within ten (10) days of sighting. 4. If individuals of Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, or Tulare cuckoo wasp are found during the preconstruction survey, an impact avoidance and minimization plan shall be developed and implemented for the species onsite. The plan will focus on temporary or permanent avoidance of occupied habitat where feasible using exclusionary fencing (temporary or permanent). Where avoidance is not feasible impacts shall be minimized through onsite biological monitoring. The onsite biological monitor shall have authority to temporarily halt any work that would directly impact occupied habitat and determine if a smaller impact footprint is feasible. Work shall then resume after concurrence on the necessary impact footprint. **Mitigation Measure BIO-5** • The following measures shall be used to avoid or minimize direct effects to San Joaquin kit fox as a result of the Project:	

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
	1. On-road haul truck trips to and from the Project site shall be limited to the period 0.5 hours prior to sunrise to 0.5 hours after sunset. 2. On-road haul trucks and other vehicles utilizing the existing access road on the Seaborn site shall be limited to a maximum speed of 10 miles per hour. 3. The entry into the Seaborn site on the existing access road shall be signed as follows "Watch for Wildlife Crossing the Road." The sign shall be a minimum of 4-feet by 4-feet in size with minimum 12-inch block letters. **Mitigation Measure BIO-6** • To avoid wildlife injury or mortality related to fencing materials, all hollow fence posts shall be capped and all empty bolt holes in metal fence posts shall be plugged. The use of sharp fencing materials is prohibited, including, but not limited to, spikes, glass, razor, or barbed wire. The use of erosion-protection materials using plastic/nylon netting is prohibited.	
Biological Resources (Impact BIO-2) – Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.	**Mitigation Measure BIO-7** • The Owners shall prepare and implement an Oak-Riparian Habitat Management Plan that identifies the management areas and requires any excavation to remain outside of those identified areas. It will also require that the construction of the reservoir inlet and outlet channels be located and built in such a manner to minimize loss of habitat.	**Less than Significant**
Biological Resources (Impact BIO-3) – Would the Project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.)	**Mitigation Measure BIO-8** • The following measures shall be used to avoid, minimize, or compensate for fill of jurisdictional waters and the removal of riparian vegetation as a result of the Project:	**Less than Significant**

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
through direct removal, filling, hydrological interruption, or other means.	1. The Owners shall consult with the Regional Water Quality Control Board (RWQCB) and if determined necessary, submit a Section 404 permit application for fill of jurisdictional waters of the United States that includes a wetland protection and compensation plan. At a minimum, the wetland protection and compensation plan shall require 3:1 compensation for permanent effects to jurisdictional waters of the United States and 1:1 compensation for temporary effects to jurisdictional waters of the United States. 2. The Owners shall submit an application for fill of waters subject to the jurisdiction of the CDFW (i.e., long-term lake and streambed alteration agreement). The application shall include a Wetland Protection and Compensation Plan that, at a minimum, requires 3:1 compensation for permanent effects and 1:1 compensation for temporary effects to waters under the jurisdiction of the State.	
Cultural Resources (Impact CUL-1) – Would the Project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5.	**Mitigation Measure CUL-1** • Prior to significant ground disturbance, conduct general Project area geoarchaeological testing and limited subsurface testing with shovels and augers at the location of P-54-005096. If a large intact buried archaeological/cultural deposit is identified, additional extended site testing would be needed to complete the CEQA-required assessment of the resource's significance and eligibility for inclusion in the CRHR. **Mitigation Measure CUL-2** • Consistent with state regulations, in the event archaeological/cultural resources are encountered during Project development or ground-disturbing activities within any portion of the Project area, all work within 100-feet (30 meters) of the find must be halted until a Secretary of the Interior qualified professional archaeologist can identify the discovery and assess its significance. Such finds include, but are not limited to, prehistoric stone grinding implements, stone tools, soapstone bowls, ornaments (e.g., beads, pendants), features such as	**Less than Significant**

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
	burned soil, earthen ovens, and floors of shelters as well as intact historic-era building foundations and concentrations of historic artifacts.	
Cultural Resources (Impact CUL-2) – Would the Project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5.	**Mitigation Measure CUL-1** • See above. **Mitigation Measure CUL-2** • See above.	**Less than Significant**
Cultural Resources (Impact CUL-3) – Would the Project disturb any human remains, including those interred outside of dedicated cemeteries.	**Mitigation Measure CUL-3** • If human remains are uncovered during construction, the Tulare County Coroner is to be notified immediately and must investigate the discovery. If the remains are identified on the basis of archaeological context, age, cultural associations, or biological traits to be those of a Native American, California Health and Safety Code 7050.5 requires that the coroner notify the NAHC within 24 hours of discovery. The NAHC will then identify the Most Likely Descendant, who will be afforded the opportunity to recommend means of treatment for the human remains pursuant to California Public Resources Code 5097.98.6.	**Less than Significant**
Geology and Soils (Impact GEO-6) – Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	**Mitigation Measure GEO-1** • A Paleontological Resource Mitigation and Monitoring Program (PRMMP) will be prepared by a qualified professional. The PRMMP will include the following: o A Worker's Environmental Awareness and Training Program to be implemented prior to the start of excavating the pit. o The PRMMP will indicate where construction monitoring is required for the Project and the frequency of required monitoring including: • Initial period of spot-checking during the preliminary shallow excavation activities. • Monitoring at depths below 5 feet. • The PRMMP will describe the different reporting standards to be used – monitoring with negative findings versus monitoring resulting in fossil discoveries.	**Less than Significant**

Significant Impacts (Before Mitigation)	Summary of Mitigation Measures (See DEIR Section 3.0 for Details)	Level of Significance (After Mitigation)
Noise (Impact NO-1) – Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	**Mitigation Measure NO-1** • Onsite material processing operations occurring at or above a depth of 16-feet below ground surface shall be prohibited between the hours of 4:00 a.m. and 7:00 a.m. **Mitigation Measure NO-2** • In order to reduce the noise level at Receptor 1 (R1) to less than the significance threshold, TID must utilize one of the following measures. This mitigation measure is not required once the processing plants or other sources of noise that could result in an exceedance of the noise threshold criteria are relocated to a minimum depth of 16-feet below ground surface: o Vacate the residence located at Receptor R1 when noise exceedances would occur; or o Inform the occupant of Receptor R1 that temporary elevated noise levels may result during certain periods of the Project, and obtain a signed waiver from the tenant indicating that they choose to remain in the house despite the temporary increase in noise levels. The waiver should describe the potential level of exceedance, times periods and approximate length of time that the exceedances could occur.	**Less than Significant**

1.0 INTRODUCTION

The Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC) and the Visalia & Kaweah Water Company (VKWC) are joint owners (Owners) of approximately 500 acres of land adjacent to the Lower Kaweah River and St. Johns River in Tulare County, California, commonly referred to as the McKay Point property. The Owners propose to construct and operate a surface water storage and re-regulation reservoir, the McKay Point Reservoir, on the property. The construction and operation of this reservoir is the Project under review.

The reservoir would allow for better management of surface water by providing 4,600 acre-feet of water storage capacity to support water demands during dry seasons, additional flood control and storm water management during the wet season.

TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah and St. Johns River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code.

Implementation of the Project requires discretionary approvals from TID for the construction and operation of the reservoir and from the Tulare County (County), under the California Surface Mining and Reclamation Act (SMARA), for the excavation of approximately 110 acres needed to create the reservoir. TID is the lead agency for the purposes of administering the requirements of the California Environmental Quality Act (CEQA) and for preparing this Draft Environmental Impact Report (DEIR). TID is also the Project applicant on behalf of the Owners.

1.1 Project Summary

The Project is located in Tulare County, California, 1.0 miles northwest of the community of Lemon Cove and 2.5 miles southeast of the community of Woodlake (Figure 1-1 – Location Map). The Owners propose to construct and operate the Project on the north side of the divergence of the Lower Kaweah River and St. Johns River (North Parcel) adjacent to and downstream of McKay Point (Figure 1-2 – Project Site and Surrounding Land Use). The area around the Project site has historically been used for agriculture, cattle grazing and aggregate mining. The Project site itself has primarily been used for cattle grazing.

The Owners propose to develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir. The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and, operation of the reservoir. The Owners intend to enter into a lease agreement with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir.

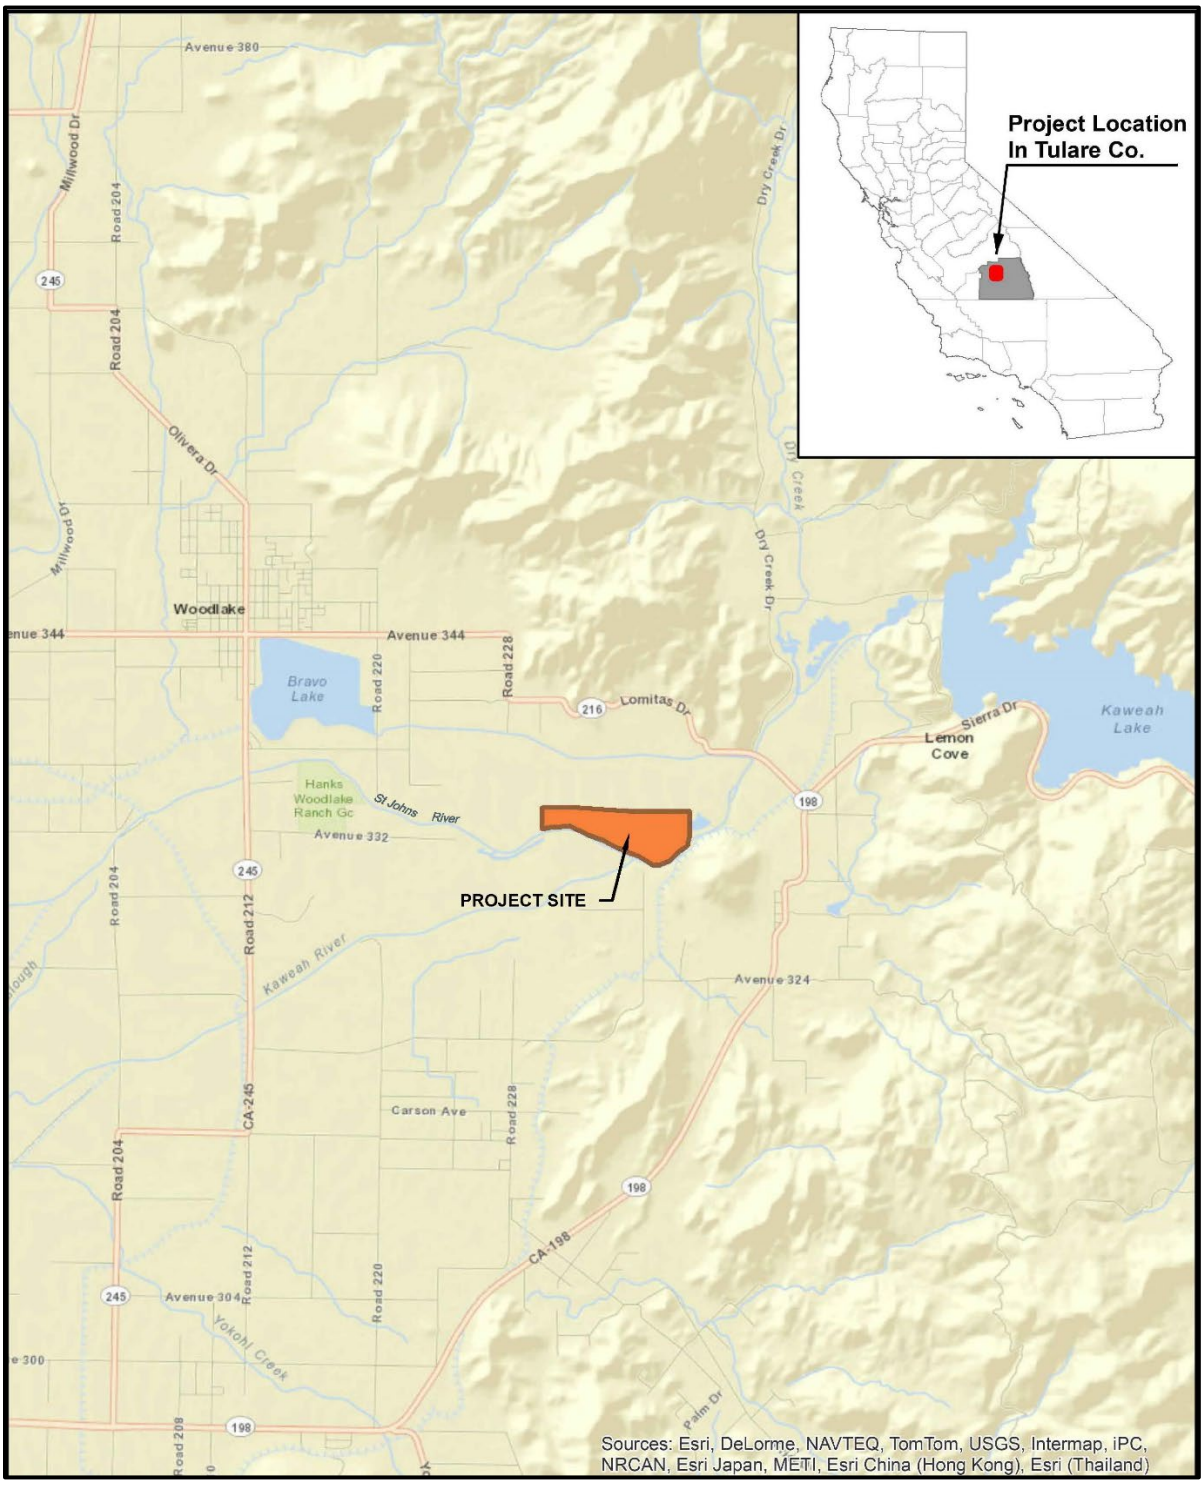
Once the construction of the reservoir is completed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies, and groundwater recharge supplies.

The operations of the reservoir would be closely coordinated with the other water control structures in the area such as the McKay Point Check Structures. The operation of the reservoir would be managed by a Supervisory Control and Data Acquisition (SCADA) system which would monitor the reservoir and river levels, monitor and operate the inflow and outflow channels, and monitor and coordinate with the automated gates of the existing McKay Point Control Structures. SCADA equipment allows for remote monitoring, control, and operations by TID operators from TID's offsite administrative office in Tulare, California. Section 2.0 – Project Description provides a detailed discussion of the construction and operations of the reservoir. Figure 2-4 shows the final reservoir site plan.

To receive river water into the reservoir, the electrically operated weir on the inflow channel would be lowered. Water would flow by gravity into the reservoir up to a maximum flow rate of 500 cubic feet per second (cfs) via the inflow channel. Upon achieving water level equilibrium between reservoir and river, the electrically operated weir would be raised. As the level of the river recedes, either by the passing of the flood peak, or by lowering the gates on the McKay Point Check Structures, the electrically operated weir would serve to hold water in the reservoir. When the St. Johns River water level is lower than that of the reservoir, lowering the electrically operated weir on the outflow channel would deliver water by gravity flow into the St. Johns River up to a maximum flow capacity of 900 cfs.

1.2 Project Objectives and Benefits

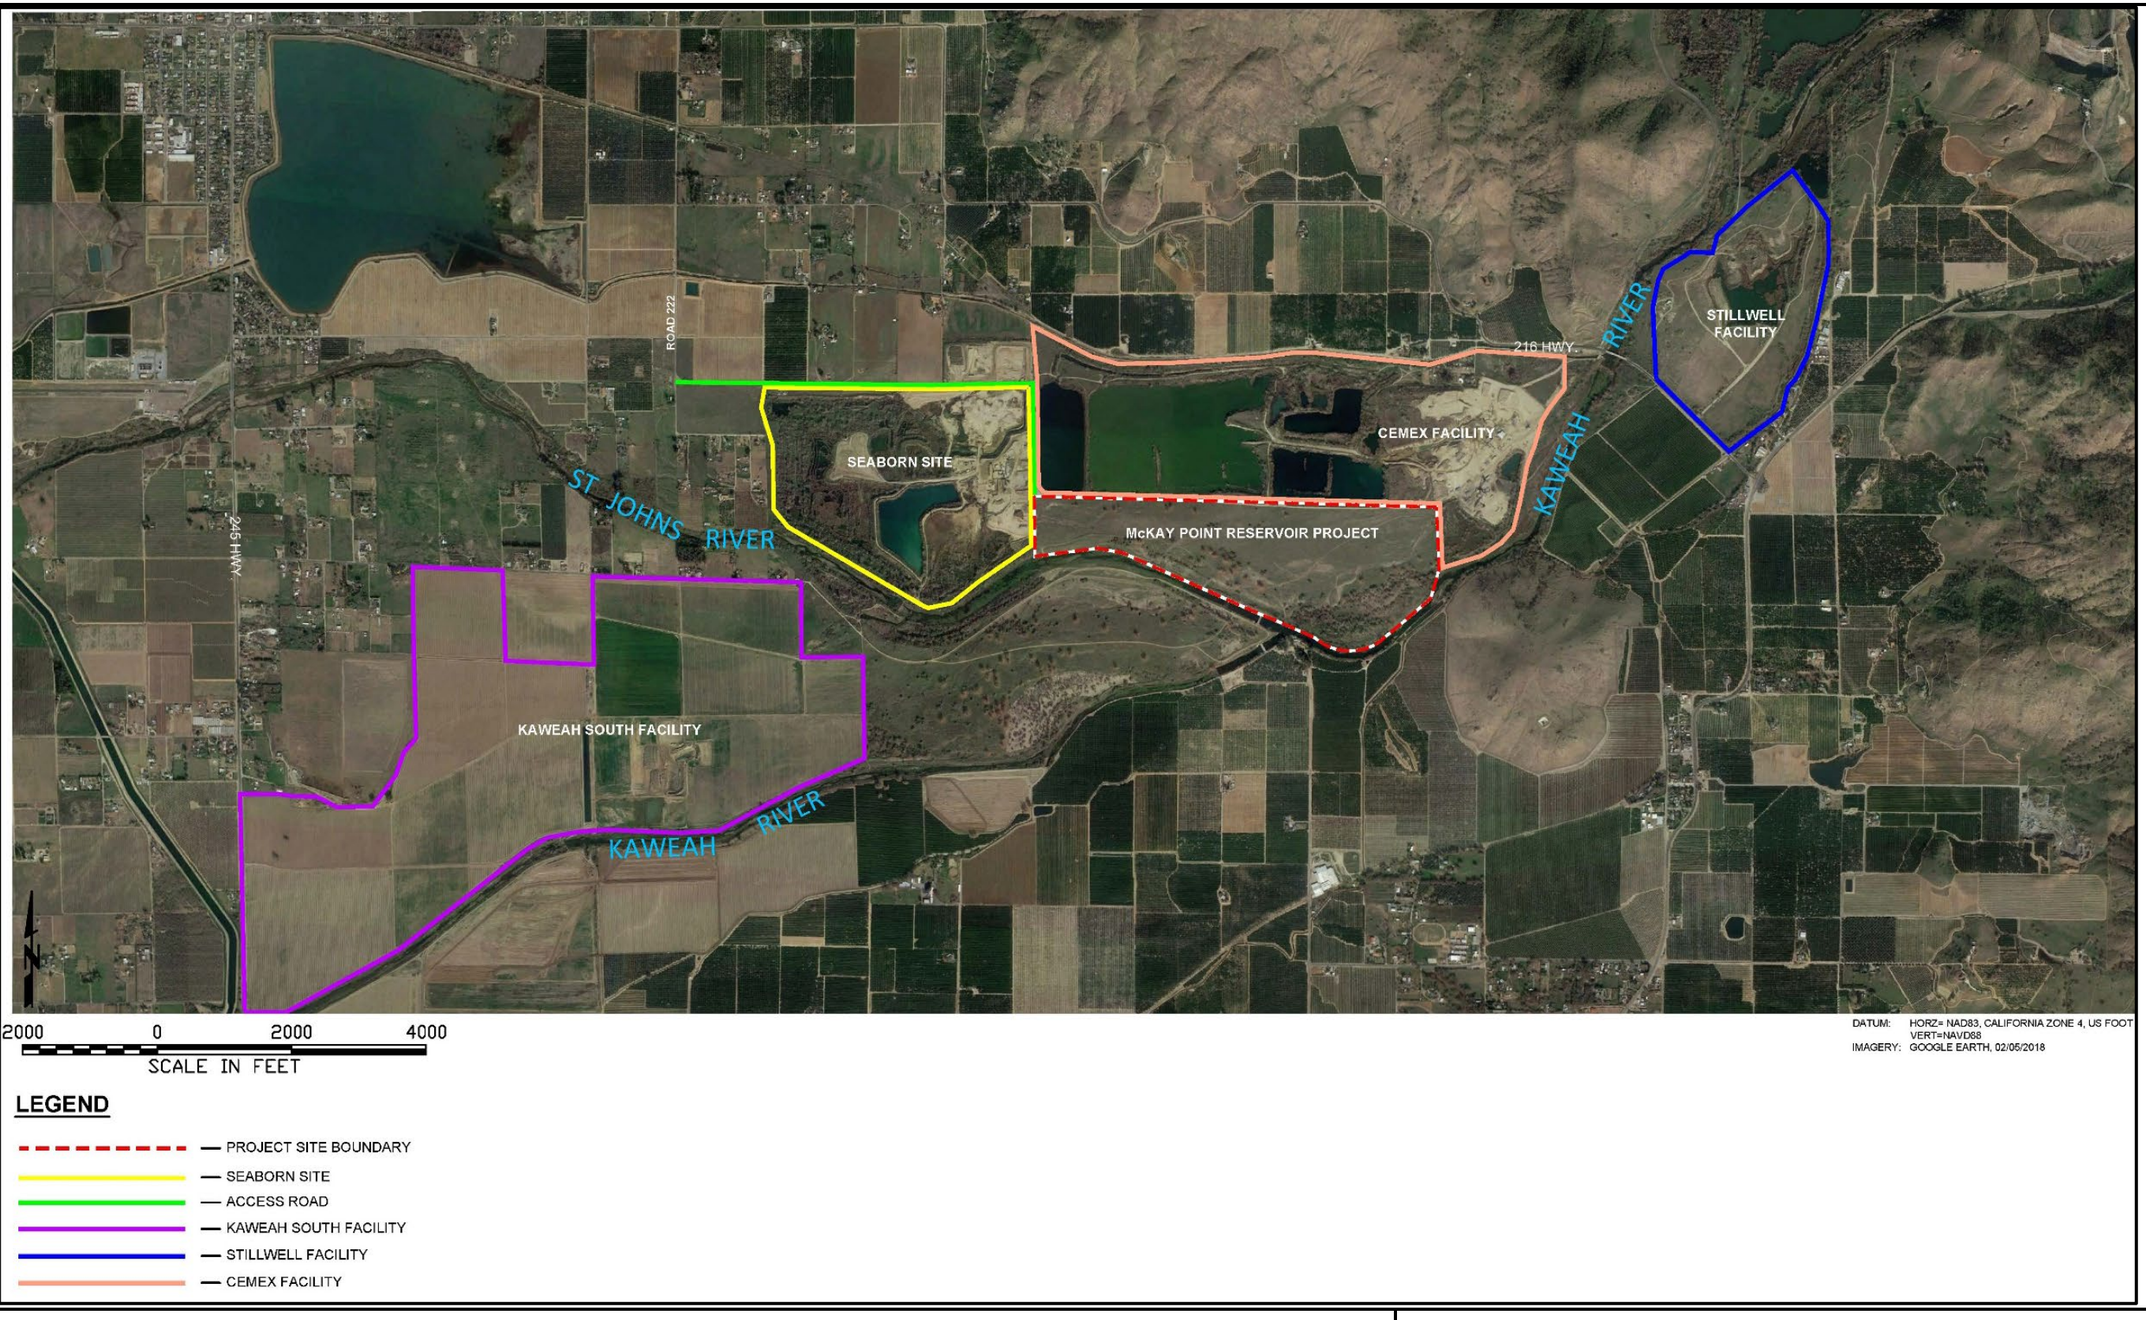
The Owners' objectives in proposing the Project include the following:



- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners at the proposed Project site.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners at the proposed Project site.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests at the proposed Project site.
- Constructing the reservoir at the proposed Project site in such a way that revenue can be obtained to offset a portion of the construction and development costs.
- Locating the reservoir adjacent to and north of the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines as part of the proposed Project.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet as part of the proposed Project.
- Deliver water back to the Lower Kaweah River or the St. Johns River using an electrically operated weir channel and pump(s), as needed.
- Provide additional storage capacity at the proposed Project site for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Enter into a lease agreement with WCSG to excavate at the proposed Project site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset a portion of the construction and development costs.



Once the reservoir is constructed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies and groundwater recharge supplies via water re-regulation. As a result, the Project would provide multiple benefits, including:

- Flow re-regulation for better surface water utilization.
- New water yield for irrigation purposes by capturing damaging and unutilized floodwater and returning it to the rivers to be used by water users served by the Owners or other Kaweah and St. Johns River Association Units. This includes the ability to increase groundwater recharge efforts.
- Flood control by capturing and temporarily holding damaging floodwater at times when downstream interests, including the City of Visalia, may otherwise see damaging flood flows.

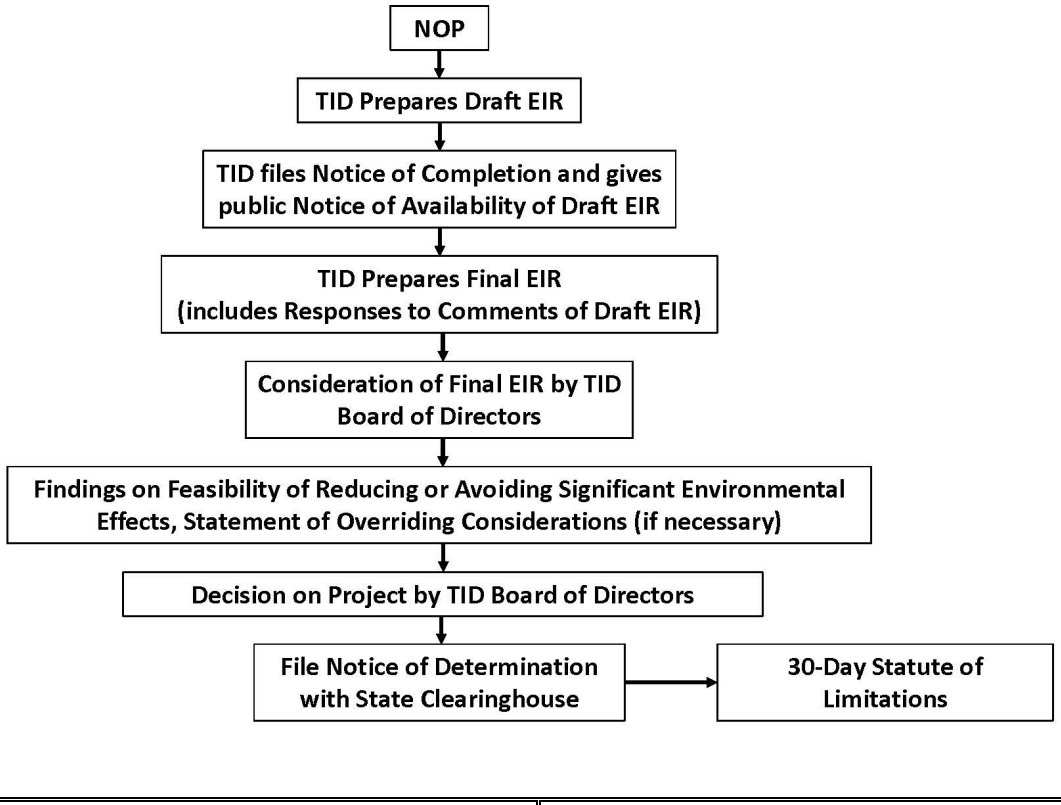
THIS PAGE IS INTENTIONALLY BLANK

1.3 CEQA Process

CEQA is a California statute passed in 1970 to institute a statewide policy of environmental protection. CEQA does not directly regulate land uses, but instead requires State and local agencies within California to follow a protocol of analysis and public disclosure of environmental impacts of proposed projects and adopt all feasible measures to mitigate those impacts.



The CEQA Guidelines were developed to explain and interpret the law for both the public agencies required to administer CEQA and for the public generally. The CEQA Guidelines provide objectives, criteria and procedures for the orderly evaluation of projects and the preparation of environmental documents. The fundamental purpose of the Guidelines is to make the CEQA process comprehensible to those who administer it, to those subject to it, and to those for whose benefit it exists. To that end, the Guidelines are more than mere regulations which implement CEQA, as they incorporate and interpret both the statutory mandates of CEQA and the principles advanced by judicial decisions.

The involvement of the public during the CEQA process is an integral part of the environmental analysis. Public involvement helps to refine the proposed action, identify issues, explore possible alternatives and identify interested and affected persons. The sections below describe the actions taken to ensure that the public has been and will be appropriately involved in this process.

A detailed flow chart of the entire CEQA process is provided in Appendix A of the CEQA Guidelines. Figure 1-3 is a simplified flow chart of the CEQA process as it applies to this Project. In general, the CEQA process for an EIR involves the following steps:

- Lead Agency preparation of an Initial Study and/or determination of the need for an EIR;
- Notice of Preparation (NOP);
- Scoping process;
- Preparation of a DEIR;
- Notice of Completion (NOC) and DEIR public and agency review process;
- Response to comments;
- Preparation of a Final EIR; and
- Notice of Determination (NOD).

These steps and how they are being addressed for this Project are discussed in the following sections.

Source: California Natural Resources Agency

Figure 1-3 CEQA Process Flowchart

1.3.1 Initial Study, Notice of Preparation and Scoping Process

In accordance with CEQA Guidelines Section 15063, an Initial Study may be prepared to determine if a proposed project may have a significant effect on the environment. An Initial Study is not required if the CEQA Lead Agency can determine that an EIR will clearly be required for a proposed project. TID, as Lead Agency, determined an EIR would be required for this Project; therefore, an Initial Study was not prepared.

After deciding that an EIR is required for a project, the Lead Agency shall send to the Office of Planning and Research (OPR) and each responsible and trustee agency a Notice of Preparation (NOP) stating that an EIR will be prepared. The NOP includes a Project Description. The NOP is also made available to the public notifying them of the Project and the opportunity to provide comments during a scoping meeting.

The public scoping process provides a mechanism for focusing and clarifying the issues to be addressed in the DEIR by actively obtaining input from the public and interested federal, state, tribal, and local agencies. Information received during the scoping assists the Lead Agency in identifying potential environmental issues, impacts, project alternatives, and mitigation measures associated with the Project.

TID submitted the NOP for this Project to Office of Planning and Research (OPR) on October 2, 2020. The scoping period ended on November 4, 2020. The State Clearinghouse (SCH) assigned the Project the

following identification number SCH #2014011078. The NOP was made available on the TID website at: https://tulareid.org/engineering-capital-projects or www.mckaypoint.com. The notice was posted on the outside noticing box located in front of the Tulare Irrigation District office at the following address: 6826 Avenue 240 – Tulare, California 93274. The NOP was also published in the Visalia Times-Delta, a local newspaper. A copy of the NOP is in Appendix A of this DEIR.

TID held two (2) scoping meetings to receive comments on the proposed Project and potential environmental impacts. In accordance with the Governor's Executive Order (N-29-20) and the declared State of Emergency, including social distancing directives as a result of the COVID-19 virus, the scoping meetings were held remotely. There was not a physical location for the meetings. Two public scoping meetings were held remotely via WebEX on October 15, 2020 at 5:30 p.m., and October 16, 2020 at 9:00 a.m.

Written comments were also received during the scoping period. Copies of these letters and emails, the list of those who provided comments, and a copy of the presentations provided during the meeting are located in Appendix A of this DEIR.

Table 1-1 provides a brief summary of the areas of concern received during the scoping process and where these concerns and comments are addressed in the DEIR. In order to fully identify the issues raised, copies of the letters/emails are provided in Appendix A. These comments will be incorporated into the EIR Administrative Record for the Project and are addressed in this DEIR, as appropriate.

Table 1-1. Issues Raised During Scoping Period

Details of the excavation of the pit for the construction of the reservoir.	Section 2.0 – Project Description Section 3.0 – Environmental Impact Analysis
Drought conditions and water supply.	Section 3.7 – Hydrology and Water Quality
Impacts to local groundwater wells.	Section 3.7 – Hydrology and Water Quality

1.3.2 Notice of Completion and DEIR Review Process

The Notice of Availability (NOA)/Notice of Completion (NOC) for the DEIR was filed on March 1, 2024 and distributed to public agencies, other affected agencies, adjacent cities, and counties, members of the public, and any parties who have submitted a written request for a copy of the DEIR. It was also posted in the Visalia Times-Delta newspaper on March 1, 2024, and on the outside noticing box located in front of the Tulare Irrigation District office at the following address: 6826 Avenue 240 – Tulare, California 93274. A copy of the NOA/NOC is provided in Appendix A of this DEIR. The 45-day public review period for the

DEIR started on March 1, 2024, and a copy of the DEIR was available for public review on the TID Website: http://www.tulareid.org.

1.3.3 Response to Comments, Final EIR, Certification, Findings and Notice of Determination

As required by CEQA, following the close of the public review period on the DEIR, comments on a project will be compiled and responses will be generated in conjunction with the preparation of the Final Environmental Impact Report (FEIR). The FEIR will consist of a list of all persons, organizations, and public agencies commenting on the DEIR; copies of the comments received on the DEIR; responses to comments; and any other pertinent information added by the lead agency. Prior to approving a project, the Lead Agency shall certify that the FEIR has been completed in compliance with CEQA and that it reflects the agency's independent judgment and analysis.

The Lead Agency shall file a Notice of Determination (NOD), and the FEIR will serve as the CEQA compliance document for the decision-making agency (in this case TID Board of Directors) and any other agencies that may be responsible for review of the Project and issuance of required permits and approvals.

No public agency shall approve a project for which an EIR has identified one or more significant environmental effects unless the agency makes findings for each of those significant effects. CEQA Guidelines Section 15093 states:

a) *"CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If specific economic, legal, social, technological, or other benefits of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered 'acceptable.*

b) *When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record."*

The Lead Agency shall file a NOD within five working days after deciding to carry out or approve a project. The FEIR will serve as the CEQA compliance document for the decision-making agency (in this case TID) and any other agencies that may be responsible for review of a project and issuance of required permits.

1.4 Mitigation Monitoring and Reporting

CEQA requires adoption of a reporting and monitoring program referred to as the Mitigation Monitoring and Reporting Program (MMRP) for those measures or conditions placed on a project to mitigate or avoid adverse effects on the environment. A final MMRP shall be adopted for this Project by TID upon certification of the FEIR.

The MMRP will contain the following elements:

- A list of measures that will act to mitigate potentially significant impacts on the environment and the actions necessary to ensure compliance.
- A procedure of compliance and verification that will be outlined for each action necessary. This procedure will designate who will take action, what action will be taken and when, and to whom and when compliance will be reported.
- The MMRP will provide focused, yet flexible guidelines. As monitoring progresses, changes to compliance procedures may be necessary based upon recommendations by those responsible for the program.

TID is the primary agency for monitoring the implementation of the majority of the mitigation measures identified in the EIR and ensuring compliance with these measures. In some cases, other public agencies, such as SMARA, San Joaquin Valley Unified Air Pollution Control District (SJVAPCD), California Department of Fish and Wildlife (CDFW), the County of Tulare, the Central Valley Regional Water Quality Control District (CVRWQCD), the U.S. Army Corp of Engineers (Army Corp) and the U.S. Fish and Wildlife (USFW) may also oversee implementation of one or more measures. The Applicant is responsible for funding the implementation of each measure.

1.5 Agency Involvement

1.5.1 Lead Agency

CEQA Guidelines Section 15367 defines the Lead Agency as "… *the public agency, which has the principal responsibility for carrying out or approving a project*." Criteria considered in identifying the Lead Agency include whether the agency: 1) has the greatest responsibility for supervising or approving the project as a whole; 2) is an agency with the general governmental powers; and 3) will act first on the project in question (CEQA Guidelines §15051). As discussed above, the Lead Agency for the Project is TID.

This DEIR reflects the independent judgment and analysis of TID as required by the CEQA Guidelines. Lists of organizations and persons consulted and the report preparation personnel are provided in Section 6.0 – Report Preparation Resources and Organizations and Persons Consulted.

1.5.2 Trustee and Responsible Agencies

In addition to TID acting in its capacity as Lead Agency, there are a number of other agencies that may have discretionary authority over the Project, including Trustee and Responsible Agencies.

A Trustee Agency is a state agency having jurisdiction by law over natural resources affected by a project which are held in trust for the people of the State of California. The CDFW, the USFWS, US Army Corp, California Department of Conservation (DOC) Division of Mine Reclamation (DMR), and the CVRWQCB are potential Trustee Agencies for this Project.

A Responsible Agency is a public agency which proposes to carry out or approve a project, for which a Lead Agency is preparing or prepared an EIR. For the purposes of CEQA, the term "Responsible Agency" includes all public agencies other than the Lead Agency which have discretionary approval power over the project. The SJVAPCD, County of Tulare, and the CVRWQCB are potential Responsible Agencies for this Project.

To comply with the Executive Order regarding Government-to-Government actions and when a proposed project may have an effect on Tribal Cultural Resources (TCR), notice and opportunity to comment must be provided to the Tribal Agencies. This is often accomplished by contacting the Native American Heritage Commission (NAHC).

In addition, in accordance with Public Resource Code Sections 21074 (AB 52), the Lead Agency, if requested by a California Native American Tribe that is traditionally and culturally affiliated with the geographic area of a project site, must conduct formal consultation with the tribe(s) which may include discussion of the type of environmental review necessary, the significance of tribal cultural resources, the significance of a project's impacts on tribal cultural resources, and, if necessary, project alternatives or the appropriate measures for preservation or mitigation that the California Native American tribe may recommend to the lead agency.

1.6 Permits, Approvals and Other Requirements

Table 1-2 identifies potential permits, approvals, and regulations that may be required for the Project. Section 3.0 – Environmental Impact Analysis, provides detailed discussions of the regulatory requirements for the Project as they relate to each of the resource areas evaluated.

Table 1-2. Potential, Anticipated or Required Permits, Approvals and Regulatory Requirements

Public Agency	Approval Required
Tulare Irrigation District	• Certification of Environmental Impact Report • Approval of Project
Tulare County (Resource Management Agency)	• Surface Mining Permit • Surface Mining and Reclamation Plan • Financial Assurance Cost Estimate (FACE)
Tulare County (Health and Human Services Agency, Environmental Health: Certified Unified Program Agency)	• Spill Prevention, Control, and Countermeasure (SPCC) Plan • Hazardous Materials Business Plan (HMBP) • Hazardous Materials Inventory • Above-Ground Storage Tank (diesel) and Generators Hazardous Materials Handler Permit
San Joaquin Valley Air Pollution Control District	• Authority to Construct • Permit to Operate

Public Agency	Approval Required
Central Valley Regional Water Quality Control Board	• National Pollutant Discharge Elimination System (NPDES) Permit (General) • Storm Water Pollution Prevention Plan (SWPPP) • Clean Water Act Section 401 Water Quality Certification • Encroachment Permit and Waste Discharge Requirements (WDRs)
California Dept. of Fish and Wildlife	• Streambed Alteration Agreement (SAA)
California Dept. of Conservation (DOC), Division of Mine Reclamation (DMR)	• Review of Surface Mining and Reclamation Plan • Review of Financial Assurance Cost Estimate (FACE)
U.S. Army Corps of Engineers	• Section 404 Permit (the Clean Water Act)

1.7 Project Baseline

Under CEQA, the impacts of a proposed project must be evaluated by comparing expected environmental conditions after project implementation to conditions at a point in time referred to as the baseline. The changes in environmental conditions between those two scenarios represent the environmental impacts of the proposed project. If there is no net change between the project baseline and the proposed project then there would be no environmental impact.

1.8 Environmental Issues Not Requiring Further Detailed Evaluation in the Draft EIR

Based on the CEQA Guidelines thresholds of significance, the following environmental resources areas were determined not to be significantly affected by the implementation of the Project; therefore, these resource areas were found to have No Impacts or Less than Significant Impacts and therefore did not require further detailed analysis in this DEIR (CEQA Guidelines Section 15128). Nonetheless, these environmental resources are discussed within the following DEIR sections:

- Aesthetics (DEIR Section 3.1);
- Agriculture and Forestry Resources (DEIR Section 3.2);
- Energy (DEIR Section 3.6);
- Mineral Resources (DEIR Section 3.12);
- Population and Housing (DEIR Section 3.14);
- Public Services (DEIR Section 3.15);
- Recreation (DEIR Section 3.16);
- Transportation (DEIR Section 3.17); and
- Utilities/Service Systems (DEIR Section 3.19).

The following sections provides a summary of applicable explanations as to why it was determined that these resources areas were found to have no impacts and therefore did not require significant analysis in this DEIR. Also see the DEIR sections listed above for additional detail.

1.8.1 Aesthetics

Appendix G of the CEQA Guidelines contains a checklist of environmental effects that may be considered significant. Under the category of "Aesthetics," a project is considered to have a significant visual impact on the environment if it would:

a) *Have a substantial adverse effect on a scenic vista (CEQA Appendix G Threshold (a));*

b) *Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway (CEQA Appendix G Threshold (b));*

c) *In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality (CEQA Appendix G Threshold (c)); or*

d) *Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area (CEQA Appendix G Threshold (d)).*

The California Scenic Highway Mapping System notes that State Highway 198 is an Eligible State Scenic Highway – Not Officially Designated. State Highway 198 passes to the southeast of the Project where intervening terrain would preclude any view of the Project. State Highway 216, which has no State Scenic Highway status, passes north of the Project and is 0.7 miles from the Project at its closest point.

The Project is adjacent to the Kaweah and St. Johns Rivers. The Project is set back from the rivers' banks and the Project would not involve any large above-grade structures that would be visible from the rivers. Because dry mining techniques would be used during the Project excavation phase, there would be no need for draglines that could have an adverse impact on the views from the rivers. Mining operations located adjacent to or in the area surrounding the Project site have been in existence since the 1940s; therefore, the Project would not change the visual character of the area.

The issue of light and glare is typically associated with excessively bright nighttime lighting that crosses over property lines (i.e., "light trespass") and illuminates offsite yards or bedroom windows. It is also associated with the condition that occurs when excessive nighttime lighting creates a "skyglow" effect. The excavation and construction phases of the Project would occur primarily during daylight hours (between dawn and 6:00 p.m.). Activities taking place during the time of year when daylight hours are shorter, some lighting may be required to provide a safe working environment. If nighttime lighting is required, high pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association [IDA]-approved fixtures) would be used and the lighting would also be designed to confine illumination to the Project site and/or to areas that do not include light-sensitive uses. Except for security lighting, no nighttime lighting would be required during the Project operations phase.

The Project would have no impact to scenic vistas and aesthetics from roadways or the river; therefore, the Project would have no significant impacts related to aesthetics or nighttime lighting. Refer to DEIR Section 3.1 – Aesthetics for additional detail.

1.8.2 Agriculture and Forestry Resources

Under the Appendix G of the CEQA Guidelines category of "Agriculture and Forestry Resources" a project is considered to have a significant impact on the environment if it would:

a) *Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use (CEQA Appendix G Threshold (a))?*

b) *Conflict with existing zoning for agricultural use, or a Williamson Act contract (CEQA Appendix G Threshold (b))?*

c) *Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)) (CEQA Appendix G Threshold (c))?*

d) *Result in the loss of forest land or conversion of forest land to non-forest use (CEQA Appendix G Threshold (d))?*

e) *Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use (CEQA Appendix G Threshold (e))?*

The California Resources Agency, Division of Land Resource Protection maintains information pertaining to, and the mapping of, farmland. The entire Project site is designated as "Grazing Land", which, among other definitions, includes "land on which the existing vegetation is suited to the grazing." The Project site is not designated Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance, nor is it under a Williamson Act contract. Historically, the site has been used for cattle grazing.

The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20-Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). Within the AE-20 zone, the County permits mining and the extraction of minerals, upon approval of a Reclamation Plan and Financial Assurance Cost Estimate (FACE).

There are no forestlands on or near the Project site. The Project would also not result in the cancellation of an open space contract made pursuant to the California Land Conservation Act of 1965, or Farmland Security Zone Contract pursuant to Public Resources Code § 15206(b)(3).

The Project would have no impact on agriculture or forestlands. Refer to DEIR Section 3.2 – Agriculture and Forestry Resources for additional detail.

1.8.3 Energy

Under the Appendix G of the CEQA Guidelines category of "Energy" a project is considered to have a significant impact on the environment if it would:

a) *Result in potentially significant environmental impact due to wasteful, inefficient or unnecessary consumption of energy resources, during the project construction or operation (CEQA Appendix G Threshold (a))?*

b) *Conflict or obstruct a state or local plan for renewable energy or energy efficiency (CEQA Appendix G Threshold (b))?*

The Project would not result in an increase of employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. The electrical services required for the onsite processing equipment would be obtained from Southern California Edison (SCE) from an existing powerline located on the north perimeter of the Project site. Additionally, the Project would provide a local source of aggregate to the County which would minimize the need to import aggregate from further away, thus reducing fuel consumption associated with long distance trucking. For these reasons, the Project would have no significant impacts on energy resources.

Based on knowledge of the proposed projects in the Project area, the Project would not conflict or obstruct a state or local plan for renewable energy or energy efficiency. Therefore, the Project would have no impact on renewable energy plans. Refer to DEIR Section 3.6 – Energy for additional detail.

1.8.4 Mineral Resources

Under the Appendix G of the CEQA Guidelines category of "Mineral Resources" a project is considered to have a significant impact on the environment if it would:

a) *Result in the loss of availability of a known mineral resource that would be of value to the region and residents of the state (CEQA Appendix G Threshold (a))?*

b) *Result in the loss of availability of a locally-important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan (CEQA Appendix G Threshold (b))?*

Implementation of the Project would not result in the loss of availability of a known mineral resource that is either locally-important or of value to the residents in the region or the State. Rather, as a result of the need to excavate the Project site in order to construct the reservoir, the Project proposes to develop this resource.

The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20 Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). The State Geologist, in accordance with the State Board's Guidelines for Classification and Designation of Mineral Lands, has classified the underlying land as MRZ-2b, which includes:

> *Areas underlain by mineral deposits where geologic data indicate that significant inferred resources are present. Areas classified MRZ-2b contain discovered mineral deposits that are either significant inferred resources or indicated reserves. Land included in MRZ-2b is of importance because it contains potential economic mineral deposits.*

An example of loss of availability in this instance would be the development of residential housing atop an area classified by the State Geologist as MRZ-2b. The excavation of lands so classified, and the subsequent processing of the resulting materials, is the utilization of such resources, which is consistent with an MRZ-2b classification.

The Project would have no impact on mineral resources. Refer to DEIR Section 3.12 – Mineral Resources for additional detail.

1.8.5 Population and Housing

Under the Appendix G of the CEQA Guidelines category of "Population and Housing" a project is considered to have a significant impact on the environment if it would:

a) *Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure) (CEQA Appendix G Threshold (a))?*

b) *Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere (CEQA Appendix G Threshold (b))?*

The Project would employ 7 to 12 people during the excavation and construction phases, which is less than the baseline of 10 to 18 employees associated with aggregate operations on the Seaborn site (baseline). The operation of the reservoir would be managed remotely primarily by TID employees from TID's offsite administrative office in Tulare, California. The Project would not require hiring additional TID employees. This would not induce substantial population growth in the area. There are no houses located on the Project site; therefore, the Project would not result in the displacement of any existing housing. The Project would not induce growth, growth would occur whether or not the Project is implemented.

The Project would have no impact on population and housing. Refer to DEIR Section 3.14 – Population and Housing for additional detail.

1.8.6 Public Services

Under the Appendix G of the CEQA Guidelines category of "Public Services" a project is considered to have a significant impact on the environment if it would:

a) *Result in physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services (CEQA Appendix G Threshold (a)):*
    i. *Fire protection?*
    ii. *Police protection?*
    iii. *Schools?*
    iv. *Parks?*
    v. *Other public facilities?*

The Project would not result in additional employee and vendor vehicles/on-road haul trucks on public roadways above baseline levels. Therefore, the Project would not interfere with public services such as fire and police protection. The Project would not involve any activities that would impacts schools, parks, public services or communications. Potential impacts associated with noise, air quality, odor, and water quality are fully evaluated in Section 3.0 Environmental Impact Analysis.

Therefore, the Project would have no impact on public services. Refer to DEIR Section 3.15 – Public Services for additional detail.

1.8.7 Recreation

Under the Appendix G of the CEQA Guidelines category of "Recreation" a project is considered to have a significant impact on the environment if the following are found to be true:

a) *Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (CEQA Appendix G Threshold (a))?*

b) *Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment (CEQA Appendix G Threshold (b))?*

The number of employees needed for the Project operations would be a decrease from baseline. As a result, any use of recreational facilities resulting from Project implementation would not result in physical deterioration, and thus no impacts would result.

The Project does not include or require recreational facilities; therefore, no impacts would result. Refer to DEIR Section 3.16 – Recreation for additional detail.

1.8.8 Transportation

Under the Appendix G of the CEQA Guidelines category of "Transportation" a project is considered to have a significant impact on the environment if it would:

a) *Conflict with program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities (CEQA Appendix G Threshold (a))?*

b) *Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b) (CEQA Appendix G Threshold (b))?*

c) *Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) (CEQA Appendix G Threshold (c))?*

d) *Result in inadequate emergency access (CEQA Appendix G Threshold (d))?*

Because the production rate of marketable aggregate would not increase from baseline, the number of on-road haul trucks transporting product offsite on public roadways would not be increased. The Project operations (excavation of the site, construction of the reservoir and reservoir operations) would be

managed such that the number of on-road haul trucks, delivery trucks and/or service vehicles would not result in an increase to the baseline. In addition, the number of employees required at the site would be less than baseline, thus reducing the number of employee vehicles on public roads. Therefore, the Project would not interfere with transportation or result in an increase of local traffic. The routine operation of the reservoir would be conducted remotely from TIDs offsite office and would not result in a significant increase in TID employees.

The distance or vehicle mile traveled (VMT) to and from the site to deliver product to WCSG's customers in the region would not significantly change from the VMT associated with the previous Seaborn mining operations.

The Project would not include design features that would increase hazards on the public roads. The existing access road has been and would continue to provide adequate emergency access to and from the Project site.

Therefore, the Project would have no impact on transportation or traffic. Refer to the traffic report prepared by Associated Transportation Engineers (ATE) and the Vehicle Miles Travelled (VMT) analysis prepared by Sespe Consulting, Inc. (Sespe) to support the determination that there would be no impact related to transportation and/or traffic (Appendix I). Also see DEIR Section 3.17 – Transportation for additional detail.

1.8.9 Utilities and Service Systems

Under the Appendix G of the CEQA Guidelines category of "Utilities and Service Systems" a project is considered to have a significant impact on the environment if it would:

a) *Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects (CEQA Appendix G Threshold (a))?*

b) *Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years (CEQA Appendix G Threshold (b))?*

c) *Result in a determination by the wastewater treatment provider, which serves or may serve the project, that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments (CEQA Appendix G Threshold (c))?*

d) *Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructures, or otherwise impair the attainment of solid waste reduction goals (CEQA Appendix G Threshold (d))?*

e) *Comply with federal, state, and local management and reduction statutes and regulations related to solid waste (CEQA Appendix G Threshold (e))?*

Because the production rate of aggregate would not increase from baseline, the requirements for services such as utilities would not significantly change during reservoir excavation, and the subsequent construction phase would require less utilities than the excavation phase. The reservoir operation would be manned remotely from the TID office and would not result in a change in the TID office utility and service system requirements. The Project would not result in an increase of onsite employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. An existing SCE electrical connection is located at the northern edge of the Project site to accommodate the onsite electrical needs of the Project. Therefore, the Project would not require the relocation or construction of new or expanded electric power or telecommunication facilities. The Project would not generate significant amount of waste that would exceed the capacity of the local landfills. Portable toilet facilities would be provided at the site and waste disposed of at an approved facility. The Project would not rely on existing storm water drainage systems nor would it require the construction of new or expanded storm water drainage systems. As discussed in Section 3.7 – Hydrology and Water Quality, the Project would have sufficient water supplies available to use for dust suppression during excavation, construction and operations.

Therefore, the Project would have no impact on utilities and services systems. Refer to DEIR Section 3.19 – Utilities and Service Systems for additional detail.

1.9 Potentially Significant Issues Analyzed in the Draft EIR

The following environmental issues have been identified as areas where the Project could potentially result in a significant impact and were therefore evaluated in the DEIR. The DEIR section number of each is identified in parentheses.

- Air Quality (3.3)
- Biological Resources (3.4)
- Cultural Resources (3.5)
- Geology and Soils (3.7)
- Greenhouse Gases Emissions (3.8)
- Hazards and Hazardous Materials (3.9)
- Hydrology and Water Quality (3.10)
- Land Use and Planning (3.11)
- Noise (3.13)
- Tribal Cultural Resources (3.18)
- Wildfire (3.20)

1.10 Project Alternatives

The CEQA Guidelines state that an EIR shall describe and analyze a range of reasonable alternatives to the proposed project. The guiding principles for the selection of alternatives for analysis in an EIR are provided in the CEQA Guidelines Section 15126.6. Pursuant to Section 15126.6(a):

> "An EIR shall describe *a range of reasonable alternatives to the project, or the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives which are infeasible."*

The following list is a summary of the key alternative provisions of the CEQA Guidelines Section 15126.6:

- The discussion of alternatives shall focus on alternatives to the project or its location that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.
- The No-Project Alternative shall be evaluated, along with its impacts. The no-project analysis shall discuss the existing conditions at the time the notice of preparation was published, as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services.
- The range of alternatives required in an EIR is governed by a "rule of reason"; therefore, the EIR must evaluate only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project.
- For alternative locations, only locations that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR.
- An EIR need not consider an alternative whose effects cannot be reasonably ascertained and whose implementation is remote and speculative.

CEQA Guidelines Section 15126.6(f)(1) also allows the following factors to be taken into consideration when evaluating the feasibility of the alternatives:

- Site suitability;
- Economic viability;
- Availability of infrastructure;
- General Plan consistency;
- Other plan or regulatory limitations;
- Jurisdictional boundaries; and
- Whether the proponent can reasonably acquire, control or otherwise have access to the alternative site.

The alternatives that were considered but determined to be infeasible include the following:

- Alternative Location;
- Alternative Depth; and
- Alternative Size.

The alternatives that were considered for analysis include the following:

- No Project Alternative;
- Wet Excavation Method Alternative; and
- Clay Liner Installation Alternative.

A detailed discussion on the proposed alternatives to the Project as well as the alternatives that were considered but determined to be infeasible for the Project is provided in Section 4.0 – Alternatives to the Proposed Project.

1.11 Environmentally Superior Alternative

CEQA Guidelines Section 15126.6(e)(2) specifies that:

> *"If the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives."*

The No Project Alternative is identified as the environmentally superior alternative. If this is the case, as stated above, it is also necessary to identify an environmentally superior alternative from among the other alternatives. However, as discussed in Section 4.0 – Alternatives, neither of the other alternatives would be environmentally superior to the Project. Please see Section 4.0 – Alternatives for additional detail.

1.12 Organization of the EIR

The DEIR is organized into the following sections:

Executive Summary: Summarizes the DEIR and is considered a standalone overview of the process and the Project. It includes a brief Project summary, Project objectives and benefits, description of the CEQA and other key regulatory processes, areas of controversy, issues to be resolved, the potentially significant environmental effects that may result from implementation of the Project, the Mitigation Measures identified to reduce or eliminate potentially significant effects, and a summary of alternatives to the Project.

Section 1.0 – Introduction: Provides an introduction and summary of the Project, the CEQA process and organization of the DEIR, the permits and entitlements required to implement the Project, and responsible agencies or County departments that would issue those permits and entitlements, areas of controversy, issues to be resolved, environment resources required to need or not need further evaluation in the EIR, the potentially significant environmental effects that may result from implementation of the Project, and a summary of alternatives to the Project.

Section 2.0 – Project Description: Provides a detailed description of the Project, including location and environmental setting, regulatory setting, Project purpose and objectives, and the Project phases and operations.

Section 3.0 – Environmental Impact Analysis: Describes the Project's characteristics related to each of the topical environmental issues and the threshold criteria used to evaluate potentially significant effects of the Project. Evaluates the potential environmental effects, identifies Mitigation Measures to reduce or eliminate effects found to be significant, and determines the level of significance of each effect after Mitigation Measures are implemented.

Section 4.0 – Alternatives to the Proposed Project: This section provides a summary comparison of the impacts of the Project with the identified Project alternatives. It includes the mandatory No Project Alternative, and an environmentally superior alternative.

Section 5.0 – Other CEQA Required Analysis: This section discusses cumulative impacts, growth inducing impacts, any significant and unavoidable adverse impacts that would remain after implementation of the Project, and significant irreversible environmental changes.

Section 6.0 – Report Preparation Resources and Organizations and Persons Consulted: This section lists the organizations which contributed to the preparation of the DEIR.

Section 7.0 – References: This section lists the references cited in the body of the DEIR.

Section 8.0 – Acronyms: This section lists the acronyms found in the body of the DEIR.

H Noise

H-1 Noise Impact Assessment (Sespe Consulting, Inc., 2021)

I Traffic

I-1 Traffic Impact Assessment (ATE, 2021)

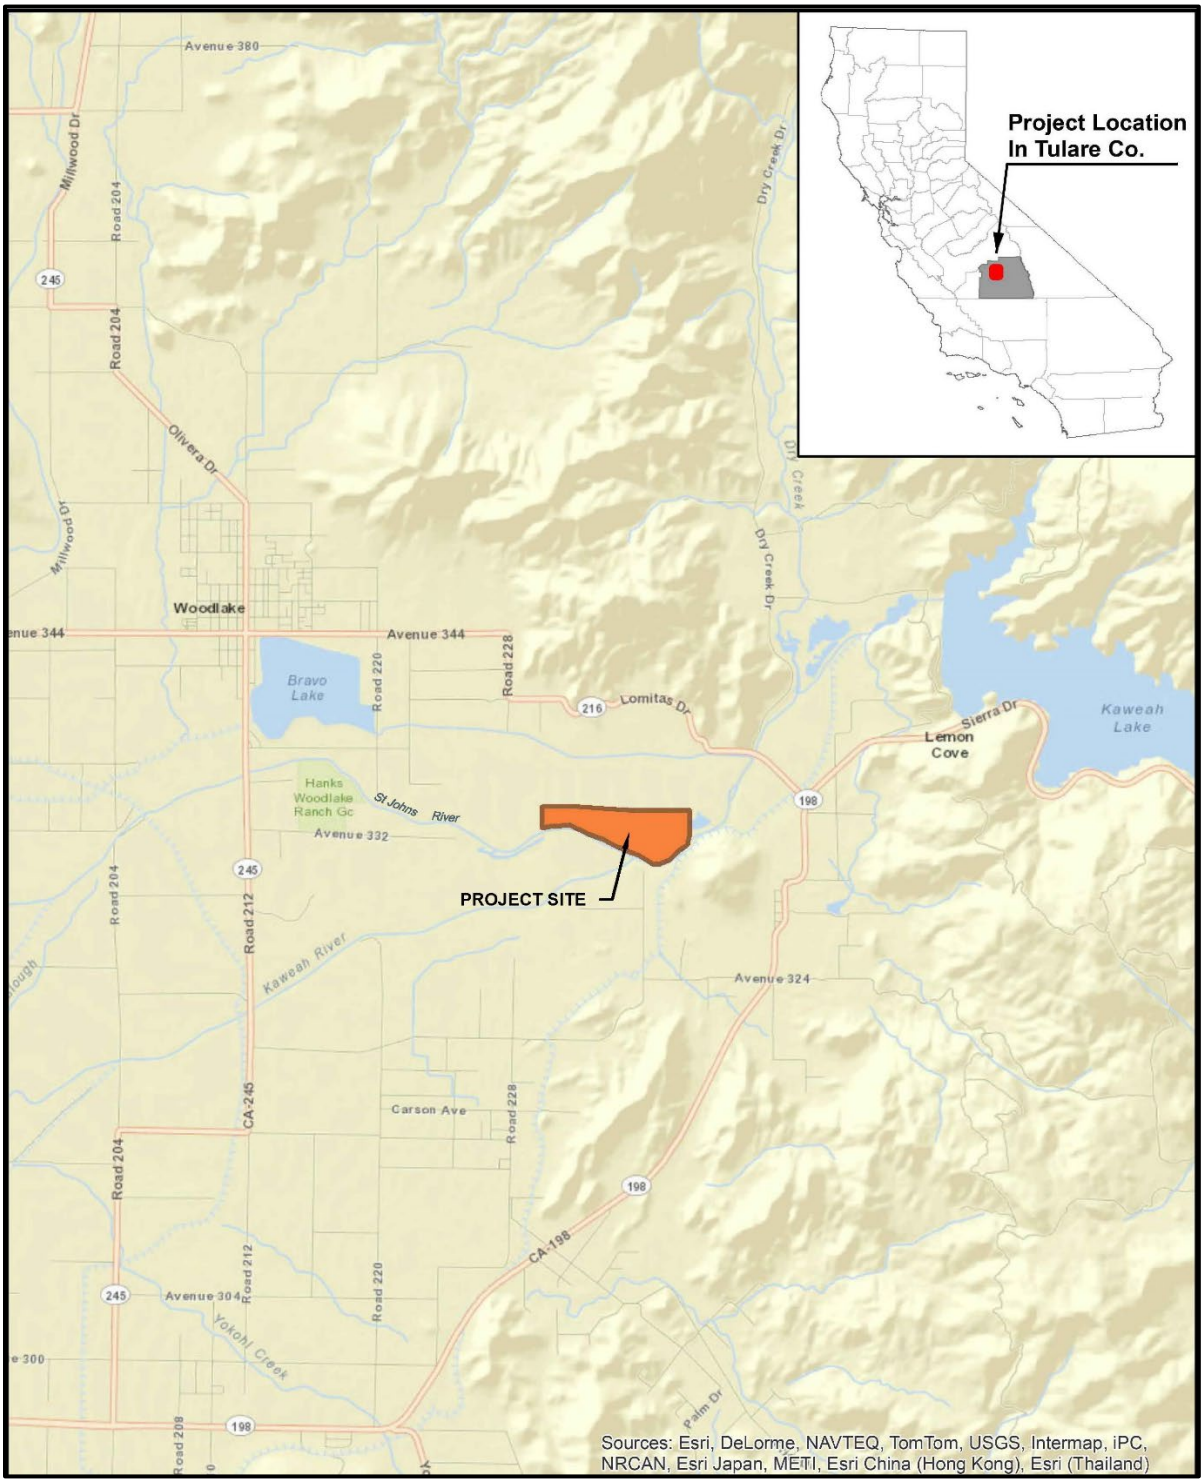
I-2 VMT Analysis (Sespe Consulting, Inc., 2022)

For those areas of potentially significant impacts, the sections of the DEIR generally use the following format:

- Topic Title and Introduction;
- Environmental Setting;
- Regulatory Setting;
- Significance Thresholds;
- Methodology of Analysis;
- Project-Level Impacts and Mitigation Measures; and
- Cumulative-Level Impacts and Mitigation Measures.

2.0 PROJECT DESCRIPTION

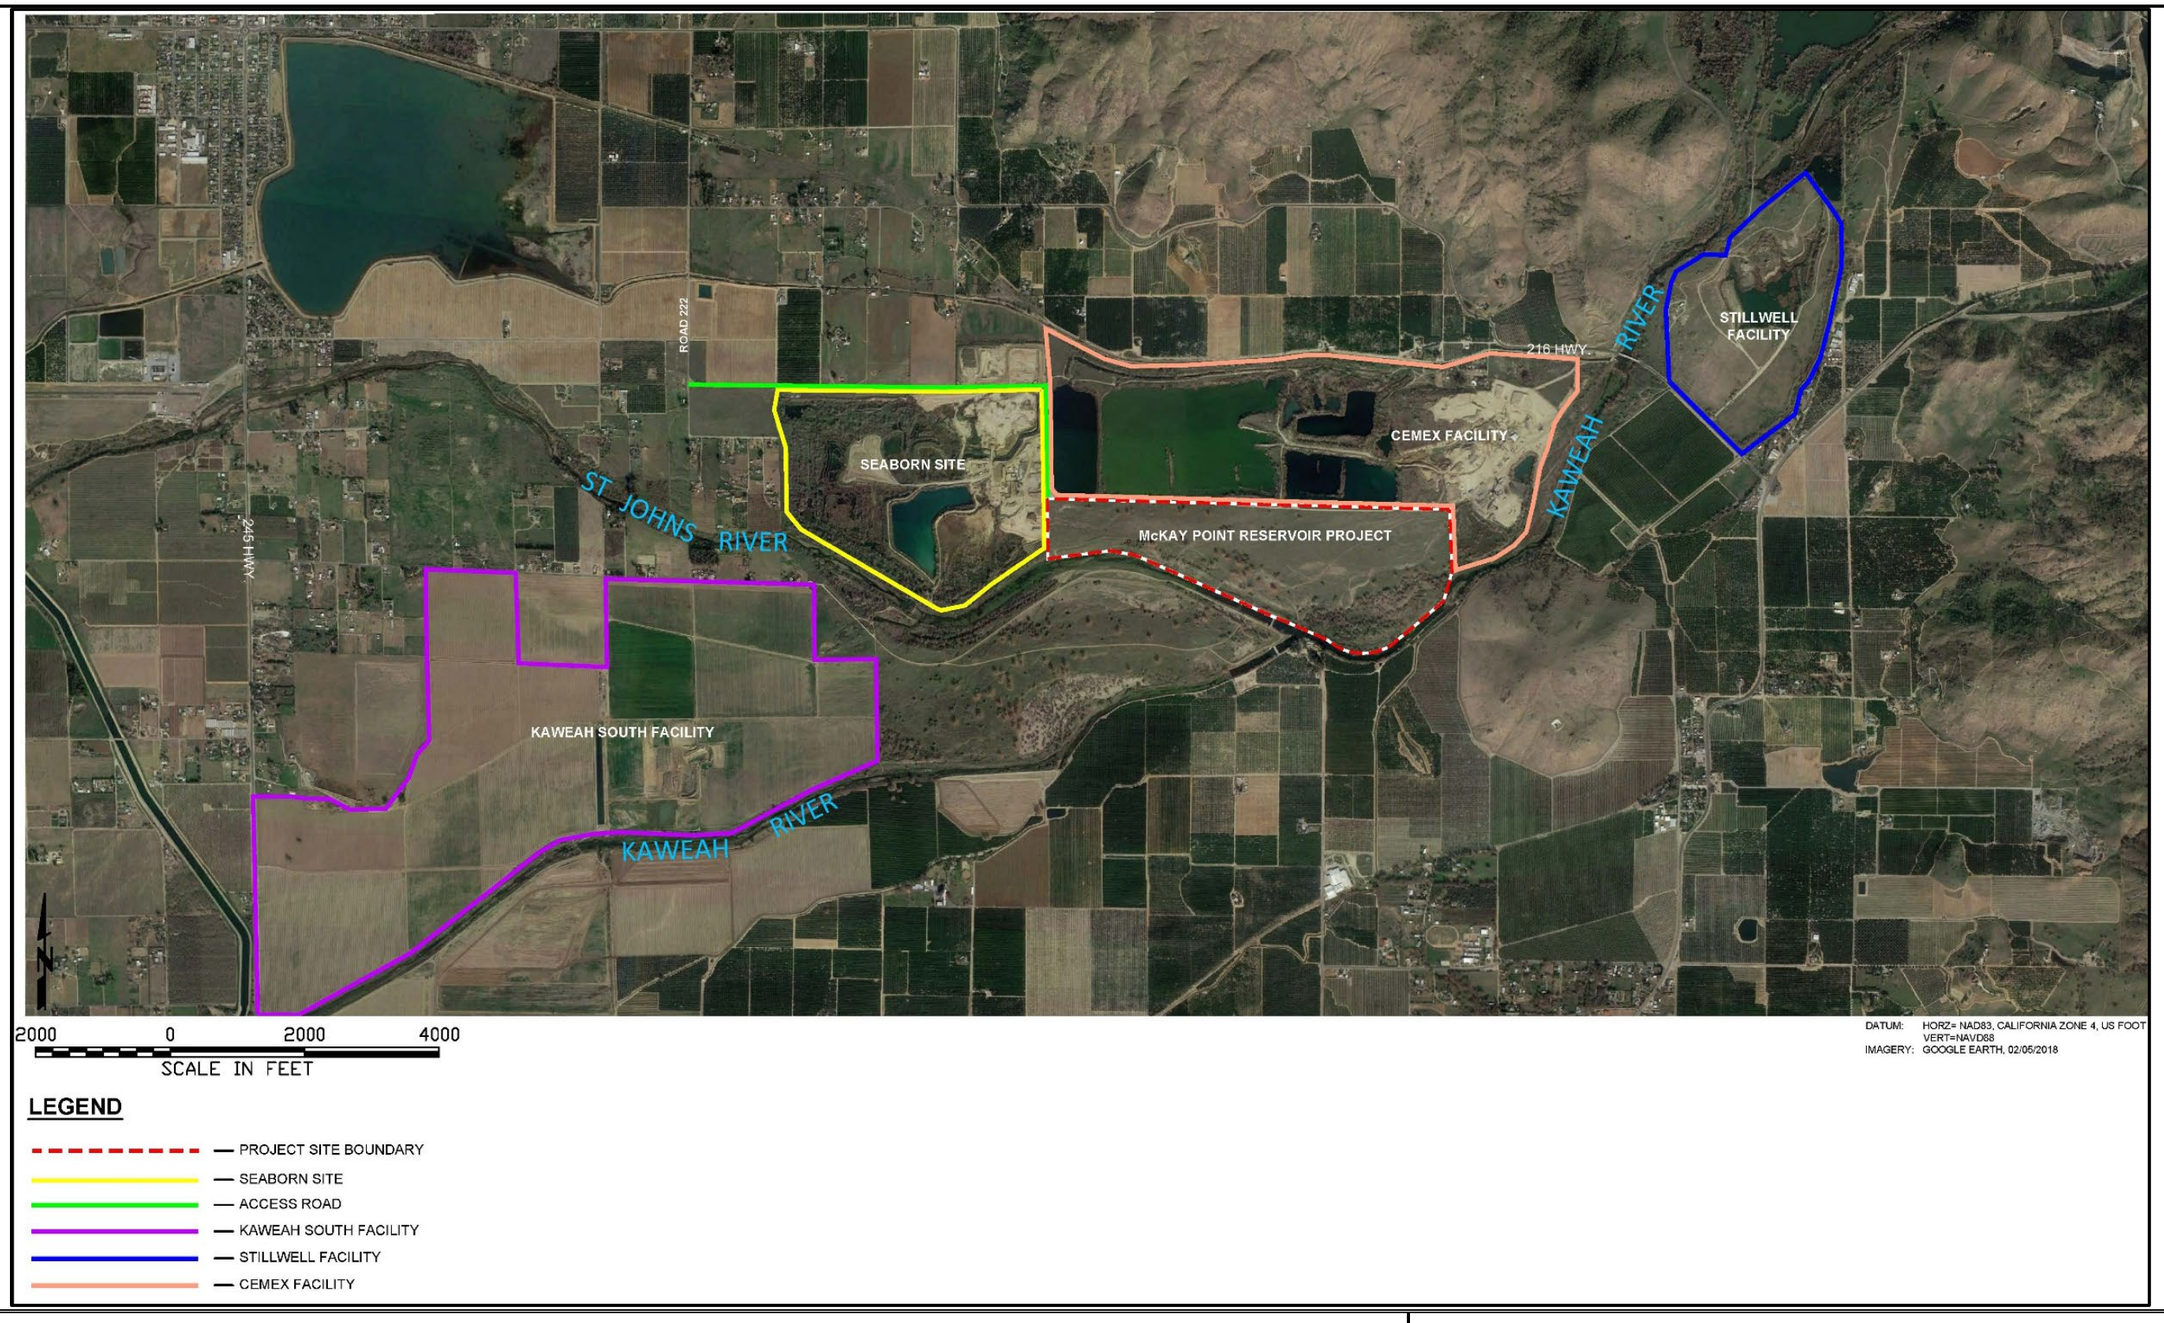
2.1 Project Overview



TID, the Consolidated Peoples Ditch Company (CPDC) and the Visalia and Kaweah Water Company (VKWC) are joint owners (Owners) of approximately 500 acres of land adjacent to the Lower Kaweah River and St. Johns River in Tulare County, California, referred to as the McKay Point property. Together, the Owners are the holders of pre-1914 and post-1919 appropriative water rights on the Kaweah and/or the St. Johns Rivers, and they own storage capacity rights in Lake Kaweah formed by the impoundment of water behind the Terminus Dam.

TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah and St. Johns River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code.

The Owners propose to develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir (the proposed Project). The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River. The surrounding land uses are mining, agricultural, and residential (Figure 2-1 – Location Map, Figure 2-2 – Project Site and Surrounding Land Use Map).



The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and operation of the reservoir. The Owners intend to enter into a lease agreement with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir would be used as a surface water storage/re-regulation reservoir. The reservoir would also be used to optimize groundwater recharge within the Owners service areas.

Discretionary approvals would be required for the Project; therefore, the Project is subject to the CEQA. TID is the Project applicant on behalf of the Owners and is the CEQA Lead Agency.

THIS PAGE IS INTENTIONALLY BLANK

2.2 Project Objectives

The Owners' objectives in proposing the Project include the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners at the proposed Project site.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners at the proposed Project site.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests at the proposed Project site.
- Constructing the reservoir at the proposed Project site in such a way that revenue can be obtained to offset a portion of the construction and development costs.
- Locating the reservoir adjacent to and north of the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines as part of the proposed Project.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet at the proposed Project site.
- Deliver water to the Lower Kaweah River or the St. Johns River using an electrically operated weir channel and pump(s), as needed.
- Provide additional storage capacity at the proposed Project site for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Enter into a lease agreement with WCSG to excavate at the proposed Project site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset a portion of the reservoir construction and development costs.

Once the reservoir is constructed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies and groundwater recharge supplies via water re-regulation. As a result, the Project would provide multiple benefits, including:

- Flow re-regulation for better surface water utilization.
- New water yield for irrigation purposes by capturing damaging and unutilized floodwater and returning it to the rivers to be used by water users served by the Owners or other Kaweah and St. Johns River Association Units. This includes the ability to increase groundwater recharge efforts.
- Flood control by capturing and temporarily holding damaging floodwater at times when downstream interests, including the City of Visalia, may otherwise see damaging flood flows.

2.3 Environmental Setting

2.3.1 Regional Setting

The Project site is located near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east. The Project site is drained by the Kaweah River, which drains to the ephemeral Tulare Lake in the southern end of the San Joaquin Valley, and by the St. Johns River, which becomes Cross Creek, before draining into the Tulare Lake bottom near Corcoran.

The *Foothill Growth Management Plan Element* of the *Tulare County General Plan* (Tulare County, 2012) describes the area climate as typical of the foothill region, with cool rainy winters having a mean daily temperature ranging from 40° to 50° Fahrenheit (F) and hot dry summers where daytime temperatures can exceed 100° F.

During the summer months, a high-pressure system off the west coast of California prevents precipitation from occurring in the foothills. During the winter, this high-pressure system is intermittent, allowing Pacific storms to bring rainfall to the foothills. Rainfall increases with elevation in the foothills and ranges from approximately 10 inches at the base to 25 inches at 3,000-feet. Most of this precipitation occurs between the months of November and April.

During daytime there is a dominant wind flow pattern from the northwest towards the Tehachapi Mountains. At night, this flow is reversed by winds that flow from the Sierra Mountains and foothill canyons.

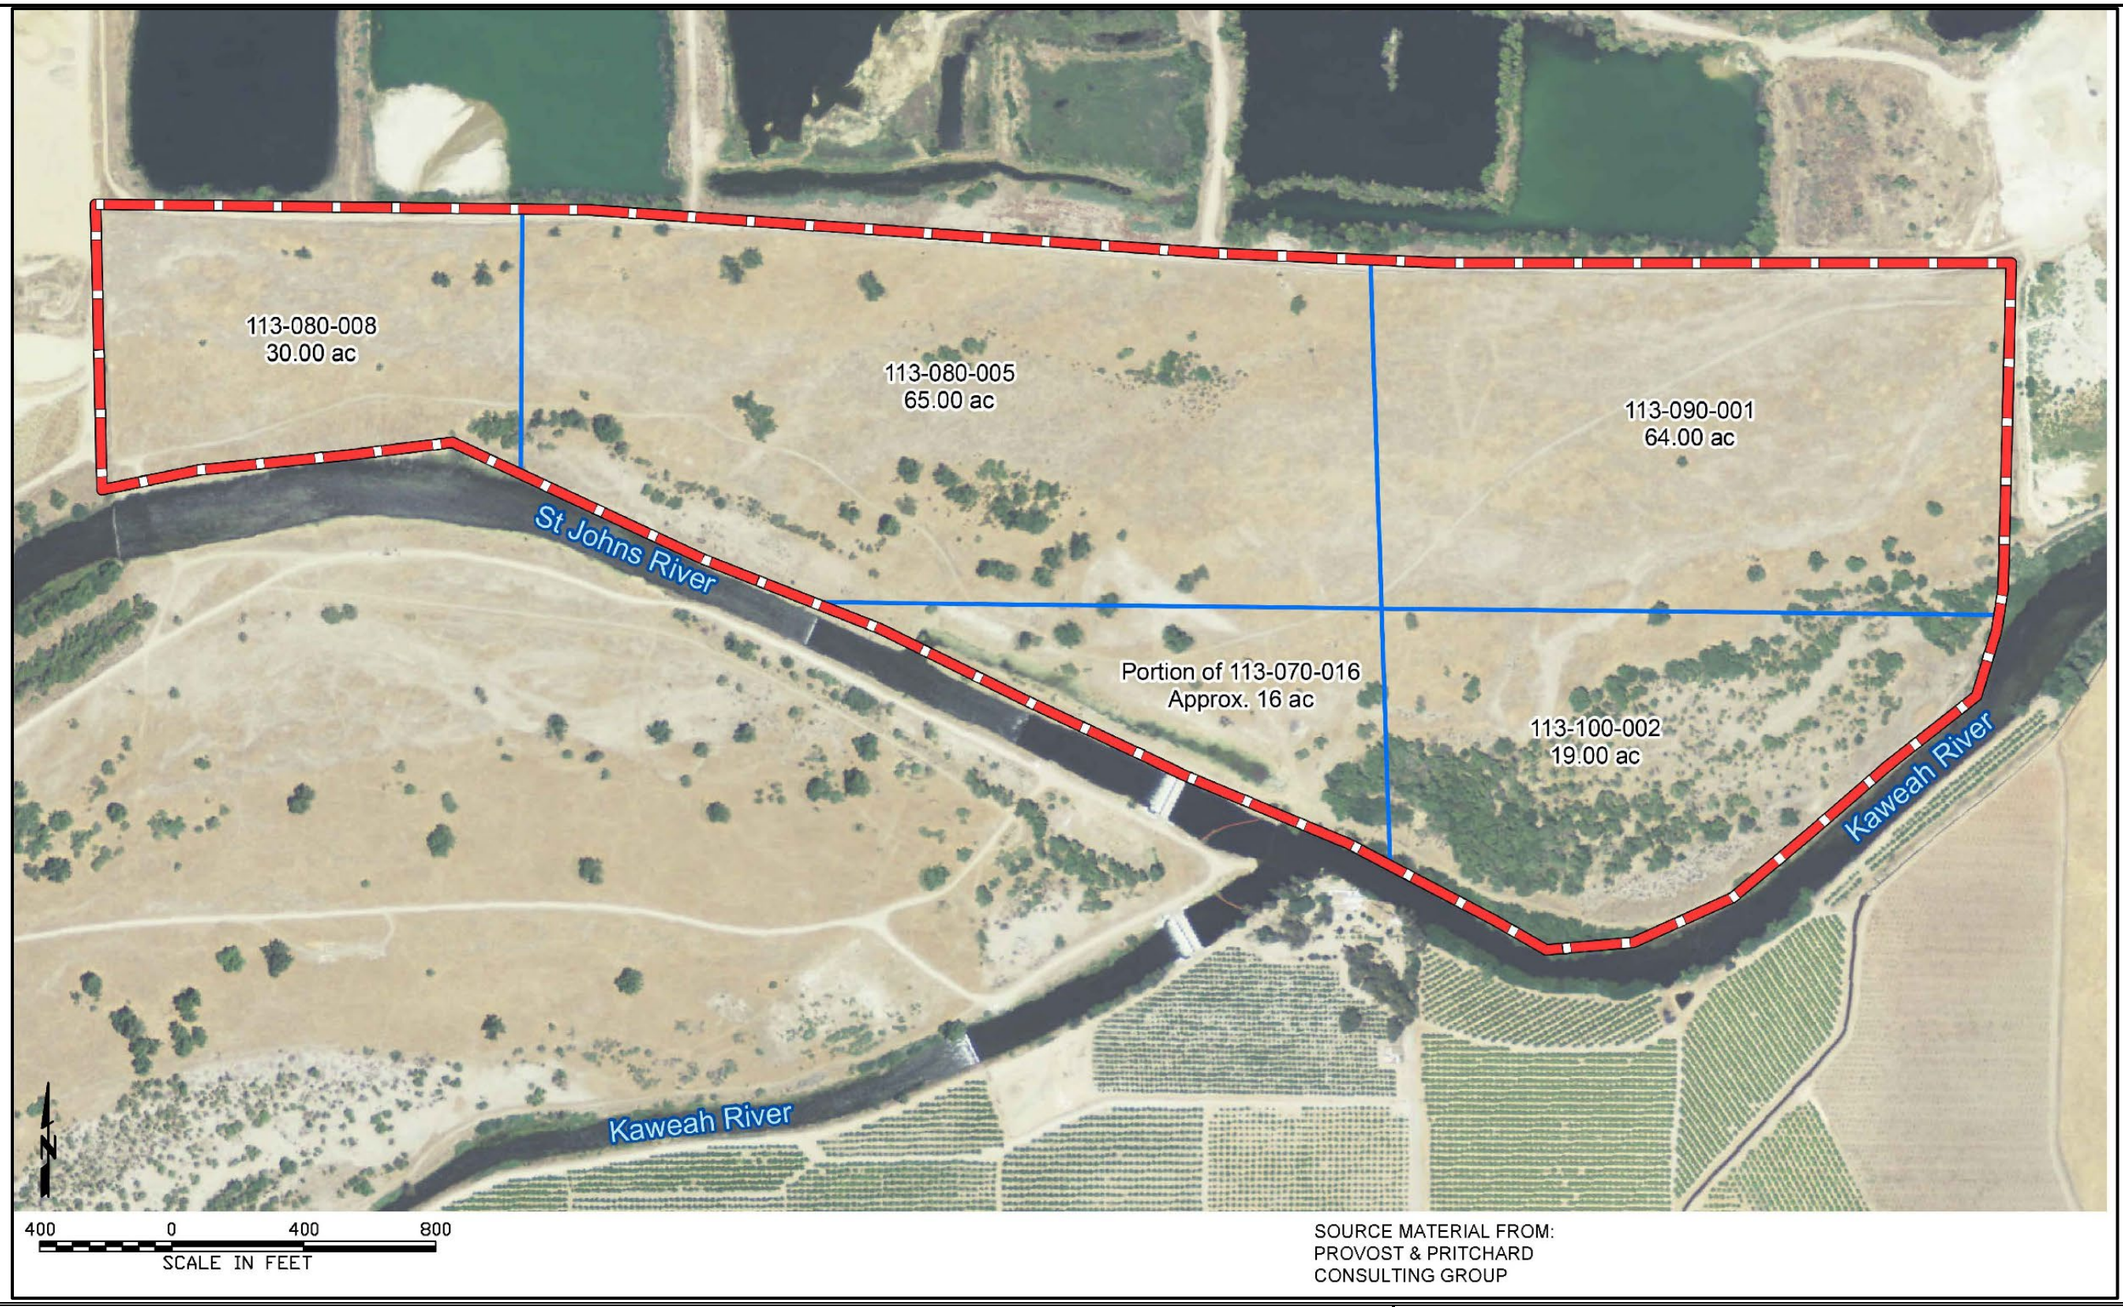
Biological resources in the region have been modified by past and present land uses. Prior to human settlement, this region was dominated by riparian vegetation within the floodplains, with stands of valley oak and interior live oak on higher ground. Herbaceous wetland bottoms and upland native grassland communities were common in this vegetation mosaic. The extensive oak forests and riparian/wetland habitats hosted a diverse and abundant wildlife community. Cattle grazing and deforestation of the oaks in the early- to mid-1800s for agriculture substantially altered both the floodplain and channel vegetation.

Currently in the foothills, the vegetation ranges from annual grasses in open areas to dense shrubs and trees. Much of the native vegetation in the area has been replaced by introduced species or has been eliminated by cultivation and overgrazing. Agriculture is currently the main land use in the region, although narrow strips of riparian vegetation grow along remnant tributaries.

2.3.2 Project Site Setting

Historically, the Project site has been used for cattle grazing under lease arrangements. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately one (1.0) mile to the northeast of the Project site. The Kaweah River Rock and later the Santa Fe aggregate mining and processing facilities were located immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately one (1.0) mile to the southwest of the Project site (Figure 2-2 – Project Site and Surrounding Land Use Map). These figures illustrate how adjacent lands to the north, northeast, southwest, and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are primarily used for agricultural uses and, to a limited extent, for scattered rural residential purposes.

Most of the Project site is vegetated with non-native grasses, except for a small portion of ground along the adjacent Kaweah River above McKay Point, which is vegetated by native trees and shrubs. The surface soil at the Project site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. The Project site topography is relatively level with a depression in the southeast corner. Site surface drainage is generally to the south and southeast toward the Kaweah River and generally to the south and southwest toward the St. Johns River. The Project site elevation decreases from approximately 472-feet above mean sea level (amsl) on the northeastern end of the property, to approximately 454-feet amsl on the southwestern end.



The long-term water-level measurements for wells in the area indicate a stability of groundwater levels, except for temporary declines during drought periods. Test borings within the Project site indicate depth to groundwater ranges from 20- to 7-feet below ground surface (bgs), with corresponding groundwater level elevations ranging from 438- to 459-feet amsl.

Table 2-1 lists the Assessor's Parcels occupied by the Project site and provides the parcel size, Tulare County General Plan Designation, Zoning, and Mineral Resources designation for each assessor's parcel numbers (APN). Figure 2-3 – Project Parcels, identifies where the parcels are located on the Project site.

Table 2-1. Assessor's Parcel Numbers, General Plan, Zoning and Mineral Resources

APN	APN Acres	Tulare County General Plan Land Use Designation	Zoning	Mineral Resources
113-070-016-000 (portion)	16.0	Rural Valley Lands Plan, Valley Agricultural	AE-20	Aggregate Resource Area (MRZ-2b)
113-080-005-000	65.0	Rural Valley Lands Plan, Valley Agricultural	AE-20	Aggregate Resource Area (MRZ-2b)
113-080-008-000	30.0	Rural Valley Lands Plan, Valley Agricultural	AE-20	Aggregate Resource Area (MRZ-2b)
113-090-001-000	64.0	Rural Valley Lands Plan, Valley Agricultural	AE-20	Aggregate Resource Area (MRZ-2b)
113-100-002-000	19.0	Rural Valley Lands Plan, Valley Agricultural	AE-20	Aggregate Resource Area (MRZ-2b)

THIS PAGE IS INTENTIONALLY BLANK

2.4 Regulatory Setting

TID is the Lead Agency for purposes of administering the requirements of the CEQA, and for preparing the Project EIR. TID is also the Project applicant on behalf of the Owners. The County is a Responsible Agency under CEQA.

Because WCSG would process material taken from the Project site during excavation of the reservoir as a marketable product (construction grade aggregate), TID would be required to comply with the Surface Mining and Reclamation Act (SMARA) and obtain the County's approval of a Surface Mining Permit, Reclamation Plan, and Financial Assurance Cost Estimate (FACE). The Tulare County Code and Zoning Ordinance states that a Special Use Permit would not be required in addition to the surface mining permit.

Other public agencies that may be involved in the permitting and/or approval of the Project include the San Joaquin Valley Unified Air Pollution Control District (SJVAPCD), California Department of Fish and Wildlife (CDFW), the Central Valley Regional Water Quality Control District (CVRWQCD), the Department of Conservation (DOC)/Division of Mine Reclamation (DMR), the U.S. Army Corp of Engineers (Army Corp) and/or the U.S. Fish and Wildlife (USFW).

2.5 Reservoir Operations

2.5.1 Overview

The Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies and groundwater recharge supplies. As a result, the Project would provide multiple benefits, including:

- Flow re-regulation for better surface water utilization.
- New water yield for irrigation purposes by capturing damaging and unutilized floodwater and returning it to the rivers to be used by water users served by the Owners or other Kaweah and St. Johns River Association Units. This includes the ability to increase groundwater recharge efforts.
- Flood control by capturing and temporarily holding damaging floodwater at times when downstream interests, including the City of Visalia, may otherwise see damaging flood flows.

2.5.1.1 McKay Point Check Structures

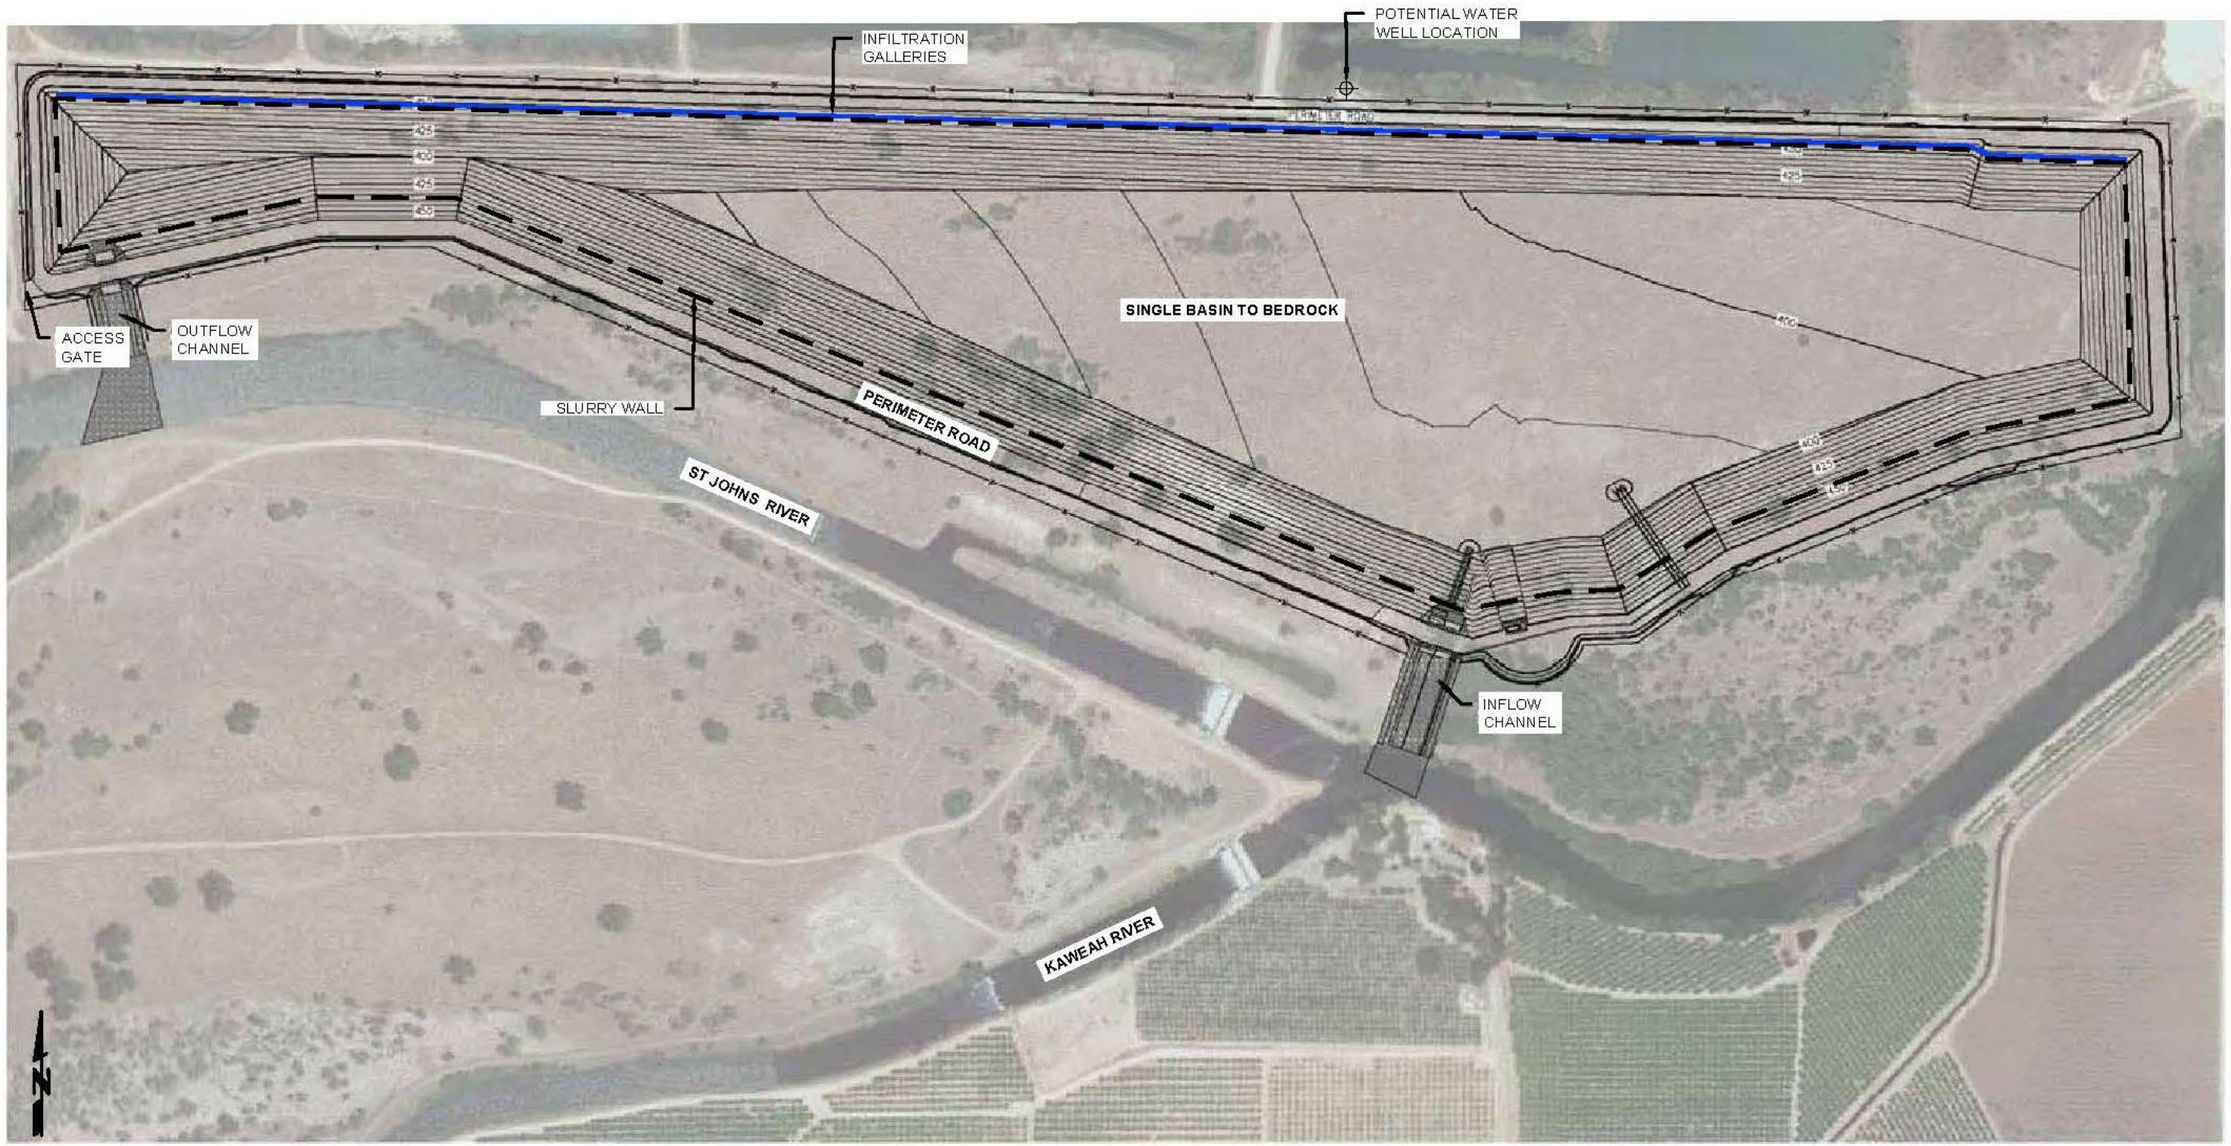
The existing McKay Point Check Structures include the water control facilities owned and operated by the Kaweah Delta Water Conservation District and the Kaweah and St. Johns Rivers Association. The structures consist of two check structures, one on the St. Johns River and one on the Lower Kaweah River, each with nine automated gates. The structures can be operated such that the gates on the St. Johns River side can be raised, therefore shunting more flows down the Lower Kaweah River. Because CPDC, VKWC, and TID hold many of the rights to the waters of the Kaweah River system, water released from the reservoir and shunted into the Lower Kaweah River in this manner would serve CPDC and VKWC customer needs, as well as TID customer needs if necessary.

In a similar manner, the McKay Point Check Structures can be operated such that the gates on the Kaweah River side can be raised, therefore shunting more flows down the St. Johns River. Because TID holds rights to waters of the St. Johns River, water released via the outflow channel would serve TID customer needs.

2.5.1.2 Inflow Channel Management

The inflow and outflow channels would be constructed perpendicular to the Lower Kaweah River and St. Johns River respectively (Figure 2-4 – Final Reservoir Site Plan). The inflow channel would provide flow into the reservoir via a reinforced concrete control structure. The control structure would include an approach apron, reinforced concrete floor, a flow/level control gate, walls, and a deck on top of the structure. The bottom of the river channel and the banks of the inflow channel would be rip-rapped to prevent erosion.

To receive river water into the reservoir, the electrically operated weir on the inflow channel would be lowered. The water level in the Kaweah River can also be raised at the same time, by raising the gates at the McKay Point Check Structures. Water would flow by gravity into the reservoir up to a maximum flow rate of 500 cubic feet per second (cfs) via the inflow channel. Upon achieving water level equilibrium between reservoir and river, the electrically operated weir would be raised. As the level of the river recedes, either by the passing of the flood peak, or by lowering the gates on the McKay Point Check Structures, the electrically operated weir would serve to hold water in the reservoir.



2.5.1.3 Outflow Channel Management

2.5.1.3.1 *Gravity-Flow Water Delivery into the St. Johns River and Kaweah River*

When the St. Johns River water level is lower than that of the reservoir, lowering the electrically operated weir on the outflow channel would deliver water by gravity flow into the St. Johns River up to a maximum flow capacity of 900 cfs. The average flow rate of return would approximate 125 to 150 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approaches the level of the outflow channel.

When the Kaweah River water level is lower than that of the reservoir, lowering the electrically operated weir on the inflow channel would deliver water by gravity flow into the Kaweah River at a flow capacity of 500 cfs. This would be done in concert with the raising of the St. Johns River control structure, since the inflow channel is upstream of the divergence of the St. Johns River from the Kaweah River. The average flow rate of return would approximate 125 to 150 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approached the level of the inflow channel.

The outflow channel would provide flow out of the reservoir via a reinforced concrete control structure. The control structure would include a reinforced concrete floor, flow/level control gate, walls, and a deck on top of the structure. The bottom of the river channel and the banks of the Outflow Channel would be rip-rapped to prevent erosion.

Source: Provost & Pritchard Consulting Group (October 2013)

Figure 2-4 Final Reservoir Site Plan

THIS PAGE IS INTENTIONALLY BLANK

The inflow channel could also be used in reverse as an outflow facility to deliver releases to the Kaweah River. When the Kaweah River water level is lower than that of the reservoir, lowering the electrically operated weir on the inflow channel would deliver water by gravity flow into the Kaweah River at a flow capacity of 500 cfs. The average flow rate of return would be approximately 125 to 150 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approached the level of the inflow channel.

Water delivery in this manner is limited by the amount of water being stored at a level higher than that of the inflow channel (i.e., approximately 15-feet of additional storage). Once the level of the reservoir falls below that of the inflow channel, the floating barge pump and its related piping would be used as described below.

2.5.1.3.2 *Pumped Water Delivery into the St. Johns River or Lower Kaweah River*

To release water to the St. Johns River or the Lower Kaweah River when the river water levels are higher than that of the reservoir, and the reservoir is lower than the Inflow or outflow channels, the water would be pumped from the reservoir, via an electrical or diesel pump, and conveyed into the Kaweah River, upstream of the McKay Point Check Structures. The pump, or series of pumps, would have an approximate maximum flow rate of 160 cfs. When this is done, the McKay Point Check Structures would be operated to direct flow into the St. Johns River or the Lower Kaweah River.

2.5.1.4 Supervisory Control and Data Acquisition

The electrically powered Supervisory Control and Data Acquisition (SCADA) equipment would be used to:

- Monitor Reservoir and river levels;
- Monitor and operate the inflow channel, outflow channel, and the electrically powered floating barge pump; and
- Monitor and coordinate with the automated gates of the McKay Point Check Structures with the Kaweah Delta Water Conservation District and the Kaweah and St. Johns River Association.

SCADA equipment would permit remote monitoring, control, and operations by TID operators from TID's offsite administration office in Tulare, California. In addition, TID operators would have the ability to set the control gates in either a condition of flow control or level control. In flow or level control, the gates would autonomously operate to maintain a desired flow, or a desired elevation, respectively, in the river channels.

2.5.1.5 Flood Control/Storm Water Management During Operations

The Project's water turnout facilities would allow the diversion of up to 500 cfs. With 4,600 acre-feet of total capacity, the reservoir could go from empty to full in just five days. This relatively short time span coincides with most of the local peak rain/flood events. The local peak rain/flood events are also of relatively short duration, with much of the flood water coming from the uncontrolled Dry Creek, which enters Kaweah River midway between the Project site and the Terminus Dam Reservoir (a distance of

approximately 1.1 miles upstream from the Project site). The ability to capture 500 cfs of floodwater is significant, considering that such a flow might otherwise impact the levees protecting the City of Visalia.

2.5.1.6 Re-regulation for More Efficient Water Utilization

When flood control releases are required from Lake Kaweah, or when Dry Creek or Yokohl Creek are running, water must be diverted to groundwater recharge basins or otherwise disposed. This is because there is reduced irrigation demand from the Owners' water users during periods of heavy rainfall. The Project would allow flood releases to be diverted and stored temporarily until the demand for irrigation water resumes or groundwater recharge facilities located downstream have capacity to receive more surface water. When diverted and stored, such water would be sold/delivered directly to irrigation users, thereby saving energy that might otherwise be consumed through pumping associated with groundwater recharge and subsequent recovery.

2.5.1.7 New Yield

The Project would have the ability to capture some of this floodwater, and it would be held in the reservoir until it can be safely returned to the Lower Kaweah River and St. Johns River for direct use or recharge. The reservoir could fill and empty multiple times during wet years when there is sufficient dry time to safely, effectively and beneficially return the water to the Lower Kaweah River and St. Johns River. Through this floodwater recapture it is estimated the Project could provide approximately 4,600 acre-feet per year of new water yield.

2.5.1.8 Water Management within the Reservoir

During long-term operations as a water management facility, it is intended that the reservoir remain relatively empty and void of local groundwater in order to provide maximum space to receive Kaweah River water as directed by the Owners. A slurry wall installed around inside perimeter of the reservoir, would minimize the groundwater inflows to approximately 500 gallons per minute (gpm). This would serve to keep the reservoir in a near dry condition when not being used for storage. If needed, de-watering would be conducted to maintain dry conditions. Seepage into the excavation would be captured at a designated location within the reservoir, and would then promptly be placed back into the aquifer via infiltration galleries located on the norther perimeter of Project site (Figure 2-4 – Final Reservoir Site Plan).

2.5.1.9 Operational Control

During Project operations and management, the Owners would have daily control over the reservoir and related facilities, which include the use of the SCADA equipment to monitor and control the facility remotely. TID staff would also perform routine onsite inspections to ensure the reservoir is operating properly.

2.5.1.10 Traffic During Operations

The routine operation of the Project would be conducted from TID’s offsite administration office in Tulare, California; therefore, the number of employees routinely driving to the site would be minimal, and primarily associated with routine maintenance operations.

2.5.1.11 Mobile Equipment Used During Operations

During the operations and maintenance of the reservoir, there would be limited equipment usage, but equipment could be needed to perform minor grading of the access road and to remove any debris that collects in the bottom of the reservoir. The following equipment could be used annually for maintenance operations:

- Grader
- Loader
- Diesel Aboveground Storage Tank (AST)
- Excavator
- Dump Truck
- Generators
- Backhoe

2.5.1.12 Onsite Hazardous Materials During Operations

An above ground storage tank (AST) approximately 10,000 gallons, diesel generators, and a generator building near the inflow chute would be used during operations. The diesel generators would provide power to the floating pump station. The Owners are currently evaluating the cost-effectiveness of a direct power supply from a power company and other options for power. These activities would be done in compliance with the requirements of a Hazardous Materials Business Plan (HMBP), Storm Water Pollution Prevention Plan (SWPPP), Spill Prevention, Control, and Countermeasure (SPCC) Plan and with the hazardous waste generator and AST regulations as described in Section 3.9 – Hazards and Hazardous Materials of the EIR.

2.5.1.13 Utilities During Operations

Electrical power would be provided by Southern California Edison (SCE) from an existing power lines located along the north perimeter of the Project.

2.5.1.14 Lighting During Operations

Except for the security lighting, no nighttime lighting is proposed and/or required.

2.5.1.15 Administration, Security, and Public Safety During Operations

The perimeter of the reservoir site would be fenced and all facilities secured. Random and frequent visits from Owners staff would provide added security. The routine operation and administration of the Project would be conducted from TID's offsite administration office in Tulare, California.

2.6 Project Phases

Prior to the operational phase of the Project, the site must be prepared. The preparation of the site includes the excavation of a pit with sufficient capacity to meet the Project needs for water storage. After the pit has been prepared, the reservoir would be constructed. Therefore, the Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and, operation of the reservoir. The operation of the McKay Point Reservoir is described above in Section 2.5. The following sections discuss the phases of the Project that are required to construct the reservoir.

2.6.1 Reservoir Excavation

In order to construct the reservoir, the site must be excavated to a depth and surface area that meet the Project's water storage capacity requirements. This would be done by WCSG. WCSG would likely begin the reservoir excavation in the western portion of the Project site and would progress eastward. The excavated area would result in an open pit with a surface area of approximately 110 acres and a depth of approximately 60 feet bgs. Final slopes are anticipated to be approximately 3H:1V (horizontal:vertical) in order to minimize any bank erosion from the wind and water. Because the excavated material would be excavated and processed onsite and then sold as a marketable product, the County considers the excavation and processing activities being conducted on the Project site subject to SMARA requirements for surface mining. Therefore, all activities associated with the reservoir excavation would be conducted in accordance with SMARA requirements (Figure 2-4 – Final Reservoir Site Plan and Figure 2-5 – Project Excavation Site Plan).

Overburden is the material located above the aggregate. Initial testing indicates that the overburden would be between 6- to 12-feet deep, comprised primarily of very sandy material (60 to 80 percent) in the top 20-feet. Below 20-feet, the material is comprised largely of gravel (40 percent) and sand (40 to 48 percent), and lesser amounts of silts and clays (12 to 20 percent).

Excavation is expected to proceed at an approximate rate of 920,000 gross tons per year but could vary based on market demand. The excavation and storage of aggregate would be coordinated with WCSG such that the maximum production rate historically achieved at the adjacent Seaborn site would not be exceeded. Once processed, approximately 70 percent of the excavated materials would be of marketable quality, which is referred to as net tons. This means a year's excavation of 920,000 gross tons would produce approximately 650,000 net tons of marketable construction-grade aggregate. The total amount of aggregate excavated during this phase of the Project is approximately 16.5 million tons (gross) and approximately 11.55 million tons (net).

Table 2-2 provides the total gross and net tons of aggregate extracted during the excavation phase as well as the acreage that would be disturbed by the excavation. Figure 2-4 and Figure 2-5 shows the final excavation/reservoir site plan and contours.

Table 2-2. Excavation Phase Summary

Gross Tons	Net Tons [1, 2]	Area (acres)
16.5 million	11.55 million	110

1 Net tons are the marketable construction-grade aggregate derived through processing. Net tons equate to approximately 70 percent of the gross tons processed.

2 11 million cubic yards * 1.5 ton/cubic yard = 16.5 million gross tons
(13.8 million tons – 9.66 million tons)/13.8 million tons = 30% fines & 70% product
16.5 million tons * 0.7 = 11.55 million net tons product

2.6.1.1 Excavated Materials

Excavated materials would be processed on the Project site by WCSG using a portable wash/screen plant. The wash/screen plant would wash and screen the excavated material to appropriate sizes in order to meet WCSG customers' requirements. Approximately 70 percent of the excavated material is expected to be PCC-grade aggregate which can be used as aggregate and in aggregate-containing products, such as concrete and asphalt. If needed, WCSG would bring a portable crush/recycle plant on site to break up oversized pieces of rock prior to screening in the processing/wash plant. The crush/recycle plant could also be used to recycle used concrete and asphalt brought in from offsite. WCSG may also import materials to be blended with the aggregate if required by their customers (Figure 2-5 – Project Excavation Site Plan).

Aggregate mining and processing activities have been conducted at the adjacent Seaborn site since the late 1940's. The Seaborn site is also owned by TID and Consolidated Peoples Ditch Company. The WCSG production rate of the Project's excavated aggregate would not exceed the historical aggregate processing production rate (baseline) from what was being done at the adjacent Seaborn site. The baseline was obtained from actual production records and was determined to be an average of 500,000 tons per year (TPY) and a maximum of 650,000 TPY. Therefore, the number of on-road haul trucks transporting the material offsite on public roads to WCSG's customers would not result in an increase of the baseline number of on-road haul trucks.

The overburden and excess fines resulting from the excavation of the reservoir would be stored on the Project site for use in backfilling the pit walls to a safe slope as required by SMARA, constructing the perimeter road and other auxiliary construction activities. The remainder of the fines could be sold by WCSG as slurry used in nonstructural concrete or as miscellaneous fill material, as WCSG has done in the past with overburden and fines resulting from their mining activities.

The transportation of all materials brought to or taken from the site, including the processed aggregate, recyclable used concrete, exported fines, and imported materials for blending with the aggregate, would be managed such that the total number of on-road haul trucks per day would not be above the baseline. ATE prepared an evaluation of the offsite traffic on public roads which is provided in Appendix I.

2.6.1.2 Slurry Wall

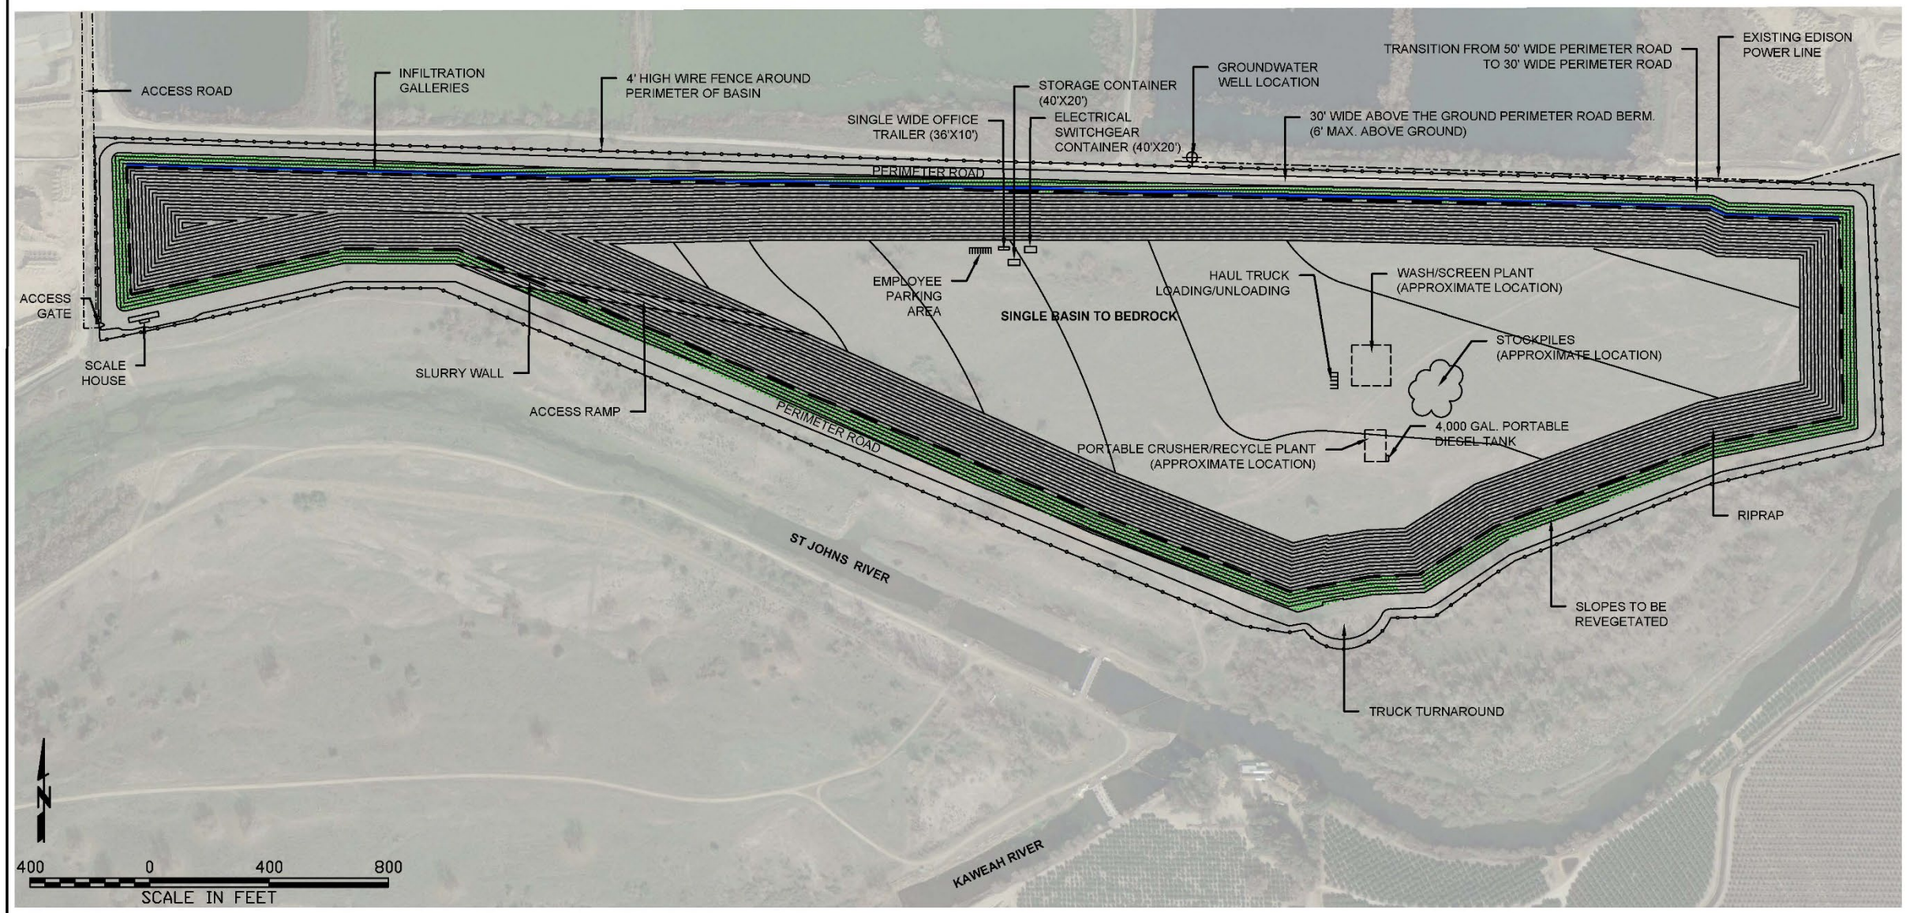
Slurry walls are below-grade walls that restrict groundwater flow or support excavations and structures, using soil-bentonite or cement-bentonite. A slurry wall would be installed early during the excavation phase of the Project to slow or eliminate groundwater from flowing into the pit during excavation and construction phases and to maintain an evacuated state as part of the long-term operations (i.e., a full reservoir has limited water re-regulation value).

The slurry wall would be a permanent fixture of the reservoir facility and would serve as an essential feature to maintain dewatered storage space to receive water diversions by the Owners. The dewatering flows would be minimized to approximately 500 gpm during reservoir facility construction and long-term reservoir operation.

Slurry wall construction consists of clearing and grubbing approximately 26 acres, excavating approximately 109,000 cubic yards of native soil, and poring of the slurry wall into the excavated trench. Approximately 4,000 dry tons of bentonite and 56,000 tons of silty/clay fines would be delivered to the site for use in the slurry wall. Construction slurry consisting of a bentonite-water slurry would be pumped into the trench to hold the sides of the trench open during the construction of the slurry wall. A mixture of bentonite, silty/clay fines and native soil would be used for the final slurry wall. A final native soil cap consisting of approximately 10,000 cubic yards would be placed on top of the slurry wall.

2.6.1.3 Water Use and Management During Reservoir Excavation

Because the groundwater table on the Project site is at a depth of 7- to 20-feet below the ground surface, a slurry wall would be constructed around the inside perimeter of the pit. This would maintain the pit in a relatively dry condition such that dry mining methods could be used. If there is some groundwater seepage or accumulation of stormwater, the water would be pump from the pit and stored for use as dust control or recirculated in infiltration galleries. The infiltration galleries would be located along the northern perimeter of the pit outside of the slurry wall. The infiltration galleries would consist of appropriately designed ditches that are covered with granular materials allowing water to percolate back to groundwater.



The primary use of water at the Project site would be to control fugitive dust. The water would be obtained either by pumping it from the pit or drawn from an onsite groundwater well. Total water consumption during excavation activities would average 3.5 million gallons per year (i.e., approximately 11 acre-feet per year).

2.6.1.4 Days and Hours of Operation and Employment During Reservoir Excavation

Approximately 7 to 12 employees would be required during the excavation of the reservoir site. Excavation would occur between 4:00 a.m. (or dawn if later) and 6:00 p.m., Monday through Saturday, and continue until the desired depth and extent of excavation achieves reservoir design.

2.6.1.5 On-Road Haul Truck Traffic During Reservoir Excavation

Excavated and processed materials would be loaded directly on to on-road haul trucks within the Project site. Once loaded, the on-road haul trucks would exit the Project site via the privately owned access road on the Seaborn site (owned by TID and CPDC) which connects to Road 222. From there the material would be transported to WCSG's customers via public roads. The number of on-road haul trucks on public roads associated with WCSG's sale of the processed material would not increase from the baseline level of on-road truck traffic (160 trips per day). The number of on-road haul trucks carrying the processed aggregate as well as the number of on-road trucks needed for the transport of other materials (recycled concrete and asphalt, excess fines, blending materials) being exported or imported to or from the site would not be allowed to exceed the baseline production rate from the previous operations at the Seaborn site (average of 500,000 TPY and a maximum of 650,000 TPY). A copy of the traffic report is provided in Appendix I.

NOTES:

a. EXCAVATION PIT WILL HAVE A FINAL DEPTH OF 60-FEET BELOW GROUND SURFACE, WITH A TOTAL SURFACE AREA OF APPROXIMATELY 110 ACRES. PIT SLOPES WILL NOT EXCEED 3H:1V (HORIZONTAL TO VERTICAL).

b. EARLY IN THE EXCAVATION PHASE, A SLURRY WALL WILL BE INSTALLED AROUND THE PERIMETER OF THE PIT TO PREVENT GROUNDWATER INTRUSION.

c. THE LOCATIONS OF THE WASH/SCREEN PLANT, PORTABLE CRUSH/RECYCLE PLANT, AND ASSOCIATED MATERIAL STOCKPILES ARE APPROXIMATE. THESE WILL BE RELOCATED WITHIN THE EXCAVATION AREA AS MINING PROGRESSES.

d. THERE ARE NO EXISTING ONSITE DRAINAGE OR WATER FEATURES THAT WOULD BE DISTURBED BY EXCAVATION/RECLAMATION ACTIVITIES.

e. SLOPES LOCATED ABOVE THE SLURRY WALL/HIGH-WATER LINE WILL BE VEGETATED TO CONTROL EROSION

f. RIPRAP WILL BE PLACED ON PIT SLOPE AREAS BELOW THE SLURRY WALL TO MINIMIZE EROSION.

g. THERE ARE NO EXISTING PUBLIC ROADS, RAILROADS, OR WATER WELLS WITHIN 500-FEET OF THE SITE.

h. EXISTING SOUTHERN CALIFORNIA EDISON (SCE) POWER LINES RUN ALONG THE NORTHERN PERIMETER OF THE SITE. THE PROPOSED WASH/SCREEN PLANT WILL CONNECT TO THESE EXISTING UTILITIES. NO OTHER UTILITIES (GAS TELEPHONE, WATER, ETC.) EXISTING WITHIN 500-FEET OF THE SITE.

i. DUST WILL BE CONTROLLED THROUGHOUT THE SITE/ON UNPAVED ROADS USING A MOBILE WATER TRUCK.

Figure 2-5 Project Excavation Site Plan

THIS PAGE IS INTENTIONALLY BLANK

The excavation phase of the Project would require only 7 to 12 onsite employees. This would be consistent with the baseline number of employees previously required during the mining and processing activities at the Seaborn site. For evaluation purposes, it is assumed that each employee would make 2 trips per day (inbound and outbound). This would result in a maximum of 24 trips (12 in-bound, 12 out-bound) on peak days, assuming all 12 employees are onsite as compared to the 35 employee trips per day during mining and processing activities at the Seaborn site. As a result, the Project would generate only nominal traffic on public roadways, which would not result in a significant increase from baseline operations at the Seaborn site (see Traffic Analysis provided in Appendix I).

Access for employees and service vehicles would be via Road 222 through the Seaborn site to the entrance to the Project site (Figure 2-5 – Project Excavation Site Plan).

Note that a single-way trip is referred to as a "trip" and a round trip (going from the WCSG facility to their customers and the return trip by the on-road truck back to the facility) is referred to as a "load" (two one-way trips).

2.6.1.6 Portable Equipment Used During Reservoir Excavation

The equipment used during the excavation of the site would include:

- Excavator
- Off-road Haul Trucks
- Bulldozer
- Loader
- Portable Generator
- Grader
- Water Truck
- Scraper
- Backhoe
- Pneumatic Pumps

In addition, a portable processing/wash plant and a portable crush/recycle plant would be used on the Project site. The plants would move from west to east along with the excavation of the aggregate.

2.6.1.7 Onsite Hazardous Materials During Reservoir Excavation

During excavation, there would be no significant quantities of hazardous materials stored on the Project site. If fueling by use of mobile fuel trucks and/or minor maintenance were to occur onsite, these activities would be subject to and done in compliance with the requirements of the site-specific SWPPP and in compliance with the hazardous material and waste generator regulations under California Code of Regulations (CCR) Title 22.

2.6.1.8 Lighting During Excavation

The excavation phase of the Project would occur primarily during daylight hours (between dawn and 6:00 p.m.), and therefore the use of nighttime lighting is not anticipated. However, if onsite activities take place during the time of year when daylight hours are shorter, some lighting may be required to provide a safe working environment. In the event of the need for nighttime lighting, high pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association [IDA]-approved fixtures) would be used and

the lighting would also be designed to confine illumination to the Project site and/or to areas that do not include light-sensitive uses.

2.6.1.9 Administration, Security, and Public Safety During Reservoir Excavation

Security personnel would monitor the Project site during nighttime and during the weekends. The perimeter of the excavation site would be fenced and all facilities secured. Administration activities would be conducted from the TID offsite admonition office in Tulare, CA.

2.6.2 Reservoir Facility Construction

Construction of the reservoir would create a storage capacity of approximately 4,600 acre-feet, and would include the following components illustrated in Figure 2-4 – Final Reservoir Plan:

- Inflow channel – 500 cfs capacity.
- Electrically operated weir for the Inflow Channel control.
- Inflow chute.
- Energy dissipation pool – Based upon the drilling logs, it is expected bedrock would be encountered at the proposed final elevation. However, if the excavation does not get down to bedrock, installation of an energy dissipation pool at the base of the Inflow Chute would prevent the potential scouring effects of the water entering the reservoir.
- Floating barge pump – 160 cfs capacity to deliver into the Kaweah River upstream of the existing McKay Point Check Structures.
- A 10,000 gallon above-ground diesel tank, generators and generator building.
- Floating barge pump discharge piping.
- Outflow Channel – up to 900 cfs capacity gravity flow into the St. Johns River.
- Electrically operated weir for the outflow channel control.
- Slurry wall to minimize groundwater seepage into/out of the reservoir (constructed during the excavation phase).
- Perimeter fencing and access gates.
- Perimeter berm, perimeter road and truck turnaround (the inflow and outflow channels will pass under the perimeter road in concrete structures).

The inflow and outflow structures would require excavation and grading to prepare the site for installation. Inflow/outflow grading would consist of clearing and grubbing of approximately 3 acres, excavation of 20,000 cubic yards, and the placement of approximately 9,000 cubic yards of rip-rap. Construction of the in/outflow building would consist of finish grading and minor excavation of approximately 600 cubic yards and the placement of approximately 1,100 cubic yards of concrete.

The Department of Water Resources (DWR), Division of Safety of Dams has jurisdiction over projects that create a dam over 25-feet in height or will have an impounding capacity of 50 acre-feet or more (Water Code Section 6002). However, artificial barriers less than 6-feet in height, or that have a storage capacity of less than 15 acre-feet are not considered dams subject to DWR jurisdiction (Water Code Sections 6003, 6025). The retention of water within the reservoir would be below grade and would not require the use of artificial barriers greater than 6-feet in height. Therefore, the Project does not exceed these criteria and is not regulated as a dam. The excavation of the pit for the construction of the reservoir would meet the engineering and safety requirements as set forth in SMARA.

2.6.2.1 Days and Hours of Operation and Employment During Construction

Approximately 7 to 12 employees would be required during the construction of the reservoir facilities, which would occur between 4:00 a.m., or dawn if later, and 6:00 p.m., Monday through Saturday, until completed. Nighttime construction activities are not anticipated.

2.6.2.2 Traffic During Construction

The Project would only require 7 to 12 employees during the construction of the reservoir; therefore, the number of employees traveling to the site would be minimal and consistent with the baseline number of employees previously required during the mining activities at the Seaborn site. Each employee is assumed to make 2 trips per day (inbound and outbound), which would result in a maximum increase of 24 trips on peak days, assuming all 12 employees are onsite. Access for reservoir facility construction employees and service vehicles would be via Road 222, through the existing Seaborn site entrance to the Project site. As a result, the Project would generate only nominal traffic on public roadways, which would be comparable to that being experienced during the Seaborn site mining and processing operations (see Traffic Analysis located in Appendix I).

2.6.2.3 Mobile Equipment Used During Construction

The equipment used for the construction of the reservoir facilities, such as inlet and outlet features, includes:

- Excavator
- Backhoe
- Water Truck
- Grader
- Loader
- Compactor
- Cement Trucks
- Pneumatic Pumps
- Cranes
- Trenchers
- Portable Generators
- Bulldozer

2.6.2.4 Onsite Hazardous Materials During Construction

During construction, there would not be significant quantities of hazardous materials stored on the Project site. If fueling by use of mobile fuel trucks and minor maintenance were to occur onsite, these activities would be subject to and done in compliance with the requirements of the site-specific SWPPP and in compliance with applicable hazardous material and hazardous waste generator regulations.

2.6.2.5 Utilities During Construction

Electrical power would be provided by SCE from existing power lines located along the north perimeter of the Project.

2.6.2.6 Lighting During Construction

The construction phase of the Project would occur primarily during daylight hours (between dawn and 6:00 p.m.), and therefore the use of nighttime lighting is not anticipated. However, if onsite activities take place during the time of year when daylight hours are shorter, some lighting may be required to provide a safe working environment. In the event of the need for nighttime lighting, high pressure sodium and/or cut-off fixtures (or equivalent IDA-approved fixtures) would be used and the lighting would also be designed to confine illumination to the Project site and/or to areas that do not include light-sensitive uses.

2.6.2.7 Administration, Security, and Public Safety During Construction

Security personnel would monitor the Project site during the weekends and at night. The perimeter of the excavation site would be fenced and all facilities secured. Administration activities would be conducted at the TID offsite administration office in Tulare, CA

2.7 Reclamation Plan

As discussed above, because the excavated material taken from the Project site would be sold as a marketable product, the excavation phase of the Project would require a Surface Mining Permit and the preparation and County approval of a Reclamation Plan in accordance with the requirements of SMARA and the Tulare County Zoning Ordinance, Chapter 25 (Surface and Mining Reclamation). Section 7-25-1085 of the County Ordinance Code (Permit) states as follows:

> *Except as provided in sections 7-25-1090 and 7-25-1095 of this Article, any person who proposes to engage in surface mining operations within the unincorporated area of Tulare County shall, prior to the commencement of such operations, obtain a permit to mine, approval of a reclamation plan and approval of financial assurances in accordance with the provisions of this Chapter*, *the Act and the regulations.* (emphasis added)

A Reclamation Plan was prepared for review and comment by the Division of Mine Reclamation (DMR), and review and approval by the County as the SMARA Lead Agency. The Reclamation Plan was developed in compliance with the reclamation standards set forth in SMARA Regulations (14 CCR Sections 3700 to 3713). The identified end use of the excavation is the creation of the McKay Point Reservoir to be used as a surface water storage/re-regulation reservoir. The reservoir can also be used to optimize groundwater recharge within the Owners service areas.

3.1 AESTHETICS

3.1.1 Introduction

This section of the DEIR presents a discussion of the existing visual environment in the proposed Project vicinity using accepted methodology to evaluate aesthetic/visual landscape quality and light/glare.

3.1.2 Environmental Setting

3.1.2.1 Regional and Local Setting

The Project site is located near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east. The Project site is drained by the Kaweah River, which drains to the ephemeral Tulare Lake in the southern end of the San Joaquin Valley, and by the St. Johns River, which becomes Cross Creek, before draining into the Tulare Lake bottom near Corcoran.

Biological resources in the region have been modified by past and present land uses. Prior to human settlement, this region was dominated by riparian vegetation within the floodplains, with stands of valley oak and interior live oak on higher ground. Herbaceous wetland bottoms and upland native grassland communities were common. The extensive oak forests and riparian/wetland habitats hosted a diverse and abundant wildlife community. Cattle grazing and deforestation of the oaks in the early- to mid-1800s for agriculture substantially altered both the floodplain and channel vegetation.

The Project site and surrounding areas have historically been used for agriculture, including cattle grazing. Specifically, the Project site has historically been used for cattle grazing. Because of the existence of high-quality aggregate in the alluvial soils in the area of the Project site there are also aggregate mining operations and processing facilities adjacent to the Project and throughout the immediate area. Figure 2-2 in Section 2.0 – Project Description illustrates how adjacent lands to the north, northeast, southwest, and west are either currently being or have been used for aggregate mining operations, and the areas south and east of the Project site are primarily used for agricultural uses and, to a limited extent, for scattered rural residential purposes.

3.1.3 Regulatory Setting

3.1.3.1 Federal

There are no direct Federal regulations applicable to the Project with respect to aesthetics. However, the U.S. Bureau of Land Management (BLM) has developed the Visual Resources Management (VRM) System to objectively rate the quality of visual resources and evaluate changes in scenic quality attributed to a proposed change in land use.

3.1.3.2 State

Title 24 Outdoor Lighting Standards

Title 24 Outdoor Lighting Standards were adopted by the State of California Energy Commission (Commission) (Title 24, Parts 1 and 6, Building Energy Efficiency Standards (Standards) on April 23, 2008,

and went into effect on January 1, 2010. The changes included new requirements for outdoor lighting, which vary according to the "Lighting Zone" district in which the equipment is located. A Light Zone 2 designation is by default for all "rural areas" as defined by the U.S. Census Bureau; these are generally locations of low lighting ambient illumination (Tulare County, 2012). Approved existing outdoor lighting systems in rural areas prior to the adoption of the 2008 Standards update, are not required to meet the Building Energy Efficiency Standards for lighting allowances in the Lighting Zone 2 district.

State Scenic Highway Program

The State of California officially designates State scenic highways through the "California Scenic Highway Program," which is managed by Caltrans. A highway may be designated "scenic" depending on how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view. In addition, highways may be identified as "candidate," pending official designation. The State laws governing the Scenic Highway Program are found in the Streets and Highways Code, Section 260 et. seq. A list of state scenic highways is found in Street and Highway Code, Section 263 (Caltrans, 2011).

There are no candidate or designated State Scenic Highways located within the immediate vicinity of the Project site. In Tulare County, portions of State Routes (SR) 190, 198, and 180 are eligible for state scenic highway designation; however, these highway corridors have not been officially designated as State Scenic Highways. The California Scenic Highway Mapping System notes that State Highway 198 is an Eligible State Scenic Highway – Not Officially Designated. State Highway 198 passes to the southeast of the Project where intervening terrain would preclude any view of the Project. State Highway 216, which has no State Scenic Highway status, passes north of the Project and is 0.7 miles from the Project at its closest point.

3.1.3.3 Local

County Scenic Roadways

Tulare County's existing General Plan identifies State designated scenic highways and County designated eligible highways. There are three highway segments designated as eligible by the State. These include State Route 198 from Visalia to Three Rivers, State Route 190 from Porterville to Ponderosa, and State Route 180 extending through Federal land in the northern portion of Tulare County. State Route 198 closely follows around Lake Kaweah and the Kaweah River, while State Route 190 follows around Lake Success and the Tule River. Both Scenic Highways travel through agricultural areas of the valley floor to the foothills and the Sierra Nevada Range. Additionally, the General Plan Update identifies preserving the rural agricultural character of SR 99 and SR 65 as valuable to the County and communities (Tulare County, 2012).

Tulare County General Plan Policies

The Tulare County General Plan has several policies that apply to projects within the County of Tulare. General Plan policies that potentially relate to the proposed Project are listed below.

> ***SL-1.1 Natural Landscapes:*** *During review of discretionary approvals, including parcel and subdivision maps, the County shall as appropriate, require new development to not significantly*

impact or block views of Tulare County's natural landscapes. To this end, the County may require new development to:

1. *Be sited to minimize obstruction of views from public lands and rights-of-ways,*
2. *Be designed to reduce visual prominence by keeping development below ridge lines, using regionally familiar architectural forms, materials, and colors that blend structures into the landscape,*
3. *Screen parking areas from view,*
4. *Including landscaping that screens the development,*
5. *Limit the impact of new roadways and grading on natural settings, and*
6. *Include signage that is compatible and in character with the location and building design.*

SL-1.2 Working Landscapes: *The County shall require that new non-agricultural structures and infrastructure located in or adjacent to croplands, orchards, vineyards, and open rangelands be sited so as to not obstruct important viewsheds and to be designed to reflect unique relationships with the landscape by:*

1. *Referencing traditional agricultural building forms and materials,*
2. *Screening and breaking up parking and paving with landscaping, and*
3. *Minimizing light pollution and bright signage.*

SL-2.1 Designated Scenic Routes and Highways: *The County shall protect views of natural and working landscapes along the County's highways and roads by maintaining a designated system of County scenic routes and State scenic highways by:*

1. *Requiring development within existing eligible State scenic highway corridors to adhere to land use and design standards and guidelines required by the State Scenic Highway Program,*
2. *Supporting and encouraging citizen initiatives working for formal designation of eligible segments of State Highway 198 and State Highway 190 as State scenic highways,*
3. *Formalizing a system of County scenic routes throughout the County and,*
4. *Requiring development located within County scenic route corridors to adhere to local design\guidelines and standards.*

LU-7.6 Screening: *The County shall require landscaping to adequately screen new industrial uses to minimize visual impacts.*

LU-7.14 Contextual and Compatible Design: *The County shall ensure that new development respects Tulare County's heritage by requiring that development respond to its context, be compatible with the traditions and character of each community, and develop in an orderly fashion which is compatible with the scale of surrounding structures.*

LU-7.19 Minimize Lighting Impacts: *The County shall ensure that lighting in residential areas and along County roadways shall be designed to prevent artificial lighting from reflecting into adjacent natural or open space areas unless required for public safety.*

3.1.4 Significance Thresholds

Appendix G of the CEQA Guidelines contains a checklist of environmental effects that may be considered significant. Under the category of "Aesthetics," a project is considered to have a significant visual impact on the environment if it would:

a) Have a substantial adverse effect on a scenic vista;

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;

c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality; or

d) Create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area.

3.1.5 Methodology of Analysis

The analysis presented in this section is based on review of applicable Federal, State and local requirements, Project design features, best management practices (BMPs), operating practices, and other environmental protection measures that have been incorporated into the Project to minimize potential impacts on the environment. Generally speaking, projects that create a high level of contrast to the existing visual character of a project setting are more likely to generate adverse impacts due to visual incompatibility. Conversely, projects that create a low level of contrast to the existing visual character are less likely to generate adverse impacts due to inherent visual compatibility.

The following points were considered in this evaluation:

- No excavation of material would take place within thirty (30) to fifty (50) feet from adjacent property lines (see Figure 2-5 in Section 2.0 – Project Description).
- Operations would occur primarily during daylight hours. Operations during the time of year when daylight hours are shorter, or for any evening/nighttime operations, would require lighting to provide a safe operating environment. For evening/nighttime lighting, high pressure sodium and/or cut-off fixtures (or equivalent International Dark Sky Association (IDA)-approved fixtures) would be used instead of mercury-vapor fixtures for any required evening/nighttime lighting of the mining operations. The lighting would also be designed to confine illumination to the Project site, and/or to areas that do not include light-sensitive uses.

3.1.6 Project-Level Impacts and Mitigation Measures

3.1.6.1 Substantial Adverse Effect on a Scenic Vista

Impact Statement

Impact AE-1: *Have a substantial adverse effect on a scenic vista?* **(Appendix G Threshold Criteria (a))**

Impact Analysis

The Project is adjacent to the Kaweah and St. Johns Rivers. The Project is set back from the rivers' banks and the Project would not involve any large above-grade structures that would be visible from the rivers. Because dry mining techniques would be used during the Project excavation phase, there would be no need for draglines that could have an adverse impact on the views from the rivers. Mining operations located adjacent to or in the area surrounding the Project site have been in existence since the 1940s. Therefore, the Project would not change the visual character of the area, nor would it have a substantial adverse effect on scenic vistas surrounding the Project site from nearby roadways or the river, and impacts are considered less than significant with no mitigation required.

Level of Significance before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.1.6.2 Substantial Damage Scenic Resources within a Scenic Highway

Impact Statement

Impact AE-2: *Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?* **(Appendix G Threshold Criteria (b))**

Impact Analysis

As stated above, the California Scenic Highway Mapping System notes that State Highway 198 is an Eligible State Scenic Highway – Not Officially Designated. State Highway 198 passes to the southeast of the Project where intervening terrain would preclude any view of the Project. State Highway 216, which has no State Scenic Highway status, passes north of the Project and is 0.7 miles from the Project at its closest point. Therefore, the Project will not substantially damage scenic resources within a State scenic highway and will result in a less than significant impact.

Level of Significance before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.1.6.3 Substantial Degrade the Existing Visual Character/Quality of the Site/Surroundings

Impact Statement

Impact AE-3: *In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?* **(Appendix G Threshold Criteria (c))**

Impact Analysis

As discussed above, the Project is located in a rural area of unincorporated Tulare County, adjacent to the Kaweah and St. Johns Rivers. The Project is set back from the river's banks and the Project would not involve any large above-grade structures that would be visible from the river. Because dry mining techniques would be used during the Project excavation phase, there would be no need for draglines that could have an adverse impact on the views from the rivers. Mining operations located adjacent to or in the area surrounding the Project site have been in existence since the 1940s; therefore, the Project would not change the visual character of the area, would not obstruct the view of nearby mountains, or conflict with any applicable policies or plans meant to protect scenic resources. Therefore, impacts are considered less than significant with no mitigation required.

Level of Significance before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.1.6.4 Create New Sources of Light or Glares that would Affect Views

Impact Statement

Impact AE-4: *Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?* **(Appendix G Threshold Criteria (d))**

Impact Analysis

The issue of light and glare is typically associated with excessively bright nighttime lighting that crosses over property lines (i.e., "light trespass") and illuminates offsite yards or bedroom windows. It is also associated with the condition that occurs when excessive nighttime lighting creates a "skyglow" effect. The excavation and construction phases of the Project would occur primarily during daylight hours (between dawn and 6:00 p.m.). Activities taking place during the time of year when daylight hours are shorter, some lighting may be required to provide a safe working environment. If nighttime lighting is required, high pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association [IDA]-approved fixtures) would be used and the lighting would also be designed to confine illumination to the Project site and/or to areas that do not include light-sensitive uses. Except for security lighting, no nighttime lighting would be required during the Project operations phase.

By employing minimal evening lighting fixtures and utilizing the proposed lighting and design features (i.e., downcast lights, high pressure sodium and/or cut-off fixtures, etc.), the Project would have a less than significant impact associated with light and glare with no mitigation required.

Level of Significance before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.1.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3.0-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to aesthetic resources.

As noted in Table 3.0-1, none of the cumulative projects meet the criteria to be further evaluated in relation to cumulative impacts associated with visual or aesthetic resources. Additionally, as discussed in Section 3.1.6 above, CEQA Guidelines Thresholds *a)* through *d)* were determined to have a less than significant impact in terms of the Project's potential effects on visual resources. Since the Project would present no significant impacts related to aesthetics, there would be no cumulative impact in conjunction with the other cumulative projects.

3.2 AGRICULTURE AND FORESTRY RESOURCES

3.2.1 Introduction

This section of the DEIR presents a discussion of agricultural land and forestry resources. A review of potential Project impacts is provided in the following analysis.

3.2.2 Environmental Setting

3.2.2.1 Regional and Local Setting

Tulare County is located in a geographically diverse are of California encompassing approximately 4,840 square miles of classified lands (lands with identified uses) and can be divided into three general topographical zones: a valley region; a foothill region east of the valley area; and a mountain region just east of the foothills. The eastern half of the County is generally comprised of public lands, including the Mountain Home State Forest, Golden Trout Wilderness area, and portions of the Dome Land and south Sierra Wilderness areas. Federal lands, which include wilderness, national forests, monuments and parks, along with County parks, make up 52% of the County. Agricultural uses, which include row crops, orchards, dairies, and grazing lands on the Valley floor and in the foothills total over 2,020 square miles or about 43% of the entire County. Urban uses such as incorporated cities, communities, hamlets, other unincorporated urban uses, and infrastructure rights-of-way make up the remaining land in the County.

The Project site and surrounding areas have historically been used for agriculture, including cattle grazing. Specifically, the Project site has historically been used for cattle grazing. The California Resources Agency, Division of Land Resource Protection maintains information pertaining to, and the mapping of, farmland. According to the Farmland Mapping and Monitoring Program (FMMP), the entire Project site is designated as “Grazing Land”, which, among other definitions, includes "land on which the existing vegetation is suited to the grazing of livestock." Therefore, the Project would convert existing agriculture land (i.e., grazing land) to a non-agricultural use. However, the Project site is not located on land designated as Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance and would not convert any Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural use.

Because of the existence of high-quality aggregate in the alluvial soils in the area of the Project site there are other aggregate mining operations and processing facilities adjacent to the Project and throughout the immediate area.

3.2.3 Regulatory Setting

3.2.3.1 Federal

Farmland Protection Policy Act (FPPA)

The FPPA is intended to minimize the impact Federal programs have on the unnecessary and irreversible conversion of farmland to nonagricultural uses. It assures that to the extent possible federal programs are administered to be compatible with state, local units of government, and private programs and policies to protect farmland. Federal agencies are required to develop and review their policies and procedures

to implement the FPPA every two years. The FPPA does not authorize the Federal Government to regulate the use of private or nonfederal land or, in any way, affect the property rights of owners. For the purpose of FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance. Farmland subject to FPPA requirements does not have to be currently used for cropland. It can be forest land, pastureland, cropland, or other land, but not water or urban built-up land (USDA, 2022).

U.S. Forest Service

The U.S. Department of Agriculture (USDA) Forest Service is a federal agency that manages public lands in national forests and grasslands. The Forest Service is also the largest forestry research organization in the world and provides technical and financial assistance to state and private forestry agencies.

3.2.3.2 State

California Department of Conservation: Farmland Mapping and Monitoring Program

The California Department of Conservation (DOC), under the Division of Land Resource Protection, has developed the Farmland Mapping and Monitoring Program (FMMP), which monitors the conversion of the state's farmland to and from agricultural use. Data is collected at the county level to produce a series of maps identifying eight land use classifications using a minimum mapping unit of 10 acres. The program also produces a biannual report on the amount of land converted from agricultural to non-agricultural use. The program maintains an inventory of state agricultural land and updates the "Important Farmland Series Maps" every two years (Tulare County, 2012).

The map series identifies eight classifications, as defined below, and uses a minimum mapping unit size of 10 acres.

- Prime Farmland has the best combination of physical and chemical features able to sustain long-term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agricultural production at some time during the 4 years prior to the mapping date.
- Farmland of Statewide Importance is similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture. Land must have been used for irrigated agricultural production at some time during the 4 years prior to the mapping date.
- Unique Farmland consists of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards as found in some climatic zones in California. Land must have been cropped at some time during the 4 years prior to the mapping date.
- Farmland of Local Importance is land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.
- Grazing Land is land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen's Association, University

of California Cooperative Extension, and other groups interested in the extent of grazing activities.

- Urban and Built-up Land is occupied by structures with a building density of at least one unit to 1.5 acre, or approximately six structures to a 10-acre parcel. Common examples include residential, industrial, commercial, institutional facilities, prisons, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, and water control structures.
- Water is defined as perennial water bodies with an extent of at least 40 acres.
- Other Land is land not included in any other mapping category. Common examples include low density rural developments, vegetative and riparian areas not suitable for livestock grazing, confined animal agriculture facilities, strip mines, borrow pits, and water bodies smaller than 40 acres. Vacant and nonagricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land. More detailed data on these uses is available in counties containing the Rural Land Use Mapping categories. (DOC, 2022)

Williamson Act: California Land Conservation Act of 1965

The California Land Conservation Act (CLCA) of 1965, Sections 51200 et seq. of the California Government Code, commonly referred to as the "Williamson Act", enables local governments to restrict the use of specific parcels of land to agricultural or related open space use. Landowners enter into contracts with participating cities and counties and agree to restrict their land to agriculture or open space use for a minimum of ten years. In return, landowners receive property tax assessments that are much lower than normal because they are based upon farming and open space uses as opposed to full market (speculative) value. Local governments receive an annual subvention of forgone property tax revenues from the state via the Open Space Subvention Act of 1971.

California Department of Forestry and Fire Protection (CAL FIRE)

CAL FIRE's mission emphasizes the management and protection of California's natural resources; a goal that is accomplished through ongoing assessment and study of the State's natural resources and an extensive CAL FIRE Resource Management Program. CAL FIRE oversees enforcement of California's forest practice regulations, which guide timber harvesting on private lands. Reviews and inspections ensure protection of watershed and wildlife, as well as renewal of timber resources. Department foresters and fire personnel work closely to encourage and implement fuels management projects to reduce the threat of uncontrolled wildfires. CAL FIRE Foresters promote conservation and the importance of our trees and forests to Californians of all ages. CAL FIRE manages eight Demonstration State Forests that provide for commercial timber production, public recreation, and research and demonstration of good forest management practices. Additional forestry programs include urban forestry, archaeology, pest management, etc. (CAL FIRE, 2022).

3.2.3.3 Local

County of Tulare General Plan

The Tulare County General Plan has policies that apply to projects within Tulare County that serve to protect farmland. General Plan policies that are potentially applicable to the proposed Project are listed below:

> ***AG-1.3 Williamson Act:*** *The County should promote the use of the California Land Conservation Act (Williamson Act) on all agricultural lands throughout the County located outside established Urban Development Boundaries (UDBs). However, this policy carries with it a caveat that support for the Williamson Act as a tax reduction component is premised on continued funding of the State subvention program that offsets the loss of property taxes.*
>
> ***AG-2.11 Energy Production:*** *The County shall encourage and support the development of new agricultural related industries featuring alternative energy, utilization of agricultural waste, and solar or wind farms.*

3.2.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Agriculture and Forestry Resources" a project is considered to have a significant impact on the environment if it would:

a) *Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use (CEQA Appendix G Threshold (a))?*

b) *Conflict with existing zoning for agricultural use, or a Williamson Act contract (CEQA Appendix G Threshold (b))?*

c) *Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)) (CEQA Appendix G Threshold (c))?*

d) *Result in the loss of forest land or conversion of forest land to non-forest use (CEQA Appendix G Threshold (d))?*

e) *Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use (CEQA Appendix G Threshold (e))?*

3.2.5 Methodology of Analysis

The following points were considered in the Agriculture and Forestry Resources evaluation:

- Historically, the site has experienced only marginal agricultural use in the form of seasonal livestock grazing. The entire Project site is designated as Grazing Land per the FMMP, which, among other definitions, includes "*land on which the existing vegetation is suited to the grazing of livestock.*" As discussed above, the Project site is not located on Prime Farmland, Unique

Farmland, or Farmland of Statewide or Local Importance. As such, the Project would have no impact on any category of important farmland. The Project site is not currently being utilized as a farming operation to cultivate or grow crops. In addition, the underlying land is not under a Williamson Act contract.

- The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies.
- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.
- In identifying the area underlying the Project site as MRZ-2b, the State of California and the County General Plan have determined this area contains mineral deposits where geologic data show that significant measured or indicated resources are present, or where geologic information indicates that significant inferred resources are present. Land included in the MRZ-2b category is of prime importance because it contains known economic mineral deposits. A typical MRZ-2b area would include an operating mine, or an area where extensive sampling indicates the presence of a significant mineral deposit. This site is also designated by the State as having aggregate deposits of regional significance.

3.2.6 Project-Level Impacts and Mitigation Measures

3.2.6.1 Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland)

Impact Statement

Impact AG-1: *Would the Project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

The California Resources Agency, Division of Land Resource Protection maintains information pertaining to, and the mapping of, farmland. Historically, the site has been used for cattle grazing. The entire Project site is designated as “Grazing Land”, which, among other definitions, includes "land on which the existing vegetation is suited to the grazing." The Project site is not designated Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance, nor is it under a Williamson Act contract. As such, the Project would have no impact on agriculture or forestlands.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.2.6.2 Conflict With Zoning for Agricultural Use, or a Williamson Act Contract

Impact Statement

Impact AG-2: *Would the Project conflict with existing zoning for agricultural use, or a Williamson Act contract?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

Table 3.11-2 in Section 3.11 – Land Use and Planning, provides a consistency analysis of the applicable Tulare County General Plan policies.

As stated above, historically the site has been used for cattle grazing, and the entire Project site is designated as “Grazing Land”, which, among other definitions, includes "land on which the existing vegetation is suited to the grazing." The Project site is not designated Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance, nor is it under a Williamson Act contract.

The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20-Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). Within the AE-20 zone, the County permits mining and the extraction of minerals, upon approval of a Reclamation Plan and Financial Assurance Cost Estimate (FACE).

The Project would also not result in the cancellation of an open space contract made pursuant to the California Land Conservation Act of 1965, or Farmland Security Zone Contract pursuant to Public Resources Code § 15206(b)(3). Therefore, the Project would have no impact on agriculture or forestlands.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.2.6.3 Conflict With Zoning for Forest Land/Timberland

Impact Statement

Impact AG-3: *Would the Project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?* **(CEQA Guidelines – Appendix G Threshold Criteria (c))**

Impact Analysis

The Project site and surrounding areas are located in the Valley portion of Tulare County and have agricultural zoning. The area contains no lands zoned or identified as forest land or timberland. The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20-Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). Within the AE-20 zone, the County permits mining and the extraction of minerals, upon approval of a Reclamation Plan and Financial Assurance Cost Estimate (FACE). Therefore, the proposed Project will not conflict with existing zoning for forest land or cause rezoning of forest land, and no impacts would occur.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.2.6.4 Loss Of Forest Land or Conversion of Forest Land to Non-Forest Use

Impact Statement

Impact AG-4: *Would the Project result in the loss of forest land or conversion of forest land to non-forest use?* **(CEQA Guidelines – Appendix G Threshold Criteria (d))**

Impact Analysis

As discussed in 3.2.6.3, the proposed Project is not located within a forestland zone or would require the change of a forestland zone. As such, no impacts would occur.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.2.6.5 Conversion of Farmland, to Non-Agricultural Use or Non-Forest Use

Impact Statement

Impact AG-5: *Would the Project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?* **(CEQA Guidelines – Appendix G Threshold Criteria (e))**

Impact Analysis

As stated above, historically the site has been used for cattle grazing, and the entire Project site is designated as “Grazing Land”, which, among other definitions, includes "land on which the existing vegetation is suited to the grazing." The Project site is not designated Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance, nor is it under a Williamson Act contract.

As previously discussed above, the proposed Project is not located within a forestland zone or will require the change of a forestland zone. The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20-Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). Within the AE-20 zone, the County permits mining and the extraction of minerals, upon approval of a Reclamation Plan and Financial Assurance Cost Estimate (FACE).

There are no forestlands on or near the Project site. The Project would also not result in the cancellation of an open space contract made pursuant to the California Land Conservation Act of 1965, or Farmland Security Zone Contract pursuant to Public Resources Code § 15206(b)(3).

For these reasons, the Project would have no impact on agriculture or forestlands, or result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.2.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3.0-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to agriculture and forestry resources.

As discussed in this Section, historically the Project site has been used for cattle grazing. The Project site is not designated Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance, nor is it under a Williamson Act contract. The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20-Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b), and the Project is consistent with the County General Plan and Zoning designations for the Project site, and with the County's General Plan policies that pertain to agricultural and forest resources. The Project impacts are less than significant. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to agriculture and forestry resources.

THIS PAGE IS INTENTIONALLY BLANK

3.3 AIR QUALITY

3.3.1 Introduction

This section of the DEIR evaluates the potential impacts associated with Toxic Air Contaminant (TAC) and criteria pollutant emissions as a result of the Project. The air quality analysis is based on the Air Quality, Health Risk, and Climate Change Impact Assessment (AQCCIA) provided in Appendix C. The AQCCIA presents technical information and analysis describing reasonably foreseeable changes to the environment and potential impacts that would occur with the Project. The AQCCIA was prepared using current best practices including the Guidance for Assessing and Mitigating Air Quality Impacts (SJVAPCD, 2015) and the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015).

Both the state and the federal government have established health-based criteria called Ambient Air Quality Standards (AAQS) for six air pollutants, referred to as criteria pollutants. The criteria pollutants are ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and suspended particulate matter ($PM_{2.5}$ and PM_{10}). Potential impacts associated with criteria pollutants are evaluated by comparing the quantified emissions to SJVACPD thresholds of significance. Toxic air contaminants (TACs) are also regulated and potential impacts associated with TACs are assessed by using health risk assessment (HRA) methods in accordance with San Joaquin Valley Air Pollution Control District (SJVAPCD) guidelines and the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015). The health effects of these pollutants are described in detail in the AQCCIA. The regulatory status both criteria pollutants and TACs are discussed in Section 3.3.3.

3.3.2 Environmental Setting

The environmental setting includes the physical setting against which changes that would occur with the Project are compared in order to determine the Project's impact. The environmental setting also includes factors that influence the setting such as meteorology, geography, and the locations of emission sources and receptors. Frequency and severity of high pollutant concentrations in the air as well result in adverse health effects which are also part of the physical setting and the primary reason for regulating air pollutants. Air quality standards are set at levels that will protect health, including the health of sensitive populations, such as school age children or hospitalized individuals.

3.3.2.1 Regional Setting

The Project site is located in the San Joaquin Valley (Valley) within the central portion of the San Joaquin Valley Air Basin (SJVAB) under the jurisdiction of the San Joaquin Valley Unified Air Pollution Control District (SJVAPCD or District). The SJVAPCD describes the SJVAB as follows:

The SJVAB consists of a continuous inter-mountain valley approximately 250 miles long and averaging 80 miles wide. On the western edge is the Coast Mountain range, with peaks reaching 5,020 feet, and on the east side of the valley is the Sierra Nevada range with some peaks exceeding 14,000 feet. The Tehachapi Mountains form the southern boundary of the valley. This mountain range includes peaks over 6,000 feet, and contains mountain passes to the Los Angeles basin and the Mojave Desert.

The SJVAB has an "inland Mediterranean" climate, which is characterized by hot, dry summers and cool, rainy winters… Precipitation in the SJVAB is confined primarily to the winter months with some occurring in late fall and early spring. Nearly 90 percent of the annual precipitation in the SJVAB falls between the months of November through April. Average annual rainfall for the entire SJVAB is about 10 inches on the valley floor. (SJVAPCD, 2003)

According to Western Regional Climate Center (WRCC), the Lemon Cove Station (044890) located within 1 mile from the Project site, is the nearest climatological monitoring station. Based on the period of record (1/1/1899 to 6/10/2016), average monthly temperature has ranged from a minimum of 36.9° Fahrenheit (F) to a maximum of 99.3° F. December and January are typically the coldest months with July and August the warmest (WRCC, 2016). The annual rainfall totals approximately 14.4 inches and mostly occurs between November and April (WRCC, 2016). Summer rainfall is minimal and generally limited to scattered thundershowers over the Sierra Nevada Mountain range. The Air Quality Report utilized SJVAPCD processed meteorological data from the Visalia Airport for modeling purposes.

SJVAPCD, together with the California Air Resources Board (CARB), maintains ambient air quality monitoring stations in the Tulare County area. Data collected at permanent monitoring stations are used by the United States Environmental Protection Agency (US EPA) and the State to classify regions as "attainment" or "nonattainment," depending on whether the regions met the requirements stated in the primary National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS or State AAQS). The federal and state attainment status in Tulare County area, including the SJVAB is shown in Table 3.3-1.

Table 3.3-1. San Joaquin Valley Air Basin Federal and State Attainment Status

Pollutant	Federal Designation [a]	State Designation [b]
Ozone - One hour	No Federal Standard [f]	Nonattainment/Severe
Ozone - Eight hour	Nonattainment/Extreme [e]	Nonattainment
PM_{10}	Attainment [c]	Nonattainment
$PM_{2.5}$	Nonattainment [d]	Nonattainment
Carbon Monoxide (CO)	Attainment/Unclassified	Attainment/Unclassified
Nitrogen Dioxide (NO_2)	Attainment/Unclassified	Attainment
Sulfur Dioxide (SO_2)	Attainment/Unclassified	Attainment
Lead (Particulate)[h] (Pb)	No Designation/Classification	Attainment
Hydrogen Sulfide	No Federal Standard	Unclassified
Sulfates	No Federal Standard	Attainment
Visibility Reducing Particles	No Federal Standard	Unclassified
Vinyl Chloride [h]	No Federal Standard	Attainment

Source: San Joaquin Valley Unified APCD (SJVAPCD, 2020)

a. See Code of Regulations (CFR) 40 CFR, Part 81.
b. See California Code of Regulations (CCR) Title 17 Sections 60200-60210.
c. On September 25, 2008, the EPA redesignated the San Joaquin Valley to attainment for the PM_{10} NAAQS and approved the PM_{10} Maintenance Plan.

d. The Valley is designated nonattainment for the 1997 federal $PM_{2.5}$ standards. The EPA released final designations for the 2006 $PM_{2.5}$ standards in December 2008 (effective in 2009), designating the Valley as nonattainment for the 2006 $PM_{2.5}$ standards.
e. Though the SJVAB was initially classified as "nonattainment/Serious" for the 1997 8-hour ozone standard, the EPA approved a reclassification to "extreme nonattainment" on May 5, 2010 (effective June 4, 2010).
f. Effective June 15, 2005, the EPA revoked the federal 1-hour ozone standard, including associated designations and classifications. However, the EPA had previously classified the SJVAB as extreme nonattainment for this standard. EPA approved the 2004 Extreme Ozone Attainment Demonstration Plan on March 8, 2010 (effective April 7, 2010). Many applicable requirements for extreme 1-hour ozone nonattainment areas continue to apply to the SJVAB.

3.3.2.2 Local Setting

The Project site is approximately 200 acres located adjacent to where the Lower Kaweah River and St. Johns River diverge. The Project is approximately 1.0 mile northwest of the community of Lemon Cove and west of the intersection of State Routes 198 and 216 in Tulare County, California. Mining activities have historically and currently been conducted adjacent to or in the vicinity of the Project site, specifically at the adjacent Seaborn site, the CEMEX Lemon Cove facility located immediately north of the Project site, and the Kaweah South Facility located approximately 0.5 miles southwest of the Project site.

The closest ambient air quality monitoring station to the Project site is the Visalia station. This station is located approximately 13.6 miles west-southwest of the Project site and measures O_3, PM_{10}, and $PM_{2.5}$. The station is constructed to monitor at a "neighborhood scale", defined by the EPA as a station covering an area between 0.5 and 4.0 square kilometers in range. Air quality at the Project site is expected to be better than air quality at the Visalia monitoring station because the monitoring station is located within an urban area where there are more emissions sources. The Project site and surrounding lands are characterized as rural with few air emissions sources and so one would expect fewer hot spots and/or near field exposures as compared to more urban areas where there are many sources and where ambient measurements are collected. Regional pollutant (e.g., ozone and $PM_{2.5}$) concentrations measured at the Visalia station conservatively represent concentrations on-site because these amounts are added to Project concentrations and cumulative concentration is compared to the AAQS in order to determine the Project's impact.

Ambient concentrations and number of days when the primary air quality standards were exceeded are presented in Table 3.3-2 and Table 3.3-3. Carbon monoxide and sulfur dioxide are not presented in these tables because the pollutants are not currently monitored within Tulare County and concentrations measured at all monitoring stations within SJVAB have been less than state or federal standards over the past five years. Ozone (O_3) levels exceeded the state one-hour and eight-hour standards and the federal eight-hour standard in each of the past five years. PM_{10} levels exceeded only the state standard in the last five years. $PM_{2.5}$ levels exceeded the federal standard for the past five years. A summary of all ambient air quality standards is presented in Table 3.3-2.

Table 3.3-2. Ambient Air Quality in the Project Area

Concentration and Averaging Period	Ambient Air Quality Standard	2015	2016	2017	2018	2019
Ozone 1-hr	0.09 ppm (State, max.)	0.110	0.098	0.109	0.112	0.093
Ozone 8-hr	0.070 ppm (State, max.)	0.079	0.080	0.083	0.085	0.084

Concentration and Averaging Period	Ambient Air Quality Standard	2015	2016	2017	2018	2019
	0.070 ppm (Fed., 4th high)	0.091	0.083	0.092	0.095	0.082
NO_2 1-hr	0.18 ppm (State, max.)	0.0623	0.0575	0.0581	0.0692	0.0707
	0.100 ppm (Fed., 98th %ile)	0.0456	0.0459	0.0556	0.0529	0.055
NO_2 Annual	0.030 ppm (State) 0.053 ppm (Fed.)	0.009	NA	0.010	0.010	0.009
PM_{10} 24-hr	50 µg/m^3 (State, max.)	140.3	132.5	145.7	159.6	418.5
	150 µg/m^3 (Fed., 2nd high)	67.3	137.1	144.8	153.4	411.1
PM_{10} Annual	20 µg/m^3 (State)	NA	NA	46.9	52.0	46.3
$PM_{2.5}$ 24-hr	35 µg/m^3 (Fed., 98th %ile)	45.8	40.7	74.6	63.4	45.5
$PM_{2.5}$ Annual	12 µg/m^3 (State, max.)	NA	15.5	16.8	17.4	12.2
	12.0 µg/m^3 (Fed., 3 Yr Avg.)	17.6	16.2	15.7	16.1	15.5

*Data Not Available

Source: Trends Summary for O_3, PM_{10}, $PM_{2.5}$ and Top 4 Summary for NO_2. (CARB, 2020).

Max. = Maximum. Hr = Hour. Fed. = Federal. ppm = parts per million. µg/m3 = micrograms per cubic meter.

4th high = Annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years.

2nd high = Not to be exceeded more than once per year on average over 3 years.

98th %ile = 98th percentile of: 1-hour daily maximum concentrations for the 1-hr NO_2 NAAQS; and of 24-hour average concentrations for PM_{10} and $PM_{2.5}$, averaged over 3 years.

Non Detectible (ND) – insufficient data available to determine. NA – data are not available from the listed sources.

Carbon monoxide and sulfur dioxide are not presented in these tables because the pollutants are not currently monitored within Tulare County and concentrations measured at all monitoring stations within the Air Basin have been less than State or federal standards over the past five years.

Table 3.3-3. Number of Days Exceeding Air Quality Standards

Monitoring Site	Year	Days Exceeding State 1-Hour O_3	Days Exceeding State 8-Hour O_3	Days Exceeding Federal 8-Hour O_3	Days Exceeding State 24-Hour PM_{10}[a]	Days Exceeding Federal 24-Hour $PM_{2.5}$[a]
Visalia	2015	9	52	49	59.4	ND
	2016	1	19	18	68.8	ND
	2017	9	65	61	89.3	135.9
	2018	8	58	53	94.0	164.4
	2019	0	26	22	ND	115.8

Source: Trends Summary (CARB, 2020).

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and 3 days, respectively. "Numbers of days exceeding the standards" are mathematical estimates.

ND – insufficient data available to determine.

3.3.2.3 Health Effects Setting

The level of air pollution historically existing in the Project area is considered the baseline for this air quality assessment. Therefore, the emissions associated with the mining activities at the adjacent Seaborn site are the baseline emissions. For more information, see Section 3.3.5.3.

3.3.3 Regulatory Setting

The following is a summary of the key regulatory plans and policies that may apply to the Project. A more detailed discussion is provided in the AQCCIA located in Appendix C.

3.3.3.1 Federal

Clean Air Act

The Clean Air Act (CAA) is the comprehensive federal law that regulates air emissions from stationary and mobile sources. Congress established much of the basic structure of the CAA in 1970, and made major revisions in 1977 and 1990. "The Clean Air Act in a Nutshell: How It Works" (EPA, 2013) contains a thorough yet concise summary of how US EPA implements the CAA which includes the following information presented in Table 3.3-4.

Table 3.3-4. Applicability of US EPA Activities under the CAA to the Project

US EPA Activity	Applicable to Project Sources?
Establish air quality standards.	Yes, see Impact AQ-1.
Designate quality of air in attainment areas.	No, the Project is not an attainment area.
Administrate state implementation plans.	No, the Project is not a SIP.
Require additional programs in nonattainment areas.	Yes, the Project would comply with SJVAPCD programs and rules that address nonattainment.
Provide guidance on control techniques.	No, the Project would employ standard controls.
Regulate interstate air pollution.	No, the Project is not a state.
Require plans to maintain clean air after a nonattainment area meets the standard.	Yes, the Project would comply with SJVAPCD programs and rules that maintain attainment.
Preserve clean air in attainment areas.	Yes, the Project would comply with SJVAPCD programs and rules that preserve attainment.
Adopt National standards for new stationary sources.	Yes, new stationary sources at the Project that have an applicable New Source Performance Standard (NSPS) are discussed in this subchapter.
Adopt National standards or guidelines for consumer and commercial products.	No, the Project does not buy products that emit air pollutant from vendors outside the country.
Adopt National standards for new vehicles and engines, and fuels.	No, the Project does not manufacture vehicles, engines, or fuels.
Regulate emissions from oil drilling on the Outer Continental Shelf.	No, the Project is not located on the Outer Continental Shelf.
Regulate hazardous air pollutants.	Yes, the Project is subject to the NESHAP for engines as discussed in this subchapter.
Protect visibility in National parks by regulating regional haze.	No, the Project is approximately 10 miles from the boundary of Sequoia National Park but does not include a major stationary source.
Control acid rain by regulating NO_2 and SO_2 emissions from power plants.	No, the Project does not include a power plant or other major source of combustion pollutants.
Protect stratospheric ozone by regulating ozone-depleting compounds (e.g., chlorofluorocarbons).	No, the Project would purchase refrigerants and other classes of products from a U.S. vendor.

US EPA Activity	Applicable to Project Sources?
Regulate major sources of air pollution by administrating a Federal operating permit program.	No, the Project is a minor source that does not require a Federal operating permit.

Ambient Air Quality Standards

Both the state and the federal government have established health-based criteria called Ambient Air Quality Standards (AAQS) for the following six criteria air pollutants: ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and suspended particulate matter ($PM_{2.5}$ and PM_{10}). Each of the criteria pollutants are described in detail in the AQCCIA (see Appendix C). The regulatory status of the criteria pollutants within the SJVAPCD and AAQS which are presented Table 3.3-5.

Table 3.3-5. State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards [1]		National Standards [2]		
		Concentration [3]	Method [4]	Primary [3,5]	Secondary [3,6]	Method [7]
Ozone (O_3) [8]	1 Hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m^3)		0.070 ppm (137 µg/m^3)		
Respirable Particulate Matter (PM_{10}) [9]	24 Hour	50 µg/m^3	Gravimetric or Beta Attenuation	150 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m^3		—		
Fine Particulate Matter ($PM_{2.5}$) [9]	24 Hour	—	—	35 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m^3	Gravimetric or Beta Attenuation	12.0 µg/m^3	15 µg/m^3	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)		—	—	
Nitrogen Dioxide (NO_2)[10]	1 Hour	0.18 ppm (339 µg/m^3)	Gas Phase Chemi-luminescence	100 ppb (188 µg/m^3)	—	Gas Phase Chemi-luminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)		0.053 ppm (100 µg/m^3)	Same as Primary Standard	
Sulfur Dioxide (SO_2)[11]	1 Hour	0.25 ppm (655 µg/m^3)	Ultraviolet Fluorescence	75 ppb (196 µg/m^3)	—	Ultraviolet Flourescence; Spectro-photometry (Pararosaniline Method)
	3 Hour	—		—	0.5 ppm (1,300 µg/m^3)	
	24 Hour	0.04 ppm (105 µg/m^3)		0.14 ppm (for certain areas)[10]	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas)[10]	—	
Lead [12,13]	30 Day Average	1.5 µg/m^3	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m^3 (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average	—		0.15 µg/m^3		

Pollutant	Averaging Time	California Standards [1]		National Standards [2]		
		Concentration [3]	Method [4]	Primary [3,5]	Secondary [3,6]	Method [7]
Visibility Reducing Particles [14]	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	**No National Standards**		
Sulfates	24 Hour	25 µg/m^3	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m^3)	Ultraviolet Fluorescence			
Vinyl Chloride [12]	24 Hour	0.01 ppm (26 µg/m^3)	Gas Chromatography			

Source: CARB, May 4, 2016 (updated Dec 2020)
https://ww3.arb.ca.gov/research/aaqs/aaqs2.pdf

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the US EPA for further clarification and current National policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent measurement method, which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard, may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.
6. Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the US EPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the US EPA.
8. On October 1, 2015, the National 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
9. On December 14, 2012, the National annual $PM_{2.5}$ primary standard was lowered from 15 µg/m^3 to 12.0 µg/m^3. The existing National 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
10. To attain the 1-hour National standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the National 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the National 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the National standard of 100 ppb is identical to 0.100 ppm.
11. On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour National standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 National standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. Note that the 1-hour National standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To

directly compare the 1-hour National standard to the California standard the units can be converted to ppm. In this case, the National standard of 75 ppb is identical to 0.075 ppm.

12. The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
13. The National standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
14. In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

New Source Performance Standards – Title 40, Code of Federal Regulations (CFR), Part 60

Subpart OOO (Nonmetallic Mineral Processing Plants)

This regulation is applicable to new, modified, or reconstructed nonmetallic mineral processing facilities (with certain exceptions, such as fixed sand and gravel plants and crushed stone plants with capacities of 25 tons per hour or less, or portable sand and gravel plants and crushed stone plants with capacities of 150 tons per hour or less). Subpart OOO restricts emissions from affected facilities equipped with capture systems used to capture and transport particulate matter to a control device. Emissions are prohibited in excess of 0.032 grams per dry standard cubic meter (g/dscm) (0.014 grains per dry standard cubic feet [g/dscf]), and from exhibiting visible emissions based on quarterly monitoring. Subpart OOO also prohibits the discharge of any fugitive emissions from affected facilities without capture systems and the discharge of fugitive emissions escaping capture systems that exhibit greater than 7% opacity (12% for crushers without capture systems).

Subpart IIII (Stationary Compression Ignition Internal Combustion Engines)

This regulation is applicable to new, modified, or reconstructed stationary engines and would apply to the generators. However, the requirements would be superseded by application of the best available control technology (BACT) which will be more stringent.

Regulations Affecting New Diesel Engines

US EPA regulates emissions from new non-road (i.e., off-road, portable, and stationary) internal combustion engines by tiered standards (e.g., compression-ignition engines in 40 CFR 89.112, 40 CFR 1039.101, and 40 CFR 1039.102). Emissions from new non-road engines are regulated using standards that apply by model year, class of vehicle, and fuel type (e.g., heavy-heavy duty diesel engines in 40 CFR 86.004-11, 40 CFR 86.007-11, and 40 CFR 86.099-11). These regulations affect manufacturers but are relevant to the Project because diesel engines are the primary source of Project emissions besides dust.

Engine tiers are emissions standards that were phased-in by size and model year between 1996 and 2015. Tier 0 engines are engines that were built before the applicable engine tier standard came into effect for each engine size. Tier requirements vary based on the size of the engine. (United States Environmental Protection Agency, 2016)

Regulations Affecting Sources of Hazardous Air Pollutants

The Federal Clean Air Act Amendments (CAAA) Section 112(k) requires the EPA to reduce hazardous air pollutant (HAP) risks in urban areas. The EPA's strategy for reducing these risks is discussed in the Integrated Urban Air Toxics Strategy. Among the major new programs are the operating permits program (Title V) and provisions to phase out ozone-depleting substances (Title VI). Existing programs that have seen major changes due to the amendments include attainment provisions for the National Emissions Standards for Hazardous Air Pollutants (NESHAP) program.

The provisions in Title I that address the control of HAP emissions, or air toxics, include provisions for the promulgation of NESHAP, or maximum achievable control technology (MACT) standards, as well as several related programs to enhance and support the NESHAP Program. The activities and responsibilities required under Section 112 directly affect not only the EPA but State and local regulatory agencies as well. In addition to air quality agencies administering the majority of Section 112, the storage of acutely hazardous materials above threshold quantities is administrated under Section 112(r) by the State Office of Emergency Management through the local Certified Unified Permitting Agencies (CUPAs).

The Project's generators to be installed would be subject to the Reciprocating Internal Combustion Engine (RICE) NESHAP (40 CFR 63, Subpart ZZZZ). The engines would need to meet BACT when installed. Such engines would require monitoring and recordkeeping under this NESHAP.

3.3.3.2 State

The California Air Resources Board (CARB) coordinates and oversees both state and federal air pollution control programs in California. CARB oversees activities of local air districts and is responsible for incorporating air quality management plans developed by each air district into the State Implementation Plan (SIP) for Federal EPA approval. CARB maintains air quality monitoring stations throughout the State in conjunction with local air districts. Data collected at these stations are used by CARB and EPA to classify areas as "attainment" or "nonattainment" with respect to each pollutant and to monitor progress towards attaining air quality standards. CARB has divided the State into 15 air basins. Significant authority for air quality control is delegated to local air districts that regulate emissions from stationary sources and develop attainment plans.

Criteria Pollutants

The State of California began to set CAAQS in 1969. The CAAQS are generally more stringent than the NAAQS. In addition to the six criteria pollutants covered by the NAAQS, there are CAAQS standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility reducing particles. These standards are listed in Table 3.3-1.

Originally, there were no attainment deadlines for the CAAQS. However, the California Clean Air Act (CCAA) provided a timeframe and a planning structure to promote their attainment. The CCAA required nonattainment areas in the State to prepare attainment plans and proposed to classify each such area on the basis of the submitted plan. The attainment plans require a minimum 5 percent annual reduction in the emissions of nonattainment pollutants unless all feasible measures have been implemented. The Tulare County area of the SJVAB is currently classified as a nonattainment area for three criteria pollutants: O_3, PM_{10}, and $PM_{2.5}$.

Toxic Air Contaminants

The CARB Statewide comprehensive air toxics program was established in the early 1980s. The Toxic Air Contaminant Identification and Control Act (AB 1807, 1983) created California's program to reduce exposure to air toxics. The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987) requires a Statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks.

Under AB 1807, CARB is required to use certain criteria in the prioritization for the identification and control of air toxics. In selecting substances for review, CARB must consider criteria relating to "the risk of harm to public health, amount or potential amount of emissions, manner of, and exposure to, usage of the substance in California, persistence in the atmosphere, and ambient concentrations in the community." AB 1807 also requires CARB to use available information gathered from the AB 2588 program to include in the prioritization of compounds. The list of TACs includes all federal HAPs plus the following pollutants: 1,2-dibromoethane, 1,2-dichloroethane, hexavalent chromium, cadmium, inorganic arsenic, nickel, inorganic lead, diesel particulate matter, and environmental tobacco smoke (17 CCR § 93000 and § 93001).

Under AB 2588, facilities are required to report air toxic emissions, ascertain health risks and notify nearby residents of significant risks. In September 1992, the Hot Spots Act was amended by Senate Bill (SB) 1731, which required facilities that pose a significant health risk to reduce their risk through a risk management plan. The emissions inventory and risk assessment information from this program is incorporated into this AQCCIA as discussed in the methodology subchapter.

In July 2007, CARB adopted an airborne toxic control measure (ATCM) for in-use off-road diesel vehicles (13 CCR § 2449 et seq.). This regulation required that specific fleet average requirements be met for NO_x emissions and for particulate matter emissions. Where average requirements cannot be met, BACT requirements apply. The regulation also included several recordkeeping and reporting requirements.

After a series of revisions and amendments, the Final Regulation Order, effective November 30, 2018, establishes a tier based phase out schedule that is outlined in Table 3.3-6 for small fleets (cumulative horsepower of up to 750) and large fleets (cumulative horsepower of greater than 750).

Table 3.3-6. Portable Engine ATCM Phase-Out Schedule

Engine Certification	Engines Rated 50 to 750 break horsepower (bhp)		Engines Rated >750 bhp
	Large Fleet	Small Fleet	
Tier 1	1/1/2020	1/1/2020	1/1/2022
Tier 2 built prior to 1/1/2009	1/1/2022	1/1/2023	1/1/2025
Tier 2 built on or after 1/1/2009	NA	NA	1/1/2027
Tier 3 built prior to 1/1/2009	1/1/2025	1/1/2027	NA
Tier 3 built on or after 1/1/2009	1/1/2027	1/1/2029	NA
Tier 1, 2, and 3 flexibility engines	December 31 of the year 17 years after the date of manufacture. This provision shall not apply to any engine operation before the effective date of this regulation.		

Source: (CARB, 2018).

The CARB ATCM for Stationary Compression Ignition Engines (17 CCR § 93115 et seq.) contains tables of emissions standards that vary based on the size, use, and existence of the engine. Specifically, new engines have to meet emissions standards for all pollutants while existing engines comply by reducing emissions of diesel particulate matter (DPM) by 85% or more. Engines used in agricultural operations have separate requirements as well.

Because the Project is located on an alluvial deposit, and naturally occurring asbestos (NOA) is not found in alluvium, the following ATCM for construction, grading, quarrying and surface mining operations applies to the Project:

- Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations (17 CCR § 93105) requires the implementation of mitigation measures to minimize emissions of asbestos-laden dust unless an exemption in the ATCM applies. Applicable to this Project, the ATCM states that the "Air Pollution Control Officer (APCO) may provide an exemption for crushing, screening and conveying equipment, stockpiles, and off-site material transport at a sand and gravel operation if the operation processes only materials from an alluvial deposit."

Assembly Bill 617

On July 26, 2017, Governor Brown approved Assembly Bill No. 617 ("AB 617"). AB 617 added and amended various sections of the California Health and Safety Code. The intent of AB 617 is to develop a collaborative relationship between CARB and local air districts to facilitate community participation, provide a science-based foundation supporting the identification of communities with high cumulative exposure burdens, accelerate the development and use of advanced air monitoring methods and equipment, and support the use of new mobile and stationary source technology. Specific communities have been identified as priority disadvantage communities that are currently subject to AB 617 requirements. The Project is not located in an identified community at this point. If in the future it is identified as being in a disadvantaged community subject to AB 617, the Project would comply with the requirements set forth in AB 617, as applicable.

3.3.3.3 Local

San Joaquin Valley Air Pollution Control District

The Project is in the Tulare County portion of the SJVAB and within jurisdiction of SJVAPCD. SJVAPCD has developed the following plans, guidance, and rules that are potentially applicable to the Project.

The California CAA (CCAA) provides the SJVAPCD with the authority to manage transportation activities and regulate stationary source emissions. Indirect sources of pollution are those sources related to a stationary facility or development project (see Rule 9510) but otherwise outside the Air District authority to regulate. An example of this would be the motor vehicles at an intersection, a mall, and on highways. As a State agency, CARB regulates motor vehicles and fuels for their emissions.

The SJVAPCD has adopted several attainment plans to achieve state and federal air quality standards. The SJVAPCD continuously monitors the region's progress implementing attainment plans and periodically reports

to CARB and the EPA. SJVAPCD periodically revises attainment plans to reflect new conditions and requirements in accordance with schedules mandated by the CCAA and Clean Air Act Amendments (CAAA).

SJVAPCD Air Quality Management Plans

The following are state plans that have been adopted by the SJVAPCD.

Extreme 1-Hour Ozone Attainment Demonstration Plan

This plan, adopted by the SJVAPCD board in 2004, sets forth measures and emission reduction strategies designed to attain the federal 1-hour ozone standard by November 15, 2010, as well as an emissions inventory, outreach, and Rate of Progress demonstration. This Plan was approved by the US EPA on March 8, 2010; however, the US EPA's approval was subsequently withdrawn effective November 26, 2012, in response to a decision issued by the U.S. Court of Appeals for the Ninth Circuit (*Sierra Club v. U.S. EPA* [9th Cir. 2012] 671 F.3d 955) remanding EPA's approval of these State Implementation Plan revisions. Concurrent with EPA's final rule, CARB withdrew the 2004 Plan. The SJVAPCD's 2013 Plan for the Revoked 1-Hour Ozone Standard was approved by the SJVAPCD Governing Board at a public hearing on September 19, 2013. The modeling confirms that the San Joaquin Valley will attain the revoked 1-hour ozone standard by 2017.

2007 8-Hour Ozone Plan

This plan sets forth measures and a "dual path" strategy to attain the federal 8-hour ozone standard for the SJVAB by reducing emissions on ozone and particulate matter precursors. The plan also includes provisions for improved pollution control technologies for mobile and stationary sources, as well as an increase in State and federal funding for incentive-based measures to reduce emissions. All local measures were to be adopted by the SJVAPCD before 2012. This plan was approved by the EPA on March 1, 2012. On November 26, 2012, however, the EPA withdrew its determination that the plan satisfied the Clean Air Act requirements regarding emission growth caused by growth in vehicle-miles traveled. All other determinations in the EPA's March 1, 2012, rule approving the plan remain unchanged and in effect.

2016 Ozone Plan for 2008 8 Hour Ozone Standard

In order to meet the December 31st, 2031 deadline for attainment, this plan incorporates emissions reduction strategies for stationary sources including regulatory actions; incentive programs; technology advancement programs; policy and legislative activities; public outreach, education, and communication; and undefined strategies under "black box" provisions. The plan demonstrates that existing regulations go above and beyond the Federal Reasonably Available Control Technology (RACT) requirement. The plan also emphasizes that mobile source emissions, which fall under state and federal jurisdiction, make up over 85% of the Valley's Nitrogen Oxide (NOx) emissions. For this reason, the District requested that CARB and EPA adopt and implement strategies so that sources outside District authority would be controlled enabling the standard to be met without the need for "black box" provisions. Moreover, the plan states that CARB and EPA action will be essential to attainment with the AAQS.

2020 Reasonable Available Control Technology (RACT) Demonstration for the 2015 8-Hour Ozone Standard

The 2020 RACT Demonstration (The Demonstration) includes a comprehensive evaluation of all NOx and VOC District rules to ensure that each rule meets or exceeds RACT. District rules were reviewed and compared to federal, state, and local regulations. State suggested control measures and technology clearinghouses were revised to ensure major sources and EPA Control Technique Guidelines sources in the jurisdiction of the SJVAPCD were subject to RACT. The Demonstration fulfills the federal Clean Air Act requirements and demonstrates that all federal RACT requirements are satisfied by SJVAPCD rules.

SJVAPCD Particulate Matter Plans:

2007 PM_{10} Maintenance Plan

On October 25, 2007, CARB approved the SJVAPCD's 2007 PM_{10} Maintenance Plan and Request for Redesignation with modifications to the transportation conformity budgets. On September 25, 2008, the EPA redesignated the SJVAB to attainment for the PM_{10} NAAQS and approved the PM_{10} maintenance plan.

2012 $PM_{2.5}$ Plan

The US EPA set the first $PM_{2.5}$ standard in 1997 and in 2005 designated the Valley as nonattainment for the 1997 standard. The 1997 standard has two limits of attainment: an annual average of 15 µg/m³ and a 24-hour average of 65 µg/m³. The SJVAPCD adopted the 2008 $PM_{2.5}$ Plan in April 2008 to demonstrate how the Valley would come into attainment of the 1997 $PM_{2.5}$ standard by no later than April 2015. US EPA subsequently lowered the 24-hour standard to 35 µg/m³ in 2006 and re-issued the nonattainment designation for the San Joaquin Valley in 2009. Through continued implementation of the 2008 $PM_{2.5}$ Plan, the San Joaquin Valley was expected to be in attainment of the 1997 annual standard by 2015.

The 2012 $PM_{2.5}$ Plan builds on the prior $PM_{2.5}$ plans and demonstrates attainment of the newer 2006 24-hour $PM_{2.5}$ standard by the federal attainment deadline of 2019, with the majority of the Valley actually experiencing attainment ahead of 2019. The SJVAPCD, in collaboration with CARB, based this attainment demonstration on comprehensive analysis, careful evaluation, and a sound scientific foundation. Using the SJVAPCD Governing Board's guiding principles adopted in February 2012, this plan emphasizes public health as the number one priority in meeting federal ambient air quality standards (NAAQS).

The 2012 $PM_{2.5}$ Plan is a multifaceted strategy that utilizes a combination of conventional and innovative control strategies to reduce emissions of $PM_{2.5}$ and other pollutants that form $PM_{2.5}$. The San Joaquin Valley's successes in adopting regulations and other strategies that have improved the San Joaquin Valley's air quality provide the foundation for the Plan. In developing the $PM_{2.5}$ Plan, the SJVAPCD claims to have left "no stone unturned" in evaluating all sources of emissions for potential strategies to reduce emissions.

In addition to reducing direct emissions of $PM_{2.5}$, the 2012 $PM_{2.5}$ Plan focuses on reducing oxides of nitrogen (NO_x) emissions, which is a predominant pollutant not only in the formation of $PM_{2.5}$ in the San Joaquin Valley, but is also the focus of SJVAPCD's ozone reduction strategies. This overlapping significance and emphasis on reducing NO_x emissions helps to address both of the San Joaquin Valley's biggest air quality challenges, $PM_{2.5}$ and ozone. Along with comprehensive efforts at the local level to reduce emissions, reducing mobile source

emissions that are not under the direct authority of SJVAPCD are critical to attaining the standard, and the 2012 $PM_{2.5}$ Plan includes State and federal measures that will provide significant new emissions reductions in the coming years. As outlined below, the Plan's comprehensive control strategy includes regulatory actions, incentive programs, technology advancement, policy and legislative positions, public outreach, participation and communication, and additional strategies.

2015 Plan for the 1997 $PM_{2.5}$ Standard

The 2015 Plan for the 1997 $PM_{2.5}$ Standard was adopted on April 16, 2015, and addresses the EPA annual $PM_{2.5}$ standard of 15 µg/m3 as well as the EPA 24-hour $PM_{2.5}$ standard of 65 µg/m3 both of which were established in 1997. The plan's strategy focuses on attaining the standard quickly, as well as prioritizing $PM_{2.5}$ emissions that pose the most health risk to residents.

2016 Moderate Area Plan for the 2012 $PM_{2.5}$ Standard

The 2016 Moderate Area Plan for the 2012 $PM_{2.5}$ Standard was adopted by the District on September 15, 2016. This plan addresses the $PM_{2.5}$ NAAQS of 12 µg/m^3 with an attainment deadline of December 31, 2021, established in 2012. This plan demonstrates the impracticability of attainment before the deadline and requests the area be reclassified from moderate to serious nonattainment.

2018 Plan for the 1997, 2006 and 2012 $PM_{2.5}$ Standards

Adopted on November 15, 2018, the plan includes significant incentive-based control measures as well as control measures for stationary and area industrial sources. The plan also calls on CARB to act in order to achieve reductions of mobile sources.

SB 656 Particulate Matter Control Measure Implementation Schedule

Senate Bill (SB) 656 was enacted in 2003 and codified as Health and Safety Code Section 39614. SB 656 seeks to reduce exposure to PM_{10} and $PM_{2.5}$ and make further progress toward attainment of the NAAQS and CAAQS for PM_{10} and $PM_{2.5}$. SB 656 required CARB, in consultation with local air districts, to develop and adopt lists of "the most readily available, feasible, and cost-effective" particulate matter control measures. Subsequently, air districts were required to adopt implementation schedules for relevant control measures. In June 2005, the SJVAPCD adopted its SB 656 Particulate Matter Control Measure Implementation Schedule, and has adopted each relevant strategy into their rules.

SJVAPCD Rules and Regulations

The following SJVAPCD rules may be applicable to the Project:

Regulation I (General Provisions):

Rule 1160 (Emission Statements)

Rule 1160 requires owners/operators of stationary sources that emit NO_X or Reactive Organic Gases (ROG) to submit annual emission inventories. More information can be found in the Air Resources Board's "Instructions for the Emission Data System Review and Update Report" document (California Air Resources Board, 1988).

Regulation II (Permits):

Rule 2010 (Permits Required)

Rule 2010 requires, prior to construction, any newly proposed air-polluting facilities to first obtain an Authority to Construct from the Air Pollution Control Officer. Prior to operation of the new facility, the SJVAPCD also requires that any new facility obtain a Permit to Operate from the Air Pollution Control Officer. Permits to Operate must be posted and maintained on or near the source of the air pollution.

Rule 2201 (New and Modified Stationary Source Review)

Rule 2201 establishes SJVAPCD's program to limit emissions at new and modified sources so that there is no net increase in emissions within the SJVAB. Rule 2201 uses BACT and mechanisms such as emissions offsets, to ensure that AAQS are met or maintained. Criteria pollutants are regulated under this Rule, including VOC, NO_x, SO_x, PM_{10}, $PM_{2.5}$, and CO. Under Rule 2201, BACT is required if the emissions of a regulated pollutant would exceed two pounds per day. In addition, emission offsets to mitigate an increase in emissions from a new or modified stationary source would be required if the facility's emissions exceed the following amounts:

- 20,000 pounds per year of NO_x or VOC;
- 200,000 pounds per year of CO;
- 54,750 pounds per year of SO_x; or
- 29,200 pounds per year of PM_{10}.

Project equipment that would be subject to this rule includes stationary sources such as diesel engines and processing units of the aggregate plant, and stockpiles.

Rule 2280 (Portable Equipment Registration)

Rule 2280 outlines the procedure and requirements associated with the registration of portable emissions units. Sand and gravel screening, rock crushing, and RAP crushing operations are among operations eligible for registration of portable equipment, if a portable diesel-fired engine will be used to power processing equipment. Rule 2280 would be applicable to the Project if temporary construction requires equipment (such as a generator set) under Rule 2280.

Regulation III (Fees):

Regulation III contains rules related to District fees. The Project may be subject to fees related to permitting, air toxics, dust, ozone, as well as others.

Regulation IV (Prohibitions):

Rule 4001 (New Source Performance Standards)

Rule 4001 codifies the SJVAPCD's adoption and incorporation of Federal New Source Performance Standards (NSPS) as set forth in 40 CFR Part 60. NSPS apply to a variety of stationary sources, including asphalt plants and aggregate processing plants. However, this Project does not trigger the thresholds to be subject to this rule. If subject to this rule, the regulation imposes emissions standards for relevant pollutants and requires that specified

emission performance standards, control equipment, and monitoring devices be installed at all new, modified, or reconstructed facilities to limit emissions. The regulation includes test methods, monitoring, notification, and recordkeeping requirements. The aggregate plant is subject to 40 CFR Part 60, Subpart OOO, which is discussed above in Section 3.3.3.3.

Rule 4002 (National Emission Standards for Hazardous Air Pollutants)

Rule 4002 incorporates the National Emission Standards for Hazardous Air Pollutants (NESHAPs) as set forth in 40 CFR Part 61, and the NESHAPs for source categories as set forth in 40 CFR Part 63. 40 CFR Part 61 includes emission standards for several known toxic air pollutants, such as beryllium, mercury, and vinyl chloride. 40 CFR Part 63 regulates NESHAP by source categories. Both regulations also include test methods and procedures, as well as monitoring, notification, and recordkeeping requirements. These requirements would be applicable to diesel engines used by the Project.

Rule 4101 (Visible Emissions)

Rule 4101 prohibits emissions of visible air contaminants from any potential source of air contaminants. The rule prohibits air contaminants, other than water vapor, from resulting in greater than Number 1 on Ringelmann Chart (i.e., 20 percent opacity) for a combined period of more than 3 minutes of any hour.

Rule 4102 (Nuisance)

To protect the public health, Rule 4102 prohibits any person from discharging such quantities of air contaminants that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public. Odors are typically addressed under this rule.

Rule 4201 (Particulate Matter Concentration)

To protect the ambient air quality, Rule 4201 establishes a particulate matter emission standard. A release or discharge of dust, fumes, or total suspended particulate matter emissions into the atmosphere from any single-source operation may not exceed 0.1 gr/dscf. Rule 4201 includes test methodology to determine the particulate concentration in an exhaust stream.

Rule 4202 (Particulate Matter Emission Rate)

Rule 4202 limits particulate matter emissions and applies to any source operation that emits or may emit particulate matter. The rule specifies allowable emissions rates based on process weight rate calculations.

Rule 4301 (Fuel Burning Equipment)

Rule 4301 limits the emission of air contaminants from fuel burning equipment. Included in this rule are requirements that fuel burning equipment not discharge:

- Combustion contaminants exceeding 0.1 gr/dscf at 12% carbon dioxide;
- Discharge greater than 200 lbs per hour of sulfur compounds;
- Discharge greater than 140 pounds per hour of nitrogen compounds; or,

- Discharge greater than 10 pounds per hour of combustion contaminants.

Rule 4623 (Storage of Organic Liquids)

Rule 4623 limits VOC emissions from the storage of organic liquids. The rule applies to any tank of organic liquid with a capacity of 1,100 gallons or greater, and requires that such tanks include VOC control systems. The rule includes maintenance, recordkeeping, and testing requirements. However, tanks exclusively receiving and/or storing an organic liquid with a true vapor pressure (TVP) less than 0.5 pound per square inch absolute (e.g., diesel fuel, lubricating and hydraulic oils) are exempt from all other requirements of the rule except for complying with the provisions for (1) TVP and American Petroleum Institute (API) gravity testing, (2) recordkeeping, and (3) test methods.

Regulation VIII (Fugitive PM_{10} Prohibitions):

The rules under Regulation VIII are intended to reduce ambient concentrations of particulate matter (PM_{10} or larger) and were developed pursuant to EPA guidance for Serious PM_{10} Nonattainment Areas. These rules are primarily applicable to specified anthropogenic (i.e., human caused) sources. Applicability of each rule is discussed below and requirements are presented for rules that apply to the Project. Rule 8081 is omitted because it only applies to agricultural sources.

Rule 8011 (General Requirements)

Rule 8011 contains resources referenced by other rules in Regulation VIII including definitions of terms (74), exemptions (4), general requirements related to road dust controls (4), test methods for visual opacity (2) and surface stabilization (6) included as appendices to the Rule, a recordkeeping requirement, and provision allowing operators to implement a Fugitive PM_{10} Management Plan (FPMP) that is designed to achieve 50% control efficiency that has been approved by the APCO.

Rule 8021 (Construction, Demolition Excavation, Extraction, and Other Earthmoving Activities)

Rule 8021 prohibits construction, demolition, excavation, extraction, or other earthmoving activities unless the appropriate requirements are sufficiently implemented to limit visible dust emissions (VDE) to 20% opacity.

Rule 8031 (Bulk Materials)

Rule 8031 requires any facility that performs outdoor handling, storage, and transport of bulk materials to use appropriate methods as listed in Rule 8031 to limit VDE to 20 percent opacity or to comply with the conditions for a stabilized surface as defined in Rule 8011 (General Requirements). Appropriate methods to limit VDE listed in Rule 8031 include:

- Applying water or chemical/organic stabilizers/suppressants;
- Constructing and maintaining sufficient barriers to obstruct wind;
- Storing materials on stabilized surfaces; covering bulk materials with tarps, plastic, or other suitable material; limiting on-site vehicle speed;
- Loading haul trucks to limit VDE;
- Applying water on the top of loads to limit VDE;

- covering haul trucks with tarps or other covers to limit VDE; and
- Maintaining haul trucks to prevent spillage or loss of bulk materials.

Rule 8041 (Carryout and Trackout)

The purpose of Rule 8041 is to prevent or limit fugitive dust emissions from carryout and trackout on paved public roads or the paved shoulders of paved public roads. Facilities subject to Rules 8021, 8031, 8061, or 8071 must also comply with this rule. Rule 8041 requires that affected facilities prevent and/or clean up carryout and trackout at the end of each workday. Cleanup of carryout and trackout is accomplished by manually sweeping and picking up, operating a rotary brush or broom accompanied by sufficient wetting to limit VDE to 20% opacity, operating a PM_{10}-efficient street sweeper that has a pick-up efficiency of at least 80%, or flushing with water if curbs and gutters are not present and where the use of water will not result in a source of trackout material or other adverse impacts, such as a water quality violation under the National Pollutant Discharge Elimination System program. Rule 8041 requires that owners/operators of sites with paved interior roads use a trackout control device to reduce carryout and trackout. Rule 8041 prohibits the use of blower devices, dry rotary brushes, or brooms for removal of carryout and trackout on public roads.

Rule 8051 (Open Areas)

The purpose of Rule 8051 is to limit fugitive dust emissions from open areas. The rule applies to any open area having 0.5 acre or more within urban areas, or 3.0 acres or more within rural areas, and that contains at least 1,000 square feet of disturbed surface area. Whenever open areas are disturbed or vehicles are used in open areas, an owner/operator must implement one or a combination of control measures to comply with the conditions of a stabilized surface at times and to limit VDE to 20 percent opacity. Control measures to be used include applying and maintaining water or dust suppressant(s) to unvegetated areas or establishing vegetation on previously disturbed areas; or paving, applying, and maintaining gravel, or applying and maintaining chemical/organic stabilizers/suppressants. Where open areas are disturbed due to trespass, such activities should be prevented by posting “No Trespassing” signs or installing physical barriers such as fences.

Rule 8061 (Paved and Unpaved Roads)

The purpose of Rule 8061 is to limit fugitive dust emissions from paved and unpaved roads by implementing control measures and design criteria. This rule applies to any new or existing public or private paved or unpaved road, road construction project, or road modification project. Rule 8061 requires that new or modified paved roads have certain specifications based on the road’s existing or projected annual average daily trips (AADT). Requirements include minimum paved or stabilized shoulder widths, as well as curbing, intersection, and median specifications. The rule prescribes requirements for maintenance of public paved roads, including specifications for PM_{10}-efficient sweepers and road cleanup. Rule 8061 also includes requirements for unpaved road segments. Unpaved road segments with 26 or more AADT must stabilize road surfaces by application of water, chemical dust suppressant, washed gravel, or similar measures. In addition, the visible dust emissions associated with such areas is limited to 20 percent opacity. Unpaved roads with fewer than 26 AADT are exempt from some requirements of this rule.

Rule 8071 (Unpaved Vehicle/Equipment Traffic Areas)

This rule limits fugitive dust emissions from unpaved vehicle and equipment traffic areas. Unpaved vehicle and equipment traffic areas with 50 or more AADT must stabilize road surfaces by application of water, chemical dust suppressant, washed gravel, or similar measures. In addition, the visible dust emissions associated with such areas is limited to 20 percent opacity. Unpaved vehicle and equipment traffic areas with less than 50 AADT are exempt from Rule 8071.

Tulare County General Plan

The Tulare County General Plan has a number of policies for air quality. General Plan policies that apply to the Project are listed below.

Section 9.1 – Regional Perspective

Goal AQ-1: To improve air quality through a regional approach and interagency cooperation.

Policy AQ-1.1 – Cooperation with Other Agencies: The County shall cooperate with other local, regional, Federal, and State agencies in developing and implementing air quality plans to achieve State and federal Ambient Air Quality Standards. The County shall partner with the SJVAPCD, Tulare County Association of Governments (TCAG), and the California Air Resource Board to achieve better air quality conditions locally and regionally.

Policy AQ-1.2 – Cooperation with Local Jurisdictions: The County shall participate with cities, surrounding counties, and regional agencies to address cross-jurisdictional transportation and air quality issues.

Policy AQ-1.3 – Cumulative Air Quality Impacts: The County shall require development to be located, designed, and constructed in a manner that would minimize cumulative air quality impacts. Applicants shall be required to propose alternatives as part of the State CEQA process that reduce air emissions and enhance, rather than harm, the environment.

Policy AQ-1.4 – Air Quality Land Use Compatibility: The County shall evaluate the compatibility of industrial or other developments, which are likely to cause undesirable air pollution with regard to proximity to sensitive land uses, and wind direction and circulation in an effort to alleviate effects upon sensitive receptors.

Policy AQ-1.5 – California Environmental Quality Act (CEQA) Compliance: The County shall ensure that air quality impacts identified during the CEQA review process are consistently and reasonable mitigated when feasible.

Policy AQ-1.7 – Support Statewide Climate Change Solutions: The County shall monitor and support the efforts of Cal/EPA, CARB, and the SJVAPCD, under AB 32 (Health and Safety Code § 38501 et seq.), to develop a recommended list of emission reduction strategies. As appropriate, the County will evaluate each new project under the updated General Plan to determine its consistency with the emission reduction strategies.

Section 9.4 – Air Pollution Control

Goal AQ-4: To implement the best available controls and monitoring necessary to regulate air emissions.

Policy AQ-4.1 – Air Pollution Control Technology: The County shall utilize the Best Available Control Measures (BACM) and the Reasonably Available Control Measures (RACM) as adopted by the County to support SJVAPCD air quality attainment plans to achieve and maintain healthful air quality and high visibility standards. These measures shall be applied to new development approvals and permit modifications as appropriate.

Policy AQ-4.2 – Dust Suppression Measures: The County shall require developers to implement dust suppression measures during excavation, grading, and site preparation activities consistent with SJVAPCD Regulation VIII – Fugitive Dust Prohibitions. Techniques may include, but are not limited to, the following:

1. Site watering or application of dust suppressants,
2. Phasing or extension of grading operations,
3. Covering of stockpiles,
4. Suspension of grading activities during high wind periods (typically winds greater than 25 miles per hour), and
5. Re-vegetation of graded areas.

Policy AQ-4.3 – Paving or Treatment of Roadways for Reduced Air Emissions: The County shall require that all new roads be paved or treated to reduce dust generation where feasible as required by SJVAPCD Regulation VIII, Rule 8061- Paved and Unpaved Roads. For new projects with unpaved roads, funding for roadway maintenance shall be adequately addressed and secured.

Policy AQ-4.5 – Public Awareness: The County shall promote public awareness of the seriousness and extent of the existing air quality problems.

3.3.4 Significance Thresholds

3.3.4.1 Appendix G Thresholds of Significance

Significant impacts to air quality resources would occur if the Project would:

a) Conflict with or obstruct implementation of the applicable air quality plan;

b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard;

c) Expose sensitive receptors to substantial pollutant concentrations;

d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The SJVAPCD guidelines, rules and regulations that were considered in the following determinations of significance are discussed below in Section 3.3.4.2.

3.3.4.2 Additional Thresholds of Significance

The standards (such as NAAQS/CAAQS) and threshold levels (such as Reference Exposure Levels (REL) that are used for health risk assessment) are designated for each pollutant at a level where no "adverse health effect" would occur to sensitive populations. As discussed in detail in the AQCCIA, the standards and threshold levels that have been established by the regulatory agencies are extremely conservative such that compliance with these requirements result in less than a significant impact.

SJVAPCD Guidance

To assess the air quality impact using the CEQA Guidelines, the SJVAPCD has established significance threshold criteria to assist Lead Agencies in determining whether a project may have a significant air quality impact during the initial study. If the project exceeds the significance threshold criteria established for an effect, then the project would be considered to have a significant impact on air quality.

This AQCCIA was prepared using current best practices including the SJVAPCD's Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI) (SJVAPCD, 2015) and the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA, 2015). Methods or guidance provided by the San Diego Air Pollution Control District (SDPACD) was also used for determination of fugitive emissions from Quarrying. The SJVAPCD does not specify an emissions factor for material quarrying, but does include a link to the SDACPD emissions factors on the SJVAPCD website. Because quarrying was a central component of the Project, use of the quarry specific SDACPD emissions factor was determined to be appropriate. Use of SDAPCD guidelines is discussed in Section 2.4.2 of the Air Quality Report.

The SJVAPCD identifies threshold criteria that separate a project's short-term emissions from its long-term emissions. The short-term emissions are mainly related to the construction phase of a project and are recognized to be short in duration. The long-term emissions are mainly related to the activities that will occur indefinitely as a result of project operations. In addition, CEQA states that another condition that could establish a project as having a significant effect on the environment is effects that are considered "cumulatively considerable." Threshold criteria for project construction impacts, project operations, and cumulative impacts are discussed below.

SJVAPCD Rules and Regulations

SJVAPCD recommends that air quality assessments reflect emission reductions achieved through compliance with their rules and regulations. The following provides the relevant thresholds that apply to the Project and Section 3.3.2 summarizes SJVAPCD rules and regulations that may be applicable to the Project depending on the emissions quantities and the SJVAB attainment status.

Regional Impacts from Criteria Pollutant Emissions

The quantities of pollutants above which SJVAPCD believes would have a significant effect on air quality are presented in Table 3.3-7. Impacts from construction, operational non-permitted equipment and activities, and operational permitted equipment and activities are evaluated independently from one another. The threshold

criteria are applied on a calendar year basis. For construction emissions, the annual emissions are evaluated on a rolling 12-month period.

Localized Impacts from Criteria Pollutants and Toxic Air Contaminants

The thresholds of significance for Ambient Air Quality are based on the CAAQS and NAAQS. A project would be considered to have a significant impact if its emissions are predicted to cause or contribute to a violation of an ambient air quality standard by exceeding any CAAQS/NAAQS. The standards are listed above in Table 3.3-1. Significance thresholds used by SJVAPCD are presented in Table 3.3-7.

Table 3.3-7. SJVACPD Threshold Criteria for Assessing Impacts

Criteria Pollutants			
Pollutant	Construction Phase [a] (ton/yr)	Operation Phase Permit-Required [a] (ton/yr)	Operation Phase Permit-Exempt [a] (ton/yr)
CO	100	100	100
NOx	10	10	10
ROG	10	10	10
Sox	27	27	27
PM_{10}	15	15	15
$PM_{2.5}$	15	15	15
Recommended Toxic Air Contaminants (TACs), Odor Thresholds [b]			
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 20 in 1 million Chronic & Acute Hazard Index ≥ 1.0 (project increment)		
Odor	More than one confirmed complaint per year averaged over a three-year period, or three unconfirmed complaints per year averaged over a three-year period. (Screening distance is one mile for Hot Mix Asphalt (HMA) plants.)		
Ambient Air Quality Standards [c]			
Screening Criteria	100 lb/day of any criteria pollutant after implementation of mitigation measures.		
Modeling Criteria	If modeling is required because emissions exceed the screening criteria (100 lb/day), then the project would have a significant impact on an AAQS if the project concentration plus background concentration measured at the closest air monitoring station exceeds the most stringent AAQS or Significant Impact Level (SIL) in cases where background concentration already exceeds or nearly exceeds the AAQS. Determination of an AAQS exceedance would be determined based on modeling per SJVAPCD policies APR 1925 and APR 2030.		

a Based on SJVAPCD "Air Quality Thresholds of Significance – Criteria Pollutants". (San Joaquin Valley Air Pollution Control District, 2015)

b Based on SJVAPCD Website. (San Joaquin Valley Air Pollution Control District, 2012)

c Based on SJVAPCD "Guidance for Assessing and Mitigating Air Quality Impacts". (SJVAPCD, 2015)

Screening Threshold for On-Site Emissions

In addition to the CAAQS/NAAQS, the Guide for Assessing and Mitigating Air Quality Impacts (GAMAQI) contains Ambient Air Quality Screening Tools. Impacts require a detailed assessment when on-site emission increases from construction activities or operational activities exceed the 100 pounds per day (lb/day) screening level for

each criteria pollutant evaluated after implementation of enforceable mitigation measures. Under such circumstance, the SJVAPCD recommends that an ambient air quality analysis be performed. An ambient air quality analysis uses air dispersion modeling to determine if emission increases from a project will cause or contribute to a violation of the ambient air quality standards.

For stationary source projects, the GAMAQI states that on-site construction emissions, on-site operational emissions from permitted equipment and activities, and on-site operational emissions from non-permitted equipment and activities each would be screened separately by comparison the 100 lb/day threshold.

Odors

Due to the subjective nature of odor impacts, the number of variables that can influence the potential for an odor impact, and the variety of odor sources, there are no quantitative or formulaic methodologies to determine if potential odors would have a significant impact. Rather, projects must be assessed on a case-by-case basis.

SJVAPCD GAMAQI recommends that all available pertinent information should be considered in order to qualitatively determine if a significant impact is likely to occur. SJVAPCD recommends that applicable information regarding the characteristics of the odor source be disclosed. Consideration of such parameters assists in evaluating the potential for odor impacts as a result of the proposed Project.

SJVAPCD has identified some common types of facilities that have been known to produce odors in the SJVAB. These are presented in Table 3.3-8. Table 3.3-8 is used as a screening tool to qualitatively assess a project's potential to adversely affect area receptors. Aggregate mining and processing is not one of the facilities identified by the District as a potential source of significant odors; however, the table is not intended to be all inclusive.

Table 3.3-8. Screening Levels for Potential Odor Sources

Type of Facility	Distance (miles)
Wastewater Treatment Facilities	2
Sanitary Landfill	1
Transfer Station	1
Composting Facility	1
Petroleum Refinery	2
Asphalt Batch Plant	1
Chemical Manufacturing	1
Fiberglass Manufacturing	1
Painting/Coating Operations (e.g., auto body shops)	1
Food Processing Facility	1
Feed Lot/Dairy	1
Rendering Plant	1

Cumulative Impacts

By its very nature, air pollution has a cumulative impact. No single project would be sufficient in size, by itself, to result in nonattainment of the regional air quality standards. Instead, a project's emissions may be individually limited, but cumulatively considerable when taken in combination with past, present, and future development within the SJVAB.

When assessing whether there is a new significant cumulative effect, SJVAPCD recommends that whether or not the incremental effects of the project are cumulatively considerable be evaluated. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects [14 CCR § 15064(h)(1)].

If the project will comply with the requirements in a previously approved plan or mitigation program, including, but not limited to an air quality attainment or maintenance plan that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located, then the project's incremental contribution to a cumulative effect is not cumulatively considerable (CEQA Guidelines §15064(h)(3)).

Cumulative Impacts Associated with Criteria Pollutants from Permitted Sources

SJVAPCD's attainment plans demonstrate that project-specific net emissions increase below NSR offset requirements will not prevent the District from achieving attainment. Consequently, emission impacts from sources permitted consistent with NSR requirements are not individually significant and are not cumulatively significant.

Cumulative Impacts Associated with Criteria Pollutants from Non-Permitted Sources

When determining cumulative significance, air quality impacts from all non-permitted equipment and activities emissions sources are to be considered when determining if project-specific emissions impacts would be individually significant. The SJVAPCD concludes that when activities and emissions from non-permitted sources are individually significant, they are also cumulatively significant.

Cumulative Impacts Associated with Toxic Air Contaminants

Impacts from TACs are localized impacts. SJVAPCD has established thresholds of significance for TACs that are extremely conservative and protective of health impacts on sensitive receptors. Because impacts from TACs are localized and the thresholds of significance for TACs have been established at such a conservative level, risks over the individual thresholds of significance are also considered cumulatively significant. No other cumulative risk thresholds apply.

3.3.5 Methodology of Analysis

Guidelines and emissions thresholds established by the SJVAPCD in the GAMAQI (SJVAPCD, 2015) are used to assess impacts in this AQCCIA. The SJVAPCD also requires evaluation of cumulative air quality impacts, which are further discussed in Section 3.3.7.

3.3.5.1 Assumptions and Project Design Features

The impact assessment incorporated the following general assumptions:

- The excavation and associated equipment would operate in compliance with applicable air quality regulations.
    - Authorities to Construct and Permits to Operate would be obtained from the SJVAPCD for the portable crush/recycle and wash/screen plants at which time the equipment would be required to utilize Best Available Control Technology (BACT). It is anticipated that the plant would be equipped with water sprays at key emissions points.
    - Diesel engines would comply with applicable State regulations (i.e., air toxic control measures (ATCM)). This includes labeling of off-road equipment with registration numbers assigned by CARB, establishment of an idling policy, and limiting idle time to less than five minutes (13 CCR §2449).
    - A fugitive emission control plan would be implemented to comply with SJVAPCD Regulation VIII, "Fugitive PM_{10} Prohibition" and would include the following measures:
        i. The area to be excavated will be irrigated or sprayed by water trucks when visible dust is observed during excavation activities.
        ii. A water truck will be utilized to wet down the haul road from the excavation to the plant site as necessary to meet SJVAPCD fugitive dust requirements.
        iii. Records demonstrating compliance with fugitive dust requirements will be maintained for those days that a control measure was implemented and include the type of control measure(s) used, the location and extent of coverage, the date, the amount, and frequency of dust suppressant applied (Rule 8011, Section 6.2).
        iv. Limit visible dust emissions to 20 percent opacity for a period or periods aggregating more than three (3) minutes in any one (1) hour and comply with the conditions for stabilized surface areas (Rule 8021, Section 5.0; Rule 8031, Section 5.0).
        v. Stabilize disturbed areas that are greater than 0.5 acres in size and which remain inactive for seven (7) days (Rule 8021, Section 5.2).
        vi. Stabilize stockpile surfaces (Rule 8031, Section 5.0).
        vii. Maintain a stabilized surface on the unpaved haul road (Rule 8021, Section 5.2).
        viii. During high wind conditions, cease excavation and other earthmoving activities that disturb the soil whenever visible dust emissions exceed 20 percent opacity. Continue operation of water trucks/control devices when activities cease, unless unsafe to do so. (Rule 8021, Section 5.4).

ix. Prevent unauthorized vehicle disturbance of open areas by posting signs or installing physical barriers such as fences, gates, posts, and/or other appropriate barriers to effectively prevent access to the area(s) (Rule 8051, Section 5.0).

- The portable crush/recycle plant / diesel generator would be eligible registration in the CARB Portable Equipment Registration Program (PERP).

- The Project is located in Tulare County, which is among the counties listed as containing serpentine and ultramafic rock (OPR, 2000). However, the Project site is located on an alluvial deposit which does not contain serpentine or ultramafic rock and no NOA has been found on the Project site or in the vicinity of the Project.

- The Project would not store hazardous substances or acutely hazardous substances in quantities that would be subject to chemical accident prevention provisions of the CAA or the implementing regulation (40 CFR Part 68).

- Electricity is currently provided to the Project site by Southern California Edison (SCE).

Project Design Features

Project design features are aspects/activities of the Project that are already included in the design of the Project and will be implemented. The impact assessment incorporated the following Project design features:

- The Project will be managed such that there will be no increase in the production rate of aggregates from the baseline level. Therefore, the number of trucks traveling offsite on public roads will not increase from baseline.
- The Project will be managed so that when recycling and/or blending activities were taking place, the excavation and processing of aggregated would be reduced such that the total emissions associated with excavation/processing of aggregate combined with the emissions associated with the transport and processing/blending of recycled materials and additives would not result in an increase to baseline.
- The number of employees will not exceed the number of employees required for previous aggregate operations (baseline).
- The number of delivery and other non-aggregate trucks would be included in the total number of trucks coming/going from the site such that the total number of trucks would not exceed baseline.
- A slurry wall would be constructed as early as feasible during the excavation phase of the Project, to facilitate dry mining techniques.
- Activities associated with the Project will comply with all applicable rules and regulations.

3.3.5.2 Emissions Calculations Methodologies

Emissions from combustion and dust sources associated with the Project including on- and non-road diesel engines, light duty truck gasoline engines, excavation/grading activities, aggregates processing, crushing and recycling of aggregates products, stockpile/loadout areas, travel on Project roads, and wind erosion of stockpile areas are calculated in the AQCCIA (Appendix C).

3.3.5.3 CEQA Baseline

In the past, mining has occurred on the adjacent Seaborn site. The emissions resulting from the mining activities on the Seaborn site are considered the baseline emissions to which the Project emissions were compared. As required by CEQA, the net change (increment) between the baseline and the Project is what was evaluated in this AQCCIA to identify potential impacts associated with the Project. The determination of Baseline using emissions that occurred on adjacent facilities in the vicinity of the Project is consistent with previously certified environmental analysis, such as the San Emidio Quarry Expansion Project DEIR and the Kaweah South DEIR.

Due to the cyclical nature of the aggregates industry, an appropriate average baseline must consider a historical time period sufficient to encompass the spectrum of macro-economic conditions that may have affected the operation.

Data provided by the Seaborn site mining operator showed that between 1997 to 2006, the Seaborn facility processing plant was operating at an estimated average of 500,000 tons per year average and 650,000 tons per year maximum. A Notice of Preparation (NOP) was issued on January 27, 2014, (Tulare Irrigation District, 2014) which marks the start of environmental analysis for the Project. Therefore, the chosen Baseline period ends approximately 8 years before the start of analysis. Baseline is discussed in detail in Section 3.3.5 and in the AQCCIA located in Appendix C. Table 3.3-9 presents the equipment associated with baseline excavation.

Based on communications with the Seaborn site operators, the baseline number of employees was 7 to 12 and the equipment used was the standard equipment typically used for aggregate excavation and operations.

The Project would have either the same or less employees and would use the same standard aggregate mining equipment as at the Seaborn site (baseline). Because the Project would be managed such that the aggregate production rate at the processing plant would not increase above baseline levels, the number of trips by on-road haul trucks delivering product to the market would not change from baseline levels. For the purposes of this analysis, the average annual production rate (500,000 tpy) was used to calculate the baseline emissions.

Baseline for Non-Road Engines

Baseline haul distance from the excavation to the processing plant was assumed to be 0.3 miles. This average trip length is half of the longest haul path on the Seaborn site. Loader, excavator and haul truck activity levels were based on haul distance and cycle time analysis. The skid steer, telehandler, de-watering pumps, and water truck(s) were assumed to have fixed operational hours. Baseline equipment activity is summarized in Table 3.3-9.

Table 3.3-9. Baseline Equipment and Activity for Excavation

Equipment	HP	Annual Operating Hours	Max Daily Operating Hours
988 Loader	540	502	14
982 Loader	400	502	14
980 Loader	390	502	14
390 Excavator	530	511	14
Two Haul Trucks	600	1044	14
Skid Steer	65	626	2
Telehandler/Aerial Lift	402	626	2
Water Truck	402	2503	14
Recycle Generator Set	1015	148	14

Source: AQCCIA, Sespe 2021.

Excavation equipment emission factors in the baseline were obtained from the CalEEMod Appendix D Table 3.4: Off-road Emissions Factors for the year 2005. Average annual emissions in the baseline are summarized in Table 3.3-10.

Table 3.3-10. Excavation Exhaust Emissions During the Baseline Period

Period	Units	ROG	CO	NO_X	SO_2	PM_{10} (diesel)	$PM_{2.5}$ (diesel)
Annual	Tons	1.7	6.1	17.5	0.13	0.67	0.67
Max Daily	Pounds	43.7	163.1	457.1	3.24	16.63	16.63
Max Hourly	Pounds	3.2	12.0	33.3	0.24	1.24	1.24

Source: AQCCIA, Sespe 2021.

Baseline for On-Road Engines

The amount of material produced by the Project would remain unchanged from the baseline level. Thus, the number of on road haul trucks and associated emissions would not increase above baseline levels.

In general, diesel engine emissions from all modes of operation decrease in the future due to phase-in of CARB engine regulations; therefore, Project haul trucks and other vehicles/equipment using diesel would emit less emissions than those used in the baseline. This primarily affects cancer risk, which is a multi-year impact.

Baseline Emissions Summary

Table 3.3-11 presents baseline emissions for each emissions source associated with the baseline activity. Sources are broken out into two categories, stationary sources and permit exempt sources. PM_{10} and $PM_{2.5}$ emissions in Table 3.3-11 include both fugitive emissions and engine exhaust emissions. Plant based emissions consist of fugitive dust from material unloading, material transfers, screening, and crushing. Aggregates storage emissions consist of fugitive dust emissions from stockpiles. Excavation fugitive emissions are a result of the quarrying process undertaken by mobile equipment.

Table 3.3-11. Baseline Annual Emissions Summary

Baseline Emissions (tons/yr)							
		ROG	**CO**	**NO_X**	**SO_2**	**PM_{10} Total**	**$PM_{2.5}$ Total**
Stationary Sources	Recycle Plant Fugitive Ems.	--	--	--	--	0.12	0.03
	Recycle Engine	0.12	0.45	1.26	0.0084	0.04	0.04
	Aggregates Plant Fugitive Ems.	--	--	--	--	0.03	0.01
	Aggregates Storage Fugitive Ems.	--	--	--	--	0.38	0.11
Permit Exempt Sources	Excavation Mobile Equipment Fugitive Ems.	--	--	--	--	7.5	2.2
	Excavation Off-road Mobile Equipment Engines	0.86	3.21	8.74	0.06	0.34	0.34
	Aggregates Transfer/Drops from Mobile Equipment, Fugitive Emissions	--	--	--	--	0.62	0.18
	Off-Road Vehicle Haul	0.72	2.48	7.49	0.055	5.6	1.4
	Total Emissions	**1.7**	**6.1**	**17.5**	**0.1**	**14.6**	**4.3**

-- indicates no emissions of certain criteria pollutants as the emissions are fugitive dust

3.3.5.4 Project Construction Activity Emissions Calculations

The majority of construction activities would take place after the excavation phase is completed and would involve the construction of the reservoir. However, some minor construction activities would take place prior to the excavation phase, such as the installation of the security fence. Because emissions associated with construction activities are typically short term, they are calculated differently than long term activities; therefore, the approach to estimating construction emissions are discussed together in the AQCCIA. The construction activities that are considered short term include building the following activities:

a) Installation of the Project site security features and on-site construction office (prefabricated trailer) including an access gate and perimeter road.

b) Installation of the reservoir inflow channel consisting of a weir, chute, and dissipation pool and Outflow Channel consisting of a weir each requires an excavator, backhoe, water truck, loader, compactor, cement trucks, cement pumps, and cranes.

c) Installation of the reservoir generator building and floating barge pump, including an aboveground diesel tank, would require an excavator, water truck, backhoe, compactor, trencher and cement trucks.

Combustion emission sources during the construction of the reservoir consist of off-road mobile and portable diesel fueled equipment. The off-road equipment emissions were calculated using emissions factors in Appendix D of the CalEEMod User's Guide.

Project Site Security Features and Onsite Office

Zero emissions are assessed for installation of site security fence and the on-site office (which is assumed to be prefabricated) because emissions from these activities are negligible.

Reservoir Inflow and Outflow Channels

The inflow and outflow structures will require excavation and grading to prepare the sites for form installation. These structures are assumed to be constructed using the average units in the 2025 off-road fleet. Inflow/outflow grading consists of clearing and grubbing of approximately 3 acres, excavation of 20,000 cubic yards, and the placement of approximately 9,000 cubic yards of rip-rap. Excavated soils are assumed to be spread onsite.
Table 3.3-12 lists the approximate equipment activity levels for grading.

Table 3.3-12. In/Out-Flow Grading

Description	Equipment	HP	Rate	Quantity	# of 8 hour Days
Clear and Grub, Haul Roads	Dozer	165	1 hr/ac	3 ac	1
Canal Excavation and Spreading	Tractor	530	15 cy/load	20,000 cy @ 3 load/hr	56
Final Shaping of Canal	Grader	200	0.5 hr/ac	3 ac	1
Placing of Rip-Rap	Excavator	184	1 cy/bucket	9,000 cy @ 20 bucket/hr	56

Construction of the in/out-flow building would consist of finish grading and minor excavation of approximately 600 cubic yards and the placement of approximately 1,100 cubic yards of concrete. Excavated soils are assumed to be spread onsite. Table 3.3-13 lists the approximate equipment activity levels for construction.

Table 3.3-13. In/Out-Flow Building

3.3.5.5 Project Construction Phase Emissions Summary

Construction emissions were determined using CalEEMod User Guide version 2016.3.2. In order to account for various potential construction timelines, construction activities were assumed to take place within the same year. This assumption is conservative, as the Project is likely to spread out construction activities, reducing annual emissions from the estimate made in this analysis. Table 3.3-15 presents emissions from off-road equipment, fugitive dust, and worker trips during the construction phase of the Project.

Table 3.3-15. Project Construction Emissions

Activity	ROG (tpy)	CO (tpy)	NO_X (tpy)	SO_2 (tpy)	PM_{10} (tpy)	$PM_{2.5}$ (tpy)
Project Construction	0.048	0.29	0.49	0.001	0.022	0.018

3.3.5.6 Project Excavation Phase Emissions

Excavation is expected to occur for approximately twenty-three years. For the purposes of this analysis the maximum annual production rate (920,000 tons gross, 650,000 tons net) was assumed to occur in the first year of the project. Slurry wall installation is also assumed to take place at the beginning of the Excavation Phase, and is expected to take 1 year. By modeling the maximum year and slurry wall installation in the first year of The Excavation Phase, the model is conservative, as modeled receptors are assumed to be infants and more sensitive to emissions. The average year (720,000 tons gross, 500,000 tons net) was modeled for every year after the first year.

Slurry Wall

The slurry wall will be designed by a qualified professional and installed by a qualified contractor. Slurry wall installation includes the following activities:

- Creation of a perimeter access road that would also serve as a leveling surface for the construction of the slurry wall.
- Creation of an approximately 60- to 80-foot-deep slurry wall surrounding the excavation/Reservoir area. Its actual depth will be determined during design and verified during construction based on subsurface information, to provide the required reduction in groundwater inflow.
- An approximately 5-foot-deep water infiltration trench along the northern border of the ultimate Reservoir area.

It is anticipated construction would take approximately 6 months and would include the following on-site facilities. After completion of the slurry wall these facilities would be demobilized from the site:

- Vehicle and equipment parking areas.
- A fill material stockpile area.
- Equipment storage area.
- A bentonite slurry mixing pond (see further discussion below on the slurry wall construction activities).
- A slurry wall backfill mixing area that would be moved along with the construction of the slurry wall so it is always adjacent to the segment being excavated.

The general sequence of slurry wall construction activities would include:

- Surface clearing, grading, and filling to create a sufficiently long section of the perimeter road.
- Excavation of the slurry wall trench through the road which also provides a relatively level surface to contain the slurry in the excavation. The trench is first excavated to its full depth and then extended in length.
- Filling the trench with a bentonite slurry (bentonite clay and water mix) to support the sides of the excavation and prevent them from collapsing. The bentonite slurry is mixed in the above referenced bentonite slurry mix pond and pumped by pipeline into the excavated trench.
- The excavated soils from the trench are placed in an adjacent prepared slurry wall backfill mixing area for use in preparing the backfill, or if unsuitable for hauling the soil back to the West Coast Sand and Gravel's (WCSG's) operations for processing as appropriate.
- As the trench is extended in length, backfilling is commenced. This is accomplished by first preparing the backfill material which typically includes granular soils mixed in with bentonite and water to create a low permeability material in the slurry wall backfill mixing area. Suitable excavated granular material will be used, or more suitable material will be obtained from the WCSG operations or imported from offsite.
- Once mixed, the backfill is pushed into the trench by a dozer, or equivalent, from the narrow end, opposite to the end of the trench that is still being excavated. The backfill materials displaces the bentonite slurry in

the trench and eventually settles and forms a low permeability wall. The ultimate length of the slurry wall is approximately 13,400-feet and its width is typically 3-feet.

- As the wall is completed and gravel cap is placed over the top of the backfilled trench, it will form part of the perimeter road.
- A road safety berm will also be constructed along the inside of the road facing the excavation area.
- As the excavation of the reservoir is deepened an access ramp will be constructed in the excavated slope to provide for equipment access.

It should be noted the above discussion is for illustration purposes and actual construction techniques will vary based on the approved means and methods the contractor selects, and possible future technology advances in slurry wall construction.

In summary, slurry wall installation consists of clearing and grubbing approximately 26 acres, excavating approximately 112,000 cubic yards of native soil, and pouring of the slurry wall into the excavated trench. For the purposes of this analysis, soil excavated and transported for the slurry wall construction would be considered part of the total excavated material, such that the average site tonnage excavated (including slurry wall excavation) does not exceed Baseline levels in the max year. Slurry wall materials imported to the site would substitute for exported material such that haul truck activity on-site and off-site would also not increase above Baseline levels. Table 3.3-16 lists the approximate equipment activity levels for construction.

Table 3.3-16. Slurry Wall Excavation and Installation

Description	Equipment	HP	Rate	Quantity	# of 8 hour Days
Clear/Grub, Haul Road, Construction Ponds	Dozer	165	1 hr/ac	26 ac	4

Source: Provost & Pritchard Consulting Group, 9/15/2014 (Appendix C).

Project Excavation Activity

Excavation activity would be limited to historical levels in the baseline. Accordingly, dust emissions related to excavation would not increase. However, the excavation emissions would change locations and have been calculated for inclusion in the HRA.

Non-Road Engines

Table 3.3-17 presents the size, type and hours of operation for equipment that would be involved in excavating the reservoir.

Table 3.3-17. Excavation Equipment

Equipment	HP	Operating Hours per Year	Max Daily Operating Hours
988 Loader	540	502	14
982 Loader	400	502	14
980 Loader	390	502	14
390 Excavator	530	511	14
Haul Truck	600	1044	14
Haul Truck	600	1044	14
Dewatering Pump	30	3754	12
Dewatering Pump	30	3754	12
Skid Steer	65	626	2
Telehandler/Aerial Lift	402	626	2
Water Truck	402	2503	14

Source: AQCCIA, Sespe 2021.

Annual hours of operation for the loaders, excavator, and haul trucks were determined based upon cycle time analysis using methods in the Caterpillar Performance Handbook (Appendix C).

The skid steer, telehandler, water trucks and dewatering pumps were assumed to have fixed operational hours. Up to two portable pumps, with 30 hp diesel engines, would be used to dewater the excavations. The pumps would operate continuously to keep the excavation dry.

On-Road Engines

The amount of material produced by the Project would remain unchanged from the Baseline level. Thus, off-site travel activity levels and associated emissions would be unaffected by the Project. Emissions from engines in trucks traveling on-site to export and import materials were calculated and incorporated into the HRA.

The number of employees would remain unchanged from Baseline condition with the Project. In general, diesel engine emissions from all modes of operation decrease in the future due to phase-in of CARB engine regulations. This primarily affects cancer risk which is a multi-year impact.

Excavation Phase Aggregates Processing Plant

The aggregates processing plant emission rate were calculated for both the aggregate screen/wash plant and crush/recycle plant. The screen/wash plant consists mostly of wet screening and material handling, and therefore only has fugitive emissions associated with dry feed materials. The wash/screen plant is run on grid electricity. The crush/recycle plant would be run using a portable diesel generator, and the associated fugitive and engine emissions were calculated for incorporation in the HRA.

Excavation Phase Stockpile/Loadout Area

The stockpile area would not increase from baseline levels with the Project. Emissions from a stockpile area two (2) acres in size was attributed to the stockpile area at the Seaborn site in the baseline and for the Project. Emissions were calculated using the emissions factor and control efficiency recommended in Stationary Source Policy 1610 (SJVAPCD, 2013).

Excavation Phase Travel on On-site Roads

Emissions from travel on roads within the Project site and the Seaborn site depend upon the number of trips, length of the road, weight and speed of the vehicle and road surface condition.

Road lengths in the baseline at the Seaborn site were determined based on aerial photography on Google Earth taken during the baseline period. Half of the longest haul path was chosen as a representative road length in the baseline. Similarly, half of the longest haul path on the Project site was chosen as the average haul trip for the purposes of this analysis.

Excavation Phase Emissions Summary

For emissions calculations, the Project is assumed to operate within the annual maximum production rate of 650,000 tons/year for the first year, and then the average production rate 500,000 tons/year for the following 22 years. Although the length of the excavation phase would be between 15 to 23 years, the actual length of this phase of the Project is dependent on the amount of high-quality aggregate is located in the pit area and the market demand. For the emission calculations it was assumed that it would take 23 years for the excavation of the pit for the reservoir to be completed. Assuming 30 percent waste factor, the maximum amount of material that would be excavated is approximately 920,000 gross tons/year. In order to conservatively model air quality impact, the maximum excavation rate is assessed in the first year, concurrently with the installation of the slurry wall. Excavation maximum annual emissions are shown in Table 3.3-18 and Table 3.3-19 respectively.

3.3.5.7 Project Operation Phase Emissions

The following assumes that on average the proposed basin could be filled two times per year for a total usable yearly volume of 9,100 acres-feet. Approximately 3,580 acres-feet can flow by gravity into the St. Johns River and the remaining 5,520 acres-feet can be pumped out at a maximum flow rate of 160 cubic feet per second. Table 3.3-20 lists the approximate equipment activity levels for operations and Table 3.3-21 shows the emissions associated with the Project operation phase.

3.3.5.8 Health Risk Assessment

A HRA was performed using current best practices including methods from the HRA Guidelines (OEHHA, 2015). The four steps involved in the risk assessment process are: 1) hazard identification, 2) exposure assessment, 3) dose-response assessment, and 4) risk characterization. These four steps were used to assess health risk for the Project and each step is discussed below.

Hazard Identification and Quantification

For air toxics sources, hazard identification involves the pollutant(s) of concern emitted by a facility, and the types of adverse health effects associated with exposure to the chemical(s), including whether a pollutant is a potential human carcinogen or is associated with other types of adverse health effects. Appendix A of the HRA Guidelines (OEHHA, 2015) includes a list of TACs that are used for HRA in California.

DPM is the primary toxic constituent emitted by mining projects. DPM has an assigned cancer potency factor (CPF) and a non-cancer reference exposure level (REL) that are used to evaluate the risk from the DPM concentration present.

Fugitive emissions were generally speciated into constituent TACs based on SJVAPCD speciation profiles. San Diego Air Pollution Control District (SDAPCD) speciation profiles were also used when speciation data was not available from SJVACPD. The resulting mass of each TAC was used as input along with the dispersion coefficients to predict the ground level concentration (GLC) of each TAC which could then be used to evaluate the dose received by each receptor along each exposure pathway and, in the case of non-cancer risk, on each target organ, which was performed using HARP2 as discussed in the following subsections.

TACs incorporated in the HRA can be found in Table 3.3-22. Specific speciation profiles for road-based emissions, aggregates processing emissions, storage emissions, and excavation emissions can be found in Appendix C. Diesel emissions were evaluated for diesel particulate matter.

Table 3.3-22. Toxic Air Contaminants Incorporated in HRA

CAS	Chemical Name
7429905	Aluminum
7440382	Arsenic
7440393	Barium
7440417	Beryllium
7440439	Cadmium
18540299	Hexavalent Chromium
7440473	Chromium
7440484	Cobalt
7440508	Copper
7439921	Lead

7782492	Selenium
1175	Silica, Crystalline
7440666	Zinc

Source: AQCCIA Sespe, 2021.

The HRA considered whether health risk from asbestos should be quantified. It was determined based on review of available maps (California Department of Conservation, Division of Mines and Geology, 2000) and language in the Asbestos ATCM's (17CCR §93105 and §93106) that allows the APCO to exempt sand and gravel facilities operating in alluvial deposits, that asbestos is unlikely to exist within, or upstream from, the Project site. Therefore, asbestos was excluded from the HRA.

Exposure Assessment

The purpose of exposure assessment is to estimate the extent of public exposure to emitted substances. For the Hot Spots program, in practice this means estimating exposures for those emitted substances for which potential cancer risk or noncancer health hazards for acute, repeated 8-hour, and chronic exposures will be evaluated. This involves emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels.

Hot Spots Analysis and Reporting Program (HARP2) software developed by CARB can be used to model ground level concentrations at specific off-site locations. HARP2 incorporates the US EPA-approved dispersion model, American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD). AERMOD is a steady-state plume model based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. CARB recommends AERMOD for Hot Spots risk assessments (OEHHA, 2015).

In this HRA, the air dispersion modeling was performed separately from HARP2 using AERMOD View by Lakes Environmental, Version 10.0.1 running AERMOD executable Version 2112. Output from the Lakes software program were imported to HARP2 (dated 21081) which was then used to perform the risk characterization portion of the HRA.

The process of using air dispersion modeling results as the basis of HRA follows these four steps:

1. Air dispersion modeling is used to estimate annual average and maximum one-hour ground level concentrations (GLC). The air dispersion modeling results are expressed as an air concentration or in terms of (Chi over Q) for each receptor point. (Chi over Q) is the modeled downwind air concentration (Chi) based on an emission rate of one gram per second (Q). (Chi over Q) is expressed in units of micrograms per cubic meter per gram per second, or $(\mu g/m^3)/(g/s)$. (Chi over Q) is sometimes written as (X/Q) and is sometimes referred to as the dilution factor.

2. When multiple substances are evaluated, the X/Q is normally utilized since it is based on an emission rate of one gram per second. The X/Q at the receptor point of interest is multiplied by the substance-specific emission rate (in g/s) to yield the substance-specific GLC in units of $\mu g/m^3$. The following equations illustrate this point.

   $$GLC = \left(\frac{X}{Q}\right) \times Q_{Substance}$$

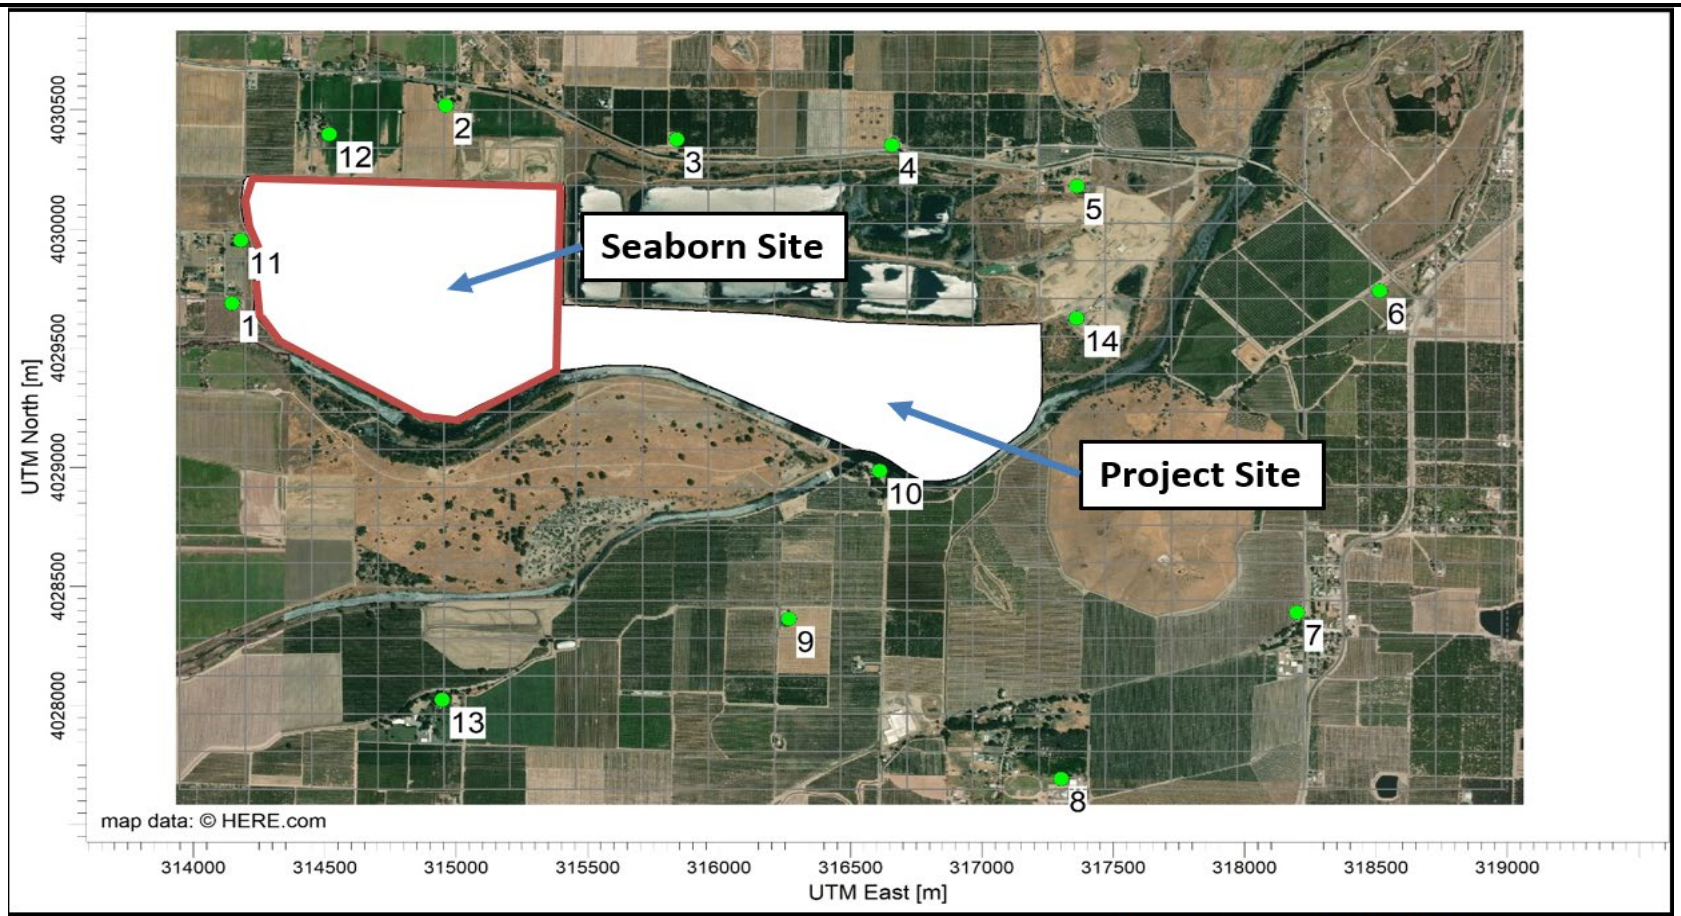
   $$\frac{X}{Q} = (Chi\ over\ Q)\ in\ \left(\frac{\mu g/m^3}{g/s}\right), from\ model\ results\ with\ unit\ emission\ rate$$

   $$Q_{Substance} = substance\ emission\ rate\ \left(g/s\right)$$

3. The applicable exposure pathways (e.g., inhalation, soil contact, fish consumption) are identified for the emitted substances, and the receptor locations are identified. This determines which exposure algorithms are ultimately used to estimate dose. After the exposure pathways are identified, the fate and transport algorithms are used to estimate concentrations in the applicable exposure media (e.g., soil or water) and the exposure algorithms are used to determine the substance-specific dose.

4. The dose is used with cancer and noncancer health values to calculate the potential health impacts for the receptor. An example calculation using the high-end point-estimates for the inhalation (breathing) exposure pathway can be found in Appendix I of the HRA Guidelines (OEHHA, 2015).

AERMOD was used as described above to calculate a X/Q for each source-receptor combination by setting the emission rate for each source in the model to one gram per second (1 g/s). Other parameters used in AERMOD describe overall control of the model domain and functionality (e.g., coordinate system, terrain, non-default options, etc.), receptors (e.g., location, height), sources (e.g., size, location, exhaust velocity, temperature, operating schedule), meteorology (files provided by SJVAPCD), and output file options.



The Control Pathway of AERMOD was set to provide output in units of concentration; and both wet and dry plume depletion were disabled. The non-regulatory default option of flat terrain was selected as well as the beta option "Adjusted Friction Velocity (u*) in AERMET (ADJ_U*)" as discussed above. Pollutant/averaging options were set to PM_{10} with averaging times of 1-hour and the period of the meteorological data file (i.e., five years). The rural dispersion coefficient was used and exponential decay was excluded.

Receptors were modeled at a flagpole height of 1.5 meters (m). Fourteen (14) discrete receptors (actual structures/residences), 441 grid receptors (location obtained from overlaying a grid on the Project area), and 179 boundary receptors (points along the boundary of the Project site) were modeled for a total of 634 receptors. The discrete receptors are shown on Figure 3.3-1 and listed in Table 3.3-23.

Figure 3.3-3 Project Site Model Sources

THIS PAGE IS INTENTIONALLY BLANK

Sources that existed during the baseline period and those proposed by the Project are illustrated on Figure 3.3-2 and Figure 3.3-3. Project and baseline sources were included in the model. Project sources were assigned positive emissions values and baseline sources were assigned negative values so that the HRA result represent the change in health risk with the Project.

A wind rose showing the frequency of direction and speed of wind at the Visalia Airport (2007 through 2010) was produced from wind data obtained from the SJVAPCD website (Figure 3.3-6). The U-star adjusted (ADJ_U*) wind data file was chosen from the SJVAPCD website for the Project because it is a mining project and similar to the project discussed in the EPA Memo on this topic (EPA, 2016). Visalia Airport (Station No. 93144) is about 19 miles west-southwest of the Project.

Output of the dispersion model in the form of plotfiles, one for each combination of source and averaging period, that contain X/Q values were then used in HARP2 with the emissions rates presented above and other human exposure parameters discussed below to predict the acute, non-cancer chronic, and cancer risk at each receptor. The modeling files are provided in the AQCCIA.

Once emissions exit the source, the substances emitted will be dispersed in the air. The emission plume may contain both vapor phase substances and particulates. A semivolatile organic toxicant can partition into both vapor and particulate phases. Particulates can deposit on vegetation, on soil, and in water at a rate that is dependent on the particle size. A deposition rate of 0.05 m/s is conservative and was used for the Project HRA. The following algorithms are used to estimate concentrations in environmental media including air, soil, water, vegetation, and animal products.

Once emissions exit the source, the substances emitted will be dispersed in the air. The emission plume may contain both vapor phase substances and particulates. A semivolatile organic toxicant can partition into both vapor and particulate phases. Particulates can deposit on vegetation, on soil, and in water at a rate that is dependent on the particle size. A deposition rate of 0.05 m/s is conservative and was used for the HRA (located in the AQCCIA). The following algorithms are used to estimate concentrations in environmental media including air, soil, water, vegetation, and animal products.

Determination of the concentration in air is made using X/Q and the emissions rate (g/s) as discussed above. The concentration of the substance in soil (Cs) is a function of the deposition, accumulation period, chemical specific soil half-life, mixing depth, and soil bulk density. For simplicity and health protection, the Tier 1 default assumes 70-year soil deposition for the accumulation period at end of 70-year facility lifetime. The water pathway is evaluated as if a standing water body (e.g., pond or lake) is impacted by facility emissions and is used as a source for drinking water by food-producing animals or humans, or is a source of angler-caught fish. The average concentration of the substance in water (Cw) is a function of direct deposition (material carried in by surface run-off may occur as well but is not modeled). Concentrations in vegetation, animal products, angler caught fish, and mother's milk are predicated on the concentrations estimate to be in the air, water, and soil. The Project HRA includes air, soil ingestion, home grown produce, and mother's milk as pathways of exposure. Detailed discussion of the

methodologies used to determine the concentrations in various media to which receptors may be exposed is located in Subchapter 5.3 of the HRA Guidelines (OEHHA, 2015).

THIS PAGE IS INTENTIONALLY BLANK

Once the concentrations of substances are estimated in air, soil, water, plants, and animal products, they are used to evaluate estimated exposure to people. Exposure is evaluated by calculating the daily dose in milligrams per kilogram body weight per day (mg/kg/d). The HRA Guidelines describe the algorithms used by HARP2 to calculate this dose for exposure through inhalation, dermal absorption, and ingestion pathways. All chemicals are assessed for exposure through inhalation. Emissions of semi-or non-volatile multi-pathway substances (e.g., earth metals in fugitive dust), the soil ingestion pathway and the dermal soil exposure pathway are also assessed. The mother's milk pathway is used depending on the multi-pathway substance released. The HRA assessed each of these pathways, as discussed in detail in the AQCCIA.

Risk Characterization

Risk characterization is the final step of the HRA. In this step, information developed through the exposure assessment is combined with information from the dose-response assessment to characterize risks to the general public from emissions. In the California, OEHHA conducts the dose-response assessment during the development of cancer potency factors and Reference Exposure Levels (REL). These are used in conjunction with the exposure estimates to estimate cancer risk and evaluate hazard from noncancer toxicity of emitted chemicals. Under AB2588, risk characterizations present both individual and population-wide health risks. A general summary of the risk characterization components includes the following items and information.

- The locations of the point of maximum impact (PMI), the maximum exposed individual receptor (MEIR), and the maximum exposed individual worker (MEIW) are to be identified. The PMI, MEIW, and MEIR for cancer risk and for noncancer hazard indices (averaging times for acute 1-hour, repeated 8-hour, and chronic hazard indices) may not be the same location; all should be identified.
- The location of any specified sensitive receptors (e.g., schools, hospitals, daycare, or eldercare facilities) should be identified.
- Estimates of population-wide cancer risk and noncancer hazard.

Cancer Risk

Cancer risk is calculated by multiplying the daily inhalation or oral dose, by a cancer potency factor, the age sensitivity factor, the frequency of time spent at home (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk. As described below, the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk at the receptor location. A brief description of the age sensitivity factors, exposure duration, and frequency of time spent at home are included below. These factors are discussed in various technical support documents to the HRA Guidelines (OEHHA, 2015).

OEHHA has determined that young animals are more sensitive than adult animals to exposure to many carcinogens. Therefore, OEHHA developed age sensitivity factors (ASFs) to take into account the increased sensitivity to carcinogens during early-in-life exposure. In the absence of chemical-specific data, OEHHA

recommends a default ASF of 10 for the third trimester to age 2 years, and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood. These values manifest in the intake parameters presented below.

Fraction of time spent at home (FAH) during the day can be used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposures to the facility's emissions are not occurring away from home. From the third trimester to age <2 years, 85% of time is spent at home. From age 2 through <16 years, 72% of time is spent at home. From age 16 years and greater, 73% of time is spent at home. Facilities with a school within the 1×10^{-6} (or greater) isopleth are directed to use FAH = 1 for the child age groups (3rd Trimester, 0<2 years, and 2<16 years).

For residential inhalation exposure, cancer risk must be separately calculated for specified age groups because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure. The following equation illustrates the formula for calculating residential inhalation cancer risk.

$$RISK_{inh-res} = DOSE_{air} \times CPF \times ASF \times \frac{ED}{AT} \times FAH$$

Where:

$RISK_{inh-res}$ = Residential inhalation cancer risk
$DOSE_{air}$ = Daily inhalation dose (mg/kg-day)
CPF = Cancer potency factor $(mg/kg\text{-}day)^{-1}$
ASF = Age sensitivity factor for a specified age group (unitless)
ED = Exposure duration (in years) for a specified age group
AT = Averaging time for lifetime cancer risk (years)
FAH = Fraction of time spent at home (unitless)

Cancer risks calculated for individual age groups are summed to estimate the total cancer risk over the period of interest and/or lifetime. Cancer risk is typically expressed in "chances per million" (cancer risk × 10^6) but may also be expressed in other ways, such as "chances per 100,000" or "chances per 10 million" (cancer risk × 10^7). The SJVAPCD utilizes a threshold of "20 in one million" when analyzing the cancer risk resulting from the operations of both permitted and non-permitted sources.

For assessment of off-site worker cancer risk at the MEIW, the default assumes working age begins at 16 years. The daily inhalation dose ($DOSE_{air}$) is based on the adjusted 8-hour concentration at the MEIW (for noncontinuous sources) and amount of time the offsite worker's schedule overlaps with the facility's emission schedule. The duration of exposure at the MEIW receptor is 25 years. Additional consideration for offsite worker cancer risk assessment is whether there are women of child bearing age at the MEIW location and whether the MEIW has a daycare center. Under most circumstances, cancer risk accumulated by inhalation is calculated using the following equation:

$$RISK_{inh-work} = DOSE_{air} \times CPF \times ASF \times \frac{ED}{AT}$$

Where:

$RISK_{inh-work}$ = Worker inhalation cancer risk
$DOSE_{air}$ = Daily inhalation dose (mg/kg-day)
CPF = Cancer potency factor $(mg/kg\text{-}day)^{-1}$
ASF = Age sensitivity factor for a specified age group (one for working age 16 to 70)
ED = Exposure duration (in years) for a specified age group (25 years)
AT = Averaging time for lifetime cancer risk (70 years)

As discussed previously, some substances (e.g., semi-volatile organics and metals) are carcinogenic regardless of how they enter the body. Exposures to these substances are called multi-pathway. HRA for a facility that emits a multi-pathway pollutant must, at a minimum, evaluate doses from soil ingestion and dermal exposure. If polycyclic aromatic hydrocarbons, lead, dioxins, furans, or polychlorinated biphenyls are emitted, then the breast-milk consumption pathway becomes mandatory for residential receptors. OEHHA has developed transfer coefficients for these chemicals from the mother to breast milk. The other exposure pathways (e.g., ingestion of homegrown produce or fish) are only evaluated for residential receptors if the facility impacts that exposure medium and the receptor under evaluation can be exposed to that medium or pathway.

Non-inhalation residential cancer risk is calculated using the same steps as inhalation cancer risk. The pathway under evaluation (e.g., soil ingestion) is multiplied by the substance-specific oral slope factor, expressed in units of inverse dose (i.e., $(mg/kg/day)^{-1}$), the appropriate ASF, and exposure duration divided by averaging time to yield the cancer risk for a specified age grouping. Cancer risk for each age group is summed as appropriate for the exposure duration.

If multiple substances are emitted, the substance-specific cancer risks for all exposure pathways are summed to give the (total) multi-pathway cancer risk at the receptor location. HARP2 displays the multi-pathway risk for each carcinogenic substance and a breakdown of the cancer risk from each exposure pathway.

This HRA evaluates mother's milk due to presence of lead in fugitive dust. The default assumption inherent in the intake rate is that the infant's only source of food is breast for the first year (e.g., is fully breastfed), which is one-half of the 0<2 year age group used in the Hot Spots program. Thus, the cancer risk by the mother's milk pathway is calculated with a slightly modified equation using a different exposure duration. Once the cancer risk is determined for the mother's milk pathway then it is summed with the other risks to calculate the total cancer risk for the receptor.

OEHHA recommends that exposure from projects longer than 2 months but less than 6 months be assumed to last 6 months (e.g., a 2-month project would be evaluated as if it lasted 6 months). Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases,

for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs. Thus, for example, if one is evaluating a proposed 10-year project, the cancer risks for the residents would be calculated based on exposures starting in the third trimester through the first ten years of life.

Non-Cancer Risk

Estimates of noncancer inhalation health impacts are determined by dividing an airborne concentration at the receptor by the appropriate REL. This is termed the Hazard Index (HI) Approach. A REL is used as an indicator of potential noncancer health impacts and is defined as the concentration at which no adverse noncancer health effects are anticipated. When a health impact calculation is performed for a single substance, then it is called the hazard quotient (HQ). Each REL for a substance will have one or more target organ systems (e.g., respiratory system, nervous system, etc.) where the substance can have a noncancer health impact. Thus, all HQs have specified target organ systems associated with them. The sum of the Hazard HQs of all chemicals emitted that impact the same target organ is the HI. Inhalation RELs for noncancer health impacts have been developed for acute, 8-hour, and chronic exposures to a number of substances.

Acute RELs are designed to protect against the maximum 1-hour ground level concentration at the receptor. Chronic RELs protect against long-term exposure to the annual average air concentration spread over 24 hours/day, 7 days/week.

Eight-hour RELs are designed to protect people with daily 8-hour schedules, such as offsite workers, in an impacted zone. The 8-hour RELs are used for typical daily work shifts of 8-9 hours and represent concentrations at or below which health impacts would not be expected even for sensitive subpopulations in the general population with repeated daily 8-hour exposures over a significant fraction of a lifetime. The 8-hour RELs can be used to evaluate the potential for health impacts (including effects of repeated exposures) in offsite workers, and to children and teachers exposed during school hours.

Acute, 8-hour, and chronic RELs are needed because the dose metrics and even the health impact endpoints may be different with the different exposure durations of acute, daily 8-hour, and chronic exposures. Also, although chronic REL values are lower or set the same as 8-hour RELs, there are some cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) or intermittent exposures where the 8-hour REL may be more protective than the chronic REL.

As discussed above, in order to calculate the acute, 8-hour, or chronic HQ, the maximum ground-level concentration (in $\mu g/m^3$) during the appropriate period of time (i.e., 1-hour acute, 8-hour, and 1-year chronic) is divided by the corresponding REL (in $\mu g/m^3$) for the substance. If a receptor is exposed to multiple substances that target the same organ system, then the HQs for the individual substances are summed to obtain a Hazard Index (HI) for that target organ as shown in the following equations.

$$HI_{Organ1} = \frac{C_{air,1}}{REL_1} + \frac{C_{air,2}}{REL_2} + \cdots + \frac{C_{air,n,}}{REL_n}$$

or

$$HI_{Organ1} = HQ_1 + HQ_2 + \cdots + HQ_n$$

A HI of 1.0 or less indicates that adverse health effects are not expected to result from exposure to emissions of that substance. As the HI increases above one, the probability of human health effects increases by an undefined amount. However, HI above one is not necessarily indicative of health impacts due to the application of uncertainty factors in deriving the RELs.

There are non-cancer multi-pathway pollutants that are assessed for inhalation, ingestion, and other non-inhalation pathways. Nickel and arsenic are two that are found in fugitive dust and so the non-inhalation exposures to these metals are assessed for the corresponding target organs. Specifically, nickel effects the respiratory, hematologic, and alimentary systems while arsenic affects development; the nervous and cardiovascular systems; and the skin.

3.3.6 Project-Level Impacts and Mitigation Measures

3.3.6.1 Conflict With or Obstruction to the Implementation of an Air Quality Plan

Impact Statement

Impact AQ-1: *Would the Project conflict with or obstruct implementation of the applicable air quality plan?* **(Appendix G Threshold Criteria (a))**

Impact Analysis

The SJVAPCD is tasked with implementing programs and regulations required by the CAA and the CCAA. In that capacity, the SJVAPCD has prepared plans to attain Federal and State ambient air quality standards. The SJVAPCD has established thresholds of significance for criteria pollutant emissions, which are based on SJVAPCD NSR offset requirements for stationary sources. Stationary sources in the SJVAPCD are subject to some of the toughest regulatory requirements in the nation. Emission reductions achieved through implementation of SJVAPCD offset requirements are a major component of the SJVAPCD's air quality plans. Thus, projects with emissions below the thresholds of significance for criteria pollutants would be determined to "Not conflict or obstruct implementation of the SJVAPCD's air quality plan". (SJVAPCD, 2015, p. 65).

The Operator would be required to comply with regional air quality rules promulgated by the SJVAPCD and participate in reducing air pollutant emissions. Aggregates production is proportional to population growth, which is a factor that is accounted for in air quality plans. Therefore, the Project would not obstruct implementation of the applicable SJVAPCD air quality plan. Project impacts were determined to be less than significant.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.3.6.2 Net Increase of Criteria Pollutants

Impact Statement

Impact AQ-2: *Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard?* **(Appendix G Threshold Criteria (b))**

Impact Analysis

CEQA defines cumulative impacts as two or more individual effects which, when considered together, are either significant or "cumulatively considerable", meaning they add considerably to a significant environmental impact. An adequate cumulative impact analysis considers a project over time and in conjunction with other past, present, and reasonably foreseeable future projects whose impacts might compound those of the project being assessed.

By its very nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development. Future attainment of State and Federal ambient air quality standards is a function of successful implementation of the SJVAPCD's attainment plans. Consequently, the SJVAPCD's application of thresholds of significance for criteria pollutants is relevant to the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality.

The CEQA Lead Agency, which for this Project is the TID, may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program, including but not limited to an air quality attainment or maintenance plan that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located (CCR §15064(h)(3)).

Thus, if project emissions (change from baseline) exceed thresholds for NOx, ROG, PM_{10} or $PM_{2.5}$, then the project would result in a cumulatively considerable net increase of a criteria pollutant for which the SJVAPCD is in non-attainment under applicable Federal or State ambient air quality standards. This does not imply that if the project impact is less than those significance criteria, it cannot be cumulatively significant. The significance criteria are presented in and include thresholds that are applied separately

to construction and operation activities of a project. Construction phase emissions are summarized and compared to applicable thresholds in Table 3.3-24.

Table 3.3-24. Construction Phase Criteria Pollutant Annual Emissions

	ROG (ton/yr)	CO (ton/yr)	NO_X (ton/yr)	PM_{10} (ton/yr)	$PM_{2.5}$ (ton/yr)	SOx (ton/yr)

Hourly and annual emissions were quantified for the excavation phase. Annual emissions thresholds apply separately for Permitted and Permit-Exempt sources. Table 3.3-25 and Table 3.3-26 present annual and hourly excavation phase emissions respectively, and compare the emissions to the applicable significance thresholds.

Table 3.3-25. Excavation Phase Criteria Pollutant Annual Emissions

Criteria Pollutant	Permitted Sources (tons/year)	Permitted Sources Significance Threshold (tons/year)	Exceeds Permitted Sources Threshold?	Permit-Exempt Sources (tons/year)	Permit-Exempt Sources Significance Threshold	Exceeds Permit-Exempt Threshold

Source: AQCCIA Sespe, 2021.

As seen in Table 3.3-26, daily PM_{10} emissions are potentially significant.

The level of road dust control in the baseline is based upon watering two to three times per day. That level of watering is assigned 80% control efficiency. Increasing the control efficiency to 90% would result in an additional reduction of approximately 50%. As shown in EPA's AP-42 Figure 13.2.2-2 pertaining to unpaved roads, watering alone can achieve up to 95% control. The certified Kaweah South Project EIR, which is a similar aggregate mining and processing operation located approximately 0.5 miles southwest of the Project site, assigned 93% to the combination of "limiting vehicle speed to 15 mph, improving surfaces with aggregate, and watering" (Tulare County, 2006). Thus, 90% control is feasible and achieved in practice using water or a combination of water and chemical dust suppressants (e.g., magnesium chloride, lignin sulfonate, etc.). The excavation phase has maximum net emissions (Project minus baseline) of 269 lbs/day which would be reduced to 84.8 lbs/day with the additional control (Appendix C, Mitigated Emissions, Maximum Year). Therefore, with Mitigation Measure AQ-1, the Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard and is therefore less than significant.

Level of Significance Before Mitigation

Daily PM_{10} emissions are potentially significant.

Mitigation Measures

Mitigation Measure AQ-1 is recommended to avoid causing or contributing to an existing or projected violation of an air quality standard.

Mitigation Measure AQ-1*:*

> *Roads upon which material is hauled to the on-site plant for processing shall be controlled by methods that will achieve 90% reduction of fugitive dust. This can be achieved by frequent watering, use of chemical dust suppressants, or a combination of watering and chemical dust suppressants. Other methods which achieve 90% reduction of fugitive dust may be acceptable with Lead Agency approval.*

Level of Significance After Mitigation

Less than Significant.

3.3.6.3 Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Impact Statement

Impact AQ-3: *Would the Project expose sensitive receptors to substantial pollutant concentrations?* **(Appendix G Threshold Criteria (c))**

Impact Analysis

Determination of whether project emissions would expose sensitive receptors to substantial pollutant concentrations is a function of assessing potential health risks. Sensitive receptors are facilities that house or attract children, the elderly, people with illnesses, or others who are especially sensitive to the effects

of air pollutants. Hospitals, schools, convalescent facilities, and residential areas are examples of sensitive receptors. When evaluating whether a Project has the potential to result in localized impacts, the nature of the air pollutant emissions, the proximity between the emitting sources associated with the Project and sensitive receptors, the direction of prevailing winds, and local topography must be considered (SJVAPCD, 2015, p. 66).

A HRA was performed as discussed in Section 3.3.5.8 to evaluate the effects of TACs including DPM from vehicles and various substances found in fugitive dust emissions (i.e., metals and crystalline silica). Risk from all three phases of the Project are each incorporated into the values presented in Table 3.3-27 which shows the cancer risk at the closest residential and sensitive receptors including Sequoia Union Elementary School.

Health risk is determined based on the change in conditions between the baseline and the Project. Emissions sources present in the baseline cease to operate, and emissions from the Project are introduced. Therefore, baseline risk is modeled as negative risk (emissions going away), and Project risk is modeled as positive (new emissions). In many cases, Project emissions end up being lower than those in the baseline, due to newer technologies and updated regulations. In such cases, risk to receptors may be reduced, as the Project results in a reduction of emissions. In cases where risk to a receptor is greater in the baseline than in the Project, the risk is represented by the statement “No Increase”.

In accordance with SJVAPCD guidance, the health risk threshold for cancer risk used in the AQCCIA was 20 in a million. As shown in Table 3.3-27, health risk from the Project is less than significant. Receptor 10 is a residence owned by the Applicant. Receptor 14 represents workers at the CEMEX Facility.

Table 3.3-27. Health Risk Results

Receptor Figure Label – Type	Receptor Model ID Number	Excess Cancer Cases per Million People Exposed (Threshold 20 in a million)	Chronic Hazard Index (Threshold i.0)	Acute Hazard Index (Threshold i.0)

3.3.6.4 Odors Affecting a Substantial Number of People

Impact Statement

Impact AQ-4: *Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?* **(Appendix G Threshold Criteria (d))**

Impact Analysis

Due to the subjective nature of odor impacts, the number of variables that can influence the potential for an odor impact, and the variety of odor sources, there are no quantitative or formulaic methodologies to determine the presence of a significant odor impact. Rather, the SJVAPCD recommends that odor analyses strive to fully disclose all pertinent information.

The intensity of an odor source's operations and its proximity to sensitive receptors influences the potential significance of odor emissions. The SJVAPCD has identified some common types of facilities that have been known to produce odors in the San Joaquin Valley. These are presented in Table 3.3-28 below along with a reasonable distance from the source within which, the degree of odors could possibly be significant. If the proposed project would result in sensitive receptors being located closer than the screening level distances, a more detailed analysis should be provided and include information regarding odor complaints (SJVAPCD, 2015, p. 103). It should be noted that aggregate mining and processing activities are not included on the SJVAPCD table; however, the table is not intended to be all inclusive.

Table 3.3-28. Odor Screening Distances

Type of Facility	Odor Screening Distance (miles)
Wastewater Treatment Facilities	2
Sanitary Landfill	1
Transfer Station	1
Composting Facility	1
Petroleum Refinery	2
Asphalt Batch Plant	1
Chemical Manufacturing	1
Fiberglass Manufacturing	1
Painting/Coating Operations (e.g., auto body shops)	1
Food Processing Facility	1
Feed Lot/Dairy	1
Rendering Plant	1

Source: (SJVAPCD, 2015).

Diesel exhaust from mobile equipment/vehicles has a slight odor. Odor intensity would decrease rapidly with distance and is not expected to be frequently (or at all) detectable at locations outside of the Project site boundary. In addition, given the subjective nature of odors, such odors are generally only considered to be objectionable by residential receptors (i.e., not by occupational workers). Given the rural nature of the Project vicinity, there are few residences located within 1 mile of the reservoir where the majority of the on-site emissions of diesel exhaust from mobile equipment/vehicles would occur. Therefore, it is not anticipated that objectionable odors affecting a substantial number of people could result from the Project.

If a substantial number of odor complaints are received by the SJVAPCD, such complaints would be addressed under the SJVAPCD nuisance rule (Rule 4102), which reads:

> *"A person shall not discharge from any source whatsoever such quantities of air contaminants or other materials which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety of any such person or the public or which cause or have a natural tendency to cause injury or damage to business or property."*

Therefore, in the unlikely event that a significant number of odor complaints were documented as a result of the Project, they would be addressed by the SJVAPCD. Project impacts were determined to be less than significant.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.3.7 Cumulative-Level Impacts and Mitigation Measures

Table 3.0-1 in Section 3.0 identifies the other projects within the County and the City of Woodlake considered in regards to potential cumulative impacts. Also see Figure 3.0-1 which displays the location of the cumulative projects in relation to the Project site.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to air quality.

Generally, the context for cumulative impacts for air quality impacts is the immediate area encompassing the site vicinity (1- to 3-mile radius from the Project site). As discussed in the impact analysis (Section 3.3.6) above for each impact threshold, the Project was determined to have either no impact, a less than significant impact, or significant but mitigated to a less than significant level. Since the Project would present no significant impacts related to noise or vibration, there would be no cumulative impact in conjunction with the other cumulative projects.

3.4 BIOLOGICAL RESOURCES

3.4.1 Introduction

This section of the DEIR describes the biological resources present onsite and in the immediate vicinity of the Project site, and an analysis of potential impacts of the Project on those biological resources. The Biological Study Area (BSA) includes the Project site, portions of the adjacent Seaborn site and adjacent lands within 250-feet of the Project site. The analysis is based on the findings in the McKay Point Reservoir Project Biological Resources Evaluation completed by Bumgardner Biological Consulting (BBC) (Bumgardner Biological Consulting, 2021) and associated field work and surveys.

The analysis and information provided within this DEIR section was derived from the following studies and associated field work/surveys, which are included in the DEIR appendices:

- Tulare Irrigation District McKay Point Reservoir Biological Resources Evaluation Report, Tulare, California (Bumgardner Biological Consulting, 2013) (Biological Resources Report, Appendix D1)
- Tulare Irrigation District McKay Point Reservoir Biological Resources Evaluation – Addendum No. 1, Tulare, California (Bumgardner Biological Consulting, 2021) (Biological Resources Report Addendum, Appendix D2)
- Elderberry Inventory Report for the Proposed Reservoir of the Tulare County Irrigation District at McKay Point Near Visalia, California (Entomological Consulting Services, Ltd., 2014) (Elderberry Inventory Report, Appendix D3)

3.4.2 Environmental Setting

3.4.2.1 Regional Setting

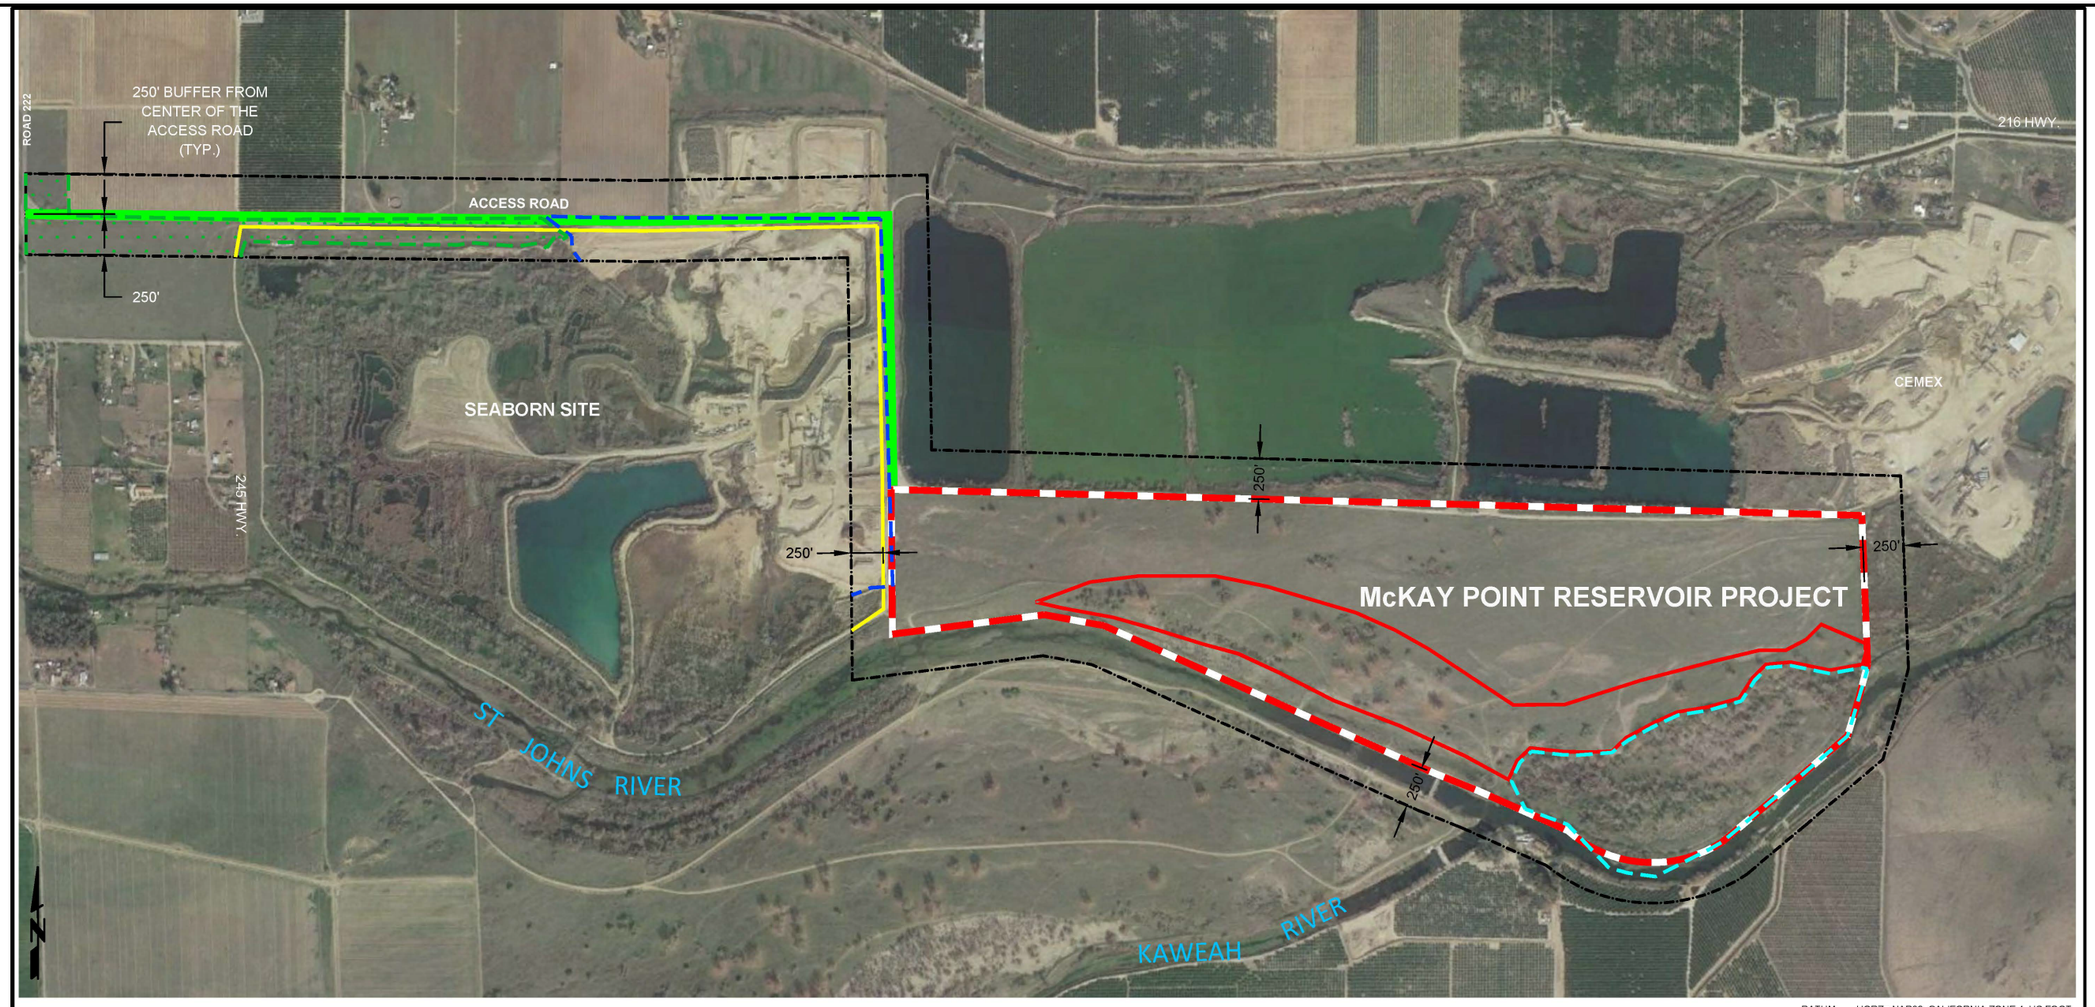
The Project site is located in unincorporated Tulare County, near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east. The site is drained by the Kaweah River, which drains to the ephemeral Tulare Lake in the southern end of the San Joaquin Valley, and by the St. Johns River, which becomes Cross Creek before draining into the Tulare Lake bottom near Corcoran. Area climate typically includes cool rainy winters having a mean daily temperature ranging from 40° to 50° Fahrenheit (F), and hot dry summers where daytime temperatures can exceed 100° F. Rainfall increases with elevation in the foothills and ranges from approximately 10 inches at the base to 25 inches at 3,000 feet. Most of this precipitation occurs from November through April.

Currently in the foothills, the vegetation ranges from annual grasses in open areas to dense shrubs and trees. Much of the native vegetation in the area has been replaced by introduced species or has been eliminated by cultivation and overgrazing. Agriculture is currently the main land use in the region, although narrow strips of riparian vegetation grow along remnant tributaries.

Biological resources in the region have been modified by past and present land uses. Prior to human settlement, this region was dominated by riparian vegetation within the floodplains, with stands of valley

oak and interior live oak on higher ground. Herbaceous wetland bottoms and upland native grassland communities were common in this vegetation mosaic. The extensive oak forests and riparian/wetland habitats hosted a diverse and abundant wildlife community. Cattle grazing and deforestation of the oaks in the early- to mid-1800s for agriculture substantially altered both the floodplain and channel vegetation.

3.4.2.2 Vicinity Setting



Surrounding land use in the immediate Project site vicinity includes existing or previously active aggregate mining operations to the north and east the CEMEX Lemon Cove and Stillwell facilities, to the southeast the Kaweah South facility, and to the west the previous Kaweah Rock/Santa Fe facilities on the Seaborn site. Lands to the south and east are used intensively for agricultural and, to a limited extent, for rural residential purposes.

3.4.2.3 Project Site Setting

Historically, the Project site has been used for cattle grazing under lease arrangements. Most of the Project site is vegetated with non-native annual grasses. However, native grasses (primarily riparian species) and oak-riparian woodlands are present and increase in density with proximity to the nearby rivers, especially in a small area along the Kaweah River in the southeastern portion of the site. Aggregate mines have historically been and/or currently are operating at properties adjacent to and in the vicinity of the Project site. Lands to the south and east are used intensively for agricultural and, to a limited extent, for rural residential purposes. The surface soil at the site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. The site topography is relatively level with a depression in the southeast corner and a slight elevation increase in the north. Site surface drainage is generally to the south and southeast toward the Kaweah River and to the south and southwest toward the St. John's River. The site elevation falls from approximately 472-feet above mean sea level (amsl) at the northeastern end of the property, to approximately 454 feet amsl at the southwestern end.

Existing Plant Communities

Much of the Project site and adjacent area's (i.e., BSA) vegetation consists of non-native annual grassland (see Figure 3.4-1), and includes grasses such as wild oat [*Avena fatua*]), as well as herbaceous species such as lamb's-quarters (*Chenopodium album*), wild cucumber (*Marah* sp.), and deer weed (*Acmispon glaber*). Small, scattered stands of mule fat (*Baccharis salicifolia*) also occur within the non-native annual grassland. However, these latter stands are not significant enough in size to warrant mapping as a discernible vegetation community.

Source: Sespe Consulting, Inc. (February 2021)

Figure 3.4-1 Biological Study Area – Vegetation Communities

THIS PAGE IS INTENTIONALLY BLANK

Sensitive Vegetation Community

The only sensitive habitats that occur on the Project site or within the BSA are the mixed oak-riparian woodland that is found in the southeastern portion of the Project site and the adjacent elderberry savannah.

Woody species that are associated with the mixed oak-riparian woodland include willows (*Salix* spp.), Fremont's cottonwood (*Populus fremontii*), western sycamore (*Platanus racemosa*), tamarisk (*Tamarix* sp.), tree tobacco (*Nicotiana glauca*), blue elderberry (*Sambucus mexicana*), and interior live oak (*Quercus wislizeni*). California wild grape (*Vitis californica*) occurs as a liana growing into the canopy of the woody species. The canopy cover in this stand of vegetation varies between approximately 20 and 100 percent and is best described as interrupted woodland. The mixed oak-riparian woodland is classified as Great Valley Mixed Riparian Forest in the Natural Communities List in *A Manual of California Vegetation, Second Edition* (Sawyer, Keeler-Wolf and Evens, 2009) and is tracked by the California Department of Fish and Wildlife (CDFW) as a sensitive natural community in the California Natural Diversity Data Base (CNDDB).

Approximately 40 acres of elderberry savannah (a sensitive natural community tracked by the CDFW) occurs adjacent to the mixed oak-riparian woodland, but also extends west along the southern border of the Project site (see Figure 3.4-1). It should be noted that the depicted boundaries approximate the borders of this vegetation community and the mixed oak-riparian woodland as the two communities have no clearly discernible boundary where they occur adjacent to and grade into each other. The dominant species in the elderberry savannah is blue elderberry. However, scattered Fremont's cottonwoods and willows also occur in this vegetation community. The onsite elderberry shrubs/clumps are large and old with many stems and likely represent the remnants of a formerly more contiguous community.

Special-Status Plant Species

No special-status plant taxa were observed within the BSA during the surveys. In addition, no special-status plant taxa that have been documented in the Project region (see Biological Resources Report, Addendum No. 1 located in Appendix D2 of this DEIR) are considered to have any potential to occur on the Project site or within the BSA given the onsite conditions (i.e., mostly high to moderately grazed non-native annual grassland and/or known and limited distribution of the taxon).

Wildlife Resources

Reconnaissance-level surveys within the BSA resulted in the documentation of relatively low wildlife diversity (i.e., 2 species of amphibians, 1 species of reptile, 14 species of birds, and 5 species of mammals). The only amphibians that were found in and adjacent to the Project site were the Pacific treefrog (*Hyla regilla*) and bullfrog (*Rana catesbeiana* = *Lithobates catesbeianus*). Both of these species are relatively widespread in lower elevation drainages, ponds, and other waters in California. The only reptile species recorded within the BSA was the western fence lizard (*Sceloporus occidentalis*). This species is relatively widespread within the non-desert, lowland portions of California. The bird species recorded within the BSA included phainopepla (*Phainopepla nitens*), northern mockingbird *(Mimus polyglottos*), Nuttall's

woodpecker (*Picoides nuttallii*), American robin (*Turdus migratorius*), willow flycatcher (*Empidonax traillii*), Pacific-slope flycatcher *(E. difficilis*), house finch (*Haemorhous mexicanus*), western scrub-jay (*Aphelocoma californica*), Anna's hummingbird (*Calypte anna*), northern flicker (*Colaptes auratus*), turkey vulture (*Cathartes aura*), killdeer (*Charadrius vociferus*), black phoebe (*Sayornis nigricans*), and California quail (*Callipepla californica*). Most of these species are common and widespread year-round or winter residents within oak and riparian woodlands within the region. However, the willow flycatcher and Pacific-slope flycatcher are only migrants through the area and do not occur as a nesting or wintering species within the BSA. Lastly, mammal species documented within the BSA included California ground squirrel (*Otospermophilus beecheyi*) (burrows only), Botta's pocket gopher (*Thomomys bottae*) (mounds only), coyote (*Canis latrans*), mule deer (*Odocoileus hemionus*), and raccoon (*Procyon lotor*) (tracks only).

Other wildlife species may occur within the BSA, but were not identified during the surveys. These other species include, but are not limited to, southern alligator lizard (*Elgaria multicarinata*), western skink (*Plestiodon skiltonianus*), common kingsnake (*Lampropeltis getula*), Pacific gopher snake (*Pituophis catenifer*), Northern Pacific rattlesnake (*Crotalus oreganus*), several species of small mammals, several species of oak or riparian-associated passerines (i.e., songbirds), red-tailed hawk (*Buteo jamaicensis*), American kestrel (*Falco sparverius*), and great horned owl (*Bubo virginianus*). These other wildlife species are not considered "sensitive species" or "special status species".

Special-Status Wildlife Species

A likelihood of occurrence analysis for special-status wildlife species that could occur within the BSA was conducted as part of the *Biological Resources Evaluation* and updated in *Addendum No. 1* (see Appendix D2 of this DEIR). Of these species, the analysis found that 15 species of special-status wildlife have some potential to occur within the BSA. These special-status wildlife are presented in Table 3.4-1 below. The Valley Elderberry Longhorn Beetle (VELB) was included on this Table 3.4-1, even though there is no potential for it to occur on the Project site or the BSA. This was done to simply emphasize the point that VELB in not present at the Project site.

Wildlife Movement Corridors

Riparian corridors often function as wildlife movement corridors for many species of wildlife given the presence of water, vegetative cover, and vegetative structure and the lack of such habitat on adjacent lands that have been fragmented by roads, development, agriculture, or other uses. The Kaweah and St. Johns River corridors provide such habitat (especially for deer, medium to large-size carnivores, and migratory birds). Though there is no data to suggest that these riparian corridors are uniquely important for the passage of any given species, the corridors do provide habitat that is used by a wide variety of species during seasonal migration, dispersal of juveniles, and movement between parts of home range that may otherwise be fragmented. Much of the river corridor that is adjacent to the Project site has little vegetative cover and the lack of vegetative cover likely limits the movement of some species through the area. However, given the adjacent open space, passage by species can still occur along the river under cover of darkness (regardless of the lack of vegetation). There are no established native resident or

migratory wildlife corridors within or adjacent to the Project site, nor are there known native wildlife nursery sites within BSA.

Table 3.4-1. Special-Status Wildlife Species with Potential to Occur within the BSA

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Lytta moesta	Moestan blister beetle	None / SA / None	The range of this species is not well known, but occurrences have been documented in the southern San Joaquin Valley in Kern, Fresno, Tulare, San Benito, and San Luis Obispo counties. The CDFW reports that life history and behavior information for the species does not exist. However, it has typically been found in association with its host species (i.e., the species' larvae feed on the pollen stores that ground-nesting solitary bees have provided for their own larvae).	**Low Potential.** Given that ground-nesting solitary bees (i.e., beetle's host species) are widely distributed in California and little is known about this species' life history and behavior, it cannot be discounted as occurring within the BSA. Therefore, it is considered to have some potential, albeit low, to occur in the BSA.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Lytta morrisoni	Morrison's blister beetle	None / SA / None	The range of this species is not well known, but occurrences have been documented in the southern San Joaquin Valley in Kern, Fresno, Tulare, San Benito, and San Luis Obispo counties. The CDFW reports that life history and behavior information for the species does not exist. However, it has typically been found in association with its host species (i.e., the species' larvae feed on the pollen stores that ground-nesting solitary bees have provided for their own larvae).	**Low Potential.** Given that ground-nesting solitary bees (i.e., beetle's host species) are widely distributed in California and little is known about this species' life history and behavior, it cannot be discounted as occurring within the BSA. Therefore, it is considered to have some potential, albeit low, to occur in the BSA.
Desmocerus californicus dimorphus	valley elderberry longhorn beetle (VELB)	FT / None / None	Until recently, this subspecies was thought to occur at scattered locations in the Central Valley and adjacent foothills of the Sierra Nevada and Coast Ranges. It is entirely dependent upon its host plant (i.e., elderberry spp.) and is only found where this shrub occurs (typically in riparian vegetation associations, but occasionally in single, isolated shrubs or stands of the plant).	**No Potential.** The BSA supports a large number of old-growth elderberry shrubs (see Figure 3.4-1). Although bona fide exit holes of *Desmocerus* sp. were observed on 13 individual elderberry plants, it is highly likely they are from the unlisted California elderberry longhorn beetle (CELB). Based on the newly published VELB rule, Tulare County has been excluded from the geographic range of the VELB. Therefore, VELB is considered to have no potential to occur within the BSA. (see Federal Register, Vol. 79, No. 180, Part II, USDI, FWS, 50 CFR Part 17: "...*it is reasonable to conclude that the Tulare County observations likely represent the California elderberry longhorn beetle.*")

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Chrysis tularensis	Tulare cuckoo wasp	None / SA / None	This species is known only from a small series of specimens that have been collected in Amador, Fresno, Monterey, and Tulare counties. Cuckoo wasps are nest parasitoids of predatory wasps and sawflies. However, the host species of this species are unknown. Adults have been found from April to June in open, sunny habitats with abundant flowers and small shrubs, where they feed on nectar.	**Low Potential.** Given that predatory wasps and sawflies (i.e., wasp's host species) are widely distributed in California and little is known about this species' life history and behavior, it cannot be discounted as occurring within the BSA. Furthermore, the nearest known record to the BSA is from immediately north of the intersection of Road 212 and Avenue 344 (less than 3 miles from the BSA). Therefore, it is considered to have some potential, albeit low, to occur within the BSA.
Actinemys marmorata *(*formerly *Emys marmorata*)	western pond turtle	None / CSC / None	This species historically occurred throughout most of the Pacific-slope drainages in California (below approximately 4,000 feet). The species now occurs at scattered locations throughout its former range (primarily in the central Sierra Nevada foothills, Central Valley, San Francisco Bay area, and north-central coast and Coast Ranges). It occurs in and adjacent to ponds, reservoirs, or other slow-moving perennial aquatic habitats (e.g., sloughs, streams, and rivers). The species may be active year-round in some parts of its range.	**Low Potential.** Given that potentially suitable habitat is provided by the adjacent Lower Kaweah River and St. Johns River and the species has been recorded upstream in the Kaweah River, it cannot be discounted as occurring within the BSA. Suitable aquatic habitat within the BSA only occurs in the Lower Kaweah River and St. Johns River. However, individuals could also enter the upland portions of the BSA for egg-laying. Therefore, it is considered to have some potential, albeit low, to occur within the BSA.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Anniella pulchra	Northern California legless lizard	None / CSC / None	This species occurs as a fossorial species in sand, sandy loam, or leaf-mold substrates. It can be found in a variety of habitats that include coastal beach, chaparral, pine-oak woodland, and riparian habitats. Soil moisture is essential. It appears to be active mostly during the morning and evening, just beneath the surface of sunlight-warmed substrate. It may also be active on the surface at night when substrate temperatures remain warm for extended intervals. It should be noted that recent mitochondrial and nuclear DNA work has resulted in the species being split into five distinct species with the local species (*A. pulchra*) occurring only along the coast, in the Coastal Ranges as far south as northwestern Ventura County and in parts of the San Joaquin Valley.	**Low Potential.** No individuals of this species were observed during the reconnaissance-level surveys of the BSA. However, there is a relatively recent occurrence (2015) documented in the CNDDB from about 0.2 miles northwest of Highway 198 at Road 180, in the vicinity of Outside Creek and Johnson Slough, about 6.5 miles east of Visalia.in the Kaweah Oaks Preserve. Therefore, given the presence of suitable habitat (primarily on the Project site), the species is considered to have some potential, albeit low, to occur within the BSA.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Accipiter cooperii	Cooper's hawk (nesting)	None / SA / None	This species occurs as an uncommon breeding resident throughout most of the low to mid-elevation wooded portions of California where it inhabits open, interrupted, or marginal woodlands. It is seldom found in areas without dense tree stands. Nest sites are typically found in riparian or deciduous trees in canyon bottoms or river flood plains.	**Low Potential.** There is suitable nesting habitat for the species (i.e., interrupted riparian woodland with dense stands of trees) located in the southeastern portion of the BSA. Furthermore, there are records from the project vicinity in the eBird data base (i.e., less than 2 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have some potential, albeit low, to nest within the BSA.
Buteo regalis	ferruginous hawk (wintering)	None / None / BCC	This species is a winter resident of the Modoc Plateau, Central Valley, and Coast Ranges. It forages in large, open tracts of grasslands, sparse scrubland, and deserts.	**Low Potential.** There is suitable wintering habitat for the species (i.e., open grassland) within the BSA. Furthermore, there are records from the project vicinity in the eBird data base (i.e., less than 1.5 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have some potential, albeit low, to winter on or immediately adjacent to the BSA.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Elanus leucurus	white-tailed kite (nesting)	None / CFP / None	This species is found as a resident throughout the lower elevation portions of California in low rolling grasslands with scattered oaks and river bottomlands or marshes adjacent to deciduous woodland. It requires grasslands, meadows, or marshes (for foraging) located near dense-topped trees (for nesting and roosting).	**Low Potential.** There is suitable nesting habitat for the species (i.e., mixed oak and riparian woodland) located in the southeastern portion of the BSA. In addition, there are records from the project vicinity in the eBird data base (i.e., less than 1.5 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have some potential, albeit low, to nest within the BSA.
Falco columbarius	merlin (wintering)	None / SA / None	This species winters in California from September to May. It occurs in a variety of low elevation, relative flat habitats that include wooded areas, coastlines, open grasslands, savannah, and the periphery of lakes. It is less often found in open desert. It typically requires dense stands of trees for cover and roosting. It is most often found where there are substantial populations of small birds (the primary prey item).	**Low Potential.** There is suitable wintering habitat for the species (i.e., open grassland) within the BSA. Furthermore, there are records from the project vicinity in the eBird data base (i.e., less than 1.5 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have some potential, albeit low, to winter on or immediately adjacent to the BSA.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Aquila chrysaetos	golden eagle (wintering)	None / CFP / BCC	Found as a breeding resident throughout most of California (other than the valley floor of the Central Valley). Also found as a wintering species throughout most of California (other than the high Sierra Nevada). Species requires open terrain for hunting (e.g., grassland, oak savannah, and early successional stages of shrub and woodland habitats). Typically nests on secluded cliffs, but may also use large, isolated trees.	**Low Potential.** There is suitable wintering habitat for the species (i.e., open grassland) within the BSA. Furthermore, there are records from the project vicinity in the eBird data base (i.e., less than 1.5 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have some potential, albeit low, to winter within the BSA.
Athene cunicularia	burrowing owl (burrow sites)	None / CSC / BCC	This species is found throughout the Central Valley, in the San Francisco Bay Area, at scattered locations along the coast, and in portions of the desert regions. It is a year-round resident in annual and perennial grasslands or other vegetation communities that support sparse or non-existent tree or shrub canopies.	**Low Potential.** Though the annual grassland on the Project site provides suitable foraging habitat for the species, there is no evidence of suitable burrow sites (i.e., no California ground squirrels or their burrows, nor were other suitable burrow surrogates observed on the Project site). However, California ground squirrel burrows were observed in the spoils materials from the adjacent sand and gravel mining operations and along the existing access road on the Seaborn site. Therefore, the species is considered to have some potential, albeit low, to occur within the BSA.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Lanius ludovicianus	loggerhead shrike (nesting)	None / CSC / BCC	This species is found as a resident and wintering species throughout the lower elevation portions of California in grasslands, saltbush scrub, chaparral, oak savannah, and other open woodland types (generally, where there are trees with dense cover for nesting).	**Low Potential.** There is suitable nesting habitat for the species (i.e., mixed oak and riparian woodland with dense stands of trees) located in the southeastern portion of the BSA. Furthermore, there are records from the project vicinity in the eBird data base (i.e., less than 2 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have some potential, albeit low, to nest within the BSA.
Baeolophus inornatus	oak titmouse (nesting)	None / None / BCC	This species occurs as a common resident throughout much of California other than the deserts, high Sierra Nevada, and redwood belt. It is generally found in cismontane woodland (particularly oak or riparian woodlands) where it nests in the cavities created by woodpeckers.	**Moderate Potential.** There is suitable cismontane woodland for the species (i.e., mixed oak and riparian woodland) in the southeastern portion of the BSA. Furthermore, there are potential nest sites (i.e., woodpecker-created nest holes) in this woodland. Lastly, there are records from the project vicinity in the eBird data base (i.e., less than 2 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have a moderate potential to occur within the BSA.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Spinus lawrencei	Lawrence's goldfinch (nesting)	None / None / BCC	This species is found as a breeding species in oak woodlands, other arid woodlands, and chaparral in the lower elevations of northern California and in riparian woodland, pinyon-juniper woodland, and lower montane communities in southern California. A local water source and a source of abundant seeds are required habitat components.	**Low Potential.** There is suitable cismontane woodland for the species (i.e., mixed oak and riparian woodland) located in the southeastern portion of the BSA. Furthermore, there are records from the project vicinity in the eBird data base (i.e., less than 2 miles from the BSA along Dry Creek Drive upstream along the Kaweah River). Therefore, the species is considered to have some potential, albeit low, to nest within the BSA.
Vulpes macrotis mutica	San Joaquin kit fox	FE / ST/ None	This taxon is found in the San Joaquin Valley from Contra Costa County south to Kern County. It is also found in the dry interior valleys of the Coast Ranges (e.g., Salinas and Santa Clara valleys). It occurs in open, sparsely vegetated areas of low relief (typically in native or non-native grassland or alkali sink scrub).	**Low Potential**. Though there is suitable habitat for the taxon within the BSA (i.e., non-native annual grassland), and it has been recorded 2.7 miles northwest and 4.8 miles southwest of the Project site, surveys of the annual grassland within the BSA found no potential dens or other evidence of the taxon to suggest it occurs within the BSA. In addition, the sandy soils on the Project site may preclude the creation and maintenance of burrows that do not easily collapse (hence the lack of California ground squirrel burrows). Therefore, the taxon is considered to have only a low potential to occur in the annual grassland associated with the easternmost and northernmost portions of the BSA.

FEDERAL	
FE	Federally listed as Endangered
FT	Federally listed as Threatened
FPE	Federally proposed as Endangered
FPT	Federally proposed as Threatened
FC	Federal Candidate Species (former Category 1 candidates)
BCC	U.S. Fish and Wildlife Service designated "Birds of Conservation Concern" 2008
STATE	
SE	State listed as Endangered
ST	State listed as Threatened
SR	State listed as Rare
CFP	California Department of Fish and Game designated "Fully Protected"
CSC	California Department of Fish and Game designated "Species of Special Concern"
SA	California Department of Fish and Game designated "Special Animal"
OTHER	
CNPS List 1A	Plants presumed extinct in California
CNPS List 1B	Plants that are rare, threatened, or endangered in California and elsewhere
CNPS List 2	Plants that are rare, threatened, or endangered in California, but are more common elsewhere
CNPS List 3	Plants about which we need more information – a review list
CNPS List 4	Plants of limited distribution – a watch list
CNPS Threat Rank 0.1	Seriously threatened in California (high degree/immediacy of threat)
CNPS Threat Rank 0.2	Fairly threatened in California (moderate degree/immediacy of threat)
CNPS Threat Rank 0.3	Not very threatened in California (low degree/immediacy of threats or no current threats known)
LIKELIHOOD OF OCCURRENCE DEFINITIONS	
Known to Occur	Taxon was observed within or immediately adjacent to the project site or has previously been documented within or immediately adjacent to the project site.
High Potential	Taxon has not been documented within or immediately adjacent to the project site, but should be expected on more than 50% of visits to suitable habitat on and near the project site during the appropriate season and time of day.

Genus / Species	Common Name	Status Federal / CA / Other	Habitats and Seasonal Distribution in California	Likelihood of Occurrence on Project Site
Moderate Potential	Taxon has not been documented within or immediately adjacent to the project site, but should be expected on less than 50% of visits to suitable habitat on and near the project site during the appropriate season and time of day.			
Low Potential	Taxon has not been documented within or immediately adjacent to the project site nor is it likely to occur on or near the project site, but its presence cannot be completely discounted due to incomplete information on the taxon's distribution or habitat requirements.			
No Potential	Taxon does not occur within or immediately adjacent to the project site due to the lack of required habitat features for the taxon, or the known range of the taxon is well defined and does not include the project vicinity.			

Protected Trees

Tulare County currently does not have a tree ordinance that protects specific types of trees. However, the adopted policies of the Environmental Resources Management Element (ERM-1.12) of the Tulare County General Plan – 2030 Update states that "*the County shall support the conservation and management of oak woodland communities and their habitats*" (Tulare County, 2012). As can be seen by comparing the proposed excavation area to the existing oak-riparian woodland on Figure 3.4-1, the Project would not result in the removal of the oak woodland community or its habitat therefore, the Project is consistent with the General Plan by conserving this area of the Project site.

Sensitive Habitats

The only sensitive habitats that occur within the BSA and specifically on the Project site are the mixed oak-riparian woodland that is found in the southeastern portion of the Project site and the adjacent elderberry savannah. The mixed oak-riparian woodland is classified as Great Valley Mixed Riparian Forest in the Natural Communities List in *A Manual of California Vegetation, Second Edition* (Sawyer, Keeler-Wolf and Evens, 2009), and is tracked by the CDFW as a sensitive natural community in the CNDDB. The elderberry savannah is classified as Elderberry Savanna in the Natural Communities List. It is also tracked by the CDFW in the CNDDB.

Aquatic Resources, Wetlands and Jurisdiction Waters

The jurisdictional waters that are associated with the BSA and Project site are the Lower Kaweah River and St. Johns River. Each of these drainages are subject to both state and federal jurisdiction under the California Fish and Game Code, Porter-Cologne Act, and Clean Water Act. An official jurisdictional waters determination was not made for the Lower Kaweah River and St. Johns River because it is assumed both rivers meet the requirements as federal and state jurisdictional waters and the associated permitting actions are required.

3.4.3 Regulatory Setting

3.4.3.1 Federal

Federal Endangered Species Act (ESA) (16 U.S.C. §§1531-1544)

The United States Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction (16 U.S.C. § 1531 et seq.). The FESA can be implemented in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend (42 U.S.C. § 4321 et seq.).

The FESA prohibits the "take" of endangered or threatened wildlife species without an authorized take permit from the United States Fish and Wildlife Service (USFWS) (16 U.S.C. § 1538(a)(1)(B)). "Take" is defined to include harassing, harming (including significantly modifying or degrading habitat), pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to

engage in such conduct (16 U.S.C. § 1532(19), 50 CFR 17.3). Actions that result in unauthorized take can result in civil or criminal penalties.

Clean Water Act (33 U.S.C. 1251-1376)

The Clean Water Act (CWA) governs the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters (33 U.S.C. § 1251 et seq). Section 404 of the CWA establishes a permit program, administered by the U.S. Army Corps of Engineers (ACOE), regulating discharge of dredged or fill materials into waters of the U.S., including wetlands. Implementing regulations by the Corps are found at 33 C.F.R. Parts 320–330. Implementing regulations were also developed by the United States Environmental Protection Agency (USEPA) in conjunction with ACOE, which are found at 40 C.F.R. Part 230. The regulations allow the discharge of fill materials into the aquatic system only if there is no practicable alternative that would have less adverse impacts.

Water Quality Certification (Clean Water Act Section 401)

The State Water Resources Control Board (SWRCB) has authority to implement Section 401 of the CWA, as well as the Porter-Cologne Act, California Code of Regulations Title 23, Section 3831(k), and California Wetlands Conservation Policy. The CWA requires that an applicant for a Federal Section 404 permit from ACOE (to discharge dredged or fill material into waters of the U.S.) first obtain a certificate from the appropriate State agency stating that the project is consistent with the State's water quality standards and criteria. In California, the authority to either grant or waive certification is delegated by the SWRCB to the Regional Water Quality Control Boards (RWQCB) (Cal. Water Code § 13370 et seq). A request for certification or waiver is submitted to the RWQCB at the same time that while an application is filed with the ACOE for a Section 404 Permit. The RWQCB then has 60 days to review the application and act on it. Because no ACOE permit is valid under the CWA unless "certified" by the State, the RWQCBs may effectively veto or add conditions to an ACOE permit.

In this instance, the Central Coast Valley RWQCB requires 401 Certification because the Project falls into the following category:

1. Projects involving discharges of dredged or fill material to waters of the United States including wetlands and other water bodies. Such discharges may result from navigational dredging, flood control channelization, levee construction, channel clearing, fill of wetlands for development, or other activities.

   These projects involve the removal or placement of soil, sediment, and other materials in or near water bodies and require Corps permits under CWA Section 404.

Regulation of Discharge (Clean Water Act Section 404)

Under Section 404 of the CWA, the ACOE has the authority to regulate activity that could discharge fill or dredge material or otherwise adversely modify wetlands or other waters of the U.S. (Cal. Water Code § 13376). The objective of the CWA is to restore and maintain the chemical, physical, and biological integrity of the nation's waters. The ACOE implements the Federal policy embodied in Executive Order 11990 (May

24, 1977), which is intended to result in no net loss of wetland values or function. Wetlands under ACOE jurisdiction must be "relatively permanent" and have a "significant nexus" to a traditionally navigable water (Rapanos v. US [2006] 547 U.S. 715.). To determine the extent of ACOE-jurisdictional waters on a project site, an applicant must delineate the property using the methodology presented in the 1987 U.S. Corps of Engineers Wetland Delineation Manual, delineation which is then verified by the ACOE.

On May 27, 2015, the U.S. EPA and the ACOE finalized the Clean Water Rule. Specifically, the Clean Water Rule aimed to do the following:

- ***Clearly defines and protects tributaries that impact the health of downstream waters.*** *The Clean Water Act protects navigable waterways and their tributaries. The rule says that a tributary must show physical features of flowing water – a bed, bank, and ordinary high-water mark – to warrant protection. The rule provides protection for headwaters that have these features and science shows can have a significant connection to downstream waters.*
- ***Provides certainty in how far safeguards extend to nearby waters.*** *The rule protects waters that are next to rivers and lakes and their tributaries because science shows that they impact downstream waters. The rule sets boundaries on covering nearby waters for the first time that are physical and measurable.*
- ***Protects the nation's regional water treasures.*** *Science shows that specific water features can function like a system and impact the health of downstream waters. The rule protects prairie potholes, Carolina and Delmarva bays, pocosins, western vernal pools in California, and Texas coastal prairie wetlands when they impact downstream waters.*
- ***Focuses on streams, not ditches.*** *The rule limits protection to ditches that are constructed out of streams or function like streams and can carry pollution downstream. So, ditches that are not constructed in streams and that flow only when it rains are not covered.*
- ***Maintains the status of waters within Municipal Separate Storm Sewer Systems.*** *The rule does not change how those waters are treated and encourages the use of green infrastructure.*
- ***Reduces the use of case-specific analysis of waters.*** *Previously, almost any water could be put through a lengthy case-specific analysis, even if it would not be subject to the Clean Water Act. The rule significantly limits the use of case-specific analysis by creating clarity and certainty on protected waters and limiting the number of similarly situated water features.*

"The rule ensures that waters protected under the Clean Water Act are more precisely defined and predictably determined, making permitting less costly, easier, and faster for businesses and industry. The rule is grounded in law and the latest science and is shaped by public input. The rule does not create any new permitting requirements for agriculture and maintains all previous exemptions and exclusions."

Migratory Bird Treaty Act (16 U.S.C. §§703-712)

The Migratory Bird Treaty Act (MBTA) governs the taking, killing, possession, transportation, and importation of migratory birds, their eggs, parts, and nests (16 U.S.C. § 703(a)). The take of all migratory birds is governed by the MBTA's regulation of taking migratory birds for educational, scientific, and recreational purposes and requiring harvest to be limited to levels that prevent over-utilization. Migratory birds are also protected, as defined in the MBTA, under Section 3513 of the California Fish and Game Code. In addition, Section 3503 of the California Fish and Game Code prohibits the take, possession, or needless destruction of the nest or eggs of any bird, except as otherwise provided by the California Fish and Game Code or other regulations.

Executive Order 13186 (January 11, 2001), which addresses the responsibilities of Federal agencies to protect migratory birds, requires that any project with Federal involvement address the impacts of any associated Federal actions on migratory birds. The order is designed to assist Federal agencies in their efforts to comply with the MBTA and does not constitute any legal authorization to take migratory birds. The order also requires Federal agencies to work with the USFWS to develop a memorandum of understanding (MOU). Protocols developed under the MOU must promote the conservation of migratory bird populations through the following means:

- Avoid and minimize, to the extent practicable, adverse impacts on migratory bird resources when conducting agency actions.
- Restore and enhance habitat of migratory birds, as practicable; and prevent or abate the pollution or detrimental alteration of the environment for the benefit of migratory birds, as practicable

Consistent with the text, purpose, and history of the MBTA, a final rule ([Docket No. FWS–HQ–MB–2018–0090; FF09M22000–201–FXMB1231090BPP0]) was issued on January 7, 2021 that clarifies that activity resulting in unintentional (incidental) injury or death of migratory birds is not prohibited under the MBTA. This rule is intended to provide regulatory certainty to the public, industries, states, tribes, and other stakeholders about implementation of the MBTA and best practices for conservation.

This rule reaffirms the original meaning and intent of the MBTA by making it clear that the USFWS will not prosecute landowners, industry, and other individuals for accidentally killing a migratory bird. This opinion has been adopted by several courts, including the U.S. Court of Appeals for the Fifth Circuit.

This final rule codifies the 2017 Department of the Interior Solicitor's Office Opinion M-37050 to provide a uniform approach that incidental take of birds resulting from an activity is not prohibited when the underlying purpose of that activity is not to take birds. This is consistent with the interpretation of several federal courts, including a 2015 ruling by the Fifth Circuit Court of Appeals. The rule does not take effect until February 6, 2021 and so may be suspended by the incoming Biden Administration. In addition, the 117th Congress may introduce legislation that seeks to clarify the scope of the MBTA at the statutory level. Whether or not incidental take of birds will result in criminal risk exposure therefore remains unsettled for the foreseeable future.

Executive Order 11990 - Protection of Wetlands (42 FR 26961-26965, May 25, 1977)

Executive Order 11990 requires Federal agencies to provide leadership and take action to minimize destruction, loss, or degradation of wetlands and to preserve and enhance the natural qualities of these lands. Federal agencies are required to avoid undertaking or providing support for new construction located in wetlands unless (1) no practicable alternative exists, and (2) all practical measures have been taken to minimize harm to wetlands.

Federal Register (Vol 79, No 180) – Endangered and Threatened Wildlife and Plants; Withdrawal of the Proposed Rule to Remove the Valley Elderberry Longhorn Beetle from the Federal List of Endangered and Threatened Wildlife; Proposed Rule

In 2012, the USFWS proposed to remove the valley elderberry longhorn beetle (VELB) from the Federal list of Endangered and Threatened Wildlife. After further evaluation of new information that became available since publication of that proposal, the USFWS has withdrawn that proposed rule such that the VELB is still considered Federally listed as endangered and threaten. However, they also revised the presumed historical range of the VELB to no longer include the Tulare County. As stated in the 2021 proposed rule change:

> *"With regard to recorded CNDDB observations of valley elderberry longhorn beetle in Tulare County, it is important to note that there is significant uncertainty as to whether the male and female adult beetles observed in that area represent observations of the valley elderberry longhorn beetle or the California elderberry longhorn beetle (CNDDB EOs 63, 66, 128, 154). Based on the distribution map prepared by Chemsak (2005, pp. 6–7) and the discussion (and map) presented in Talley et al. (2006a, pp. 5–6), it is reasonable to conclude that the Tulare County observations likely represent the California elderberry longhorn beetle."*

A copy of the Federal Register and revised map of the VELB range is provided in Appendix D.

3.4.3.2 State

California Environmental Quality Act

Although threatened and endangered species are protected by specific Federal and State statutes, CEQA Guidelines Section 15380(d) provides that a species not listed on the Federal or State list of protected species may be considered rare or endangered if the species can be shown to meet certain criteria. These criteria have been modeled after the definition in FESA and the section of the California Fish and Game Code dealing with rare or endangered plants and animals. These criteria allow a public agency to undertake a review to determine if there would be significant effects to species that have not yet been listed by either the USFWS or CDFW (i.e., Species of Special Concern).

California Endangered Species Act (CESA) (Cal. Fish & Wildlife Code §2050 et seq)

The State of California enacted the California Endangered Species Act (CESA) in 1984 (Cal. Fish & Game Code § 2050 et seq). The CESA is similar to the FESA but pertains to State-listed endangered and

threatened species. It establishes the policy of the State to conserve, protect, restore, and enhance threatened or endangered species and their habitats, and requires lead agencies to consult with the CDFW when preparing CEQA documents to ensure that the Lead Agency actions do not jeopardize the existence of listed species if reasonable and prudent alternatives are available that would avoid jeopardy. CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur, and allows CDFW to identify "reasonable and prudent alternatives" to the Project consistent with conserving the species.

CESA prohibits the taking of State-listed endangered or threatened plant and wildlife species without an authorized take permit from CDFW (Cal. Fish & Game Code §2080). CDFW may authorize taking if an approved habitat management plan or management agreement that avoids or compensates for possible jeopardy is implemented. CDFW requires preparation of mitigation plans in accordance with published guidelines.

For projects that affect both state- and federally listed species, compliance with FESA satisfies CESA, if CDFW determines that the Federal incidental take authorization is consistent with CESA under Fish and Game Code Section 2080.1. For projects that result in a "take" of a State-only listed species, the Lead Agency may apply for a take permit under Fish and Game Code Section 2081(b).

CDFW Species of Concern

In addition to species formally listed under the ESA and the CESA, "species of special concern" receive consideration by CDFW and local lead agencies during the CEQA process. Species that may be considered for review are included on a list of "Species of Special Concern," developed by CDFW. It tracks species in California whose breeding populations in California may be decreasing or facing local extirpation. To avoid the future need to list these species as endangered or threatened, CDFW recommends consideration of these species, which do not yet have any legal status, during analysis of the impacts of projects.

Birds of Prey (Cal. Fish & Wildlife Code § 3503.5)

Birds of prey are also protected in California under provisions of the Fish and Wildlife Code, Section 3503.5, which states that it is "unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (bird-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by this code or any regulation adopted pursuant thereto." Construction disturbance during the breeding season could result in the incidental loss of fertile eggs or nestlings, or otherwise lead to nest abandonment. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "taking" by the CDFW.

Stream Alteration (Cal. Fish & Wildlife Code § 1601 – 1603)

Under Fish and Game Code Sections 1601 – 1603, a lead agency must notify CDFW prior to implementing a project that would divert, obstruct, or change the natural flow, bed, channel, or bank of any river, stream, or lake (Cal. Fish & Game Code §1601-1603). Preliminary notification and project review generally

occur during the environmental process. When an existing fish or wildlife resource may be substantially adversely affected, CDFW is required to propose reasonable project changes to protect the resource. These modifications may be formalized in a Lake and Streambed Alteration Agreement (LSAA).

Porter-Cologne Water Quality Control Act (Water Code 13000 et seq)

The Porter-Cologne Water Quality Control Act charges the SWRCB and nine RWQCBs with protecting water quality throughout California. Typically, the SWRCB and RWQCB act in concert with the ACOE under Section 401 of the CWA in relation to permitting fill of Federally jurisdictional waters (Cal. Water Code §13000 et seq). Waters of the State are defined in Section 13050(e) of the Porter-Cologne Water Quality Control Act as "*…any surface water or groundwater, including saline waters, within the boundaries of the state.*" In cases where an area meets the criteria to be considered a wetland, but the ACOE does not have jurisdiction, the applicant is referred to the appropriate RWQCB. The Porter-Cologne Act contains a complete framework for the regulation of waste discharges to both surface waters and groundwaters of the State through the issuance of Waste Discharge Requirements (WDRs) by the RWQCB.

Surface Mining and Reclamation Act of 1975, as Amended (Public Resources Code 2710-2796)

The Surface Mining and Reclamation Act (SMARA) requires a process of reclamation after mining, which includes maintaining water and air quality, and minimizing flooding, erosion and damage to wildlife and aquatic habitats caused by surface mining. Reclamation activities must comply with the reclamation performance standards prescribed under 14 CCR § 3700-3713. These include performance standards for:

- Financial Assurances (§3702).
- Wildlife Habitat (§3703).
- Backfilling, Regrading, Slope Stability, and Recontouring (§3704).
- Revegetation (§3705).
- Drainage, Diversion Structures, Waterways, and Erosion Control (§3706).
- Prime Agricultural Land Reclamation (§3707).
- Other Agricultural Land (§3708).
- Building, Structure and Equipment Removal (§3709).
- Stream Protection, Including Surface and Groundwater (§3710).
- Topsoil Salvage, Maintenance, and Redistribution (§3711).
- Tailing and Mine Waste Management (§3712).
- Closure of Surface Openings (§3713).

Native Plant Protection Act (Cal. Fish & Wildlife Code § 1900 – 1913)

California's Native Plant Protection Act of 1977 requires all State agencies to use their authority to carry out programs to conserve endangered and rare native plants (Cal. Fish & Game Code § 1900 et seq). Provisions of this Act prohibit the taking of listed plants from the wild and require notification of CDFW at least 10 days in advance of any change in land use which would adversely impact listed plants. This allows CDFW to require the salvaging of listed plant species that would otherwise be destroyed.

3.4.3.3 Local

Tulare County General Plan (2012)

The Tulare County General Plan – 2030 Update (Tulare County, 2012) identifies environmental, social and economic goals for the region, and sets forth policies, standards, and programs to guide physical development within the County. The goals and policies for the protection of wildlife and other biological resources from the General Plan Environmental Resource Management (Chapter 8) element listed below are relevant to the Project.

SECTION 8.1 – BIOLOGICAL RESOURCES

Goal ERM-1: To preserve and protect sensitive significant habitats, enhance biodiversity, and promote healthy ecosystems throughout the County.

Policy ERM-1.1 – Protection of Rare and Endangered Species: The County shall ensure the protection of environmentally sensitive wildlife and plant life, including those species designated as rare, threatened, and/or endangered by state and/or federal government, through compatible land use development.

Policy ERM-1.2 – Development in Environmentally Sensitive Areas: The County shall limit or modify proposed development within areas that contain sensitive habitat for special status species and direct development into less significant habitat areas. Development in natural habitats shall be controlled so as to minimize erosion and maximize beneficial vegetative growth.

Policy ERM-1.4 – Protect Riparian Areas: The County shall protect riparian areas through habitat preservation, designation as open space or recreational land uses, bank stabilization, and development controls.

Policy ERM-1.5 – Riparian Management Plans and Mining Reclamation Plans: The County shall require mining reclamation plans and other management plans to include measures that protect, maintain, and restore riparian resources and habitats.

Policy ERM-1.6 – Management of Wetlands: The County shall support the preservation and management of wetland and riparian plant communities for passive recreation, groundwater recharge, and wildlife habitats.

Policy ERM-1.7 – Planting of Native Vegetation: The County shall encourage the planting of native trees, shrubs, and grasslands in order to preserve the visual integrity of the landscape, provide habitat conditions suitable for native vegetation and wildlife, and ensure that a maximum number and variety of well-adapted plants are maintained.

Policy ERM-1.8 – Open Space Buffers: The County shall require buffer areas between development projects and significant watercourses, riparian vegetation, wetlands, and other sensitive habitats and

natural communities. These buffers should be sufficient to assure the continued existence of the waterways and riparian habitat in their natural state.

Policy ERM-1.12 – Management of Oak Woodland Communities: The County shall support the conservation and management of oak woodland communities and their habitats.

Policy ERM-1.14 – Mitigation and Conservation Banking Program: The County shall support the establishment and administration of a mitigation banking program, including working cooperatively with TCAG, federal, state, not-for-profit and other agencies and groups to evaluate and identify appropriate lands for protection and recovery of threatened and endangered species impacted during the land development process.

Policy ERM-1.15 – Minimize Lighting Impacts: The County shall ensure that lighting associated with new development or facilities (including street lighting, recreational facilities, and parking) shall be designed to prevent artificial lighting from illuminating adjacent natural areas at a level greater than one foot candle above ambient conditions.

Policy ERM-1.16 – Cooperate with Wildlife Agencies: The County shall cooperate with State and federal wildlife agencies to address linkages between habitat areas.

Policy ERM-1.17 – Conservation Plan Coordination: The County shall coordinate with local, state, and federal habitat conservation planning efforts (including Section 10 Habitat Conservation Plan) to protect critical habitat areas that support endangered species and other special-status species.

3.4.4 Significance Thresholds

3.4.4.1 Appendix G Thresholds of Significance

Significant impacts to biological resources would occur if the Project would:

a) *Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;*

b) *Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;*

c) *Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filing, hydrological interruption, or any other means;*

d) *Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;*

e) Conflict with any local policies or ordinances protecting biological resources such as a tree preservation policy or ordinance; or

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional or state habitat conservation plan.

3.4.4.2 Additional Thresholds of Significance

In addition to the CEQA Appendix G criteria described in Section 3.4.4.1, mandatory findings of significance are required under CEQA Guidelines Section 15065 if there is substantial evidence, in light of considering the whole record, that the Project may cause any of the following conditions to occur:

- Substantially reduce the habitat of a fish or wildlife species;
- Cause a fish or wildlife population to drop below self-sustaining levels;
- Threaten to eliminate a plant or animal community; or
- Reduce the number or restrict the range of an endangered, rare, or threatened species.

CEQA Guidelines Section 15380 provides that a plant or animal species may be treated as "endangered, rare, or threatened" even if not on an official list of such species if, for example, it is likely to become endangered or rare in the foreseeable future or can otherwise be shown to meet the criteria for "rare" or "endangered" species.

Other requirements identified in the County policies and plans are addressed by the significance criteria(s) described above. There are no additional thresholds of significance related to the topical environmental issue.

3.4.5 Methodology of Analysis

In this analysis, three (3) components were considered:

- Magnitude of the impact (i.e., substantial/not substantial);
- Uniqueness of the affected resource (i.e., rarity of the resource); and
- Susceptibility of the affected resource to perturbation (i.e., sensitivity of the resource).

The evaluation of the significance of the following impacts considered the interrelationship of these three components. For example, a relatively small magnitude impact to a state or federally listed species would be considered significant, because the species is rare and is believed to be very susceptible to disturbance. Conversely, a plant community such as non-native annual grassland is not necessarily rare or sensitive to disturbance. Therefore, a much larger magnitude of impact would be required to result in a significant impact.

The BSA included the Project site, the existing access road located on the Seaborn site and adjacent areas (within 250-feet). A review was conducted of the available information on special-status species, wildlife habitats, vegetation communities, and waters that are subject to state or federal jurisdiction that are known to occur within the BSA. This review was supplemented with reconnaissance-level field surveys

conducted on May 16, 2011 and September 18, 2013 to validate which of these resources (or other resources) are associated with the Project site. On October 15, 2020, an updated survey was conducted within the BSA that also addressed the access road and adjacent land on the Seaborn site.

Sources of information utilized in the evaluation of biological resources include the following:

- California Natural Diversity Database, Rarefind 5 computer program (CDFW 2021), query for the Woodlake and surrounding Stokes Mtn., Ivanhoe, Exeter, Aukland, Rocky Hill, Shadequarter Mtn., Kaweah, and Chickencoop Canyon California 7.5-minute topographic quadrangles (U.S. Department of the Interior, Geological Survey, 1979 and 1980);
- eBird Data Base (http://ebird.org/ebird/eBirdReports?cmd=Start) (2021);
- Special Vascular Plants, Bryophytes, and Lichens List (CDFW, January 2021);
- Special Animals List (CDFW, July 2020);
- California Native Plant Society Inventory of Rare and Endangered Plants (online edition) (CNPS, 2020);
- The Calflora Database (http://www.calflora.org/) (2020);
- Consortium of California Herbaria (http://ucjeps.berkeley.edu/consortium/) (2020);
- A Manual of California Vegetation (Sawyer, Keeler-Wolf and Evens, 2009);
- Kaweah River Rock Company Revised Draft Environmental Impact Report (Jones & Stokes Associates, Inc., 1997);
- *Tulare Irrigation District McKay Point Reservoir Biological Resources Report, Tulare, California* (Bumgardner Biological Consulting, 2013) (see Appendix D1);
- *Elderberry Inventory Report for the Proposed Reservoir of the Tulare County Irrigation District at McKay Point Near Visalia, California* (Entomological Consulting Services, Ltd., 2014) (see Appendix D3);
- Section 7 Consultation on the McKay Point Check Structures Project, Tulare County, California (SPK-2009-152) (USFWS 2009) (Appendix D and its enclosures); and
- McKay Point Reservoir Project Biological Resources Evaluation, Addendum No. 1 (Bumgardner Biological Consulting, 2021) (see Appendix D2).

A list of special-status species that are likely to occur within the BSA, or be affected by the Project, was derived from a CNDDB query, review of various botanical databases listed above, and the professional experiences and opinions of Bumgardner Biological Consulting. These special-status species are identified in the *Tulare Irrigation District McKay Point Reservoir Biological Resources Report* (Appendix D1) and as updated in the January 2021 Addendum No. 1 (see Appendix D2).

Potential impacts to biological resources from the Project have been assessed based on site reconnaissance surveys to determine what habitats (i.e., vegetation communities, wetlands and other aquatic resources, or other habitat structures) occur within the BSA and comparison with the known ecology and distribution of the special-status species that occur in the region.

The BSA was surveyed by Bumgardner Biological Consulting on May 16, 2011, September 18, 2013, and October 12, 2020. The surveys were conducted on foot as random meander transects such that all portions of the BSA could be effectively evaluated. A search for special-status plant and wildlife species was conducted and focused on local taxa that have been recorded in the CNDDB or CNPS Online Inventory of Rare and Endangered Plants. A reconnaissance-level search for waters with regulatory jurisdiction under the CWA, California Fish and Game Code and/or Porter Cologne Water Quality Control Act was conducted within the Project site boundaries.

An inventory of the resident elderberry plants was conducted in April 2014. Inventory data were collected in accordance with the procedures described in the VELB Conservation Guidelines (USFWS 1999).

A Biological Resources Report (Bumgardner Biological Consulting, 2013) and Elderberry Inventory Report (Entomological Consulting Services, Ltd., 2014) were prepared and are provided in Appendix D, respectively. During personal communication with Dr. Richard A. Arnold, Entomological Consulting Services, Ltd. and Michael Bumgardner, Bumgardner Biological Consulting on March 21, 2016, the USFWS Ruling in the September 17, 2014 Federal Register Rule regarding the range of the VELB was discussed. Both Dr. Arnold and Mr. Bumgardner were in agreement that based on the September 17, 2014 Rule, there would be no potential for the presence of VELB on the Project site.

CEQA requires that projects analyze potential impacts on special-status plant and animal species, as well as on sensitive habitats, wildlife corridors, and waters of the United States. Impacts on wildlife species that are not considered special-status are generally not considered significant unless the impacts are associated with the species' migration or movement routes, other important habitats (e.g., avian nesting rookeries), or the species is considered locally important.

3.4.5.3 Project Design Features and Environmental Protection Measures

Numerous design features, best management practices (BMPs), operating practices and other environmental protection measures have been incorporated into the Project to minimize potential impacts on the environment. Some of the protective measures that directly relate to biological resources are as follows:

1. Employee training programs will be conducted to educate personnel of sensitivity issues including but not limited to biological resources/habitat resources.
2. Operations would occur primarily during daylight hours. Operations during the time of year when daylight hours are shorter, or for any evening/nighttime operations, would require lighting to provide a safe operating environment. For evening/nighttime lighting, high pressure sodium

and/or cut-off fixtures (or equivalent International Dark-Sky Association [IDA]-approved fixtures) would be used instead of mercury-vapor fixtures for any required nighttime lighting. The lighting would also be designed to confine illumination to the Project site, and/or to areas that do not include light-sensitive uses.

3. BMPs (e.g., gravel bag or rock check dams along drainage swales, silt fencing or fiber rolls to contain drainage and sediment, lined swales, etc.) would be implemented to prevent stormwater runoff in accordance with the Project Storm Water Pollution Prevention Plan (SWPPP).

4. Blasting would not be used for the excavation phase of the Project.

5. A Protection and Monitoring Plan would be prepared, if necessary, to address the mitigation measures identified below in Section 3.4.6.

3.4.6 Project-Level Impacts and Mitigation Measures

3.4.6.1 Adverse Effects on Special-Status Species

Impact Statement

Impact BIO-1: *Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?* **(CEQA Guidelines Threshold Criteria (a))**

Impact Analysis

Much of the native vegetation within the BSA has been replaced by introduced species or has been eliminated due to past cattle grazing activities. As discussed in Section 3.4.2.3 and/or shown on Table 3.4-1, there were no special-status plant species observed within the BSA. However, 2 sensitive vegetation communities were documented as occurring within the BSA, while 15 special-status species of wildlife were considered to have some potential to occur within the BSA. As shown on Figures 2-4 and 2-5 in Section 2.0 – Project Description, the Project is set back approximately 100-feet or more from the banks of the rivers, except for the inlet and outlet channel locations.

The following impact statements address potential impacts to special-status invertebrates, reptiles, birds, and mammals as well as all nesting birds (raptor and non-raptor species).

Special-Status Nesting Birds

The BSA may support nesting by various species of birds. Though most nesting birds within the BSA are expected to utilize the mixed oak-riparian woodland, nesting may occur in the elderberry savannah or annual grassland. Direct effects to nesting birds could occur as a result of construction activities that remove active nests. Indirect effects to nesting birds could occur as a result of construction activities that cause either abandonment or inattention at the nest for long periods of time. The latter allows for predation or other sources of mortality (e.g., loss of eggs or juveniles from extreme cold or heat) that can contribute to nest failure. Non-raptor special-status birds considered to have some potential, albeit low,

to occur within the BSA include loggerhead shrike, oak titmouse, and Lawrence's goldfinch. The Project could result in direct or indirect impacts to one or more of these species.

By removing potential nesting habitat prior to the nesting season (non-nesting season), the potential impacts to nesting birds can be reduced to a Less than Significant Impact. The non-nesting season is considered to be August 15 to February 15 for all birds potentially affected by the Project. Removal of the vegetation (i.e., rough grading) earlier in the non-nesting season (i.e., prior to January 1) could potentially allow the vegetation to recover by the time birds in the area initiate nesting activities. Thus, it is best to remove potential nesting habitat later in the non-nesting season (January 1 to February 15) to discourage birds from nesting on the site during the early part of the nesting season.

If construction is initiated during the nesting season (February 15 through August 15), the Owner's shall conduct a pre-construction nesting bird survey by a qualified wildlife biologist (approved by CDFW and TID) prior to any site preparation activities in association with any phase.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure BIO-1: *The following avoidance and minimization efforts shall be used as methods to avoid accidental take of all native nesting birds as a result of the Project. During all Project activities, the Owners shall use the following mitigation measures to minimize impacts to all native nesting birds:*

1. *The Owners shall rough grade all annual grassland and elderberry savannah within the construction footprint of the Project during the end of the non-nesting season (January 1 through February 15) of the year in which construction starts to ensure that there is no available nesting habitat for birds in these onsite habitats.*
2. *If construction is initiated during the nesting season (February 15 through August 15), the Owner's shall conduct a pre-construction nesting bird survey by a qualified wildlife biologist (approved by CDFW and TID) prior to any site preparation activities in association with any phase.*

   The surveys shall be conducted 30 days prior any site preparation activities (vegetation clearing) and again no later than three days prior to any site preparation activities (vegetation clearing). The survey shall be conducted within all onsite habitats that could support nests and are within 120 feet or less of proposed construction activities. All active nests that are found during the survey will be geo-referenced with a global positioning system (GPS) unit and mapped on an appropriate scale map of the Project site (no smaller than 1 inch = 40 feet). Data will be collected for each active nest site and at a minimum will include: (1) identification of nesting species; (2) description of nest site; (3) estimated nesting

cycle status (i.e., time to nest completion, egg-laying, fledging, etc.); and (4) likelihood of nest failure from adjacent project-related activities.

Results of surveys, including negative findings, shall be submitted to CDFW within three days of their conclusion. If any special-status species are present onsite, the Owners shall develop and implement a plan for the protection of these species, to be approved by CDFW in a timely manner. The results of any protective measures instituted as a part of the protection and monitoring plan shall be provided to CDFW in electronic format within one week of implementation. The Owners shall be responsible for reporting all observations of special-status species to CNDDB within ten (10) days of sighting.

3. *All active nests found during the preconstruction survey will be monitored at least twice per week to assess whether adjacent project-related activities are adversely affecting the nest. If adverse effects are observed, all Project-related activities within 120 feet of the nest will be temporarily halted until fledging occurs (i.e., the juveniles are no longer dependent upon the nest).*
4. *No preconstruction nesting bird survey is required in areas within 120 feet of construction activities, if construction is initiated in the non-nesting season (August 15 to February 15).*

Level of Significance after Mitigation

Less than significant.

Special-Status Nesting Birds

The BSA may support nesting by various species of birds (including raptors). Raptors (birds in the orders Falconiformes, diurnal birds of prey, or Strigiformes, nocturnal birds of prey) are addressed separately from other nesting birds, given that they are subject to more rigorous regulatory protection, and the potential indirect effects to these species may occur over longer distances than occurs with other birds. As with other nesting birds, indirect effects to nesting raptors could occur as a result of construction activities that cause either abandonment or inattention at the nest for long periods of time. The latter allows for predation or other sources of mortality (e.g., loss of eggs or juveniles from extreme cold or heat) that result in nest failure. Direct effects to nesting raptors could occur as a result of construction activities that remove active nests. Special-status raptors considered to have some potential, albeit low, to occur within the BSA include Cooper's hawk, white-tailed kite, and burrowing owl. The Project could result in direct or indirect impacts to one or more of these species as well as species such as red-tailed hawk and red-shouldered hawk (species only afforded protection under pertinent sections of the California Fish and Game Code).

Level of Significance before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure BIO-2: *The following measures shall be used to avoid or minimize indirect effects to nesting raptors as a result of the Project:*

1. *If construction is initiated during the nesting season (between February 15 and August 15), the Owners shall conduct a pre-construction nesting raptor survey by a qualified wildlife biologist (approved by CDFW and TID) prior to any site preparation activities in association with any phase.*

   The surveys shall be conducted 30 days prior any site preparation activities (vegetation clearing) and again no later than three days prior to any site preparation activities (vegetation clearing). The survey shall be conducted within all onsite areas that could support nests and are within 300-feet or less of proposed construction activities. All active nests that are found during the survey will be geo-referenced with a global positioning system (GPS) unit and mapped on an appropriate scale map of the Project site (no smaller than 1 inch = 100 feet). Data will be collected for each active nest site and at a minimum will include: (1) identification of nesting species; (2) description of nest site; (3) estimated nesting cycle status (i.e., time to nest completion, egg-laying, fledging, etc.); and (4) likelihood of nest failure from adjacent project-related activities.

   Results of surveys, including negative findings, shall be submitted to CDFW within three days of their conclusion. If any sensitive species are present onsite, the Owners shall develop and implement a plan for the protection of these species, to be approved by CDFW in a timely manner. The results of any protective measures instituted as a part of the protection and monitoring plan shall be provided to CDFW in electronic format within one week of implementation. The Owners shall be responsible for reporting all observations of special-status species to the CNDDB within ten (10) days of sighting.

2. *All active raptor nests found during the preconstruction survey will be monitored at least twice per week to assess whether adjacent project-related activities are adversely affecting the nest. If adverse effects are observed, all Project-related activities within 300-feet of the nest will be temporarily halted until fledging occurs (i.e., the juveniles are no longer dependent upon the nest).*

3. *No preconstruction nesting raptor survey is required in areas within 300-feet of construction activities, if construction is initiated in the non-nesting season (August 15 to February 15).*

Level of Significance after Mitigation

Less than significant.

Western Pond Turtle or Northern California Legless Lizard

The reaches of the Lower Kaweah River and St. Johns River that are adjacent to the BSA may provide habitat for western pond turtle. No occurrences of this species have been documented near the BSA nor was it observed during the surveys conducted by Bumgardner Biological Consulting. However, the species

has been documented both upstream and downstream in the watersheds of these two rivers. As such, its presence within the BSA cannot be discounted, though it is projected to have a low likelihood of occurrence at or adjacent to the Project site. Individuals could then be injured or killed during construction activities in and on the banks of the rivers. Furthermore, the BSA provides potential nesting habitat and nests (i.e., eggs) could be unearthed and destroyed during construction activities (particularly grading and earth-moving). Therefore, the Project could result in direct or indirect effects to western pond turtles.

The sandy loam soils within the BSA may provide habitat for Northern California legless lizard. No occurrences of this fossorial (i.e., subterranean) species have been documented near the BSA nor was it observed during the surveys conducted by Bumgardner Biological Consulting. However, the species has been documented downstream in the Kaweah River corridor. As such, its presence within the BSA cannot be discounted, though it is projected to have a low likelihood of occurrence at or adjacent to the Project site. Nonetheless, individuals could be injured or killed during construction activities in suitable habitat.

Level of Significance before Mitigation

Potentially significant

Mitigation Measures

Mitigation Measure BIO-3: *The following measures shall be used to avoid or minimize direct effects to western pond turtle as a result of the Project:*

1. *The Owners shall conduct a preconstruction survey for western pond turtle by a qualified wildlife biologist (approved by CDFW and TID) along the adjacent reaches of the Lower Kaweah River and St. Johns River. The survey shall be conducted by a qualified biologist within three days of the initiation of construction on those portions of the Project that occur in the rivers, or on their adjacent banks (if there is flowing or standing water in these reaches). If turtles are observed during the preconstruction survey, and a qualified biologist determines construction activities could harm the turtles, the qualified biologist shall conduct the salvage and relocation of turtles downstream to the nearest appropriate aquatic habitat during the same day of their capture. The aquatic habitat to which the turtles are being relocated shall be less than one (1) mile downstream of the Project.*
2. *All construction staff shall be aware of the potential to uncover western pond turtle nests or during grading and earthmoving activities involving the top 12 inches of soil. Construction staff shall be advised, if turtle eggs are discovered during such activities, construction shall be temporarily halted until a qualified biologist can evaluate the site and egg scatter. Construction staff shall be responsible for covering the eggs with a small layer of sand or soil (to prevent damage or overheating) prior to the arrival of the qualified biologist. The qualified biologist will then salvage the eggs and transport them to a nearby wildlife rehabilitation center that has been approved in advance by the CDFW. Release of any*

hatchling turtles from the wildlife rehabilitation center shall occur in either the Kaweah or St. Johns rivers in appropriate aquatic habitat.

3. *All construction staff shall be aware of the potential to uncover Northern California legless lizards during grading and earthmoving activities involving the top 12 inches of soil. Therefore, monitoring for Northern California legless lizards shall be conducted concurrently with monitoring for western pond turtle nests. Construction staff shall be advised, if Northern California legless lizards are discovered during such activities, construction shall be temporarily halted until the individual can be captured by hand and placed in a lidded two-gallon bucket containing no less than three inches of moist soil from the location of capture. Construction staff shall be responsible for placing the bucket in a continuously cool, shaded, and protected location until the arrival of a qualified biologist. The qualified biologist will then relocate the individual(s) to an adjacent location at least 100 feet beyond the boundaries of the Project that has been approved in advance by the CDFW.*

Level of Significance after Mitigation

Less than significant.

Special-Status Invertebrate Species

The Project site has some potential, albeit low, to support Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, and Tulare cuckoo wasp. The ecology of each of these species is poorly known, but they have all been recorded in the general vicinity of the Project site. Consequently, construction activities associated with the Project could result in the loss of populations of one or more of these species. The Project could result in direct or indirect effects to special-status invertebrate species.

Valley elderberry longhorn beetle (VELB) was previously considered to be a special-status invertebrate species that could be affected by the Project. However, the USFWS published a Final Rule in the September 17, 2014 Federal Register indicating that all previous occurrences in Tulare County that had been attributed to VELB are the non-listed "sister" subspecies *Desmocerus californicus californicus*. Hence, no impacts to VELB would occur as a result of the Project.

Level of Significance before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure BIO-4: *The following measures shall be used to compensate for direct and indirect effects to Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, or Tulare cuckoo wasp as a result of the Project:*

1. *The Owners shall conduct preconstruction surveys for Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, and Tulare cuckoo wasp during the known active season of each of these species prior to the commencement of construction activities. The survey shall*

be conducted by a qualified biologist within all onsite habitats that could support these species.

2. *If individuals of Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, or Tulare cuckoo wasp are found during the preconstruction survey, pertinent data regarding the associated habitat (e.g., vegetation communities, soils, associated invertebrate species, etc.) shall be collected to better understand the ecology of the species.*
3. *All pertinent data collected during the preconstruction survey shall be included in the information submitted to the CNDDB along with the new occurrence record. Results of surveys, including negative findings, shall be submitted to CDFW within three days of their conclusion. If any of these special-status invertebrates are found to be present onsite, the Owners shall develop and implement a plan for the protection of the species, to be approved by CDFW in a timely manner. The results of any protective measures instituted as a part of the protection and monitoring plan shall be provided to CDFW in electronic format within one week of implementation. The Owners shall be responsible for reporting all observations of special-status species to the CNDDB within ten (10) days of sighting.*
4. *If individuals of Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, or Tulare cuckoo wasp are found during the preconstruction survey, an impact avoidance and minimization plan shall be developed and implemented for the species onsite. The plan will focus on temporary or permanent avoidance of occupied habitat where feasible using exclusionary fencing (temporary or permanent). Where avoidance is not feasible impacts shall be minimized through onsite biological monitoring. The onsite biological monitor shall have authority to temporarily halt any work that would directly impact occupied habitat and determine if a smaller impact footprint is feasible. Work shall then resume after concurrence on the necessary impact footprint.*

Level of Significance after Mitigation

Less than significant.

San Joaquin Kit Fox

The BSA has some potential, albeit low given the distribution of known occurrences in the project vicinity, to support San Joaquin kit fox. However, this potential is limited to lands adjacent to the existing access road in the northwestern portion of the Seaborn site where there is documented California ground squirrel activity and burrows. There is no California ground squirrel activity associated with the Project site given that the onsite sandy soils are unsuitable for burrow construction. It should be noted that the environmental baseline for San Joaquin kit fox on the Seaborn site would only change regarding on-road haul truck trips. Therefore, potential impacts to San Joaquin kit fox are considered limited to the increase in number of on-road haul truck trip and San Joaquin kit foxes being hit by on-road haul trucks utilizing the access road. The Project could then result in direct effects to San Joaquin kit fox. However, it should be noted that the Project would not result in an increase from the baseline number of on-road haul trucks.

Regardless, Mitigation Measure BIO-5 would provide additional protection measures to the San Joaquin kit fox.

Level of Significance before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure BIO-5: *The following measures shall be used to avoid or minimize direct effects to San Joaquin kit fox as a result of the Project:*

1. *On-road haul truck trips to and from the Project site shall be limited to the period 0.5 hours prior to sunrise to 0.5 hours after sunset.*
2. *On-road haul trucks and other vehicles utilizing the existing access road on the Seaborn site shall be limited to a maximum speed of 10 miles per hour.*
3. *The entry into the Seaborn site on the existing access road shall be signed as follows "Watch for Wildlife Crossing the Road." The sign shall be a minimum of 4-feet by 4-feet in size with minimum 12-inch block letters.*

Level of Significance after Mitigation

Less than significant.

Fencing Effects on Wildlife

At the request of CDFW, potential impacts due to the use of Project fencing were evaluated and it was determined that fencing materials could be harmful to wildlife, or result in wildlife becoming trapped, resulting in injury or mortality. For example, birds and reptiles sometimes seek out hollow metal fence posts in which to reside and then become trapped, resulting in mortality. In addition, raptor's talons can become entrapped within the bolt holes of metal fence stakes resulting in injury or mortality. Lastly, erosion protection such as wattles encased in plastic/nylon netting can result in entrapment of snakes and lizards. Ultimately resulting in injury or mortality of individuals.

Level of Significance before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure BIO-6: *To avoid wildlife injury or mortality related to fencing materials, all hollow fence posts shall be capped and all empty bolt holes in metal fence posts shall be plugged. The use of sharp fencing materials is prohibited, including, but not limited to, spikes, glass, razor, or barbed wire. The use of erosion-protection materials using plastic/nylon netting is prohibited.*

Level of Significance after Mitigation

Less than significant.

3.4.6.2 Adverse Effects on Riparian and Other Critical / Special-Status Habitats

Impact Statement

Impact BIO-2: *Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?* **(CEQA Guidelines Threshold Criteria (b))**

Impact Analysis

The BSA supports, mixed oak-riparian woodland and elderberry savannah, both considered sensitive vegetation communities. Tulare County has determined that such vegetation communities are an important resource that should be protected and/or conserved, where feasible. Applicable General Plan policies (see Section 3.4.3.3) that address oak and riparian resources include the following:

- **Policy ERM-1.4 – Protect Riparian Areas:** The County shall protect riparian areas through habitat preservation, designation as open space or recreational land uses, bank stabilization, and development controls.
- **Policy ERM-1.5 – Riparian Management Plans and Mining Reclamation Plans:** The County shall require that mining reclamation plans, and other management plans include measures to protect, maintain and restore riparian resources and habitats.
- **Policy ERM-1.6 – Management of Wetlands:** The County shall support the preservation and management of wetland and riparian plant communities for passive recreation, groundwater recharge, and wildlife habitats.
- **Policy ERM-1.12 – Management of Oak Woodland Communities:** The County shall support the conservation and management of oak woodland communities and their habitats.

The Project is designed to minimize the removal of the oak-riparian woodland, as can be seen by comparing the area of proposed excavation shown with the mixed oak-riparian woodland shown on Figure 3.4-1. Except for the limited area associated with the inlet channel, the Project boundaries would be significantly pulled back to provide protection to the oak-riparian habitat. The Project boundaries would also be pulled back by approximately 100-feet along the rest of the riverbank to protect the riparian vegetation (except for the limited area of the outlet channel). In addition, the inflow and outflow channels would remove some riparian vegetation; however, as discussed in Impact Statement BIO-3 below because the rivers are considered jurisdictional waters, disturbance of these areas would require consultation and approval from the ACOE and CDFW; therefore, providing further protection to these habitats.

As previously discussed, the elderberry savannah is not potential habitat for the VELB. Therefore, the Project would not have a substantial adverse effect on any riparian or other sensitive natural community identified in local or regional plans, policies, or regulations by CDFW or USFWS.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

> ***Mitigation Measure BIO-7:*** *The Owners shall prepare and implement an Oak-Riparian Habitat Management Plan that identifies the management areas and requires any excavation to remain outside of those identified areas. It will also require that the construction of the reservoir inlet and outlet channels be located and built in such a manner to minimize loss of habitat.*

Level of Significance after Mitigation

Less than significant.

3.4.6.3 Adverse Effects on Wetlands

Impact Statement

Impact BIO-3*: Would the Project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filing, hydrological interruption, or any other means?* **(CEQA Guidelines Threshold Criteria (c))**

Impact Analysis

A reconnaissance-level search for waters with regulatory jurisdiction under the CWA, California Fish, and Game Code and/or Porter Cologne Act within the Project site boundaries was conducted by BBC during the biological site surveys. As discussed in Section 3.4.2.3, BBC notes the Project site includes waters that are subject to state and federal jurisdiction. These waters, Lower Kaweah River and St. Johns River, would receive fill associated with the construction of the Inflow and Outflow Channels of the Project. As such, both the riverbed/riverbank, as well as any riparian vegetation within the immediate construction area would be affected by the Project. The Project would remove riparian vegetation and could result in fill of jurisdictional waters.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

None required.

Mitigation Measure BIO-8*: The following measures shall be used to avoid, minimize, or compensate for fill of jurisdictional waters and the removal of riparian vegetation as a result of the Project:*

1. *The Owners shall consult with the RWQCB and if determined necessary, submit Section 401/404 permit applications for fill of jurisdictional waters of the United States that includes a Wetland Protection and Compensation Plan. At a minimum, the wetland protection and compensation plan shall require 3:1 compensation for permanent effects to jurisdictional waters of the United States and 1:1 compensation for temporary effects to jurisdictional waters of the United States.*
2. *The Owners shall submit an application for fill of waters subject to the jurisdiction of the CDFW (i.e., long-term lake and streambed alteration agreement). The application shall include a Wetland Protection and Compensation Plan that, at a minimum, requires 3:1 compensation for permanent effects and 1:1 compensation for temporary effects to waters under the jurisdiction of the State.*

Level of Significance after Mitigation

Less than significant.

3.4.6.4 Conflict with Movement of Migratory Fish or Wildlife Species

Impact Statement

Impact BIO-4*: Would the Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?* (**CEQA Guidelines Threshold Criteria (d))**

Impact Analysis

As previously noted, much of the river corridor that is within the BSA has little vegetative cover, which likely limits the movement of some species through the area. However, given the adjacent open space, passage by other species still occurs along the river under cover of darkness, despite the lack of vegetation. In addition, there are no established native resident or migratory wildlife corridors within or adjacent to the BSA, nor are there known native wildlife nursery sites within the BSA.

Because the Project is set back from the adjacent rivers (as illustrated in Figures 2-4 and 2-5 in Section 2.0 – Project Description), it does not provide a substantive barrier to wildlife movement along the river corridor. Because the bottom of the inlet and outlet channels are below the grade of the bottom of the river channel, there would be water in the inlet and outlet channels when there is water in the rivers. However, there are alternative ways to move east and west through the area such as the perimeter road that goes over the inlet and outlet structures and also by going around the BSA and CEMEX Lemon Cove Facility to the north.

Therefore, the Project would not interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.4.6.5 Interference with Biological Resource Policies or Ordinances

Impact Statement

Impact BIO-5: *Would the Project conflict with any local policies or ordinances protecting biological resources such as a tree preservation policy or ordinance?* (**CEQA Guidelines Threshold Criteria (e))**

Impact Analysis

Applicable General Plan policies that address biological resources are discussed in Section 3.4.3.3 above, and a consistency analysis is provided in Table 3.8-2 in Section 3.8 – Land Use. The following are the primary policies that affect the Project in regard to biological resources:

- **Policy ERM-1.4 – Protect Riparian Areas:** The County shall protect riparian areas through habitat preservation, designation as open space or recreational land uses, bank stabilization, and development controls.
- **Policy ERM-1.5 – Riparian Management Plans and Mining Reclamation Plans:** The County shall require that mining reclamation plans, and other management plans include measures to protect, maintain and restore riparian resources and habitats.
- **Policy ERM-1.6 – Management of Wetlands:** The County shall support the preservation and management of wetland and riparian plant communities for passive recreation, groundwater recharge, and wildlife habitats.
- **Policy ERM-1.12 – Management of Oak Woodland Communities:** The County shall support the conservation and management of oak woodland communities and their habitats.

As discussed above in Section 3.4.6.2 and addressed in Table 3.8-2, the Project would not conflict with any local policies or ordinances protecting biological resources.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.4.6.6 Conflict with Habitat Conservation Plans

Impact Statement

Impact BIO-6: *Would the Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional or state habitat conservation plan?* **(CEQA Guidelines Threshold Criteria (f))**

Impact Analysis

There are no approved habitat conservation plans, natural community conservation plans, or other approved local, regional, or state habitat conservation plans that include the BSA. As such, the Project would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan.

Level of Significance Before Mitigation

No impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.4.7 Cumulative-Level Impacts and Mitigation Measures

Table 3.0-1 identifies the other projects in the County to be considered in regards to potential cumulative impacts. Figure 3.0-1 provides the location of the cumulative projects in relation to the Project site. As discussed in the impact analysis above, the Project was determined to have a less than significant impact or less than significant impact after mitigation. Since the Project would present less than significant impacts related to biological resources, there would be no cumulative impact in conjunction with the other cumulative projects.

A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) Planning Branch. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects and are listed in Table 3.0-1 and their location provided in illustrated Figure 3.0-1, both of which appear in Section 3.0 – Environmental Impact Analysis.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to biological resources.

The majority of the cumulative projects provided by the County are located some distance from the Project and involve activities that are not similar to the Project, such as minor divisions of land, rezoning, or amendments to the General Plan. Therefore, these projects are not considered to have a potential cumulative impact on biological resources.

Cumulative projects numbers 18 through 22 are existing and/or approved mining projects in the immediate vicinity of the Project. These projects have completed their entitlement phase and as part of the evaluation process the applicants were required to analyze their project's impacts and conduct field surveys to evaluate potential impacts to biological resources. Potential impacts were found to be less than significant. In addition, projects 18 through 20 are existing and their operations have been included in the baseline for this Project.

As discussed in this section, the Project impacts are either less than significant or significant, but mitigated to less than significant. Therefore, the Project's contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts to biological resources.

3.5 CULTURAL RESOURCES

3.5.1 Introduction

This section of the DEIR describes the cultural and historical resources identified within the cultural study area, evaluates the potential effects that the Project may have on these resources, and identifies mitigation measures to address potentially significant impacts. The primary source used in this evaluation was the Cultural Resource Investigation (Applied EarthWorks, Inc., 2013, Updated 2021) for the McKay Point Reservoir Project prepared by Applied EarthWorks, Inc. (*Æ*). Copies of the 2013 Cultural Resource Investigation and the 2021 Addendum are provided in Appendix E.

3.5.2 Environmental Setting

The following descriptions refer to cultural and historical resources that may be found in the region, vicinity and on the Project site. Cultural resources consist of remains and sites associated with past human activities. These include prehistoric Native American archaeological sites, historic archaeological sites, and historic sites, buildings, structures or objects. They also include traditional cultural properties or areas such as Native American sacred sites that have been, and often continue to be, of special economic and/or religious significance.

Historical resources are generally those associated with periods of recorded history, often in connection with European settlement of North America. Some historical resource sites can also be of cultural significance to contemporary Native Americans or other ethnic groups because they contain objects or elements important to their cultural heritage. Significant historical resources and traditional cultural properties are afforded a measure of protection under existing Federal, State and local laws.

The Cultural Resource Investigation characterizes the Project setting in terms of the natural environment, local prehistory, ethnography and history.

3.5.2.1 Regional Setting

The Project is located in the San Joaquin Valley, the southern half of an elongated trough called the Central Valley. The Central Valley is a 50-mile-wide lowland that extends approximately 500 miles from the Cascade Range to the Tehachapi Mountains (Applied EarthWorks, Inc., 2013, Updated 2021). The Central Valley is divided into two (2) unequally sized lobes separated by the Stockton fault. The northern lobe is the Sacramento Valley, drained by the Sacramento River, whereas the southern lobe is the San Joaquin Valley, drained by the San Joaquin River. The southeastern end of the San Joaquin Valley contains the now dry Tulare–Buena Vista–Kern Lake basin.

The San Joaquin Valley is bound by the Sacramento/San Joaquin River Delta to the north, the Sierra Nevada to the east, the Coast Ranges to the west, and the Tehachapi Mountains to the south. The San Joaquin Valley comprises two (2) distinct hydrologic subbasins: the San Joaquin and the Tulare. The San Joaquin subbasin is drained by the San Joaquin River. The Tulare subbasin has no regular surface outlet; it was formed by the merging of alluvial fans from the Kings River to the east and Los Gatos Creek to the

west (Applied EarthWorks, Inc., 2013, Updated 2021). The Tulare subbasin rivers—the Kings, Kaweah, Tule, and Kern—flowed into the subbasin, forming large inland lakes. Tulare Lake, approximately 30 miles southeast of the Project area, was an extremely shallow seasonal lake that expanded horizontally across the flat landscape as it filled with winter and spring runoff. It's broad yet shallow dimensions resulted in wide fluctuations of the lake's shoreline during both prehistoric and historical times. As it filled beyond its natural alluvial barriers, water was channeled down the Fresno Slough into the San Joaquin River. Tulare Lake was the largest naturally occurring lake in California as recently as 1920 (Applied EarthWorks, Inc., 2013, Updated 2021). The size of the lake was gradually reduced by the historical development of irrigation systems and the reclamation of water from the Kings River and other sources. Today, Tulare Lake only exists in times of flooding, and the deep reserve of groundwater is tapped for private and public use.

The Project area is located on the north side of the confluence of the St. Johns River and the Lower Kaweah River, near Woodlake in Tulare County. The Kaweah River flows from a canyon in the Sierra Nevada approximately 3 miles to the northeast. The Kaweah is one of a number of rivers (including the Kern, Tule, and Kings) that deposit low-gradient fans along the eastern San Joaquin Valley and drain the western slopes of the Sierra Nevada range. The development of agriculture within the Project area resulted in the replacement of native plants and animals with domesticated species. Elevations in the Project area range between 450- and 470-feet above mean sea level (amsl).

Several branch streams (including the St. Johns River) diverge from the Kaweah River soon after it exits the canyon at the head of a large low-gradient alluvial fan commonly referred to as the Kaweah Delta. The river is now dammed, and water flow is highly regulated; however, many of the formerly natural channels are still evident. Additionally, sloughs, abandoned channels, and overflow channels further connect or distribute water across the lower portion of the alluvial fan. Between channels are large masses of recently vegetated alluvium, rapidly aggrading due to the cohesive nature of fine particles and root binding by vegetation (Applied EarthWorks, Inc., 2013, Updated 2021). This hydrological system has been highly modified by channelization and water control in the valley, and some drainages (including the St. Johns River) flow only seasonally, if at all.

Regionally, natural conditions and resources have greatly influenced human occupation and resource utilization. The presence of archaeological and historic resources would generally be most likely along rivers and streams and in other areas with ground cover or other features which could have invited and sustained habitation. Extensive accounts of California and local prehistory, ethnography, and history are provided below and in the Cultural Resource Investigation (Applied EarthWorks, Inc., 2013, Updated 2021) in Appendix E1.

Prehistoric Context

Relatively few research-oriented archaeological investigations have been conducted in the Central Valley south of the Stockton area, and synthesized information on prehistoric events in the area is sparse. Nonetheless, archaeological work performed within the Kaweah River drainage, and specifically a few

miles to the east at Lake Kaweah provides valuable information germane to regional prehistory. Further information comes from excavations performed in the mountains and hills to the south and southeast (Applied EarthWorks, Inc., 2013, Updated 2021).

The first large-scale excavations in the southern San Joaquin Valley were conducted near Tulare and Kern Lakes by Gifford and Schenck, who unearthed flexed burials, pottery, obsidian arrow points, milling stones and mortars, and intricately fashioned steatite artifacts. In the late 1940s, Riddell (Applied EarthWorks, Inc., 2013, Updated 2021) investigated a Yokuts cemetery near the town of Delano. The graves contained Euro-American items along with shell ornamentation, flaked stone tools, and steatite artifacts. Less than 10 years later, a team of archaeologists from University of California, Los Angeles, excavated another burial site at the edge of former Tulare Lake approximately 29 miles west of the Project.

Later archaeological investigations at Kern and Tulare lakes revealed that occupation occurred possibly as early as 11,000 years before present (B.P.). The Witt Site on the southwest shore of Tulare Lake contains fluted projectile points as well as later types, suggesting continuous occupation of the basin from Paleoindian times until historical contact (Applied EarthWorks, Inc., 2013, Updated 2021).

Excavation of a prehistoric site at Buena Vista Lake, found a deeply-buried component ascribed to the Western Pluvial Lakes Tradition that dated from circa 11,500–7500 B.P. Population density was low at that time, with a few settlements focused around the shores of ancient lakes. Between 8000 and 4000 B.P., the prehistoric economy centered on hunting and fishing, although mortars and pestles as well as Olivella and Haliotis shell beads and ornaments appear in some assemblages. Although populations may have centered on the lakes, there is some evidence for use of the mountains of eastern Tulare County as early as 6000 B.P. by small, highly mobile parties who repeatedly visited specific resource procurement areas (Applied EarthWorks, Inc., 2013, Updated 2021).

Beginning about 4000 B.P., the subsistence base expanded to include seed processing. Sites dating to this period contain assemblages comparable to the roughly coeval Early Horizon components of the Sacramento–San Joaquin Delta region (e.g., extended burials with grave goods, Pinto series projectile points, time-diagnostic Haliotis and Olivella beads as well as ornaments and charmstones). It is difficult to clearly determine the ancestry of these early peoples, although artifact assemblages associated with occupations postdating 3000 B.P. may be linked to the ancestors of the ethnographic Yokuts. The latest period of occupation, from 1500 B.P. to historic contact, indicates a greater reliance on acorns and other plant foods as well as trade with the Central Coast region and Southern California interior (Applied EarthWorks, Inc., 2013, Updated 2021).

Chronological data from research conducted within the Kaweah River drainage to the east of the Project area is limited as few radiocarbon dates, obsidian hydration measurements, or time-diagnostic artifacts have been collected or reported. Available data suggest that occupation of the Lake Kaweah area began around 2500 B.P., although it is likely that earlier occupations are simply unrecognized (Applied EarthWorks, Inc., 2013, Updated 2021).

The Kaweah River drainage generally, and the location currently covered by Lake Kaweah specifically, was well-populated in late prehistory. Some ethnohistoric period estimates place the population as high as 2,400 individuals. The area supported a large variety of site types, including villages, cemeteries, bedrock milling stations, hunting blinds and traps, and rock art. The settlement system appears to have centered on villages, occupied most or all of the year, from which small groups (likely families) would radiate out to gather resources at seasonal camps and special-use sites (e.g., hunting locations, acorn gathering spots, etc.) (Applied EarthWorks, Inc., 2013, Updated 2021).

The identity of the prehistoric occupants of the Lake Kaweah area is open to some interpretation. Several sites indicate cemetery burials in keeping with late prehistoric and ethnohistoric Yokuts traditions. However, other sites contain cremations and burials in house floors. This may indicate retention of earlier burial practices within the Lake Kaweah area, or it may indicate that the area was occupied by both Yokuts and Mono peoples. This latter hypothesis is further supported by local rock art, which appears to be more similar to known Mono styles than to that of the Yokuts. Moreover, pottery, an innovation often attributed to the Mono, is relatively abundant in Lake Kaweah sites, while steatite vessels more common in the western Yokuts sites are rare (Applied EarthWorks, Inc., 2013, Updated 2021). While, the ethnographic record indicates that the region was populated by Yokuts people, the aggregate data seem to suggest that either the Yokuts population regularly interacted with and shared many traits of the neighboring Mono population, or that the area prehistorically was used by both groups.

Ethnographic Context

The Project area is within the homeland of the Gáwea (or Kaweah) Yokuts, one of the many autonomous tribes that make up the Southern Valley Yokuts ethnolinguistic group. At the time of first contact with the Spanish missionaries, the Yokuts people, including northern valley and foothill groups, collectively inhabited the San Joaquin Valley as well as the eastern foothills of the Sierra Nevada from the Calaveras River southward to the Kern River (Applied EarthWorks, Inc., 2013, Updated 2021).

The basic unit of Yokuts society was the nuclear family, which was identified with a totem symbol specific to the paternal line. Within each tribe, lineage totems were further grouped into one of two moieties, designated by the overarching symbols of the eagle and coyote. The basic political unit was the tribe or tribelet, which encompassed a single village or several settlements (Applied EarthWorks, Inc., 2013, Updated 2021).

Tulare Lake and its tributary rivers, including the Kaweah and the St. Johns, were a central part of Southern Valley Yokuts subsistence, providing food, building material, and avenues of travel for small watercraft. Not surprisingly, most Yokuts villages were situated near major waterways or around Tulare Lake. For example, the main Gáwea village, also known as *Gáwea*, was situated on the north side of the Kaweah River at the current location of Terminus Dam. The rivers provided fish, waterfowl, and other game attracted to the fresh water. The tule stalk was used in the manufacture of mats, baskets, and other goods (Applied EarthWorks, Inc., 2013, Updated 2021).

Most flaked stone artifacts were fashioned from obsidian and other imported material. Ground stone artifacts, inclusive of handstones and milling slabs/slicks as well as mortars and pestles, were manufactured of granitic and metavolcanics rock. Where suitable outcrops were available, milling slicks and bedrock mortars were manufactured on bedrock. Where bedrock was not available, portable mortars and slabs manufactured from large cobbles and small boulders were used.

At the broader interregional level, the villages of the Southern Valley Yokuts profited from the east-west trade of goods that flowed between the Pacific coast and the high Sierra and Great Basin. The Yokuts bartered their local staples (e.g., freshwater fish, acorns, and tule reeds) to obtain such goods as Olivella beads and other shell material from the west as well as obsidian from the east.

As with other Indian groups in California, the lifeways of the Yokuts were dramatically altered as a result of contact with Spanish explorers and missionaries, miners, ranchers, and other immigrants who entered the San Joaquin Valley after 1700. In 1856, the Tule River Indian Reservation was established for the Koyeti and Yaudanchi tribes. The reservation was moved from its original site just east of Porterville, designated as State Historical Landmark #388, to its present location in 1873. As late as 1926, adobe ruins from the original reservation were still present. The introduction of European culture and new diseases proved devastating to the native population. In the 1860s, smallpox decimated Indians living at the Cobble Lodge site near Lake Kaweah (Applied EarthWorks, Inc., 2013, Updated 2021).

There are several Native American tribal groups with ancestral ties to the Project area, including the Santa Rosa Rancheria Tachi Yokut Tribe, Tule River Indian Tribe, and the Wuksache Indian Tribe/Eshom Valley Band. Several Southern Valley Yokuts tribes have survived the effects of colonization. Yokuts today have developed language apprenticeship programs and early childhood education centers to serve tribal members, including the Wukchumne of the Tule-Kaweah near Porterville, Choynimni speakers of the Kings River tribes, Chukchansi at the Picayune and Table Mountain rancherias near Fresno, and Yawelmani speakers of the Tule River Reservation. Several Yokuts tribal groups are governed by elders' councils and operate auxiliary departments that serve local tribal populations in areas of healthcare, education, and cultural resource management.

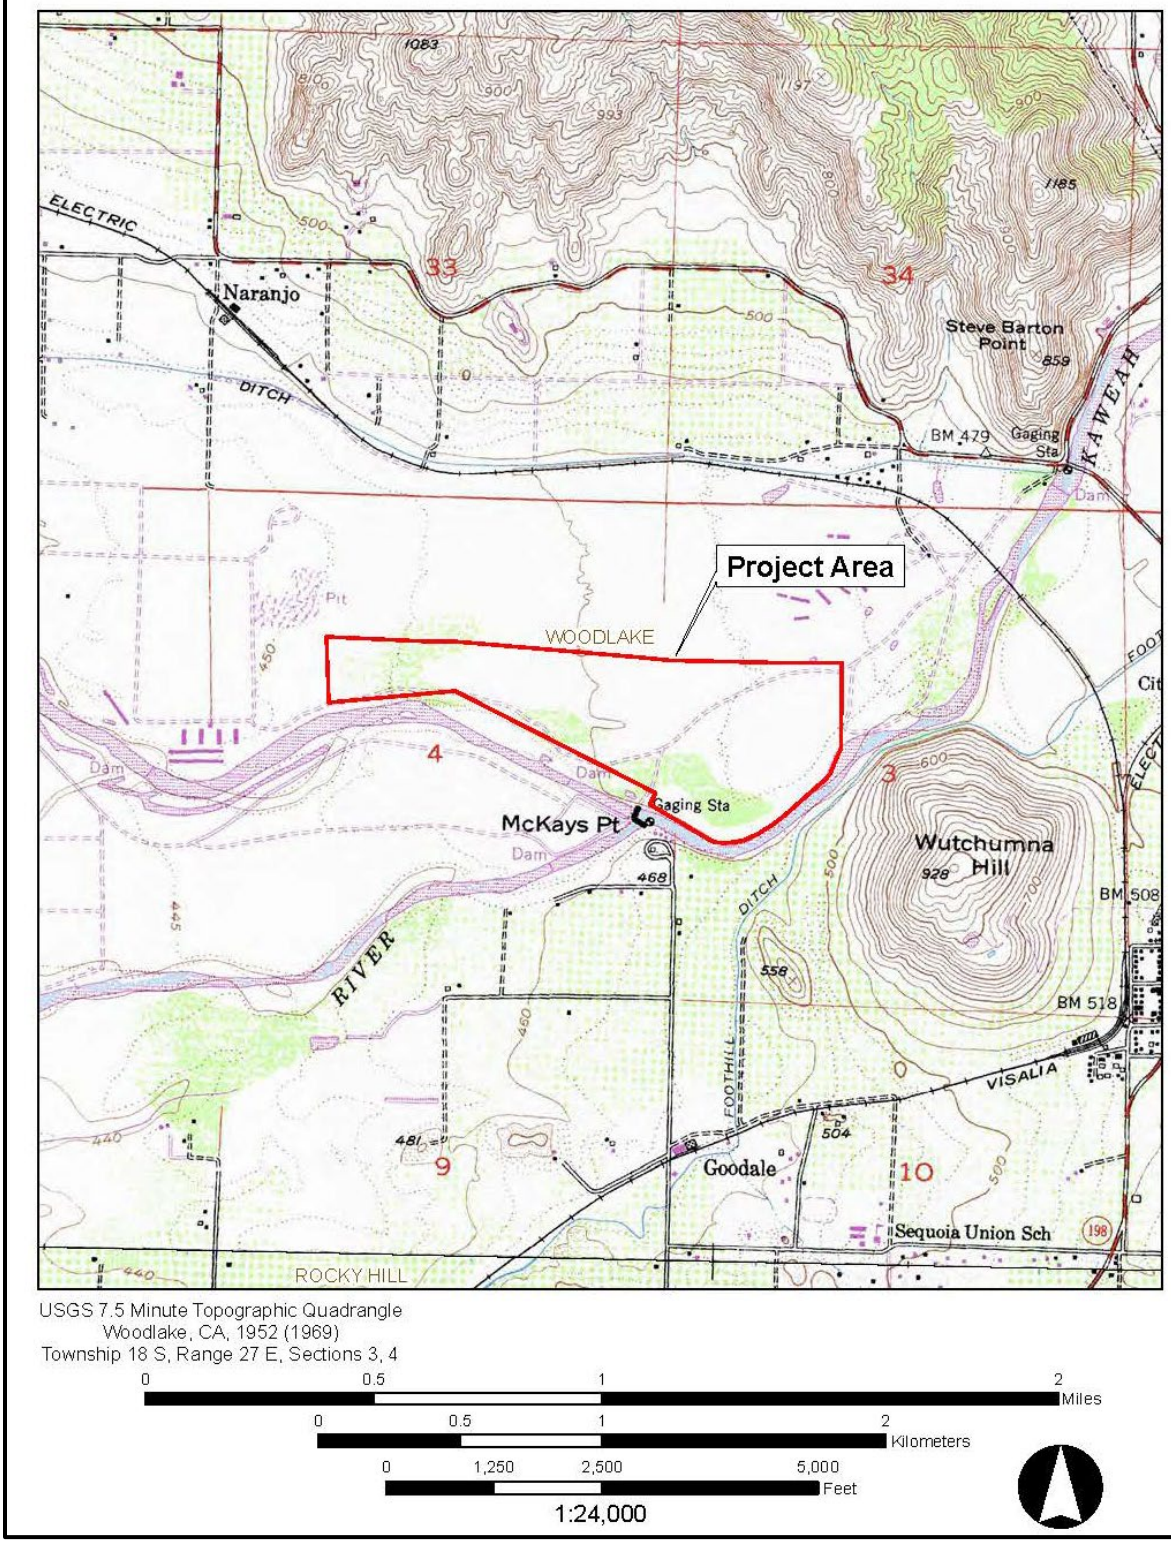
History

Government expeditions to the Tulare Lake basin during the mid to late 1840s resulted in recommendations for the development of agricultural settlements that would permanently alter the area. After discovery of gold at Coloma in 1848, speculators began entering the San Joaquin Valley. The miners' needs for food and supplies subsequently facilitated the development of ranching in the Tulare Lake basin. New roads and trails emerged throughout the area, and the ranching industry boomed when access to livestock markets to the north and south became available.

In 1853, Tulare County, which at the time included most of present-day Kings County, was established with the budding town of Visalia as the county seat. By the 1870s many Southern Pacific Railroad towns

had emerged, including Hanford (1877), Lemoore (1877), and Tulare (1872) (Applied EarthWorks, Inc., 2013, Updated 2021).

The pace of economic development in Tulare County greatly accelerated with the construction of irrigation systems. Several irrigation companies formed in the early and mid-1870s, and after overcoming initial financial and physical difficulties, the Lower Kings River, People's, and Last Chance ditches, among others, were delivering water to farms by the end of the decade. Tulare irrigation concerns tapped the ample Kings River, although some canals draw water from the Kaweah River and its branches.



Citrus fruit, now a major crop in Tulare County, was initially thought "too exotic" for the San Joaquin Valley. Lemons, specifically, were thought to be ill-suited to the valley climate, until they were planted by James William Center Pogue in 1868. Initially planting nearer the Kaweah River, the Pogue family moved their orchards to the community of Lime Kiln. In addition to serving as the home base for Pogue's growing citrus operation, Lime Kiln also became the base for a large operation organized by Pogue, J. B. Wallace, and C. W. Crocker. The three also built the Pogue Hotel to serve travelers. In 1894, Pogue subdivided the land in and around Lime Kiln and sold residential lots, renaming the town Lemon Cove (Kaweah Commonwealth n.d.).

By 1910 the development of new towns and settlements had slowed dramatically, and improvements were initiated to construct better roads. Agricultural concerns continued to prosper, resulting in the intensification of local farming until the 1930s, when individual farmers emerging from the Great Depression no longer found agriculture to be a lucrative endeavor. Since that time farmland has increasingly been developed for commercial interests.

Despite the general slowdown in the development of new towns, Woodlake was founded in 1912 by land developer Gilbert F. Stevenson as a planned community surrounded by citrus orchards. Initial growth was rapid, and by 1913 Woodlake contained two schools, retail stores, two churches, a bank, and a newspaper. Stevenson further ensured the growth of the community by paying half of the cost to install a bridge across the St. Johns River, donating right-of-way to the railroad companies to bring trains (including the Visalia Electric Railroad) to the town, and building levees around Wood Lake (now known as Bravo Lake) to ensure that it remained a permanent year-round water feature (Applied EarthWorks, Inc., 2013, Updated 2021).

3.5.2.2 Vicinity Setting

As described in Section 3.5.5, Æ conducted various records searches to determine the presence of prehistoric or historic resources, including Native American cultural resources, on and in the vicinity of the Project. Specifically, a cultural resources records search, additional research, intensive-level pedestrian field survey, and a Sacred Lands File Search with the Native American Heritage Commission were conducted. The results of these searches and field surveys are described in Sections 3.5.2.3 and 3.5.5.

Source: (Applied EarthWorks, Inc., 2013, Updated 2021)

Figure 3.5-1 Cultural Resources Survey Coverage

3.5.2.3 Project Site Setting

The existing Project site and surrounding survey area has historically been used for cattle grazing and is covered in seasonal grasses with a sparse scatter of live oaks, maples, and cottonwood trees. Cattle have eaten most of the grass cover, and soil is visible throughout the proposed reservoir locations. Vegetation is dense in the reserved habitat area in the southeastern portion of the Project area. Approximately 90 percent of the survey area exhibited 60 percent or better ground visibility.

Sediments within the survey area consist of poorly sorted coarse- to fine-grained sand and sandy loams, ranging from gray to light tan in color. Based on examination of rodent burrows and areas of disturbance, it appears that the soils are poorly developed, consistent with recent sediment deposition. During a visit to the Project area on October 7, 2013, TID Project Engineer Aaron Fukuda informed Æ's personnel that overflow water from the mines and reservoirs immediately north of the Project has washed over the Project area and into the river channels. It is possible that recent sediments overlie previously deposited cultural materials obscuring them from view.

During the intensive-level field survey, cultural resources were recorded on Department of Parks and Recreation (DPR) 523 forms (see the Cultural Resource Investigation in Appendix E1). Æ's survey for the Project resulted in the discovery of two (2) isolated artifacts, one (1) from the historic era (Figures 3.5-2 and 3.5-3) and one (1) that is prehistoric P-54-005096 (Figures 3.5-4 and 3.5-5). Tribal cultural resources are discussed in Section 3.10 – Tribal Cultural Resources. The following sections describe the resources observed and recorded during the pedestrian surveys. The field methodology is described in Section 3.5.5 and the results in Section 3.5.6. Both sites are excluded from mapping for confidentiality and resource protection purposes.

Prehistoric Resources

The prehistoric find, P-54-005096 is an isolated basalt flake that is 4.5 centimeters long by 1.3 centimeters wide by 0.8 centimeters thick. It appears to be a secondary core reduction flake with no cortex. Three (3) flake scars are present on its dorsal side.

Historic Resources

The historic era find, P-54-005095 is the collapsed remains of a wood object, likely a wagon. The majority of planks were too badly degraded to measure, but those that could be measured were 3.5 inches by 3.5 inches in cross section, and of unknown length due to decay and breakage (see Figure 3.5-2). The hardware that held the planks together includes square nuts, round-headed nails, and metal rods of undetermined length (all were partially buried) that terminate in threaded nuts (see Figure 3.5-3). The longer rods are consistent with cross rods of the sort that held the sides on wood wagons. None of the observed hardware is time diagnostic, but wood wagons would have been more common in the nineteenth and early twentieth centuries.

Resources Immediately Outside the Project Area

Outside but immediately adjacent to the Project's eastern boundary are pieces of old machinery and a flatbed truck. These comprise a distinct scatter of unknown age and purpose. The bed, fenders, and cab of the truck are present, all other parts are missing (see Figure 3.5-6). It appears to be a Ford flatbed truck, likely from the late 1930s to mid-1940s. It is not possible to determine when the truck was left at this location. The machinery appears to be parts of pulley and conveyor belt systems, consistent with equipment used in both mining and agriculture (see Figure 3.5-7 and Figure 3.5-8). The age of these objects is unknown, although their association with the truck and the accumulation of sediments on parts of the machinery suggest that the truck and machinery were all deposited at or around the same time.

The Project, as currently designed, will not impact these objects, but their presence provides some information regarding the types of activities performed in the general vicinity of the Project. As such, they are worth noting, but they have not been formally recorded as cultural resources because they fall outside the Project area.

3.5.3 Regulatory Setting

3.5.3.1 Federal

The National Historic Preservation Act (NHPA) of 1966 (16 U.S.C. § 470 et seq.), as amended, is the center piece for historic preservation. This NHPA established the National Register of Historic Places (NRHP) which serves as the nation's inventory of districts, buildings, structures, and objects significant in American history, architecture, archaeology, engineering, and culture. A historic property is a cultural resource that is eligible for listing in the NRHP. The NRHP significance criteria applied to evaluate the cultural resources are defined in 36 CFR Section 60.4 as follows:

> *The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and*
>
> *(a) that are associated with events that have made a significant contribution to the broad patterns of our history; or*
> *(b) that are associated with the lives of persons significant in our past; or*
> *(c) that embody the distinctive characteristics of type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent*

a significant and distinguishable entity whose components may lack individual distinction; or

(d) that has yielded, or may be likely to yield, information important in prehistory or history.

Section 106 of the NHPA prescribes specific criteria for determining whether a project would adversely affect a *historic property*, as defined in 36 Code of Federal Regulations (CFR) Section 800.5. An impact is considered significant when prehistoric or historic archaeological sites, structures, or objects listed in or eligible for listing in the NRHP are subjected to the following adverse effects:

- Physical destruction of or damage to all or part of the property;
- Alteration of a property that is not consistent with the Secretary's standards for the treatment of historic properties (36 CFR Part 68) and applicable guidelines;
- Removal of the property from its historic location;
- Change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance;
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant historic features;
- Neglect of a property that causes its deterioration; and
- Transfer, lease, or sale of the property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance.

3.5.3.2 State

California Public Resources Code Sections 5020-5029

The California Public Resources Code Sections 5020-5029 (inclusive) provide the regulatory framework for State agencies regarding the inventory, evaluation and protection of historical properties and resources of significance. The Code states:

> "*No state agency shall alter the original or significant historical features or fabric, or transfer, relocate, or demolish historical resources on the master list maintained pursuant to subdivision (d) of Section 5024 without, early in the planning process, first giving notice and a summary of the proposed action to the State Historic Preservation Officer (SHPO) who shall have 30 days after receipt of the notice and summary for review and comment."* (Public Resources Code § 5024.5a)

Resources listed in, or determined to be eligible for listing in, the California Register of Historical Resources (CRHR) are resources that are required to be given consideration in the CEQA process. A resource listed in, or eligible for listing in the CRHR is presumed to be historically or culturally significant: this includes listed archaeological resources. The CRHR is an authoritative guide to the State's historical resources, and listed properties are considered significant for purposes of CEQA. The CRHR includes resources listed in or formally determined eligible for listing in the NRHP, as well as some California State Landmarks and Points of Historical Interest. Properties of local significance that have been designated under a local

preservation ordinance (local landmarks or landmark districts), or that have been identified in a local historical resources inventory may be eligible for listing in the CRHR and are presumed to be significant resources for purposes of CEQA, unless a preponderance of evidence indicates otherwise (Pub. Resources Code § 5024.1, 21084.1, 14 CCR § 15064.5).

However, a resource does not need to have been identified previously either through listing or survey, to be considered significant under CEQA. In addition to assessing whether historical resources potentially impacted by a proposed project are listed or have been identified in a survey process, lead agencies have a responsibility to evaluate them against the CRHR criteria prior to making a finding as to a proposed project's impacts to historical resources (Pub. Resources § 21084.1, 14 CCR § 15064.5(3)). Generally, a resource will be considered by the lead agency to be "historically significant" if it meets the criteria for listing on the CRHR (Pub. Resources Code § 5024.1, Title 14 CCR 4852) including the following:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Is associated with the lives of persons important in our past;
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Has yielded, or may be likely to yield, information important in prehistory or history.

Historic resources eligible for listing in the CRHR must meet one of the criteria of significance described above and, like the NRHP, must retain enough of their historic character to be recognizable and to convey the reasons for their significance. Integrity is evaluated with regard to the retention of location, design, setting, materials, workmanship, feeling, and association. It must also be judged with reference to the particular criteria under which a resource is proposed for eligibility. Alterations over time to a resource or historic changes in its use may themselves have historical, cultural, or architectural significance. It is possible that historical resources may not retain sufficient integrity to meet the criteria for listing in the NRHP, but they may still be eligible for listing in the CRHR. A resource that has lost its historic character or appearance may still have sufficient integrity for the CRHR, if it maintains the potential to yield significant scientific or historical information or specific data.

California Health and Safety Code Section 7050.5 (b) – Human Remains

In accordance with California Health and Safety Code Section 7050.5 (b), if human remains are discovered during ground disturbing activities, the County Coroner must be notified. Section 7050.5 (b) states that "*there shall be no further excavation or disturbance of the site or any nearby area reasonably expected to overlie adjacent remains*" until the coroner has made certain determinations as required by California Government Code, commencing with Section 27460. Health and Safety Code Section 7050.5 (c) states: "*If the coroner determines that the remains are not subject to his or her authority and if the coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission (NAHC).*"

Upon notification by the coroner, the NAHC must comply with Public Resources Code § 5097.98:

(a) Whenever the commission receives notification of a discovery of Native American human remains from the county coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code:

1. *It shall immediately notify those persons it believes to be most likely descended from the deceased Native American.*
2. *The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the site of the discovery of the Native American human remains and may recommend… means for treatment or disposition, with appropriate dignity, of the human remains and any associated grave goods. The descendants shall complete their inspection and make recommendations or preferences for treatment within 48-hours of being granted access to the site.*

(b) Upon the discovery of Native American remains, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in this section, with the most likely descendants regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. The landowner shall discuss and confer with the descendants all reasonable options regarding the descendants' preferences for treatment.

Public Resource Code Sections 21074, 5024.1 – AB 52

On September 25, 2014 Governor Brown signed Assembly Bill No. 52 (AB 52), which created a new category of environmental resources, specifically Tribal Cultural Resources, which must be considered under CEQA. The law went into effect on July 1, 2015.

AB 52 created new requirements for consultation with tribal governments regarding projects that may affect tribal cultural resources. It includes a definition of tribal cultural resources, a tribal consultation process and identification of mitigation measures as agreed upon with tribal representatives. AB 52 and tribal cultural resources are discussed in detail in Section 3.18 – Tribal Cultural Resources.

3.5.3.3 Local

Tulare County General Plan (2012)

The Tulare County General Plan (Tulare County, 2012) includes goals and policies directed toward protecting cultural resources in the County. Policies found in the Scenic Landscapes (Chapter 7) and Environmental Resources Management (Chapter 8) elements seek to preserve the historical, archeological, and cultural resources of the County through development review, acquisition, and encouragement of easements, coordination with other agencies and groups, and other methods. Select goals and policies relevant to this analysis are listed below.

SECTION 7.2 – SCENIC CORRIDORS AND PLACES

Goal SL-2: To protect the scenic views for travelers along the County's roads and highways.

Policy SL-2.3 – Historic and Cultural Landscapes: The County shall use the County's scenic routes and highways to connect cultural landscapes, historic landmarks and communities, and points of interest including:

1. Historic travel routes and trails,
2. Historic settlements,
3. Historic places, events, sites, buildings and structures,
4. Prehistoric and archeological features, and
5. Majestic trees, streetscapes, and parks.

SECTION 8.6 – CULTURAL RESOURCES

Goal ERM-6: To manage and protect sites of cultural and archaeological importance for the benefit of present and future generations.

Policy ERM-6.1 – Evaluation of Cultural and Archaeological Resources: The County shall participate in and support efforts to identify its significant cultural and archaeological resources using appropriate state and federal standards.

Policy ERM-6.2 – Protection of Resources with Potential State or Federal Designations: The County shall protect cultural and archaeological sites with demonstrated potential for placement on the National Register of Historic Places and/or inclusion in the California State Office of Historic Preservation's California Points of Interest and California Inventory of Historic Resources. Such sites may be of Statewide or local significance and have anthropological, cultural, military, political, architectural, economic, scientific, religious, or other values as determined by a qualified archaeological professional.

Policy ERM-6.3 – Alteration of Sites with Identified Cultural Resources: When planning any development or alteration of a site with identified cultural or archaeological resources, consideration should be given to ways of protecting the resources. Development can be permitted in these areas only after a site-specific investigation has been conducted pursuant to CEQA to define the extent and value of resource, and mitigation measures proposed for any impacts the development may have on the resource.

Policy ERM-6.4 – Mitigation: If preservation of cultural resources is not feasible, every effort shall be made to mitigate impacts, including relocation of structures, adaptive reuse, preservation of facades, and thorough documentation and archival of records.

Policy ERM-6.5 – Cultural Resources Education Programs: The County should support local, state, and national education programs on cultural and archaeological resources.

Policy ERM-6.6 – Historic Structures and Sites: The County shall support public and private efforts to preserve, rehabilitate, and continue the use of historic structures, sites, and parks. Where applicable, preservation efforts shall conform to the current Secretary of the Interior's Standards for the Treatment of Historic Properties and Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings.

Policy ERM-6.7 – Cooperation of Property Owners: The County should encourage the cooperation of property owners to treat cultural resources as assets rather than liabilities, and encourage public support for the preservation of these resources.

Policy ERM-6.8 – Solicit Input from Local Native Americans: The County shall continue to solicit input from the local Native American communities in cases where development may result in disturbance to sites containing evidence of Native American activity and/or to sites of cultural importance.

Policy ERM-6.9 – Confidentiality of Archaeological Sites: The County shall, within its power, maintain confidentiality regarding the locations of archaeological sites in order to preserve and protect these resources from vandalism and the unauthorized removal of artifacts.

Policy ERM-6.10 – Grading Cultural Resources Sites: The County shall ensure all grading activities conform to the County's Grading Ordinance and California Code of Regulations, Title 20, § 2501 et. seq.

Tulare County Code

The Tulare County Code does not contain any regulations or requirements specific to cultural, historical and/or archeological resources.

3.5.4 Significance Thresholds

3.5.4.1 Appendix G Thresholds from the State CEQA Guidelines

Appendix G of the State CEQA Guidelines provides thresholds of significance for determining whether a project could have a significant effect on the environment. According to Appendix G, a project could have a potentially significant impact on cultural and paleontological resources if the project would:

a) *Cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5 of the State CEQA Guidelines.*

b) *Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5 of the State CEQA Guidelines.*

c) *Disturb any human remains, including those interred outside of formal cemeteries.*

3.5.4.2 Additional Thresholds of Significance

Requirements identified in the County policies and plans are addressed by the CEQA Appendix G significance criteria above.

The CRHR criteria were also utilized by Æ to evaluate the CEQA Appendix G significance criteria. The CRHR criteria are based on NRHP criteria. As discussed in Section 3.5.3.2, for a property to be eligible for inclusion on the CRHR, one or more of the following criteria must be met:

1. *It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the U.S.;*
2. *It is associated with the lives of persons important to local, California, or U.S. history;*

3. *It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, possesses high artistic values; and/or*
4. *It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.*

In addition to meeting one or more of the above criteria, the CRHR requires that sufficient time has passed since a resource's period of significance to "*obtain a scholarly perspective on the events or individuals associated with the resources.*" (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association. There are no additional thresholds of significance related to the topical environmental issue.

3.5.5 Methodology of Analysis

This analysis is based on the review of applicable federal, state and local requirements, Project design features, best management practices (BMP's), operating practices and other environmental protection measures that have been incorporated into the Project to minimize potential impacts on the environment. Impacts to cultural resources are assessed based on the potential for a project to adversely affect existing known and unknown historic and archaeological resources. This requires an analysis of whether there are significant historical resources on-site or within the vicinity of the Project area, and whether the Project would result in a substantial adverse change (i.e., physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings) in the significance of a resource. The significance of historical resources is defined in Section 3.5.4.

3.5.5.1 Records Search

Æ requested records searches from the California Historical Resources Information System (CHRIS) Southern San Joaquin Valley Information Center (SSJVIC) at California State University, Bakersfield in October 2013 and November 16, 2020. These searches encompassed all land within a 0.5-mile radius of the Project area. Sources consulted included archaeological site and survey base maps, reports of previous investigations, cultural resource records, the listings of the National Register of Historic Places, the Historic Property Data File (3/18/2013), the California Historical Landmarks, the California Register of Historical Resources, the California Inventory of Historic Resources, the California Points of Historical Interest, and the Built Environment Resources Directory (see Appendix E).

Æ's first records search request was submitted to the SSJVIC on October 10, 2013, and results were returned on October 14, 2013 (RS# 13-403). Æ requested a supplementary records search to capture new resources or studies that have occurred in the Project vicinity since the 2013 investigations. The second records search was requested on November 16, 2020, and was returned on November 30, 2020. The results of both records searches are provided below. Until Æ's investigations in 2013 (TU-1668), no cultural resources studies had occurred within the Project area. Three (3) cultural resource investigations have occurred within a 0.5-mile radius of the Project (see Table 3.5-1), one (1) of which (TU-01365)

overlaps slightly with a portion of the survey. The cultural resource records search is summarized below in Table 3.5-1.

Table 3.5-1. Previous Cultural Resources Studies within 0.5 Mile of the Project Area

SSJVIC Report No.	Report Author(s)	Report Date	Report Title
TU-01365	Pruett, Catherine	2009	A Cultural Resource Assessment for Approximately 30 Acres, Located Northeast of Visalia, Tulare County, California
TU-01394	Parr, Robert	2009	Cultural Resource Assessment for the Replacement of Eleven Deteriorated Power Poles on the Southern California Edison Company Bravo, Cairns, Campbell, Homer, Merryman, and Redbanks 12 kV Circuits, Tulare County, California
TU-01498	Leach-Palm, Laura; Brandy, Paul; King, Jay; Mikkelsen, Pat; Seil, Libby; Hartman, Lindsay; and Bradeen, Jill	2010	Cultural Resources Inventory of Caltrans District 6 Rural Conventional Highways in Fresno, Western Kern, Kings, Madera, and Tulare Counties

Until 2013, no resources had been recorded within the Project area, but five (5) resources were identified within 0.5 miles of the Project area (see Table 3.5-2): four (4) historic-era resources (P-54-004034, -004587, -004615, and -004676) and one (1) prehistoric habitation site located across the Kaweah River (P-54-000316). P-54-004676 was mistakenly mapped by the SSJVIC within the Project area, but a review of the site record found that it is on the St. Johns River, just outside both the Project area and the survey area. The site record describes P-54-000316 as a "village site" but provides no information regarding the site constituents. Documentation of the records searches is included in Appendix E, and summarized below in Table 3.5-2.

Table 3.5-2. Previously Recorded Resources within 0.5 Mile of the Project Area

Primary No.	Date Recorded	Prehistoric/ Historic	Description
P-54-004676	2008	Historic	Historic-era diversion dam (built in 1938)
P-54-004587	2008	Historic	Historic-era recreation area
P-54-000316	Unknown	Prehistoric	Probable habitation site
P-54-004034	2001	Historic	Historic-era electric railroad (built in 1905)
P-54-004615	1999	Historic	Historic-era ditch (built in 1878)

Æ also examined the historic United States Geological Survey (USGS) topographic maps of the Project area. The 1928 Lemon Cove and 1952 Woodlake 7.5-minute quadrangles (the name of the quadrangle was changed from Lemon Cove to Woodlake in 1952) show no infrastructure in the Project area itself, although the 1928 map shows a small dam on the St. Johns River downstream of the Project area. The 1952 map shows the current dam (P-54-004676) adjacent to the Project area and notes that the St. Johns River has gone dry. The 1969 revision to the 1952 map indicates water once again flowing in the St. Johns

River and depicts dirt roads within the Project area (the same dirt roads still exist and were used by Æ during survey). The Project area is surrounded by the historic Visalia Electric Railroad, but this section of the electric railroad has not been formally recorded and does not intrude into the Project area.

3.5.5.2 Native American Outreach

On September 30, 2013, Æ contacted the Native American Heritage Commission (NAHC) on behalf of TID to request a search of its Sacred Lands File to identify any Native American cultural resources recorded in the Project area. Æ also requested a list of individuals and groups with whom TID may consult regarding resources of sacred or special cultural and spiritual significance in the Project area. On October 2, 2013, Æ sent letters describing the Project and its location to the contacts identified by the NAHC (listed below).

- Neil Peyron, Chairperson, Tule River Indian Tribe;
- Lalo Franco, Cultural Coordinator, Santa Rosa Tachi Rancheria;
- Kenneth Woodrow, Chairperson of the Wuksache Indian Tribe/Eshom Valley Band;
- John Sartuche of the Wuksache Tribe;
- Jennifer Malone; and
- Kerri Vera, Environmental Department, and Joey Garfield, Tribal Archaeologist, Tule River Indian Tribe.

On October 14, 2013, Æ sent a follow-up e-mail or made a phone call to those contacts that had not yet responded. A contact log and copies of the Native American outreach documentation are included in Appendix E.

On October 2, 2013, the NAHC responded to Æ's request and stated that the Sacred Lands File did not indicate the presence of sacred sites in the Project area. The NAHC provided Æ with a list of individuals and organizations to be contacted regarding information on Native American cultural resources in the Project area. Æ sent a letter soliciting concerns about the Project to the each of the individuals and tribes on October 2, 2013. Follow-up phone calls were made and emails sent on October 14, 2013. No further outreach was undertaken in 2020. The TID is responsible for government-to-government Native American consultation pursuant to CEQA and Assembly Bill (AB) 52.

To date, Æ has received responses from two (2) of the seven (7) individuals contacted, as summarized in Table 3.5-3 below. A copy of Æ's Native American outreach log is provided in Appendix E.

Table 3.5-3. Excerpt from the Native American Outreach Log

Individual/Organization	Contact	Comments
Santa Rosa Rancheria Tachi Yokut Tribe	Shana Brum	Brum stated that the Project is in a highly sensitive area and requested an on-site meeting and Native American monitoring during ground-disturbing activities. Brum further recommended that the Project proponent contact the Wukchumni Tribe.

Individual/Organization	Contact	Comments
Wuksache Tribe	Johnny Sartuche	Sartuche stated that the Project area is sensitive for cultural resources and requested that he be notified of any resources identified. He further recommended that the Project not proceed due to the sensitivity of the area.

3.5.5.3 Field Survey

Æ archaeologists Matthew Armstrong and Elizabeth Rapp conducted a pedestrian survey of the Project area using 15- to 20-meter transects on October 7th and 11th, 2013. The approximately 175-acre survey area encompassed the Project site, including the banks of the St. Johns River adjacent to the Project's southern boundary.

When an artifact or feature was encountered that appeared to be of historic age (i.e., 45 years old or older), surveyors marked its position and closely examined the surrounding area for associated artifacts and/or features. Cultural resources identified within the Project area were mapped using a Trimble GeoXH hand-held Global Positioning System (GPS) and documented on California Department of Parks and Recreation (DPR) 523 series cultural resources inventory forms. Cultural resources and survey conditions were photographed using a Canon Powershot A810 digital camera. Methods and field observations were recorded on Æ's Daily Work Record and Survey Field Record forms. All photographs and field notes are on file at Æ's Fresno office. Also see Section 3.5.2.3 above which summarizes the results of Æ's field surveys.

3.5.5.4 Project Design Features and Environmental Protection Measures

Numerous design features, best management practices (BMPs), operating practices and other environmental protection measures have been incorporated into the Project to minimize potential impacts on the environment. The environmental protective measures that were considered during this evaluation include, but are not limited to, the following:

- Employee training programs will be conducted to educate personnel of sensitivity issues including but not limited to cultural resources.
- Blasting would not be used for the excavation phase of the Project.

3.5.6 Project-Level Impacts and Mitigation Measures

3.5.6.1 Historical Resources

Impact Statement

Impact CUL-1: *Would the Project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?* **(CEQA Guidelines Threshold Criteria (a))**

Impact Analysis

As discussed in Section 3.5.2.3 above, Æ discovered one historic-era isolate P-54-005095 and one prehistoric isolate P-54-005096 within the Project site. Isolates are objects lacking clear associations with other materials, time, or people, and as such can provide only limited information regarding history and prehistory. P-54-005095 and P-54-005096 are not unique, rare, or otherwise exceptional, and thus they are considered insignificant resources a priori under CRHR criteria because they lack important associations and scientific data potential. No further treatment of these resources is recommended.

Based on Æ's site assessment (see Appendix E), the cultural resources identified within the Project site fail to meet the necessary requirements for recognition as historical resources. Based on the results of the cultural analysis, Æ recommended that no additional cultural resources work or monitoring is necessary during proposed Project activities. Although the current study has not indicated sensitivity for significant cultural resources within the Project site, ground disturbing activities always have the potential to reveal buried deposits not observed on the surface during previous surveys. However, with the implementation of Mitigation Measure CUL-1 and Mitigation Measure CUL-2 described in Section 3.5.6.2 below, the Project would have a less than significant impact of historical resources.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

See Mitigation Measures CUL-1 and CUL-2 below.

Level of Significance After Mitigation

Less than significant.

3.5.6.2 Archaeological Resources

Impact Statement

Impact CUL-2: *Would the Project cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?* **(CEQA Guidelines Threshold Criteria (b))**

Impact Analysis

As discussed in Section 3.5.2.3 above, Æ discovered one historic-era isolate P-54-005095 and one prehistoric isolate P-54-005096 within the Project boundary. Isolates are objects lacking clear associations with other materials, time, or people, and as such can provide only limited information regarding history and prehistory. P-54-005095 and P-54-005096 are not unique, rare, or otherwise exceptional, and thus they are considered insignificant resources a priori under CRHR criteria because they lack important associations and scientific data potential. No further treatment of these resources is recommended.

However, isolated prehistoric artifacts may indicate the potential for significant buried archaeological deposits. There is a potential for the Project to uncover significant intact buried archaeological or cultural deposits given the Project's position on the landform and proximity to a meandering river environment that would have provided habitat and rich sources for food and materials that would have sustained prehistoric Native American populations in the immediate area. Meandering river environments characterized by landforms that are subject to rapid alluvial deposition throughout time further increase the sensitivity of Project area. Further bolstering this point is the presence of a Native American site across the Kaweah River southeast of the Project area.

Because of the potential sensitivity for buried cultural resources in the Project area, Æ recommended two complimentary approaches to be completed prior to implementation of the Project: general Project area geoarchaeological testing and limited subsurface testing with shovels and augers at the location of P-54-005096. The latter would confirm if there is a larger intact buried archaeological deposit. If a more substantial deposit is identified, additional extended site testing would be needed to complete the CEQA-required assessment of the resource's significance and eligibility for inclusion in the CRHR. Geoarchaeological testing uses systems theory as a guiding framework to analyze patterns of geology, hydrology, sedimentology, and anthropogenic landscape use to interpret the potential for paleosols that may contain intact archaeological deposits within the study area (Applied EarthWorks, Inc., 2013, Updated 2021). Subsurface coring or trenching then focuses on investigating key areas identified as having moderate to high potential for containing anthropogenic paleosols. Application of these recommendations would provide the CEQA Lead Agency with a more complete understanding of the potential for Project activities to cause adverse impacts to historical resources within the Project area.

With implementation of Mitigation Measure CUL-1 and Mitigation Measure CUL-2, potential impacts to cultural resources will not exceed a level of significance.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure CUL-1*: Prior to significant ground disturbance, conduct general geoarchaeological testing and limited subsurface testing with shovels and augers at the location of P-54-005096. If a large intact buried archaeological deposit is identified, additional extended site testing would be needed to complete the CEQA-required assessment of the resource's significance and eligibility for inclusion in the CRHR.*

Mitigation Measure CUL-2: *Consistent with state regulations, in the event archaeological resources are encountered during Project development or ground-disturbing activities within any portion of the Project site, all work within 100-feet (30 meters) of the find must be halted until a qualified professional archaeologist can identify the discovery and assess its significance. Such finds include, but are not limited to, prehistoric stone grinding implements, stone tools, soapstone bowls, ornaments (e.g., beads, pendants), features such as burned soil, earthen ovens, and floors of shelters as well as intact historic-era building foundations and concentrations of historic artifacts.*

Level of Significance After Mitigation

Less than significant.

3.5.6.3 Human Remains

Impact Statement

Impact CUL-3: *Would the Project disturb any human remains, including those interred outside of dedicated cemeteries?* **(CEQA Guidelines Threshold Criteria (c))**

Impact Analysis

No human remains were observed during Æ's field survey of the Project site. Although unlikely, the discovery of human remains is always a possibility. If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC. With the implementation of Mitigation Measures CUL-3, potential impacts to this cultural resource will be less than significant. Also see the analysis and mitigation measures presented in Section 3.10 – Tribal Cultural Resources for more detail.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure CUL-3: *If human remains are uncovered within the Project site, the Tulare County Coroner is to be notified immediately and must investigate the discovery. If the remains are identified on the basis of archaeological context, age, cultural associations, or biological traits to be those of a Native American, California Health and Safety Code 7050.5 requires that the coroner notify the NAHC within 24 hours of discovery. The NAHC will then identify the Most Likely Descendant, who will be afforded the opportunity to recommend means of treatment for the human remains pursuant to California Public Resources Code 5097.98.6.*

Level of Significance After Mitigation

Less than significant.

3.5.7 Cumulative-Level Impacts and Mitigation Measures

The geographical context for the analysis of potentially cumulative impacts to cultural resources is the geographical area where the Project is located and includes the County of Tulare and the nearby City of Woodlake.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to cultural and historical resources.

Impacts to cultural resources are site-specific, yet the destruction and/or loss of such resources could be cumulatively significant if not collectively addressed by individual projects. All the cumulative projects are required to comply with local, state, and federal. The County General Plan includes policies requiring the identification and mitigation of cultural and archeological resources on a project-by-project basis as a means of protecting those resources countywide. Therefore, overall cumulative impacts associated with cultural resources are considered less than significant.

Additionally, the Project design features, BMPs and mitigation measures would prevent impacts to cultural and archeological resources from becoming significant at the project level. Therefore, the Project's contribution would also be cumulatively less than considerable. No additional mitigation measures are necessary. For these reasons, the Project would not contribute to cumulatively significant impacts related to cultural resources.

3.6 ENERGY

3.6.1 Introduction

This section of the DEIR presents a discussion of energy resources. A review of potential Project impacts is provided in the following analysis.

3.6.2 Environmental Setting

3.6.2.1 Regional and Local Setting

As discussed in Section 2.0 – Project Description, the Project would not result in an increase of employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. The electrical services required for the onsite processing equipment would be obtained from Southern California Edison (SCE). Additionally, the Project would provide a local source of aggregate to the County which would minimize the need to import aggregate from out-of-County sources, thus reducing fuel consumption associated with long distance trucking.

Based on knowledge of the proposed projects in the Project area, the Project would not conflict or obstruct a state or local plan for renewable energy or energy efficiency. Therefore, the Project would have no impact on renewable energy plans.

3.6.3 Regulatory Setting

In addition to the regulations and policies summarized below, energy efficiency is also regulated by climate change greenhouse gas (GHG) regulations. By having regulatory/policy goals for more electric vehicles and energy efficient engines, energy demands will be shifted (gas/diesel to electricity). Heavy duty off and on road tucks are required to phase into more efficient and cleaner engines under various air quality requirements. See Sections below for a detailed discussion of air quality regulations that also affect energy use.

3.6.3.1 Federal

Corporate Average Fuel Standards

First enacted by the U.S. Congress in 1975, the Corporate Average Fuel Economy (CAFE) standards reduce energy consumption by increasing the fuel economy of cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and United States Environmental Protection Agency (USEPA) jointly administer the CAFE standards. The U.S. Congress has specified that CAFE standards must be set at the "maximum feasible level" with consideration given for: 1) technological feasibility; 2) economic practicality; 3) effect of other standards on fuel economy; and 4) need for the nation to conserve energy.

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by USEPA and NHTSA. The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type. USEPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through

2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type (USEPA and NHTSA, 2016).

Energy Policy Act of 2005

The Energy Policy Act of 2005 addresses energy efficiency; renewable energy requirements; oil, natural gas, and coal; alternative-fuel use; tribal energy, nuclear security; vehicles and vehicle fuels; hydropower and geothermal energy; and climate change technology. The act provides revised annual energy reduction goals (two percent per year beginning in 2006), revised renewable energy purchase goals, federal procurement of Energy Star or Federal Energy Management Program designated products, federal green building standards, and fuel cell vehicle and hydrogen energy system research and demonstration.

Energy Independence and Security Act of 2007

Signed into law in December 2007, the Energy Independence and Security Act was passed to increase the production of clean renewable fuels; increase the efficiency of products, buildings, and vehicles; improve the energy performance of the federal government; and increase U.S. energy security, develop renewable fuel production, and improve vehicle fuel economy. The act included the first increase in fuel economy standards for passenger cars since 1975, and also included a new energy grant program for use by local governments in implementing energy-efficiency initiatives, as well as a variety of green building incentives and programs.

3.6.3.2 State

Assembly Bill 1575 (AB 1575)

In 1975, largely in response to the oil crisis of the 1970s, the California State Legislature adopted Assembly Bill (AB) 1575, which created the California Energy Commission (CEC). The statutory mission of the CEC is to forecast future energy needs, license thermal power plants of 50 megawatts or larger, develop energy technologies and renewable energy resources, plan for and direct state responses to energy emergencies, and, perhaps most importantly, promote energy efficiency through the adoption and enforcement of appliance and building energy efficiency standards. AB 1575 also amended Public Resources Code Section 21100(b)(3) to require Environmental Impact Reports (EIRs) to consider the wasteful, inefficient, and unnecessary consumption of energy resources caused by a project. Since the passage of AB 1575, the California Natural Resources Agency finalized updates to the CEQA Guidelines in December 2018. New CEQA Guidelines Section 15126.2(b) treats "wasteful, inefficient, or unnecessary" energy consumption as a significant environmental impact. As a result, the following energy thresholds have been incorporated into Appendix G of the CEQA Guidelines (see Section 3.6.4):

a) *Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?*

b) *Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?*

As discussed above, this DEIR section has been prepared to assess energy impacts in accordance with these CEQA Appendix G of criteria specific to energy resources.

California Energy Commission

The California Energy Commission (CEC) was created in 1974 to serve as the state's primary energy policy and planning agency. The CEC is tasked with reducing energy costs and environmental impacts of energy use, such as greenhouse gas emissions, while ensuring a safe, resilient, and reliable supply of energy.

Assembly Bill 32: California Global Warming Solutions Act of 2006

California Global Warming Solutions Act of 2006 (Assembly Bill 32) Assembly Bill 32 (Health and Safety Code Sections 38500–38599; AB 32), also known as the California Global Warming Solutions Act of 2006, commits the state to achieving year 2000 GHG emission levels by 2010 and year 1990 levels by 2020. To achieve these goals, AB 32 tasked the California Public Utilities Commission and CEC with providing information, analysis, and recommendations to the California Air Resources Board regarding ways to reduce GHG emissions in the electricity and natural gas utility sectors.

Senate Bill 100

On September 10, 2018, Governor Brown signed SB 100, establishing that 100 percent of all electricity in California must be obtained from renewable and zero-carbon energy resources by December 31, 2045. SB 100 also creates new standards for the Renewables Portfolio Standard (RPS) goals established by SB 350 in 2015. Specifically, the bill increases required energy from renewable sources for both investor-owned utilities and publicly-owned utilities from 50 percent to 60 percent by 2030. Incrementally, these energy providers must also have a renewable energy supply of 33 percent by 2020, 44 percent by 2024, and 52 percent by 2027. California must procure 100 percent of its energy from carbon free energy sources by the end of 2045.

Low-Carbon Fuel Standard

The Low-Carbon Fuel Standard (LCFS), established in 2007 through Executive Order S-1-07 and administered by CARB, requires producers of petroleum-based fuels to reduce the carbon intensity of their products, starting with 0.25 percent in 2011 and culminating in a 10 percent total reduction in 2020. Petroleum importers, refiners and wholesalers can either develop their own low-carbon fuel products or buy LCFS credits from other companies that develop and sell low-carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.

Senate Bill 1389

Senate Bill (SB) 1389 (Public Resources Code Sections 25300–25323; SB 1389) requires the CEC to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the state's electricity, natural gas, and transportation fuel sectors and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the state's economy; and protect public health and safety (Public Resources Code Section 25301[a]). The most recent 2021 Integrated Energy Policy Report provides the results of the CEC's assessments of a variety of energy issues facing California, including energy efficiency and reliability, decarbonizing buildings and California's natural has system, as well as forecasting California's energy demand and quantifying the benefits of clean transportation programs, such as California's transition to zero-emission vehicles (ZEVs).

The 2021 Report also provides updates on trends in California's sources of crude oil, update on California's nuclear plants, and other energy issues.

Advanced Clean Car Program

The Advanced Clean Cars emissions-control program was approved by the California Air Resources Board (CARB) in 2012 and is closely associated with the Pavley regulations. The program requires a greater number of zero-emission vehicle models for years 2015 through 2025 to control smog, soot, and GHG emissions. This program includes the Low-Emissions Vehicle (LEV) regulations to reduce criteria pollutants and GHG emissions from light- and medium-duty vehicles; and the Zero-Emissions Vehicle (ZEV) regulations to require manufactures to produce an increasing number of pure ZEVs (meaning battery and fuel cell electric vehicles) with the provision to produce plug-in hybrid electric vehicles (PHEVs) between 2018 and 2025.

Senate Bill 350

SB 350 was approved on October 7, 2015. SB 350 will: 1) increase the standards of the California Renewables Portfolio Standard (RPS) program by requiring that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by December 31, 2030; 2) require the State Energy Resources Conservation and Development Commission to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by January 1, 2030; 3) provide for the evolution of the Independent System Operator into a regional organization; and 4) require the state to reimburse local agencies and school districts for certain costs mandated by the state through procedures established by statutory provisions. Among other objectives, the State legislature intends to double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.

California Assembly Bill 1493 (AB 1493, Pavley)

In response to the transportation sector accounting for more than half of California's greenhouse gas (GHG) emissions, Assembly Bill (AB) 1493 (commonly referred to as CARB's Pavley regulations), enacted in 2002, requires CARB to set GHG emission standards for new passenger vehicles, light-duty trucks, and other vehicles manufactured in and after 2009 whose primary use is non-commercial personal transportation. Phase 1 of the legislation established standards for model years 2009-2016 and Phase 2 established standards for model years 2017-2025 (CARB, 2017).

California Energy Code (Title 24, Part 6, Building Energy Efficiency Standards)

California Code of Regulations Title 24, Part 6 comprises the California Energy Code, which was adopted to ensure that building construction, system design and installation achieve energy efficiency. The California Energy Code was first established in 1978 by the CEC in response to a legislative mandate to reduce California's energy consumption, and apply to energy consumed for heating, cooling, ventilation, water heating, and lighting in new residential and nonresidential buildings.

3.6.3.3 Local

County of Tulare – General Plan

The Tulare County – General Plan (Tulare County, 2012) has a number of policies that apply to projects within Tulare County that support reduction efforts of GHG. General Plan policies that relate to the proposed Project are listed as follows:

> ***AG-2.11 – Energy Production:*** *The County shall encourage and support the development of new agricultural related industries featuring alternative energy, utilization of agricultural waste, and solar or wind farms.*
>
> ***ERM-4.1 – Energy Conservation and Efficiency Measures:*** *The County shall encourage the use of solar energy, solar hot water panels, and other energy conservation and efficiency features in new construction and renovation of existing structures in accordance with State law.*
>
> ***ERM-4.3 – Local and State Programs:*** *The County shall participate, to the extent feasible, in local and State programs that strive to reduce the consumption of natural or man-made energy sources.*
>
> ***ERM-4.6 – Renewable Energy:*** *The County shall support efforts, when appropriately sited, for the development and use of alternative energy resources, including renewable energy such as wind, solar, bio-fuels and co-generation.*

3.6.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Energy" a project is considered to have a significant impact on the environment if it would:

a) *Result in potentially significant environmental impact due to wasteful, inefficient or unnecessary consumption of energy resources, during the project construction or operation (CEQA Appendix G Threshold (a))?*

b) *Conflict or obstruct a state or local plan for renewable energy or energy efficiency (CEQA Appendix G Threshold (b))?*

3.6.5 Methodology of Analysis

The following points were considered in terms of the Project's potential effects related to energy resources:

- The Project will be managed such that there will be no increase in the production rate of aggregates from the baseline level. Therefore, the number of trucks traveling offsite on public roads will not increase from baseline.
- The Project will be managed so that when recycling and/or blending activities were taking place, the excavation and processing of aggregated would be reduced such that the total emissions associated with excavation/processing of aggregate combined with the emissions associated with the transport and processing/blending of recycled materials and additives would not result in an increase to baseline.

- The number of employees will not exceed the number of employees required for previous aggregate operations (baseline).
- The number of delivery and other non-aggregate trucks would be included in the total number of trucks coming/going from the site such that the total number of trucks would not exceed baseline.
- An existing SCE electric connection is located at the northern boundary of the Project.
- Activities associated with the Project will comply with all applicable rules and regulations.

3.6.6 Project-Level Impacts and Mitigation Measures

3.6.6.1 Wasteful, Inefficient or Unnecessary Consumption of Energy Resources

Impact Statement

Impact ENG-1: *Would the Project result in potentially significant environmental impact due to wasteful, inefficient or unnecessary consumption of energy resources, during the project construction or operation?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

As discussed above, the Project would not result in an increase of employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. The electrical services required for the onsite processing equipment would be obtained from SCE. Additionally, the Project would provide a local source of aggregate to the County which would minimize the need to import aggregate from further away, thus reducing fuel consumption associated with long distance trucking. For these reasons, the Project would have no significant impacts on energy resources, or result in a wasteful, inefficient or unnecessary consumption of energy resources.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.6.6.2 Conflict or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency

Impact Statement

Impact ENG-2: *Would the Project conflict or obstruct a state or local plan for renewable energy or energy efficiency?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

As discussed above, the Project would not result in an increase of employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. Additionally, the Project would provide a local source of aggregate to the County which would minimize the need to import aggregate from out-of-County sources, thus reducing fuel consumption associated with long distance trucking. For these reasons, the Project would have no significant impacts on energy resources. Based on knowledge of the proposed projects in the Project area, the Project would not conflict or obstruct a state or local plan for renewable energy or energy efficiency. Therefore, the Project would have no impact on renewable energy plans.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.6.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3.0-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3

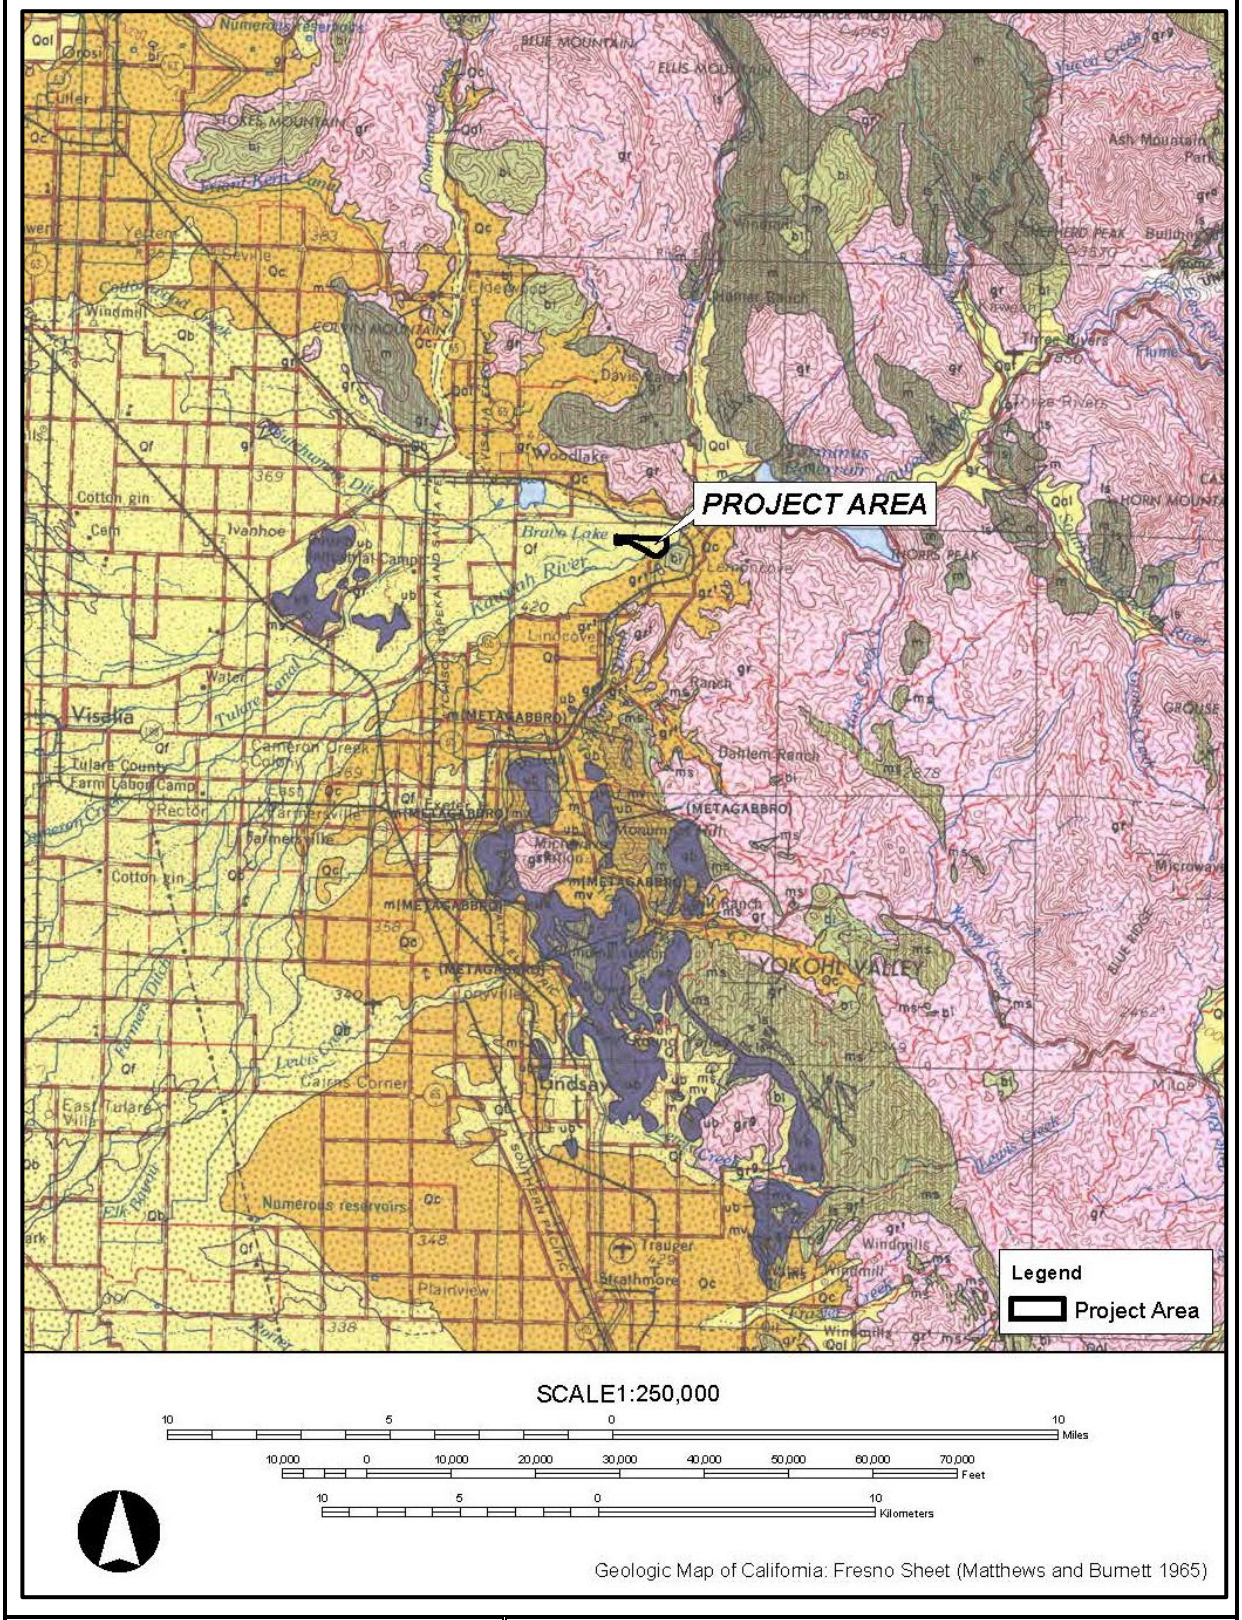
miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to energy resources.

As discussed above, the Project would have no specific impacts related to energy resources. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to energy resources.

3.7 GEOLOGY AND SOILS

3.7.1 Introduction

This section of the DEIR provides analyses of geology, soils and paleontological related impacts of the Project. Geotechnical hazards analyzed also include seismic hazards, and slope stability. The information provided in this section was derived from the following studies, which are included in the appendices of this DEIR:



- *McKay Point Reservoir Project – Geology and Soils Technical Study,* prepared by Osma Pekin, PhD, P.E., G.E., and Ian Hutchison, PhD., P.E., SLR International Corp. (SLR, 2021) (Appendix F1).
- *Geotechnical Engineering Investigation Report, Proposed McKay Point Reservoir Project, Phase 1: Summary of Field Exploration and Boring Logs, Tulare Irrigation District, Tulare, California*, BSK Associates, Engineers and Laboratories (BSK Associates Engineering & Laboratories, 2011) (Appendix F2).
- *Paleontological Resource Assessment for the McKay Point Reservoir Project,* Applied EarthWorks, Inc. (Applied EarthWorks, Inc., 2014) (Appendix E2).
- *Addendum to Paleontological Resource Assessment for the McKay Point Reservoir Project,* Applied EarthWorks, Inc. (Applied EarthWorks, Inc., 2021) (Appendix E3).

3.7.2 Environmental Setting

3.7.2.1 Regional Setting

The Project is located in the San Joaquin Valley, which is the southern portion of the Central Valley of California. The Central Valley formed by millions of years of deposition of Quaternary sediments derived from the uplifted Sierra Nevada and Coast Ranges, which bound the Central Valley on its east and west. The Central Valley is an alluvial plain approximately 50 miles wide and 400 miles long (north-south). Sediments have been deposited into the Central Valley for the last 160 million years, and can be thousands of feet thick in certain areas.

Numerous rivers and streams originating in the higher elevations of the Sierra Nevada, including the Kaweah River, flow westward into the Central Valley, depositing Quaternary alluvial sediments upon which the Project site is located (Mathews and Burnett, 1965). This alluvium is underlain by a sequence of marine and continental sedimentary rocks consisting of shale, siltstone, and sandstone. Beneath these rocks lie impermeable basement complex of igneous and metamorphic rocks that extend as deep as 13,000-feet below ground surface (bgs). A geologic map of the region is included as Figure 3.7-1.

Source: (Applied EarthWorks, Inc., 2014)

Figure 3.7-1 Geology in the Vicinity of the Project

3.7.2.2 Vicinity & Project Site Setting

A total of six soil borings were conducted at the Project site in November 2011 (BSK Associates Engineering & Laboratories, 2011). Based on these borings and hydrogeologic interpretations by Schmidt (2012), the thickness of fluvial sediments within the Reservoir area ranges between approximately 40- and 100-feet bgs. Alluvial deposits at the Project site consist of sand that is about 15- to 20-feet thick. Luhrdorff and Scalmanini (1995) describe these upper alluvial sediments as Younger Alluvium. Below this, cobbles, boulders with sand, silt, and clay are common. These deposits extended to a depth of about 40-feet bgs on the eastern portion of the Project site, and to about 100-feet bgs on the western portion. Luhrdorff and Scalmanini (1995) describe these lower alluvial sediments as Older Alluvium. Geologic cross-sections for the Project site have been prepared by Schmidt (2012) and SES (2012), which are included in Attachment A of the Geology and Soils Technical Study (SLR, 2021) located in Appendix F of this DEIR.

Weathered bedrock was not encountered in borings on the western portion of the Project site, but was encountered at approximately 77-feet bgs in two borings drilled at the eastern portion of the Project site. The bedrock encountered is likely Mesozoic granitic rocks of the Sierra-Nevada batholith, which has been mapped as outcrops at higher elevations within a few miles to the north, east and south of Project site. The weathered bedrock is presumed to underlie the entire Project site, but is apparently present at various depths (refer to Attachment A of the Geology and Soils Technical Study (SLR, 2021)) located in Appendix F of this DEIR. Discontinuous intrusions of clay or clayey sand were also occasionally encountered (SES, 2012).

Faults and Seismicity

The Project site is located in the eastern portion of the San Joaquin Valley, which is an area of relatively moderate seismicity for California. This area is centrally located between two zones of significant seismicity: the Eastern Sierra Seismic Zone (located approximately 50 miles to the east) and the San Andreas Fault Zone (located approximately 80 miles to the west). There are no active or potentially active faults within 30 miles of the Project site. The nearest potentially active fault is the Independence Fault located 48 miles to the east. This fault is part of the Owens Valley Fault Zone, which is capable of producing large earthquakes, such as the Owens Valley Earthquake of 1872, which measured 7.4 on the Richter Scale.

Soils, Erosion and Slope Stability

The Project site is essentially flat, with a slight topographic slope to the south and west. The Project site is undeveloped, so erosion is minimal and there are no obvious slope failures at the Project site. Soil erosion is limited to the relatively steep slopes facing the St. Johns River at the southern portion of the Project site, and select portions of the few man-made dirt roads at the Project site. Other than these small areas, the Project site is almost 100 percent covered with vegetation, primarily grasses. The upper 5- to 10-feet of the onsite soil consists of poorly-graded sand with increasing gravel at depth. Below 15-feet, the soil consists of sandy and silty gravel of increasing size and rounded cobbles to approximately 30- to 35-feet bgs. At greater depth, silty clayey sand and silty clay/low plasticity clay are predominant before bedrock is encountered (BSK Associates Engineering & Laboratories, 2011).

Paleontological Setting

The Addendum to Paleontological Resources Assessment (PRA) prepared by Applied EarthWorks, Inc. (Applied EarthWorks, Inc., 2021) discusses the vicinity around the Project site in detail. A copy of the PRA is provided in Appendix E3. The following is a summary of the two formations found in the area of the Project that have high paleontological sensitivity.

Modesto Formation (Qf)

The Modesto Formation is late Pleistocene in age and consists of poorly indurated fluvial and alluvial deposits and well-developed soils (Davis and Hall, 1959; Marchand and Allwardt, 1981). The sediments consist of andesitic to arkosic granitic sand, silt, and gravel, which drained from the Sierra Nevada during the late Pleistocene Wisconsin glaciations (Weissmann et al., 2002). The Modesto Formation extends from the Sacramento River in the north to the Tule River in the south (Matthews and Burnett, 1965).

Local deposits of Holocene alluvial sediments cover the Modesto Formation. An unconformable contact marks the boundary between the Modesto Formation and the underlying middle Pleistocene Riverbank Formation. The Modesto Formation was first described by Davis and Hall (1959) and later redescribed by Marchand (1977) at its type section located at a road cut near the Mitchell Road Bridge above the Tuolumne River in the town of Ceres, California.

Marchand (1977) informally divides the Modesto Formation into a lower and upper member based on topographic expression and the presence of paleosols (i.e., buried soil horizons). The upper member has a maximum thickness of 30-feet and the lower member is up to 70-feet thick (Marchand and Allwardt, 1981). The upper member is composed of massive to well-bedded sand, silt, and clay, with subordinate gravel deposits. Where stratification is absent, the sedimentary structures were most likely destroyed by soil development. The lower member is predominately composed of moderately stratified sand and silt deposits, with localized lenticular cross-lamination. Where exposed, the base of lower member of the Modesto Formation is marked by a distinct layer of red clay (Hudson, 1960).

The total thickness of the Modesto Formation ranges from 50- to 100-feet and its age is estimated to range from 9,000 to 42,000 years before present (B.P.) (Marchand, 1977). These depths are characteristic of the Modesto Formation near its type section in center of the San Joaquin Valley where sediment accumulation has been significant. Adjacent to the Sierran foothills, in the vicinity of the Project area, basement rock is near the surface and sediment accumulation is shallower. Borings from the geotechnical report for the Project do not specify sediments by formation, but sand, silt, and gravel likely from the Modesto Formation, are noted at depths up to 35-feet bgs (Lau and Schwartz, 2011).

The Modesto Formation is generally categorized as having paleontological sensitivity and, therefore, contributes to the sensitivity determination of the Project area. Paleontological details supporting this ranking are provided in the PRA (Applied EarthWorks, Inc., 2021) located in Appendix E3.

Riverbank Formation (Qc)

The middle Pleistocene Riverbank Formation consists of granitic sand, silt, and clay primarily derived from the Sierra Nevada (Davis and Hall, 1959). In the vicinity of the Project area elsewhere in Tulare County, the Riverbank Formation is unconformably underlain by Mesozoic granitic rocks (mapped as granitic sand by Matthews and Burnett [1965]). Davis and Hall (1959) first described the Riverbank Formation, which was later redescribed by Marchand and Allwardt (1981) at its type section located on the banks of the Stanislaus River in the town of Riverbank.

The Riverbank Formation consists of moderately consolidated deposits of massive to well-bedded silty sand, arkosic sand, pebbly sand, and gravel lenses. Locally, fine sand may exhibit eolian sorting and coarse sand and gravel may be interbedded with silt and clay deposits (Marchand, 1977). These sediments comprise older alluvium, dissected fan, and nonmarine sedimentary deposits in the San Joaquin Valley (Smith, 1964; Matthews and Burnett, 1965). The thickness of the Riverbank Formation ranges from approximately 50- to 250-feet in the San Joaquin Valley and it is estimated to range in age from 130,000 to 450,000 thousand years (Marchand and Allwardt, 1981). Borings from the geotechnical report indicate sediments likely attributed to the Riverbank Formation as at least 30-feet thick, with granitic rock at depths of approximately 65- to 80-feet bgs in the eastern half of the Project area (Lau and Schwartz, 2011).

The Riverbank Formation is generally categorized as having paleontological sensitivity and, therefore, contributes to the sensitivity determination of the Project area. The PRA provides paleontological details supporting this ranking.

3.7.3 Regulatory Setting

3.7.3.1 Federal

Uniform Building Code

The 1997 Uniform Building Code (UBC) was developed by the International Conference of Building Officials (ICBO) and is used by most states, including California, as well as local jurisdictions to set basic standards for acceptable design of structures and facilities. The UBC provides information on criteria for seismic design, construction, and load-bearing capacity associated with various buildings and other structures and features. Additionally, the UBC identifies design and construction requirements for addressing and mitigating potential geologic hazards. New construction generally must meet the requirements of the most recent version of the UBC.

Earthquake Hazards Reduction Act

Enacted in 1972, The Earthquake Hazards Reduction Act (EHRA) was promulgated to reduce the risks to human life and property associated with earthquakes in the United States. The law provides developing and implementing the National Earthquake Hazard Reduction Program (NEHRP), which defines the program goal and objectives, and scope of the agency's responsibilities. The program is focused on identifying seismic hazards and vulnerabilities, as well their risk and probability of occurrence. The NEHRP

also supports planning and building code requirements such as emergency evacuation responsibilities and seismic code standards.

3.7.3.2 State

Alquist-Priolo Earthquake Fault Zone Act

The State Alquist-Priolo Earthquake Fault Zoning Act (A-P Act) of 1972 (Cal. Pub. Resources Code §2621 et seq.) was passed to mitigate the hazards associated with surface faulting in California. Administered by the California Department of Conservation, the A-P Act prevents construction of buildings used for human occupancy on the surface traces of active faults. Before a project can be permitted, cities and counties must require a geologic investigation to demonstrate that proposed buildings would not be constructed across active faults.

Seismic Hazards Mapping Act of 1990

The 1990 Seismic Hazards Mapping Act (Cal. Pub. Resources Code §2690 et seq.) and related regulations establish a statewide minimum public safety standard for mitigation of earthquake hazards. The purpose of this Act is to protect the public from the effects of strong ground shaking, liquefaction, landslides, or other ground failure as well as other hazards caused by earthquakes. The Act provides the minimum level of mitigation needed to reduce the risk of a building collapse. Under this Act, the lead agency can withhold permits until geologic investigations are conducted, and mitigation measures are incorporated into building plans. In addition, the Act addresses not only seismically induced hazards but also expansive soils, settlement, and slope stability. The program and actions mandated by this Act closely resemble those of the A-P Act by requiring the State Geologist to delineate various “seismic hazard zones” and providing cities, counties, and/or other local permitting bodies with the authority to regulate certain development “projects” within these zones by withholding the development permits for a site until the geologic and soil conditions are investigated and appropriate mitigation measures (if required) are incorporated into development plans.

California Building Code

The California Building Code (CBC), known as Title 24, CCR, Part 2, specifies the acceptable design and construction requirements associated with various facilities or structures. These requirements are administered and updated by the California Building Standards Commission. This Code specifies criteria for open excavation, seismic design, and load-bearing capacity directly related to construction in the State. The CBC augments the UBC and provides information for specific changes to various sections therein. The seismic building requirements under the CBC are more stringent than the Federal UBC.

Surface Mining and Reclamation Act (SMARA)

With respect to addressing geotechnical slope stability for final reclamation slopes, SMARA (Cal. Pub. Resources Code §2710 et seq.) does not specify a minimum factor of safety for slope stability. However, § 3502(b)(3) of SMARA Regulations (14 CCR §3502) states:

> "*The designed steepness and proposed treatment of the mined lands' final slopes shall take into consideration the physical properties of the slope material, its probable maximum water content, landscaping requirements, and other factors. In all cases, reclamation plans shall specify slope angles flatter than the critical gradient for the type of material involved. Whenever final slopes approach the critical gradient for the type of material involved, regulatory agencies shall require an engineering analysis of the slope stability. Special emphasis on slope stability and design shall be necessary when public safety or adjacent property may be affected.*"

§ 3704(d) requires final reclaimed fill slopes to be 2H:1V (horizontal to vertical) or flatter, except when site-specific geologic and engineering analysis demonstrate that the proposed final slope would have a minimum slope stability factor of safety that is suitable for the proposed end use, and when the proposed final slope can be successfully revegetated. § 3704(f) further states:

> "*Cut slopes, including final highwalls and quarry faces, shall have a minimum slope stability factor of safety that is suitable for the proposed end use and conform with the surrounding topography and/or approved end use."*

California Public Resources Code (PRC 5097) – Paleontological Resources

In California, paleontological resources are protected under state policies and regulations in the Public Resources Code (PRC). Moreover, paleontological resources are recognized as nonrenewable resources and receive protection under the PRC and California Environmental Quality Act (CEQA). Requirements for paleontological resource management are included in the PRC Division 5, Chapter 1.7, Section 5097.5, and Division 20, Chapter 3, Section 30244, which states: No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor. These statutes prohibit the removal, without permission, of any paleontological site or feature from lands under the jurisdiction of the state or any city, county, district, authority, or public corporation, or any agency thereof.

3.7.3.3 Local

Tulare County General Plan Policies

The Tulare County General Plan (Tulare County, 2012) outlines several goals and policies related to seismic and geologic hazards, as well as paleontological resources for projects within their jurisdictional area. These goals and policies are summarized as follows:

Section 8.7 – Soil Resources

Goal ERM-7: To preserve and protect soil resources in the County for agricultural and timber productivity and protect public health and safety.

Policy ERM-7.1 – Soil Conservation: The County of Tulare shall establish the proper controls and ordinances for soil conservation.

Policy ERM-7.3 – Protection of Soils on Slopes: Unless otherwise provided for in this General Plan, building and road construction on slopes of more than 30 percent shall be prohibited, and development proposals on slopes of 15 percent or more shall be accompanied by plans for control or prevention of erosion, alteration of surface water runoff, soil slippage, and wildfire occurrence.

Section 10.2 – Geologic and Seismic Hazards

Goal HS-2: To reduce the risk to life and property and governmental costs from seismic and geologic hazards.

Policy HS-2.8 – Alquist-Priolo Act Compliance: The County shall not permit any structure for human occupancy to be placed within designated Earthquake Fault Zones (pursuant to and as determined by the Alquist-Priolo Earthquake Fault Zoning Act; Public Resource code, Chapter 7.5) unless the specific provision of the Act and Title 14 of the California Code of Regulations have been satisfied.

3.7.4 Significance Thresholds

3.7.4.1 Appendix G Thresholds from the State CEQA Guidelines

According to Appendix G of the CEQA Guidelines, the Project would have a significant effect if it would:

a) Directly or indirectly cause potential substantial adverse effects, involving the risk of loss, injury, or death involving:

- *I. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zone Map issued by the State Geologist for the area or based on other substantial evidence of known fault. Refer to Division of Mines and Geology Special Publication 42;*
- *II. Strong seismic ground shaking;*
- *III. Seismic-related ground failure, including liquefaction; or*
- *IV. Landslides.*

b) Result in substantial soil erosion or the loss of topsoil.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to the life or property.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

3.7.4.2 Additional Threshold of Significance

Requirements identified in the County policies and plans are addressed by the significance criteria above. There are no additional thresholds of significance related to geology and soils.

3.7.5 Methodology of Analysis

To evaluate potential impacts to geology, soils and paleontological resources field studies and the following technical reports were prepared:

- *McKay Point Reservoir Project – Geology and Soils Technical Study* (SLR, 2021).
- *Geotechnical Engineering Investigation Report, Proposed McKay Point Reservoir Project, Phase 1: Summary of Field Exploration and Boring Logs* (BSK Associates Engineering & Laboratories, 2011).
- *Paleontological Resource Assessment, McKay Point Reservoir Project* (Applied EarthWorks, Inc., 2014).
- *Addendum to Paleontological Resource Assessment, McKay Point Reservoir Project* (Applied EarthWorks, Inc., 2021).

3.7.5.3 Geology and Soils

The geology and soil conditions of the Project were assessed through review of the following Project technical reports. Data from other publicly available documents was reviewed and evaluated, including the sources referenced in Appendix E and Appendix F – Geology and Soils Technical Study, Addendum to Paleontological Resources Assessment, and the other sources listed below.

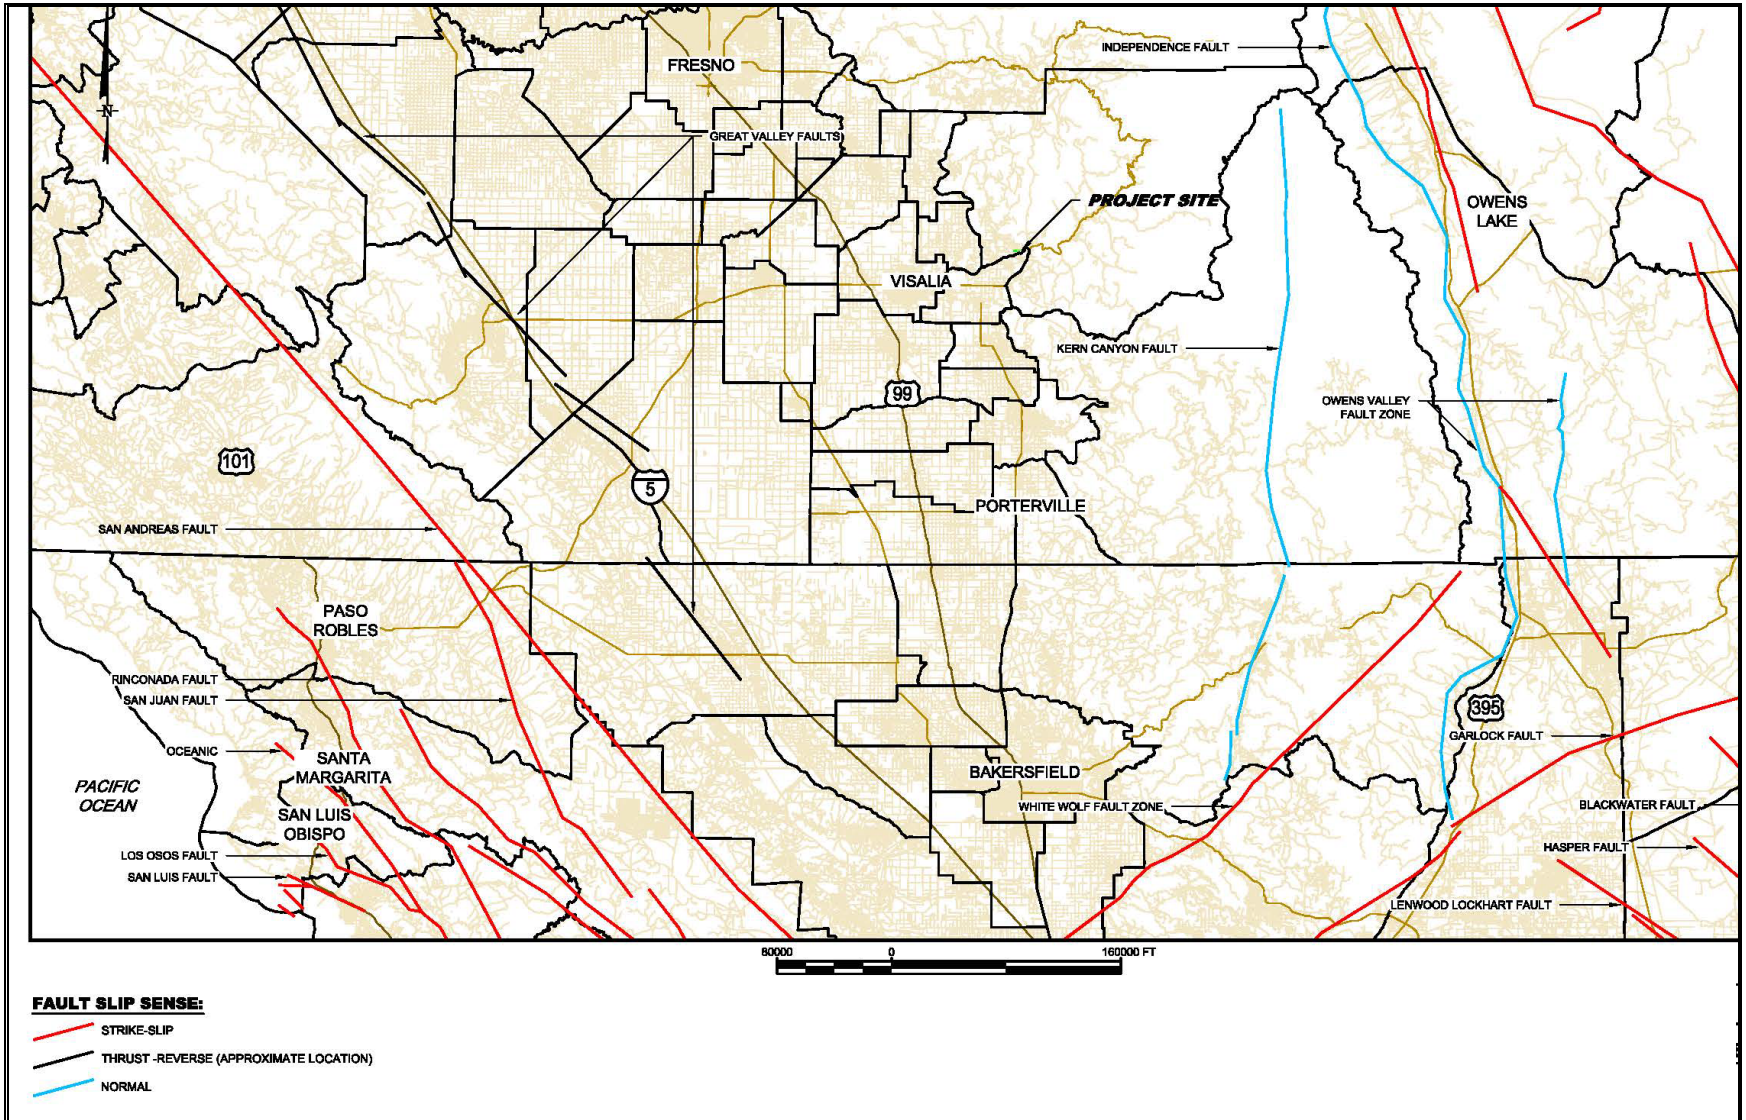
- Department of Conservation, California Geologic Society, Special Publication 42, Interim Revision 2007 (ftp://ftp.consrv.ca.gov/pub/dmg/pubs/sp/Sp42.pdf).
- Department of Conservation, California Geologic Society, Map Sheet 58: Susceptibility to Deep-Seated Landslides in California [2011]: (http://www.conservation.ca.gov/cgs/information/publications/ms/documents/ms58.pdf).
- Department of Conservation, California Geological Survey, Geologic Data Map No. 6: 2010 Fault Activity Map of California (http://www.quake.ca.gov/gmaps/FAM/faultactivitymap.html).
- Tulare County General Plan, August 2012, Figure 10-4 – Ground Shaking and Landslide Potential at page 10-13 (http://generalplan.co.tulare.ca.us/).

- Tulare County General Plan, August 2012, Figure 10-4 – Ground Shaking and Landslide Potential at page 10-13, and Figure 10-5 – Seismic/Geologic Hazards and Microzone at page 10-15 (http://generalplan.co.tulare.ca.us/).

The environmental setting of the Project site in relation to geology and soils is provided in Section 3.7.2.

Seismic Hazards – Surface Fault Rupture

Earthquake surface rupture is the physical displacement of surface deposits, either laterally or vertically, along a fault trace. Surface rupture is the surface expression of the subsurface fault movement and generally only occurs along or within a few hundred feet of the fault trace that moves during an earthquake. Not all large earthquakes have a surface expression or co-seismic surface rupture (e.g., blind thrust faulting associated with the 1994 Northridge, MW6.7 earthquake).



The Project is in Tulare County, which is not a designated Alquist-Priolo Earthquake Zone (APEZ) as issued in Special Publication 42 by the California Geological Survey (2007). Geographic areas are designed as APEZ if they encompass potentially active or recently-active faults.

A review of the 2014 fault activity map for California indicates that no active faults cross the Project site. Refer to Table 3.7-1 and Figure 3.7-2. The closest faults to the Project site are all located at least 35 miles from the site.

Table 3.7-1. Active or Potentially Active Faults within 75 Miles of the Project Site

Fault Zone	Approximate Distance (Miles)
Independence	48

Figure 3.7-2 Active Faults Map

THIS PAGE IS INTENTIONALLY BLANK

Seismic Hazards – Strong Seismic Ground Shaking

Earthquakes on active or potentially active faults, depending on magnitude and distance from the Project site, can produce a range of ground-shaking intensities. Although there are no active faults within the immediate vicinity of the Project site, distant earthquakes have historically caused strong ground-motion in the Project site vicinity. The most significant example is perhaps the aforementioned Owens Valley Earthquake, which occurred in March of 1872. The epicenter was approximately 56 miles east of the Project site, but this earthquake is estimated to have caused strong (Mercalli Intensity, MM VI) shaking intensities in the area (Hough and Hutton, 2008).

The current state of practice to determine the seismic hazard at a given location is to perform a Probabilistic Seismic Hazard Analysis (PSHA), from which the probability of exceeding a specific ground motion parameter (typically the peak ground acceleration, or PGA) within a time period is calculated. Typically evaluated sets of probability and time-period are seismic events with 10 percent probability of occurrence in 50 years, and those with 2 percent probability of occurrence in 50 years. These probabilities correspond to return periods of 475 and 2,475 years respectively. The probability of exceedance of the ground motion parameter is calculated based on the following input parameters:

- Seismic sources that can generate ground shaking at the Project site;
- Characteristics of each seismic source: length, rate of ruptures, maximum magnitude, earthquake occurrence; and
- The ground motion parameter versus distance attenuation relationships appropriate for each seismic source and Site conditions.

Seismic sources include active and potentially active faults (or fault zones) in the vicinity of the Project site. Active faults are those that have experienced displacement within Holocene time (the past 11,000 years) whereas potentially active faults are those that have experienced displacement within Quaternary times (approximately past 1.6 million years).

The United States Geological Survey (USGS) website provides tools that are commonly used to identify the active and potentially active faults that could generate ground shaking at sites located in the United States. These tools are also used to perform the PSHA to estimate the level of ground shaking a given site may experience. These tools are based on the user defined location coordinates of the site, and a user defined radius of influence selected based on the general level of seismicity of the site. A typical radius used for such evaluations is on the order of 100 km (67 miles).

The maximum PGAs for the Project site were estimated to be 0.1 g for a return period of 475 years and 0.2 g for a return period of 2,475 years. PSHA outputs are included in Attachment G of the Geology and Soils Technical Study (Appendix F). It is noted that these PGA values are not equivalent to the seismic coefficient used in the pseudostatic slope stability analysis. Guidelines for Evaluating and Mitigating Seismic Hazards in California, SP-117 (California Geological Survey, 2008) states PGA should not be used

as a pseudostatic coefficient, as that would result in overly conservative factor of safety (FS). The generally accepted value for pseudostatic coefficient is 0.1, with an acceptable FS of the order of 1.1.

The Project site may be subjected to moderate to strong shaking based on correlations between PGA and the Modified Mercalli Intensity chart relating perceived shaking to PGA (Trifunac and Brady, 1975), provided by the USGS (Table 3.7-2).

Table 3.7-2. Modified Mercalli Intensity and Peak Ground Acceleration

Perceived Shaking	Not felt	Weak	Light	Moderate	Strong	Very Strong	Severe	Violent	Extreme
Potential Damage	None	None	None	Very light	Light	Moderate	Moderate-Heavy	Heavy	Very Heavy
Peak Acc (% g)	<0.17	0.17-1.4	1.4-3.9	3.9-9.2	9.2-18	18-34	34-65	65-124	>124
Peak Vel (cm/s)	<0.1	0.1-1.1	1.1-3.4	3.4-8.1	8.1-16	16-31	31-60	60-116	>116
Instrumental Intensity	I	II-III	IV	V	VI	VII	VIII	IX	X+

Seismic Hazards – Ground Failure and Liquefaction

Settlement of the ground surface (i.e., ground failure) can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of the relatively rapid compaction and settling of subsurface materials (particularly loose, uncompacted, and variable sandy sediments above the water table) due to the rearrangement of soil particles during prolonged ground-shaking. Settlement can occur both uniformly and differentially (i.e., where adjoining areas settle at different amounts). Areas underlain by artificial fill are particularly susceptible to this type of settlement. Given the geologic setting of the Project site, the fluvial nature of sediment deposition and the absence of fill, seismically-induced ground failure is not a significant hazard.

Soil liquefaction is a condition in which saturated granular soils undergo a substantial loss of strength and deformation due to increased pore pressure, resulting from cyclic stress application induced by earthquakes. During liquefaction, the soil becomes sufficiently mobile to permit both horizontal and vertical movements if the soil mass is not confined. Soils most susceptible to liquefaction are sand deposits that are saturated, loose, clean, uniformly-graded, and fine-grained. If liquefaction occurs, foundations resting on or within the liquefiable layer may undergo differential settlement. This would result in reduction of foundation stiffness and capacity. When this occurs, the structure can settle, tip, or even become buoyant and shift upwards. Liquefaction and associated ground failures could damage foundations, roads, underground cables and pipelines, and disrupt utility service.

Earthquake induced liquefaction typically occurs within the top 50-feet of liquefaction-prone soil, if those soils are saturated. A review of the logs associated with borings advanced at the Project site (BSK, 2011) indicates that the water table is at an average depth of 15 feet below grade (refer to Attachment C of

Appendix F – *Geology and Soils Technical Study*). The saturated soils below that depth are classified as silty sand to poorly-graded sandy silt and cobbles, as is illustrated in Table 3.7-3. The sieve analyses on the samples recovered at depth greater than 15 feet indicate silt contents on the order of 10 percent. Whereas these materials may generally be considered liquefiable, the presence of at least 10 percent of fines in the sand reduces the liquefaction potential of the sand. The depth of groundwater, combined with the anticipated level of ground shaking, means that the potential for liquefaction at the Project site is low.

Table 3.7-3. Representative Soils Cross-Section at McKay Reservoir Project Site

Layer	Description	Thickness (feet)	Friction Angle (degrees)	Cohesion (psf)	Unit Weight (pcf)	Hydraulic Conductivity (cm/s)
1	Poorly graded sand	13	36°	0	110	1.6×10^{-3}
2	Poorly graded sandy gravel	15	35°	0	120	2.25×10^{-3}
3	Silty clayey sand	42	33°	0	110	1.0×10^{-6}
4	Silty clay/low plasticity clay	25	28°	200	105	1.0×10^{-7}
5	Bedrock	---	40°	1,500	130	1.0×10^{-7}

Seismic Hazards – Landslides

There are currently no significant slopes or other topographic features at the Project site that appear susceptible to slope failure. The California Geologic Survey has produced a series of landslide inventory and landslide hazard maps for unstable areas of the State. The Project site and the vicinity are not mapped as having pre-existing or future slope stability hazards.

Slope Stability – Material Properties

Available subsurface information at the site consists of six borings B-1 through B-6, performed by BSK Associates in November 2011 (BSK Associates Engineering & Laboratories, 2011). These borings provide descriptions of the subsurface strata, which have been generalized into five strata as described below and used in the slope stability modeling.

Moist Sand

In the available borings, this light colored, moist, sand layer generally exists from the ground surface down to depths ranging from 7- to 15-feet bgs. It has a typical thickness of 12-feet. It is expected to have little to no cohesion and is expected to be medium-dense. The bottom of this layer is at or slightly above the groundwater levels noted in the borings. In the slope stability analysis material layers as depicted in the output figures (slope stability profiles) provided in Appendix F.

Wet Sand, Gravel, Cobbles

This is a water-bearing layer of olive-gray colored sand, gravel, cobbles, with an approximate thickness ranging from 15- to 25-feet. In the easterly portion of the site (Borings B-3, B-4, B-5, B-6), groundwater was noted at the top of or close to the top of this strata. In the easterly portion of the site (Borings B-1 and B-2), groundwater is noted to gradually dip to the mid-depth or slightly below the mid-depth of this layer. This stratum is also expected to have little or no cohesion, but with higher friction angles than the sandy layer above it, due to the presence of gravel and cobbles.

Wet Clayey Sand, Grave, Cobbles

The top of this yellow-brown to olive-brown, wet, clayey sand, gravel, cobble layer is generally at approximate elevation 430-feet mean sea level (MSL) (Borings B-1 through B-5). It rises to approximate elevation 440 feet MSL near the east end of the site (Boring B-6). The thickness of this layer is of the order of 20- to 50-feet, generally increasing to the west, as the underlying bedrock and the dense soil mantle over the bedrock dip down to the west. This layer is expected to have both cohesion due to its clay content, and relatively high friction angle due to its sand, gravel, and cobble components.

Dense Silty Clayey Sand

This layer consists of mixtures of gray, olive-gray, bluish-gray, olive-brown colored silty clayey sand. It is described as moist to dry, indicating that it is a 'tight' formation since it is dry despite being below groundwater. In some zones, the boring logs note hard to very hard drilling. This layer is expected to have a higher strength, with properties of a stiffer cohesive material intermixed with frictional material. This layer generally tends to follow the bedrock surface as a mantle with thickness of 20-feet or more. Towards the west end of the site, bedrock was not encountered at a depth of 90-feet. The thickness of this layer may increase towards the west.

Granitic Bedrock

Dry, granitic bedrock was encountered at its shallowest, at elevation 400-feet MSL or 67-feet bgs in the easterly quadrant of the site (B-4). Based on an approximate extension of the bedrock surface profile to the west, the top of bedrock can be estimated to be in the range of 340- to 360-feet MSL, or 100- to 120-feet bgs, under the westerly portions of the site. Borings B-1 and B-2 in this area did not encounter bedrock withing their maximum exploration depths of 90-feet bgs. For slope stability modeling purposes, bedrock has been assigned a very high strength and is not considered to be an influencing factor in the stability calculations.

Slope Stability – Manmade Material Properties

The man-placed materials related to the analysis include the following.

Slurry Wall

It is expected that the slurry wall would be a low-permeability barrier consisting of either a soil-bentonite mix or a soil-cement-bentonite mix, depending on the design details. Two types of walls have been

conceptually evaluated in the analysis: one with an approximate equivalent cohesion value of 400 psf, referred to as the "low strength wall; and another with an approximate equivalent cohesion value of about 2,000 psf, referred to as the 'moderate strength wall". In practice, an increase in the shear resistance values for the slurry wall would be achieved by adjusting the cement content of the slurry mix.

Compacted Fill

Fill would be used to create the 3H to 1V (horizontal:vertical) reservoir slope. It is expected to consist of excavated on-site materials which would likely be a blend of granular and fine materials obtained from the pit. For stability purposes, the excavation slope would be benched and the fill material would be placed against the slope in horizontal lifts.

Summary – Material Properties

The material parameters relevant to the slope stability analysis are listed in Table 3.7-4.

Laboratory test data is not available but presumed soil strength parameters can reasonably be assigned based on the available descriptions and professional judgement. The values assigned to each generalized strata as well as the future backfill and slurry wall materials are as summarized in Table 3.7-4. The permeability values listed in Table 3.7-4 are the same as those used in the Hydrology Study (SLR, 2021).

During design, additional geotechnical investigations and laboratory testing would be performed to confirm or modify these parameters as appropriate.

Table 3.7-4. Material Properties for Slope Stability Analysis

Material	Unit Weight γ (lbs/ft^3)	Cohesion c (psf)	Friction Angle Φ (°)	Permeability (ft/s)
Sand (SP)	115	0	35	5E-05 (1.5E-3)
Sand, Gravel, Cobbles (GP)	125	0	38	7E-04 (2E-2)
Clayey Sand, Gravel, Cobbles (SC/SM)	120	200	36	2E-06 (6E-5)
Silty Clayey Sand (SC/CL)	120	400	28	5E-08 (1.5E-6)
Granitic Bedrock	135	"INFINITE" STRENGTH		3E-06 (9E-5)
Slurry Wall	130	varies	0	3E-11 (9E-10)
Compacted Fill	120	200	33	2E-06 (6E-5)

3.7.5.4 Slope Stability Analysis

Slope stability analysis was performed using the Slide2 geotechnical software by RocScience. Slide2 is a two-dimensional limit equilibrium slope stability analysis program for estimating the slope Factor of Safety (FS) by various methods of slices. Circular surfaces were used in the analyses to identify the critical failure surface having the lowest FS for each assumed scenario.

Excavation Slope Stability

This portion of the evaluation pertains only to the excavation conditions until permanent reservoir slopes are constructed at a shallower gradient. Throughout the duration of excavation, dewatering systems would be in place to allow safe operation inside the pit. This requires a dewatering system capable of maintaining the groundwater water levels at or below the lowest excavation level in the pit, as excavation progresses. This would be accomplished by the combination of the perimeter slurry wall outside and interior dewatering systems inside the pit, such as pumps, sumps, and trenches. The critical slope condition would be at the maximum excavation depth.

The desired excavation slopes would generally be targeted to achieve the steepest safe gradient. For most applications, this would be in the range of 1.5H:1V to 1H:1V. Depending on site-specific conditions and the localized variations in the exposed conditions, various measures are then implemented as excavation proceeds. Some of these measures may include varying the slope gradients, using benches, providing additional drainage and dewatering systems, and if needed, installing additional structural support systems.

The analysis aimed to evaluate the feasibility of the project based on the soil parameters summarized in Section 3.7.5.3, without relying on additional stabilizing measures such as benches. Further evaluation and verification of these parameters would be undertaken during design and additional safeguards would be implemented during construction to address the specific conditions.

A generally acceptable factor of safety (FS) value for temporary excavation slopes is of the order of 1.25. For relatively longer temporary excavation durations involved here, an additional margin may be desirable, though not mandated.

Dewatering Scenarios

For the fully excavated condition, the groundwater levels between the toe of the excavation slopes and front of the slurry wall system would depend on the type and location of the dewatering systems to be used, as well as the slurry wall properties, the permeability of the materials beneath the slurry wall, and the base of the excavation. The assumed permeability values based on generalized subsurface material types are as provided in Table 3.7-4. The slurry wall configuration is as shown in the various slope stability outputs. During design and construction, further details and verification would take place.

For our evaluation, the dewatering system effectiveness between the toe of slope and the slurry wall has been assumed in three categories. In all cases, the dewatering would have to bring the groundwater levels to no higher than the toe of slope. For groundwater levels projected under the slope, three different conditions have been presumed. These are shown in the output figures of Attachment C of the Geology and Soils Report (Appendix F), as part of the different slope stability analysis scenarios. From a typical construction practice point of view, these three dewatering levels may consist of the following methods:

- **Dewatering by Wells:** Groundwater assumed at or below the bottom of the excavation level between the toe of slope and the front of the slurry wall;

- **Dewatering by Continuous Trenches at the Base and Perimeter of the Excavation:** Groundwater assumed to rise from the toe of slope to + 10 feet at the front face of the slurry wall; and
- **Dewatering by Intermittent Sumps:** Groundwater assumed to rise from the toe of slope to + 20 feet at the front face of the slurry wall.

The nomenclature used here for differing categories of dewatering aggressiveness is only intended as a descriptive tool, it does not imply the application of a specific dewatering system. The suitability and the details of any dewatering system would be developed during design and construction.

Slope Gradient Scenarios

For each of these three dewatering categories, three different slope gradients have been evaluated, for a total of nine (9) scenarios. The results of these scenarios are briefly described in the sections below and summarized in Table 3.7-5.

- **1.5H:1V Slope:** The estimated FS for an excavation slope of 1.5H:1V is satisfactory for each of the dewatering scenarios considered. The FS values range from 1.4 (with trench or sump dewatering) to 1.5 (with well dewatering). A 1H:1V slope gradient provides an additional margin above the minimum 1.25 FS value for each of the scenarios analyzed.
- **1.25H:1V Slope:** The estimated FS for an excavation slope of 1.25H:1V is adequate with trench or sump dewatering. An added margin can be achieved if a more aggressive dewatering well system is used. It may be possible to achieve higher FS values with this slope with other dewatering methods, depending on the results of further explorations, additional field and laboratory tests, and refinements that can be made during design and construction.
- **1H:1V Slope:** The estimated FS values for an excavation slope of 1H:1V range from 1.1 (with sump dewatering) to 1.2 (with trench or well dewatering). These findings may vary depending on the results of further studies. Unless additional studies indicate otherwise, a 1H:1V excavation gradient is not considered to be suitable under the current assumptions.

Summary of Excavation Slope Stability Scenarios

The estimated FS for different excavation slope scenarios is summarized in Table 3.7-5.

Table 3.7-5. Estimated Factor of Safety for Different Excavation Scenarios

Excavation Slope Gradient	Condition Analyzed		
	Excavation dewatered from toe of slope to slurry wall	Excavation dewatered from toe of slope to +10 feet at slurry wall	Excavation dewatered from toe of slope to +20 feet at slurry wall
1.5H:1V (33°)	1.5	1.4	1.4
1.25H:1V (39°)	1.4	1.3	1.3
1H:1V (45°)	1.2	1.2	1.1

Reservoir Slope Stability

Upon completion of excavation, the cut slopes would be backfilled to a permanent gradient of 3H:1V to use the facility as a reservoir. The reservoir would be subject to various cycles of filling and emptying. The results of the slope stability analysis for this long-term use condition are summarized in Table 3.7-6.

The analysis for reservoir slopes includes steady state, rapid drawdown, and seismic (pseudostatic) conditions. A commonly used dynamic slope stability analysis method is pseudostatic analysis. This method applies a simulated equivalent acceleration acting on the mass of a potential slide mass, using limit equilibrium analysis methods. The ground motion parameter used in a Pseudostatic analysis is referred to as the seismic coefficient "k", which is different than the peak ground acceleration values.

Steady State: Steady state seepage conditions were incorporated in the model using the groundwater boundary conditions for the final configuration, using the estimated hydraulic conductivities of subsurface layers and the properties of the slurry wall cutoff system.

Rapid Drawdown: The rapid drawdown conditions are applicable when the reservoir is emptied. Emptying the reservoirs is expected to occur over approximately 2 weeks which would allow some of the water pressure in the slope to dissipate. However, the analyses performed conservatively assumed no pressure dissipation, which is an extreme worst-case condition.

Pseudostatic: Seismic slope stability has been evaluated by considering an equivalent horizontal ground acceleration corresponding to a pseudostatic seismic coefficient of 0.1.

Table 3.7-6. Estimated Factor of Safety for Different Reservoir Conditions

3H:1V Backfill Placed Over	Condition Analyzed		
	Steady State	Rapid Drawdown	Pseudostatic
1.5H:1V (33°)	1.6	1.3	1.1
1.25H:1V (39°)	1.6	1.3	1.1
1H:1V (45°)	1.5	1.3	1.1

The slope stability FS values for each of the permanent condition scenarios are all within their respective acceptable FS values. The rapid drawdown FS value reflects a conservative assumption and actual conditions would likely be higher. There is no significant difference in FS values for a 3H:1V slope placed on different excavation slope gradients. This is as expected since the overall stability of the permanent slope is largely governed by the wedge of compacted fill placed over the temporary excavation slopes.

Slurry Wall Stability Analysis

The finite element analysis method aimed to assess the displacements which would develop in the slurry wall as the strength and stiffness parameters of the wall were varied over an expected range that can be achieved. Analysis was carried out using the finite element modelling software RS2, developed by Rocscience. RS2 is a 2D finite element program for soil and rock applications, with the ability to carry out slope stability analysis using the shear strength reduction method.

The developed slope model was meshed using a graded mesh with 6-noded triangles. The boundaries were fixed both in the x and y plane. Groundwater was set at a total head condition of 5-feet bgs. The typical model configuration and output graphics are provided in Appendix F.

The limit equilibrium method such as that used in the slope stability analysis, evaluates the different failure conditions of the slope system, but does not provide information on ground movements within the system. On the other hand, the fine element model evaluates the ground deformations within the system.

The FS value in limit equilibrium is based on the ratio of resisting forces in relation to the sliding forces. In the finite element method, an equivalent FS is obtained by reducing the soil strength until the deformations become excessive and the computation becomes unstable (failure). The ratio of actual soil strength in relation to the reduced strength for failure is called the Strength Reduction Factor (SRF). The FRS and FS values for a given slope would be similar, but not necessarily identical.

The basic soil strength parameters are as established for the slope stability analysis (Table 3.7-4). These values were supplemented with elastic properties corresponding to each layer. The expanded soil material properties are as summarized in the Geology and Soils Technical Study located in Appendix F.

Slurry Wall Stability for Excavation

In the Finite Element Model (FEM) scenarios studied, the slurry wall and the slope have the same layout as in the slope stability analysis above. The analyses were conducted for a 3-foot-wide slurry wall, located behind the top of the excavated slope. A slope of 1.5H:1V was applied to all Excavation scenarios since this is the most realistic case. To be conservative, the total excavation depth for all scenarios is 76-feet bgs (the reservoir is anticipated to be 70 feet bgs).

The excavation progress in front of the slurry wall was modeled for the interim stages of excavation. The models were staged to simulate the excavation in approximate depth increments of 3.8-feet, representing a typical annual production rate, to reach the total excavation depth of 76-feet in 20 years.

Outputs from the RS2 finite element model for the various scenarios discussed here are provided in Geology and Soils Technical Study.

For each scenario, the deflections of the slurry wall were estimated as provided in the Geology and Soils Technical Report located in Appendix F. The strength reduction method was applied to obtain the critical Strength Reduction Factor (SRF, FS) for each slurry wall strength scenario at the full excavation stage. A summary of the results for the four scenarios are provided in Table 3.7-7.

Table 3.7-7. Summary of FEM Results for Different Slurry Wall Scenarios

Scenario	Estimated Max. Displacement (inches)	Estimated annual Displacement (inches)	SRF (FS)
Low Strength Slurry Wall (400 psf)	5.2	0.3	1.20
Moderate Strength Slurry Wall (2 ksf)	3.8	0.2	1.26

Slurry Wall Stability for Reservoir

A finite element model analysis was performed for the case of the slurry wall behind the permanent 3H:1V slope of the reservoir. The input for our analysis is based on the geotechnical characteristics of the materials in the excavation area, that are assessed from available boring logs.

For the conditions analyzed, the slurry wall extends from the ground surface behind the top of the outer slope, down to approximately 10-feet below the bottom of the Reservoir, into the low permeability native materials.

For the completed reservoir with 3H:1V slopes and empty condition, which is more critical for slope stability, the calculated FS exceeds the generally accepted value of 1.5.

For rapid drawdown conditions which represents emptying of the reservoir without allowing adequate time for dissipation of water from the soil within the slope, the FS exceeds the generally accepted values which range from 1.25 to 1.40.

For pseudostatic (seismic) conditions, the FS exceeds the generally accepted value of 1.1.

Results show that the proposed slopes are sufficiently stable, including during earthquake conditions. The slope and slurry wall deformation analyses that demonstrate that the slopes and slurry wall deformations would be tolerable with adequate safety.

Further analysis during design will establish a suitable slurry wall mix design to provide the desired performance of the system.

The key design aspects of the slurry wall are the mix designs for both the bentonite slurry that is used to support the trench during excavation and for the backfill soil-bentonite mixture that forms the slurry wall. The details of these mixes would be established during the detailed design process discussed below and would incorporate the following essential design bases and criteria.

- The bentonite slurry mix, which is predominantly a bentonite-water mixture is designed to have sufficient viscosity and density to support the trench walls during excavation.

- The soil-bentonite backfill mix is designed to have a low permeability, be sufficiently ductile to adjust to deformations in the excavation slopes, and to resist the hydraulic pressures that will develop behind the wall as the Excavation is dewatered or the Reservoir is emptied.
- A key parameter in the design is to ensure the grain size of the soil materials are sufficiently large so that the water pressure cannot force them to migrate through the adjacent natural soils to prevent what is known as "piping". Use of a soil-cement-bentonite mix could further improve the resistance to piping.

These types of walls are frequently constructed and therefore there is a sound basis for assessing appropriate mix designs that will meet the above requirements.

3.7.5.5 Paleontological Resources and Unique Geological Features

Applied EarthWorks completed the original Paleontological Resources Assessment (PRA) for the Project in 2014 and updated the study in 2021. The 2021 Addendum to the 2014 PRA addresses the updated Project plans through a new museum records search, comprehensive literature and geologic map reviews, and pedestrian survey. Using the results of museum records search and literature review, Applied EarthWorks determined the paleontological resource potential of the Project in accordance with Society of Vertebrate Paleontology guidelines. The report summarizes the methods and results of the PRA and provides Project-specific management recommendations.

Published geologic maps indicate the late Pleistocene Modesto Formation and underlying middle Pleistocene Riverbank Formation occur within the Project area (a radius of approximately 43 miles from Project site). Online museum and database records indicate numerous fossil specimens representing plants, mammals, reptiles, and birds from within the Modesto and Riverbank Formations throughout the San Joaquin Valley. These include at least 14 vertebrate fossil specimens from 12 localities within unnamed Pleistocene deposits in Tulare County. Records search results indicate three vertebrate fossil localities yielding *Mammuthus* (mammoth) and *Equus* (horse) within sediments in Tulare County consistent with the Modesto and Riverbank Formations. However, no previously recorded paleontological localities were found within Project site.

Applied EarthWorks paleontology field monitor completed a pedestrian field survey of the Project site and adjacent property on January 12, 2021, to confirm the presence/absence of exposed fossils on the ground surface and to evaluate geologic exposures for their potential to yield subsurface fossil material. There was no recording of any new fossil localities during the survey.

As a result of this study, Applied EarthWorks concluded that there was the potential for paleontological resource at the Project site because the fossiliferous Modesto and Riverbank Formations mapped in the Project area. Significant and intact fossils have been recorded in these geologic units in the Project area and elsewhere in the San Joaquin Valley. Recent fluvial sediments overlying these geologic formations and visible at the present ground surface have low paleontological sensitivity. Therefore, Applied EarthWorks

felt that paleontological sensitivity increases with depth within the Project area (within a 43-mile radius of the Project site).

Undisturbed geologic units with a proven potential to yield paleontological resources occur at shallow depths in the Project area. Therefore, there is a potential for impacting fossils during ground-disturbing construction activities. Applied EarthWorks recommended paleontological resource mitigation monitoring during the excavation of the Project site. Applied EarthWorks also suggested that a Paleontological Resource Mitigation and Monitoring Program be prepared for the Project, including, but not limited to, a preconstruction Worker's Environmental Awareness Training module. By implementing these mitigation measures during Project development, adverse impacts to paleontological resources can be reduced to a less than significant level.

3.7.5.6 Project Design Features and Environmental Protection Measures

Numerous design features, BMPs, operating practices and other environmental protection measures have been incorporated into the Project to minimize potential impacts on the environment. The following identifies some of the environmental protective measures that were considered during this evaluation:

- The Project site would be designed to comply with the best management practices (BMPs) identified in the site-specific Storm Water Pollution Prevention Plan (SWPPP).
- The Project site would be graded to prevent sediment from leaving the site.
- BMPs (e.g., gravel bag or rock check dams along drainage swales, silt fencing or fiber rolls to contain drainage and sediment, lined swales, etc.) would be implemented to prevent stormwater runoff in accordance with the SWPPP.
- Equipment and vehicle parking/storage areas would be either graded to prevent stormwater from leaving the site or located within the pit.
- Excavation equipment would be inspected, maintained and repaired to ensure that the equipment is operating properly, and leaks are prevented to the maximum extent feasible.
- Minor/routine maintenance and fueling activities conducted on-site would be done in accordance with the BMPs identified in the SWPPP.
- Hazardous materials and hazardous waste would be managed in accordance with applicable local, state and federal regulations. Any hazardous waste generated at the site would be disposed of at a permitted off-site facility.
- Exposed slopes within the reservoir basin above the anticipated water line would be stabilized using riprap or would be protected by other equally effective means, if necessary, to prevent water and wind erosion.
- The design slope configurations were evaluated under both static and pseudo-static conditions, and would be stable according to appropriate factors of safety.

3.7.6 Project-Level Impacts and Mitigation Measures

3.7.6.7 Seismic and Seismic Related Hazards

Impact Statement

Impact GEO-1**:** *Would the Project directly or indirectly cause potential substantial adverse effects, involving the risk of loss, injury, or death involving*: **(CEQA Guidelines Threshold Criteria (a))**

a.i *Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zone Map issued by the State Geologist for the area or based on other substantial evidence of known fault. Refer to Division of Mines and Geology Special Publication 42;*

a.ii *Strong seismic ground shaking;*

a.iii *Seismic-related ground failure, including liquefaction; or*

a.iv *Landslides?*

Impact Analysis

The majority of Tulare County is free of the faults noted on the Alquist-Priolo Earthquake Fault Zoning Map. Such faulting is noted only along the eastern-most boundary with Inyo County. As such, there is no known active earthquake fault in or within 30 miles of the Project site. Risks associated with different manifestations of seismic hazards are addressed below.

Seismic Hazards – Surface Fault Rupture (criteria a.i)

Earthquake surface rupture is the physical displacement of surface deposits, either laterally or vertically, along a fault trace. Surface rupture is the surface expression of the subsurface fault movement and generally only occurs along or within a few hundred feet of the fault trace that moves during an earthquake. Not all large earthquakes have a surface expression or co-seismic surface rupture (e.g., blind thrust faulting associated with the 1994 Northridge, MW6.7 earthquake).

The Project is in Tulare County, which is not a designated Alquist-Priolo Earthquake Zone (APEZ) as issued in Special Publication 42 by the California Geological Survey (2007). Geographic areas are designed as APEZ if they encompass potentially active or recently-active faults.

A review of the 2014 fault activity map for California indicates that no active faults cross the Project site. Refer to and Figure 3.7-2. The closest faults to the Project site are all located at least 35 miles from the site. Because the Project site is not located within or near an APEZ, there is little potential for the occurrence of surface fault rupture. As a result, the Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving major geological hazards. Therefore, the Project would result in Less than Significant Impacts.

Table 3.7-8. Active or Potentially Active Faults within 75 Miles of the Project Site

Fault Zone	Approximate Distance (Miles)
Independence	48
Birch Creek	56
Great Valley (Segment 14)	56
Owens Valley	56
South Sierra Nevada	60
Great Valley (Segment 13)	62
Round Valley	63
White Mountains	65
Hunter Mountain Connected	69
Little Lake	73
Great Valley (Segment 12)	73

Source: USGS (http://earthquake.usgs.gov/hazards/qfaults/)

Seismic Hazards – Strong Seismic Ground Shaking (criteria a.ii)

Ground Shaking Intensity: The estimated ground shaking (acceleration) at the Project site does not pose a potentially significant impact because Project's proposed design accounts for the estimated ground acceleration and therefore ground shaking is expected to pose a less than significant impact. The proposed slopes into the quarry are at an inclination of 3H:1V (horizontal to vertical) corresponding to an angle of 18.5 degrees. The materials at the site range from silty sand to sandy gravel with shear resistance characterized by friction angles which, for that type of material, ranges from 30 to 38 degrees. Stability analyses were carried out for these conditions and the applicable pseudostatic coefficient. The calculated FS values as discussed in Section 3.7.5.4, meet the necessary stability criteria. Therefore, the Project would result in less than significant impacts.

Ground Shaking Induced Seiche: Seismic events can create hazards with their impact on water bodies. One such phenomenon is Tsunami, which would not apply here since the Project site is not near the coast. A seiche is a standing wave that can occur in small water bodies such as basins, swimming pools, and lakes as a result of ground shaking. The wave can reduce water levels at one end of the water body and increase the water level on the other, similar to the "sloshing" of water back and forth.

The risk of seiche developing in the proposed reservoir as a result of ground shaking during an earthquake has been evaluated and the results indicate this to be unlikely.

The occurrence of a seiche and the amplitude of the wave are controlled by the natural period of the reservoir and that of the earthquake. If the two periods are similar, resonance can occur, thus amplifying the wave.

The natural period of the reservoir can be calculated using the Merian formula assuming a rectangular basin (USNRC, 2011):

$$\mathrm{T} = \frac{2\,L}{\sqrt{gh}}$$

Where L is the length of the basin, g the acceleration of gravity (32.2 cm/sec^2), and h the depth of water. Combining a representative value of 600-feet as the average width of the basin and a depth of water h of 70-feet, the natural period of the reservoir is estimated to be:

$$T = \frac{(2)(600)}{\sqrt{(32.2)(70)}} = 25\ s$$

This natural period is to be compared to that of the earthquake that may shake the site. The typical range of period for strong ground motion is between 0 and 5.0 seconds, with the dominant period for the site-specific event being on the order of 0.2 second (USGS, http://geohazards.usgs.gov/hazardtool/application.php). Therefore, the difference in period between the reservoir and the design earthquake is two orders of magnitude.

An empirical formula is provided in HAZUS (FEMA, 2003) to estimate the peak wave height of the seiche as:

$$H = \sqrt{\frac{A}{L\,(\pi f)^2}}$$

Where H is peak height, A the acceleration in, g's, f the frequency of the lake, and L the wavelength (5.12/ft^2). Using the PGA calculated for the 2,475-year event of 0.20 g, the maximum wave height a seiche is estimated to be 0.06 cm.

The estimated value of the peak wave for the seiche at the site is extremely low and for practical purposes, insignificant. In addition, the ratio between the reservoir and the natural period of the seismic event that could occur on site indicates that a possible resonance condition is unlikely. Therefore, the Project would result in less than significant impacts.

Seismic Hazards – Ground Failure and Liquefaction, Lateral Spreading (criteria a.iii)

Settlement of the ground surface (i.e., ground failure) can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of the relatively rapid compaction and settling of subsurface materials (particularly loose, uncompacted, and variable sandy sediments above the water table) due to the rearrangement of soil particles during prolonged ground-shaking. Settlement can occur both uniformly and differentially (i.e., where adjoining areas settle at different amounts). Areas underlain by artificial fill are particularly susceptible to this type of settlement. Given the geologic setting of the Project site, the fluvial nature of sediment deposition and the absence of fill,

seismically-induced ground failure is not a significant hazard. Therefore, the Project is expected to result in less than significant impacts.

Soil liquefaction is a condition in which saturated granular soils undergo a substantial loss of strength and deformation due to increased pore pressure, resulting from cyclic stress application induced by earthquakes. During liquefaction, the soil becomes sufficiently mobile to permit both horizontal and vertical movements if the soil mass is not confined. Soils most susceptible to liquefaction are sand deposits that are saturated, loose, clean, uniformly-graded, and fine-grained. If liquefaction occurs, foundations resting on or within the liquefiable layer may undergo differential settlement. This would result in reduction of foundation stiffness and capacity. When this occurs, the structure can settle, tip, or even become buoyant and shift upwards. Liquefaction and associated ground failures could damage foundations, roads, underground cables and pipelines, and disrupt utility service.

Earthquake induced liquefaction typically occurs within the top 50-feet of liquefaction-prone soil, if those soils are saturated. A review of the logs associated with borings advanced at the Project site (BSK Associates Engineering & Laboratories, 2011) indicates that the water table is at an average depth of 15-feet below grade (refer to Attachment C of Appendix F – *Geology and Soils Technical Study*). The saturated soils below that depth are classified as silty sand to poorly-graded sandy silt and cobbles, as is illustrated in Table 3.7-9. The sieve analyses on the samples recovered at depth greater than 15-feet indicate silt contents on the order of 10 percent. Whereas these materials may generally be considered liquefiable, the presence of at least 10 percent of fines in the sand reduces the liquefaction potential of the sand. The depth of groundwater, combined with the anticipated level of ground shaking, means that the potential for liquefaction at the Project site is low. As such, the Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving major geological hazards. Therefore, the Project would result in less than significant impacts.

Table 3.7-9. Representative Soils Cross-Section at McKay Reservoir Project Site

Layer	Description	Thickness (feet)	Friction Angle (degrees)	Cohesion (psf)	Unit Weight (pcf)	Hydraulic Conductivity (cm/s)
1	Poorly graded sand	13	36°	0	110	1.6×10^{-3}
2	Poorly graded sandy gravel	15	35°	0	120	2.25×10^{-3}
3	Silty clayey sand	42	33°	0	110	1.0×10^{-6}
4	Silty clay/low plasticity clay	25	28°	200	105	1.0×10^{-7}
5	Bedrock	-	40°	1,500	130	1.0×10^{-7}

Seismic Hazards – Landslides (criteria a.iv)

Slope stability at the Project site does not currently present a significant landslide hazard. There are currently no significant slopes or other topographic features at the Project site that appear susceptible to slope failure. The California Geologic Survey has produced a series of landslide inventory and landslide

hazard maps for unstable areas of the State. The Project site and the vicinity are not mapped as having pre-existing or future slope stability hazards. As such, the Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving major geological hazards. Therefore, the Project would result in less than significant impacts.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.7.6.8 Soil Erosion or Loss of Topsoil

Impact Statement

Impact GEO-2**:** *Would the Project result in substantial soil erosion or the loss of topsoil?* **(CEQA Guidelines Threshold Criteria (b))**

Impact Analysis

Erosion is the removal of soils and rocks due to natural process, such as flow of water and wind. Erosion is expected to occur within the Project site as a result of excavation, but not at the ground surface outside the Project perimeter. The Project incorporates design considerations and practices to reduce the potential for, and impacts of erosion. These are discussed in detail in the Reclamation Plan and SWPPP and include Best Management Practices (BMPs) such as sediment catchment basins, berms, rock dams, and energy dissipaters.

Vegetation and topsoil would be removed during the initial site preparation and excavation of the Project site. If feasible, topsoil would be stockpiled for use in reclamation/revegetation. However, because the site would be used as a water reservoir, it may not be feasible to revegetate of the Project site. As a result, impacts due to soil erosion and topsoil loss are considered less than significant.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.7.6.9 Ground Instability

Impact Statement

Impact GEO-3**:** *Would the Project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?* **(CEQA Guidelines Threshold Criteria (c))**

Impact Analysis

This CEQA criterion seeks to answer if the Project site is located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse. The seismically induced risk of ground instability (liquefaction, lateral spreading) was addressed in detail in the Geology and Soils Technical Study located in Appendix F.

The Project is considered feasible and capable of containing such risks by applying proper design and construction practices. Ground instability related to Project activities and evaluation of different ground instability factors are addressed below.

Stability of Existing Ground Conditions: There are no known existing geologic conditions or natural slopes that would impact the stability of existing ground conditions.

Stability of Project Slopes: The Project involves excavation of pit that meets the requirements for the construction of a reservoir. The anticipated depth of the reservoir is approximately 75-feet with slopes out at 3H:1V (horizontal to vertical).

A slurry wall would be installed around the perimeter of the pit. The subsoil conditions at the Site were established based on existing onsite soil boring logs and the grain size analyses performed on samples recovered during the drilling operations (BSK Associates Engineering & Laboratories, 2011). The subsoil conditions generally consist of sand, sandy gravel, and clayey sand with cobbles. For the purpose of the SLR slope stability evaluation, a representative cross-section was developed and slope stability analyses were performed as summarized in Section 3.7.5.4 and discussed in the Geology and Soils Technical Study (Appendix F). Based on the SLR analysis, the Project slopes have adequate FS values and impacts due to ground conditions and instability are considered less than significant.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.7.6.10 Potential Impacts Associated with Expansive Soils

Impact Statement

Impact GEO-4: *Would the Project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?* **(CEQA Guidelines Threshold Criteria (d))**

Impact Analysis

The soils in the area are predominately classified as granular materials, such as sand, gravel and cobbles, with some silt and occasional clay lenses. None of those soils are subject to expansion when wetted. As such, the Project presents no risk to life or property from expansive soils, resulting in less than significant impacts.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.7.6.11 Potential Impacts Associated with Septic Tanks or Wastewater Disposal

Impact Statement

Impact GEO-5: *Would the Project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?* **(CEQA Guidelines Threshold Criteria (e))**

Impact Analysis

The Project would not use septic tanks or alternative wastewater treatment systems. Portable toilets would be provided on site. Impacts associated with septic tanks and/or wastewater disposal would have no impact.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.7.6.12 Paleontology and Unique Geologic Features

Impact Statement

Impact GEO-6: *Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?* **(CEQA Guidelines Threshold Criteria (f))**

Impact Analysis

As discussed in Section 3.7.5.5, undisturbed geologic units with a proven potential to yield paleontological resources occur at shallow depths in the Project area (a radius of approximately 43 miles from the Project site). Therefore, there is a potential for impacting fossils during ground-disturbing excavation and construction activities at depths greater than 5-feet bgs at the Project site. Applied EarthWorks recommended paleontological resource mitigation monitoring during the excavation of the pit. Applied EarthWorks also suggested that a Paleontological Resource Mitigation and Monitoring Program be prepared for the Project, including, but not limited to, a preconstruction Worker's Environmental Awareness Training module. By implementing these mitigation measures during Project development, adverse impacts to paleontological resources can be reduced to a less than significant.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

Mitigation Measure GEO-1: *A Paleontological Resource Mitigation and Monitoring Program (PRMMP) will be prepared by a qualified professional. The PRMMP will include the following:*

- *A Worker's Environmental Awareness and Training Program to be implemented prior to the start of excavating the pit.*
- *The PRMMP will indicate where construction monitoring is required for the Project and the frequency of required monitoring including:*
    - *Initial period of spot-checking during the preliminary shallow excavation activities.*
    - *Monitoring at depths below 5 feet.*

- *The PRMMP will describe the different reporting standards to be used—monitoring with negative findings versus monitoring resulting in fossil discoveries.*

Level of Significance After Mitigation

Less than significant with mitigation incorporated.

3.7.7 Cumulative-Level Impacts and Mitigation Measures

Table 3.0-1 identifies the other projects located within the County and the City of Woodlake considered in regards to potential cumulative impacts. As noted in Table 3.0-1, none of the cumulative projects meet the criteria to be further evaluated in relation to cumulative impacts associated with geological, soil or paleontological resources.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to geology and soils.

The geological context for cumulative impacts for soils and geology impacts is the immediate area encompassing the site vicinity (1- to 3-mile radius from the Project site). As discussed in the impact analysis above for each impact threshold, the Project was determined to have either no impact or a less than significant impact. Since the Project would present no significant impacts to geological resources, there would be no cumulative impact in conjunction with the other cumulative projects.

THIS PAGE IS INTENTIONALLY BLANK

3.8 GREENHOUSE GASES

3.8.1 Introduction

This DEIR section assesses greenhouse gas (GHG) impacts of the Project. The methodologies used, and the information provided in this section are supported by calculations in the Air Quality, Health Risk, and Climate Change Impact Assessment (AQCCIA) located in Appendix C.

3.8.2 Environmental Setting

Climate change refers to global changes in the average weather of the Earth measured by changes in wind patterns, storms, precipitation, and temperature. While climate change is global in scale, California-specific impacts to the climate may result in a loss of snow-pack, increased risk of large wildfires, and a potential reduction in the quality and quantity of certain agricultural products.

Gases that trap heat in the atmosphere are GHGs, analogous to the way a greenhouse retains heat. Consequently, these GHG emissions are believed to directly affect the global climate.

3.8.2.1 Emissions Inventories

The California Air Resources Board's (CARB's) most recent GHG emission inventory, the 2020 Edition, tracks the emissions of seven GHGs identified in the California Health and Safety Code for years 2000 to 2018. In 2018, total GHG emissions were 425 million metric tons of carbon dioxide equivalent ($MMTCO_2e$), an increase of 1.0 $MMTCO_2e$ compared to 2017. Emissions have decreased since peak levels in 2004. Overall trends in the inventory also demonstrate that the carbon intensity of California's economy (the amount of carbon pollution per million dollars of gross domestic product [GDP]) is declining, representing a 43% decline since 2000, while the State's gross domestic product (GDP) has grown 59% during this period (Trend Report, 2020, pp. 1-3).

The transportation sector remains the largest source of GHG emissions in the State, accounting for 40% of statewide emissions in 2018. Emissions from the electricity sector have increased slightly in 2018 and account for 15% of the inventory. Emissions from the remaining sectors have remained relatively constant, although emissions from high-global warming potential (GWP) gases have continued to climb as they replace ozone depleting substances banned under the Montreal Protocol (Trend Report, 2020, p. 5).

3.8.3 Regulatory Setting

The accumulation of GHGs in the atmosphere contributes to the regulation of the earth's temperature. Some GHGs can remain in the atmosphere for long periods of time (i.e., long-lived). There are six GHGs recognized under the Kyoto Protocol and have been found by the International Panel on Climate Change (IPCC) to have an effect on global climate change. These are described below. The primary one associated with the Project are Nitrous Oxides (N_2O). Also see the AQCCIA in Appendix C for additional detail.

Each GHG exhibits a different GWP. The mass of emissions of each GHG is multiplied by its GWP to determine the carbon dioxide equivalent (CO_2e) potential for global warming. GWPs have changed over

time by the IPCC which is considered an authority on GHGs and their effects. GHG emissions inventories and plans use GWPs that are an iteration or two behind and the most recent IPCC publication. Characteristics of each GHG and the associated GWP is presented below.

Carbon Dioxide (CO_2) is an odorless, colorless natural GHG. CO_2 is emitted from natural and anthropogenic sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources include burning coal, oil, natural gas, and wood. By definition, CO_2 has a GWP equal to one (1).

Methane (CH_4) is a flammable GHG. A natural source of CH_4 is from the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain CH_4, which is extracted for fuel. Other sources include landfills, fermentation of manure, and ruminants such as cattle. CH_4 has a GWP equal to 28.

Nitrous Oxide (N_2O) is a colorless GHG. N_2O is produced by microbial processes in soil and water, including those reactions that occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. N_2O has a GWP equal to 265.

Hydrofluorocarbons (HFCs) are synthetic chemicals that are used as a substitute for chlorofluorocarbons (CFCs). Of all the GHGs, they are one of three groups with the highest global warming potential. HFCs are human made for applications such as air conditioners and refrigerants. HFCs have GWPs that range from 124 (HFC 125a) to 14,300 (HFC 23).

Perfluorocarbons (PFCs) have stable molecular structures and do not break down through the chemical processes in the lower atmosphere; therefore, PFCs have long atmospheric lifetimes, between 10,000 and 50,000 years. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. PFCs have GWPs that range from 7,390 (PFC 14) to 12,200 (PFC 116).

Sulfur Hexafluoride (SF_6) is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF_6 is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection. SF_6 has a GWP equal to 22,800.

3.8.3.1 Federal

To date, there is no federal overarching law specifically related to climate change or the reduction of GHGs. The Environmental Protection Agency (EPA) authority to regulate GHG emissions stems from the U.S. Supreme Court decision in *Massachusetts v. EPA,* 549 US 497 (2007). The Supreme Court found that GHGs are air pollutants covered by the Clean Air Act, and the EPA Endangerment Findings concluded the elements CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6 threatened public health for both current and future generations. In 2009, the U.S. EPA published a rule for the mandatory reporting of GHG from sources that in general emit 25,000 metric tons or more of carbon dioxide equivalent per year in the United States.

Implementation of 40 CFR Part 98 is referred to as the Greenhouse Gas Reporting Program (GHGRP). This collection of comprehensive, nationwide emissions data is intended to provide a better understanding of the sources of GHGs and to guide development of policies and programs to reduce emissions (U.S. EPA, 2013). Additional federal actions have included the implementation of standards for vehicles, biofuel production, and power generation. Federal actions relating to GHG emissions are summarized and provided in the AQCCIA (Appendix C).

3.8.3.2 State

The following tables provide a brief summary of the numerous pieces of legislations, regulations, plans and policies relating to GHG in California. The AQCCIA in Appendix C has additional detail on the California regulatory history and current status.

Table 3.8-1. California Climate Change Legislation

Date	Legislation	Description
September 10, 2018	Senate Bill 100 (De León, Chapter 312, Statues of 2018)	California Renewables Portfolio Standard Program: emissions of greenhouse gases. This bill establishes the 100 Percent Clean Energy Act of 2017 which increases the Renewables Portfolio Standard (RPS) requirement from 50 percent by 2030 to 60 percent, and creates the policy of planning to meet all of the state's retail electricity supply with a mix of RPS-eligible and zero-carbon resources by December 31, 2045, for a total of 100 percent clean energy.
July 26, 2017	Assembly Bill 617 (Christina Garcia, Chapter 136, Statutes of 2017)	Companion to Cap-and-Trade Extension Establishes a groundbreaking program to measure and reduce air pollution from mobile and stationary sources at the neighborhood level in the communities most impacted by air pollutants. Requires the Air Resources Board to work closely with local air districts and communities to establish neighborhood air quality monitoring networks and to develop and implement plans to reduce emissions. The focus on community-based air monitoring and emission reductions will provide a national model for enhanced community protection.
July 25, 2017	Assembly Bill 398 (Eduardo Garcia, Chapter 135, Statutes of 2017)	Cap-and-Trade Extension Extends and improves the Cap-and-Trade Program, which will enable the state to meet its 2030 emission reduction goals in the most cost-effective manner. Furthermore, extending the Cap-and-Trade Program will provide billions of dollars in auction proceeds to invest in communities across California.
September 19, 2016	Senate Bill 1383 (Lara, Chapter 395, Statutes of 2016)	Short-lived Climate Pollutants Establishes statewide reduction targets for short-lived climate pollutants.

Date	Legislation	Description
September 8, 2016	Assembly Bill 197 (Eduardo Garcia, Chapter 250, Statutes of 2016)	Greenhouse gas regulations Prioritizes direct emission reductions from large stationary sources and mobile sources.
September 8, 2016	Senate Bill 32 (Pavley, Chapter 249, Statutes of 2016)	Greenhouse Gas emission reduction target for 2030 Establishes a statewide greenhouse gas (GHG) emission reduction target of 40 percent below 1990 levels by 2030.

Source: California Air Quality and Climate Legislation | California Air Resources Board.

Table 3.8-2. California Climate Change Regulations

Regulation	Description
AB 32 Climate Change Scoping Plan	In June 2021, CARB began holding a Public Workshop Series to commence development of the 2022 Scoping Plan. The 2022 Scoping Plan Update will assess progress towards achieving the SB 32 2030 target of a 40% GHG reduction and lay out a path to achieve carbon neutrality by 2045.
Greenhouse Gas Reduction Fund	State program allocating proceeds from cap-and-trade auctions to support investments and projects that reduce greenhouse gas emissions throughout California.
Amendments to the Mandatory Greenhouse Gas Reporting Regulation	The CARB Regulation for the Mandatory Reporting of Greenhouse Gas Emissions was originally approved in 2007 and revised in 2010, 2012, 2013, 2014, 2016 and 2018. Amendments to Mandatory Reporting Requirements (MRR) were approved on March 29, 2019 and became effective on April 1, 2019, for 2019 data. The 2019 amendments were implemented to: • Support California's Cap-and-Trade Regulation to ensure consistency with the calculation of compliance obligations • Ensure that reported GHG emissions and product data are accurate and complete in order to support California's GHG reduction programs
Cap & Trade Amendments	December 2018 amendments to the cap-and-trade regulation included: • New price containment points and a price ceiling • Limits on offset use • New industrial facility leakage assistance factors for 2018 and beyond • Clarifications on electric and gas utility use of allowance value • Compliance provisions for Energy Imbalance Market (EIM)-related GHG emissions • Offset invalidation clarifications • Streamlining implementation requirements • Adjustments to linkage reflecting Ontario's actions to revoke its participation in the cap-and-trade market. September 2016 amendments to the cap-and-trade regulation included: • Emission caps for the post-2020 program • Post-2020 continuation of the allowance price containment reserve • Linking with Ontario's cap-and-trade program • Compliance with the federal Clean Power Plan • Modifications to allowance allocation

Regulation	Description
Cap & Trade Offset Protocols	The Air Resources Board has adopted five protocols for offset compliance projects. In addition to the original four protocols adopted in 2011, ARB has adopted: Mine Methane Capture (MMC) Projects Compliance Offset Protocol, adopted April 2014
Cap & Trade Link with Quebec	California linked its cap-and-trade program with Quebec's program in January 2014. Linkage allows for the use of compliance instruments from Quebec's greenhouse gas emission trading system to meet compliance obligations pursuant to the California Cap-and-Trade Regulation, and the reciprocal approval of compliance instruments issued by California to meet compliance obligations in the external trading program.
Mandatory Commercial Recycling	This regulation addresses recycling requirements for businesses that generate 4 or more cubic yards of commercial solid waste per week and multifamily residential dwellings with 5 or more units, regardless of the amount of waste generated; local jurisdiction requirements for education, outreach, monitoring and reporting; and CalAsphalt and concrete recycling review. The regulations were approved on May 7, 2012.

Source: (Climate Change | California Air Resources Board, 2021).

On December 14, 2017, CARB approved the 2017 Climate Change Scoping Plan Update (Scoping Plan) which aims to reduce GHG emissions. The Scoping Plan "is a package of economically viable and technologically feasible actions to not just keep California on track to achieve its 2030 target, but stay on track for a low- to zero-carbon economy by involving every part of the state. Every sector, every local government, every region, every resident is part of the solution. The Scoping Plan underscores that there is no single solution but rather a balanced mix of strategies to achieve the GHG target. This Plan highlights the fact that a balanced mix of strategies provides California with the greatest level of certainty in meeting the target at a low cost while also improving public health, investing in disadvantaged and low-income communities, protecting consumers, and supporting economic growth, jobs and energy diversity. Successful implementation of this Plan relies, in part, on long-term funding plans to inform future appropriations necessary to achieve California's long-term targets." (2017 Scoping Plan, p. ES4).

3.8.3.3 Local

San Joaquin Valley Unified Air Pollution Control District

SJVAPCD GHG policy is established in the *District Policy Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency* (SJVAPCD, 2009). The document outlines a methodology to determine if a project meets the Best Performance Standards (BPS) for GHG emissions. The document states, "Projects implementing BPS would be determined to have a less than significant individual and cumulative impact on global climate change and would not require project specific quantification of GHG emissions". When serving as the lead agency, the SJVAPCD requires stationary sources that do not comport with a BPS to demonstrate GHG reductions of 29% as compared to Business-as-Usual (BAU). Business-as-Usual is defined by the SJVAPCD as "The emissions for a type of equipment or operation within an identified class and category projected for the year 2020, assuming no change in GHG emissions per unit of activity as established for the baseline period".

This policy, however, does not apply to the Project; CARB regulations adopted in 2010 established a cap-and-trade program for the largest sources of GHG emissions in the State. Included in cap-and-trade are the fuels that are utilized by the Project.

As discussed in Section 3.3.4.2 south Coast Air Quality Management District (SCAQMD) guidelines, which are more recent than the SJVAPCD guidelines, were used to evaluate significance of GHG impacts. Specifically, SCAQMD excludes emissions from sectors that are required to participate in the Cap-and-Trade Program administered by the California Air Resources Board (CARB) as discussed in the *Final Negative Declaration for Phillips 66 Los Angeles Refinery Carson Plant - Crude Oil Storage Project* (SCAQMD, 12/12/2014).[1] This approach takes into account the cumulative nature of the energy industry and recognizes that consumers of electricity and diesel fuel are in effect regulated by the higher level emissions restrictions on the producers of these energy sources. Energy and fuel suppliers are required to report emissions under the Cap-and-Trade which is designed to reduce GHG emissions as needed to achieve emissions reductions described in related planning documents which primarily consists of the Assembly Bill (AB) 32 Scoping Plan.

Tulare County

The Tulare CAP (Tulare County, 2012a) serves as a guiding document for County actions to reduce GHG emissions and adapt to the potential effects of climate change. The CAP is an implementation measure of the 2030 General Plan Update.

The Tulare County Climate Action Plan (CAP) (Tulare County, 2012a) serves as a guiding document for County actions to reduce GHG emissions and adapt to the potential effects of climate change. The CAP is an implementation measure of the 2030 General Plan Update.

General Plan 2030

The Tulare County General Plan (Tulare County, 2012b) policies that relate to greenhouse gas emissions from the proposed Project are listed below.

AQ-1.5 California Environmental Quality Act (CEQA) Compliance

The County shall ensure that air quality impacts identified during the CEQA review process are consistently and reasonably mitigated when feasible.

AQ-1.7 Support statewide Climate Change Solutions

The County shall monitor and support the efforts of CalEPA, CARB, and the SJVAPCD, under AB 32 (Health and Safety Code §38501 et seq.), to develop a recommended list of emission reduction strategies. As appropriate, the County will evaluate each new project under the updated General Plan to determine its consistency with the emission reduction strategies.

[1] http://www.aqmd.gov/home/research/documents-reports/lead-agency-permit-projects/permit-project-documents---year-2014

AQ-1.8 Greenhouse Gas Emissions Reduction Plan/Climate Action Plan

The County will develop a Greenhouse Gas Emissions Reduction Plan (Plan) that identifies greenhouse gas emissions within the County as well as ways to reduce those emissions. The Plan will incorporate the requirements adopted by the California Air Resources Board specific to this issue. In addition, the County will work with the Tulare County Association of Governments and other applicable agencies to include the following key items in the regional planning efforts.

1. Inventory all known, or reasonably discoverable, sources of greenhouse gases in the County,
2. Inventory the greenhouse gas emissions in the most current year available, and those projected for year 2020, and
3. Set a target for the reduction of emissions attributable to the County's discretionary land use decisions and its own internal government operations.

AQ-1.9 Support Off-Site Measures to Reduce Greenhouse Gas Emissions

The County will support and encourage the use of off-site measures or the purchase of carbon offsets to reduce greenhouse gas emissions.

Climate Action Plan

The Climate Action Plan (CAP) describes itself as follows.

> *…a four-step process recommended by the Institute for Local Government.*
>
> *First, an inventory of greenhouse gas emission sources was developed for a base year (2007) to identify the most important categories and potential for emission reductions.*
>
> *Second, future year inventories for 2020 and 2030 were projected to illustrate what emissions would be in the future accounting for projected growth, but without controls on the sources. The future year inventory is referred to as a "business-as-usual scenario." The year 2020 projection was used to allow comparison to the State's target year in CARB's Scoping Plan. The year 2030 projection was used to identify the growth in emissions that would occur by the General Plan planning horizon year. The 2020 inventory was projected by interpolating emissions growth predicted between 2007 and 2030.*
>
> *The third step was to identify and describe policies, regulations, and programs that apply to sources in the County's emission inventories and will achieve reductions by the target years. The policies, regulations, and programs considered in the CAP include those by federal, state, and local governments. These were then quantified to the extent possible using best available methodologies and data to determine the amount of reductions that are needed by the target years from Tulare County to achieve consistency with state targets.*
>
> *The last step was the development of a monitoring program that tracks implementation progress and emission reductions over time and identifies a process for taking corrective actions, if needed.* (Tulare County, 2012a, pp. 2-3).

The CAP describes the County's, the State's and the SJVAPCD's role in reducing GHGs as follows:

> *The County's focus is on emission sources within its regulatory authority, which are mainly related to land use and the local transportation system. To some extent, the County can influence activities that provide greenhouse gas reductions such as water conservation and solid waste diversion and recycling. The County also can require feasible mitigation measures for new projects as a Lead Agency under the CEQA… new projects are required to address greenhouse gas and climate impacts under CEQA during the approval process.*
>
> *…*
>
> *The CARB has the primary responsibility for the State's climate programs and regulations that would apply to mobile and industrial sources of greenhouse gases. The California Energy Commission has primary responsibility for energy efficiency standards related to buildings and certain consumer products. The San Joaquin Valley Air Pollution Control District (SJVAPCD) regulates stationary, areawide, and indirect sources of emissions that impact health. Many SJVAPCD regulations on health-based pollutant emissions also reduce greenhouse gas emissions. (Tulare County, 2012a, p. 3).*

Regarding CEQA, the CAP states:

> *One of the most important uses for a CAP is to establish significance thresholds for reviewing projects under CEQA. Greenhouse gas emissions from an individual project will not result in a perceptible impact on global climate. Impacts to global climate are caused by the cumulative impacts of greenhouse gases emitted anywhere and everywhere on Earth. The Office of Planning and Research CEQA Guidelines encourages use of a plan consistency threshold for cumulative impacts on climate change. Projects that demonstrate consistency with the policies, implementation measures, and emission reduction targets contained in the CAP would have a less than significant impact on climate change. (Tulare County, 2012a, p. 4).*
>
> *…*
>
> *Although it is technologically possible to reduce greenhouse gases if cost is not considered, the potential exists that a locally implemented measure will only serve to relocate the emissions to another place that does not require the new technology. Therefore, even if emission rates are lower in one place, it could have no effect on global climate if the emission-producing activity is shipped out of State or overseas. (Tulare County, 2012a, p. 4).*
>
> *…*

The CAP operational boundary includes emissions associated with operations owned or controlled by the County. These include direct and indirect emissions resulting from the energy (electricity and natural gas), mobile source (on- and off-road), agriculture (dairy/feedlots), and solid waste (landfills) sectors in

unincorporated Tulare County. Southern California Edison (SCE) is considered within the CAP operational boundary.

Table 3.8-3 presents the list of emissions reductions that the CAP takes credit for in demonstrating consistency with the AB 32 Scoping Plan and objective to reduce GHG emissions to 1990 levels by 2020. The following discussion in the CAP is applicable to the Project. ”*Commercial and industrial development in Tulare County during the 2020 and 2030 planning timeframes will be subject to conditions of approval and mitigation measures that will reduce GHG emissions beyond State regulations in most projects. For industrial projects where the SJVAPCD is a Responsible Agency, the project will be expected to implement Best Performance Standards included in the SJVAPCD Guidelines for Addressing Greenhouse Gas Emissions on the processes and stationary equipment that emit GHGs to levels that meet or exceed State targets*.” (Tulare County, 2012a, p. 55).

Table 3.8-3. Emission Reductions from State Regulations and Measures

Affected Emission Sources	California Legislation	Percent Reduction from 2020 GHG Inventory	Fraction Applicable to Tulare Co. Inventory	End Use Sector	Scaled Emission Reduction Credit
Mobile	AB 1493 Pavley	19.7	0.387	On-road passenger/ light truck transportation	7.62
	LCFS	7.2	0.387	On-road passenger/ light truck transportation	2.79
	LCFS	7.2	0.067	On-road Heavy/ Medium Duty transportation	0.48
	Heavy Duty Efficiency	2.9	0.013	On-road Heavy Duty transportation	0.04

Total Reductions from Statewide Measures in Tulare County					**24.63**

Source: (Tulare County, 2012a, p. B12).

The following discussion in the CAP is applicable to the Project:

> *"Commercial and industrial development in Tulare County during the 2020 and 2030 planning timeframes will be subject to conditions of approval and mitigation measures that will reduce GHG emissions beyond State regulations in most projects. For industrial projects where the SJVAPCD is a Responsible Agency, the project will be expected to implement Best Performance Standards included in the SJVAPCD Guidelines for Addressing Greenhouse Gas Emissions on the processes and stationary equipment that emit GHGs to levels that meet or exceed State targets." (Tulare County, 2012a, p. 55)*

Other measures only applicable to commercial, residential and mixed uses (i.e., not industrial) are presented in the AQCCIA (see Appendix C).

3.8.4 Significance Thresholds

Determination of whether an impact is significant usually involves the comparison of Project impact levels to threshold criteria set by the lead agency. For air quality and GHG impacts, lead agencies often rely on guidance from a responsible agency. In this report, SCAQMD guidance is utilized, as discussed in the AQCCIA (see Appendix C).

3.8.4.1 CEQA Guidelines Appendix G

Appendix G of the CEQA Guidelines presents questions about projects that, if true for a particular project, would be considered a significant impact. This document considers the following Appendix G checklist questions to be the Significance Thresholds for GHG emissions from this Project.

Would the project:

a) Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

3.8.4.2 Additional Threshold Criteria

Tulare County

The Tulare County CAP identifies the items in Table 3.8-4 as requirements for determining consistency of a project with the CAP.

Table 3.8-4. CEQA Project Requirements for Consistency with CAP

Item	Required for Consistency?
Percent reduction in greenhouse gas emissions	6%
Consistency with General Plan policies	Yes
Consistency with Rural Valley Land Plans or Foothill Growth Management Plan development criteria	Yes
Consistency with Urban Growth Boundary expansion criteria	Yes

Item	Required for Consistency?
Consistency for development within Rural Community Urban Development Boundaries and Hamlet Development Boundaries	Yes

Source: (Tulare County, 2012a, p. 58)

South Coast Air Quality Management District

This analysis utilizes SCAQMD guidelines because the SCAQMD guidelines are more recent than the SJVAPCD guidelines (see Section 3.8.6.2). With the new cap-and-trade policy, fuels used by the Project are regulated at a higher level, so GHG emissions associated with these fuels are calculated and summarized for disclosure purposes. SCAQMD uses a 10,000 metric ton/year (MT/yr) CO_2e for determining significant impacts for proposed projects (SCQAMD, 2008). The SCAQMD threshold is compared to the Project GHG emissions for context and disclosure.

3.8.5 Methodology of Analysis

As discussed previously, CO_2e emissions associated with off-road mobile equipment were calculated using CalEEMod. The estimated mass of GHGs that would be emitted during construction phase of the Project was determined to be an annual maximum of 96.7 metric tons of CO_2e ($MTCO_2e$) per year based on the activity levels provided by Provost and Pritchard Consulting Group located in the AQCCIA (see Appendix C).

3.8.5.1 Baseline Condition

The baseline condition consists of emissions associated with excavation of materials at the adjacent Seaborn site. The amount of work required to excavate material at each site and for the Project is considered to be equal because of the similar topography of the sites. The amount of work performed in transporting material to the Seaborn processing plant is the main difference between the sites. The maximum annual CO_2e emissions during the baseline period is conservatively represented by assuming average annual activity levels of 500,000 tons per year, and summarized in Table 3.8-5

Table 3.8-5. Baseline GHG Emissions at Maximum Historical Rate

Source	CO_2e (MT/yr)
Recycle Plant Engine	85.6
Excavation Off-Road Engines	644.8
Off-Road Vehicle Haul	549.4
Total	**1,280**

Source: AQCCIA, 2021 (see Appendix C).
Notes: Converted from App. C based on 2204.6 lb/MT. GWP of CH_4 assumed to be 28 per IPCC Fifth Assessment Report (AR5).

3.8.5.2 Excavation Phase

Equipment and activity levels for excavation in the baseline and for the Project are presented in the AQCCIA, and the associated GHG emissions are summarized in Table 3.8-6 below.

Table 3.8-6. Project Excavation Phase GHG Emissions at Proposed Maximum Annual Rate

Source	CO_2e (MT/yr)
Recycle Plant Engine	85
Excavation Off-Road Engines	638
Off-Road Vehicle Haul	598
Dewatering Pumps	95
On-Road Vehicle Haul	79
Slurry Wall Installation	613
Total	**2,108**

Source: AQCCIA, 2021 (see Appendix C).
Notes: Converted from App. C based on 2204.6 lb/MT. GWP of CH_4 assumed to be 28 per IPCC Fifth Assessment Report (AR5).

3.8.5.3 Construction Phase

The construction Phase consists of the following features:

- Site security features and on-site construction office (prefabricated trailer) including an access gate and perimeter road;
- Inflow channel consisting of a weir, chute, and dissipation pool and Outflow Channel consisting of a weir each requires an excavator, backhoe, water truck, loader, compactor, cement trucks, cement pumps, and cranes; and
- Generator building and floating barge pump, including an aboveground diesel tank, would require an excavator, water truck, backhoe, compactor, trencher and cement trucks.

3.8.5.4 Operation Phase

Calculated operation phase emissions include:

- operation of the generators;
- off-road engines for road maintenance; and
- on-road support vehicles.

Operation phase emissions are presented below in Table 3.8-7.

Table 3.8-7. Operation Phase Greenhouse Gas Emissions

Source	CO_2e (MT/yr)
Reservoir Operation Pumps	147
Off-Road Engines	23
On-Road Engines	5
Total	**175**

Source: AQCCIA, 2021 (see Appendix C).

3.8.6 Project-Level Impacts and Mitigation Measures

3.8.6.1 Generate GHG Emissions That May Have a Significant Impact on the Environment

Impact Statement

Impact GHG-1: *Would the Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?* **(Appendix G Threshold Criteria (a)).**

Impact Analysis

"It is widely recognized that no single project could generate enough GHG emissions to noticeably change the global climate temperature. However, the combination of GHG emissions from past, present, and future projects could contribute substantially to global climate change. GHG emissions, and their associated contribution to climate change, are inherently a cumulative impact issue. Therefore, project-level impacts of GHG emissions are treated as one-in-the-same as cumulative impacts." (SJVAPCD, 2015, p. 111). As recognized by SJVAPCD in the preceding quote, climate change is a cumulative effect and no single project is large enough to impact climate change. Thus, the Project would not, by itself, either directly or indirectly result in a significant impact on the environment due to generation of GHG emissions.

This is reflected in the 2017 Scoping Plan, which regulates fuels at a level in the supply chain above the level of a single project, such that a project has no choice but to use energy in California that is already regulated. The Project therefore does not have its own emissions, but is simply a location in which GHG emissions are taking place as a result of fuel that is already regulated. Therefore, the Project itself cannot have a significant impact on the environment.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.8.6.2 Conflict With an Applicable Plan, Policy or Regulation that Reduces GHGs

Impact Statement

Impact GHG-2: *Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?* **(Appendix G Threshold Criteria (b)).**

Impact Analysis

Project emissions of GHGs are presented in Table 3.8-8 below, primarily for purposes of disclosure. SJVAPCD guidance on impact analysis for GHGs is outdated and the methods used in South Coast Air Quality Management District (SCAQMD) which are more recent were used to evaluate significance of GHG

impacts. Specifically, SCAQMD excludes emissions from sectors that are required to participate in the Cap-and-Trade Program administered by the California Air Resources Board (CARB) as discussed in the *Final Negative Declaration for Phillips 66 Los Angeles Refinery Carson Plant - Crude Oil Storage Project* (SCAQMD, 12/12/2014).[2] This approach takes into account the cumulative nature of the energy industry and recognizes that consumers of electricity and diesel fuel are in effect regulated by the higher level emissions restrictions on the producers of these energy sources. Energy and fuel suppliers are required to report emissions under the Cap-and-Trade. Cap-and-Trade is designed to reduce GHG emissions as needed to achieve emissions reductions described in related planning documents which primarily consists of the AB 32 Scoping Plan. Thus, the emissions reductions will occur at a level in the supply chain above the Project which will have no choice but to use fuels with GHG intensities that are consistent with the Scoping Plan.

Table 3.8-8. Project GHG Emissions

Source	CO_2e (MT/yr)
Baseline Emissions	1,280
Future Emissions (Max Year)	2,283
Total Project Emissions (Max Year)	1,003
Screening Criteria (SCAQMD)	10,000
Project Exceeds Screening Criteria?	No

Source: AQCCIA, 2021 (see Appendix C).
Note: (a) http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/ghg-significance-thresholds.

In summary, each Project source would emit GHGs in amounts consistent with the AB 32 Scoping Plan. Therefore, the Project impact on GHG emissions is less than significant. Additionally, for context, emissions from the Project are less than the SCAQMD GHG screening criteria.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

[2] http://www.aqmd.gov/home/research/documents-reports/lead-agency-permit-projects/permit-project-documents---year-2014

3.8.7 Cumulative-Level Impacts and Mitigation Measures

Table 3.0-1 in Section 3.0 identifies the other projects that the County and the City of Woodlake felt should be considered in regards to potential cumulative impacts. As noted in Table 3.0-1, none of the cumulative projects meet the criteria to be further evaluated in relation to cumulative impacts associated with greenhouse gas emissions. As discussed in Section 3.8.6.2 above, GHG impact assessment is cumulative by nature. The GHG threshold criteria are the amounts that are cumulatively considerable. Thus, the impact analysis prepared above demonstrates that the project will have a less than significant individual impact as well as an impact that is less than cumulatively considerable.

3.9 HAZARDS AND HAZARDOUS MATERIALS

3.9.1 Introduction

This section of the DEIR evaluates potential hazards and hazardous materials that currently exist in the area surrounding the Project site, or that could exist as a result of implementing the Project.

3.9.2 Environmental Setting

3.9.2.1 Regional Setting

The Project site is located within unincorporated Tulare County near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. The Project is also located in California's Central Valley which is one of the most productive agricultural regions in the world. The Project is generally surrounded by semi-rural/agricultural land uses, specifically to the south across the Kaweah and St. Johns Rivers. The CEMEX Lemon Cove aggregate facility is located immediately north and east of the Project site, and the Seaborn aggregate facility is located immediately to the west. Nearby urban communities include the unincorporated community of Lemon Cove (approximately 1.0 miles to the southeast) and the City of Woodlake (approximately 2.5 miles to the northwest).

3.9.2.2 Vicinity Setting

Surrounding land uses in the Project site vicinity include: aggregate mining operations to the north, southwest and east; and, agricultural operations/rural residences to the west, north west and also south across the Kaweah and St. Johns Rivers. The Kaweah and St. Johns Rivers are located along the southern boundary of the Project site.

3.9.2.3 Project Site Setting

The existing Project site is relatively flat and undisturbed grassland except for a small portion of ground along the adjacent Kaweah River above McKay Point, which is vegetated by native trees and shrubs. The Project site has historically been used for cattle grazing; therefore, it is unlikely that extensive use of pesticides, herbicides or fertilizers typically used in agriculture have been used at the site. The areas immediately around the site have also been, and in some cases is still being, used for aggregate mining which typically involves the storage of fuels and maintenance materials such as grease, lubricant and other fluids used in the routine maintenance of vehicles and mining equipment. However, the use of hazardous materials at these adjacent aggregate facilities is expected to have been minimal and consistent with the routine mining operations (fuel, lubricants, oil, cleaners, grease, etc.).

As shown on Figure 3.20-1 in Section 3.20 – Wildfire, the Project site is not located within an area of Tulare County designated by the California Department of Forestry and Fire Protection (CalFire) (https://calfire.ca.gov) as a "Very High Fire Hazard Severity Zone (VHFHSZ)" area that may contain substantial fire risks and hazards. However, a designated State Responsibility Area (SRA) "High FHSZ" is located approximately 0.6 miles north/northeast of the Project site (https://osfm.fire.ca.gov/media/6830/fhszs_map54.pdf), and the southern portion of the Project is

located within a Local Responsibility Area (LRA), specifically a designated LRA "Moderate FHSZ" as designated by CalFire. There are no high-voltage power lines located on or near the Project site.

The presence of sperrylite in gravels of the Kaweah River has been raised as a potential concern for mining projects in the County. Sperrylite, also known as platinum arsenide, is a rare, naturally occurring ore that is known to occur as a trace mineral in river systems in California and that might be present in gravels of the Kaweah River.

The Project is located more than 2 miles away from the nearest public airstrip/airport, the Woodlake Airport. The larger Exeter Airport is located more than 11 miles away to the southwest of the Project site. The Project site is not located in the airport safety zone (e.g., takeoff or landing flight paths, etc.) for either airport.

3.9.3 Regulatory Setting

A number of federal, state, and local laws have been enacted to regulate the management, use, storage, treatment, transport and disposal of hazardous materials and hazardous wastes (referred to jointly as hazardous materials). An overview of the key hazardous materials laws and regulations that apply to the Project are provided below.

3.9.3.1 Federal

Resource Conservation and Recovery Act (RCRA)

RCRA (42 U.S.C. §6901 et seq.) regulates hazardous waste from the time that the waste is generated through its management, storage, and treatment until its final disposal. RCRA regulations address numerous aspects of hazardous waste management, including determination of hazardous waste, containment requirements, inspections, training, spill response, contingency plans, treatment, disposal, recycling, reporting and additional other areas of hazardous waste management. The United States Environmental Protection Agency (USEPA) has authorized the California Department of Toxic Substance Control (DTSC) to administer the RCRA program in California.

Oil Pollution Prevention

The Oil Pollution Prevention regulation (40 CFR § 112 et seq.) establishes procedures, methods, equipment and other requirements to prevent the discharge of oil and oil products from non-transportation related facilities into the waters of the United States. The regulation applies to facilities engaged in, among other activities, storing, processing, using or consuming oil and oil products. If specified storage thresholds are triggered, a Spill Prevention, Control and Countermeasure (SPCC) Plan must be prepared and implemented.

Facilities with a single tank or cumulative aboveground storage capacities of 1,320 gallons or greater of petroleum are required to prepare an SPCC plan. Exceptions to this rule include farms, nurseries, logging

and construction sites, so long as these businesses have a total storage capacity of less than 100,000 gallons or if the individual storage tanks are less than 20,000 gallons.

Occupational Safety and Health Act (OSHA)

OSHA (29 U.S.C. §651 et seq.) and federal occupational safety and health regulations (29 CFR §1910 et seq.) contain provisions for managing hazardous materials. OSHA promotes worker safety, worker training, and worker right-to-know. Hazardous Waste Operations and Emergency Response (HAZWOPER) training is required for workers who handle hazardous materials, as appropriate for their job description and responsibilities. In the State of California, the Division of Occupational Safety and Health (Cal/OSHA) implements OSHA requirements.

Emergency Planning and Community Right-to-Know Act (EPCRA)

EPCRA (42 U.S.C. §11001 et seq.), which is also known as Title III of the Superfund Amendments and Reauthorization Act (SARA), helps communities protect public health, safety and the environment from chemical hazards. EPCRA provides the requirements for emergency release notification, chemical inventory reporting and toxic release inventories for facilities that handle chemicals over certain thresholds.

Mine Safety and Health Act (MSHA)

MSHA (30 U.S.C. §801 et seq.) requires that the Mine Safety and Health Administration inspect each surface mine at least two (2) times a year to determine compliance with health and safety standards and whether an imminent danger exists. MSHA also requires rigorous training and education programs for employers and employees in the mining industry.

U.S. Department of Transportation (DOT)

DOT regulates the transportation of hazardous materials. DOT regulations (CFR Title 49) include requirements that companies transporting hazardous materials maintain a current DOT HAZMAT Certification Registration and implement a drug screening program. DOT also has stringent standards for all vehicles that transport hazardous materials as well as the hazardous waste containers used during transportation.

3.9.3.2 State

Surface Mining and Reclamation Act (SMARA)

SMARA (Cal Pub. Resources Code §2710 et seq.) provides a comprehensive set of regulations for surface mining and reclamation to ensure that adverse environmental and safety impacts are minimized and that mined lands are reclaimed to a usable and safe condition.

California Occupational Safety and Health (Cal/OSHA) Mine Safety Orders

The Cal/OSHA Mine Safety Orders (8 CCR §6950 et seq.) regulate the safe operation of mining activities including:

- Article 4: Accident Prevention Program;
- Article 6: General Safety Precautions;
- Article 11: Materials – Storage and Handling;
- Article 12: Ground Control;
- Article 15: Mining Equipment and Practices;
- Article 17: Loading, Hauling, and Dumping;
- Article 22: Fire Prevention and Control; and
- Article 40: Inspections.

Hazardous Waste Control Law (HWCL)

The California Environmental Protection Agency (CalEPA) has established regulations governing the use of hazardous materials in the state. Within CalEPA, the DTSC has primary hazardous materials regulatory responsibility, but can delegate enforcement responsibilities to local jurisdictions. State environmental health standards applicable to hazardous waste are contained primarily in Division 4.5 of Title 22 of the CCR. Title 26 of the CCR is a compilation of those chapters or titles of the CCR that are applicable to hazardous materials management.

Unified Hazardous Waste and Hazardous Materials Management Regulatory Program

The Unified Hazardous Waste and Hazardous Materials Management Regulatory Program ("the Unified Program") (Cal. Health & Safety Code §25404 et seq.; 14 CCR §15100 et seq.) allows certain state laws and regulation to be implemented by local governmental agencies that are certified by CalEPA. The local agencies are referred to as the Certified Unified Program Agency (CUPA). The CUPA is responsible for implementing a unified hazardous materials and hazardous waste management program. The Tulare County Division of Environmental Health is the CalEPA-designated CUPA in Tulare County. Depending upon the quantities of hazardous materials actually managed at the Project site, the CUPA programs that could apply to the Project are as follows:

- Hazardous Materials Release Response Plans and Inventories (Business Plans): The California Office of Emergency Services (OES) established the Business Plan Program (19 CCR §2620 et seq.) to prevent or minimize the damage to public health and safety and the environment from a release or threatened release of hazardous materials, and to satisfy community right-to-know laws. This is accomplished by requiring businesses that handle hazardous materials over threshold quantities to prepare a Hazardous Materials Business Plan that includes a hazardous materials inventory, a site map identifying the location of hazardous materials storage, an emergency response and spill prevention plan, and a training program. The Business Plan must be submitted to the CUPA/emergency responders and updated annually.

- Aboveground Petroleum Storage Act (APSA) Program: The APSA Program (Cal. Health & Safety Code § 25270 et seq.) regulates the management of petroleum/oils stored in ASTs. It requires that the owner/operator of aboveground petroleum/oil storage tanks with cumulative capacities over 1,320 gallons prepare a SPCC Plan, conduct inspections, and implement the plan when necessary.
- Hazardous Waste Generator, On-site Hazardous Waste Management and Treatment Permitting Programs: These programs regulate the generation, management, treatment and disposal of hazardous waste (Cal. Health & Safety Code §25100 et seq.; CCR Title 22, Division 4.5). California has more stringent requirements than those established by the U.S. EPA, therefore hazardous waste is referred to as RCRA (Federal) and non-RCRA (California) hazardous waste. The regulations contain comprehensive requirements ranging from the identification of hazardous waste (RCRA/non-RCRA), specific details on how a waste must be managed based on quantities and type, various levels of permit requirements for the treatment of hazardous waste and stringent disposal requirements.
- Underground Storage Tanks (UST) Program: This Program (16 CCR §2610 et seq.) is designed to protect public health and safety and the environment from releases of petroleum and other hazardous substances from USTs. The CUPA regulates how a UST should be closed or removed. Permits must be obtained prior to initiating removal or closure of a UST. Soil sampling to identify potential contamination from the UST may be required.

California Fire Code (CFC)

The California Fire Code (CFC) also requires that a business that handles hazardous materials prepare a Business Plan as well as other regulations regarding fire safety.

Solid Waste Management

The California Department of Resources Recycling and Recovery (CalRecycle) is responsible for protecting the public's health and safety and the environment through management of the solid waste generated in California. Solid waste regulations are generally enforced through local agencies. CalRecycle works in partnership with local government, industry, and the public to reduce waste disposal and ensure environmentally safe landfills. Solid waste management provisions are outlined in the Public Resources Code, Division 30 (Cal. Pub. Resources Code §40000 et seq.).

3.9.3.3 Local

Certified Unified Program Agency

As previously described above under State regulations, the Unified Program is implemented at the local level by a local agency – the CUPA. The CUPA is responsible for consolidating the administration of the program elements within its jurisdiction. The Tulare County Division of Environmental Health is the designated CUPA in Tulare County.

Tulare County General Plan (2012)

The Environmental Resources Management (Chapter 8) and Healthy and Safety (Chapter 10) elements of the Tulare County General Plan (Tulare County, 2012) contains goals and policies regarding general hazard and risk reduction strategies and policies to minimize potential dangers to residents, workers, and visitors; reduce the level of property loss resulting from a potential disaster; and, identify ways to respond to a crisis situation. General Plan policies are also intended to protect persons and structures from fires and ensure that development minimizes the risk of creating fire hazards and provides means for defending against those hazards.

The following are applicable goals and policies taken from the Environmental Resources Management (Chapter 8) and Health and Safety (Chapter 10) elements of the Tulare County General Plan that apply to the Project.

Section 14.7 – Fire Protection and Law Enforcement

Goal PFS-7: To provide adequate fire and law enforcement facilities and services to ensure the safety of County residents and the protection of County property.

PFS-7.1 Fire Protection. The County shall strive to expand fire protection service in areas that experience growth in order to maintain adequate levels of service

PFS-7.2 Fire Protection Standards. The County shall require all new development to be adequately served by water supplies, storage, and conveyance facilities adequate volume, pressure, and capacity for fire protection.

PFS-7.3 Visible Signage for Roads and Buildings. The County shall strive to ensure all roads are properly identified by name or number with clearly visible signs.

PFS-7.5 Fire Staffing and Response Time Standards. The County shall strive to maintain fire department staffing and response time goals consistent with National Fire Protection Association (NFPA) standards.

Table 3.9-1. Fire Staffing and Reponses Time Standards

Land Use	Demographics	Staffing/Response Time	% of Calls
Urban	> 1,000 people/sq. mi.	15 FF/9 min.	15 FF/9 min.
Suburban	500-100 people/sq. mi.	10 FF/10 min.	80
Rural	< 500 people/sq. mi.	6 FF/14 min.	80
Remote*	Travel Dist. > 8 min.	4 FF/no specific response time	90
*Upon assembling the necessary resources at the emergency scene, the fire department should have the capacity to safety commence an initial attach within 2 minutes, 90% of the time. (FF = Fire Fighters) Source: Tulare County General Plan 2030 Update			

Section 8.3 – Mineral Resources-Other

Goal ERM-3: To protect the current and future extraction of mineral resources that are important to the County's economy while minimizing impacts of this use on the public and the environment.

Policy ERM-3.1 – Environmental Contamination: All mining operations in the County shall be required to take precautions to avoid contamination from wastes or incidents related to the storage and disposal of hazardous materials, or general operating activity at the site.

Section 10.1 – General (Health and Safety)

Goal HS-1: To protect County residents and visitors from injury and damage resulting from natural catastrophes, man-made events, and hazardous conditions.

Policy HS-1.2 – Development Constraints: The County shall permit development only in areas where the potential danger to the health and safety of people and property can be mitigated to an acceptable level.

Policy HS-1.5 – Hazard Awareness and Public Education: The County shall continue to promote awareness and education among residents regarding possible natural hazards, including soil conditions, earthquakes, flooding, fire hazards, and emergency procedures.

Policy HS-1.11 – Site Investigations: The County shall conduct site investigations in areas planned for new development to determine susceptibility to landslides, subsidence/settlement, contamination, and/or flooding.

Section 10.14 – Hazardous Materials

Goal HS-4: To protect residents, visitors, and property from hazardous materials through their safe use, storage, transport, and disposal.

Policy HS-4.1 – Hazardous Materials: The County shall strive to ensure hazardous materials are used, stored, transported, and disposed of in a safe manner, in compliance with local, State, and Federal safety standards, including the Hazardous Waste Management Plan, Emergency Operations Plan, and Area Plan.

Policy HS-4.2 – Establishment of Procedures to Transport Hazardous Wastes: The County shall continue to cooperate with the California Highway Patrol (CHP) to establish procedures for the movement of hazardous wastes the County.

Policy HS-4.4 – Contamination Prevention: The County shall review new development proposals to protect soils, air quality, surface water, and groundwater from hazardous materials contamination.

Tulare County Ordinance Code

The Tulare County Ordinance Code was reviewed. The County Ordinance Code does not contain any requirements or policies related to hazardous materials or hazardous wastes that apply to the Project. Therefore, the applicable goals and policies found in the County General Plan are the local regulations primarily relied upon in the analysis presented in this section.

3.9.4 Significance Thresholds

3.9.4.1 Appendix G Thresholds from the State CEQA Guidelines

According to Appendix G of the State CEQA Guidelines, the Project would have a significant effect if it would:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter miles of an existing or proposed school;

d) Be located on a site which is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or environment;

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would result in a safety hazard or excessive noise for people residing or working in the project area;

f) Impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan; or

g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.

3.9.4.2 Additional Thresholds of Significance

Requirements identified in the County policies and plans are addressed by the significance criteria above. There are no additional thresholds of significance related to hazards or hazardous materials.

3.9.5 Methodology of Analysis

This analysis is based on the review of applicable federal, state and local requirements, Project design features, best management practices (BMPs), operating practices and other environmental protection measures that have been incorporated into the Project to minimize potential impacts on the environment.

The hazardous materials that would most likely be used at the Project site were identified, and the associated rules and regulations were reviewed to evaluate if the Project posed a potentially significant impact associated with the management of hazardous materials. Relevant BMPs and Project design features that are incorporated into the Project to minimize potential environmental impacts associated with the management of hazardous materials and waste were evaluated.

For purposes of this hazardous materials analysis, a material is considered hazardous if it has characteristics defined as "hazardous" by the California Code of Regulations (CCR) or appears on a list of hazardous materials prepared by a Federal, State, or local agency. The CCR defines hazardous material by reference to Section 25501 of the Health and Safety Code, which provides:

> "*Hazardous material means any material that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. 'Hazardous materials' include, but are not limited to, hazardous substances, hazardous waste, and any material that a handler or the unified program agency has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment." (Cal. Health &Safety Code §25501(m); 22 CCR §66260.10).*

A substance may be considered hazardous due to a number of criteria including, toxicity, flammability, corrosivity, or reactivity. Once a hazardous material is disposed of or no longer intended for use, it is considered "hazardous waste." Hazardous waste is any hazardous material that is abandoned, discarded, or in certain cases recycled. The same criteria, as stated above, that renders a material hazardous also renders a waste hazardous.

Based on the review of the Project's description and knowledge of materials typically found at similar mining sites, it is anticipated that the following potentially hazardous materials may be present on the Project site:

- Hazardous Materials (lubricating oils, diesel/gasoline, transmission fluid, etc.): and/or
    - Vehicle and equipment maintenance supplies and waste (i.e., motor oils, transmission fluids, brake fluids, hydraulic fluids, lubricating grease, oils, cleaning solvents); and
    - Fuel (diesel, gasoline).
- Asphaltic materials.

3.9.5.1 Project Design Features and Environmental Protection and Measures

Numerous design features, BMPs, operating practices and other environmental protection measures have been incorporated into the Project to minimize potential impacts on the environment. The environmental protective measures that were considered during this evaluation include, but are not limited to, the following:

1. The Project would comply with the BMPs and requirements identified in the SWPPP; Waste Discharge Requirements (WDRs); Streambed Alteration Agreement; Hazardous Materials Business Plan (HMBP); SPCC Plan; and the SMARA Reclamation Plan.
2. The use of hazardous materials at the Project site would be limited and include primarily fuels, lubricants and fluids associated with equipment and vehicles.
3. Hazardous materials would not be stored onsite during reservoir excavation and construction.
4. The 10,000-gallon aboveground storage tank (AST) used during reservoir operations for the operation of the floating pump would have secondary containment and be in compliance with the SPCC Plan.
5. The AST would not be used for fueling of vehicles or equipment.
6. Filling of the AST would only occur in a designated area with secondary containment to facilitate potential spill cleanup.
7. "No Smoking" and other hazard warning signs would be posted through the site and employees would be trained as to recognition of fire hazards and ignition sources.
8. An inspection and maintenance program would be established to ensure that vehicles and equipment are operated and maintained properly and that hazardous materials handling areas, storage areas, AST and containers meet regulatory requirements.
9. Prior to removal of topsoil and subsoil and during mining activities, the affected area would be sprayed by water trucks, as necessary to control dust and comply with air quality regulations.
10. The Project site would be designed to address stormwater runoff and drainage per the requirements of the site-specific Storm Water Pollution Prevention Plan (SWPPP).
11. The Project site would be graded to prevent sediment from leaving the site.
12. Equipment and vehicle parking/storage areas would be graded to prevent stormwater from leaving the site and/or located in the bottom of the excavated pit such that stormwater would be captured.
13. BMPs (e.g., gravel bag or rock check dams along drainage swales, silt fencing or fiber rolls to contain drainage and sediment, lined swales, etc.) would be implemented to prevent stormwater runoff in accordance with the SWPPP.
14. Excavation equipment would be inspected, maintained and repaired to ensure that the equipment is operating properly, and leaks are prevented to the maximum extent feasible.
15. Minor/routine maintenance and fueling activities conducted on-site would be done in accordance with the BMPs identified in the SWPPP.
16. Major maintenance and repairs of equipment and vehicles would be conducted off-site.

17. Hazardous materials and hazardous waste would be managed in accordance with applicable local, state and federal regulations. Any hazardous waste generated at the site would be disposed of at a permitted off-site facility.

18. Personnel would be trained in the management of hazardous materials/waste and also in surveillance and control of mosquitoes in case there is standing water after storm events.

19. Blasting would not be used for the excavation of the site.

20. In the unlikely event that an abandoned underground storage tank is discovered, the County would be notified, and the tank would be removed in accordance with applicable regulations and requirements.

3.9.6 Project-Level Impacts and Mitigation Measures

3.9.6.2 Routine Transport or Disposal of Hazardous Materials

Impact Statement

Impact HAZ-1: *Would the Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?* **(CEQA Guidelines Threshold Criteria (a))**

Impact Analysis

The use of hazardous materials during reservoir excavation, construction, and operations would primarily include fuels, lubricants, and fluids associated with vehicles and equipment fueling and minor servicing conducted onsite. Reservoir excavation and construction activities at the Project site would involve the use of mobile equipment (e.g., excavators, dozers, scrapers, loaders, etc.). Therefore, diesel, gasoline and/or lubricating oil would be present within equipment and vehicles operating on-site. The equipment may also be refueled and receive minor maintenance (lubed and greased) onsite by mobile fueling (diesel) and maintenance trucks on an as-needed basis. These activities would be conducted in compliance with hazardous material management regulations, hazardous waste generator requirements as well as the site-specific SWPPP and Hazardous Materials Business Plan (HMBP). Any spill from vehicles or equipment would likely be small and would be cleaned up and disposed of in accordance with applicable regulatory requirements. Any transport of hazardous materials to and from the site would be conducted in compliance with federal, state and local requirements.

Reservoir operations would involve the installation and use of an approximately 10,000 gallon diesel AST, diesel generator, and a generator building near the inflow channel, all of which would be used during reservoir operations. Except for the diesel stored in the AST, hazardous materials would not be stored within the Project site. The AST would be used to fuel the generator powering the floating barge pump, and would not be used for fueling of vehicles or equipment. The AST would be dual-walled for leak protection. Filling of the AST would only occur in a designated area with secondary containment to facilitate any potential cleanup. Because the AST capacity is greater than 1,320 gallons, the Owners would be required to prepare and implement a SPCC Plan, which describes fuel storage, transfer, and spill avoidance, and spill response procedures.

Vehicle fueling and minor maintenance activities that would occur onsite would be conducted in accordance with the hazardous material regulations. Major maintenance and repairs of trucks and equipment would be conducted offsite. Additionally, because the diesel AST would be constructed, operated and maintained in accordance with the site-specific SPCC Plan and APSA requirements and regulations, the probability of an onsite spill would be minimized during reservoir operations.

In the event hazardous wastes are generated on the Project site, the hazardous waste would be transported offsite in Department of Transportation (DOT) approved containers to a permitted hazardous waste treatment, recycling or disposal facility. Potentially hazardous waste that may be generated onsite include accidental cleanup materials/soil, and rags/containers from minor maintenance activities. If hazardous waste is generated on-site, it would be in a designated 90-day storage area and/or satellite accumulation areas. Appropriate spill and emergency response equipment would be located or made available in the case of an accidental spill.

Sperrylite is a rare platinum arsenide with a limited range of occurrence. It can be found in the weathered zone of mineral deposits, and may be present as detrital grains in trace amounts within the Kaweah River gravel. Both platinum and arsenic are considered hazardous, but only in soluble forms. Because sperrylite, if present at all, would be present in very low amounts, and it is not highly soluble within the non-acidic conditions, such as at the Project site, the potential presence of sperrylite in the Kaweah river gravel is not considered to present a potentially significant concern.

For the reasons outlined above, the Project would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials, and therefore the Project would have a less than significant impact with no mitigation required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.9.6.3 Release of Hazardous Materials into the Environment

Impact Statement

Impact HAZ-2: *Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?* **(CEQA Guidelines Threshold Criteria (b))**

Impact Analysis

See response to item *a)* above. As only minimal amounts of hazardous materials would be used or stored onsite, the potential for an accidental release of significant quantities of hazardous materials that could impact the surrounding environment is less than significant.

Accidents, such as a minor spill, could occur during the routine use management of hazardous materials used at the Project site. However, the use of these materials would be conducted in accordance with the federal, state and local regulations in order to prevent or minimize the impact of a release. As discussed above, numerous design features, BMPs, operating practices and other environmental protection measures have been incorporated into the Project to minimize the potential for foreseeable upset and accident conditions involving the release of hazardous materials.

The use of hazardous materials during reservoir excavation and construction operations would mainly include fuels, lubricants, and fluids associated with mobile vehicles and equipment. Hazardous materials used as part of reservoir excavation and construction operations for onsite equipment and vehicles would primarily include fuels and lubricants. Any spill from vehicles or equipment would likely be small and would be promptly cleaned up and disposed of in accordance with applicable regulatory requirements. Other than the 10,000 diesel AST used during reservoir operations, large quantities of hazardous materials would not be stored at the Project site. While vehicles and mobile equipment may be refueled and receive minor maintenance (lubed and greased) onsite by mobile fueling (diesel) and maintenance trucks on an as-needed basis, significant equipment servicing and maintenance would be conducted offsite. Any onsite storage, handling, use and disposition of potentially hazardous materials would be conducted in compliance with the requirements outlined in the Owner's HMBP.

As discussed above, reservoir operations would involve the use of an approximately 10,000-gallon diesel AST, diesel generator, and a generator building near the inflow channel, all of which would be used during reservoir operations. Except for the diesel stored in the AST, hazardous materials would not be permanently stored within the Project site. The AST would be used to fuel the generator powering the floating barge pump, and would not be used for fueling of vehicles or equipment. Therefore, dispenser-related spillage would not occur. The AST would be dual-walled for leak protection. Filling of the AST would only occur in a designated area with secondary containment. Because the AST capacity is greater than 1,320 gallons, the Owners would be required to prepare and implement a SPCC Plan, which describes fuel storage, transfer, and spill avoidance, and spill response procedures.

Because trucks and equipment would be fueled and maintained offsite, and the AST would be constructed, operated and maintained in accordance with existing regulations, the probability of an onsite spill would be minimized. In the unlikely event of an accidental release of hazardous materials from operating vehicles or the 10,000-gallon AST, onsite employees would be trained to properly recognize, contain, and cleanup such releases. The Project site would also be designed and graded to contain accidentally released materials and stormwater that may be contaminated as a result of equipment spills or leaks. In addition to the SPCC, a site-specific SWPPP would be prepared which would outline BMP's, cleanup requirements, and other procedures that would be implemented on-site to ensure stormwater is properly contained and kept free of contaminants. Examples of BMP's include but are not limited to:

- Spill prevention, control and cleanup.
- Vehicle and equipment fueling, cleaning and repair.
- Waste handling and disposal.
- Perimeter vegetation.
- Use of silt fencing, fiber rolls or similar perimeter controls, as needed.

Because the vehicle fueling and minor maintenance activities that would occur at the site would be conducted in accordance with the hazardous material regulations and the AST would be constructed, operated and maintained in accordance with the site SPCC Plan and APSA requirements, the probability of an onsite spill would be minimized. For these reasons, an accidental release of hazardous materials that could impact the surrounding environment is unlikely, and therefore the Project would have a less than significant impact with no mitigation required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.9.6.4 Potential Impacts to Schools

Impact Statement

Impact HAZ-3: *Would the Project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?* **(CEQA Guidelines Threshold Criteria (c))**

Impact Analysis

The Project is not located within 0.25 miles of an existing or proposed school. The closest school site is the Sequoia Union Elementary School located approximately 0.9 miles south of the Project site. Therefore, the Project would have no impact.

Level of Significance Before Mitigation

No impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.9.6.5 Listed Hazardous Waste Site

Impact Statement

Impact HAZ-4: *Would the Project be located on a site which is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or environment?* **(CEQA Guidelines Threshold Criteria (d))**

Impact Analysis

The GeoTracker Groundwater Ambient Assessment and Monitoring (GAMA) and EnviroStar databases were reviewed to determine whether the Project site is a listed hazardous material/waste site or located near a known contaminated site. Table 3.9-2 identifies the information available from these databases.

Table 3.9-2. Hazardous Materials Databases Reviewed

Database	Agency	Results
GeoTracker Groundwater Ambient Assessment and Monitoring (GAMA)	State Water Resources Control Board	Project site not identified on this database.
EnviroStor: Federal Superfund Sites National Priority List State Responses Stats Superfund Military Facilities Voluntary Cleanup School Sites Site Evaluations Tiered Permits Corrective Actions	Department of Toxic Substances Control	Project site not identified on any of these databases.

As shown in Table 3.9-2, The Project is not located on a site which is included on a list of hazardous material sites pursuant to Government Code Section 65962.5. Therefore, the Project would have no impact.

Level of Significance Before Mitigation

No impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.9.6.6 Potential Impacts to Airports

Impact Statement

Impact HAZ-5: *Would the Project be located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?* **(CEQA Guidelines Threshold Criteria (e))**

Impact Analysis

The Project site is not within 2 miles of an existing public airport or public use airport. The closest public airport/airstrip is the Woodlake Airport, located approximately 2.4 miles west of the Project site.

Although, the Project is not located near an airport or within an airport land use plan, there could be a concern that the proposed reservoir, once constructed and filled with water, would become an attractant to birds that could result in bird aircraft strike hazards for planes landing or departing from the Woodlake Airport to the west.

The Federal Aviation Administration (FAA) Advisory Circular 150/5200-33B identifies the following minimum Separation Criteria for land-use practices that attract hazardous wildlife to the vicinity of airports:

- *For airports serving piston-powered aircraft hazardous wildlife attractants must be 5,000 feet from the nearest air operations area (AOA).*

This Project is approximately 2.4 miles away from the Woodlake Airport therefore it meets the minimum separation criteria of 5,000 feet from the AOA.

- *For Airports serving turbine-powered aircraft, hazardous wildlife attractants must be 10,000 feet from the nearest AOA.*

As stated above, The Project is approximately 2.4 miles away from the Woodlake Airport therefore it meets the minimum separation criteria of 10,000 feet from the AOA.

- *For all airports, the FAA recommends a distance of 5 statute miles between the farthest edge of the airport's AOA and the hazardous wildlife attractant if the attractant could cause hazardous wildlife movement into or across the approach or departure airspace.*

The Project is 2.4 miles from the Woodlake Airport so it is within 5 miles of an airport. However, there are multiple, existing water features in the vicinity of the airport that would already have created the potential to attract wildlife, including Bravo Lake which is significantly closer to the airport than the Project. Therefore, the Project would not cause a significant increase to wildlife movement into or across the approach or departure airspace and this potential impact is considered less than significant with no mitigation required.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.9.6.7 Emergency Plans

Impact Statement

Impact HAZ-6: *Would the Project impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?* ***(CEQA Guidelines Threshold Criteria (f))***

There are no adopted emergency response or evacuation plans that would be impacted by the proposed the Project site, primarily because the Project would not result in an increased number of vehicles on public roadways (i.e., State Route 216). The evacuation route in and out of the Project site is the existing access route in the western portion of the Project site, which connects to the Seaborn site to the west and eventually Road 222. This existing ingress and egress point would sufficiently serve the Project site in the event of an emergency. Please see Section 3.20 – Wildfire, which further discusses Project site evacuation route in greater detail. Therefore, no significant adverse impacts are identified or are anticipated, and no mitigation measures are required.

Level of Significance Before Mitigation

Less than significant impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.9.6.8 Wildland Fires

Impact Statement

Impact HAZ-7: *Would the Project expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires?* **(CEQA Guidelines Threshold Criteria (g))**

Impact Analysis

As shown in Figure 3.11-1 in Section 3.11 – Wildfire, the Project site is not located in a SRA or a designated Very High Fire Hazard Severity Zone (VHFHSZ)" area. However, a designated SRA "High FHSZ" is located approximately 0.6 miles north/northeast of the Project site (https://osfm.fire.ca.gov/media/6830/fhszs_map54.pdf). Additionally, the southern portion of the Project is located within a Local Responsibility Area (LRA), specifically a designated LRA "Moderate FHSZ" as designated by CalFire. Additionally, there are no high-voltage power lines located on or near the Project site.

Management of flammable materials would be conducted in accordance with applicable regulations. In addition, no flammable structures would be located onsite and there would be minimal vegetation on the Project site during the reservoir excavation, construction and operational phases. The clearing of the site to allow for excavation of the reservoir basin would result in a type of "fire break" or "safe zone" that would help prevent the spread of a wildfire originating from areas adjacent to the Project site.

In addition, existing draught-stressed vegetation and grassland onsite would be would be cleared to allow for the proposed Project; thus, further reducing a potential fire hazard onsite. Therefore, in addition to having a less than significant impact, the Project would also minimize the potential of hazards associated with a wildfire.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.9.7 Cumulative-Level Impacts and Mitigation Measures

Table 3.0-1 in Section 3.0 of this DEIR identifies projects within the County and the City of Woodlake that were considered in regards to potential cumulative impacts. The County and City webpages provided a list of current and reasonably foreseeable projects that could result in cumulative impacts for the resource areas affected by the Project. As noted in Table 3.0-1, none of the cumulative projects meet the criteria to be further evaluated in relation to cumulative impacts associated with hazardous materials and/or hazardous waste.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to hazards and hazardous materials.

The context for cumulative impacts for hazardous materials/hazardous waste impacts is the immediate area encompassing the site vicinity (1- to 3-mile radius from the Project site). As discussed in the Impact Analysis, specifically in Section 3.9.6 above for each impact threshold, the Project was determined to have either no impact or a less than significant impact. Since the Project would not result in any significant impacts related to hazardous materials or hazardous wastes, no cumulative impacts in conjunction with other cumulative projects would result.

3.10 HYDROLOGY AND WATER QUALITY

3.10.1 Introduction

This section of the DEIR provides analyses of the hydrologic and water quality related impacts of the Project. The information provided in this chapter was derived from the following studies, modeling reports and background documents:

- *McKay Point Reservoir Project – Hydrology and Water Quality Technical Study*, prepared by Osma Pekin, PhD, P.E., G.E., and Ian Hutchison, PhD., P.E., SLR International Corp. (SLR, 2022) (Appendix G);
- *McKay Point Reservoir Project – Geology and Soils Technical Study*, prepared by Osma Pekin, PhD, P.E., G.E., and Ian Hutchison, PhD., P.E., SLR International Corp. (SLR, 2021) (Appendix F1);
- *Geotechnical Engineering Investigation Report, Proposed McKay Point Reservoir Project, Phase 1: Summary of Field Exploration and Boring Logs, Tulare Irrigation District, Tulare, California*, BSK Associates, Engineers and Laboratories (BSK, 2011) (Appendix F2);
- Existing publicly-available data and reports; and
- Field observations.

3.10.2 Environmental Setting

3.10.2.1 Regional Setting

The Project is located in California's Central Valley near the western boundary in the foothills of the Sierra Nevada Geomorphic Province of California. The Central Valley was formed by millions of years of deposition of Quaternary sediments derived from the uplifted Sierra Nevada and Coast Ranges. Numerous rivers and streams originating in the higher elevations of the Sierra Nevada, including the Kaweah River, flow westward into the Central Valley, depositing Quaternary alluvial sediments upon which the Project site is located (Mathews and Burnett, 1965). This alluvium is underlain by a sequence of marine and continental sedimentary rocks consisting of shale, siltstone, and sandstone. Beneath these rocks lie impermeable basement complex of igneous and metamorphic rocks that extend as deep as 13,000-feet below ground surface (bgs). These basement rocks are a subsurface extension of the same rocks that occur in the Sierra Nevada (Faunt et al., 2009). A geologic map of the region is included as Figure 3.4-1 (Geology in the Vicinity of the Project) in Section 3.7 – Geology and Soils.

The Project site is located in the Kaweah Sub-basin of the San Joaquin Valley Groundwater Basin, within the Tulare Lake Hydrologic Region (DWR, 2003) (Figure 3.10-1). The San Joaquin Valley Groundwater Basin has been designated by the California Department of Water Resources (DWR) as a high priority basin. The Project site is also near the eastern boundary of the Kaweah Delta Water Conservation District (KDWCD) (refer to Figure 3.10-3). Approximately 265,000 acres of the KDWCD is irrigated for agriculture and approximately 45,000 acres is urbanized. Numerous public and private entities within the KDWCD boundaries divert water from the Kaweah River and its distributaries, mainly for irrigation. In addition,

almost all of the land served by the KDWCD receives irrigation water obtained from groundwater, often as a supplement to surface water (Groundwater Sustainability Plan – GWSP, GKGSA, 2020).

The KDWCD and surrounding areas have been in long-term groundwater overdraft. The KDWCD-wide overdraft for the period of 2007 to 2017 was estimated at approximately 78,000 acre-feet (AF) per year. Most of the overdraft occurs in the western portion of the KDWCD, not in the Project vicinity (GKGSA, 2020).

Within the region, groundwater flows generally toward the west from areas of recharge where streams and rivers from the Sierra Nevada Mountains transition onto the alluvium (Figure 3.10-2). Groundwater elevations in the region vary from around 460-feet above mean sea level (amsl) near the Project site, to around 250-feet amsl near the City of Visalia (DWR, 2014). Groundwater is pumped in the area for agricultural and urban uses.

3.10.2.2 Vicinity Setting

The environmental setting of the vicinity is essentially the same as the Project site and is discussed below in Section 3.10.2.3.

3.10.2.3 Project Site Setting

The Project site is currently undeveloped and has been used for cattle grazing under lease arrangements. Most of the Project site is vegetated with non-native grasses.

Immediately north of the Project site is the Lemon Cove Facility. The Lemon Cove Facility includes the historic mining area which is now being used as infiltration ponds and the processing plant located in the northeast portion of the Lemon Cove Facility. The Kaweah River Rock aggregate mining and processing facility was located immediately to the west of the Project site on the Seaborn site. As discussed previously, access for the reservoir would be via Road 222, through the Seaborn site entrance to the Project site. The Kaweah South Project is also located across the river and to the south, and the Stillwell Mine is to the northeast of the Project site (see Figure 2-2 – Project Site and Land Use Map). Adjacent lands to the south and east are used for agricultural and, to a limited extent, scattered rural residential purposes.

The Project site is located in the eastern portion of Kaweah Sub-basin of the San Joaquin Valley Groundwater Basin. This area is underlain by young, unconsolidated alluvial deposits (largely sands and gravels) that originated from the nearby Sierra Nevada Mountains. These moderately to highly permeable sands and gravels extend to depths of several hundred feet or more. The Project vicinity is drained by the Kaweah River and by the St. Johns River, which drain ultimately to the Tulare Lake bed in the southern end of the San Joaquin Valley (see Figure 3.10-1). In 1962, Lake Kaweah, located upstream from the Project site, was created by the construction of Terminus Dam on the Kaweah River. Renovations of this dam in 2004 significantly reduced the potential for flooding at the Project site and surrounding area.

The surface soil at the Project site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. Project site surface drainage east of the river split is generally to the south and southeast toward the Kaweah River and west of the river split generally to the south and southwest toward the St. Johns River. The Project site elevation falls from approximately 472-feet amsl on the northeastern end of the property, to approximately 454-feet amsl on the southwestern end.

Climate is typical of the foothill region of the Central Valley, with cool, rainy winters having a mean daily temperature ranging from 40° to 50° Fahrenheit (F), and hot, dry summers when daytime temperatures can exceed 100° F (see Table 3.10-1). During the summer months, a high-pressure system off the west coast of California prevents precipitation from occurring in the area. During the winter, this high-pressure system is intermittent, allowing Pacific storms to bring rainfall to the foothills. Rainfall increases with elevation in the foothills and ranges. Most precipitation occurs from November through April.

Table 3.10-1. Project Vicinity Climate Summary

	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC	ANNUAL
Average Max. Temperature (F)	56.5	62.9	68.6	75.6	84.4	92.8	99.3	97.5	91.2	80.3	66.7	56.8	77.7

Hydrology – East Kaweah Basin

The following sections were taken from the Hydrology and Water Quality Technical Study (Appendix G). Based on studies conducted for the Greater Kaweah Groundwater Sustainability Agency (GEI/GSI, 2020) the following changes to the precipitation, evapotranspiration, and runoff in the East Kaweah Basin are projected for 2030 and 2070 respectively. These projections are compared to current, or baseline conditions determined for the period 1981 to 2010.

Precipitation

Annual precipitation is projected to change by approximately 0.5% either up or down (SLR, 2022). However, the seasonal distribution of precipitation will change with increases projected for Winter and late Summer and decreases in Spring. Specific projected changes are:

- 2030 Precipitation:

  - Annual increase of 0.06 inches or 0.4%.
  - Increases in the November to April period; maximum increase in March (0.25 inches or 10%).
  - Decrease in the May through July period; maximum decrease in May (-0.08 inches or 14%).
  - Increase in the August to September period; maximum increase in August (negligible or 9%).

- 2070 Precipitation:
  - Annual decrease of -0.09 inches or -0.6%.
  - Increases in the December to March period; maximum increase in January (0.46 inches or 17%).
  - Decrease in the April through June period; maximum decrease in May (-0.18 inches or -31%).
  - Increase in the July to September period; maximum increase in September (0.05 inches or 25%).

Evapotranspiration

Annual evapotranspiration is projected to increase, by approximately 3.2% to 8.2%. Maximum increases are projected to occur in the Winter and Spring periods. Specific projected changes are:

- 2030 Evapotranspiration:
  - Annual increase of 2.1 inches or 3.2% measured as pan evaporation.
  - Maximum relative increases occur in January (0.06 inches or 4.3%) and June (0.35 inches or 3.8%).

- 2070 Evapotranspiration:
  - Annual increase of 5.3 inches or 8.2% as pan evaporation.
  - Maximum relative increases occur in December (0.18 inches or 12.8%) and May (0.58 inches or 8.0%).

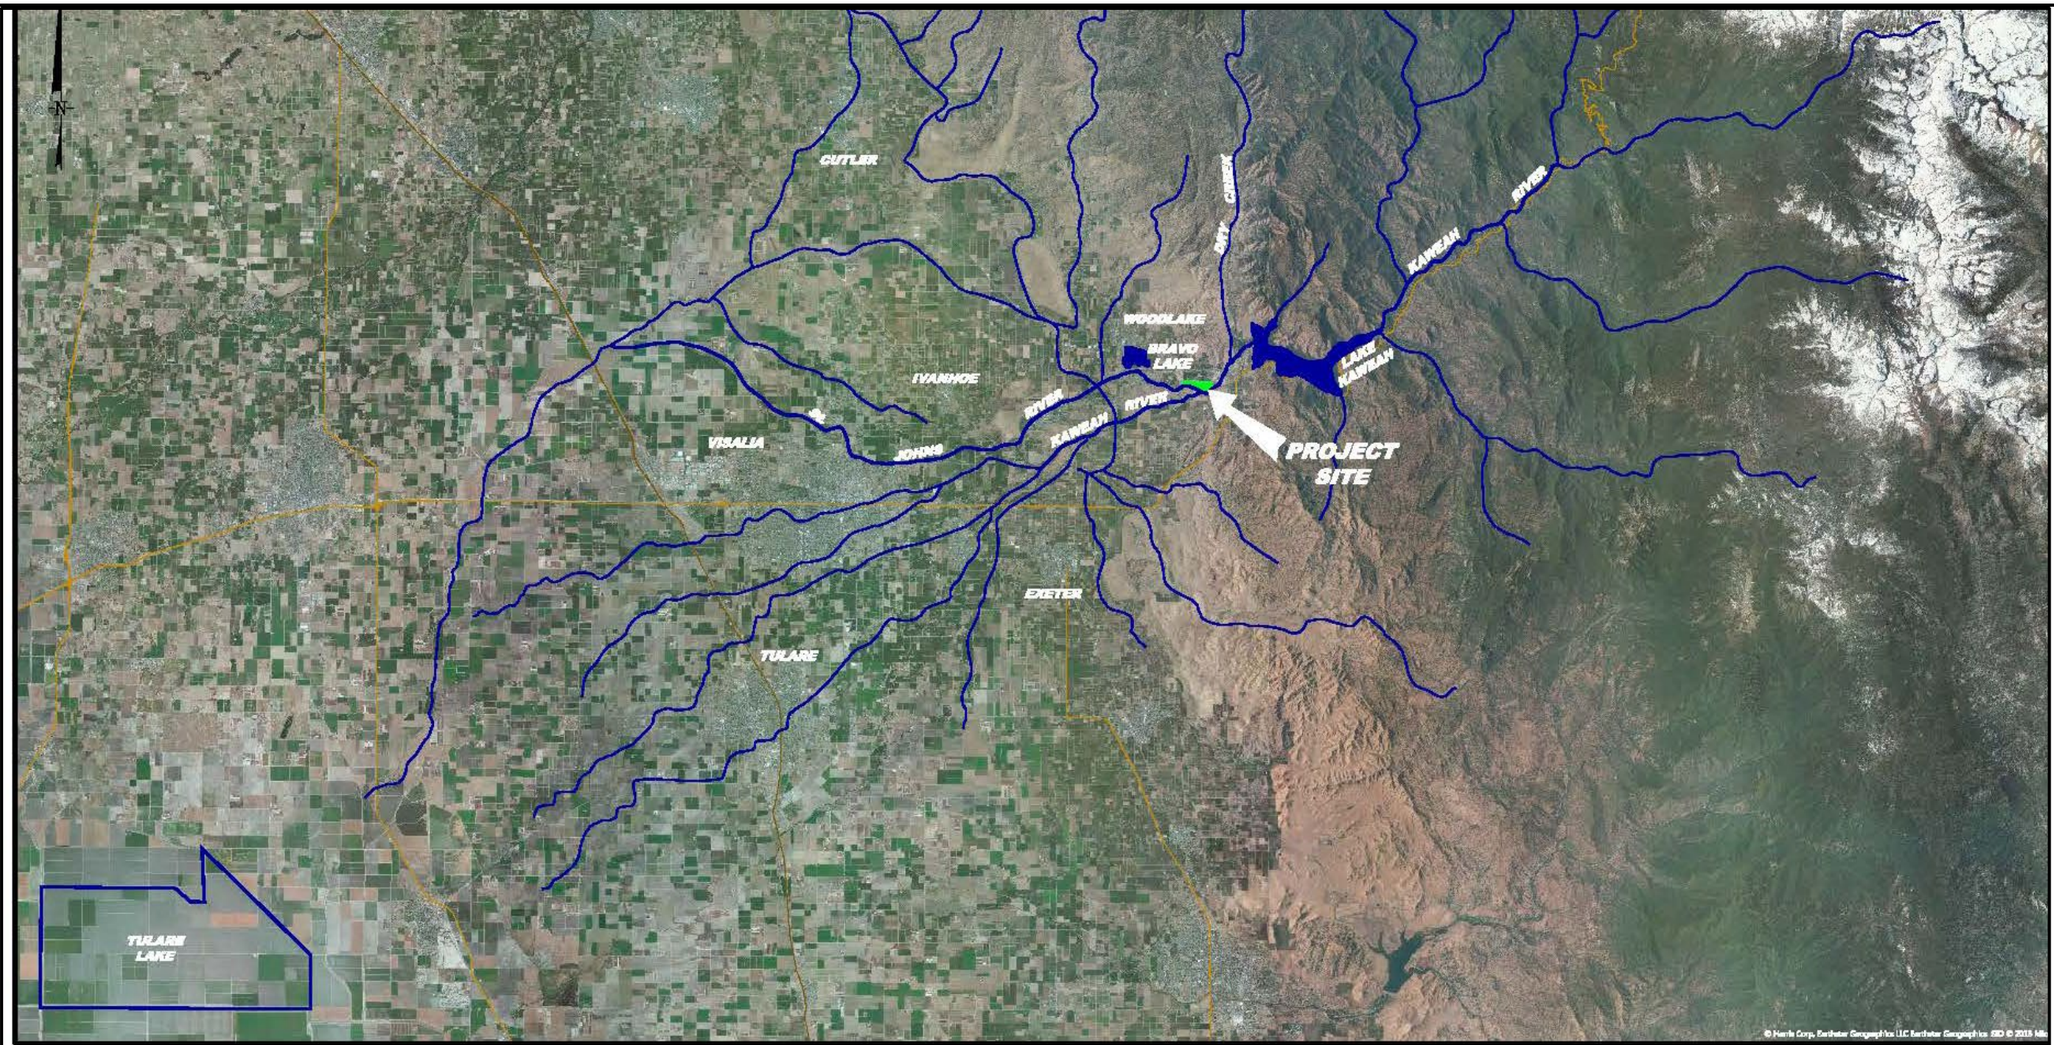
Under these conditions it can be expected that the crop demands for water would generally increase in proportion to the increased evapotranspiration estimates; by approximately 3% to 8% over time.

Runoff

Annual runoff is projected to be reduced by approximately -5% by and after 2030. A significant change is projected to occur in the seasonal distribution of runoff. Under current and the projected 2030 conditions the peak inflows occur, and are projected to occur, in May each year (i.e., in mid spring). By 2070 inflows are predicted to peak in late winter, two months earlier than March.

Storm Precipitation

As part of California's Fourth Climate Change Assessment, the California Energy Commission (CEC) sponsored a study of the projected changes to California's precipitation intensity-duration-frequency



curves which evaluated how the intensity and frequency of 1-to-7-day precipitation events would change for extreme storms such as the 25-year to 100-year events, compared to those experienced in from 1950 to 1999. The projections were made for the period 2050 to 2099 (50-years). The work was undertaken by the University of California, Irvine (UCI, 2018).

The general conclusions of the study are that extreme precipitation is expected to increase across most cities in California. Climate model simulations under the Representative Concentration Pathway (RCP)[1] 8.51 project that in the future, the frequency of what is currently a 50-year event could double in both Southern and Northern California. This means that areas across California may experience extreme precipitation that is more intense and twice as frequent, relative to historical records.

The closest city to the Project that was analyzed is Fresno. Evaluation of the climate change effect on one-day storm precipitation frequencies for Fresno indicates, for example, that the precipitation values for a return period of 100-years would increase by 14% to 19% for the RCP 4.5 and RCP 8.5[1] scenarios respectively for the 50-year future projection period. The current storm precipitation amounts would occur more frequently. For example, the annual probability of occurrence of the current 100-year precipitation which is 1% could be increased to between 1.4% and 1.9% respectively (i.e., this storm event would become nearly twice as likely).

[1] A Representative Concentration Pathway (RCP) is a greenhouse gas (GHG) concentration trajectory generally adopted by the Intergovernmental Panel on Climate Change (IPCC) for climate change forecasting. The RCPs describe the possible changes in future anthropogenic (i.e., human) GHG emissions. RCP 4.5 is described by the IPCC as an intermediate scenario. Emissions peak occurs around 2040, and then declines. RCP 8.5 emissions continue to rise throughout the 21st century and this pathway is generally taken as the basis for worst-case climate change scenarios.

3.10.3 Regulatory Setting

3.10.3.1 Federal

Clean Water Act/NPDES

The Federal Water Pollution Control Act, commonly referred to as the Clean Water Act (CWA), was passed in 1972 (33 U.S.C. § 1251 et seq.). The CWA is the primary federal law in the United States governing water pollution, with the objective to restore and maintain the chemical, physical, and biological integrity of the nation's waters by preventing pollution from point and nonpoint sources, providing assistance to publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands.

The CWA made it unlawful to discharge any pollutant from a point source into navigable waters, without a permit (33 U.S.C. § 1342). Under the CWA, the United State Environmental Protection Agency (US EPA) has implemented the National Pollutant Discharge Elimination System (NPDES) permit program to control discharges. Industrial facilities, such as the Project, must obtain permits if their discharges go directly to surface waters.

U.S. Army Corps of Engineers

Section 404 of the CWA establishes a program to regulate the discharge of dredged or fill material into waters of the United States, including wetlands (33 U.S.C. § 1344). Activities in waters of the United States regulated under this program include fill for development, water resource projects (such as dams and levees), infrastructure development (such as highways and airports) and mining projects. Section 404 requires a permit before dredged or fill material may be discharged into Waters of the United States (WOTUS), unless the activity is exempt from Section 404 regulation (e.g., water filled depressions created in dry land incidental to mining activity).

The basic premise of the program is that no discharge of dredged or fill material may be permitted if: (1) a practicable alternative exists that is less damaging to the aquatic environment or (2) the nation’s waters would be significantly degraded. In other words, when an applicant applies for a permit, an applicant must first show that steps have been taken to avoid impacts to wetlands, streams and other aquatic resources; that potential impacts have been minimized; and that compensation will be provided for all remaining unavoidable impacts.

Proposed activities are regulated through a permit review process. An individual permit is required for potentially significant impacts. Individual permits are reviewed by the US Army Corps of Engineers (ACOE), which evaluates applications under a public interest review, as well as the environmental criteria set forth in the CWA Section 404(b)(1) Guidelines, regulations promulgated by US EPA. However, for most discharges that would have only minimal adverse effects, a general permit may be suitable. General permits are issued on a nationwide, regional, or State basis for particular categories of activities. The general permit process eliminates individual review and allows certain activities to proceed with little or no delay, provided that the general or specific conditions for the general permit are met. For example,

minor road activities, utility line backfill, and bedding are activities that can be considered for a general permit. States also have a role in Section 404 decisions, through State program general permits, water quality certification, or program assumption (see Cal. Water Code § 13376).

FEMA Flood Insurance Rate Map

In 1962, Lake Kaweah, located upstream from the Project site, was created by the construction of Terminus Dam. The raising of the dam in 2004 significantly reduced flooding in the vicinity of the Project site, but did not eliminate it totally. Federal Emergency Management Agency (FEMA) maps indicate that the Project site is located within 100-Year Floodway (Zone AE = where Base Flood Areas Determined), and the Special Flood Hazard Area Subject to Inundation. The Tulare County General Plan – Flood Hazards and Faults (Figure 10-1) map indicates the Project site is located within the FEMA 100-year Flood Zone, and the Dam Failure Inundation Zone (Flood Insurance Rate Map [FIRM] Number 06107C0693E). Also, the following section for additional detail.

Federal Safe Drinking Water Act of 1974

First enacted in 1974 and substantively amended in 1986 and 1996, the Federal Safe Drinking Water Act (42 U.S.C. §300f et seq.) authorizes the US EPA to set national health-based standards for drinking water to protect against both naturally occurring and manmade contaminants that may be found in drinking water.

3.10.3.2 State

The Porter-Cologne Water Quality Control Act

Under the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) of 1969 (Cal. Water Code § 13000 et seq.), California's State Water Resources Control Board (SWRCB) has the ultimate authority over State water rights and water quality policy. The Porter-Cologne Act also establishes nine Regional Water Quality Control Boards to oversee water quality on a day-to-day basis at the local/regional level.

Regional Water Quality Control Board

Created by the State Legislature in 1967, the SWRCB protects water quality by setting statewide policy, coordinating and supporting the Regional Water Quality Control Boards' efforts, and reviewing petitions that contest the Regional Water Quality Control Boards' actions. The Regional Water Quality Control Boards exercise rule making and regulatory activities by basins. Tulare County falls within the jurisdiction of the Central Valley Regional Water Quality Control Board (CVRWQCB). As such, the Project is subject to the requirements of the *Water Quality Control Plan for the Tulare Lake Basin, Third Edition* (Basin Plan), revised May 2018 (RWQCB - Central Valley Region, 2018).

Basin plans consist of designated beneficial uses to be protected, water quality objectives (WQOs) to protect those uses, and a program of implementation needed for achieving the objectives (California Water Code, Section 13050(j)). Beneficial uses, together with their corresponding WQOs, meet Federal regulatory criteria for water quality standards. Hence, California's basin plans serve as regulatory

references for meeting both State and Federal requirements for water quality control (40 CFR Parts 130 and 131). One significant difference between the State and Federal programs is that California's basin plans establish standards for ground waters in addition to surface waters.

The Porter-Cologne Water Quality Control Act defines water quality objectives as "*...the limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area*" (Water Code Section 13050(h)). It also requires the Regional Water Quality Control Board (RWQCB) to establish WQOs, while acknowledging that it is possible for water quality to be changed to some degree without unreasonably affecting beneficial uses.

The 2018 Basin Plan for the Tulare Lake Basin identifies the beneficial uses and WQOs for the Project area. The beneficial uses include municipal and domestic water supply; agricultural supply; industrial service and process supply; water contact recreation; non-contact water recreation; warm freshwater habitat; wildlife habitat; and groundwater recharge. The Basin Plan surface water objectives include, but are not limited to, pH, dissolved oxygen, pesticides, temperature, and turbidity.

CVRWQCB's responsibilities also include drafting and enforcing waste discharge requirements (WDRs) and federal NPDES permits (Cal. Water Code § 13376). If pollutants are directly discharged into surface waters, an application for a NPDES permit must be submitted to the RWQCB. For other types of discharge, such as those affecting groundwater or in a diffused manner (e.g., erosion from soil disturbance or discharges to land), a Report of Waste Discharge must be filed with the RWQCB in order to obtain the necessary WDRs.

The SWRCB elected to issue a statewide General Permit that applies to all industrial storm water discharges requiring a permit except those from construction activities. The SWRCB adopted the General Permit on November 19, 1991, which was reissued on April 17, 1997. A new Industrial General Permit (IGP) (Order 2014-0057-DWQ) was adopted April 1, 2014 and became effective on July 1, 2015.

Section 1605 Long-Term Streambed Alteration Agreement

California Fish and Game Code Section 1602 requires an entity to notify the California Department of Fish and Wildlife (CDFW) and, if necessary, to obtain a Lake or Streambed Alteration Agreement (Agreement), before commencing any activity that may do one or more of the following: (1) substantially divert or obstruct the natural flow of any river, stream or lake; (2) substantially change or use any material from the bed, channel or bank of any river, stream, or lake; or (3) deposit debris, waste or other materials that could pass into any river, stream or lake. If CDFW determines that the activity may substantially adversely affect fish and wildlife resources, a Lake or Streambed Alteration Agreement would be prepared. The Agreement includes reasonable conditions necessary to protect those resources and must comply with the California Environmental Quality Act (CEQA). The entity may proceed with the activity in accordance with the final Agreement. The term of regular Agreements is generally limited to 5 years, with the potential for a 5-year renewal. Section 1605(g) allows CDFW to approve agreements for a longer term.

Sustainable Groundwater Management Act

In 2014, California adopted the Sustainable Groundwater Management Act (SGMA) (Water Code § 10720 et seq.), which became effective on January 1, 2015. The SGMA established a State policy requiring that all groundwater resources be managed "sustainably" (Water Code § 10720.1). "Sustainable groundwater management" is generally defined as the management and use of groundwater that can be maintained without causing an "undesirable result" for at least a 50-year planning and implementation horizon (*Id.* § 10721). "Undesirable results" under the SGMA include significant and unreasonable depletion of supply, significant and unreasonable reductions in groundwater storage, actions resulting in seawater intrusion, water quality degradation, land subsidence, and/or depletion of interconnected surface water (*Id.*).

The centerpiece of the SGMA was the creation of local groundwater sustainability agencies (GSAs) and the requirement that GSAs develop and implement "groundwater sustainability plans" for California's high and medium priority groundwater basins by the deadlines set forth in the SGMA (*Id.* §§ 10720.7, 10723-10724, 10727). The SGMA placed initial responsibilities on the California DWR to create the regulatory framework that GSAs would subsequently rely on in developing and implementing local groundwater management programs (*Id.* §§ 10729, 10733.2). Once DWR adopted the necessary rules and regulations, local agencies within high and medium priority basins were required to choose or establish a GSA by June 30, 2017 (*Id.* §§ 10723-10724, 10735.2(a)). GSAs then had until January 31, 2020 (for high and medium priority basins subject to critical conditions of overdraft) or January 31, 2022 (for other high and medium priority basins) to develop groundwater sustainability plans and until at least 2040 to "achieve sustainability" within their respective basins or sub-basins (*Id.* §§ 10720.7, 10727.2(b)).

As discussed in Section 3.10.2.1 above, the Project site is located in the Kaweah Sub-basin (Basin/Subbasin No. 5-022.11) of the San Joaquin Valley Groundwater Basin. The San Joaquin Valley Groundwater Basin has been designated by the California DWR as a high priority basin. Additionally, the most recent list of basins in critical overdraft was published by DWR in the 2018 Bulletin 118 update, and the San Joaquin Valley – Kaweah Sub-basin is identified as a basin subject to critical condition of overdraft. Because the basin is critically overdrafted, the Greater Kaweah GSA was formed in 2017 to manage the Kaweah Sub-basin sustainably and to prepare a Groundwater Sustainability Plans (GSPs), and a Groundwater Sustainability Plan (Greater Kaweah Groundwater Sustainability Agency, 2020) was prepared by the Grater Kaweah GSA and adopted on January 22, 2020. The Project is subject to the provisions within this Groundwater Sustainability Plan. Please see discussions in Section 3.10.12.19 for additional detail.

The SGMA grants GSAs like the Grater Kaweah GSA a broad array of authorities, including adoption of rules and regulations on groundwater extraction and use, investigatory and inspection powers, the authority to require registration of wells and use of water-measuring devices, imposition of operating restrictions on groundwater extractions, imposition of fees and penalties, enforcement powers, etc. (*Id.* §§ 10725.2, 10725.4, 10725.8, 10726.4, 10730, 10730.2, 10732). The SGMA does not modify rights or priorities to extract and use groundwater and also does not impact rights to surface water (*Id.* § 10720.5).

3.10.3.3 Local

Tulare County General Plan

The County General Plan has a number of policies that apply to projects. General Plan policies that relate to the proposed Project are listed in Section 3.4 – Land Use and Planning, specifically in Table 3.8-2, along with Project consistency determinations regarding the listed policies. The following are the primary General Plan policies that relate to the hydrology and water quality impact evaluation for the Project:

Section 11.1 – General

Goal WR-1: To provide for the current and long-range water needs of the County and for the protection of the quality and quantity of surface and groundwater resources.

Policy WR-1.1 – Groundwater Withdrawal: The County shall cooperate with water agencies and management agencies during land development processes to help promote an adequate, safe, and economically viable groundwater supply for existing and future development within the County. These actions shall be intended to help the County mitigate the potential impact on groundwater resources identified during the planning and approval processes.

Policy WR-1.5 – Expand Use of Reclaimed Wastewater: To augment groundwater supplies and to conserve potable water for domestic purposes, the County shall seek opportunities to expand groundwater recharge efforts.

Policy WR-2.1 – Protect Water Quality: All major land use and development plans shall be evaluated as to their potential to create surface and groundwater contamination hazards from point and non-point sources. The County shall confer with other appropriate agencies, as necessary, to assure adequate water quality review to prevent soil erosion; direct discharge of potentially harmful substances; ground leaching from storage of raw materials, petroleum products, or wastes; floating debris; and runoff from the site.

Policy WR-2.2 – National Pollutant Discharge Elimination System (NPDES) Enforcement: The County shall continue to support the State in monitoring and enforcing provisions to control non-point source water pollution contained in the U.S. EPA NPDES program as implemented by the Water Quality Control Board.

Policy WR-2.3 – Best Management Practices (BMPs): The County shall continue to require the use of feasible BMPs and other mitigation measures designed to protect surface water and groundwater from the adverse effects of construction activities, agricultural operations requiring a County Permit, and urban runoff in coordination with the Water Quality Control Board.

Policy WR-2.4 – Construction Site Sediment Control: The County shall continue to enforce provisions to control erosion and sediment from construction sites.

Policy WR-2.5 – Major Drainage Management: The County shall continue to promote protection of each individual drainage basin within the County based on the basins unique hydrologic and use characteristics.

Policy WR-2.6 – Degraded Water Resources: The County shall encourage and support the identification of degraded surface water and groundwater resources and promote restoration where appropriate.

Policy WR-2.8 – Point Source Control: The County shall work with the Regional Water Quality Control Board to ensure that all point source pollutants are adequately mitigated (as part of the California Environmental Quality Act review and project approval process) and monitored to ensure long-term compliance.

Policy WR-3.1 – Develop Additional Water Sources: The County shall encourage, support and, as warranted, require the identification and development of additional water sources through the expansion of water storage reservoirs, development of groundwater banking for recharge and infiltration, and promotion of water conservation programs, and support of other projects and programs that intend to increase the water resources available to the County and reduce the individual demands of urban and agricultural users.

Policy WR-3.10 – Diversion of Surface Water: Diversions of surface water or runoff from precipitation should be prevented where such diversions may cause a reduction in water available for groundwater recharge.

Section 10.5 – Flood Hazards

Goal HS-5: To minimize the possibility for loss of life, injury, or damage to property as a result of flood hazards.

Policy HS-5.1 – Development Compliance with Federal, State and Local Requirements: The County shall ensure that all development within the designated floodway or floodplain zones conforms with FEMA regulations and the Tulare County Flood Damage Prevention Ordinance.

Policy HS-5.2 – Development in Floodplain Zones: The County shall regulate development in the 100-year floodplain zones as designated on maps prepared by FEMA in accordance with the following:

1. Critical facilities (those facilities which should be open and accessible during emergencies) shall not be permitted.
2. Passive recreational activities (those requiring non-intensive development, such as hiking, horseback riding, picnicking) are permissible.
3. New development and divisions of land, especially residential subdivisions, shall be developed to minimize flood risk to structures, infrastructure, and ensure safe access and evacuation during flood conditions.

Policy HS-5.4 – Multi-Purpose Flood Control Measures: The County shall encourage multipurpose flood control projects that incorporate recreation, resource conservation, preservation of natural riparian habitat, and scenic values of the County's streams, creeks, and lakes. Where appropriate, the County shall also encourage the use of flood and/or storm water retention facilities for use as groundwater recharge facilities.

Policy HS-5.5 – Development in Dam and Seiche Inundation Zones: The County shall review projects for their exposure to inundation due to dam failure. If a project presents a direct threat to human life, appropriate mitigation measures shall be taken, including restriction of development in the subject area.

Policy HS-5.6 – Impacts to Downstream Properties: The County shall ensure that new County flood control projects will not adversely impact downstream properties or contribute to flooding hazards.

Policy HS-5.9 – Floodplain Development Restrictions: The County shall ensure that riparian areas and drainage areas within 100-year floodplains are free from development that may adversely impact floodway capacity or characteristics of natural/riparian areas or natural groundwater recharge areas.

Policy HS-5.11 – Natural Design: The County shall encourage flood control designs that respect natural curves and vegetation of natural waterways while retaining dynamic flow and functional integrity.

3.10.4 Significance Thresholds

3.10.4.1 Appendix G Thresholds from the State CEQA Guidelines

A hydrology or water quality impact is considered significant if it would result in any of the following CEQA Guidelines, Appendix G Thresholds:

a) Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality;

b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

- *I. result in substantial erosion or siltation on- or offsite;*
- *II. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;*
- *III. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or*
- *IV. impede or redirect flood flows?*

d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation; or

e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

3.10.4.2 Additional Thresholds of Significance

Requirements identified in the County policies and plans are addressed by the significance thresholds above. There are no additional thresholds of significance used in this evaluation of hydrology and water quality.

3.10.5 Methodology of Analysis

Hydrology and water quality impacts were determined based on an evaluation of existing Project site surface and groundwater hydrology and water quality conditions, and consideration of Project water supply/consumption and potential changes to surface and groundwater hydrology and quality due to Project ground disturbance and land uses. As discussed in Section 3.10.1, this section of the DEIR presents a discussion of baseline conditions at the Project site based on, but not limited to, information obtained from the following:

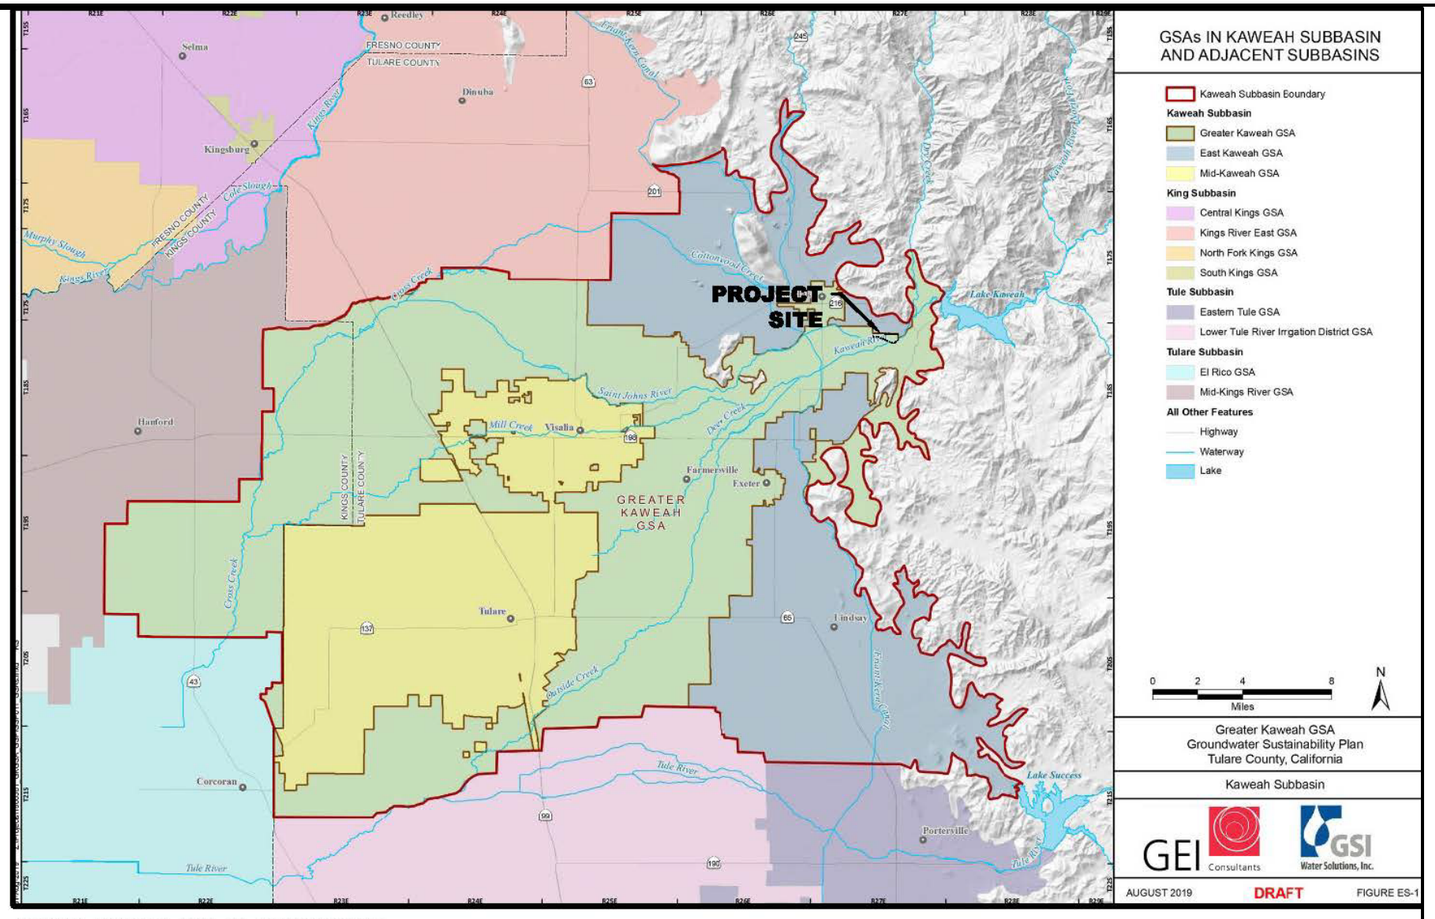
- *McKay Point Reservoir Project – Hydrology and Water Quality Technical Study*, prepared by Osma Pekin, PhD, P.E., G.E., and Ian Hutchison, PhD., P.E., SLR International Corp. (SLR, 2022) (Appendix G);
- *McKay Point Reservoir Project – Geology and Soils Technical Study*, prepared by Osma Pekin, PhD, P.E., G.E., and Ian Hutchison, PhD., P.E., SLR International Corp. (SLR, 2021) (Appendix F1);
- *Geotechnical Engineering Investigation Report, Proposed McKay Point Reservoir Project, Phase 1: Summary of Field Exploration and Boring Logs, Tulare Irrigation District, Tulare, California*, BSK Associates, Engineers and Laboratories (BSK, 2011) (Appendix F2);
- Existing publicly-available data and reports; and
- Field observations.

The following sections present the baseline conditions used in this evaluation.

A total of six (6) soil borings were conducted at the Project site in November 2011 (BSK, 2011). Based on these borings and hydrogeologic interpretations by Schmidt (2012), the thickness of fluvial sediments within the Project area ranges between approximately 40- and 100-feet (SES, 2012). Alluvial deposits at the Project site consist of sand that is about 15- to 20-feet thick. Luhdorff and Scalmanini (1995) describe these sediments as Younger Alluvium. Below this sand interval, cobbles, boulders with sand, clay, and silt are common. These deposits extended to a depth of about 40-feet on the eastern portion of the Project site, and to about 100-feet on the western portion. Luhdorff and Scalmanini (1995) describe these sediments as Older Alluvium. Geologic cross-sections for the Project site have been prepared by Schmidt (2012) and for this study, and are included in Attachment A of Appendix G – McKay Point Reservoir Project Hydrology and Water Quality Technical Study (SLR, 2022).

3.10.5.3 Groundwater

The shallow aquifer at the Project site is composed of the alluvial deposits associated with the local rivers. In some areas near the Project site where overlying sediments are relatively thin, such as the Lemon Cove and Lindmore community areas south of the Project site, weathered bedrock forms the predominant aquifer. For example, one Lemon Cove public supply well is screened in the bedrock aquifer. Most of the groundwater production south of the Kaweah River is from the bedrock interval (Schmidt, 2012).



Regionally, groundwater flows generally toward the west from the recharge areas of the Sierra Nevada mountains to the center of the valley (Figure 3.10-2). Groundwater elevations in the region vary from around 460 feet amsl near the Project site, to around 250-feet amsl near the City of Visalia (DWR, 2014). Groundwater is pumped in the area for agricultural and urban uses.

The Project site is in the Kaweah Subbasin, within the Tulare Lake Hydrologic Region (DWR, 2003). The Project site is also near the eastern boundary of the KDWCD (Figure 3.10-3). Approximately 265,000 acres of the district is irrigated for agriculture, and about 45,000 acres is urbanized. Numerous public and private entities within the district boundaries divert water from the river and its distributaries mainly for irrigation. In addition, almost all the land within the KDWCD receives some irrigation water obtained from groundwater, often as a supplement to surface water (Groundwater Sustainability Plan – GWSP, GKGSA, 2020).

KDWCD and surrounding areas have been in long-term groundwater overdraft. The KDWCD wide overdraft for the period 2007 to 2017 was estimated at approximately 78,000 AF/year. Most of the overdraft occurs in the western portion of the district; not the Project vicinity (GKGSA, 2020).

In January 2020, the Greater Kaweah Sustainability Agency (GKGSA) published its “Groundwater Sustainability Plan” (GWSP). The purpose of the GWSP, is among others, to identify and describe Minimum Thresholds and Measurable Objectives for each monitoring location for each applicable Sustainability Indicator, as required to achieve the Sustainability Goal, and to define and identify Projects and Management Actions proposed by the GKGSA to achieve the Sustainability Goal. The Sustainability Plan area and its jurisdictional boundaries are shown on Figure 3.10-4. The reservoir would be in Hydrogeologic Zone 10 within these boundaries. For this zone, the Minimum Threshold and Measurable Objective groundwater levels have been established for Well KSB-2822 (also referred to as 18S27E05J001M), located between the St. Johns and Kaweah Rivers (Figure 3.10-5), as 421- and 420-feet amsl respectively. The levels at KSB-2822 are at the Minimum Threshold and Measurable Objective levels established by the GKGSA.

Figure 3.10-6 Groundwater Levels in the Vicinity

THIS PAGE IS INTENTIONALLY BLANK

The shallow aquifer in the Project site vicinity is unconfined (Schmidt, 2012) and water levels are significantly higher than the Minimum Threshold and Measurable Objective levels. The long-term water level measurements for wells in the region surrounding the Site indicate stable water levels, except for temporary declines during drought periods (Figure 3.10-5). Seasonal water level fluctuations in the Project site vicinity have generally varied by less than 20-feet for the last 50 years (Fugro, 2007). Within the Project site, approximate water level elevations ranged from 463-feet amsl near the east edge of the Lemon Cove Facility, to just under than 430-feet amsl in the western part of the Project site in December 2011 (Figure 3.10-6) based on six borings sampled during the site investigation program. The CEMEX excavations located immediately to the north of the Project site, have exposed groundwater because of the permitted surface mining on that site. As presented in Appendix G, groundwater level elevations have ranged from about 438- to 443-feet amsl in the area immediately northwest of the Project site, to between 456- to 460-feet to the northeast of the Site in the 2008 to 2010 period.

The main source of recharge to the aquifers in the Project area is groundwater flow from the east. Localized groundwater gradients suggests that the St. Johns and Kaweah Rivers lose some of their flow to infiltration, and that these rivers are sources of groundwater recharge. Other sources of groundwater recharge in the Project site vicinity include infiltration of water used for irrigation, and infiltration from local irrigation ditches in the area and from seasonal surface water flow.

Groundwater Quality

Groundwater in the region is generally considered suitable for beneficial uses, including municipal/domestic, industrial, and agricultural purposes except for a few instances that are discussed below. In the Project vicinity, groundwater quality is favorable with respect to physical parameters (total dissolved solids, pH, and specific conductivity), and other major constituents related to potability (such as chloride, and sulfate, and nitrate). Groundwater in the Project area generally reflects the properties of local surface water runoff, which serves as a replenishment source. While there are localized occurrences of high dissolved minerals or high nitrate levels due to the influence of land use (e.g., infiltration of irrigation tailwater), groundwater generally satisfies Title 22 Drinking Water Standards and is utilized as a drinking water source for municipalities, small community systems, and individual households. High concentrations of iron and manganese are also known to occur in the region, which in some instances may exceed secondary drinking water standards (Luhdorff and Scalmanini, 2004).

Consistent with the regional characteristics, groundwater quality at the Project site is characterized by relatively low conductance and is of calcium-bicarbonate to calcium-sodium bicarbonate in composition. Samples collected from monitoring wells completed in the younger alluvium and the older alluvium at the project site had specific conductance values of 120 to 260 umhos/cm and total dissolved solids (TDS) levels of 95 to 170 mg/l (Jones & Stokes, 1998). Calcium and bicarbonate are the predominant cation and anion. Compared with sources to the west, the groundwater in the project area exhibits lower mineralization due to the apparent influences of surface waters in the Kaweah and St. Johns Rivers (Bookman-Edmonston 1972).

Several locations surrounding the project vicinity have experienced degraded groundwater quality in the shallower aquifers due to agricultural practices in the area. Examples include the Lemon Cove area, the areas immediately south of Wutchumna Hill and west of the reservoir, which have elevated levels of nitrate in groundwater, up to approximately 100 mg/L (Schmidt, 2001).

The City of Woodlake has also reported problems with elevated nitrate concentrations and is concerned with any project that may increase degradation (Jones & Stokes, 1998). Other than nitrate, groundwater and surface water in the Site vicinity appear suitable for existing beneficial uses (Fugro, 2007).

3.10.5.4 Surface Water

The east side of the San Joaquin Valley consists of a broad plain formed by coalescing alluvial fans associated with streams draining the western slopes of the Sierra Nevada (Figure 3.10-1). The southern end of the San Joaquin Valley is known as the Tulare Basin. The Tulare Basin is hydrologically closed. Instead of flowing to the ocean, streams from the Sierra Nevada flowing into the Tulare Basin terminate at depressions, the largest of which is the Tulare Lakebed.

The primary natural surface water bodies in the Project site vicinity are the Kaweah River and St. Johns River, which form the eastern and southern Project site boundaries. The Kaweah River flows westward from its headwaters in the Sierra Nevada. Along the southern Project site perimeter at a location referred to as McKay Point, the Kaweah River bifurcates into two rivers, forming the St. Johns River, as is illustrated in Figure 3.10-7. This figure also depicts the series of ponds located just north of the Project site at the adjacent Lemon Cove Facility. These ponds consist of exposed groundwater, created by previous mining beneath the groundwater elevation.

Downstream of the site, the Kaweah River historically branched into 8 to 10 shallow channels that overflowed during high flows, creating marshlands. These shallow channels were later integrated into irrigation canals and ditches for the delivery of irrigation water in support of the agricultural industry. These channels still carry non-irrigation flow to the Tulare Lakebed but only during periods of extraordinary precipitation or snow melt (refer to Figure 3.10-1).

In 1962, Lake Kaweah, located approximately 3.0 miles upstream of the Project site, was created by the construction of Terminus Dam (Figure 3.10-1). Construction of this dam provided storage of irrigation water and flood protection for downstream areas. Lake Kaweah has a capacity of approximately 185,630 acre-feet (AF). Flood control considerations require that, between November and March, a portion of Lake Kaweah volume be reserved to store runoff in high rainfall or snowmelt events. Therefore, during a wet year the Lake typically releases most of the water to maintain low levels. In dry years, Lake Kaweah outflow is typically very low in winter with sporadic increases in response to significant precipitation or snowmelt conditions.

Storage for water supply begins in late winter and releases increase in late spring and early summer. In wetter years, releases may begin in late winter and remain high (above 1,500 to 2,000 cfs) through spring

and early summer (EPA, 2005; Army Corp, 2005; Kaweah, and St. Johns Rivers Association – Water Master Reports though 2007). Water released from the Terminus Dam serves multiple local water districts such as the Tulare Irrigation District (TID) and the Kaweah Delta Water Conservation District (KDWCD) as well as several small ditch companies. The dam also discharges water to generate hydroelectricity.

During a typical average year streamflow upstream from McKay Point (gauge Kaweah River at McKay Point) is intermittent for about 8 months during late summer through late winter (September through April (Watermaster Reports). When they occur, flows can typically range up to 1,000 to 2,000 cubic feet per second (cfs). During June and July flows are more consistent with maximum flows still ranging up to approximately 2,000 cfs or higher (Table 3.10-2 below).

Table 3.10-2. Kaweah River at McKay Point – Monthly Flows (Period 2001-2020)

	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC	ANNUAL
Average (cfs)	313	355	298	314	731	1,359	1,265	525	94	15	61	127	455
Average (cfs)	---	---	---	---	8	454	207	15	---	---	---	---	61
Maximum monthly (cfs)	1,862	2,071	2,241	1,709	2,241	2,303	2,135	1,609	701	178	668	723	1,274
Average (AF)	19,261	19,701	18,301	18,665	44,939	80,854	77,805	32,286	5,577	907	3,637	7,832	329,765

Streamflow data from the annual Water Master Reports (Kaweah & St. Johns Rivers Association) for the period of record 2001 to 2020.

The annual flows vary significantly and since 2001 have ranged from 43,815 AF per year to 922,247 AF per year. The gauged values are summarized in Table 3.10-3 below. In approximately 30% of the years the flow is above average, and in the remaining 70% of the years, below average.

Table 3.10-3. Kaweah River at McKay Point – Annual Flows (Period 2001-2020)

Year	2000-01	-02	-03	-04	-05	-06	-07	-08	-09	-10
Flow	211,316	237,860	**358,716**	176,410	**548,184**	**640,557**	115,958	266,014	242,423	454,670
Year	2010-11	-12	-13	-14	-15	-16	-17	-18	-19	-20
Flow	**746,509**	200,737	99,523	52,893	43,813	287,178	**922,247**	202,334	**631,189**	156,873

Notes:
- Values above shown in AF per year.
- Bold values are years with above average flows.
- Streamflow data from the annual Water Master Reports (Kaweah & St. Johns Rivers Association) for the period of record 2001 to 2020. Year is based on the October to September time frame.

Flows arriving at McKay point are divided between the St. John and Kaweah Rivers by the McKay Point Structure which consists of two flow control structures, one in the St. Johns and one in the Kaweah River. These water control facilities are owned and operated by the Kaweah Delta Water Conservation District (KDWCD) and the Kaweah & St. Johns Rivers Association. Both check structures are located immediately

downgradient of McKay Point. The check structures can be closed or opened to control flow rates in the St. Johns and Kaweah Rivers.

Dry Creek flows into the Kaweah between Terminus Dam and McKay Point and is the largest source of runoff below Terminus Dam (refer to Figure 2-4 in Section 2.0 – Project Description, and Figure 3.10-8 below). Dry Creek flows southward from its headwaters and joins the Kaweah approximately 1.0 mile down from Terminus Dam. Water supply diversions begin immediately downstream of the dam through Hawkeye, Lemon Cove, and Foothill Ditches, and flows diverted are less than 10,000 AF per year total. Farther downstream, Wutchumna Ditch Company diverts water into Bravo Lake, a 4,000 AF reservoir (U. S. Army Corps of Engineers, 1990).

Spills from the irrigation systems of the Kaweah and St. Johns Rivers are limited to the above average years as shown by the measured flows in Table 3.10-4.

Table 3.10-4. Spillages from the Kaweah and St. Johns River Irrigation Areas

Year	2000-01	-02	-03	-04	-05	-06	-07	-08	-09	-10

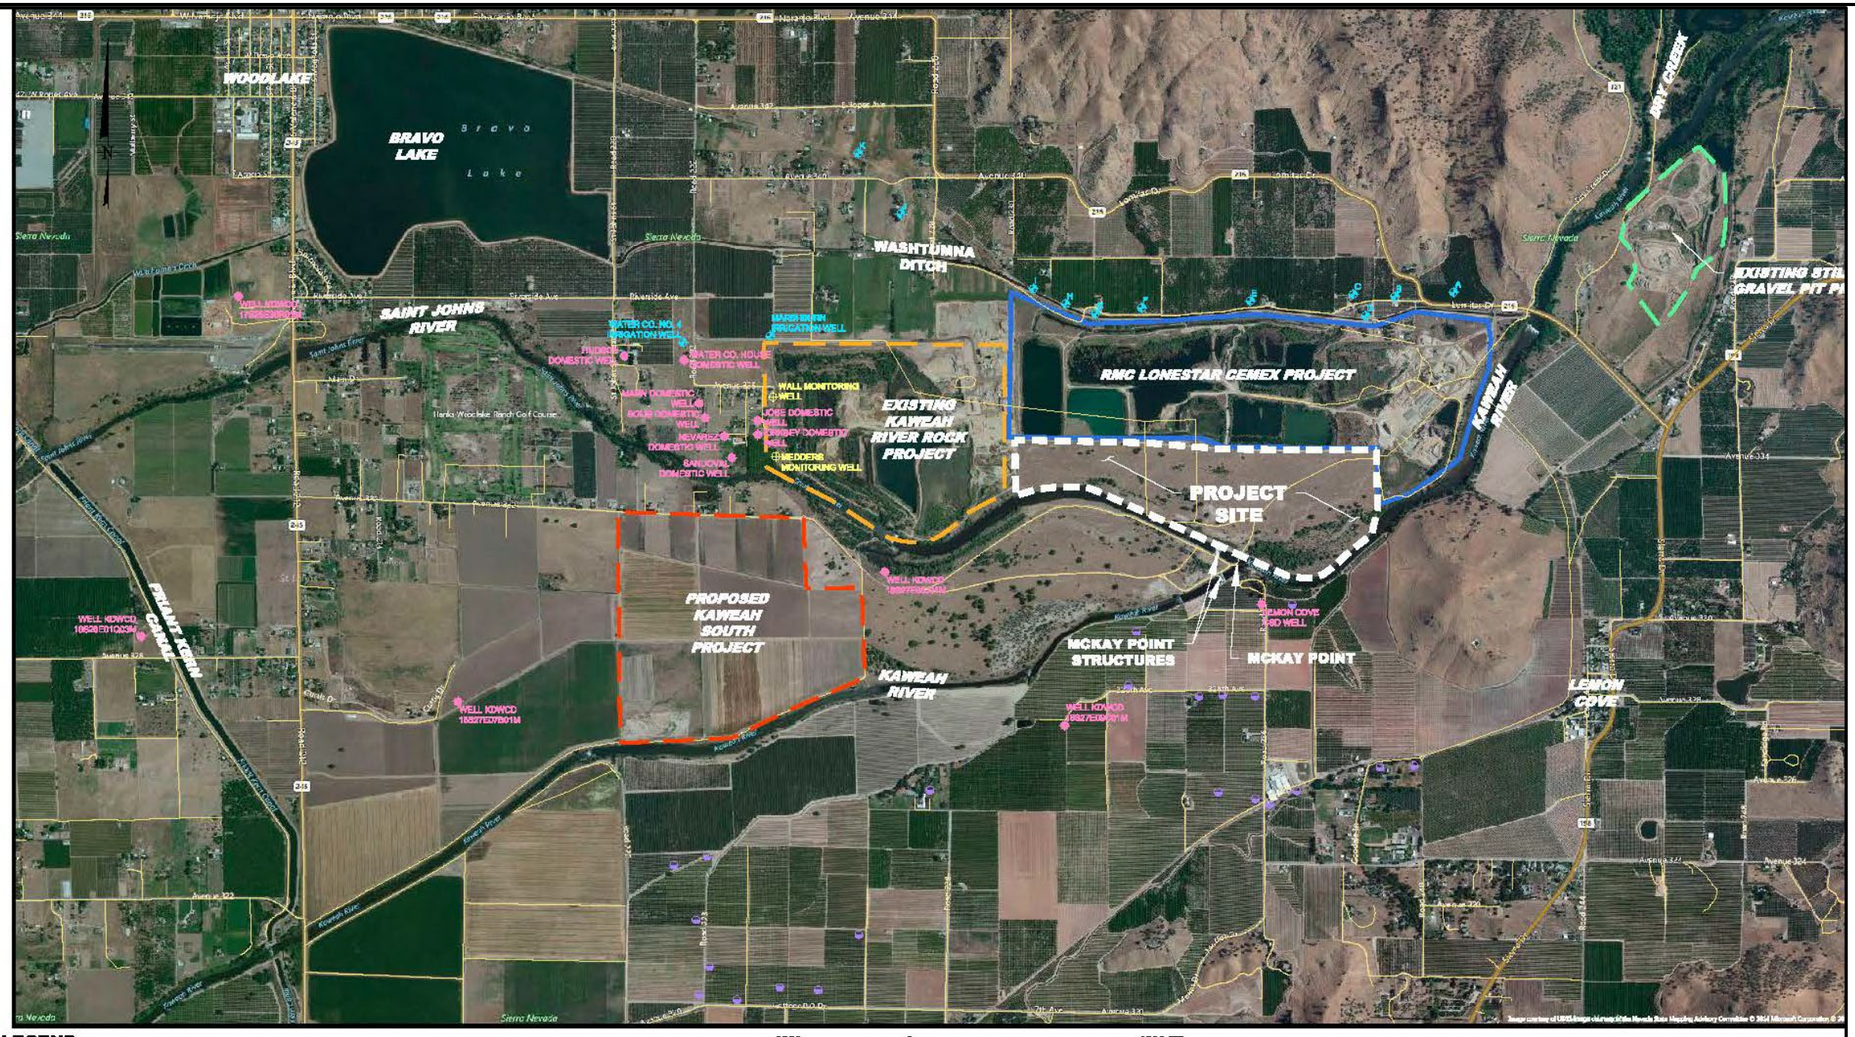
Notes:

- Measured at (1) elk bayou below Road 96 and (2) cross creek at Highway 43 to Tulare Lake – annual flows in AF/year (period 2001-2020).
- Streamflow data from the annual Water Master Reports (Kaweah & St. Johns Rivers Association) for the period of record 2001 to 2020. Year is based on the October to September time frame.



3.10.5.5 Flooding

Before Terminus Dam was constructed, extraordinary storm events in December 1955 resulted in an estimated peak flood discharge at McKay Point of 87,000 cfs, the largest peak runoff from the Kaweah River watershed in the 20th century. Since the construction of Terminus Dam in 1962, most flooding concerns for areas downstream of the dam were greatly alleviated. For example, the peak inflow to Lake Kaweah during the 1966 flood was 105,000 cfs, whereas the maximum release from the dam was 5,666 cfs. Lake Kaweah is operated with an objective of maintaining a flow of less than 5,500 cfs at McKay Point, which includes flow from undammed tributaries such as Dry Creek. Above this flow rate, flood damage can occur to downstream properties, infrastructure, and municipalities (US Army Corps, 1990).

The Terminus Dam height was increased by approximately 21-feet in 2004, which further reduced flooding in the area (US Army Corp, 2005). It is estimated that currently the dam provides protection for a design flood event of a 50-year return period (FEMA, 2009).

FEMA has prepared a flood hazard map for the area including the Project site (Figure 3.10-9 – FEMA Flood Hazard Zone). FEMA has calculated base flood elevations for the Lower Kaweah River and St. Johns River (i.e., only downstream of McKay Point). Upstream of McKay Point, the FEMA 100-year flood inundation area is not based on any hydrologic analysis or calculations. The flood hazard map indicates that the 100-year flood level near the Project site along the St. Johns River is approximately 465 feet amsl or similar. During most flooding conditions, major and minor flooding in the area is dissipated by diversions to the network of irrigation ditches, irrigation diversions, channel percolation, and evapotranspiration (US Army Corps, 1990).

3.10.5.6 Surface Water Quality

Surface water near the Project site is generally considered suitable for beneficial uses including municipal, domestic, agricultural and groundwater recharge purposes. Virtually all municipal and industrial water supply in the Project region is derived from groundwater and surface water is essentially used exclusively for agricultural purposes. As such, the surface water quality is classified as Class I for irrigation by the Department of Water Resources (DWR). The water is characterized by relatively low conductance and dissolved solids and is of calcium-bicarbonate to calcium-sodium bicarbonate in composition (Luhdorff & Scalmanini, 2004)

3.10.6 Reservoir Operations

This DEIR section describes the reservoir objectives, a discussion of the initial excavation and final construction of the reservoir, as well as a description of the design of the excavation, slurry wall, and final reservoir. This section also provides the water balance analyses for both the excavation and reservoir operational stages and describes how the reservoir would be operated. The section concludes with an analysis of the water supply and flood control benefits that would be achieved. Please see the Hydrology and Water Quality Technical Study in Appendix G for additional detail.

3.10.7 Reservoir Objectives and Benefits

Once the reservoir is completed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies, groundwater recharge supplies, and to provide for additional flood flow reductions by temporarily storing high flood waters. Its purpose is to provide multiple benefits including the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners at the proposed Project site.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests at the proposed Project site.
- Constructing the reservoir at the proposed Project site in such a way that revenue can be obtained to offset a portion of the construction and development costs.
- Locating the reservoir adjacent to and north of the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines as part of the proposed Project.

Once the reservoir is constructed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies and groundwater recharge supplies via water re-regulation. As a result, the Project would provide multiple benefits, including:

- Flow re-regulation for better surface water utilization.
- New water yield for irrigation purposes by capturing damaging and unutilized floodwater and returning it to the rivers to be used by water users served by the Owners or other Kaweah and St. Johns River Association Units. This includes the ability to increase groundwater recharge efforts.
- Flood control by capturing and temporarily holding damaging floodwater at times when downstream interests, including the City of Visalia, may otherwise see damaging flood flows.

The reservoir would be constructed in such a way that revenue can be obtained to offset the construction and development costs. Locating the reservoir adjacent to the Kaweah River allows for easy connection between the river and the reservoir, thus minimizing the need for pipelines. The elevation of the water surface above McKay Point in the Kaweah River would be used to divert water into the reservoir by gravity.

3.10.8 Reservoir Construction

3.10.8.7 Approach

As discussed previously, the proposed reservoir would occupy a surface area of approximately 120 acres, have an average water depth of 60- to 80-feet below the existing ground surface, and would have a total storage capacity of approximately 4,600 acre-feet (refer to Figure 3.10-8 and Figure 3.10-10). Final side slopes would be approximately 3:1, horizontal to vertical (H:V), to maximize stability and minimize bank erosion from wind, water, and waves. The upper portions of the reservoir slopes for several feet above and below the full reservoir water level would be covered with suitable riprap from natural stone sources or processed construction concrete debris to prevent wave action from eroding the surface.

3.10.8.8 Excavation

Over the estimated approximate 15- to 23-year excavation phase, excavation is expected to proceed at annual rates of up to approximately 920,000 gross tons per year of silts, sands, and gravels, although this rate will likely vary in any given year. The excavation equipment, the material processing plant and associated settling pond would be located within the reservoir perimeter as shown in Figure 3.10-11. Different areas of the excavation bottom would be lowered in stages and the process equipment relocated as appropriate. The excavated materials would be processed to produce a specified range of granular construction materials and sold. As discussed previously, the excavation would be done by West Coast Sand and Gravel (WCSG). WCSG would also receive, stockpile, and recycle concrete construction debris materials on an as needed basis.

During the initial excavation and material processing stage, an impermeable slurry wall would be constructed around the exaction area to limit the amount of groundwater flow into the excavation as excavation progresses below the water table.

The WCSG excavation phase (Figure 3.10-11) would include the following key facilities:

- A security fence that surrounds the excavation and eventual reservoir area.

- A controlled access gate along the west side of the excavation area.
- A scale hose near the entrance gate to provide for weighing recycle materials coming into the Project site and construction materials being shipped from the Project site.
- A haul truck unloading and loading area.
- Portable crusher and recycle plant.
- Portable diesel fuel tank for onsite equipment (4,000 gallon).
- An aggregated production (wash/screen) plant.
- A stockpile area, or areas.
- A slurry wall.
- A settling pond for clarifying/recycling process and wash water for reuse.

As shown on Figure 3.10-11 the excavations would occur within the footprint of the total area and be expanded and deepened over time. The initial excavation area shown in Figure 3.10-11 and Figure 3.10-12, is approximately sufficient for a 6-month supply of processed material. Typically, the side slopes of the excavation would be 1.5 to 1 (Horizontal:Vertical). It should be noted that the layout and facilities shown on the figure are for illustrative purpose and WCSG will refine and adjust these as necessary at the start of the excavation phase as onsite conditions warrant minor changes, but keeping all the operations within the excavation footprint. During excavation phase, the area would be dewatered, as needed, by a series of wells constructed within the excavation area to draw down the water table to below the excavation floor. Seepage calculations presented in the Hydrology and Water Quality Technical Study (Appendix G) indicate these extraction rates would initially be minimal and increase to their maximum as the excavation is deepened to the maximum depth:

- Initial Rate = 0 gallons per minute (gpm)
- Final Rate = 220 gpm (approximate)

The water extracted to dewater the excavation would be pumped to the northern edge of the excavation and re-injected into a gravel fill infiltration gallery along and outside of the northern border of the slurry wall as shown on Figure 3.10-8, Figure 3.10-11 and Figure 3.10-12. This groundwater pumping would therefore not result in a consumptive loss of water.

The slurry wall would be designed by a qualified professional and constructed by a qualified contractor with experience in installing similar facilities. Construction would include the following facilities:

- A perimeter access road that would also serve as a leveling surface for the construction of the slurry wall. The road would vary in width from approximately 30- to 50-feet and be built on fill, up to 8 foot in height.
- An approximately 60- to 80-foot-deep slurry wall surrounding the excavation/reservoir area. Its actual depth will be determined during design and verified during construction based on subsurface information, to provide the required reduction in groundwater inflow. As shown on Figure 3.10-13, the slurry wall would be constructed through the perimeter road and capped off with a durable gravel layer.

- An approximately 5-foot-deep water infiltration trench along the northern border of the ultimate reservoir area (Figure 3.10-13 and Figure 3.10-14).

It is anticipated construction of the slurry wall would take approximately 6 months and would include the following onsite facilities as shown on Figure 3.10-11. After completion of the slurry wall these facilities would be demobilized from the site to allow for excavation:

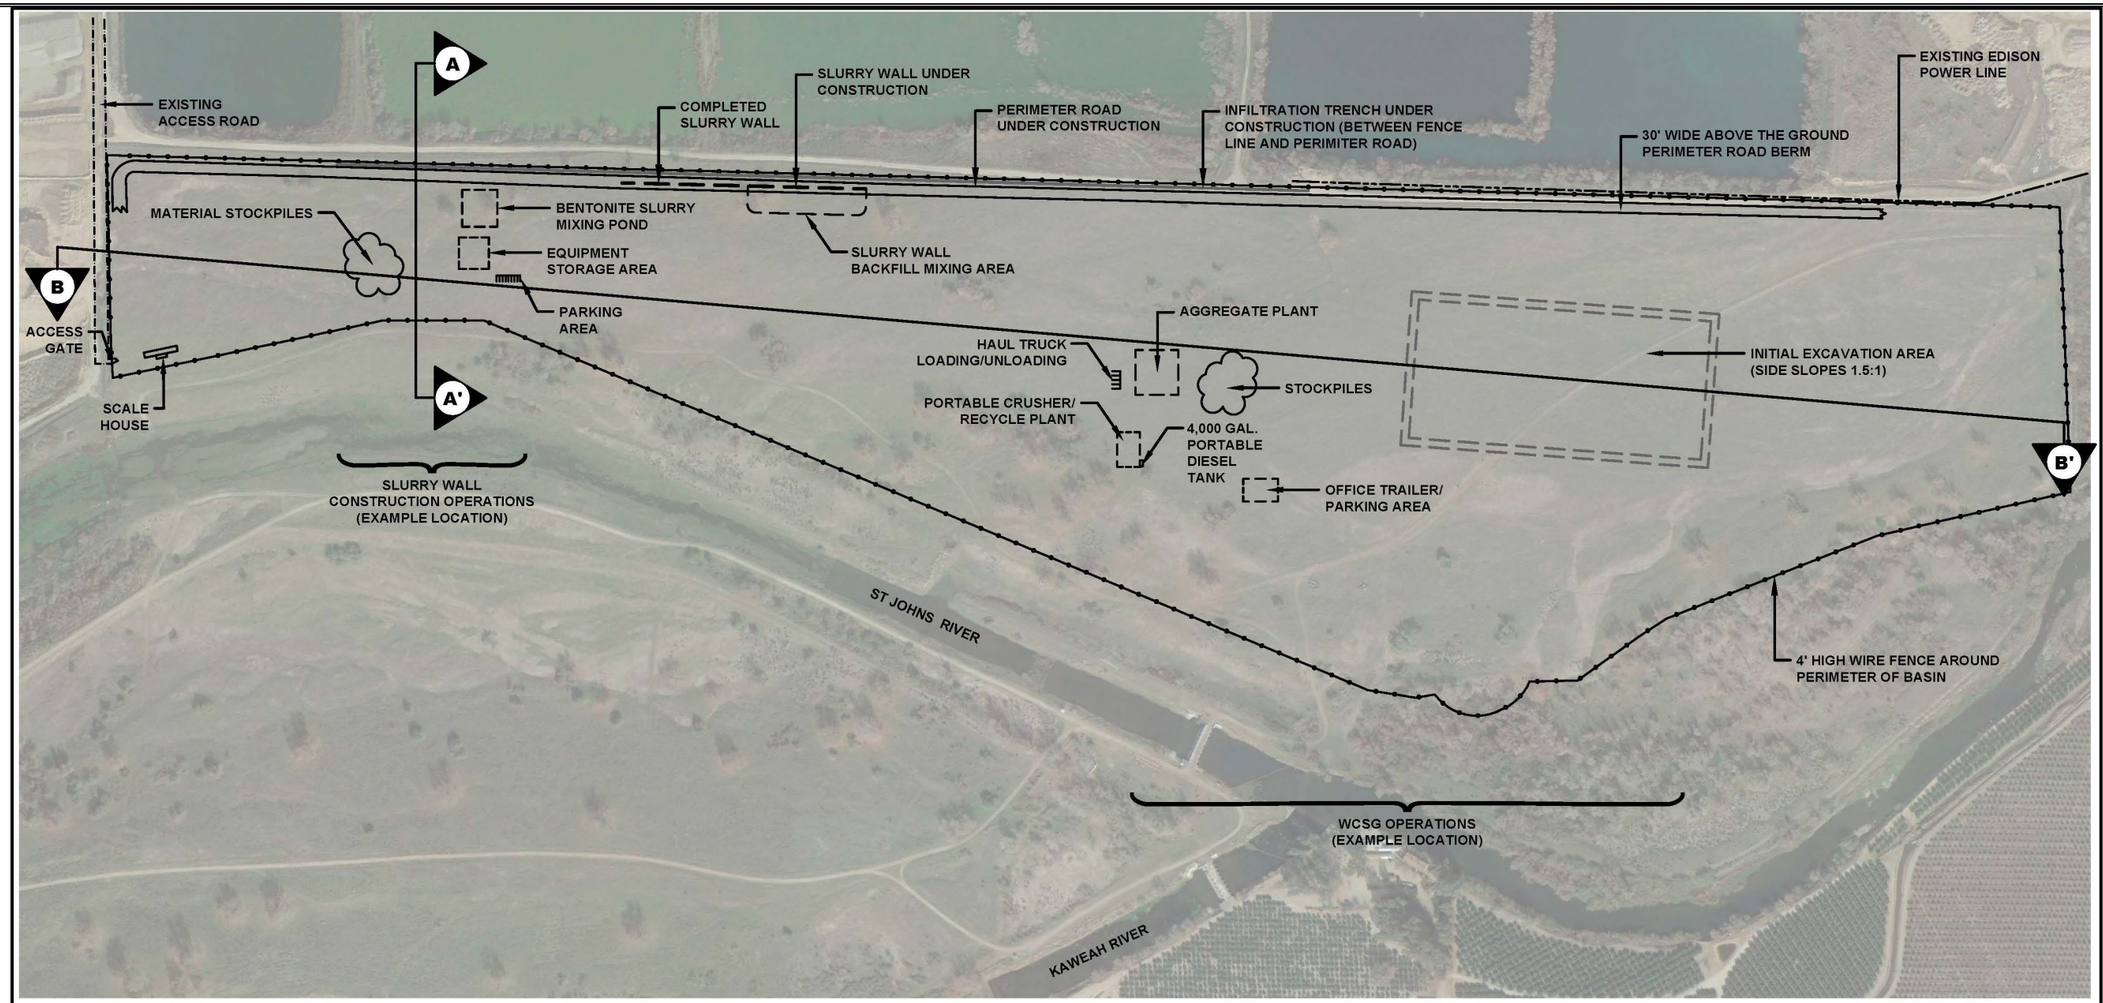
- Vehicle and equipment parking areas.
- A fill material stockpile area.
- Equipment storage area.
- A bentonite slurry mixing pond (see further discussion below on the slurry wall construction activities).
- A slurry wall backfill mixing area that would be moved along with the construction of the slurry wall, so it is always adjacent to the segment being excavated.

The general sequence of slurry wall construction activities would include:

- Surface clearing, grading, and filling to create a sufficiently long section of the perimeter road.
- Excavation of the slurry wall trench (Figure 3.10-13) through the road which also provides a relatively level surface to contain the slurry in the excavation. The trench is first excavated to its full depth and then extended in length.
- Filling the trench with a bentonite slurry (bentonite clay and water mix) to support the sides of the excavation and prevent them from collapsing. The bentonite slurry is mixed in the above-referenced bentonite slurry mix pond and pumped by pipeline into the excavated trench.
- The excavated soils from the trench are placed in an adjacent prepared slurry wall backfill mixing area for use in preparing the backfill, or if unsuitable for hauling the soil back to the WCSG operations for processing as appropriate. The crushed concrete from offsite recycling may also be used as final riprap protection on the reservoir slopes.
- As the trench is extended in length, backfilling is commenced. This is accomplished by first preparing the backfill material which typically includes granular soils mixed in with bentonite and water to create a low permeability material in the slurry wall backfill mixing area. Either suitable durable excavated granular material would be used, or suitable material would be obtained from the WCSG operations or imported from offsite.
- Once mixed, the backfill is pushed into the trench by a dozer, or equivalent, from the narrow end, opposite to the end of the trench that is still being excavated. The backfill material displaces the bentonite slurry in the trench and eventually settles and forms a low permeability wall. The ultimate length of the slurry wall is approximately 13,400-feet and its width is typically 3-feet.
- As the wall is completed and gravel cap is placed over the top of the backfilled trench, it would form part of the perimeter road as shown on Figure 3.10-13.
- A road safety berm would also be constructed along the inside of the road facing the excavation area.

- As the excavation of the reservoir is deepened an access ramp as shown on Figure 3.10-14 would be constructed in the excavated slope to provide for equipment access.

It should be noted the above discussion is for illustration purposes and actual construction techniques will vary based on the approved means and methods the contractor selects, and possible future technology advances in slurry wall construction.



The longitudinal section through the initial and final excavation is shown on Figure 3.10-12. The excavation configuration is relatively shallow compared to its length (horizontal to vertical dimensions are of the order of 100 to 1).

The material balance during the excavation phase is as follows:

- Excavated to a 1.5 to 1 slope (Horizontal:Vertical): 16.4 million tons (11,050,000 cy).
- Use of excavated materials: Exported as product = 11.5 million tons.
- Use for 3 to 1 fill: 2.4 million tons (based on a 75% usability factor).
- Use for road construction: 0.1 million tons.
- Other uses: 2.5 million tons.

Compared to the above volumes the volume of the slurry wall is much less, at approximately 112,000 cy (0.2 million tons).

Figure 3.10-15 Completed Reservoir

THIS PAGE IS INTENTIONALLY BLANK

3.10.8.9 Reservoir

Construction of the reservoir would be initiated during the final stages of the excavation and material processing Project phase, or if necessary, at a later stage. It would include two major construction activities:

- Backfilling of the excavation slopes to flatten them from 1.5 to 1 (H:V) to 3 to 1 (H:V). This is shown on Figure 3.10-12, Figure 3.10-13 and Figure 3.10-14. The backfill would be of suitable materials that has both sufficient strength and is relatively free draining. It would be constructed from the bottom up in compacted layers of suitable thickness. Figure 3.10-14 shows the first layer of the backfill being placed along the east side of the excavation.
- The second major activity would include construction of the following components (Figure 3.10-15):
    - Inflow Channel – controlled by gates.
    - Electrically operated slide gates in the Inflow Channel.
    - Inflow Chute – with rip-rap erosion protection.
    - Energy Dissipation Pool – Based upon the drilling logs, it is expected bedrock will be encountered at the proposed final elevation of the Inflow Chute. However, if the excavation does not get down to bedrock, installation of an energy dissipation pool at the base of the Inflow Chute would prevent potential scouring of the excavation slope by water entering the reservoir.
    - Floating Barge Pump and Discharge Pipeline to deliver into the Kaweah River upstream of the existing McKay Point Structures.
    - Above-Ground Diesel Tank, Generators and Generator Building.
    - Outflow Channel into the St. Johns River.
    - Electrically Operated Weir for the Outflow Channel.
    - Supervisory Control and Data Acquisition (SCADA) equipment would be used to monitor Reservoir levels and conditions, and to operate the Inflow Channel, Outflow Channel, and Floating Barge Pump.

3.10.9 Design

Conceptual level designs have been completed for the purposes of this report. These are also described in the Geology and Soils Technical Study (SLR, 2021) presented in Appendix F1, as well as Section 3.7 – Geology and Soils in the DEIR. These conceptual designs are at a level of detail that allows for the evaluation of the impacts and benefits associated with the proposed facilities. A brief discussion is also provided of the typical detailed design activities that would be performed before the facilities are constructed.

Conceptual designs of the various reservoir components discussed in Section 3.10.8.9 above are provided by Provost and Pritchard.

3.10.10 Water Balance

3.10.10.10 During Excavation

Processing would include both crushing and screening as well as washing. A total water flow rate of up to 1,500 gpm would be required for these processes. The used water would be collected and conveyed to a settling pond in the bottom of the excavation where the washed-out fine material would settle, and the clarified water would be recycled back to the processing plant with the remainder infiltrating back into groundwater under the excavation area. A much smaller amount of makeup water would be required to replace the water lost in the processing and water used for dust control at the Project site. This water would be extracted from several wells located within the excavation area, the same wells that are used to dewater the excavation. Estimated makeup water requirements (or consumptive use of water during the construction period) amount to:

- Losses in the Processing = 110 AF/year
- Settling Pond Evaporation = 1 AF/year
- Dust Control Water = 30 AF/year
- Total = 141 AF/year

The processing would also result in the accumulation of fine silt which collects in the bottom of the settling pond, some of which may be used as a soil amendment onsite in association with revegetation activities, and in construction of safety and slope stabilization berms.

During excavation the groundwater extracted to maintain dry conditions would be pumped back into the infiltration trench so would not represent a consumptive use.

3.10.10.11 During Reservoir Operations

Water balance analyses have been performed to assess how the reservoir would typically be operated and how much consumptive use is associated with these operations. Water loss would occur form:

- Evaporative loss from the moist surface of the Reservoir when it is maintained in an empty condition.
- Evaporative loss from the reservoir's surface when it is full, or partially full.

Estimated consumptive use during a year when the reservoir is operating is approximately 200 AF. During years when the reservoir is not used, net evaporation losses range from insignificant for the case where the reservoir is maintained empty by continuous pumping of the inflowing groundwater into the infiltration trench, to approximately 340 AF for the case when the reservoir is maintained in a filled condition, thus saving the pumping energy consumption.

3.10.11 Anticipated Resource Operations

3.10.11.12 Inflow Channel Management

The inflow and outflow channels would be constructed perpendicular to the Kaweah and St. Johns Rivers (Figure 3.10-8 and Figure 3.10-15). The inflow channel would provide flow into the reservoir via a reinforced concrete control structure. The control structure would include an approach apron, reinforced concrete floor, flow/level control gates, walls, and a deck on top of the structure. The existing check structures downstream of McKay Point and the proposed inlet gates would control the flow rate into the reservoir (Provost and Pritchard, 2014).

To divert river water into the reservoir, when the river water level is higher than that of the reservoir, the electrically operated weir on the inflow channel would be opened. Water would flow by gravity into the reservoir up to a maximum flow capacity of up to 3,500 cfs and an average of approximately 2,400 cfs as the reservoir fills up. Upon achieving water level equilibrium between reservoir and river, the electrically operated weir would be closed. As the level of the river recedes, the electrically operated weir would serve to hold water in the reservoir.

3.10.11.13 Outflow Channel Management

Gravity-Flow Water Delivery into The St. Johns River and Kaweah River

The gravity outflow channel for the reservoir is located downstream of the St. John's check structure (Figure 3.10-8 and Figure 3.10-15). The discharge capacity of the outlet is currently estimated to be approximately 900 cubic feet per second (cfs). The outlet could gravity drain up to approximately 1,100-acre feet of the reservoir into the St. Johns River. A proposed floating pump would empty the remaining 3,500 acre-feet stored in the reservoir. Discharge capacity of the floating pump is currently estimated to be 160 cubic feet per second and would discharge upstream of McKay's Point allowing for diversions into either the St. Johns or the Lower Kaweah River (Provost and Pritchard, 2014).

When the St. Johns River water level is lower than that of the reservoir, lowering the electrically operated weir on the outflow channel would deliver water by gravity flow into the St. Johns River up to a maximum flow capacity of 900 cfs. The average flow rate would be approximately 350 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approaches the level of the outflow channel.

The outflow channel would include a riprap or concrete apron, constructed across the riverbed of the St. Johns River when dry. This apron would prevent the potential scouring effects of the water entering the river.

The inflow channel could also be used as an outflow channel to deliver releases to the Kaweah River. It also includes riprap protection in the river. When the Kaweah River water level is lower than that of the reservoir, lowering the electrically operated weir on the inflow channel would deliver water by gravity flow into the Kaweah River at a flow capacity of 500 cfs (the inflow channel could be used for inflow or outflow). The average flow rate of return will approximate 200 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approaches the level of the inflow channel.

Water delivery in this manner is limited by the amount of water being stored at a level higher than that of the inflow channel (i.e., approximately 15-feet of additional storage). Once the level of the reservoir falls below that of the inflow channel, the floating barge pump would be used.

Pumped Water Delivery into The St. Johns and Lower Kaweah River

To release water to the St. Johns River or the Lower Kaweah River when the river water levels are higher than that of the reservoir, the floating barge pump would pump water from the reservoir, via the floating barge pump discharge, into the Kaweah River, upstream of the McKay Point structure.

3.10.11.14 Reservoir Operations

The reservoir would be operated in one of the following modes:

- Water Conservation Mode during which excess water would be stored in the reservoir for later release downstream for irrigation use or groundwater recharge.
- Flood Control Mode during which the reservoir would be used to store flood peaks to alleviate downstream flood damage.
- Dual Use Mode during which the reservoir would be operated either for conservation or flood control.

From mid-April through the end of October, the reservoir would be in Water Conservation Mode for water supply re-regulation. It is anticipated that the reservoir would fill for the final time with flood water or otherwise storable Owner entitlement. Before the end of the irrigation season the reservoir would be emptied to meet Owner irrigation demand and would remain empty for the upcoming flood season.

From the beginning of November to the end of January the reservoir would be in Flood Control Mode. Flood peaks resulting from Terminus dam release and flood flows in the unregulated Dry Creek which exceed a stipulated flow rate would be diverted into the reservoir to decrease downstream flood flows. Further discussion of this control mode is provided in Section 3.10.11.16 below.

From early February through mid-April approximately, the reservoir would be in a Dual Use Mode which involves the overlapping of two operational drivers: Flood Control and Water Conservation Modes. During this period the reservoir would be filled based on the availability of refused floodwater and the need to have an empty reservoir for flood mitigation given forecasted weather conditions.

The reservoir could be filled in a few days, depending on the flow in the Kaweah River and would decrease the peak flood flows. The quickest the reservoir could be completely dewatered would be in approximately 12 days.

3.10.11.15 Water Supply Benefits (Conservation Mode Operation)

Tulare Irrigation District (TID) has established a water balance model that simulates the irrigation water system from the outflow from Terminus Dam and Dry Creek down to the spill areas Cross Creek at Highway

43 into Tulare Lake, including supplies from, and exchanges with the Central Valley Project (CVP) and the Friant-Kern Canal, and the demands of the TID and the Consolidated Peoples Ditch Company (CPDC) and the Visalia and Kaweah Water Company (VKWC). The model incorporates the reservoir operation. This model has been used to illustrate reservoir operations for the climatic conditions observed for ten years from 2010 to 2019. The results of these simulations are shown in Figure 3.10-16 through Figure 3.10-20, and the associated agricultural water gains are summarized in Table 3.10-5[2]. These results indicate that the reservoir benefits occur when the mean annul flow conditions exceed approximately 50% of the long-term mean annual flow, or in 6 out of the 11 years simulated. In these years, it would have benefited agencies to put Kaweah water into the reservoir to be able to take Central Valley Project (CVP) water during events in which Owners' delivery systems were at capacity due to a combination of Kaweah and CVP water and there was surplus CVP water available which had to be refused to avoid additional spill on the Kaweah system.

As shown on Figure 3.10-16 for example, the solid red line indicates the period of the Flood Control Mode, the dashed red line indicates the duration of the Dual Use Mode, and the remaining period corresponds to the Conservation Mode. As noted from this figure there were no diversions for flood control purposes. During the Dual Use and Conservation Mode periods water was transferred into the reservoir in the April and May, and smaller amounts in June and August as indicated by the green dashed line. This stored water would have been used in May and again in July and August as indicated by the dotted blue line. The corresponding reservoir volumes are indicated by the solid blue line.

Table 3.10-5. Summary of Annual Agricultural Benefits

Year	Annual Precipitation at Terminus Reservoir		Annual Runoff of Kaweah River at McKay Point		Agricultural Benefit	
	Inches	% Of Long-Term Mean	Acre Feet	% Of Long-Term Mean	Additional Water Provided for D/S Use (AF)	Number Of Major Water Supply Events
2009-10	18.96	127%	454,670	122%	7,092	2
2010-11	22.38	150%	746,509	201%	6,910	2
2011-12	12.23	82%	200,737	54%	4,600	1
2012-13	6.77	45%	99,523	27%	---	---
2013-14	6.15	41%	52,893	14%	---	---
2014-15	8.97	60%	43,813	12%	---	---
2015-16	18.39	123%	287,178	77%	---	---
2016-17	19.89	133%	922,247	248%	5,842	1
2017-18	8.93	60%	202,334	54%	61	1
2018-19	17.33	116%	631,189	170%	11,445	2
AVERAGE ANNUAL	**14.94**	**100%**	**371,790**	**371,790**	**3,595**	**1.5**

[2] Note that the year 2017-18 is not plotted in the Figure 3.10-16 through Figure 3.10-20 series since the additional water provided is very small.

The benefits of the Conservation Mode operations are expected to increase for climate change scenarios. While the total annual runoff changes are minor (a reduction of up to 5%, See Section 3.10.2.3 the higher seasonal flows are projected to occur earlier in the year likely resulting in increased flood releases from Terminus Dam. With the reservoir in place these earlier releases could be stored and then used to increase the CVP water by a like amount later in the year. Furthermore, use of the reservoir will more critical since overall, less runoff will be available, making it more important to reduce any spillage of unused water by storing it in the reservoir.

3.10.11.16 Flood Management Benefits (Flood Control Mode Operations)

The Terminus Dam and Kaweah Project is operated so that flows do not exceed 5,500 cfs in the Kaweah at McKay Point to protect the downstream municipalities, rural communities, and agricultural lands in the Tulare Lakebed from flood damage (USACOE, Revised 2005). Dry Creek is the major uncontrolled tributary to the Kaweah River below Terminus Dam and upstream of the reservoir. This tributary can produce high magnitude flows that require rapid release changes from the dam if the impact is to be reduced, since there are no flood control measures in place for these flows.

Flood attenuation benefits were assessed by considering the three largest instantaneous flood peak flows that were recorded on Dry Creek between 1960 and 1997. As shown on Table 3.10-6, these include:

- December 6, 1966 (peak flow = 14,500 cfs).
- January 25, 1969 (6,070 cfs).
- January 2, 1997 (4,380 cfs).

Operations of Terminus Dam allowed for low release rates on these flood days to compensate for the higher Dry Creek flows as shown by the measured average daily flows in Table 3.10-6 (column 3). However even with these reduced discharges the flood peak flows in the Kaweah River at McKay point were still elevated as shown in column 4 of Table 3.10-6 (i.e., 4,508, 6,646 and 15,549 cfs respectively). In extremely wet years such as 2017, it would be desirable to have the reservoir absorb the Dry Creek flows so that Terminus can keep releasing as opposed to reducing releases from Terminus, thereby keeping storage available for flood inflow to Terminus (Watermaster of the Kaweah Delta).

Flood routing simulations were conducted to assess how much the reservoir, had it been in place, could have reduced these flood peaks. For these simulations it was assumed that once the Kaweah River at McKay Point flows exceed 2,500 cfs, the excess flows up to the maximum capacity of the inlet to the reservoir (3,500 cfs[3]) are diverted into the reservoir. As shown by the results listed in Table 6 (column 5), it would have been possible to reduce the flows to below approximately 3,000 cfs in the river, except for the very large December 1966 flood. Even for this event the flood peak would have been reduced to 12,472 cfs, a reduction of 3,068 cfs.

[3] This assumes the gates will all be opened to provide for the maximum inflow capacity during a flood event. During normal operations inflow rates would be less.

Figure 3.10-21 shows which day of the year the measured annual maximum flood peaks occurred in Dry Creek, and these can be considered to cover the periods during which future large floods may occur and during which the reservoir could potentially be used for flood control purposes. The solid lines in the chart indicate the approximate starts and finishes to the Flood Control Mode period that could be considered. These periods would include:

- November 1 would be the start of the flood control operations during which the reservoir would exclusively be used for flood control purposes and emptied after each flood storage event in anticipation of the next flood event. The released water could be used for recharge in a variety of basins around TID ranging from several acres to 150 acres in size.
- January 31 would be considered the end of the Flood Control Mode period.
- February 1 through April 15 would be considered a Dual Use Mode period during which water from a projected large flood would be stored in the reservoir, but after the flood the water would only be released in accordance the which agricultural demand as discussed in Section 3.10.11.15.

Table 3.10-6. Kaweah River at McKay Point – Annual Flows

Historic Flood Flow Data				**Simulated Effect of Storing Flood Flows Above 2,500 CFS[4] In Reservoir**		
Date	**Measured Instantaneous Peak Dry Creek Flow Rate (CFS)**	**Measured Average Same Day Daily Outflow from Terminus Dam (CFS)[5]**	**Calculated Maximum Instantaneous Peak Flow in Kaweah at McKay Point (CFS)[6]**	**Reduced Flood Flows to Downstream of Reservoir (CFS)[7]**	**Reduction In Kaweah River at McKay Point Flow by Storing Flood Water in The Reservoir (CFS)**	**Reservoir Storage Untilized (AF)**
December 6, 1966	14,500	1,040	15,540	12,472	3,068[8]	4,600
January 25, 1969	6,070	576	6,646	3,146	3,500	2,429
January 2, 1997	4,380	128	4,508	2,628	1,880	939

The flood routing was repeated for the estimated 10-year to 100-year flood peaks at McKay Point developed by FEMA and discussed in Section 3.10.5.5 above. The results are provided in Table 3.10-7 showing the reductions that could be achieved. It is evident that the reservoir could reduce flood peaks to below the target 5,500 cfs for flood events up to approximately the one in 50-year event. For larger

[4] The 2,500 cfs has been set as a threshold above which water is diverted into the reservoir. During floods in Dry Creek of this magnitude the flood peaks could be potentially further reduced if necessary.

[5] Based on the difference between the measured average daily flows at "Dry Creek" from "Total Kaweah River at McKay Point" as recorded in the Water Master Reports.

[6] Sum of the measured instantaneous Dry Creek flow and the average daily outflow from the Terminus Dam.

[7] Based on flood routing through the reservoir.

[8] It was not possible to reduce the flood peak by the capacity of the inlet structure because the reservoir was filled with flood water before the actual peak river flow occurred.

floods, it would still be possible to reduce the flood peaks, however it would not be possible to meet the 5,500 cfs target at McKay Point.

In conclusion the reservoir would have the ability to capture some of the floodwater from large floods in Dry Creek, where it would be held until it can be safely returned to the Kaweah and St. Johns rivers for direct use or recharge. The reservoir has the capacity to reduce flood peak up to approximately the 50-year return period event to below the target 5,5000 cfs. There would still be a benefit during still larger floods in reducing the peak flow rates.

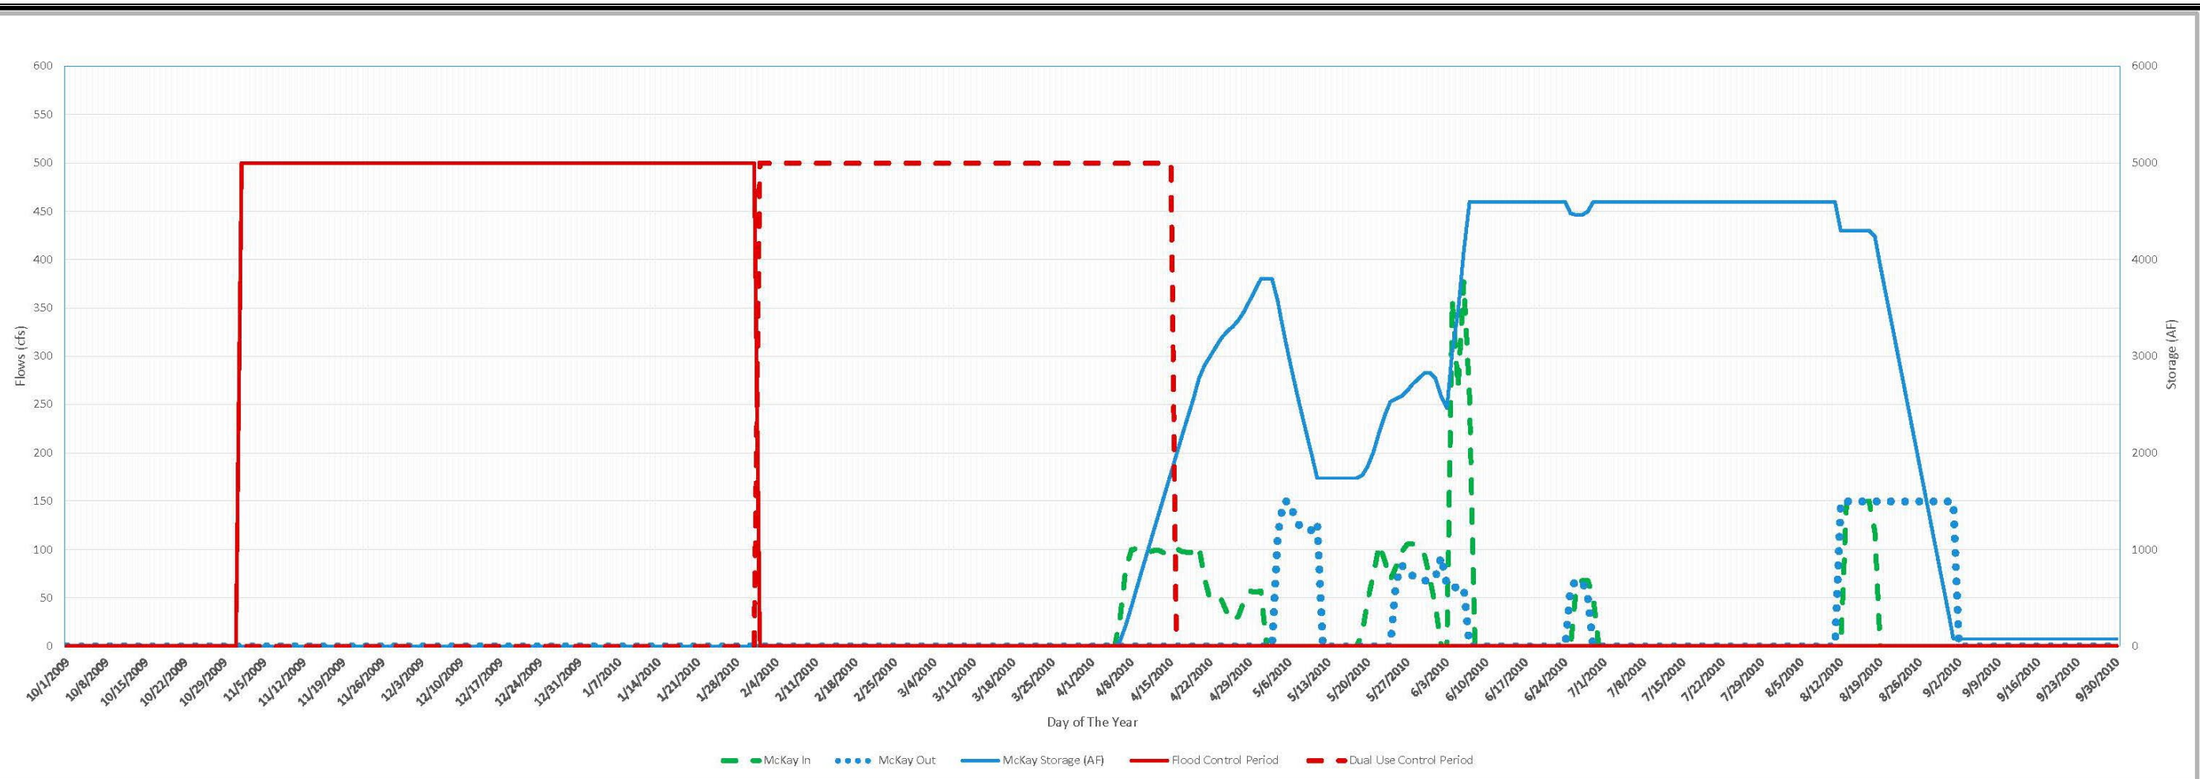
Table 3.10-7. Simulated Effect of Storing Flood Flows Above 2,500 CFS[9] in Reservoir

Date	Estimated Maximum Instantaneous Peak Flow in Kaweah at McKay Point (CFS)[10]	Reduced Flood Flows to Downstream of Reservoir (CFS)	Reduction In Kaweah River at McKay Point Flow by Storing Flood Water in the Reservoir (CFS)	Reservoir Storage Untilized (AF)
100-year	18,456	16,706	1,750	4,600
50-year	8,725	5,225	3,500	3,998
10-year	4,400	2,500	1,900	955

Since climate change is expected to result in increased intensities of flood events, more frequent flood events, and earlier arrival of high winter flows. Under these conditions the reservoir would provide for increased flood control benefits. For example, as discussed in Section 3.10.2.3, flood peaks for the current frequencies are expected to occur almost twice as often. This would mean that instead of the reservoir contribution to flood reductions for storms exceeding the 10-year event, it would be more useful and would be able to provide for reductions in flood flows for storms exceeding the 5-year event. This means that over a Project life of 50-year say, instead of the reservoir being used approximately 5 times, it would be used approximately 10 times.

3.10.11.17 Project Design Features and Environmental Protection Measures

The following provides a brief summary of the best management practices (BMPs) and Project design features that would be implemented to minimize impacts to hydrology and water quality.



- The Project would comply with the BMPs and requirements identified in the site-specific Storm Water Pollution Prevention Plan (SWPPP); WDRs; Streambed Alteration Agreement; Hazardous Materials Business Plan (HMBP); Spill Prevention, Control and Countermeasure (SPCC) Plan; and the Surface Mining and Reclamation Act (SMARA) Reclamation Plan.

[9] The 3,500 cfs has been set as a threshold above which water is diverted into the Reservoir. During floods in Dry Creek of this magnitude the flood peaks could be potentially further reduced if necessary.

[10] Based on FEMA estimates.

- BMPs may include:
    - Energy dissipaters;
    - Sediment catchment basins/sumps;
    - Rock dams;
    - Berms;
    - Employee training;
    - Documented operating, inspection and maintenance procedures; and
    - General housekeeping.
- Runoff would be directed into the reservoir or local detention areas to the extent practical.
- The perimeter road would be graded to direct runoff into the reservoir or onsite detention areas. The road would be inspected and maintained regularly for erosion and sediment control.
- The use of hazardous materials at the Project site would be limited and include mainly fuels, lubricants and fluids associated with equipment and vehicles.
- During the operations period, all vehicles would be serviced and fueled offsite.
- During reservoir excavation and construction, fueling and minor service of vehicles (haul trucks, service vehicles and earth-moving equipment) would be conducted in a designated area where the receipt, storage, handling, use and disposition of these materials would be performed in compliance with the requirements of an approved HMBP, Hazardous Materials Inventory, and SWPPP. Fuel would be brought in by truck and any major servicing to vehicles and equipment would be conducted off-site.
- The 10,000-gallon aboveground storage tank (AST) used during reservoir operations for the operation of the floating pump would have secondary containment and be in compliance with the SPCC Plan.
- The AST would not be used for fueling of vehicles or equipment.
- Filling of the AST would only occur in a designated area underlain by concrete paving to facilitate spill cleanup and to inhibit migration of fuel contaminants into the soil column.
- The AST would not be located in an area predicted to be inundated by a 100-year flood.
- During the time water is stored in the reservoir, sufficient time would be allowed for settlement of sediments to occur to assure that the discharged water does not degrade water quality of the rivers with respect to suspended sediment and turbidity.
- Large portions of the water for discharge would be drawn from the upper portions of the water column (where the turbidity would be the lowest) by using a floating pump.
- Monitoring and reporting would be conducted as required by permit and regulatory requirements.
- The outflow and inflow channels would include rip rap or concrete aprons to prevent potential scouring effects.

3.10.12 Project-Level Impacts and Mitigation Measures

3.10.12.18 Water Quality Standards

Impact Statement

Impact HWQ-1: *Would the Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?* **(CEQA Guidelines Threshold (a))**

Impact Analysis

The potential for water quality impacts to be caused by the Project due to the use and storage of fuels and chemicals, and possibly due to runoff from the Project Area, is evaluated below.

Any unacceptable impacts due to suspended sediment entrainment in surface water would be prevented by the appropriate engineering measures and regulated under the State Water Resources Control Board's (SWRCB's) General Storm Water Permit. These measures are discussed further below.

The use of hazardous materials during reservoir excavation, construction and operations would mainly include petroleum fuels, lubricants, and fluids associated with vehicles and equipment operating onsite. As discussed in Section 3.10.5, a variety of management practices and Project design features would be implemented that would minimize the possibility of significant releases of these substances.

Water quality could be impacted by the use and storage of hazardous materials at the Project site, possible storm water runoff from the site, discharges from the reservoir that could contain suspended solids, and discharges of groundwater that contain naturally-occurring metals (e.g., iron, manganese) at concentrations that could cause exceedance of water quality objectives in the river(s). These potential impacts are evaluated below.

Use Of Fuels and Other Chemicals for Equipment Operation and Maintenance

The use of hazardous materials during reservoir excavation and construction operations would mainly include fuels, lubricants, and fluids associated with vehicles and equipment. During reservoir excavation and construction, fueling and minor service of vehicles (haul trucks, service vehicles and earth-moving equipment) would be conducted in a designated area where the receipt, storage, handling, use and disposition of these materials would be performed in compliance with applicable regulatory requirements (refer to Section 3.6 – Hazards and Hazardous Materials). Any spill from vehicles or equipment would likely be small and would be promptly and easily cleaned up and disposed of in accordance with State and County regulations. Therefore, during excavation and construction, the Project would result in less than significant impacts with respect to the use of hazardous materials.

Reservoir construction would include the installation of an AST (approximately 10,000 gallons), diesel generators, and a generator building near the inflow channel. Except for the diesel and fluids stored in or on the vehicles and equipment, and, during operations, stored in the AST, significant amounts of hazardous materials would not be stored within the Project site. The AST would be used to fuel the

generator powering the floating barge pump, and would not be used for fueling of vehicles or equipment. Therefore, dispenser-related spillage would not occur.

The AST would be dual-walled for leak protection. Filling of the AST would only occur in a designated area underlain by concrete paving to facilitate spill cleanup and to inhibit migration of fuel contaminants into the soil column. Because the AST capacity is greater than 1,320 gallons, the Owners would be required to prepare and implement a SPCC Plan, which describes fuel storage, transfer, and spill avoidance, and spill response procedures (also refer to Section 3.6 – Hazards and Hazardous Materials).

Because trucks and equipment would be fueled and maintained offsite during the reservoir operational period, and the AST would be constructed, operated, and maintained in accordance with existing regulations, the probability of an onsite spill would be minimized. Additionally, the AST would not be in an area predicted to be inundated by a 100-year flood, as described in subsequent sections, and as shown on Figure 3.10-9. Therefore, damage of the AST because of flooding is not anticipated. Therefore, for the reasons outlined above, the Project would result in less than significant impacts with respect to the use of hazardous materials.

Storm Water Runoff

The SWRCB has jurisdiction throughout California. Created by the State Legislature in 1967, the SWRCB protects water quality by setting statewide policy, coordinating, and supporting the Regional Water Board efforts, and reviewing petitions that contest Regional Board actions. Nine Regional Water Quality Control Boards exercise rule making and regulatory activities by basins. As discussed previously, Tulare County (including the Project site) falls within the jurisdiction of the Central Valley Regional Water Quality Control Board (CVRWQCB). As such, the Project is subject to the requirements of the *Water Quality Control Plan for the Tulare Lake Basin*, revised January 2004.

The SWRCB issued a statewide Industrial General Storm Water Permit Industrial General Permit (IGP) that applies to all industrial storm water discharges. SWRCB adopted a new Permit that took effect July 1, 2020.

The Owners would obtain coverage under the IGP, as required. Storm water runoff from the Project site would be managed through proper implementation of BMPs (sediment and erosion control measures) as described in the SWPPP. The primary objective of the SWPPP and BMPs is to ensure that polluted runoff, including runoff containing suspended solids and sediment, does not leave the Project site and degrade other water bodies. The SWPPP would contain descriptions of aspects such as potential discharge areas, significant materials, and BMPs. BMPs also include non-structural elements such as employee training, documented operating procedures, and general housekeeping. Compliance with applicable storm water regulations will prevent impacts to water quality.

The Project is designed to divert water from the Kaweah River and store this water for later release downstream for use by irrigation water customers. The Project design incorporates engineering measures

such as concrete slabs and riprap to prevent erosion and entrainment of suspended solids at the inlets and outlets to the reservoir where higher water velocities are expected to occur. The Project would not create large areas of impermeable surfaces and would not result in increased rates of surface runoff. In fact, the Project would serve to capture rainfall, thereby reducing surface runoff compared to baseline conditions. Geologic materials exposed in the reservoir would consist of natural sediments, which do not contain chemical constituents capable of degrading surface or groundwater. Process water would not be generated or discharged to groundwater, or surface water as part of the Project. Therefore, the Project would not produce additional runoff or convey pollutants to surrounding waterbodies.

During reservoir construction, energy dissipaters would be installed, such as sediment catchment basins or sumps, rock dams, and berms within the pit. These measures would serve to reduce erosion, trap sediment, and minimize the potential for off-site transport of pollutants. During the excavation phase of the construction, activities would take place inside the excavation itself, thereby preventing any runoff from these activities from entering the rivers. Once the reservoir construction has been completed, and the Project site reclaimed in accordance with a County-approved Reclamation Plan, reservoir operations would not result in additional disturbed areas. Operations would minimize the extent of disturbed areas. As such, discharges of storm water runoff from the Project site would decrease, and runoff would be directed into the reservoir itself or local detention areas to the extent practical. As a result, storm water runoff from the Project site would decrease significantly as runoff would be directed into the reservoir.

The final side slopes for the reservoir would be protected from erosion by wind-wave action by the placement of suitable granular material including riprap to armor these surfaces. The perimeter road would also be graded to direct runoff into the reservoir or onsite detention areas instead of toward the rivers or adjacent lands. In addition, the road would continue to be inspected and maintained regularly. Inspections of the road condition and the status of sediment and erosion control measures would be integrated with regular required storm water inspection pursuant to the IGP.

In summary, the Project is not expected to cause increased siltation or degrade water quality of surface waters or groundwater, or cause violations of water quality criteria. The Project site would be subject to conditions of the IGP, including provisions for inspections, monitoring, and reporting. The Project involves creation of a reservoir, which is a topographic depression that would reduce runoff discharges from the Project site by redirecting those flows into the reservoir. As a result of proper implementation of sediment and erosion control measures, the Project is not expected to exacerbate the pollutant load of St. Johns or Kaweah Rivers. Therefore, the Project would result in less than significant impacts related to storm water runoff.

Reservoir Discharge

During operations, the Owners may choose to fill the reservoir during high river flow conditions, which may occur in response to periods of extraordinary precipitation. High flow conditions would naturally entrain soil particles from the banks or bottom of the Kaweah River. As a result, water diverted into the reservoir may contain elevated concentrations of sediments. Releases from the reservoir containing

excessive sediments could violate the Basin Plan WQOs, and could adversely affect beneficial uses that are designated for the St. Johns River.

Once water has been diverted into the reservoir, it will be necessary to ensure that the discharged water meets the Water Quality Objectives (WQOs) with respect to suspended sediment and turbidity. The minimization of discharged sediments would be achieved with the settlement of suspended materials; and by first drawing water from the top of the reservoir, via the outflow chutes, then by use of the floating pump to draw water from the upper portions of the water column, where the turbidity will be lowest. During the time water is stored within the reservoir, sufficient time will be allowed for settlement of sediments to occur to assure that the discharged water will meet the WQOs with respect to suspended sediment and turbidity.

Conclusion

As discussed above, the Project is not expected to cause increased siltation or degrade water quality of surface waters or groundwater, or cause violations of water quality criteria. As applicable the Project site would be subject to conditions of the SWPPP and SPCC Plan, including provisions for inspections, monitoring, and reporting. The Project involves creation of a reservoir, which is a topographic depression that will reduce runoff discharges from the Project site and vicinity. As a result of proper implementation of sediment and erosion control measures, the Project is not expected to exacerbate the pollutant load of St. Johns or Kaweah Rivers.

If needed, major maintenance of the trucks and equipment would be conducted at approved facilities located outside of the Project area, both during the excavation construction and operational phases. During the excavation- and construction-related activities of the reservoir, trucks and equipment would be fueled onsite with mobile fuel trucks within the excavation area. Since the AST would be constructed, operated, and maintained in accordance with applicable regulations, the probability of an onsite spill is minimized.

As a result of the factors discussed above, with operational controls and WDRs that protect surface and groundwater quality, the Project is not expected to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality. Impacts would be less than significant with no mitigation required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Less than significant.

3.10.12.19 Groundwater

Impact Statement

Impact HWQ-2: *Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?* **(CEQA Guidelines Threshold (b))**

Impact Analysis

Groundwater supplies could potentially be impacted as a result of the Project. These potential impacts are evaluated below.

Slurry Wall

As noted above, a slurry wall installed during the initial phases of reservoir excavation (i.e., prior to excavation reaching groundwater), before the construction of the reservoir, would decrease the flux of groundwater between the reservoir/excavation pit and surrounding aquifer. Slurry walls are underground walls made of bentonite (clay) mixtures that are installed to inhibit groundwater flow and once installed, would keep the excavation in a relatively dry condition. In this case, the slurry wall would be installed around the reservoir perimeter to decrease groundwater seepage flowing into the reservoir during excavation and construction phases, and to keep the reservoir in a relatively dry condition when not being used for storage. Section 3.10.6 through 3.10.11 provides a detailed discussion on the construction and purpose of the slurry wall.

The slurry wall would be a permanent fixture of the reservoir and would serve as an essential feature of reservoir operations to achieve the following:

- Assist in maintaining dewatered storage capacity to receive surface water diversions;
- Keep groundwater out of the Reservoir to minimize aquifer impacts and provide maximum space to receive Kaweah River water; and
- Inhibit losses of surface water stored in the reservoir to the surrounding aquifer when the reservoir is full.

It is recognized that even with the slurry wall installed there will be groundwater seepage into the reservoir from under the slurry wall when the reservoir is empty and some leakage of stored water to groundwater when the reservoir is full. Management of this seepage/leakage is described in Section 3.10.6 through 3.10.11 and in the discussion below.

Groundwater Flow, Seepage Rate and Supply

Dry reservoir conditions would exist during construction after slurry wall installation. Dry reservoir conditions would also exist during reservoir operations during time periods in which the Owners wish to reserve storage for anticipated dam releases or precipitation events. Under these conditions, the Owners would intend to keep groundwater out of the reservoir.

The slurry wall would not completely eliminate flow of groundwater into the reservoir when the Owners wish to keep it dry. Dewatering will still be required when the bottom of the reservoir is at a lower elevation than the surrounding groundwater, creating a hydraulic gradient toward the reservoir.

Therefore, some groundwater seepage into the reservoir would occur under the slurry wall and SLR estimated the rate of groundwater seepage into the site during excavation at approximately 220 gallons per minute (gpm) when the Reservoir is being kept dry (Attachment D of the Hydrology and Water Quality Technical Study located in Appendix G of the DEIR). These estimates were calculated using the finite element program SEEP/W and site-specific soil and groundwater conditions. The modeling represents maximum inflow conditions in that dry conditions at the maximum extent of excavation were modeled.

Resulting groundwater seepage into the reservoir with a slurry wall is estimated to be 220 gpm, which is the maximum estimated range of groundwater seepage into the reservoir. This would occur at the final extent of the Project's excavation and construction when the reservoir is being kept empty. At the end of reservoir excavation and construction, the bottom of the reservoir would be approximately 60- to 75-feet bgs, the maximum amount of reservoir wall would be exposed, and the maximum amount of groundwater head surrounding the reservoir would be realized.

Reservoir operations do not involve the storage of groundwater. Therefore, when dry reservoir conditions are desired, any water present as a result of rainfall, storm water runoff, or seepage would be captured in a sump at a designated location within the reservoir and pumped back and reintroduced into the local aquifer via an infiltration trench. The infiltration gallery would consist of gravel-filled ditches with perforated pipe and be located along the northern boundary of the reservoir, between the slurry wall and the adjacent CEMEX property (Figure 3.10-10).

As previously noted, groundwater in the immediate vicinity of the Project site generally flows toward the northwest (Schmidt, 2012). Based on this gradient, the Kaweah River (Main and Lower) and St. Johns River appear to contribute to groundwater recharge, and together with groundwater inflow from the east appear to be primary factors in driving the direction of groundwater flow.

After the slurry wall is installed, the general direction of groundwater flow is not expected to change since it is driven by recharge from the east and from the river channels. This northwest flow is expected to flow around the slurry wall to the north and south. This is not expected to significantly inhibit groundwater flow to areas west or north (downgradient) of the project site because the abundant coarse-grained soils of the alluvium and the fractured rock of the aquifer in the area is expected to accommodate flow around (to the north and south) and underneath the Project site (refer to Attachment A in the Hydrology and Water Quality Technical Study located in Appendix G of the DEIR).

Groundwater is not expected to significantly mound (accumulate vertically) on the upgradient side of the Site or cause a "shadow" of depressed groundwater levels downgradient of the Project site. Parcels located adjacent west of the Project site would continue to receive recharge as groundwater flows around the slurry wall.

As stated above, seepage into the excavation would be collected and infiltrated back into to the aquifer, so the seepage will not constitute a loss and is not expected to affect groundwater supplies or levels.

The St. Johns and Kaweah Rivers create a significant hydraulic divide in the groundwater system. In general, any changes occurring on one side of a hydraulic divide are unlikely to affect conditions on the other side. Therefore, it is unlikely that potential groundwater related impacts, if any, would occur at sites located south of the St. Johns River or east of the Kaweah River. Because of the hydraulic divide and because the Project would not affect the fractured rock groundwater unit, groundwater levels in wells south of the Kaweah River such as the Lemon Cove municipal supply well are not expected to be affected by the Project.

The reservoir, when pumped out, is not expected to impact the Minimum Threshold and Measurable Objective groundwater levels that have been established for Well KSB-2822 (also referred to as 18S27E05J001M, located between the St. Johns and Kaweah Rivers – Figure 3.10-5). The modeled changes to the groundwater levels around the outside of the slurry wall (refer to Attachment D in the Hydrology and Water Quality Technical Study located in Appendix G) which indicates these are insignificant (i.e., less than 3-feet).

Operational Reservoir Conditions & Evaporation

An estimated approximately 200 AF per year (approximately 124 gpm as a continuous flow) of net evaporation would occur during a typical year of operation during which the reservoir remains full or partially full, during the months of May through September and for short periods of days or weeks in the November through January period when used for flood control (see Section 3.10.10.11). This compares to the additional annual average 3,129 AF of additional agricultural water that would be made available by operating the reservoir (Section 3.10.11.14). This evaporation rate amounts to 6% of the added water generated.

During reservoir operations, when the reservoir is filled with diverted water, the water surface elevation would be up to approximately 460-feet elevation which exceeds the groundwater elevation at several locations within the reservoir footprint. Although the slurry wall would have been installed to inhibit groundwater flux into and out of the reservoir, aquifer recharge would occur under full reservoir conditions because the reservoir level would be higher than the surrounding groundwater. The recharge rate is expected to be minor due to the presence of the low-permeability slurry wall. The recharge volume depends on how much time the reservoir water level remains above the groundwater levels in the vicinity. This recharge volume is not further evaluated because it is small and, in any event, constitutes a source of groundwater recharge no more than the recharge from the rivers.

Water Consumption

During site excavation, water would primarily be utilized for material processing (i.e., washing aggregate material in the plant[s]) and for dust control within the McKay Point site. No landscaping that would

require irrigation is proposed onsite. Water would be provided by a water well, proposed to be installed in the northern portion of the McKay Point site (see Figure 2-5).

As discussed above, it is estimated that the Project would utilize approximately to 114 AF per year for materials processing and dust control purposes during reservoir excavation and construction. Water for these purposes would be obtained from wells installed in the bottom of the excavation. These wells would also be used for maintaining the excavation in a dry enough state for the excavation and processing activities. These consumptive uses from the existing source constitute a minimal impact over baseline conditions. These consumptive uses are not expected to affect groundwater levels or supplies in the Project site vicinity.

Conclusion

Negligible groundwater losses are anticipated. The slurry wall would be in place, which would form a flow barrier in the alluvial groundwater system. As a result, in the Project site area, groundwater flow directions would change as groundwater flows around the slurry wall through the alluvium and fractured rocks that surround the Project. Any nominal quantity of groundwater that incidentally seeps into the excavation through the slurry wall would promptly be collected and re-infiltrated back to the aquifer using infiltration drains as discussed above. The infiltration galleries would be located north of the excavation, which would minimize changes to the current direction of groundwater flow in this area. Because recharge would not be significantly interrupted and offsite groundwater elevations are not expected to change noticeably, the Project would therefore result in less than significant impacts.

Reservoir operations are not expected to result in less impact to groundwater than the excavation and construction phases described above. The slurry wall would reduce impacts to groundwater supply by inhibiting groundwater from entering the reservoir, where it would be subjected to evaporation. Seepage into the reservoir through the slurry wall during dry-reservoir periods would be promptly returned to the aquifer. For these reasons, the Project, including reservoir operations, are considered less than significant impacts.

Level of Significance After Mitigation

Not applicable.

3.10.12.20 Erosion and Siltation

Impact Statement

Impact HWQ-3: *Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:*

I. result in substantial erosion or siltation on- or offsite;

II. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;

III. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

IV. *impede or redirect flood flows?* **(CEQA Guidelines Threshold (c))**

Impact Analysis

Erosion Impacts

This section describes an evaluation of the potential for drainage pattern changes to cause erosion or siltation impacts. Drainage system associated with the Project includes installation and use of the inlet and outlet channels. As described above, the Project involves creation of a topographic depression that will capture precipitation and possibly some storm water runoff. However, there are no identifiable creeks or water bodies that would be disturbed by the Project. The Project would not involve placing structures in the St. Johns or Kaweah River channels. The only changes to the river channels would be placement of riprap at the inflow and outflow channels, and construction of the inflow and outflow channels. The riprap would be placed below the elevation of and on the banks of the main river channel and on the banks and floor of the inflow and outflow channels. The inflow/outflow channels would also be set back from the main river channel. As such, these structures are designed to avoid impedance of river flows or drainage impacts.

To evaluate scouring, SLR reviewed historical aerial photos to determine the extent of river channel movement under baseline conditions. Previous aerials photos from the years 1954, 1956, 1969, 1974, 1984, 1989, and 1994 obtained from Environmental Data Resources, Inc. (EDR, 2014) were reviewed to determine if major scouring or changes in morphology of the Kaweah and St. Johns Rivers have historically occurred near the Project site (refer to the Hydrogeology and Water Quality Technical Study in Appendix G for additional detail). Based on review of these aerial photographs, no significant changes have occurred since the 1954 photograph. Terminus Dam, constructed in 1962, regulates flows and flooding, and thus river morphology and scouring. Because of the regulated flows which prevent flooding, future rapid changes in river morphology and scouring would therefore be minimized.

The potential for scouring to occur during delivery of water from the reservoir to the St. Johns and Kaweah Rivers would be minimized. The outflow and inflow channels would include a riprap and concrete aprons, constructed across the riverbed of the Kaweah River (see Figure 3.10-8). These aprons would prevent the

potential scouring effects of the water being returned to the rivers. In addition, the aprons would be installed so they do not protrude into the stream, nor affect river flow rates or patterns.

After a flood storage event in the reservoir, water stored in the upper portion of the reservoir would be released at flows ranging up to 900 cubic feet per second (cfs). The erosion protection measured installed in the reservoir will prevent erosion in the outflow structure and the 900 cfs flow rate is significantly lower than the prior natural flood flows that have occurred in the rive channels and would not result in any changes to the natural erosion patterns in these.

To release water to the Lower Kaweah River or the St. Johns River when the river water levels are higher than that of the reservoir, a floating barge pump would pump water from the reservoir into the Kaweah River, upstream of the McKay Point Structure. The floating barge pump, or series of pumps, would have an approximate maximum flow rate of 160 cfs. Erosion control features would be constructed in the floating barge pump discharge area so that the main channel of the Kaweah River is not scoured.

In addition to review of aerial photos, SLR conducted sediment transport modeling using a computer application (see Appendix G). The HEC-RAS computer application was utilized to evaluate the potential for sediment transport in the channels of the Kaweah River east of McKay Point, St. Johns River, and the Lower Kaweah River. The potential for sediment transport is dependent on the grain size distribution of channel materials, riverbed gradient, flow rate, and water flow regime. Further details regarding this evaluation are provided in the Hydrology and Water Quality Technical Study (Appendix G).

The sediment transport analysis was conducted based on the average maximum monthly flow of 1,500 cfs. This value consists of the highest average monthly flow rate measured between 2001 and 2007 documented in annual Watermaster reports (Watermaster, 2007). In other words, the flow rate used is considered the higher range of typical flow rates that occur in the Kaweah River in the Project site vicinity.

Results of the HEC-RAS sediment transport analysis are presented in Attachment C of the Hydrology and Water Quality Technical Study (DEIR Appendix G). These results include profile views of the riverbeds, which illustrate a minimal potential for scour and transport at the flow rate applied.

Based on the results of the analyses, the Project is not anticipated to alter the natural flow rates or conditions in the Lower Kaweah River and St. Johns River. During reservoir operations, flow rates in the Lower Kaweah River and St. Johns River would remain within the existing range of typical flow rates that are currently managed through outflows of Terminus Dam. Use of the Project's reservoir for flood storage may actually cause flow rates in the Lower Kaweah River and St. Johns River to decrease during periods of high precipitation, thereby reducing scour potential.

The aerial photograph analysis and HEC-RAS sediment transport evaluation both indicate that, under typical conditions, there is insignificant movement of the river channels or channel morphology along the southern boundary of the Project site. Terminus Dam is used extensively to manage flow rates in the rivers, and to avoid flow rates that would result in extensive scouring or bank movement. The Project

does not involve features or facilities that would change these conditions, and may conversely reduce flow rates during periods of extraordinary precipitation by providing flood storage. Based on these factors, Project would not result significantly impacts to existing drainage patterns due to siltation or erosion.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Less than significant.

Flood Impacts

The Project, including reservoir excavation and construction, would not alter the course of streams or rivers. The Project would, however, change onsite drainage patterns because construction of a topographic depression would reduce the amount of storm water runoff flowing out of the reservoir area. Releases from the reservoir would not cause river flows to exceed their normal flow rate range and would not cause flooding. Conversely, the reservoir would be used for flood storage, which would decrease river flow rates during period of extraordinary precipitation. Based on these factors, the Project would not increase the potential for flooding onsite or offsite. As such, the Project would have a less than significant impact.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

Create Runoff Exceeding Storm Water Drainage Systems or Create Pollution

As previously noted, since both during the excavation and reservoir phases the Project would store any rainfall that falls within the Project area, there would be no increases in flood flows outside of the Project area so the capacity of existing or planned stormwater drainage systems would not be affected. Since stormwater in the Project area would also be collected with either the excavation or reservoir, there would be no offsite sources of polluted runoff. Discharges from the reservoir for agricultural purposes

would be subject to appropriate water quality standards. Therefore, the Project is not expected to produce additional runoff or polluted runoff. The Project would result in less than significant impacts.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

Impede or Redirect Flood Flows

The Federal Emergency Management Agency (FEMA) flood map for the area including the Project site indicates that the eastern portion of the proposed reservoir is located within the 100-Year Flood Hazard Zone (Figure 3.10-5). FEMA has established base flood elevations for the St. Johns and Lower Kaweah Rivers downstream of McKay Point, but not for the Kaweah River upstream of McKay Point and the portion of the proposed reservoir within the 100-year Flood Hazard Zone. This situation is common because FEMA tends to apply its resources to conducting detailed flood mapping in populated areas (such as near the City of Visalia) rather than rural areas.

FEMA's work on the eastern portion of the Project site was not conducted in sufficient detail to establish base flood elevations, and it follows that the accuracy of the flood hazard zone presented by FEMA could be improved if flood mapping in greater detail was conducted. Therefore, SLR conducted flood modeling for this area in greater detail to establish base flood elevations, and to delineate the 100-year flood inundation area.

The HEC-RAS hydraulic software package, released by the United States Army Corps of Engineers, was used to simulate the 100-year flood flow at the Kaweah River east of McKay Point. The flow is based upon the raised spillway at the Terminus dam. The peak flow at McKay Point is 18,220 cfs, as calculated by the United States Army Corps of Engineers. Details regarding this flood modeling are included in Attachment C of the Hydrology and Water Quality Technical Study (Appendix G).

The topographic data used for flood modeling consisted of the LiDAR survey conducted for the Tulare and Visalia basin in 2004. These topographic data were part of the same dataset used by FEMA for the flood mapping conducted downstream of McKay Point as documented in FEMA (2009). A total of 12 cross-sections, spaced at a maximum of 1,000-feet apart, were created along the length of 7,600-feet east of the McKay Point junction of the Kaweah River. For purposes of model stability, cross sections were interpolated throughout the reach with sections positions at distances no larger than 75-feet apart.

SLR conducted a steady state flow analysis to calculate the based flood elevations for the peak flow of the 100-year flood for the Kaweah River east of McKay Point. The analysis was calibrated to tie into the water surface elevations calculated in the prior analyses conducted by FEMA for stretches of the St. Johns and Kaweah Rivers downstream of McKay Point.

Figure 3.10-9 presents the water surface elevations and floodway for the 100-year flood peak flow. Based on SLR's detailed flood modeling evaluation, the floodway for the 100-year flood peak flow would only encroach minimally on the proposed reservoir footprint. Although the eastern end of proposed reservoir footprint is in the areas subject to inundation as sated by FEMA, no significant quantities of water will be present in these areas. Therefore, since the Project is not expected to place structures in the 100-year flood hazard zone and is not expected to redirect flood flows this potential impact is considered less than significant.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.10.12.21 Flood Hazard, Tsunami, Seiche Zones, or Inundation

Impact Statement

Impact HWQ-4: *Would the Project be in a flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?* **(CEQA Guidelines Threshold (d))**

Impact Analysis

The Project is not near the coast, so it is not susceptible to inundation by a tsunami. In addition, the Project is surrounded by relatively flat topography, and calculations presented in Section 3.7 – Geology and Soils concluded the proposed reservoir slopes are within acceptable factors of safety. Therefore, the Project is not expected to be affected by a mudflow.

A seiche is a standing wave that can occur in small water bodies such as basins, swimming pools, and lakes. The wave can reduce water levels at one end of the water body and increase the water level on the other, similar to the "sloshing" of water back and forth.

The potential for seismic ground shaking during an earthquake to generate a seiche in the proposed reservoir was evaluated. The risk associated with a seiche overtopping of the reservoir, which could result

if the energy of the wave, is a function of its amplitude and wavelength, if the amplitude of the wave exceeds the freeboard included in the design by an amount large enough force to be detrimental to the facility.

The occurrence of a seiche and the amplitude of the wave are controlled by the natural period of the reservoir and that of the earthquake. If the two periods are similar, resonance can occur, thus amplifying the wave. Comparison of the natural period of the reservoir to that of the earthquake that may shake the site (refer to Section 4.10 of Appendix G – McKay Point Reservoir Project Hydrology and Water Quality Technical Study) indicates that a resonance condition amplifying the wave is very unlikely to occur. Specifically, the estimated value of the peak wave for the seiche at the Project site is extremely low and for practical purposes, insignificant. In addition, the ratio between the reservoir and the natural period of the seismic event that could occur on Project site is on the order of 125:1 (25/0.2), which indicates a possible resonance condition is unlikely.

Given the size of the reservoir and the anticipated earthquake dominant period, resonance would not occur at the Project site between the reservoir and ground shaking. Therefore, the risk of a damaging seiche is insignificant and any seismic generated wave would be controlled by the design freeboard. Therefore, the Project would have a less than significant impact.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.10.12.22 Water Quality/Groundwater Plans

Impact Statement

Impact HWQ-5: *Would the Project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?* **(CEQA Guidelines Threshold (e))**

Impact Analysis

As discussed in Section 3.10.12.19, the Project would not place an additional demand on surface or groundwater resources, nor would it involve a discharge that could potentially impact surface water or groundwater quality. Moreover, the site-specific pollution control plans (i.e., SWPPP, SPCC, etc.) would be prepared for the proposed Project including implementation of BMPs to provide for protection of water sources from impacts to storm water. Taken together, these Project features would not create or

otherwise result in an impediment to implanting regional water quality control plans (Basin Plans) or conflict with or obstruct the implementation of a sustainable groundwater management plans (i.e., GKSGA's Groundwater Sustainability Plan). Therefore, the Project would result in a less than significant impact and no mitigation is required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not applicable.

3.10.13 Cumulative-Level Impacts and Mitigation Measures

Table 3.0-1 identifies the other projects within the County and the City of Woodlake considered in regards to potential cumulative impacts. As noted in Table 3.0-1, none of the cumulative projects meet the criteria to be further evaluated in relation to cumulative impacts associated with hydrology and water quality resources.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3.0-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project. Two (2) are existing aggregate mining operations, and one (1) is a community plan update). Three (3) other projects are located within 3 miles of the Project one (1) is an existing aggregate mining operation, one (1) is a residential sub-division, and one (1) is a stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to hydrology and water quality.

The context for cumulative impacts for water quality impacts is the immediate area encompassing the site vicinity (1- to 3-mile radius from the Project site). As discussed in the impact analysis, specifically Section 3.10.12 above for each impact threshold, the Project was determined to have either no impact or a less than significant impact. Since the Project would present no significant impacts to hydrology and water quality resources, there would be no cumulative impact in conjunction with the other cumulative projects.

Additionally, as discussed in Section 3.10.5, the Project would include numerous Project design features and BMPs to protect water resources. There would be a site-specific SPCC, SWPPP, and employee training. The Project would comply with all applicable local, State and Federal requirements and regulations and obtain the necessary permits. Therefore, the Project would not make a cumulatively considerable

contribution, and the Project's cumulative impact associated with water resources would be less than significant.

3.11 LAND USE AND PLANNING

3.11.1 Introduction

This section of the DEIR presents a discussion of land use, focusing primarily on matters of land use consistency and compatibility. The information provided in this section was primarily derived from the following source:

- Tulare County Ordinance Code, Part VII, Chapter 25 – Surface Mining and Reclamation (Tulare County).
- Tulare County Zoning Ordinance (Tulare County).
- California Surface Mining and Reclamation Act of 1975 (SMARA), as amended (Public Resources Code, Section 2710 et. seq.) (Department of Conservation).
- *Map Sheet 52 (Updated 2018) Aggregate Availability in California,* by John P. Clinkenbeard & Fred W. Gius, Department of Conservation (Department of Conservation, 2018).
- Final EIR for the Tulare County General Plan 2030 Update (SCH No. 2006041162), as certified by the Tulare County Board of Supervisors on August 28, 2012 (Tulare County, 2012).
- Tulare County General Plan 2030 Update (August 2012), Part I – Goals and Policies Report (Tulare County, 2012).
- Tulare County General Plan 2030 Update (August 2012), Part II – Area Plans, Chapter 1 – Rural Valley Lands Plan (Tulare County, 2012).

3.11.2 Environmental Setting

3.11.2.1 Regional and Local Setting

Tulare County is located in a geographically diverse encompassing approximately 4,840 square miles of classified lands (lands with identified uses) and can be divided into three general topographical zones: a valley region; a foothill region east of the valley area; and, a mountain region just east of the foothills. The eastern half of the County is generally comprised of public lands, including the Mountain Home State Forest, Golden Trout Wilderness area, and portions of the Dome Land and south Sierra Wilderness areas. Federal lands, which include wilderness, national forests, monuments and parks, along with County parks, make up 52% of the County. Agricultural uses, which include row crops, orchards, dairies, and grazing lands on the Valley floor and in the foothills total over 2,020 square miles or about 43% of the entire County. Urban uses such as incorporated cities, communities, hamlets, other unincorporated urban uses, and infrastructure rights-of-way make up the remaining land in the County.

The Project site and surrounding areas have historically been used for agriculture, including cattle grazing. Specifically, the Project site has historically been used for cattle grazing. The California Resources Agency, Division of Land Resource Protection maintains information pertaining to, and the mapping of, farmland. According to the Farmland Mapping and Monitoring Program (FMMP), the entire Project site is designated as “Grazing Land”, which, among other definitions, includes "land on which the existing vegetation is suited to the grazing of livestock." Therefore, the Project would convert existing agriculture land (i.e.,

grazing land) to a non-agricultural use. However, the Project site is not located on land designated as Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance and would not convert any Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural use.

Due to the existence of high-quality aggregate in the alluvial soils in the area of the Project site there are also aggregate mining operations and processing facilities adjacent to the Project and throughout the immediate area.

3.11.3 Regulatory Setting

The Project is subject to a variety of land use regulatory requirements and designations, which are discussed fully in the sections to follow.

3.11.3.1 Federal

There are no federal land use and planning regulations that directly affect the Project.

3.11.3.2 State

Department of Conservation

The Project is also located within a designated Mineral Resource Area (MRZ-2b) as determined by the California Department of Conservation (Department of Conservation, 1997) and referenced in County General Plan (Tulare County, 2012).

Surface Mining and Reclamation Act

Even though the Project is the construction and operation of a water storage and re-regulation reservoir it is located within a designated MRZ zone. A MRZ zone is a designation by the State Mining and Geology Board (SMGB) that classifies the area as containing a mineral resource of regional or statewide significance. Because the sand and gravel (aggregate) located underneath the Project site is considered a high-quality aggregate and the County is in need of aggregate for construction materials, it seemed logical to use the material excavated for the construction of the reservoir as a marketable product. Therefore, West Coast Sand and Gravel (WCSG (i.e., an aggregate mining company) has been contracted to excavate the aggregate beneath the Project site and process it at their facility on the Seaborn site such that it could be sold as high-quality construction grade aggregate. This would be beneficial to both the County and the Project. However, by doing this the Project would be subject to the Surface Mining and Reclamation Act (SMARA).

The County permits mining and the extraction of minerals within the AE-20 zone upon "*approval of a reclamation plan and approval of financial assurances*" (Tulare County Ordinance Code, Section 7-25-1085). Tulare County Ordinance Code Section 7-25-1020 provides that "*appurtenant uses*" typical of a surface mining operation "*may be permitted through the surface mining permit approved for surface mining operations in lieu of requiring a special use permit, when such uses are found by the Planning Commission to be a reasonably necessary adjunct to the mining operations.*" (Tulare County).

California's Surface Mining and Reclamation Act (SMARA) provides a comprehensive surface mining and reclamation policy with the regulation of surface mining operations to assure that adverse environmental impacts are minimized and mined lands are reclaimed to a usable condition. SMARA's Section 2762(a) requires the SMARA Lead Agency (the County of Tulare for this Project) to:

> *"…establish mineral resource management policies to be incorporated in its general plan which will:*
>
> *(1) Recognize mineral information classified by the State Geologist and transmitted by the board.*
>
> *(2) Assist in the management of land use which affect areas of statewide and regional significance.*
>
> *(3) Emphasize the conservation and development of identified mineral deposits."*

SMARA requires the following be approved by the SMARA lead agency (the County) and requires the concurrence from Department of Mine Reclamation (DMR) before mining may begin:

- Surface Mining Permit;
- Reclamation Plan; and
- Financial Assurance Mechanism.

SMARA §2773.1(a)(3) requires that the financial assurances for each mining operation be adjusted annually to account for new lands disturbed, inflation, and reclamation of lands accomplished in accordance with SMARA and the site's approved reclamation plan. Section 3804 of the State regulations states: "The financial assurance amount shall be calculated and based on (1) an analysis of the physical activities and materials necessary to implement the approved reclamation plan; (2) the lead agency's unit costs, or costs for third party contracting, for each of these activities, if applicable, (3) the number of units of each of these activities, if applicable; (4) a contingency amount not to exceed 10% of the reclamation cost. The calculated amount should not include the cost of completing mining of the site." In order to meet the SMARA requirement, surface mining operators must submit a Financial Assurance Cost Estimate (FACE) each year.

3.11.3.3 Local

County of Tulare Zoning and General Plan Designation

The Project site is located in a semi-rural area on unincorporated Tulare County, upon lands zoned "AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)", with a General Plan designation of "Valley Agriculture". The existing County General Plan and zoning designations in the vicinity of the Project site are described in Table 3.11-1 below. The Project is also located within a designated Mineral Resource Area (MRZ-2b) as determined by the California Department of Conservation (Department of Conservation, 1997) and referenced in County General Plan (Tulare County, 2012).

Table 3.11-1. Site Vicinity General Plan Land Use Designations and Zoning

Location	County General Plan Designation	Zoning Designation
Project Site	Valley Agricultural	AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)
North	Valley Agricultural	AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)
South	Valley Agricultural	AE-40 (Exclusive Agriculture Zone – 40 Acre Minimum)
East	Valley Agricultural	AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)
West	Valley Agricultural	AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)

County General Plan Policies

The Tulare County General Plan has a number of policies that apply to projects within County of Tulare. General Plan policies that relate to the Project are listed in Table 3.11-2 along with Project consistency determinations regarding the listed policies.

Rural Valley Lands Plan Policies

The Project is located upon lands designated as Valley Agriculture in the Rural Valley Lands Plan (RVLP), which is an Area Plan within the 2030 Update of the Tulare County General Plan. Part II – Chapter 1 (Rural Valley Lands Plan) notes the following:

> *"The RVLP was initiated in order to establish minimum parcel sizes for areas zoned for agriculture and to develop a policy that is fair, logical, legally supportable, and which consistently utilizes resource information to determine the suitability of rural lands for non-agricultural uses. The policies in this chapter will act as a guide to the Planning Commission and Board of Supervisors in determining appropriate minimum parcel sizes and areas where non-agricultural use exceptions in the rural areas of the County may be allowed." (Tulare County, 2012)*

RVLP General Plan policies that relate to the Project are listed in Table 3.11-2 located in Section 3.8.6.2 along with Project consistency determinations regarding the listed policies.

3.11.4 Significance Thresholds

According to Appendix G of the CEQA Guidelines, the Project would have a significant impact if it would:

a. *Physically divide an established community.*

b. *Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.*

3.11.5 Methodology of Analysis

The following points were considered in the Land Use and Planning evaluation:

- Historically, the site has experienced only marginal agricultural use in the form of seasonal livestock grazing. The entire Project site is designated as Grazing Land per the FMMP, which,

among other definitions, includes "*land on which the existing vegetation is suited to the grazing of livestock.*" As discussed above, the Project site is not located on Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance. As such, the Project would have no impact on any category of important farmland. The Project site is not currently being utilized as a farming operation to cultivate or grow crops. In addition, the underlying land is not under a Williamson Act contract.

- The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies.
- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.
- In identifying the area underlying the Project site as MRZ-2b, the State of California and the County General Plan have determined this area contains mineral deposits where geologic data show that significant measured or indicated resources are present, or where geologic information indicates that significant inferred resources are present. Land included in the MRZ-2b category is of prime importance because it contains known economic mineral deposits. A typical MRZ-2b area would include an operating mine, or an area where extensive sampling indicates the presence of a significant mineral deposit. This site is also designated by the State as having aggregate deposits of regional significance.

3.11.6 Project-Level Impacts and Mitigation Measures

3.11.6.1 Divide Established Community

Impact Statement

Impact LU-1: *Would the Project physically divide an established community?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

As shown in Figure 2-2 – Project Site and Land Use Map, the Project would not physically divide an established community, nor would it require a land division. Therefore, the Project would have no impact in regards to CEQA Threshold Criterion (a) and therefore does not require further analysis.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.11.6.2 Conflict with Applicable Plans, Policies or Regulations

Impact Statement

Impact LU-2: *Would the Project Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

Table 3.11-2 provides a consistency analysis of the applicable Tulare County General Plan policies.

Table 3.11-2. General Plan Policy Consistency Analysis

Policy	Consistency Analysis
PART 1 – GOALS AND POLICIES REPORTS	
Agriculture	
AG-1: To promote for the long-term preservation of productive and potentially productive agricultural lands and to accommodate agricultural support services and agriculturally related activities that supports the viability of agriculture and further the County's economic development goals.	
AG-1.1 – Primary Land Use: The County shall maintain agriculture as the primary land use in the valley region of the County, not only in recognition of the economic importance of agriculture, but also in terms of agriculture's real contribution to the conservation of open space and natural resources.	**The Project is consistent with this policy:** The Project is located in an area designated Valley Agriculture, Mineral Resources Zone (MRZ-2b), as well as Grazing Land per the FMMP. The Project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural activities. The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, groundwater recharge supplies.
AG-1.2 – Coordination: The County shall coordinate its agricultural policies and programs with state and federal regulations to preserve agricultural lands.	**The Project is consistent with this policy:** Through CEQA, SMARA and County approval process, the County shall review the Project to ensure that it is consistent with County agricultural policies and programs as well as state and federal regulations to preserve agricultural lands.

Policy	Consistency Analysis
AG-1.7 – Preservation of Agricultural Lands: The County shall promote the preservation of its agricultural economic base and open space resources through the implementation of resource management programs such as the Williamson Act, Rural Valley Lands Plan, Foothill Growth Management Plan or similar types of strategies and the identification of growth boundaries for all urban areas located in the County.	**The Project is consistent with this policy:** The Project is not subject to the Williamson Act, Rural Valley Lands Plan, Foothill Growth Management Plan or other similar plans related to growth boundaries of urban areas, with the exception Rural Valley Lands Plan (RVLP) which is discussed below. The Project does not involve growth of urban areas. The Project would also not convert Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural activities.
AG-1.10 – Extension of Infrastructure into Agricultural Areas: The County shall oppose extension of urban services such as sewer line, water lines or other urban infrastructure, into areas designated for agriculture use unless necessary to resolve a public health situation. Where necessary to address a public health issue, services should be located in public rights-of-way in order to prevent interference with agricultural operations and to provide ease of access for operation and maintenance. Service capacity and length of lines should be designed to prevent the conversion of agricultural lands into urban/suburban uses.	**The Project is consistent with this policy:** The Project is located in an area designated Valley Agriculture and Mineral Resources Zone (MRZ-2b). The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies . The Project would not require extensions of any urban services, nor would it interfere with nearby existing agricultural operations. The Project would also not convert Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural activities.

Policy	Consistency Analysis
AG-1.13 – Agricultural Related Uses: The County shall allow agriculturally related uses, including value added processing facilities by discretionary approvals in areas designated Valley or Foothill Agriculture, subject to the following criteria: 1. The use shall provide a needed service to the surrounding agricultural area which cannot be provided more efficiently within urban areas or which requires location in a non-urban area because of unusual site requirements or operational characteristics; 2. The use shall not be sited on productive agricultural lands if less productive land is available in the vicinity; 3. The operational or physical characteristics of the use shall not have a significant adverse impact on water resources or the use or management of surrounding agricultural properties within at least one-quarter (1/4) mile radius; 4. A probable workforce should be located nearby or be readily available; and 5. For proposed value-added agricultural processing facilities, the evaluation under criterion "1" above shall consider the service requirements of the use and the capability and capacity of cities and unincorporated communities to provide the required services.	**The Project is consistent with this policy:** The Project is located in an area designated Valley Agriculture and Mineral Resources Zone (MRZ-2b). The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies . The reservoir and related facilities would help manage surface water supplies to increase the long-term availability of irrigation supplies, therefore providing a benefit to surrounding agricultural operations. The Project would also not convert Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural activities.
AG-1.17 – Agricultural Water Resources: The County shall seek to protect and enhance surface water and groundwater resources critical to agriculture.	**The Project is consistent with this policy:** The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies. As such, the Project would enhance surface water and groundwater resources critical to agriculture.
Land Use	
LU-1: To encourage the overall economic and social growth of the County while maintaining the quality of life standards and highly efficient land use.	

Policy	Consistency Analysis
LU-1.1 – Smart Growth and Healthy Communities: The County shall promote the principles of smart growth and healthy communities in Urban Development Boundaries (UDBs) and Hamlet Development Boundaries (HDBs), including: 1. Creating walkable neighborhoods, 2. Providing a mix of residential densities, 3. Creating a strong sense of place, 4. Mixing land uses, 5. Directing growth toward existing communities, 6. Building compactly, 7. Discouraging sprawl, 8. Encouraging infill, 9. Preserving open space, 10. Creating a range of housing opportunities and choices, 11. Utilizing planned community zoning to provide for the orderly pre-planning and long-term development of large tracks of land which may contain a variety of land uses, but are under unified ownership or development control, and 12. Encouraging connectivity between new and existing development.	**The Project is consistent with this policy:** Although the Project is not located in UDBs or HDBs, it does promote the principles of smart growth and healthy communities through creation of a reservoir that would benefit the local community, as seen by the Project objectives (Refer to Section 1.2 – Project Objectives).
LU-1.2 – Innovative Development: The County shall promote flexibility and innovation through the use of planned unit development, development agreements, specific plans, Mixed Use project and other innovative development and planning techniques.	**The Project is consistent with this policy:** Although the Project is not an urban development project, it does promote flexibility and innovation through re-regulation and storage of flood waters, as seen by the Project objectives (Refer to Section 1.2 – Project Objectives).
LU-1.6 – Permitting Procedures and Regulations: The County shall continue to ensure that its permitting procedures and regulations are consistent and efficient.	**The Project is consistent with this policy:** Through the CEQA, SMARA and County review and approval process, the County shall ensure that permitting procedures and regulations are consistent and efficient.
LU-1.7 – Development on Slopes: The County shall require a preliminary soils report for development projects in areas with shallow or unstable soils or slopes in excess of 15 percent. If the preliminary soil report indicates soil conditions could be unstable, a detailed geologic/hydrologic report by a registered geologist, civil engineer, or engineering geologist shall be required demonstrating the suitability of any proposed or additional development.	**The Project is consistent with this policy:** A geologic/hydrologic analysis was prepared by SLR Consulting Limited/Hutchison Engineering, Inc. The hydrogeologic technical reports are provided in Appendix G. As described in the technical reports report, the soils underlying the Project site would be suitable and stable for the proposed development.

Policy	Consistency Analysis
LU-1.10 – Roadway Access: The County shall require access to public roadways for all new development.	**The Project is consistent with this policy:** As discussed in Section 1.0, the Project would not result in additional vehicles/trucks on offsite public roadways. Additionally, no new access roads would be constructed as a result of the Project.
LU-2: To provide for the long-term conservation of productive and natural resource lands including agricultural, foothill, mountain and riparian areas and to accommodate services and related activities that support the continued viability and conservation of resource lands.	
LU-2.3 – Open Space Character: The County shall require that all new development requiring a County discretionary approval, including parcel and subdivision maps, be planned and designed to maintain the scenic open space character of open space resources including, but not limited to, agricultural areas, rangeland, riparian areas, etc., within the view corridors of highways. New development shall utilize natural landforms and vegetation in the least visually disruptive way possible and use design, construction and maintenance techniques that minimize the visibility of structures on hilltops, hillsides, ridgelines, steep slopes, and canyons.	**The Project is consistent with this policy:** As discussed in Section 1.0, the Project is set back from the river's banks and there would not be large above-grade structures visible from the adjacent Kaweah and St. Johns Rivers. Once the construction of the reservoir is completed it would have a scenic open space character. additionally, because dry mining techniques would be used during the Project excavation phase, there would be no need for draglines that could have an adverse impact on the views from the rivers or nearby open space areas.
LU-2.6 – Industrial Development: Other than provided in Policy LU-2.5: Agricultural Support Facilities, the County shall and the cities should, through their industrial development policies, approve only those agriculturally-oriented or related industries and uses that can demonstrate, whether by location and/or controlled methods of operation, that they will not adversely affect agricultural production or the County's natural resources. These uses should be located inside UDBs, HDBs, PCAs and regional growth corridors unless necessary for the support of agricultural operations or as provided in Policy LU-2.5: Agricultural Support Facilities.	**The Project is consistent with this policy:** The Project is located in an area designated Valley Agriculture and Mineral Resources Zone (MRZ-2b). The Project would not convert any existing Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural activities and the Project would allow for the extraction of important mineral resources (aggregate). The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies. As such, the Project would enhance agricultural operations.
LU-5: To designate adequate land for and promote development of, industrial uses to meet the present and future needs of the County residents for jobs and to maintain economic vitality.	
LU-5.4 – Compatibility with Surrounding Land Use: The County shall encourage the infill of existing industrial areas and ensure that proposed industrial uses will not result in significant harmful impacts to adjacent land uses.	**The Project is consistent with this policy:** The Project has been designed so as not to impact adjacent land uses, which include existing aggregate mining and processing operations.

Policy	Consistency Analysis
LU-5.5 – Access: The County shall locate industrial development where there is access from collector or arterial roads, and where industrial/heavy commercial traffic is not routed through residential or other areas with uses not compatible with such traffic.	**The Project is consistent with this policy:** As discussed in Section 1.0, the Project would not result in additional vehicles/trucks on offsite public roadways. Additionally, there are no proposed changes to the existing Project access routes connecting to arterial roads.
LU-5.7 – **Industrial Uses Allowed on Resource Land**: The County shall allow asphalt batch plants and similar processing facilities that are directly associated with the development of a resource to be located at the site of the resource under the following criteria: 1. Any such site shall be developed under the Special Use Permit process, and 2. The Special Use Permit shall not permit any commercial or industrial uses that are not related to the processing of the resource.	**The Project is consistent with this policy:** The portable aggregate processing plant with would be located either on the Seaborn site or the Project site would be consistent with this policy. The portable processing plant would be used to for processing of aggregate removed during the excavation of the reservoir. The County requires a Surface Mining Permit and the preparation and County approval of a Reclamation Plan and Financial Insurance in accordance with the requirements of SMARA and the Tulare County Zoning Ordinance, Section 25.
Economic Development	
ED-5: To take full advantage of the natural, cultural and social opportunities available in the County for the enhancement of tourism.	
ED-5.5 – Rivers: The County shall encourage the development of recreational activities and promote tourism along the Kaweah, Tule and Kings River.	**The Project is consistent with this policy:** The Project is located adjacent to the Lower Kaweah River and the St. Johns River. The majority of the existing and potential recreational use of the Kaweah River is above Lake Kaweah, not in the lower portions of the Kaweah River. The Project would not result in impacts to existing or future recreational activities along the Lower Kaweah River and the St. Johns River. It would also have less than significant impacts on views from the rivers and would not diminish the enjoyment from recreational use of the rivers (Refer to Section 1.0 – Introduction).
Scenic Landscapes	
SL-1: To protect and feature the beauty of Tulare County's views of working and natural landscapes.	

Policy	Consistency Analysis
SL-1.1 – Natural Landscapes: During review of discretionary approvals, including parcel and subdivision maps, the County shall as appropriate, require new development to not significantly impact or block views of Tulare County's natural landscapes. 1. Be sited to minimize obstruction of views from public lands and rights-of-ways, 2. Be designed to reduce visual prominence by keeping development below ridge lines, using regionally familiar architectural forms, materials, and colors that blend structures into the landscape, 3. Screen parking areas from view, 4. Include landscaping that screens the development, 5. Limit the impact of new roadways and grading on natural settings, and 6. Include signage that is compatible and in character with the location and building design.	**The Project is consistent with this policy:** The Project is consistent with the surrounding land uses and would not include large above grade structures that would impact or block views of the landscape (Refer to Section 1.7).
SL-1.2 – Working Landscapes: The County shall require that new non-agricultural structures and infrastructures located in or adjacent to croplands, orchards, vineyards, and open rangelands be sited so as to not obstruct important viewsheds and to be designed to reflect unique relationships with the landscape by: 1. Referencing traditional agricultural building forms and materials, 2. Screening and breaking up parking and paving with landscaping, and 3. Minimizing light pollution and bright signage.	**The Project is consistent with this policy:** The Project is consistent with the surrounding land uses and would not include large above-grade structures that would impact or block views of the landscape. Once the construction of the reservoir is completed it would have a scenic open space character (Refer to Section 1.7).
SL-1.3 – Watercourses: The County shall protect visual access to and the character of, Tulare County's scenic rivers, lakes and irrigation canals by: 1. Locating and designing new development to minimize visual impacts and obstruction of views of scenic watercourses from public lands and right-of-ways, and 2. Maintaining the rural and natural character of landscape viewed from trails and watercourses used for public recreation.	**The Project is consistent with this policy:** The Project is located adjacent to the Lower Kaweah River and the St. Johns River. The Project is consistent with the surrounding land uses and would not include large above-grade structures that would impact or block views of the landscape from the watercourses. The Project would have less than significant impacts on views from the rivers and would not diminish the enjoyment from recreational use of the rivers. Once the construction of the reservoir is completed it would have a scenic open space character (Refer to Sections 1.7 and 3.0).
Environmental Resources Management	

Policy	Consistency Analysis
ERM-1: To preserve and protect sensitive significant habitats, enhance biodiversity, and promote healthy ecosystems throughout the County.	
ERM-1.1 – Protection of Rare and Endangered Species: The County shall ensure the protection of environmentally sensitive wildlife and plant life, including those species designated as rare, threatened, and/or endangered by State and/or federal government, through compatible land use development.	**The Project is consistent with this policy:** The DEIR evaluated potential impacts to environmentally sensitive wildlife and plant life. Biological resource studies were conducted and Mitigation Measures have been identified to protect these species if they occur on the Project site (Refer to Sections 3.3.5 and 3.3.6).
ERM-1.2 – Development in Environmentally Sensitive Areas: The County shall limit or modify proposed development within areas that contain sensitive habitat for special status species and direct development into less significant habitat areas. Development in natural habitats shall be controlled so as to minimize erosion and maximize beneficial vegetative growth.	**The Project is consistent with this policy:** The DEIR evaluated potential impacts to areas that contain sensitive habitat for special status species. Biological resource studies were conducted and Mitigation Measures have been identified to protect these species if they occur on the Project site (Refer to Sections 3.3.5 and 3.3.6).
ERM-1.4 – Protect Riparian Areas: The County shall protect riparian areas through habitat preservation, designation as open space or recreational land uses, bank stabilization, and development controls.	**The Project is consistent with this policy:** The Project is located adjacent to the Lower Kaweah and St. Johns Rivers. These rivers are considered Waters of the United States and the State; therefore, the Project would be subject to the regulatory and permitting requirements (development controls) under the federal Clean Water Act (CWA) and California Porter Cologne Act. The DEIR evaluated potential impacts to wetland and riparian areas along the rivers.
ERM-1.5 – Riparian Management Plans and Mining Reclamation Plans: The County shall require that mining reclamation plans and other management plans include measures to protect, maintain and restore riparian resources and habitats.	**The Project is consistent with this policy:** The Project is located adjacent to the Lower Kaweah and St. Johns Rivers. The DEIR evaluated potential impacts to riparian area along the rivers. The reservoir excavation phase of the Project would not disturb the oak wildland in the southern portion of the Project site and would be conducted per SMARA requirements. In addition, a Reclamation Plan would be prepared and submitted to the County. The reservoir is the identified reclaimed end use for the Project site.

Policy	Consistency Analysis
ERM-1.6 – Management of Wetlands: The County shall support the preservation and management of wetland and riparian plant communities for passive recreation, groundwater recharge, and wildlife habitats.	**The Project is consistent with this policy:** The Project is a surface water storage and re-regulation reservoir which would support groundwater recharge and the general character of the habitats in the area of the Project. The Project is located adjacent to the Lower Kaweah and St. Johns Rivers. These rivers are considered Waters of the United States and the State; therefore, the Project would be subject to the regulatory and permitting requirements under the federal CWA and California Porter Cologne Act. These regulations protect and preserve the wetland and riparian communities. The DEIR evaluated potential impacts to wetland and riparian areas and has identified mitigation measures as necessary to support the preservation and management of these communities. In additional, as part of the Project design, the oak riparian woodland in the southern portion of the Project site would not be included in the excavation of the sire.
ERM-1.7 – Planting of Native Vegetation: The County shall encourage the planting of native trees, shrubs, and grasslands in order to preserve the visual integrity of the landscape, provide habitat conditions suitable for native vegetation and wildlife, and ensure that a maximum number and variety of well-adapted plants are maintained.	**The Project is consistent with this policy:** The reservoir excavation phase of the Project would be conducted per SMARA requirements and accordingly a Reclamation Plan would be prepared and submitted to the County. The Reclamation Plan would include a Revegetation Plan using native vegetation with goals to maintain the number and variety of native species. The reservoir is the identified reclaimed end use for the Project site. In addition, the oak riparian woodland in the southern portion of the site would not be included in the excavation of the site.
ERM-1.8 – Open Space Buffers: The County shall require buffer areas between development projects and significant watercourses, riparian vegetation, wetlands, and other sensitive habitats and natural communities. These buffers should be sufficient to assure the continued existence of the waterways and riparian habitat in their natural state.	**The Project is consistent with this policy:** The Project is located adjacent to the Lower Kaweah and St. Johns Rivers. Figure 2-4 – Final Reservoir Site Plan, illustrates how the Project boundary is pulled back from the river, in most areas at least 200-feet, except where the Inflow and Outflow Channels would be installed. The vast majority of the oak-riparian woodland to the southeast would not be affected by the Project, save for some use of that area to plant replacement trees.

Policy	Consistency Analysis
ERM-1.12 – Management of Oak Woodland Communities: The County shall support the conservation and management of oak woodland communities and their habitats.	**The Project is consistent with this policy:** There is an oak-riparian woodland in the southeastern portion of the Project site, the vast majority of which would not be affected by the Project, save for some use of that area to plant replacement trees.
ERM-2: To conserve protect and encourage the development of areas containing mineral deposits while considering values relating to water resources, air quality, agriculture, traffic, biotic, recreation, aesthetic enjoyment and other public interest values.	
ERM-2.1 – Conserve Mineral Deposits: The County will encourage the conservation of identified and/or potential mineral deposits, recognizing the need for identifying, permitting, and maintaining a 50-year supply of locally available PCC grade aggregate.	**The Project is consistent with this policy:** The Project will promote the development of identified mineral (aggregate) deposits. As discussed in Section 3.11.3.1, if approved, the Project would add an estimated 9.66 million net tons to the 50-year supply of permitted aggregate reserves within the Tulare County.
ERM-2.5 – Resources Development: The County will promote the responsible development of identified and/or potential mineral deposits	**The Project is consistent with this policy:** The Project would not prevent the availability of a mineral deposit. The Project will promote the responsible development of identified mineral (aggregate) deposits providing the rock removed during the excavation of the reservoir to be processed and used as commercial aggregate.
ERM-2-7 – Minimize Adverse Impacts: The County will minimize the adverse effects on environmental features such as water quality and quantity, air quality, flood plains, geophysical characteristics, biotic, archaeological and aesthetic factors.	**The Project is consistent with this policy:** Potential environmental impacts associated with the Project have been evaluated under CEQA in this DEIR, including but not limited to Hydrology/Water Quality, Air Quality, Biological Resources, Cultural Resources and Aesthetic Resources (Refer to Section 1.0 – Introduction).
ERM-2.8 – Minimize Hazards and Nuisances: The County will minimize the hazards and nuisances to persons and properties in the area during extraction, processing and reclamation operations.	**The Project is consistent with this policy:** The Project would be conducted in compliance with SMARA requirements.
ERM-2.9 – Compatibility: The County will encourage the development of mineral deposits in a manner compatible with surrounding land uses.	**The Project is consistent with this policy:** Project excavation would be conducted in a manner compatible with surrounding land uses, which include existing aggregate operations.
ERM-2.10 – Incompatible Development: Proposed incompatible land uses in the County shall not be on lands containing or adjacent to identified mineral deposits, or along key access roads, unless adequate mitigation measures are adopted or a statement of overriding considerations stating public benefits and overriding reasons for permitting the proposed use are adopted.	**The Project is consistent with this policy:** The Project is compatible with lands containing mineral deposits. Project excavation would allow for the extraction of aggregate to then be used to support the County's need for construction materials.

Policy	Consistency Analysis
ERM-2.13 – SMARA Requirements: All surface mines in the County, unless otherwise exempt, shall be subject to reclamation plans that meet SMARA requirements. Reclamation procedures shall restore the site for future beneficial use of the land consistent with the Tulare County General Plan, subsequent to the completion of surface mining activities. Mine reclamation costs shall be borne by the mine operator, and guaranteed by financial assurances set aside for restoration procedures.	**The Project is consistent with this policy:** The Project would be subject to and comply with all applicable SMARA requirements.
ERM-3.1 – Environmental Contamination: All mining operations in the County shall be required to take precautions to avoid contamination from wastes or incidents related to the storage and disposal of hazardous materials, or general operating activity at the site.	**The Project is consistent with this policy:** The use, storage, transportation and disposal of hazardous materials associated with the Project was evaluated during the CEQA process and discussed in Section 3.7 – Hydrology/Water Quality. Hazardous materials would be managed in accordance with applicable local, state and federal requirements, including the preparation of a Spill Prevention, Control and Countermeasure Plan (SPCC), Storm Water Pollution Prevention Plan (SWPPP), a Hazardous Materials Business Plan (HMBP) and a Contingency Plan.
ERM-6: To manage and protect sites of cultural and archaeological importance for the benefit of present and future generations.	
ERM-6.2 – Protection of Resources with Potential State or Federal Designations: The County shall protect cultural and archaeological sites with demonstrated potential for placement on the National Register of Historic Places and/or inclusion in the California State Office of Historic Preservation's California Points of Interest and California Inventory of Historic Resources. Such sites may be of Statewide or local significance and have anthropological, cultural, military, political, architectural, economic, scientific, religious, or other values as determined by a qualified archaeological professional.	**The Project is consistent with this policy:** Site surveys and record searches did indicate that cultural and archaeological resources could be located at the Project site. Therefore, Mitigation Measure CUL-1 and CUL-2 are designed to protect these resources (Refer to Sections 3.3.5 and 3.3.6). The Project would also be subject to the requirements of Assembly Bill (AB) 52 to protect Tribal Cultural Resources (see Section 3.11).
ERM-6.3 – Alteration of Sites with Identified Cultural Resources: When planning any development or alteration of a site with identified cultural or archaeological resources, consideration should be given to ways of protecting the resources. Development can be permitted in these areas only after a site specific investigation has been conducted pursuant to CEQA to define the extent and value of resource, and Mitigation Measures proposed for any impacts the development may have on the resource.	**The Project is consistent with this policy:** Site surveys and record searches indicate cultural and archaeological resources could be located at the Project site. Therefore, Mitigation Measure CUL-1 and CUL-2 are designed to protect these resources (Refer to Sections 3.3.5 and 3.3.6).

Policy	Consistency Analysis
ERM-6.4 – Mitigation: If preservation of cultural resources is not feasible, every effort shall be made to mitigate impacts, including relocation of structures, adaptive reuse, preservation of facades, and thorough documentation and archival of records.	**The Project is consistent with this policy:** Site surveys and record searches indicate cultural and archaeological resources could be located at the Project site. Mitigation Measure CUL-1 and CUL-2 are designed to protect these resources (Refer to Sections 3.3.5 and 3.3.6).
ERM- 6.8 – Solicit Input from Local Native Americans: The County shall continue to solicit input from the Native American communities in cases where development may result in disturbance to sites containing evidence of Native American activity and/or to site of cultural importance.	**The Project is consistent with this policy:** The Native American Heritage Commission (NAHC) was contacted and letters sent to contacts identified by the NAHC. Site surveys and record searches also indicated cultural and archaeological resources could be located at the Project site. Therefore, Mitigation Measures CUL-1, and CUL-2 are designed to protect these resources (Refer to Sections 3.3.5 and 3.3.6). The Project would also be subject to the requirements of AB 52 to protect Tribal Cultural Resources (see Section 3.10- Tribal Cultural Resources).
ERM- 6.10 – Grading Cultural Resources Sites: The County shall ensure all grading activities conform to the County's Grading Ordinance and the CCR Title 20 Section 2501 et. Seq.	**The Project is consistent with this policy:** The Project comply with all grading requirements required by the County's Grading Ordinance and the CCR Title 20 Section 2501 et. Seq. In addition, the Project would comply with the grading and slope stability requirements of SMARA. In addition, cultural resources would be protected as described in Section 3.3 – Cultural Resources.
ERM-7: To preserve and protect soil resources in the County for agricultural and timber productivity and protect public health and safety.	
ERM-7.2 – Soil Productivity: The County shall encourage landowners to participate in programs that reduce soil erosion and increase soil productivity. To this end, the County shall promote coordination between the Natural Resources Conservation Service, Resource Conservation Districts, UC Cooperative Extension, and other similar agencies and organizations.	**The Project is consistent with this policy:** As required by SMARA, the Project incorporates many design considerations and practices to reduce the potential for, and impacts of erosion. Vegetation and topsoil would be removed during the initial site preparation and excavation of the reservoir. Topsoil removed would be stockpiled for use in reclamation and revegetation of the Project site in accordance with the SMARA Reclamation Plan (Refer to Section 3.2.5).

Policy	Consistency Analysis
ERM-7.3 – Protection of Soils on Slopes: Unless otherwise provided for in this General Plan, building and road construction on slopes of more than 30 percent shall be prohibited, and development proposals on slopes of 15 percent or more shall be accompanied by plans for control or prevention of erosion, alteration of surface water runoff, soil slippage, and wildfire occurrence.	**The Project is consistent with this policy:** Erosion control associated with the slopes created during excavation activities would be implemented as required by SMARA and discussed in the Reclamation Plan. The Project incorporates many design considerations and practices to reduce the potential for, and impacts of erosion. The Project would also comply with SMARA's requirements for slope stability (Refer to Section 3.2.5).
Air Quality	
AQ-1: To improve air quality through a regional approach and interagency cooperation.	
AQ-1.1 – Cooperation with Other Agencies: The County shall cooperate with other local, regional, Federal, and State agencies in developing and implementing air quality plans to achieve State and federal Ambient Air Quality Standards. The County shall partner with the SJVAPCD, Tulare County Association of Governments (TCAG), and the California Air Resource Board to achieve better air quality conditions locally and regionally.	**The Project is consistent with this policy:** The San Joaquin Valley Air Pollution Control District (SJVAPCD) is a responsible agency in this CEQA process. The Project would be in compliance with applicable SJVAPCD rules and regulations and California Air Resources Board (CARB) policies and guidelines. An Air Quality and Climate Change Impact Assessment (AQCCIA) was prepared for the Project in order to demonstrate compliance with CEQA threshold and state, federal and local air quality regulations (Refer to Section 3.1 – Air Quality).
AQ-1.2 – Cooperation with Local Jurisdictions: The County shall participate with cities, surrounding counties, and regional agencies to address cross-jurisdictional transportation and air quality issues.	**The Project is consistent with this policy:** The SJVAPCD is a responsible agency in this CEQA process. The Project would be in compliance with applicable SJVAPCD rules and regulations and CARB policies and guidelines. An Air Quality and Climate Change Impact Assessment (AQCCIA) was prepared for the Project in order to demonstrate compliance with CEQA threshold and state, federal and local air quality regulations (Refer to Section 3.1 – Air Quality).
AQ-1.3 – Cumulative Air Quality Impacts: The County shall require development to be located, designed, and constructed in a manner that would minimize cumulative air quality impacts. Applicants shall be required to propose alternatives as part of the State CEQA process that reduce air emissions and enhance, rather than harm, the environment.	**The Project is consistent with this policy:** Cumulative impacts associated with air quality have been evaluated in the DEIR and it was determined that the Project would not have cumulatively considerable impacts. An Air Quality and Climate Change Impact Assessment (AQCCIA) was prepared for the Project in order to demonstrate compliance with CEQA threshold and state, federal and local air quality regulations (Refer to Section 3.1.7).

Policy	Consistency Analysis
AQ-1.4 – Air Quality Land Use Compatibility: The County shall evaluate the compatibility of industrial or other developments, which are likely to cause undesirable air pollution with regard to proximity to sensitive land uses, and wind direction and circulation in an effort to alleviate effects upon sensitive receptors.	**The Project is consistent with this policy:** The SJVAPCD is a responsible agency in this CEQA process. The Project would be in compliance with applicable SJVAPCD rules and regulations and CARB policies and guidelines. A Health Risk Assessment (HRA) was prepared for this DEIR and it was determined that there would not be significant impacts to sensitive receptors other than at one receptor, a rental property owned by TID. Mitigation Measure AQ-4 would be implemented to mitigate this impact (Refer to Section 3.1.6).
AQ-1.5 – California Environmental Quality Act (CEQA) Compliance: The County shall ensure that air quality impacts identified during the CEQA review process are consistently and reasonable mitigated when feasible.	**The Project is consistent with this policy:** Potential air quality impacts were identified and evaluated during this CEQA process. An Air Quality and Climate Change Impact Assessment (AQCCIA) was prepared for the Project in order to demonstrate compliance with CEQA threshold and state, federal and local air quality regulations. Mitigation Measure AQ-4 was identified to mitigate potential health risk impacts (Refer to Section 3.1.6).
AQ-1.7 – Support Statewide Climate Change Solutions: The County shall monitor and support the efforts of Cal/EPA, CARB, and the SJVAPCD, under AB 32 (Health and Safety Code §38501 et seq.), to develop a recommended list of emission reduction strategies. As appropriate, the County will evaluate each new project under the updated General Plan to determine its consistency with the emission reduction strategies.	**The Project is consistent with this policy:** Greenhouse Gas (GHG) emissions were evaluated for compliance and/or consistency with AB 32 and other GHG policies and guidelines. No mitigation measures would be required (Refer to Section 3.5.6).
AQ-4: To implement the best available controls and monitoring necessary to regulate air emissions.	
AQ-4.1 – Air Pollution Control Technology: The County shall utilize the BACM and RACM as adopted by the County to support SJVAPCD air quality attainment plans to achieve and maintain healthful air quality and high visibility standards. These measures shall be applied to new development approvals and permit modifications as appropriate.	**The Project is consistent with this policy:** The SJVAPCD is a responsible agency in this CEQA process. The Project would be in compliance with applicable SJVAPCD rules and regulations and CARB policies and guidelines (Refer to Section 3.1).

Policy	Consistency Analysis
AQ-4.2 – Dust Suppression Measures: The County shall require developers to implement dust suppression measures during excavation, grading, and site preparation activities consistent with SJVAPCD Regulation VIII – Fugitive Dust Prohibitions. Techniques may include, but are not limited to, the following: 1. Site watering or application of dust suppressants, 2. Phasing or extension of grading operations, 3. Covering of stockpiles, 4. Suspension of grading activities during high wind periods (typically winds greater than 25 miles per hour), and 5. Re-vegetation of graded areas.	**The Project is consistent with this policy:** The SJVAPCD is a responsible agency in this CEQA process. The Project would be in compliance with applicable SJVAPCD rules and regulations and CARB policies and guidelines. Project Design Features as well as Mitigation Measures have been incorporated into the Project to ensure that potential dust impacts are less than significant (Refer to Section 3.1).
AQ-4.3 – Paving or Treatment of Roadways for Reduced Air Emissions: The County shall require that all new roads be paved or treated to reduce dust generation where feasible as required by SJVAPCD Regulation VIII, Rule 8061- Paved and Unpaved Roads. For new projects with unpaved roads, funding for roadway maintenance shall be adequately addressed and secured.	**The Project is consistent with this policy:** The SJVAPCD is a responsible agency in this CEQA process. The Project would be in compliance with applicable SJVAPCD rules and regulations and CARB policies and guidelines. Project Design Features as well as Mitigation Measures have been incorporated into the Project to ensure that potential dust impacts are less than significant (Refer to Section 3.1).
AQ-4.5 – Public Awareness: The County shall promote public awareness of the seriousness and extent of the existing air quality problems.	**The Project is consistent with this policy:** Public awareness is a key component of the CEQA process. Public meetings were held during the CEQA scoping process and the DEIR and FEIR will be provided to the public for review and comment.
AQ-4.6 – Asbestos Airborne Toxic Control and Dust Protection: Asbestos is of concern to Tulare County because it occurs naturally in surface deposits of several types of ultramafic materials (materials that contain magnesium and iron and a very small amount of silica). Asbestos emissions can result from the sale or use of asbestos-containing materials, road surfacing with such materials, grading activities, and surface mining. See Implementation Measure 15.	**The Project is consistent with this policy:** The Project is not located in an area where Naturally Occurring Asbestos (NOA) is expected to be present. Alluvial deposits are considered exempt from NOA regulations. In addition, the Project would not involve the use of asbestos containing materials.
Health & Safety	
HS-2: To reduce the risk to life and property and governmental costs from seismic and geologic hazards.	

Policy	Consistency Analysis
HS-2.1 – Continued Evaluation of Earthquake Risks: The County shall continue to evaluate areas to determine levels of earthquake risk.	**The Project is consistent with this policy:** Potential risks associated with earthquakes were evaluated in this DEIR. In addition, slope stability analysis was conducted as required by SMARA. The closest faults to the Project site are the Independence Fault, the Owens Valley Fault Zone, and the San Andreas Fault Zone, at least 35 miles from the Project site. Because the Project site is not located within or near a designated Alquist-Priolo Earthquake Zone (APEZ), there is little potential for the occurrence of surface fault rupture. As a result, the Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving major geological hazards (Refer to Section 3.4 – Geology/Soils).
HS-2.4 – Structure Siting: The County shall permit development on soils sensitive to seismic activity permitted only after adequate site analysis, including appropriate siting, design of structure, and foundation integrity.	**The Project is consistent with this policy:** Potential risks associated with earthquakes were evaluated in this DEIR. In addition, slope stability analysis was conducted as required by SMARA. The closest faults to the Project site are the Independence Fault, the Owens Valley Fault Zone, and the San Andreas Fault Zone, at least 35 miles from the Project site. Because the Project site is not located within or near a designated Alquist-Priolo Earthquake Zone (APEZ), there is little potential for the occurrence of surface fault rupture. As a result, the Project would not expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving major geological hazards (Refer to Section 3.4 – Geology/Soils).
HS-2.7 – Subsidence: The County shall confirm that development is not located in any known areas of active subsidence. If urban development may be located in such an area, a special safety study will be prepared and needed safety measures implemented. The County shall also request that developments provide evidence that its long-term use of ground water resources, where applicable, will not result in notable subsidence attributed to the new extraction of groundwater resources for use by the development.	**The Project is consistent with this policy:** Potential risks associated with subsidence were evaluated in this DEIR (Refer to Section 3.4 – Geology/Soils).

Policy	Consistency Analysis
HS-2.8 – Alquist-Priolo Act Compliance: The County shall not permit any structure for human occupancy to be placed within designated Earthquake Fault Zones (pursuant to and as determined by the Alquist-Priolo Earthquake Fault Zoning Act; Public Resource code, Chapter 7.5) unless the specific provision of the Act and Title 14 of the California Code of Regulations have been satisfied.	**The Project is consistent with this policy:** The Project site is not located within or near a designated APEZ (Refer to Section 3.4 – Geology/Soils).
HS-4: To protect residents, visitors, and property from hazardous materials through their safe use, storage, transport, and disposal.	
HS-4.1 – Hazardous Materials: The County shall strive to ensure hazardous materials are used, stored, transported and disposed of in a safe manner, in compliance with local, State and Federal safety standards, including the Hazardous Waste Management Plan, Emergency Operations Plan and Area Plan.	**The Project is consistent with this policy:** The use, storage, transportation and disposal of hazardous materials associated with the Project was evaluated during the CEQA process. Minimal amounts of hazardous materials would be used at the site with the exception of an above surface tank (AST) for the storage of diesel fuel. Hazardous materials would be managed in accordance with applicable local, state and federal requirements, including the preparation of a SPCC Plan, SWPPP and a HMBP (which includes a Contingency Plan).
HS-4.4 – Contamination Prevention: The County shall review new development proposals to protect soils, air quality, surface water, and groundwater from hazardous materials contamination.	**The Project is consistent with this policy:** The County is the lead agency for SMARA compliance and a responsible agency under CEQA. These roles require that the County shall review the Project for potential environmental impacts and compliance with state, federal and local regulations. The use, storage, transportation and disposal of hazardous materials associated with the Project was evaluated during the CEQA process. Hazardous materials would be managed in accordance with applicable local, state and federal requirements, including the preparation of a SPCC, SWPPP, and a HMBP. Potential impacts associated with air and water quality are further evaluated in the DEIR (Refer to Sections 3.6 and 3.7).
HS-4.8 – Hazardous Materials Studies: The County shall ensure that the proponents of new development projects address hazardous materials concerns through the preparation of Phase I or Phase II hazardous materials studies for each identified site as part of the design phase for each project. Recommendations required to satisfy federal or State cleanup standards outlined in the studies will be implemented as part of the construction phase for each project.	**The Project is consistent with this policy:** A Phase I assessment of the Project site was completed by BSK Associates. The Phase I revealed no evidence of recognized environmental conditions in connection with the property, and no further investigation was recommended.

Policy	Consistency Analysis
HS-5: To minimize the possibility for loss of life, injury, or damage to property as a result of flood hazards.	
HS-5.1 – Development Compliance with Federal, State and Local Requirements: The County shall ensure that all development within the designated floodway or floodplain zones conforms to FEMA regulations and the Tulare County Flood Damage Prevention Ordinance. New development and divisions of land, especially residential subdivisions, shall be developed to minimize flood risk to structures, infrastructure, and ensure safe access and evacuation during flood conditions.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of flood control. The Project would comply with FEMA and County regulations.
HS-5.2 – Development in Floodplain Zones: The County shall regulate development in the 100-year floodplain zones as designated on maps prepared by FEMA in accordance with the following: 1. Critical facilities (those facilities which should be open and accessible during emergencies) shall not be permitted. 2. Passive recreational activities (those requiring non-intensive development, such as hiking, horseback riding, picnicking) are permissible. 3. New development and divisions of land, especially residential subdivisions, shall be developed to minimize flood risk to structures, infrastructure, and ensure safe access and evacuation during flood conditions.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of flood control. The Project would comply with FEMA and County regulations.
HS-5.4 – Multi-Purpose Flood Control Measures: The County shall encourage multipurpose flood control projects that incorporate recreation, resource conservation, preservation of natural riparian habitat, and scenic values of the County's streams, creeks, and lakes. Where appropriate, the County shall also encourage the use of flood and/or storm water retention facilities for use as groundwater recharge facilities.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood control. Groundwater recharge and infiltration galleries would also be part of the Project. The Project would comply with FEMA and County regulations.
HS-5.5 – Development in Dam and Seiche Inundation Zones: The County shall review projects for their exposure to inundation due to dam failure. If a project presents a direct threat to human life, appropriate mitigation measures shall be taken, including restriction of development in the subject area.	**The Project is consistent with this policy:** The Project is located below the Lake Kaweah dam but one of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood control. The Project would comply with FEMA and County regulations (Refer to Section 3.7 – Hydrology/Water Quality).

Policy	Consistency Analysis
HS-5.6 – Impacts to Downstream Properties: The County shall ensure that new County flood control projects will not adversely impact downstream properties or contribute to flooding hazards.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood control. Groundwater infiltration ponds would also be part of the Project. The Project would comply with FEMA and County regulations (Refer to Section 3.7 – Hydrology/Water Quality).
HS-5.9 – Floodplain Development Restrictions: The County shall ensure that riparian areas and drainage areas within 100-year floodplains are free from development that may adversely impact floodway capacity or characteristics of natural/riparian areas or natural groundwater recharge areas.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood control. The DEIR evaluated potential impacts to the riparian areas (Refer to Section 3.2 – Biological Resources) and groundwater (Refer to Section 3.7 – Hydrology/Water Quality). Groundwater recharge would not be significantly interrupted and offsite groundwater elevations would not be expected to change noticeably.
HS-5.10 – Flood Control Design: The County shall evaluate flood control projects involving further channeling, straightening, or lining of waterways until alternative multipurpose modes of treatment, such as wider berms and landscaped levees, in combination with recreation amenities, are studied.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood control. However, the Project would not impact the existing channels or floodways of the adjacent rivers.
HS-5.11 – Natural Design: The County shall encourage flood control designs that respect natural curves and vegetation of natural waterways while retaining dynamic flow and functional integrity.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood control.
HS-6: To minimize the exposure of County residents, visitors, and public and private property to the effects of urban and wildland fires.	

Policy	Consistency Analysis
HS-6.2 – Development in Fire Hazard Zones: The County shall ensure that development in very high or high fire hazard areas is designed and constructed in a manner that minimizes the risk from fire hazards and meets all applicable State and County fire standards. This shall include promoting the use of fire resistant materials designed to reduce fire vulnerability within high or very high fire hazard areas through use of Article 86-A of the 2001 California Fire Code, SRA Fire Safe Regulations, and other nationally recognized standards, as may be updated periodically. Special consideration shall be given to the use of fire-resistant-materials and fire-resistant construction in the underside of eaves, balconies, unenclosed roofs and floors, and other similar horizontal surfaces in areas with steep slopes. Ensure new development proposals contain specific fire protection plans, actions, and codes for fire engineering features for structures in Very High Fire Hazard Safety Zones including automatic sprinklers as required by applicable codes.	**The Project is consistent with this policy:** Per Figure 10-2 in the County General Plan, the Project site is located within an area designated as "Non-Fuel" or "Moderate" Fire Threat. The Project site is not located within a County-designated "High" or "Very High" Fire Threat area, nor is it locate within a State Responsibility Area (SRA). In addition, once the reservoir is constructed, it would act as a fire break to help prevent the spread of a wildfire.
HS-6.6 – Wildland Fire Management Plans: The County shall require the development of wildland fire management plans for projects adjoining significant areas of open space that may have high fuel loads.	**The Project is consistent with this policy:** As discussed above, the Project site is not located within a County or State fire hazard area. Additionally, the Project site is not adjacent to wildlands or open spaces with high fuel loads.
HS-6.7 – Water Supply System: The County shall require that water supply systems be adequate to serve the size and configuration of land developments, including satisfying fire flow requirements. Standards as set forth in the subdivision ordinance shall be maintained and improved as necessary.	**The Project is consistent with this policy:** The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies via water re-regulation. As such, the Project would enhance local water supply systems and satisfy local fire flow requirements.
HS-8: To protect County residents and visitors from the harmful effects of excessive noise while promoting the County economic base.	
HS-8.2 – Noise Impacted Areas: The County shall designate areas as noise-impacted if exposed to existing or projected noise levels that exceed 60 dB L_{dn} (or Community Noise Equivalent Level (CNEL)) at the exterior of buildings.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measures NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise). There would be no need for the County to designate the Project area as noise-impacted.

Policy	Consistency Analysis
HS-8.3 – Noise Sensitive Land Uses: The County shall not approve new noise sensitive uses unless effective mitigation measures are incorporated into the design of such projects to reduce noise levels to 60 dB L_{dn} (or CNEL) or less within outdoor activity areas and 45 dB L_{dn} (or CNEL) or less within interior living spaces.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is are designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
HS-8.5 – State Noise Standards: The County shall enforce the State Noise Insulation Standards (California Administrative Code, Title 24) and Section 35 of the Uniform Building Code (UBC). Title 24 requires that interior noise levels not exceed 45 dB L_{dn} (or CNEL) with the windows and doors closed within new developments of multi-family dwellings, condominiums, hotels, or motels. Where it is not possible to reduce exterior noise levels within an acceptable range the County shall require the application of noise reduction technology to reduce interior noise levels to an acceptable level.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
HS-8.6 – Noise Level Criteria: The County shall ensure noise level criteria applied to land uses other than residential or other noise-sensitive uses are consistent with the recommendations of the California Office of Noise Control (CONC).	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels, including consistency with CONC, except at one receptor. Mitigation Measure NO-1 through NO24 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
HS-8.8 – Adjacent Uses: The County shall not permit development of new industrial, commercial, or other noise-generating land uses if resulting noise levels will exceed 60 dB L_{dn} (or CNEL) at the boundary of areas designated and zoned for residential or other noise-sensitive uses, unless it is determined to be necessary to promote the public health, safety and welfare of the County.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measures NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor.

Policy	Consistency Analysis
HS-8.10 – Automobile Noise Enforcement: The County shall encourage the CHP, Sheriff's office, and local police departments to actively enforce existing sections of the California Vehicle Code relating to adequate vehicle mufflers, modified exhaust systems, and other amplified noise.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors and also address noise associated with equipment and vehicles. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
HS-8.11 – Peak Noise Generators: The County shall limit noise generating activities, such as construction, to hours of normal business operation (7 a.m. to 7 p.m.). No peak noise generating activities shall be allowed to occur outside of normal business hours without County approval.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels (daytime and nighttime levels) except at one receptor. Mitigation Measure NO-1 through NO24 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
HS-8.13 – Noise Analysis: The County shall require a detailed noise impact analysis in areas where current or future exterior noise levels from transportation or stationary sources have the potential to exceed the adopted noise policies of the Health and Safety Element, where there is development of new noise sensitive land uses or the development of potential noise generating land uses near existing sensitive land uses. The noise analysis shall be the responsibility of the project applicant and be prepared by a qualified acoustical engineer (i.e., a Registered Professional Engineer in the State of California, etc.). The analysis shall include recommendations and evidence to establish mitigation that will reduce noise exposure to acceptable levels (such as those referenced in Table 10-1 of the Health and Safety Element).	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted and prepared by a Registered Professional Engineer in the State of California. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
HS-8.14 – Sound Attenuation Features: The County shall require sound attenuation features such as walls, berming, heavy landscaping, between commercial, industrial, and residential uses to reduce noise and vibration impacts.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).

Policy	Consistency Analysis
HS-8.16 – State Noise Insulation: The County shall enforce the State Noise Insulation Standards (California Administrative Code, Title 24) and Section 35 of the Uniform Building Code.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
HS-8.18 – Construction Noise: The County shall seek to limit the potential noise impacts of construction activities by limiting construction activities to the hours of 7 am to 7 pm, Monday through Saturday when construction activities are located near sensitive receptors. No construction shall occur on Sundays or national holidays without a permit from the County to minimize noise impacts associated with development near sensitive receptors.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor. Mitigation Measure NO-1 through NO-2 includes limitations as to when excavation activities can take place (Refer to Section 3.9 – Noise).
HS-8.19 – Construction Noise Control: The County shall ensure that construction contractors implement best practices guidelines (i.e., berms, screens, etc.) as appropriate and feasible to reduce construction-related noise-impacts on surrounding land uses.	**The Project is consistent with this policy:** As part of the CEQA process a noise evaluation was conducted. The evaluation included noise measurements at or near offsite receptors. The noise study determined that the Project would not exceed regulatory noise levels except at one receptor. Mitigation Measure NO-1 through NO-2 is designed to mitigate noise impacts at the one receptor (Refer to Section 3.9 – Noise).
Water Resources	
WR-1: To provide for the current and long-range water needs of the County and for the protection of the quality and quantity of surface and groundwater resources.	

Policy	Consistency Analysis
WR-1.1 – Groundwater Withdrawal: The County shall cooperate with water agencies and management agencies during land development processes to help promote an adequate, safe, and economically viable groundwater supply for existing and future development within the County. These actions shall be intended to help the County mitigate the potential impact on groundwater resources identified during planning and approval processes.	**The Project is consistent with this policy:** The Central Valley Regional Water Quality Control Board (CVRRWQCB) is a responsible agency in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater. As part of the CEQA process a hydrology and water quality evaluation was conducted. It included field studies to identify baseline groundwater conditions. Prior to the installation of the slurry wall or clay liner, any groundwater seepage would be collected and re-infiltrated back to the aquifer by using infiltration galleries. Recharge would not be significantly interrupted nor would offsite groundwater elevations be noticeably changed (Refer to Section 3.7 – Hydrology/Water Quality).
WR-1.5 – Expand Use of Reclaimed Wastewater: To augment groundwater supplies and to conserve potable water for domestic purposes, the County shall seek opportunities to expand groundwater recharge efforts.	**The Project is consistent with this policy:** The CVRRWQCB is a responsible agency in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater. As part of the CEQA process a hydrology and water quality evaluation was conducted. It included field studies to identify baseline groundwater conditions. Prior to the installation of the slurry wall or clay liner, any groundwater seepage would be collected and re-infiltrated back to the aquifer by using infiltration galleries. Recharge would not be significantly interrupted nor would offsite groundwater elevations be noticeably changed (Refer to Section 3.7 – Hydrology/Water Quality).

Policy	Consistency Analysis
WR-1.10 – Channel Modification: Channel modification shall be discouraged in streams and rivers where it increases the rate of flow, rate of sediment transport, erosive capacity, have adverse effect on aquatic life or modify necessary groundwater recharge.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood prevention. The CVRRWQCB, California Department of Fish and Wildlife (CDFW), US Army Corp of Engineers are responsible agencies and, as appropriate, are closely involved in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater and surface water. As part of the CEQA process a hydrology and water quality evaluation was conducted. The Project would obtain the necessary permits and approvals and would implement a SPCC Plan, SWPPP and other Best Management Practices (BMPs) as required by the regulatory agencies (Refer to Section 3.7 – Hydrology/Water Quality).
WR-2: To provide for the current and long-range water needs of the County and for the protection of the quality of surface water and groundwater resources.	
WR-2.1 – Protect Water Quality: All major land use and development plans shall be evaluated as to their potential to create surface and groundwater contamination hazards from point and non-point sources. The County shall confer with other appropriate agencies, as necessary, to assure adequate water quality review to prevent soil erosion; direct discharge of potentially harmful substances; ground leaching from storage of raw materials, petroleum products, or wastes; floating debris; and runoff from the site.	**The Project is consistent with this policy:** The CVRRWQCB, CDFW, US Army Corp of Engineers are responsible agencies and, as appropriate, are closely involved in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater and surface water. As part of the CEQA process a hydrology and water quality evaluation was conducted. The Project would obtain the necessary permits and approvals and would implement a SPCC Plan, SWPPP and other BMPs as required by the regulatory agencies (Refer to Section 3.7 – Hydrology/Water Quality).
WR-2.2 – National Pollutant Discharge Elimination System (NPDES) Enforcement: The County shall continue to support the State in monitoring and enforcing provisions to control non-point source water pollution contained in the U.S. EPA NPDES program as implemented by the Water Quality Control Board.	**The Project is consistent with this policy:** The CVRRWQCB, CDFW, US Army Corp of Engineers are responsible agencies and, as appropriate, are closely involved in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater and surface water. As part of the CEQA process a hydrology and water quality evaluation was conducted. A SWPPP would be prepared in accordance with the NPDES Industrial General Permit (IGP) and BMPs would be implemented.

Policy	Consistency Analysis
WR-2.3 – Best Management Practices (BMPs): The County shall continue to require the use of feasible BMPs and other mitigation measures designed to protect surface water and groundwater from the adverse effects of construction activities, agricultural operations requiring a County Permit and urban runoff in coordination with the Water Quality Control Board.	**The Project is consistent with this policy:** The Project would comply with NPDES requirements. A SWPPP would be prepared in accordance with the IGP and BMPs would be implemented (Refer to Section 3.7 – Hydrology/Water Quality).
WR-2.4 – Construction Site Sediment Control: The County shall continue to enforce provisions to control erosion and sediment from construction sites.	**The Project is consistent with this policy:** The Project would comply with NPDES requirements. A SWPPP would be prepared in accordance with the IGP and BMPs would be implemented, including those associated with sediment control (Refer to Section 3.7 – Hydrology/Water Quality).
WR-2.5 – Major Drainage Management: The County shall continue to promote protection of each individual drainage basin within the County based on the basins unique hydrologic and use characteristics.	**The Project is consistent with this policy:** The CVRRWQCB is a responsible agency under CEQA. The Project would comply with NPDES requirements. A SWPPP would be prepared in accordance with the IGP and BMPs would be implemented (Refer to Section 3.7 – Hydrology/Water Quality).
WR-2.6 – Degraded Water Resources: The County shall encourage and support the identification of degraded surface water and groundwater resources and promote restoration where appropriate.	**The Project is consistent with this policy: :** The CVRRWQCB, CDFW, US Army Corp of Engineers are responsible agencies and, as appropriate, are closely involved in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater and surface water. As part of the CEQA process a hydrology and water quality evaluation was conducted. The Project would not degrade surface water or groundwater resources. The Project would comply with NPDES requirements. A SWPPP would be prepared in accordance with the IGP and BMPs would be implemented (Refer to Section 3.7 – Hydrology/Water Quality).

Policy	Consistency Analysis
WR-2.7 – Industrial and Agricultural Sources: The County shall work with agricultural and industrial concerns to ensure that water contaminants and waste products are handled in a manner that protects the long-term viability of water resources in the County.	**The Project is consistent with this policy:** The CVRRWQCB, CDFW, US Army Corp of Engineers are responsible agencies and, as appropriate, are closely involved in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater and surface water. As part of the CEQA process a hydrology and water quality evaluation was conducted. The Project would not contaminate surface or groundwaters resources. The Project would comply with NPDES requirements. A SWPPP would be prepared in accordance with the IGP and BMPs would be implemented (Refer to Section 3.7 – Hydrology/Water Quality).
WR-2.8 – Point Source Control: The County shall work with the Regional Water Quality Control Board to ensure that all point source pollutants are adequately mitigated (as part of the California Environmental Quality Act review and project approval process) and monitored to ensure long-term compliance.	**The Project is consistent with this policy:** The CVRRWQCB is a responsible agency in the CEQA process**.** The Project would comply with all applicable requirements associated with groundwater. As part of the CEQA process a hydrology and water quality evaluation was conducted. It included field studies to identify baseline groundwater conditions (Refer to Section 3.7 – Hydrology/Water Quality).
WR-3: To provide a sustainable, long-term supply of water resources to meet domestic, agricultural, industrial, and recreational needs and to assure that new urban development is consistent with available water resources.	
WR-3.1 – Develop Additional Water Sources: The County shall encourage, support and, as warranted, require the identification and development of additional water sources through the expansion of water storage reservoirs, development of groundwater banking for recharge and infiltration, and promotion of water conservation programs, and support of other projects and programs that intend to increase the water resources available to the County and reduce the individual demands of urban and agricultural users.	**The Project is consistent with this policy:** One of the objectives of the Project is to capture and re-regulate water in order to manage water supplies to increase the long-term availability of irrigation supplies, and groundwater recharge supplies (Refer to Section 3.7 – Hydrology/Water Quality).
WR-3.3 – Adequate Water Availability: The County shall review new development proposals to ensure the intensity and timing of growth will be consistent with the availability of adequate water supplies. Projects must submit a Will-Serve letter as part of the application process, and provide evidence of adequate and sustainable water availability prior to approval of the tentative map or other urban development entitlement.	**The Project is consistent with this policy:** One of the main Project objectives and benefits is to capture and re-regulate flows of the Lower Kaweah River and the St. Johns River for purposes of storm water layoff and flood prevention. Therefore, the Project would be consistent with the availability of adequate water supplies, and would potentially increase the local water supply available to local agriculture.

Policy	Consistency Analysis
WR-3.5 – Use of Native and Drought Tolerant Landscaping: The County shall encourage the use of low water consuming, drought-tolerant and native landscaping and emphasize the importance of utilizing water conserving techniques, such as night watering, mulching, and drip irrigation.	**The Project is consistent with this policy:** No landscaping is proposed as part of the Project.
WR-3.10 – Diversion of Surface Water: Diversions of surface water or runoff from precipitation should be prevented where such diversions may cause a reduction in water available for groundwater recharge.	**The Project is consistent with this policy.** One of the objectives of the Project is to capture and re-regulate water in order to manage water supplies to increase the long-term availability of irrigation supplies, and groundwater recharge supplies (Refer to Section 3.7 – Hydrology/Water Quality).
Transportation & Circulation	
TC-1: To promote an efficient roadway and highway system for the movement of people and goods, which enhances the physical, economic, and social environment while being safe, environmentally friendly, and cost-effective.	
TC-1.14 – Roadway Facilities: As part of the development review process, new development shall be conditioned to fund, through impact fees, tonnage fees, and/or other mechanism, the construction and maintenance of roadway facilities impacted by the project. As projects or locations warrant, construction or payment of pro-rata fees for planned road facilities may also be required as a condition of approval.	**The Project is consistent with this policy:** As discussed in Section 1.0 – Introduction, the Project would not result in additional vehicles/trucks on offsite public roadways.
TC-1.15 – Traffic Impact Study: The County shall require an analysis of traffic impacts for land development projects that may generate increased traffic on County roads. Typically, applicants of projects generating over 100 peak hour trips per day or where LOS "D" or worse occurs, will be required to prepare and submit this study. The traffic impact study will include impacts from all vehicles, including truck traffic.	**The Project is consistent with this policy:** As discussed in Section 1.0 – Introduction, the Project would not result in additional vehicles/trucks on offsite public roadways. Additionally, there are no proposed changes to the existing Project access routes connecting to arterial roads. Regardless, a traffic analysis technical memorandum was prepared to further document that the Project would not have an impact on offsite traffic or Level of Service (LOS) (see Appendix I).

Policy	Consistency Analysis
TC-1.16 – County Level of Service (LOS) Standards: The County shall strive to develop and manage its roadway system (both segments and intersections) to meet a LOS of "D" or better in accordance with the LOS definitions established by the Highway Capacity Manual.	**The Project is consistent with this policy:** As discussed in Section 1.0, the Project would not result in additional vehicles/trucks on offsite public roadways. Therefore, the Project would not impact existing LOS on County roadways. Regardless, a traffic analysis technical memorandum was prepared to further document that the Project would not have an impact on offsite traffic or LOS (see Appendix I).
TC-3: To enhance airports in the County to meet the County's changing needs and demands while minimizing adverse airport related environmental impacts and safety hazards.	
TC-3.4 – Airport Compatibility: Protect existing and future airport operations from encroachment by potentially incompatible land uses and require developers to file an aviation easement with the County if a proposed development or expansion of an existing use is located within the approach or approach transition zones designation in the Tulare County Comprehensive Airport Land Use Plan.	**The Project is consistent with this policy:** Per the Tulare County Comprehensive Airport Land Use Plan, the Project site is not located within the approach or approach transition zone of a County airport.
Public Facilities & Safety	
PFS-1: To establish and maintain acceptable levels of service, minimize costs, and provide criteria for determining the location, capacity, and timing of existing and future public facilities and services.	
PFS-1.2 – Maintain Existing Levels of Services: The County shall ensure new growth and developments do not create significant adverse impacts on existing County-owned and operated facilities.	**The Project is consistent with this policy:** Through the CEQA, SMARA and County review and approval process, the County shall ensure the Project would not create significant adverse impacts on existing County-owned and operated facilities.
PFS-1.3 – Impact Mitigation: The County shall review development proposals for their impacts on infrastructure (for example, sewer, water, fire stations, libraries, streets, etc). New development shall be required to pay its proportionate share of the costs of infrastructure improvements required to serve the project to the extent permitted by State law. The lack of available public or private services or adequate infrastructure to serve a project, which cannot be satisfactorily mitigated by the project, may be grounds for denial of a project or cause for the modification of size, density, and/or intensity of the project.	**The Project is consistent with this policy:** The Project would not impact existing County infrastructure (e.g., sewer, water, fire stations, libraries, streets, etc.), nor would it require the County to construct new or expand existing infrastructure. Through the CEQA, SMARA and County review and approval process, the County shall ensure the Project is sufficient served by existing infrastructure.

Policy	Consistency Analysis
PFS-1.4 – Standards of Approval: The County should not approve any development unless the following conditions are met: 1. The applicant can demonstrate all necessary infrastructure will be installed and adequately financed, 2. Infrastructure improvements are consistent with adopted County infrastructure plans and standards, and 3. Funding mechanisms are provided to maintain, operate, and upgrade the facilities throughout the life of the project.	**The Project is consistent with this policy:** The Project would not require the expansion existing or installation of new infrastructure. Through the CEQA, SMARA and County review and approval process, the County shall ensure the Project is sufficient served by existing infrastructure.
PFS-2: To ensure the provision of a reliable, safe, and adequate supply of high quality water as well as effective distribution and storage facilities to meet the existing and future needs in the County.	
PFS-2.2 – Adequate Systems: The County shall review new development proposals to ensure that the intensity and timing of growth will be consistent with the availability of adequate production and delivery systems. Projects must provide evidence of adequate system capacity prior to approval.	**The Project is consistent with this policy:** The Project would not require the expansion existing or installation of new water infrastructure. The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies via water re-regulation. This would help the County in their goal to provide reliable, safe, and adequate supply of high-quality water to meet the regional needs.
PFS-2.3 – Well Testing: The County shall require new development that includes the use of water wells to be accompanied by evidence that the site can produce the required volume of water without impacting the ability of existing wells to meet their needs.	**The Project is consistent with this policy:** A hydrologic study was prepared to evaluate potential impacts on local wells and it was demonstrated that the Project would not impact exiting nearby water wells (see Appendix G). A groundwater well would be installed in accordance with County rules and regulations.
PFS-3: To ensure the provision of adequate wastewater collection, treatment, and disposal within the County.	
PFS-3.2 – Adequate Capacity: The County shall require development proposals to ensure the intensity and timing of growth is consistent with the availability of adequate wastewater treatment and disposal capacity.	**The Project is consistent with this policy:** The Project would not require any new wastewater treatment facilities. Therefore, the Project would no impact the County's existing disposal capacity.
PFS-4: To ensure the management of stormwater in a safe and environmentally sensitive manner through the provision of adequate storm drainage facilities that protect people and property.	

Policy	Consistency Analysis
PFS-4.3 – Development Requirements: The County shall encourage project designs that minimize drainage concentrations and impervious coverage, avoid floodplain areas, and where feasible, provide a natural watercourse appearance.	**The Project is consistent with this policy:** The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies. No impervious surfaces are proposed, and, once constructed, the reservoir would have a natural appearance consistent with the surrounding landscape.
PFS-5: To ensure the safe and efficient disposal and recycling of solid and hazardous waste generated in the County.	
PFS-5.6 – Ensure Capacity: The County shall require evidence that there is adequate capacity within the solid waste system for the processing, recycling, transmission, and disposal of solid waste prior to approving new development.	**The Project is consistent with this policy:** Project would not generate significant quantities of solid waste. The County's existing solid waste disposal infrastructure is sufficient to serve the proposed Project.
PFS-5.8 – Hazardous Waste Disposal Capabilities: The County shall require the proper disposal and recycling of hazardous materials in accordance with the County's Hazardous Waste Management Plan.	**The Project is consistent with this policy:** Project is not expected to generate hazardous waste. If generated, hazardous waste would be properly stored and disposed of in accordance with the County's Hazardous Waste Management Plan. A HMBP and Contingency Plan, SWPPP and SPCC have been prepared for the Project.
PFS-7: To provide adequate fire and law enforcement facilities and services to ensure the safety of County residents and the protection of County property.	
PFS-7.2 – Fire Protection Standards: The County shall require all new development to be adequately served by water supplies, storage, and conveyance facilities supplying adequate volume, pressure, and capacity for fire protection.	**The Project is consistent with this policy:** The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies via water re-regulation. As such, the Project would enhance local water supply systems. Existing fire protection infrastructure would be sufficient to serve the Project.
Part II – Area Plan Policies	
Rural Valley Lands Plan Policies	
RVLP-1: To sustain the viability of Tulare County's agriculture by restraining division and use of land which is harmful to continued agricultural use of non-replaceable resources.	

Policy	Consistency Analysis
RVLP-1.4 – Determination of Agriculture Land: The County shall not allow re-zoning of parcels that accumulate 17 or more points according to the RVLP Development Criteria (contained in Section 1.3 of this chapter). If the number of points accumulated is 11 or less, the parcel may be considered for non-agricultural zoning. A parcel receiving 12 to 16 points shall be determined to have fallen within a "gray" area in which no clear cut decision is readily apparent. In such instances, the Planning Commission and Board of Supervisors shall make a decision based on the unique circumstances pertaining to the particular parcel of land, including factors not covered by this system.	**The Project is consistent with this policy:** The Project is located in an area designated Valley Agriculture, Mineral Resources Zone (MRZ-2b), as well as Grazing Land per the FMMP. The Project site is zoned AE-20. The Project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance to non-agricultural activities. The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies. As discussed in Section 3.11.2.3, the Project would not re-zone any parcels, and the proposed use (i.e., aggregate extraction and water storage reservoir) is an allowable use in the AE-20 zone upon "approval of a reclamation plan and approval of financial assurances".

Based on the consistency evaluation provided in Table 3.11-2 above, the Project does not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.11.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative

analysis. The cumulative projects are listed in Table 3-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Therefore, these projects are not considered to have a potential cumulative impact related to land use and planning.

As discussed in this Section, the Project was determined to be consistent with the County General Plan and Zoning designations for the Project site, and with the County's General Plan policies, which is summarized in Table 3.11-2. The Project impacts are less than significant. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to land use and planning.

3.12 MINERAL RESOURCES

3.12.1 Introduction

This section of the DEIR presents a discussion of mineral resources. A review of potential Project impacts is provided in the following analysis.

3.12.2 Environmental Setting

3.12.2.1 Regional and Local Setting

The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20 Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). The State Geologist, in accordance with the State Board's Guidelines for Classification and Designation of Mineral Lands, has classified the underlying land as MRZ-2b, which includes:

> *Areas underlain by mineral deposits where geologic data indicate that significant inferred resources are present. Areas classified MRZ-2b contain discovered mineral deposits that are either significant inferred resources or indicated reserves. Land included in MRZ-2b is of importance because it contains potential economic mineral deposits.*

An example of loss of availability in this instance would be the development of residential housing atop an area classified by the State Geologist as MRZ-2b. The excavation of lands so classified, and the subsequent processing of the resulting materials, is the utilization of such resources, which is consistent with an MRZ-2b classification.

3.12.3 Regulatory Setting

The Project is subject to a variety of land use regulatory requirements and designations, which are discussed fully in the sections to follow.

3.12.3.1 Federal

There are no federal mineral resource regulations that directly affect the Project.

3.12.3.2 State

Surface Mining and Reclamation Act (SMARA)

Even though the Project is the construction and operation of a water storage and re-regulation reservoir, it is located within a designated MRZ zone. A MRZ zone is a designation by the State Mining and Geology Board (SMGB) that classifies the area as containing a mineral resource of regional or statewide significance. Because the sand and gravel (aggregate) located underneath the Project site is considered a high-quality aggregate and the Tulare County needs aggregate for construction materials, it is reasonable to use the material excavated for the construction of the reservoir as a marketable product. Therefore, West Coast Sand and Gravel (WCSG) (i.e., an aggregate mining company) has been contracted to excavate the aggregate beneath the Project site and process it at their facility on the Seaborn site such that it could be sold as high-quality construction grade aggregate. This would be beneficial to both the county and the

Project. However, by doing this, the Project would be subject to the Surface Mining and Reclamation Act (SMARA).

The County of Tulare (specifically, the Tulare County Resource Management Agency (RMA)) allows mining and the extraction of minerals via permits within the AE-20 zone upon "*approval of a reclamation plan and approval of financial assurances*" (Tulare County Ordinance Code, Section 7-25-1085). Tulare County Ordinance Code Section 7-25-1020 provides that "*appurtenant uses*" typical of a surface mining operation "*may be permitted through the surface mining permit approved for surface mining operations in lieu of requiring a special use permit, when such uses are found by the Planning Commission to be a reasonably necessary adjunct to the mining operations.*" (Tulare County).

California's Surface Mining and Reclamation Act (SMARA) provides a comprehensive surface mining and reclamation policy with the regulation of surface mining operations to assure that adverse environmental impacts are minimized, and mined lands are reclaimed to a usable condition. SMARA's Section 2762(a) requires the SMARA Lead Agency (in this case, the County of Tulare for this Project) to:

> *"…establish mineral resource management policies to be incorporated in its general plan which will:*
>
> *(1) Recognize mineral information classified by the State Geologist and transmitted by the board.*
>
> *(2) Assist in the management of land use which affect areas of statewide and regional significance.*
>
> *(3) Emphasize the conservation and development of identified mineral deposits."*

SMARA requires the following be approved by the SMARA lead agency (the County) and requires the concurrence from Department of Mine Reclamation (DMR) before mining may begin:

- Surface Mining Permit;
- Reclamation Plan; and
- Financial Assurance Mechanism.

SMARA §2773.1(a)(3) requires that the financial assurances for each mining operation be adjusted annually to account for new lands disturbed, inflation, and reclamation of lands accomplished in accordance with SMARA and the site's approved reclamation plan. Section 3804 of the State regulations states: "The financial assurance amount shall be calculated and based on (1) an analysis of the physical activities and materials necessary to implement the approved reclamation plan; (2) the lead agency's unit costs, or costs for third party contracting, for each of these activities, if applicable, (3) the number of units of each of these activities, if applicable; (4) a contingency amount not to exceed 10% of the reclamation cost. The calculated amount should not include the cost of completing mining of the site." In order to meet the SMARA requirement, surface mining operators must submit a Financial Assurance Cost Estimate (FACE) each year.

3.12.3.3 Local

County of Tulare – General Plan

The General Plan has a number of policies that apply to projects within Tulare County. General Plan policies that potentially relate to the proposed Project are listed below.

> ***ERM-2.1 Conserve Mineral Deposits:*** *The County will encourage the conservation of identified and/or potential mineral deposits, recognizing the need for identifying, permitting, and maintaining a 50-year supply of locally available PCC grade aggregate.*
>
> ***ERM-2.3 Future Resource Development:*** *The County will provide for the conservation of identified and/or potential mineral deposits within Tulare County as areas for future resource development. Recognize that mineral deposits are significantly limited within Tulare County and that they play an important role in support of the economy of the County.*
>
> ***ERM-2.10 Incompatible Development:*** *Proposed incompatible land uses in the County shall not be on lands containing or adjacent to identified mineral deposits, or along key access roads, unless adequate mitigation measures are adopted or a statement of overriding considerations stating public benefits and overriding reasons for permitting the proposed use are adopted.*
>
> ***ERM-4.6 Renewable Energy:*** *Proposed incompatible land uses in the County shall not be on lands containing or adjacent to identified mineral deposits, or along key access roads, unless adequate mitigation measures are adopted or a statement of overriding considerations stating public benefits and overriding reasons for permitting the proposed use are adopted.*

3.12.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Mineral Resources" a project is considered to have a significant impact on the environment if it would:

a) *Result in the loss of availability of a known mineral resource that would be of value to the region and residents of the state (CEQA Appendix G Threshold (a))?*

b) *Result in the loss of availability of a locally-important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan (CEQA Appendix G Threshold (b))?*

3.12.5 Methodology of Analysis

The following points were considered in the mineral resource evaluation:

- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.
- In identifying the area underlying the Project site as MRZ-2b, the State of California and the County General Plan have determined this area contains mineral deposits where geologic data show that significant measured or indicated resources are present, or where geologic

information indicates that significant inferred resources are present. Land included in the MRZ-2b category is of prime importance because it contains known economic mineral deposits. A typical MRZ-2b area would include an operating mine, or an area where extensive sampling indicates the presence of a significant mineral deposit. This site is also designated by the State as having aggregate deposits of regional significance.

3.12.6 Project-Level Impacts and Mitigation Measures

3.12.6.1 Loss of Availability of a Known Mineral Resource

Impact Statement

Impact MIN-1: *Would the Project result in the loss of availability of a known mineral resource that would be of value to the region and residents of the state?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

Implementation of the Project would not result in the loss of availability of a known mineral resource that is either locally-important or of value to the residents in the region or the State. Rather, as a result of the need to excavate the Project site in order to construct the reservoir, the Project proposes to develop this resource.

The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20 Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). The State Geologist, in accordance with the State Board's Guidelines for Classification and Designation of Mineral Lands, has classified the underlying land as MRZ-2b, which includes:

> *Areas underlain by mineral deposits where geologic data indicate that significant inferred resources are present. Areas classified MRZ-2b contain discovered mineral deposits that are either significant inferred resources or indicated reserves. Land included in MRZ-2b is of importance because it contains potential economic mineral deposits.*

An example of loss of availability in this instance would be the development of residential housing atop an area classified by the State Geologist as MRZ-2b. The excavation of lands so classified, and the subsequent processing of the resulting materials, is the utilization of such resources, which is consistent with an MRZ-2b classification.

The Project would have no impact on mineral resources.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.12.6.2 Conflict with Applicable Plans, Policies or Regulations

Impact Statement

Impact MIN-2: *Would the Project result in the loss of availability of a locally-important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

See Section 3.12.6.1, above. Implementation of the Project would not result in the loss of availability of a known mineral resource that is either locally-important or of value to the residents in the region or the State. Rather, as a result of the need to excavate the Project site in order to construct the reservoir, the Project proposes to develop this resource.

The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone, 20 Acre Minimum), with a General Plan designation of Valley Agriculture, Mineral Resource Area (MRZ-2b). An example of loss of availability in this instance would be the development of residential housing atop an area classified by the State Geologist as MRZ-2b. The excavation of lands so classified, and the subsequent processing of the resulting materials, is the utilization of such resources, which is consistent with an MRZ-2b classification.

The Project would have no impact on mineral resources.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.12.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project (2 are existing aggregate mining operations, and 1 is a community plan update) while three (3) other projects are located within 3 miles of the Project (1 existing aggregate mining operation, 1 residential sub-division, and 1 stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to land use and planning.

As discussed in this Section, the Project would not result in the loss of availability of a known mineral resource that would be of value to the region and residents of the Tulare County or result in the loss of a locally-important mineral resource recovery site delineated in a local general plan, specific plan, or other land use plan. Conversely, the Project would facilitate the utilization of such resources, which is consistent with an MRZ-2b classification. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to mineral resources.

3.13 NOISE

3.13.1 Introduction

This section discusses the existing noise environment in the vicinity of the Project site and quantifies the potential noise impacts that may result from implementation of the Project. Analysis in this section is based on the State CEQA Guidelines (CCR Section 15000 et. Seq.), the Tulare County General Plan – 2030 Update (Tulare County, 2012), and other applicable federal and state guidelines related to noise and vibration. A Noise Impact Assessment (NIA) prepared by Sespe Consulting, Inc. (Sespe Consulting, Inc., 2021) is included in Appendix H and provides additional technical analysis.

3.13.1.1 Characteristics of Noise

Noise is often described as unwanted sound. Sound is defined as any pressure variation in air that the human ear can detect. If the pressure variations occur frequently enough (at least 20 times per second) they can be heard by the human ear and are called sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second, called Hertz (Hz).

Measuring sound directly in terms of pressure requires use of a large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the human hearing threshold (20 micropascals of pressure) as a point of reference, defined as 0 decibels (dB). Other sound pressure levels are divided by the reference pressure, and the logarithm is used to keep the dB values within a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB. Another useful aspect of the decibel scale is that changes in decibel levels correspond closely to human perception of relative loudness as presented in Table 3.13-1.

The perceived loudness of sound is dependent upon many factors, including sound pressure level (i.e., amplitude) and frequency of the sound waveform. However, within the usual range of environmental noise levels, frequency perception of loudness is relatively predictable, and can be approximated by weighing the sound level pressures between 1,000 and 5,000 Hz, which are the most sensitive frequencies perceived by a healthy human ear and coincidentally span the natural frequency range of human speech. This weighting comes in several varieties used for different purposes, but the A-weighting scale is applicable here. There is a strong correlation between A-weighted sound levels (expressed as dBA) and human response to noise. For this reason, the A-weighted sound level is the standard for environmental noise regulations and impact assessments. Noise levels reported in this section are A-weighted levels as required for comparison to applicable thresholds. Table 3.13-1 provides sound pressure levels of typical noise sources in units of dBA and micropascals (µPa) of pressure.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level (L_{eq}) over a given time period (usually one hour or less). The L_{eq} is also the foundation of the Day-Night Average Level (L_{dn}) and the Community Noise Equivalent Level (CNEL) noise descriptors presented below, each of which has a strong correlation with community response to noise. The maximum sound level (L_{max}) represents the highest

instantaneous noise level recorded over a given time period (usually one hour or less), and may also be utilized to assess noise impacts.

Table 3.13-1. Typical A-Weighted Sound Levels of Common Noise Sources

Loudness Ratio	Micropascals (µPa)	dBA	Description
128	63,245,553	130	Threshold of Pain
64	20,000,000	120	Jet aircraft Take-Off at 100 feet
32	6,324,555	110	Riveting Machine at Operator's Position
16	2,000,000	100	Shotgun at 200 feet
8	632,456	90	Bulldozer at 50 feet
4	200,000	80	Diesel Locomotive at 300 feet
2	63,246	70	Commercial Jet Aircraft Interior During Flight
1	20,000	60	Normal Conversation Speech at 5-10 feet
0.5	6,325	50	Open Office Background Level
0.25	2,000	40	Background Level Within a Residence
0.125	632	30	Soft Whisper at 2 feet
0.0625	200	20	Interior of Recording Studio

Source: (US EPA, 1971) and (Federal Interagency Committee on Noise, 1992).

The Day-Night Average Level (L_{dn}) is the weighted average noise level over a 24-hour day, with a +10 dB penalty applied to noise occurring at night (10:00 p.m. to 7:00 a.m.). The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average, it tends to smooth out short-term variations in the noise environment. L_{dn} based noise standards are commonly used to assess noise impacts associated with variable noise sources, such as transportation sources (i.e., traffic, railroad and aircraft noise).

Similar to L_{dn}, Community Noise Equivalent Level (CNEL) is also based upon the weighted average noise level over a 24-hour day, with a +5 dB penalty applied to noise during the evening (7:00 p.m. to 10:00 a.m.) and a +10 decibel penalty applied to noise during the night (10:00 p.m. to 7:00 a.m.). These penalties or weightings account for the noise sensitive time periods during the evening and night hours, when people are generally at home, possibly sleeping, and more sensitive to sound.

The maximum sound level (L_{max}) presents the highest instantaneous noise level recorded over a given time period (usually one hour or less) and is useful because it captures short and/or intermittent noise sources (e.g., railroads, aircraft noise) within a noise environment, which are of objectionable amplitude but would be lost with average L_{dn} or CNEL noise descriptors.

3.13.1.2 Characteristics of Groundborne Vibration

Vibration is like noise transmitted through movement of the ground rather than the air. Both involve a source, a transmission path, and a receptor. Both noise and vibration consist of a pressure value having an amplitude and frequency. A person's response to vibration depends on their individual sensitivity as

well as the amplitude and frequency of the source. Additionally, damage to structures can occur when exposed to groundborne vibration.

Vibration is usually described in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration in terms of peak particle velocity (PPV), usually measured in inches per second (in/sec). Standards pertaining to human perception and damage to structures are expressed in terms of PPV. Although aggregate mining and processing vibration levels for this Project would be minimal due to the relatively large distances from Project sources to acoustically sensitive receptors, and the absence of blasting, an assessment of vibration levels at nearby receptors is nonetheless addressed.

According to the California Department of Transportation's (Caltran's) *Transportation and Construction Vibration Guidance Manual* (Caltrans, 2020), operation of construction equipment and certain construction techniques (e.g., pile driving) generate groundborne vibration. Traffic on roadways is also a source of vibration. At high enough amplitudes, ground vibration has the potential to damage structures and/or cause cosmetic damage (e.g., crack plaster). Ground vibration can also be a source of annoyance to individuals who live and/or work in proximity to vibration-generating activities. Traffic, including heavy duty trucks (i.e., haul trucks) traveling on a highway, rarely generates vibration high enough to cause structural or cosmetic damage.

As vibrations travel outward from the source, they excite the particles of rock and soil through which they pass and cause them to oscillate by a few ten-thousandths to a few thousandths of an inch. Transmissivity of subsurface geology and distance from the source affect attenuation rate and the intensity of resulting vibration experienced by a receptor. Vibration amplitudes generally decrease with increasing distance. The velocity of particle movement is the commonly accepted descriptor of the vibration "strength." This is referred to as the peak particle velocity (PPV) and is typically measured in a unit of time (e.g., in/sec).

Human response to vibration varies. Vibration can be felt or heard well below the levels that would damage structures. The duration of the event has an effect on human response, as does frequency. Generally, as the duration and vibration frequency increase, the potential for adverse human response increases.

Human and structural responses to vibration are influenced by a number of factors, including geology, construction materials, age of structure, distance between source and receptor, duration, and the number of perceived vibration events.

Table 3.13-2 displays the human response to transient vibration sources (i.e., construction/mobile equipment) in terms of PPV vibration levels.

Table 3.13-2. General Human Responses to Transient Vibration Levels

Human Response to Vibration	Peak Vibration Threshold (in./sec. PPV)
Severe	2.0
Strongly perceptible	0.9
Distinctly perceptible	0.24
Barely perceptible	0.035

3.13.2 Environmental Setting

3.13.2.1 Regional Setting

The Project site is located in a semi-rural area of unincorporated Tulare County, in the easterly portion of the San Joaquin Valley, California. The existing ambient noise environment experienced by residential receptors closest to the Project site consists primarily of natural sounds (wind, birds, insects, etc.), local roadway traffic (e.g., SR-228/Lomitas Drive, SR-198/Sierra Drive, etc.), crop dusters/occasional commercial aircraft over-flights, aggregates mining and processing (e.g., Seaborn facility, CEMEX Lemon Cove facility, Kaweah South facility, etc.), and commercial agricultural operations. Nearby urban centers include the census-designated community of Lemon Cove (1.0 miles to the southeast) and the City of Woodlake (2.5 miles to the northwest); however, urban activities from these nearby communities are generally not audible at the Project site. The closest airports/airstrips are the Woodlake Airport, located approximately 2.4 miles away to the west, and the larger Exeter Airport, located approximately 11.3 miles away to the southwest. Neither airport has an appreciable influence on noise levels near the Project site. See Figure 3.13-1 and Figure 3.13-2 below which show the regional location of the Project site as well as nearby receptors of concern.

3.13.2.2 Local Setting

Local Vibration Environment

The existing ambient vibration environment in the immediate Project vicinity is extremely low, as would be expected in typical environments with no appreciable sources of local vibration. During field visits, Sespe staff could not detect any appreciable groundborne vibrations resulting from adjacent land uses, including the nearby aggregate and agricultural operations. Background vibration levels around the Project perimeter are less than the threshold of perception.

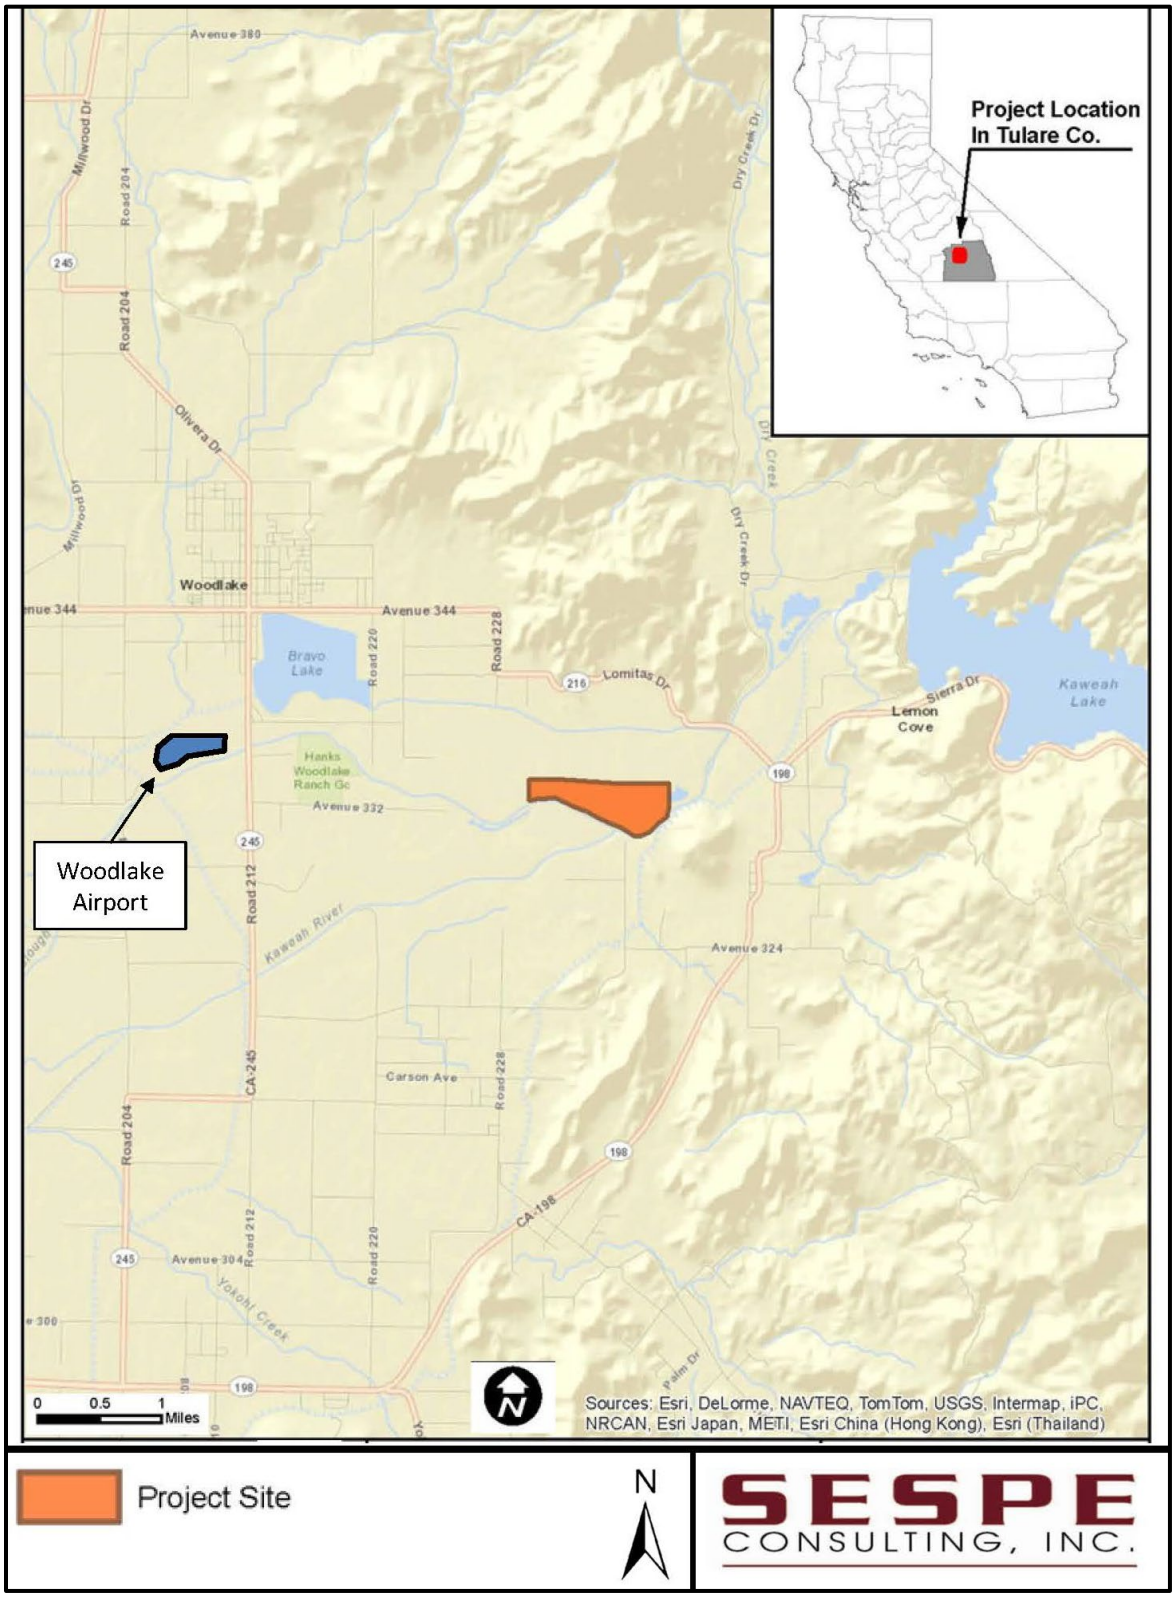
Local Noise Environment

The existing ambient noise environment is consistent with that of typical semi-rural areas. As discussed above, existing noise sources near the Project site receptors include equipment noise from aggregates mining and agricultural operations, vehicular noise from adjacent roadways, occasional aircraft over-flights, and natural sounds. The existing aggregate operations and surrounding noise sources constitute the existing physical conditions.

To quantify the existing ambient (i.e., baseline) noise environment experienced by neighboring receptors closest to the Project site, a total of sixteen (16) short-duration (15-minute) measurements and one (1)

long-duration (24-hour) reference noise measurement were collected at ten (10) locations surrounding the Project site on October 21st and 22nd, 2020 (see Figure 3.13-2). The noise measurements were recorded using two (2) Quest DL SoundPro, Type 2 noise meters (Serial #'s BGI04008, BIJ090010). Noise meters were programmed in "slow" mode, in "A" weighted form, and logging every minute. The microphones were equipped with a windscreen during measurements, and noise meters were calibrated using two (2) Quest QC-10 calibrators (Serial #'s QIB070141, QIJ090052) prior to, and following each, measurement taken.

As discussed in Section 3.13.3.3 – Local Regulatory Setting, noise sensitive land uses (i.e., receptors) are defined as "residential areas, hospitals, convalescent homes and facilities, schools, and other similar land uses" within the Tulare County General Plan (Tulare County, 2012). Per the County noise standards and General Plan criteria, noise impacts to nearby commercial and industrial receptors, specifically the Seaborn and CEMEX Lemon Cove aggregate facilities, resulting from the Project are not assessed. The locations of the baseline noise measurement and the corresponding Project site receptors are shown on Figure 3.13-2. The long-duration (i.e., 24-hour) measurement represents a receptor (R1), and was also utilized as a reference measurement to quantify the Day-Night Average (L_{dn}) noise levels at the other receptor locations where only short-duration measurements were collected. The details of these calculations are presented in Appendix H.



The monitoring locations and associated receptors are provided on Table 3.13-3. The closest relevant receptor in each direction from the Project site was included. Furthermore, measurements at these closest receptors conservatively account for potentially-affected receptors located at locations farther from the Project noise sources. When appropriate, receptors are grouped together and the noise impact at the worst-case portion of the group is determined. See Figure 3.13-2 for the locations of the Project site receptors respectively.

Table 3.13-3. Summary of Monitoring Locations

Receptor	Duration	Date(s) Measured	Time Start	Time Stop	Description
R1	24-hours	10/21/20 10/22/20	1:29 p.m. ---	--- 1:29 p.m.	Residence owned by Tulare Irrigation District (TID), south of Project Site.
R2	30-mins	10/21/20 10/22/20	5:29 p.m. 10:52 a.m.	5:44 p.m. 11:07 a.m.	Residence southwest of Project site, along Road 228.
R3	30-mins	10/21/20 10/22/20	5:08 p.m. 11:18 a.m.	5:23 p.m. 11:33 a.m.	Residence southeast of Project site, along Goodale Lane.
R4	30-mins	10/21/20 10/22/20	4:42 p.m. 11:18 a.m.	4:57 p.m. 11:33 a.m.	Residence(s) east of Project site, adjacent to SR-198.
R5	30-mins	10/21/20 10/22/20	3:27 p.m. 12:06 p.m.	3:42 p.m. 12:21 p.m.	Residence north/northeast of Project site, along a private dirt road connecting to SR-216.
R6	30-mins	10/21/20 10/22/20	3:27 p.m. 12:06 p.m.	3:42 p.m. 12:21 p.m.	Residence north of Project site, along a private dirt road connecting to SR-216.

Receptor	Duration	Date(s) Measured	Time Start	Time Stop	Description
R7	30-mins	10/21/20 10/22/20	3:03 p.m. 12:29 p.m.	3:18 p.m. 12:44 p.m.	Residence north of Project site, along a private dirt road connecting to SR-216.
R8	30-mins	10/21/20 10/22/20	2:43 p.m. 12:53 p.m.	2:58 p.m. 1:08 p.m.	Residence northwest of Project site, along Road 228.
R9	30-mins	10/21/20 10/22/20	5:50 p.m. 1:14 p.m.	6:05 p.m. 1:29 p.m.	Residence(s) west of Project site, along Avenue 335 west of the Seaborn facility.
R10	30-mins	10/21/20 10/22/20	10:25 a.m. 1:34 p.m.	10:40 a.m. 1:49 p.m.	Residence west of Project site, along Avenue 332.

Note: Figure 3.13-2 below shows the receptor locations.

Figure 3.13-1 Location Map

THIS PAGE IS INTENTIONALLY BLANK

Source: *Noise Impact Assessment* (Sespe Consulting, Inc., 2021)

Figure 3.13-2 Noise Receptors & Measurement Locations

THIS PAGE IS INTENTIONALLY BLANK

Based on ambient noise measurements taken October 21st and 22nd, 2020, Table 3.13-4 presents the ambient noise levels at the receptors in the Project site vicinity. Noise from the existing aggregate operations is included in the ambient noise levels as the site was operating while the measurements were taken. Noise measurement logs and additional information regarding the background noise level determination are included in Appendix H. Project site monitoring locations are illustrated on Figure 3.13-2.

Long-term (i.e., 24-hour) measurements consist of daytime, evening and nighttime hours, and reveal average L_{eq} and L_{dn} noise levels. One (1) long-term measurement was collected at Receptor 1, a residence that is owned and rented out by the TID. This receptor is in close proximity to the Project site (approximately 250-feet to the south) but far away from any intermittent or high-intensity noise sources (i.e., roads, agricultural and mining operations, etc.), making it generally representative of existing ambient conditions near the Project site. The average hour L_{eq} value from long-term measurements during the applicable measurement periods, as well as the 24-hour L_{dn} are presented below in Table 3.13-4.

To estimate average L_{dn} noise levels for receptors where only short-duration (i.e., 15-minute) measurements were collected (i.e., R2 through R10), L_{eq} measurements collected at the long-duration (24-hour) reference location were compared to L_{eq} measurements at each short-duration receptor location(s) during the same time of day to determine the dBA difference between the two points. For example, Receptor 7 measurements (2 measurements, 15 minutes each) collected between 3:03 p.m. and 3:18 p.m. on 10/21/2020 and 12:29 p.m. and 12:44 p.m. on 10/22/2020, when compared to the L_{eq} values collected at the 24-hour reference point during the same time periods shows a noise level difference of +8.0 dBA and +1.8 dBA respectively (average noise difference equates to +4.9 dBA). This difference between the noise levels can be used as a correction factor, which is utilized to estimate the L_{dn} noise levels at each receptor where only short-duration measurements were collected. Additional details regarding these calculations are included in Appendix H. Using this concept, Table 3.13-4 shows the measured/estimated ambient noise levels (L_{eq} and L_{dn}) at each receptor.

Table 3.13-4. Ambient Noise in Project Site Vicinity (dBA)

Receptor	L_{eq}	Day-Night (L_{dn})
R1	43.8	47.6
R2	44.6	51.7
R3	50.2	59.3
R4	37.8	44.7
R5	56.5	57.4
R6	56.5	57.4
R7	47.0	52.5
R8	46.3	56.0
R9	41.1	51.8
R10	47.0	47.8

3.13.3 Regulatory Setting

Each level of government has some responsibility for reducing annoyances caused by noise and vibration. Each is discussed below.

3.13.3.1 Federal

The adverse impact of noise was officially recognized by the Federal government in the Noise Control Act of 1972 (42 U.S.C. § 4901 et seq.), which serves three purposes:

- Promulgate noise emission standards for interstate commerce (i.e., vehicle noise standards).
- Assist state and local transportation system noise abatement efforts.
- Promote noise education and research.

The Federal Office of Noise Abatement and Control (ONAC) was initially tasked with implementing the Noise Control Act. However, the ONAC has since been eliminated, leaving the development of federal noise policies and programs to other federal agencies and interagency committees. For example, the Occupational Safety and Health Administration (OSHA) agency prohibits exposure of workers to excessive sound levels. The Department of Transportation (DOT) assumes a significant role in noise control through its various operating agencies.

The Federal Aviation Administration (FAA) regulates noise from aircraft and airports. Surface transportation system noise is regulated by a host of agencies, including the Federal Transit Administration (FTA) (formerly the Urban Mass Transit Administration). Transit noise is regulated by the FTA, while freeways that are part of the interstate highway system are regulated by the Federal Highway Administration (FHWA). Finally, the Federal government actively advocates that local jurisdictions use their land use authority to arrange developments projects such that "noise sensitive" land uses are either prohibited from being sited adjacent to a highway or, alternately, that development projects are planned and constructed such that potential noise impacts are minimized.

Since the Federal government has preempted the setting of standards for noise levels that can be emitted by the transportation sources, the State and local governments may regulate transportation system noise by adopting nuisance abatement ordinances and through the land use planning process.

3.13.3.2 State

Established in 1973, the California Department of Health Services Office of Noise Control (ONC) was instrumental in developing regulatory tools that control and abate noise when implemented by local agencies. One significant tool is the "Land Use Compatibility for Community Noise Environments Matrix," which enables local agencies to more clearly delineate compatibility of sensitive uses with various levels of ambient noise.

Article 4 of the California Administrative Code (California Noise Insulation Standards, Title 24, Chapter 1) requires noise insulation in new hotels, motels, apartment houses, and dwellings (other than single-family detached housing) intended to prevent interior Day-Night (L_{dn}) and/or CNEL noise levels from exceeding

45 dBA. When such structures are located within a 60-dBA L_{dn} or CNEL noise contour, an acoustical analysis is required to ensure that interior levels will not exceed the 45-dBA limit.

State Government Code §65302 mandates that the legislative body of each county and city in California adopt a noise element as part of its comprehensive general plan. The noise element must recognize the Land Use Compatibility Guidelines published by the State Department of Health Services, which rank noise land use compatibility in terms of normally acceptable, conditionally acceptable, normally unacceptable, and clearly unacceptable.

3.13.3.3 Local

In California, cities and counties are required to adopt a noise element as part of their general plan. Cities and counties can also adopt noise control requirements through their zoning ordinances or as a separate noise ordinance. The Project site is located within the County of Tulare; therefore, the County noise standards are utilized to determine the significance of Project noise impacts.

Tulare County does not have any specific development codes or zoning ordinances related to noise or vibration; therefore, the County General Plan criteria, as discussed in the following sections, represent the only applicable noise thresholds by which Project impacts can be compared.

Tulare County General Noise Policies & Guidelines

The *Tulare County General Plan – 2030 Update*, Noise Element (Section 10.8) has a number of policies related to noise (Tulare County, 2012). General Plan noise policies that apply to the Project are listed below. Please note, the General Plan defines "noise sensitive land use(s)/receptors" to include "residential areas, hospitals, convalescent homes and facilities, schools, and other similar land uses" (Tulare County General Plan, Section 10 – Health and Safety).

HS-8.1 **Economic Base Protection** – The County shall protect its economic base by preventing the encroachment of incompatible land uses on known noise-producing industries, railroads, airports, and other sources.

HS-8.2 **Noise Impact Areas** – The County shall designate areas as noise-impacted if exposed to existing or projected noise levels that exceed 60 dB Ldn (or Community Noise Equivalent Level (CNEL)) at the exterior of buildings.

HS-8.3 **Noise Sensitive Land Uses** – The County shall not approve new noise sensitive uses unless effective mitigation measures are incorporated into the design of such projects to reduce noise levels to 60 dB Ldn (or CNEL) or less within outdoor activity areas and 45 dB Ldn (or CNEL) or less within interior living spaces.

HS-8.4 **Airport Noise Contours** – The County shall ensure new noise sensitive land uses are located outside the 60 CNEL contour of all public use airports.

HS-8.6 **Noise Level Criteria** – The County shall ensure noise level criteria applied to land uses other than residential or other noise-sensitive uses are consistent with the recommendations of the California Office of Noise Control (CONC).

Table 10.1: Land Use Compatibility for Community Noise Environments *(see Figure 3.13-3)*, is provided as a reference concerning the sensitivity of different land uses to their noise environment. It is intended to illustrate the range of noise levels which will allow the full range of activities normally associated with a given land use.

HS-8.7 **Inside Noise** – The County shall ensure that in instances where the windows and doors must remain closed to achieve the required inside acoustical isolation, mechanical ventilation or air conditioning is provided.

HS-8.8 **Adjacent Uses** – The County shall not permit development of new industrial, commercial, or other noise-generating land uses if resulting noise levels will exceed 60 dB Ldn (or CNEL) at the boundary of areas designated and zoned for residential or other noise-sensitive uses, unless it is determined to be necessary to promote the public health, safety and welfare of the County.

HS-8.10 **Automobile Noise Enforcement** – The County shall encourage the CHP, Sheriff's office, and local police departments to actively enforce existing sections of the California Vehicle Code relating to adequate vehicle mufflers, modified exhaust systems, and other amplified noise.

HS-8.11 **Peak Noise Generators** – The County shall limit noise generating activities, such as construction, to hours of normal business operation (7 a.m. to 7 p.m.). No peak noise generating activities shall be allowed to occur outside of normal business hours without County approval.

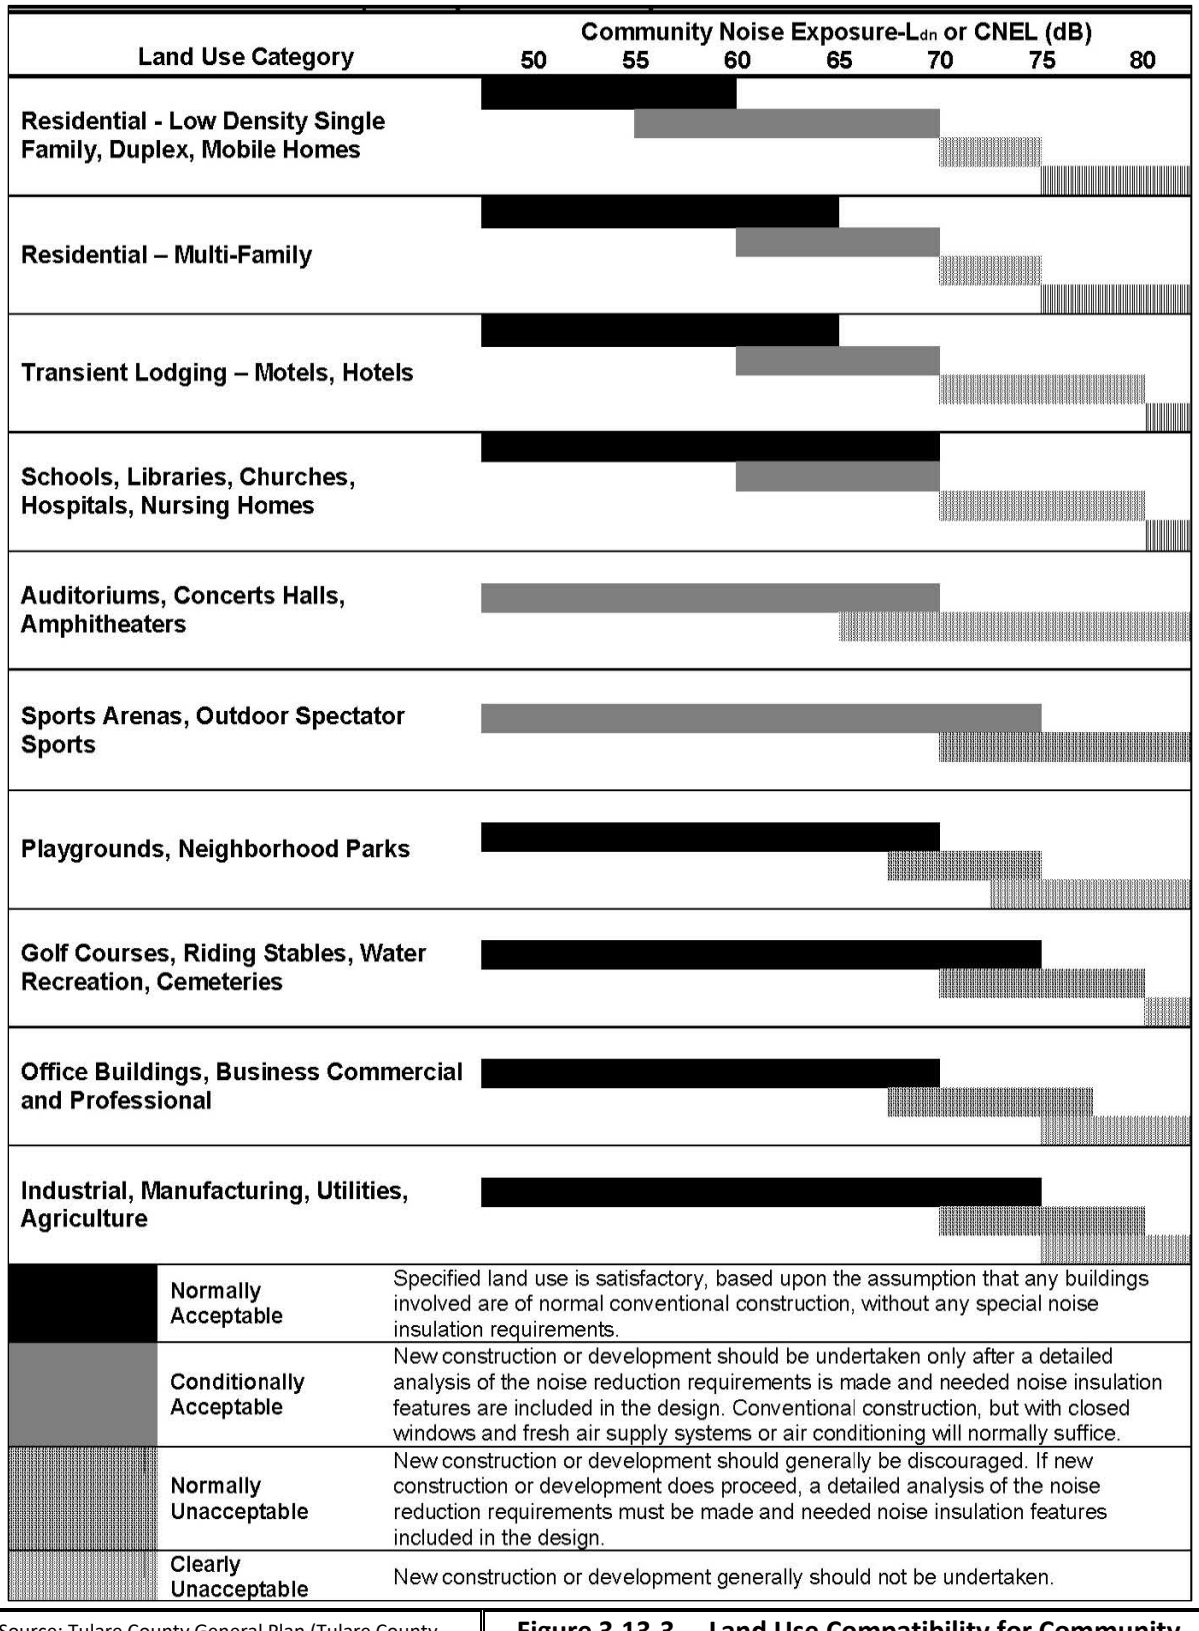
HS-8.13 **Noise Analysis** – The County shall require a detailed noise impact analysis in areas where current or future exterior noise levels from transportation or stationary sources have the potential to exceed the adopted noise policies of the Health and Safety Element, where there is development of new noise sensitive land uses or the development of potential noise generating land uses near existing sensitive land uses. The noise analysis shall be the responsibility of the project applicant and be prepared by a qualified acoustical engineer (i.e., a Registered Professional Engineer in the State of California, etc.). The analysis shall include recommendations and evidence to establish mitigation that will reduce noise exposure to acceptable levels (such as those referenced in Table 10-1 *(see Figure 3.13-3)* of the Health and Safety Element).

HS-8.14 **Sound Attenuation Features** – The County shall require sound attenuation features such as walls, berming, heavy landscaping, between commercial, industrial, and residential uses to reduce noise and vibration impacts.

HS-8.18 **Construction Noise** – The County shall seek to limit the potential noise impacts of construction activities by limiting construction activities to the hours of 7 am to 7 pm, Monday through Saturday when construction activities are located near sensitive receptors.

No construction shall occur on Sundays or national holidays without a permit from the County to minimize noise impacts associated with development near sensitive receptors.

HS-8.19 **Construction Noise Control** – The County shall ensure that construction contractors implement best practices guidelines (i.e., berms, screens, etc.) as appropriate and feasible to reduce construction-related noise impacts on surrounding land uses.



Vibration Criteria

Tulare County does not have any specific ordinances, policies, criteria or restriction related to groundborne vibration. However, the California Department of Transportation (Caltrans) has developed a set of criteria to assess the potential impacts caused by vibration-generating activities. Table 3.13-5 outlines threshold criteria for Project-related vibration impacts on nearby human populations, based on test subjects' responses to transient vibrations in terms of peak particle velocity (PPV) in units of inches per second (in/sec). These criteria form the basis of the groundborne vibration impact analysis in Section 3.13.6.8.

Table 3.13-5. Human Responses to Transient Vibration

PPV (inches/second)	Human Response
2.0	Severe
0.9	Strongly perceptible
0.24	Distinctly perceptible
0.035	Barely perceptible

Source: *Transportation and Construction Induced Vibration Guidance Manual* (Caltrans, 2020).

Figure 3.13-3 Land Use Compatibility for Community Noise Environments

3.13.4 Significance Thresholds

3.13.4.1 Appendix G Thresholds of Significance

According to Appendix G of the State CEQA Guidelines (CCR, Title 14, Division 6, Chapter 3, § 15000 – 15387), the Project would have a significant effect on public health and safety if there is:

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

b) Generation of excessive groundborne vibration or groundborne noise levels.

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

3.13.4.2 Additional Thresholds of Significance

Tulare County Noise Regulations

As described in Sections 3.13.3.3, Tulare County has adopted various guidelines, requirements and policies related to noise in their General Plan. Tulare County does not have any specific development codes or zoning ordinances related to noise, therefore the County General Plan criteria represent the only applicable noise thresholds by which Project impacts can be compared. The Tulare County noise thresholds are utilized to address CEQA Checklist item *a)*.

Table 3.13-6 presents the applicable unadjusted Project noise thresholds, which are derived from the Tulare County regulatory standards presented in Section 3.13.3.3 above.

Table 3.13-6. Unadjusted Tulare County Noise Standards

Parameter/Description	Day-Night (L_{dn}) or CNEL Average Noise Limit
Policy HS-8.8: Noise level not to be exceeded at the boundary of areas designated and zoned for residential or other noise-sensitive uses as a result of the Project activities.	60 dB(A)

Source: (Tulare County, 2012)

Although not specified within the Tulare County General Plan, generally in cases where the existing ambient noise levels exceed the applicable standards, then the noise level standard would be increased at +3 dBA increments to encompass the ambient noise. This concept corresponds with the concept that a +3 dBA increase or decrease is generally accepted as the minimum perceptible change in noise. Additionally, if ambient noise levels are within ±1 dBA of the applicable significance threshold, the applicable County noise level standards are increased by +3 dBA increments to encompass the ambient (e.g., ambient level of 59.3 dB results in a significance threshold of 62.3 dB rather than 60 dB). Table 3.13-7 below presents the applicable Tulare County significance thresholds for each receptor, adjusted as needed to encompass the ambient noise levels presented in Table 3.13-4. Additional detail regarding

these calculations is included in Appendix H.

Table 3.13-7 below presents the applicable Tulare County significance thresholds for each receptor. These noise thresholds are utilized to address CEQA Checklist item *a)* in Section 3.13.6.7 below.

Table 3.13-7. Applicable Tulare County Noise Standards

Receptor	Measured Ambient Noise Level (L_{dn})	Tulare County General Plan Threshold	Adjusted Threshold to Account for Ambient
R1	47.6	60	---
R2	51.7	60	---
R3	59.3	60	62.3
R4	44.7	60	---
R5	57.4	60	60.4
R6	57.4	60	60.4
R7	52.5	60	---
R8	56.0	60	---
R9	51.8	60	---
R10	47.8	60	---

Note: Appendix H.

Vibration Significance Thresholds

As discussed in Section 3.13.3.3, Tulare County does not have any specific standards or criteria related to vibration. Therefore, the Caltrans vibration criteria presented in Section 3.13.3.3 is utilized to determine the significance of Project vibration impacts. Specifically, the peak particle velocity (PPV) of 0.24 inches per second (in/sec) presented in Table 3.13-9, which is considered a "distinctly perceptible" vibration level, is utilized to determine the significance of Project vibration impacts per CEQA Checklist item *b)*.

3.13.5 Methodology of Analysis

To quantify the noise generated by the Project noise sources (i.e., excavation, construction and reservoir maintenance equipment/structures) reference data was gathered from the Federal Highway Administration's (FHWA) *Roadway Construction Noise Model User Guide* (Federal Highway Administration, 2006) and other relevant sources. The following sections summarize the methodologies, assumptions and reference noise levels utilized in the analyses of each Project phase: 1) Reservoir Excavation; 2) Reservoir Construction; and, 3) Reservoir Operations. Also see Appendix H for more detail.

3.13.5.3 Reservoir Excavation

To determine the appropriate sound pressure levels generated during reservoir excavation activities, various noise reference data was utilized. Per information provided by TID and West Coast Sand and Gravel (WCSG), mobile equipment (e.g., loaders, excavators, haul trucks, etc.) would operate onsite during the reservoir excavation phase to mine and transport material. Mobile equipment source noise average (L_{eq}) and maximum (L_{max}) sound pressure levels were determined using FHWA reference data. Appendix H summarizes the FHWA source noise data utilized to quantify mobile equipment noise levels during reservoir excavation.

In addition to mobile equipment, an aggregate screen/wash plant and, as needed, a mobile crush/recycle plant (referred to as the processing plants) would also operate onsite during reservoir excavation. Noise levels associated with these plants are based on field measurements collected by Sespe Consulting, Inc. in 2020 from a comparable processing and recycling operation in Otay Mesa, California. In addition to these plants, other ancillary equipment, specifically haul trucks and loaders, were operating nearby simultaneously when these measurements were collected. Therefore, the measured noise levels represent a conservative overestimation of the noise generated by the Project's aggregate screen/wash plant and crush/recycle plant. Appendix H contains additional detail and relevant references for the processing plant noise sources.

Table 3.13-8 shows the type and quantity of equipment that would be utilized onsite during the reservoir excavation phase. Usage fraction (%) and maximum sound pressure level (L_{max}) noise data shown for mobile sources are FHWA default values. Source noise calculations in Appendix H provide additional detail.

Table 3.13-8. Reservoir Excavation – Reference Equipment Noise Data

Noise Source	L_{max} @ 50-feet (dBA)	Usage (%)	L_{eq} @ 50-feet (dBA)
Mobile Equipment Sources			
Loaders (x4)	80	40%	76
Excavator	85	40%	81
Haul Trucks (x2)	84	40%	80
Water Truck	84	40%	80
Processing Plants Sources			
Screen/Wash Plant	---	---	84.1
Crush/Recycle Plant	---	---	84.1

Equipment Sources: Federal Highway Administration (Federal Highway Administration, 2006) and Otay Mesa Noise Study (Sespe Consulting, 2020). See Appendix H for more detail.

Per information provided by WCSG, reservoir excavation activities would be limited to Monday through Saturday, between the hours of 4:30 a.m. (or dawn if later) and 6:00 p.m. (or sundown if earlier). Because the County criteria applies to noise impacts over a 24-hour period (i.e., Day-Night [L_{dn}] noise levels), it was assumed that the onsite equipment summarized in Table 3.13-8 would operate simultaneously for up to 14-hours in a given day. Additionally, it was conservatively assumed that the equipment would operate at-grade in the onsite locations in closest proximity to each receptor (see Figure 3.13-2).

Noise Attenuation due to Excavation Pit Walls

To determined worst-case noise impacts during the reservoir excavation phase, it is assumed that the excavation and processing equipment summarized in Table 3.13-8 would operate simultaneously at-grade in the onsite location closest to each affected receptor (see Figure 3.13-2). Therefore, shielding and noise attenuation due to distance and intervening topography was conservatively not accounted for in the impact calculations. In reality, as the excavation progresses, the processing plants would operate within

the pit. Being located at the bottom of the pit would eventually block line-of-sight between equipment and nearby receptors.

As the excavation pit deepens, significant noise attenuation will be provided by the pit walls as they would sufficiently break line-of-sight between Project excavation noise sources (i.e., mobile equipment and processing plants) and nearby residential receptors. Barrier insertion loss calculations presented in Appendix H show that once reservoir excavation operations reach a depth of 16-feet bgs, assuming equipment is operating within the bottom of the pit, noise levels experienced at nearby receptors would be significantly attenuated (estimated to be a minimum -14.0 dBA reduction at Receptor 1 [R1]). Please see the discussion in Section 3.13.6 below and the calculations in Appendix H for additional detail.

3.13.5.4 Reservoir Construction

Once the pit is fully excavated and the basin/slopes stabilized, construction of the reservoir would commence. Specifically, this Project phase would involve construction of the inflow/outflow channels and chutes, installation of the electrically operated weirs and energy dissipation pools, and installation of other ancillary structures (e.g., perimeter berm/access road, aboveground storage tank [AST] tank and related generator/housing structure, etc.).

Per information provided by TID, Table 3.13-9 summarizes mobile equipment that would operate onsite during this Project phase. As with excavation, construction of the reservoir is estimated to occur between the hours of 4:30 a.m. (or dawn if later) and 6:00 p.m. (or sundown if earlier). Although much of the reservoir construction activities are expected occur below-grade within the excavation pit, conservatively it is assumed that the equipment presented in Table 3.13-9 would operate simultaneously, at-grade in the onsite locations in closest proximity to each receptor (see Figure 3.13-2). See Appendix H for the source noise calculations.

Table 3.13-9. Reservoir Construction – Reference Equipment Noise Data

Noise Source	L_{max} @ 50-feet (dBA)	Usage (%)	L_{eq} @ 50-feet (dBA)
Mobile Equipment Sources			
Loaders	80	40%	76
Excavator	85	40%	81
Backhoe	80	40%	76
Grader	85	40%	81
Trencher	80	40%	76
Compactor	80	20%	73
Crane	85	16%	77
Cement Truck	85	40%	81
Water Truck	84	40%	80
Generator	82	50%	79
Pumps	77	50%	74

Equipment Sources: Federal Highway Administration (Federal Highway Administration, 2006). See Appendix H for more detail.

3.13.5.5 Reservoir Operations

Once the reservoir is constructed, the Owners would manage the operations remotely from TID's offsite administration office in Tulare, California. As needed, TID staff would perform onsite inspections to ensure the reservoir. During the operations and maintenance of the reservoir, there would be limited equipment usage. For example, equipment may be needed to perform minor grading of the access. TID estimates that onsite reservoir maintenance using mobile equipment would occur only a few times per year (approximately 1 to 2 days per year).

Mobile equipment summarized in Table 3.13-10 would be used onsite annually for intermittent reservoir maintenance operations. Reservoir operations and maintenance activities would be conducted by TID staff during normal working hours, specifically between the hours of 8:00 a.m. and 5:00 p.m.

Table 3.13-10. Reservoir Operations/Maintenance – Reference Equipment Noise Data

Noise Source	L_{max} @ 50-feet (dBA)	Usage (%)	L_{eq} @ 50-feet (dBA)
Mobile Equipment Sources			
Loaders	80	40%	76
Grader	85	40%	81
Dump Truck	84	40%	80
Generator	82	50%	79

Equipment Sources: Federal Highway Administration (Federal Highway Administration, 2006). See Appendix H for more detail.

3.13.5.6 Project Design Features and Environmental Protection Measures

Numerous design features, best management practices (BMPs), operating practices and other environmental protection measures have been incorporated into the Project to minimize potential impacts on the environment. The environmental protective measures that were considered during this evaluation include, but are not limited to, the following:

1. Blasting would not be used for the excavation operations.
2. No excavation of material would take place within thirty (30) to fifty (50) feet from adjacent property lines (see Figure 2-5 in Section 2.0 – Project Description).
3. The processing of aggregate at the Project site has been designed not to exceed the production rates historically achieved at the Seaborn site.

Due to design feature Number 3, the number of haul trucks and employee vehicles on public roadways would not increase above existing levels as a result of the Project. Therefore, noise impacts resulting transportation sources are not analyzed in this DEIR.

3.13.6 Project-Level Impacts and Mitigation Measures

3.13.6.7 Generation of Ambient Noise Levels in Excess of Applicable Standards

Impact Statement

Impact NO-1: *Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?* **(Appendix G Threshold Criteria (a))**

Impact Analysis

To address the CEQA Criteria *a)*, the applicable Tulare County General Plan criteria presented in Section 3.13.4.2 (also see Table 3.13-6 and Table 3.13-7) is utilized. The following sections summarize the Project noise impacts determined for each individual Project phase: 1) Reservoir Excavation; 2) Reservoir Construction; and, 3) Reservoir Operations. The predicted change in noise level experience at each receptor due to Project operations is quantified and compared to the applicable Tulare County thresholds to determine the significance of Project impacts. Where Project noise levels exceed applicable thresholds, feasible mitigation measures are proposed. The detailed methodology is provided in Section 3.13.5 and the calculations in Appendix H.

Reservoir Excavation

Table 3.13-11 below shows the predicted change in Day-Night (L_{dn}) noise level estimated at each receptor as a result of reservoir excavation operations. As discussed in Section 3.13.5.3, it is assumed that the excavation and processing equipment summarized in Table 3.13-8 would operate simultaneously at-grade in the onsite location closest to each affected receptor (see Figure 3.13-2) to determined worst-case noise impacts during this initial Project phase.

As shown in Table 3.13-11 below, worst-case, unmitigated noise levels during reservoir excavation exceed the applicable Tulare County Day-Night (L_{dn}) noise thresholds at Receptors R1, R5, and R6. The calculations in Appendix H provide additional detail. It is also important to note that these exceedances associated with the reservoir excavation operations are expected to be short-term and temporary in nature. Over time, as the excavation pit proceeds to a final depth of approximately 60-feet bgs, equipment noise would be increasingly shielded due to the attenuation provided by the deepening pit walls. Appendix H contains the calculations and details (e.g., receptor/equipment heights, noise transmission paths, etc.) used to estimate noise attenuation provided by the excavation pit walls.

Table 3.13-11. Reservoir Excavation – Project Noise Impacts/Tulare County Criteria

Receptor	Distance – Source to Receptor (feet)	Project Noise Levels (L_{dn})	Tulare County Threshold (L_{dn})	Significant?	Level of Exceedance (dBA)
R1	465	73.4	60	**Yes**	+13.4
R2	4,978	55.3	60	No	---
R3	3,980	60.6	62.3	No	---
R4	4,190	54.7	60	No	---
R5	2,560	61.0	60.4	**Yes**	+0.6
R6	2,539	61.1	60.4	**Yes**	+0.7

Receptor	Distance – Source to Receptor (feet)	Project Noise Levels (L_{dn})	Tulare County Threshold (L_{dn})	Significant?	Level of Exceedance (dBA)
R7	2,382	60.0	60	No	---
R8	3,262	59.3	60	No	---
R9	4,251	56.1	60	No	---
R10	3,891	55.7	60	No	---

Note: Values shown in **bold** represent a potentially significant impact. See Appendix H for more detail.

Referring to Table 3.13-11, noise levels during the Project excavation phase do not exceed the applicable County noise standards except at Receptors 1 (R1), 5 (R5) and 6 (R6). Please see the mitigation measures presented below.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

As shown in Table 3.13-11, at the initial stages of the excavation phase when mobile and processing equipment would be operating at-grade, noise impacts at Receptors R1, R5 and R6 exceed various County L_{dn} noise standards. As discussed in Section 3.13.5.3, at an approximate depth of 16-feet bgs, an estimated -16.3 dBA of noise attenuation would result at Receptor 1 (R1). Similar reductions would also be expected at the receptors. Therefore, once reservoir excavation reaches this depth (i.e., 16-feet bgs or lower), and the processing plants are relocated into the pit, Project noise levels would be less than the applicable Tulare County criteria at every receptor, and no additional mitigation measures would be required.

Nevertheless, to ensure noise levels do not exceed these applicable threshold criteria during Project's reservoir excavation operations occurring at 16-feet bgs or higher, control measures sufficient to obtain noise reductions ranging from -13.4 dBA's (i.e., L_{dn} at R1) to -0.6/-0.7 dBA's (L_{dn} at R5 and R6) would need to be implemented. The following discusses potential control measures:

- Because the Tulare County Day-Night (L_{dn}) noise criteria averages noise impacts over an adjusted 24-hour period, Project noise levels can also be controlled by limiting daily operational hours. This is especially true when prohibiting operations between the hours of 10:00 p.m. and 7:00 a.m., as the L_{dn} threshold adds a +10 dBA penalty to Project noise levels generating during those hours.
- As discussed above, the residence located at Receptor 1 (R1) is owned by TID and leased out periodically to tenants. Therefore, TID has the ability to control the occupancy of R1, set the terms of lease agreements, and inform the current occupants of any temporary noise impacts resulting from the Project.

Until the reservoir excavation operations reach a depth of 16-feet bgs and the processing plants are relocated, mitigation measures are required to ensure Project noise levels comply with the applicable Tulare County criteria. As discussed above, one such method would be restricting the operational hours when noise generating activities are occurring. Specifically, if at-grade onsite processing (i.e., screen/wash plant and crush/recycle plant) operations were prohibited between the hours of 4:00 a.m. and 7:00 a.m.,

noise impacts at affected receptors would be reduced. Table 3.13-12 presents the predicted Day-Night (L_{dn}) noise level experienced at each receptor, assuming processing operations were prohibited between the hours of 4:00 a.m. and 7:00 a.m. As discussed above, once excavation reaches a minimum depth of 16-feet bgs and the processing plants are relocated, the processing operations would not be restricted during these hours.

Mitigation Measure NO-1: *Onsite material processing operations occurring at or above a depth of 16-feet below ground surface shall be prohibited between the hours of 4:00 a.m. and 7:00 a.m.*

Table 3.13-12. Reservoir Excavation – Limited Processing Hours of Operation

Receptor	Distance – Source to Receptor (feet)	Project Noise Levels (L_{dn})	Tulare County Threshold (L_{dn})	Significant?
R1	465	**71.6**	**60**	**Yes**
R2	4,978	54.4	60	No
R3	3,980	60.2	62.3	No
R4	4,190	53.1	60	No
R5	2,560	60.1	60.4	No
R6	2,539	60.1	60.4	No
R7	2,382	58.6	60	No
R8	3,262	58.4	60	No
R9	4,251	55.1	60	No
R10	3,891	54.2	60	No

Note: Values shown in **bold** represent a potentially significant impact. See Appendix H for more detail.

As shown in Table 3.13-12, even with at-grade onsite processing operations prohibited between the hours of 4:00 a.m. and 7:00 a.m., estimated noise levels experienced at Receptor 1 (R1) still exceed the applicable County L_{dn} threshold by +11.6 dBA's. Therefore, in addition to the provisions outlined above, the following mitigation specific to Receptor 1 (R1) is required. As discussed previously, TID owns and leases the residential receptor located at R1. As with Mitigation Measure NO-1, this additional measure is only necessary if excavation/noise-generating operations are occurring at a depth of 16-feet bgs or higher.

Mitigation Measure NO-2: *In order to reduce the noise level at Receptor 1 (R1) to less than the significant, TID must utilize one of the following measures. This mitigation measure is not required once the processing plants or other sources of noise that could result in an exceedance of the noise threshold criteria are relocated to a minimum depth of 16-feet below ground surface:*

- *Vacate the residence located at Receptor R1 when noise exceedances would occur; or*
- *Inform the occupant of Receptor R1 that temporary elevated noise levels may result during certain periods of the Project, and obtain a signed waiver from the tenant indicating that they choose to remain in the house despite the temporary increase in noise levels. The waiver should describe the potential level of exceedance, times periods and approximate length of time that the exceedances could occur.*

Through the implementation of Mitigation Measures NO-1 or NO-2, or a combination thereof, reservoir excavation noise sources are expected to have a less than significant impact at nearby receptors with mitigation incorporated.

It is also important to note this analysis was designed to estimate conservative worst-case Project noise impacts at nearby receptors. In reality, when taking into account the shielding or absorption effects from intervening topography/vegetation, and the fact that most operations would not always occur simultaneously near the outermost Project site boundary or within direct line-of-sight of affected receptors (as was assumed in this analysis), noise levels are expected to be less than those calculated within this DEIR. Furthermore, as excavation progresses to a final depth of 60-feet bgs and the pit walls deepen, additional noise attenuation can be assumed.

Level of Significance After Mitigation

Less than significant.

Reservoir Construction

Impact Analysis

Table 3.13-13 below shows the predicted change in Day-Night (L_{dn}) noise level at each receptor during reservoir construction. As with the reservoir excavation analysis, it is conservatively assumed that the reservoir construction equipment summarized in Table 3.13-9 would operate simultaneously, at-grade in the onsite location closest to each affected receptor (see Figure 3.13-2). Additionally, onsite materials processing, specifically the screen/wash plant and crush/recycle plant, would no longer be required during the reservoir construction phase. As shown in Table 3.13-13, worst-case, unmitigated noise levels during onsite reservoir construction activities exceed the applicable Tulare County Day-Night (L_{dn}) noise thresholds at Receptor R1. Because this residence is owned by TID, as discussed above, implementation of Mitigation Measure NO-2 is sufficient to reduce the potential impact to less than significant.

Table 3.13-13. Reservoir Construction – Project Noise Impacts/Tulare County Criteria

Receptor	Distance – Source to Receptor (feet)	Project Noise Levels (L_{dn})	Tulare County Threshold (L_{dn})	Significant?	Level of Exceedance (dBA)
R1	465	71.9	60	**Yes**	+11.9
R2	4,978	54.5	60	No	---
R3	3,980	60.3	62.3	No	---
R4	4,190	53.4	60	No	---
R5	2,560	60.2	60.4	No	---
R6	2,539	60.3	60.4	No	---
R7	2,382	58.8	60	No	---
R8	3,262	58.5	60	No	---
R9	4,251	55.2	60	No	---
R10	3,891	54.4	60	No	---

Note: Values shown in **bold** represent a potentially significant impact. See Appendix H for more detail.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

Upon implementation of Mitigation Measure NO-2 described above, Project impacts to nearby receptors would be less than significant.

Level of Significance After Mitigation

Less than significant.

Reservoir Operations

Impact Analysis

Table 3.13-14 below shows the predicted change in Day-Night (L_{dn}) noise level at each receptor during ongoing reservoir operations/routine maintenance. To determined worst-case noise impacts during this Project phase, it is assumed that maintenance equipment listed in Table 3.13-10 would operate at-grade in the onsite location closest to each affected receptor. Although onsite reservoir operations/maintenance activities would be very infrequent (approximately 1 to 2 times per year) and would generally not require the use of mobile equipment, conservatively this analysis assumed that all maintenance equipment listed in Table 3.13-10 would operate simultaneously for one full day (i.e., 8:00 a.m. to 5:00 p.m.).

As shown in Table 3.13-14, worst-case, unmitigated noise levels during reservoir operations/maintenance exceed the applicable Tulare County Day-Night (L_{dn}) noise thresholds at Receptor R1. As discussed above, Receptor R1 is owned by TID; therefore, implementation of Mitigation Measure NO-2 would be sufficient to reduce the potential impact to less than significant.

Table 3.13-14. Reservoir Operations – Project Noise Impacts/Tulare County Criteria

Receptor	Distance – Source to Receptor (feet)	Project Noise Levels (L_{dn})	Tulare County Threshold (L_{dn})	Significant?	Level of Exceedance (dBA)
R1	465	61.9	60	**Yes**	+1.9
R2	4,978	52.1	60	No	---
R3	3,980	59.4	62.3	No	---
R4	4,190	46.8	60	No	---
R5	2,560	57.8	60.4	No	---
R6	2,539	57.8	60.4	No	---
R7	2,382	53.7	60	No	---
R8	3,262	56.3	60	No	---
R9	4,251	52.3	60	No	---
R10	3,891	49.1	60	No	---

Note: Values shown in **bold** represent a potentially significant impact.

Level of Significance Before Mitigation

Potentially significant.

Mitigation Measures

Upon implementation of Mitigation Measure NO-2 described above, Project impacts to nearby receptors would be less than significant.

Level of Significance After Mitigation

Less than significant.

3.13.6.8 Generation of Excessive Groundborne Vibration

Impact Statement

Impact NO-2: *Generation of excessive groundborne vibration or groundborne noise levels?* **(Appendix G Threshold Criteria (b))**

Impact Analysis

The Federal Transit Administration's (FTA) *Transit Noise and Vibration Impact Assessment* (Federal Transit Administration, 2006) and Caltrans's *Transportation and Construction Vibration Guidance Manual* (Caltrans, 2020) documents provide guidelines for assessing vibration impacts resulting from construction activities. Table 3.13-15 below lists vibration source levels for common types of construction equipment, in terms of peak particle velocity (PPV) in units of inches per second at a distance of 25-feet.

Table 3.13-15. Vibration Source Level for Construction Equipment

Equipment	PPV (in/sec) @ 25-feet away
Vibratory Roller	0.210
Large bulldozer	0.089
Caisson drilling	0.089
Loaded trucks	0.076
Jackhammer	0.035
Small bulldozer	0.003
Vibratory Roller	0.210

Source: *Transportation and Construction Induced Vibration Guidance Manual* (Caltrans, 2020). *Transit Noise and Vibration Impact Assessment* (Federal Transit Administration, 2006).

To assess Project vibration impacts at each receptor location, the reference PPV value of 0.089 inches per second (i.e., large bulldozer) is utilized. It is assumed that nothing larger or more powerful than a large bulldozer would be utilized at the Project site in close proximity to nearby receptors. The distance shown represents the measured distance from the closest boundary of the active mining area to the nearest property line of the receptor. Using this information, Table 3.13-16 summarizes the predicted groundborne vibration impacts resulting from the Project. Significance was determined by comparing the

predicted change in groundborne vibration to the applicable County Code vibration threshold described in Section 3.13.4.1.

Table 3.13-16. Predicted Project Vibration Levels at Receptors

Receptors	Distance (feet)	Predicted Vibration – PPV (in/sec) [A]	Applicable San Bernardino County Significance Threshold – PPV (in/sec	Significant?
R1	465	0.0036	≤ 0.2	No
R2	4,978	0.0003	≤ 0.2	No
R3	3,980	0.0003	≤ 0.2	No
R4	4,190	0.0003	≤ 0.2	No
R5	2,560	0.0005	≤ 0.2	No
R6	2,539	0.0006	≤ 0.2	No
R7	2,382	0.0006	≤ 0.2	No
R8	3,262	0.0004	≤ 0.2	No
R9	4,251	0.0003	≤ 0.2	No
R10	3,891	0.0003	≤ 0.2	No

Note: See Appendix H for more detail.

A – The Project vibration levels shown above are considered "barely perceptible" per Caltrans guidance (Caltrans, 2020).

As shown in Table 3.13-16, predicted vibration impacts to nearby receptors were well below the applicable San Bernardino County vibration significance threshold. It should also be noted that predicted vibration impacts at nearby receptors are considered "barely perceptible" per Caltrans criteria (see Table 3.13-5) for human response (i.e., ≤ 0.035 PPV in/sec). Therefore, groundborne vibration impacts to nearby receptors resulting from Project operations are less than significant with no mitigation required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not Applicable.

3.13.6.9 Airport Land Use/Vicinity Analysis

Impact Statement

Impact NO-3: *For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?* **(Appendix G Threshold Criteria (c))**

Impact Analysis

The proposed Project site is not located within 2.0 miles of any private or public airports or airstrips, or in an area governed by an airport land use plan. The closest airport/airstrip is Woodlake Airport, located approximately 2.4 miles west of the Project site. Please see Figure 3.13-1 which displays the location of this airport in relation to the Project site. Furthermore, the Project does not involve creation of a new noise-sensitive land uses (i.e., residences). Therefore, the Project would have no impact related to airport/airstrip noise levels.

Level of Significance Before Mitigation

No impact.

Mitigation Measures

None required.

Level of Significance After Mitigation

Not Applicable.

3.13.7 Cumulative-Level Impacts and Mitigation Measures

Table 3-1 identifies the other projects that the County and the City of Woodlake considered in regards to potential cumulative impacts. As noted in Table 3-1, none of the cumulative projects meet the criteria to be further evaluated in relation to cumulative impacts associated with noise and vibration impacts.

Generally, the context for cumulative impacts for noise and vibration impacts is the immediate area encompassing the site vicinity (1- to 3-mile radius from the Project site). As discussed in the impact analysis (Section 3.13.6) above for each impact threshold, the Project was determined to have either no impact, a less than significant impact, or significant but mitigated to less than significant. Since the Project would present no significant impacts related to noise or vibration, there would be no cumulative impact in conjunction with the other cumulative projects.

THIS PAGE IS INTENTIONALLY BLANK

3.14 POPULATION AND HOUSING

3.14.1 Introduction

This section of the DEIR presents a discussion of population and housing resources. A review of potential Project impacts is provided in the following analysis.

3.14.2 Environmental Setting

3.14.2.1 Regional and Local Setting

Tulare County is located in a geographically diverse encompassing approximately 4,840 square miles of classified lands (lands with identified uses) and can be divided into three general topographical zones: a valley region; a foothill region east of the valley area; and, a mountain region just east of the foothills. The eastern half of the County is generally comprised of public lands, including the Mountain Home State Forest, Golden Trout Wilderness area, and portions of the Dome Land and south Sierra Wilderness areas. Federal lands, which include wilderness, national forests, monuments and parks, along with County parks, make up 52% of the County. Agricultural uses, which include row crops, orchards, dairies, and grazing lands on the Valley floor and in the foothills total over 2,020 square miles or about 43% of the entire County. Urban uses such as incorporated cities, communities, hamlets, other unincorporated urban uses, and infrastructure rights-of-way make up the remaining land in the County.

Historically, the Project site has been used for cattle grazing under lease arrangements. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately 1.0 mile to the northeast of the Project site. The Kaweah River Rock aggregate mining and processing facility is located immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately 1.0 mile to the southwest of the Project site (Figure 2-2 – Project Site and Surrounding Land Use Map in Section 2.0 – Project Description). The figures in Section 2.0 – Project Description illustrate how adjacent lands to the north, northeast, southwest, and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are primarily used for agricultural and, to a limited extent, for rural residential purposes.

Because of the existence of high-quality aggregate in the alluvial soils in the area of the Project site there are also aggregate mining operations and processing facilities adjacent to the Project and throughout the immediate area.

3.14.3 Regulatory Setting

3.14.3.1 Federal

U.S. Department of Housing and Urban Development (HUD)

HUD's mission is to create strong, sustainable, inclusive communities and quality affordable homes for all. HUD works to strengthen the housing market to bolster the economy and protect consumers; meet the need for quality affordable rental homes: utilize housing as a platform for improving quality of life; build inclusive and sustainable communities free from discrimination; and transform the way HUD does business.

3.14.3.2 State

California Department of Housing and Community Development (HCD)

HCD's mission is to provide leadership, policies and programs to preserve and expand safe and affordable housing opportunities and promote strong communities for all Californians. In 1977, the State Department of Housing and Community Development (HCD) adopted regulations under the California Administrative Code, known as the Housing Element Guidelines, which are to be followed by local governments in the preparation of local housing elements. Assembly Bill (AB) 2853, enacted in 1980, further codified housing element requirements. Since that time, new amendments to State Housing Law have been enacted. Each of these amendments has been considered during development of this Housing Element.

California Relocation Assistance Act

The State of California adopted the California Relocation Assistance Act (California Government Code §7260 et seq.) in 1970. This State law, which follows the federal Uniform Relocation Assistance and Real Property Acquisition Act, requires public agencies to provide procedural protections and benefits when they displace businesses, homeowners, and tenants in the process of implementing public programs and Projects. This State law calls for fair, uniform, and equitable treatment of all affected persons through the provision of relocation benefits and assistance to minimize the hardship of displacement on the affected persons.

3.14.3.3 Local

Tulare County 2014 Regional Housing Needs Assessment Plan

Housing element law requires all local governments to adequately plan to meet their existing and projected housing needs including their share of the regional housing need. In Tulare County, the regional housing need is determined by the Tulare County Association of Governments (TCAG) through the Regional Housing Needs Assessment (RHNA) process. The RHNA planning period for this element is January 1, 2014 – September 30, 2023. The RHNA process specifies the number of housing units that must be accommodated in four income categories: very low, low, moderate and above moderate. RHNA is not a production quota; however, demonstration of adequate capacity for new dwelling units on vacant or underutilized sites is the basis for compliance with the RHNA component of housing element law.

Tulare County Regional Blueprint 2009

This Blueprint includes the following preferred growth scenario principals:

- Increase densities county-wide by 25% over the status quo densities;
- Establish light rail between cities;
- Extend Highway 65 north to Fresno County;
- Expand transit throughout the county;
- Maintain urban separators around cities; and
- Growth will be directed toward incorporated cities and communities where urban development exists and where comprehensive services and infrastructure are or will be provided.

Tulare County Housing Authority

The Housing Authority of the County of Tulare (HATC) has been officially designated as the local public housing agency for the County of Tulare by the Board of Supervisors and was created pursuant to federal and state laws. HATC is a unique hybrid: a public sector agency with private sector business practices. Their major source of income is the rents from residents. The HATC mission is "to provide affordable, well-maintained rental housing to qualified low and very low-income families. Priority shall be given to working families, seniors and the disabled. Tenant self-sufficiency and responsibility shall be encouraged. Programs shall be self-supporting to the maximum extent feasible." HATC provides rental assistance to very low and moderate-income families, seniors and the handicapped throughout the county. HATC offers many different programs, including the conventional public housing program, the housing choice voucher program (Section 8), the farm labor program for families with farm labor income, senior housing programs, and other programs. They also own or manage some individual subsidized rental complexes that do not fall under the previous categories, and can provide information about other affordable housing that is available in Tulare County. All programs are handicap accessible. Almost all of the complexes have 55-year recorded affordability covenants.

Tulare County General Plan

The Project site is located in a semi-rural area on unincorporated Tulare County, upon lands zoned "AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)", with a General Plan designation of "Valley Agriculture". The Tulare County General Plan has a number of policies related to housing that apply to projects within County of Tulare. General Plan policies that relate to housing and population are listed as follows:

- ***Housing Guiding Principle 1.1:*** *Endeavor to improve opportunities for affordable housing in a wide range of housing types in the communities throughout the unincorporated area of the County.*
- ***Housing Policy 1.11:*** *Encourage the development of a broad range of housing types to provide an opportunity of choice in the local housing market.*
- ***Housing Policy 1.13:*** *Encourage the utilization of modular units, prefabricated units, and manufactured homes.*
- ***Housing Policy 1.14:*** *Pursue an equitable distribution of future regional housing needs allocations, thereby providing a greater likelihood of assuring a balance between housing development and the location of employment opportunities.*
- ***Housing Policy 1.15:*** *Encourage housing counseling programs for low income homebuyers and homeowners.*
- ***Housing Policy 1.16:*** *Review community plans and zoning to ensure they provide for adequate affordable residential development.*
- ***Housing Guiding Principle 1.2:*** *Promote equal housing opportunities for all persons regardless of race, religion, sex, marital status, ancestry, national origin, color, family status, disability, or any other arbitrary basis.*

- ***Housing Guiding Principle 1.3:*** *Strive to meet the housing needs of migrant and non-migrant farmworkers and their families with a suitable, affordable and satisfactory living environment.*
- ***Housing Policy 1.31:*** *Encourage the provision of farmworker housing opportunities in conformance with the Employee Housing Act.*
- ***Housing Policy 1.33:*** *Encourage and support a balance between housing and agricultural needs.*
- ***Housing Policy 1.51:*** *Encourage the construction of new housing units for "special needs" groups, including senior citizens, large families, single heads of households, households of persons with physical and/or mental disabilities, minorities, farmworkers, and the homeless in close proximity to transit, services, and jobs.*
- ***Housing Policy 1.52:*** *Support and encourage the development and improvement of senior citizen group housing, convalescent homes and other continuous care facilities.*
- ***Housing Policy 1.55:*** *Encourage development of rental housing for large families, as well as providing for other housing needs and types.*
- ***Housing Guiding Principle 1.6:*** *Assess and amend County ordinances, standards, practices and procedures considered necessary to carry out the County's essential housing goal of the attainment of a suitable, affordable and satisfactory living environment for every present and future resident in unincorporated areas.*
- ***Housing Policy 2.14:*** *Create and maintain a matrix of Infrastructure Development Priorities for Disadvantaged Unincorporated Communities in Tulare County thorough analysis and investigation of public infrastructure needs and deficits, pursuant to Action Program 9.*
- ***Housing Guiding Principle 2.2:*** *Require proposed new housing developments located within the development boundaries of unincorporated communities to have the necessary infrastructure and capacity to support the development.*
- ***Housing Policy 2.21:*** *Require all proposed housing within the development boundaries of unincorporated communities is either (1) served by community water and sewer, or (2) that physical conditions permit safe treatment of liquid waste by septic tank systems and the use of private wells.*
- ***Housing Guiding Principle 3.1:*** *Encourage "smart growth" designed development that serves the unincorporated communities, the environment, and the economy of Tulare County.*
- ***Housing Policy 3.11:*** *Support and coordinate with local economic development programs to encourage a "jobs to housing balance" throughout the unincorporated area.*
- ***Housing Policy 3.12:*** *Support locally initiated programs to provide neighborhood parks and recreational facilities for residential areas within unincorporated communities.*
- ***Housing Policy 3.13:*** *Encourage subdivision and housing unit design, which provides for a reasonable level of safety and security.*

- ***Housing Policy 3.16:*** *Actively seek federal, state, and private foundation grant funds for park and recreation facilities in unincorporated areas, including dual-use storm drainage ponding basins/recreation parks.*
- ***Housing Policy 3.23:*** *Prepare new and/or updated community plans that provide adequate sites for a variety of types of housing within the development boundaries of community.*
- ***Guiding Principle 4.1:*** *Support and encourage County ordinances, standards, practices and procedures that promote residential energy conservation.*
- ***Housing Policy 4.11:*** *Review residential projects for environmental impacts and impose conditions to reduce those impacts.*
- ***Housing Policy 4.12:*** *Facilitate land use policies and programs that meet housing and conservation objectives.*
- ***Housing Policy 4.13:*** *Promote energy efficiency and water conservation.*
- ***Housing Policy 4.14:*** *Enforce the requirements of County Ordinances regarding the disposal of construction and demolition debris.*
- ***Housing Policy 4.15:*** *Enforce energy Efficiency Standards for Residential and Non-Residential properties (Title 24).*
- ***Housing Policy 4.21:*** *Promote energy conservation opportunities in new residential development.*
- ***Housing Policy 4.22:*** *Enforce provisions of the Subdivision Map Act regulating energy-efficient subdivision design.*
- ***Housing Policy 5.21:*** *Administer and enforce the relevant portions of the Health and Safety Code.*
- ***Housing Policy 5.26:*** *Prohibit concentrations of dwelling units near potentially incompatible agricultural uses as defined in the Animal Confinement Facilities Plan.*

3.14.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Population and Housing" a project is considered to have a significant impact on the environment if it would:

a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure) (CEQA Appendix G Threshold (a))?

b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere (CEQA Appendix G Threshold (b))?

3.14.5 Methodology of Analysis

The following points were considered in the Population and Housing evaluation:

- The Project would create a water storage reservoir, which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies.
- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.
- The Project will be managed such that there will be no increase in the production rate of aggregates from the baseline level. Therefore, the number of trucks traveling offsite on public roads will not increase from baseline.
- The number of employees will not exceed the number of employees required for previous aggregate operations (baseline).
- The number of delivery and other non-aggregate trucks would be included in the total number of trucks coming/going from the site such that the total number of trucks would not exceed baseline.

3.14.6 Project-Level Impacts and Mitigation Measures

3.14.6.1 Induce Substantial Unplanned Population

Impact Statement

Impact POP-1: *Would the Project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

The Project would employ 7 to 12 people during the excavation and construction phases, which is less than the baseline of 10 to 18 employees associated with aggregate operations on the Seaborne site (baseline). The operation of the reservoir would be managed remotely primarily by TID employees from TID's offsite administrative office in Tulare, California. The Project would not require hiring additional TID employees. This would not induce substantial population growth in the area. The Project would not induce growth, growth would occur whether or not the Project is implemented.

The Project would have no impact on population and housing.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.14.6.2 Displace Substantial Numbers of Existing People/Housing

Impact Statement

Impact POP-2: *Would the Project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

There are no houses located on the Project site; therefore, the Project would not result in the displacement of any existing housing. The Project would have no impact on population and housing.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.14.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3-1 – Cumulative

Projects, only three (3) cumulative projects are within 1-mile of the Project (2 are existing aggregate mining operations, and 1 is a community plan update) while three (3) other projects are located within 3 miles of the Project (1 existing aggregate mining operation, 1 residential sub-division, and 1 stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the Project site. Therefore, these projects are not considered to have a potential cumulative impact related to population and housing.

As discussed in this Section, the Project was determined to be consistent with the County General Plan and Zoning designations for the Project site, and with the County's General Plan policies. The Project would have no impacts. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to population and housing.

3.15 PUBLIC SERVICE

3.15.1 Introduction

This section of the DEIR presents a discussion of public service resources. A review of potential Project impacts is provided in the following analysis.

3.15.2 Environmental Setting

3.15.2.1 Regional and Local Setting

Historically, the Project site has been used for cattle grazing under lease arrangements. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately 1.0 miles to the northeast of the Project site. The Kaweah River Rock aggregate mining and processing facility is located immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately 1.0 mile to the southwest of the Project site (Figure 2-2 – Project Site and Surrounding Land Use Map in Section 2.0 – Project Description). The figures in Section 2.0 – Project Description illustrate how adjacent lands to the north, northeast, southwest, and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are primarily used for agricultural and, to a limited extent, for rural residential purposes.

3.15.3 Regulatory Setting

3.15.3.1 Federal

There are no federal public service regulations that directly affect the Project.

3.15.3.2 State

There are no state public service regulations that directly affect the Project.

3.15.3.3 Local

Tulare County General Plan

The Project site is located in a semi-rural area on unincorporated Tulare County, upon lands zoned "AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)", with a General Plan designation of "Valley Agriculture". The General Plan has a number of public service policies that apply to projects within Tulare County. General Plan policies that potentially relate to the proposed Project are listed below.

- ***PFS-7.1 Fire Protection:*** *The County shall strive to expand fire protection service in areas that experience growth in order to maintain adequate levels of service.*
- ***PFS-7.2 Fire Protection Standards:*** *The County shall require all new development to be adequately served by water supplies, storage, and conveyance facilities supplying adequate volume, pressure, and capacity for fire protection.*
- ***PFS-7.3 Visible Signage for Roads and Buildings:*** *The County shall strive to ensure all roads are properly identified by name or number with clearly visible signs.*

- ***PFS-7.5 Fire Staffing and Response Time Standards:*** *The County shall strive to maintain fire department staffing and response time goals consistent with National Fire Protection Association (NFPA) standards.*

Table 3.15-1. Fire Staffing and Reponses Time Standards

Land Use	Demographics	Staffing/Response Time	% of Calls
Urban	> 1,000 people/sq. mi.	15 FF/9 min.	15 FF/9 min.
Suburban	500-100 people/sq. mi.	10 FF/10 min.	80
Rural	< 500 people/sq. mi.	6 FF/14 min.	80
Remote*	Travel Dist. > 8 min.	4 FF/no specific response time	90
*Upon assembling the necessary resources at the emergency scene, the fire department should have the capacity to safety commence an initial attach within 2 minutes, 90% of the time. (FF = Fire Fighters) Source: Tulare County General Plan 2030 Update			

- ***PFS-7.6 Provision of Station Facilities and Equipment:*** *The County shall strive to provide sheriff and fire station facilities, equipment (engines and other apparatus), and staffing necessary to maintain the County's service goals. The County shall continue to cooperate with mutual aid providers to provide coverage throughout the County.*
- ***PFS-7.8 Law Enforcement Staffing Ratios:*** *The County shall strive to achieve and maintain a staffing ratio of 3 sworn officers per 1,000 residents in unincorporated areas.*
- ***PFS-7.9 Sheriff Response Time:*** *The County shall work with the Sheriff's Department to achieve and maintain a response time of:*
    - *Less than 10 minutes for 90 percent of the calls in the valley region; and*
    - *15 minutes for 75 percent of the calls in the foothill and mountain regions.*
- ***PFS-7.12 Design Features for Crime Prevention and Reduction:*** *The County shall promote the use of building and site design features as means for crime prevention and reduction.*
- ***PFS-8.1 Work with Local School Districts:*** *The County shall work with local school districts to develop solutions for overcrowded schools and financial constraints of constructing new facilities.*
- ***PFS-8.4 Library Facilities and Services:*** *The County shall encourage expansion of library facilities and services as necessary to meet the needs (e.g., internet access, meeting rooms, etc.) of future population growth.*

3.15.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Public Services" a project is considered to have a significant impact on the environment if it would:

a) Result in physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain

acceptable service ratios, response times or other performance objectives for any of the public services (CEQA Appendix G Threshold (a)):

i. Fire protection?
ii. Police protection?
iii. Schools?
iv. Parks?
v. Other public facilities?

3.15.5 Methodology of Analysis

The following points were considered in the Public Service evaluation:

- The Project would create a water storage reservoir, which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies.
- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.
- The Project will be managed such that there will be no increase in the production rate of aggregates from the baseline level. Therefore, the number of trucks traveling offsite on public roads will not increase from baseline.
- The number of employees will not exceed the number of employees required for previous aggregate operations (baseline).
- The number of delivery and other non-aggregate trucks would be included in the total number of trucks coming/going from the site such that the total number of trucks would not exceed baseline.

3.15.6 Project-Level Impacts and Mitigation Measures

3.15.6.1 Physically Altered Governmental Facilities

Impact Statement

Impact PUB-1: *Would the Project result in physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services* **(CEQA Guidelines – Appendix G Threshold Criteria (a))***:*

vi. Fire protection?
vii. Police protection?
viii. Schools?
ix. Parks?

x. Other public facilities?

Impact Analysis

The Project would not result in additional employee and vendor vehicles/on-road haul trucks on public roadways above baseline levels. Therefore, the Project would not interfere with public services such as fire and police protection. The Project would not involve any activities that would impacts schools, parks, public services or communications. Potential impacts associated with noise, air quality, odor, and water quality are fully evaluated in Section 3.0 – Environmental Impact Analysis.

Therefore, the Project would have no impact on public services.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.15.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Therefore, these projects are not considered to have a potential cumulative impact related to land use and planning.

As discussed in this Section, the Project was determined to be consistent with the County General Plan and Zoning designations for the Project site, and with the County's General Plan policies. The Project impacts are less than significant. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to public services.

3.16 RECREATION

3.16.1 Introduction

This section of the DEIR presents a discussion of recreation resources. A review of potential Project impacts is provided in the following analysis.

3.16.2 Environmental Setting

3.16.2.1 Regional and Local Setting

Historically, the Project site has been used for cattle grazing under lease arrangements. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately 1.0 mile to the northeast of the Project site. The Kaweah River Rock aggregate mining and processing facility is located immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately 1.0 mile to the southwest of the Project site (Figure 2-2 – Project Site and Surrounding Land Use Map). These figures illustrate how adjacent lands to the north, northeast, southwest, and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are primarily used for agricultural and, to a limited extent, for rural residential purposes.

Most of the Project site is vegetated with non-native grasses except for a small portion of ground along the adjacent Kaweah River above McKay Point, which is vegetated by native trees and shrubs. The surface soil at the Project site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. The Project site topography is relatively level with a depression in the southeast corner. Site surface drainage is generally to the south and southeast toward the Kaweah River and generally to the south and southwest toward the St. Johns River. The Project site elevation decreases from approximately 472-feet above mean sea level (amsl) on the northeastern end of the property, to approximately 454-feet amsl on the southwestern end.

3.16.3 Regulatory Setting

The Project is subject to a variety of land use regulatory requirements and designations, which are discussed fully in the sections to follow.

3.16.3.1 Federal

United States National Park Service (NPS)

The National Park Service (NPS) is a bureau of the U.S. Department of the Interior. The NPS manages the 397 units of the National Park System. The NPS also helps administer dozens of affiliated sites, the National Register of Historic Places, National Heritage Areas, National Wild and Scenic Rivers, National Historic Landmarks, and National Trails.

3.16.3.2 State

California Department of Parks and Recreation

The California Department of Parks and Recreation aims to provide for the health, inspiration and education of the people of California by helping to preserve the state's extraordinary biological diversity, protecting its most valued natural and cultural resources, and creating opportunities for high-quality outdoor recreation.

California's state parks and the recreational programs supported by the California Department of Parks and Recreation and its divisions of Boating and Waterways, Off-Highway Motor Vehicle Recreation, and Office of Historic Preservation, are gateways to these benefits and to opportunities to connect with families, friends, and communities. With 280 state park units, over 340 miles of coastline, 970 miles of lake and river frontage, 15,000 campsites, and 4,500 miles of trails, the department contains the largest and most diverse recreational, natural, and cultural heritage holdings of any state agency in the nation.

More than 75 million people annually visit California's State Park System. The system includes:

- Beaches Museums
- Coastal Beaches Natural and Cultural Preserves
- Conference Centers Natural Reserves
- Ghost Towns Off-Highway Vehicle Recreation Areas
- Historic Homes Parks
- Historic Monuments Recreation Areas
- Historic Parks Seashores
- Lakes and Reservoirs Spanish-era Adobe Buildings
- Lighthouses Visitor Centers
- Marine parks

Together, state park system lands protect and preserve an unparalleled collection of culturally and environmentally sensitive structures and habitats, threatened plant and animal species, ancient Native American sites, historic structures and artifacts.

3.16.3.3 Local

Tulare County General Plan

The Tulare County General Plan has a number of policies that apply to projects within County of Tulare. General Plan policies that potentially relate to the proposed Project are listed below.

- ***ERM-5.2 Park Amenities:*** *The County shall provide a broad range of active and passive recreational opportunities within community parks. When possible, this should include active sports fields and facilities, community center/recreation buildings, children's play areas, multiuse areas and trails, sitting areas, and other specialized uses as appropriate.*

- ***ERM-5.3 Park Dedication Requirements:*** *The County shall require the dedication of land and/or payment of fees, in accordance with local authority and State law (for example the Quimby Act), to ensure funding for the acquisition and development of public recreation facilities.*
- ***ERM-5.5 Collocated Facilities:*** *The County shall encourage the development of parks near public facilities such as schools, community halls, libraries, museums, prehistoric sites, and open space areas and shall encourage joint-use agreements whenever possible.*
- ***ERM-5.11 Cooperation with Federal and State Agencies:*** *The County shall work with Federal and State agencies that manage land within the County, as appropriate.*
- ***ERM-5.12 Meet Changing Recreational Needs:*** *The County shall promote the continued and expanded use of national and State forests, parks, and other recreational areas to meet the recreational needs of County residents.*
- ***ERM-5.15 Open Space Preservation:*** *The County shall preserve natural open space resources through the concentration of development in existing communities, use of cluster development techniques, maintaining large lot sizes in agricultural areas, discouraging conversion of lands currently used for agricultural production, limiting development in areas constrained by natural hazards, and encouraging agricultural and ranching interests to maintain natural habitat in open space areas where the terrain or soil is not conducive to agricultural production.*

3.16.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Recreation" a project is considered to have a significant impact on the environment if the following are found to be true:

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (CEQA Appendix G Threshold (a))?

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment (CEQA Appendix G Threshold (b))?

3.16.5 Methodology of Analysis

The following points were considered in the Recreation evaluation:

- The Project would create a water storage reservoir, which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies.
- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.

- The Project will be managed such that there will be no increase in the production rate of aggregates from the baseline level. Therefore, the number of trucks traveling offsite on public roads will not increase from baseline.
- The number of employees will not exceed the number of employees required for previous aggregate operations (baseline).
- The number of delivery and other non-aggregate trucks would be included in the total number of trucks coming/going from the site such that the total number of trucks would not exceed baseline.

3.16.6 Project-Level Impacts and Mitigation Measures

3.16.6.1 Increase use of regional parks/other recreational facilities

Impact Statement

Impact REC-1: *Would the Project would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

The number of employees needed for the Project operations would be a decrease from baseline. As a result, any use of recreational facilities resulting from Project implementation would not result in physical deterioration, and thus no impacts would result.

The Project does not include or require recreational facilities; therefore, no impacts would result.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.16.6.2 Require Construction/Expansion of Recreational Facilities

Impact Statement

Impact REC-2: *Does the project include recreational facilities or require the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

The number of employees needed for the Project operations would be a decrease from baseline. As a result, any use of recreational facilities resulting from Project implementation would not result in physical deterioration, and thus no impacts would result.

The Project does not include or require recreational facilities; therefore, no impacts would result.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.16.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Specifically, as summarized in Table 3-1 – Cumulative Projects, only three (3) cumulative projects are within 1-mile of the Project (2 are existing aggregate mining operations, and 1 is a community plan update) while three (3) other projects are located within 3 miles of the Project (1 existing aggregate mining operation, 1 residential sub-division, and 1 stormwater retention basin). The remainder of cumulative projects considered are located greater distances from the

Project site. Therefore, these projects are not considered to have a potential cumulative impact related to land use and planning.

As discussed in this Section, the Project was determined to be consistent with the County General Plan and Zoning designations for the Project site, and with the County's General Plan policies. The Project impacts are less than significant. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to recreational facilities.

3.17 TRANSPORTATION

3.17.1 Introduction

This section of the DEIR presents a discussion of transportation. A review of potential Project impacts is provided in the following analysis. Additionally, see the traffic report prepared by Associated Transportation Engineers (ATE) and the Vehicle Miles Travelled (VMT) analysis prepared by Sespe Consulting, Inc. (Sespe) in Appendix I for additional detail.

3.17.2 Environmental Setting

3.17.2.1 Regional and Local Setting

Tulare County is located in a geographically diverse encompassing approximately 4,840 square miles of classified lands (lands with identified uses) and can be divided into three general topographical zones: a valley region; a foothill region east of the valley area; and, a mountain region just east of the foothills. The eastern half of the County is generally comprised of public lands, including the Mountain Home State Forest, Golden Trout Wilderness area, and portions of the Dome Land and south Sierra Wilderness areas. Federal lands, which include wilderness, national forests, monuments and parks, along with County parks, make up 52% of the County. Agricultural uses, which include row crops, orchards, dairies, and grazing lands on the Valley floor and in the foothills total over 2,020 square miles or about 43% of the entire County. Urban uses such as incorporated cities, communities, hamlets, other unincorporated urban uses, and infrastructure rights-of-way make up the remaining land in the County.

Historically, the Project site has been used for cattle grazing under lease arrangements. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately 1.0 miles to the northeast of the Project site. The Kaweah River Rock aggregate mining and processing facility is located immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately 1.0 mile to the southwest of the Project site (Figure 2-2 – Project Site and Surrounding Land Use Map in Section 2.0 – Project Description). The figures in Section 2.0 – Project Description illustrate how adjacent lands to the north, northeast, southwest, and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are primarily used for agricultural and, to a limited extent, for rural residential purposes.

Excavated and processed materials would be loaded directly on to on-road haul trucks within the Project site. Once loaded, the on-road haul trucks would exit the Project site via the privately owned access road on the Seaborn site (owned by TID and CPDC) which connects to Road 222. From there the material would be transported to West Coast Sand and Gravel's (WCSG's) customers via public roads. The number of on-road haul trucks on public roads associated with WCSG's sale of the processed material would not increase from the baseline level of on-road truck traffic (160 trips per day) leaving from TID's access road. The number of on-road haul trucks carrying the processed aggregate as well as the number of on-road trucks needed for the transport of other materials (recycled concrete and asphalt, excess fines, blending materials) being exported or imported to or from the site would not be allowed to exceed the baseline production rate from the previous operations at the Seaborn site (average of 500,000 TPY and a maximum

of 650,000 TPY). A copy of the applicable traffic analyses prepared by ATE and Sespe are provided in Appendix I.

The excavation phase of the Project would require only 7 to 12 onsite employees. This would be consistent with the baseline number of employees previously required during the mining and processing activities at the Seaborn site. For evaluation purposes, it is assumed that each employee would make 2 trips per day (inbound and outbound). This would result in a maximum of 24 trips on peak days, assuming all 12 employees are onsite as compared to the 35 employee trips per day during mining and processing activities at the Seaborn site. As a result, the Project would generate only nominal automobile traffic on public roadways, which would not result in a significant increase from baseline operations at the Seaborn site (see analyses provided in Appendix I).

Access for employees and service vehicles would be via Road 222 through the Seaborn site to the entrance to the Project site (Figure 2-5 – Project Excavation Site Plan in Section 2.0 – Project Description).

Note that a single-way trip is referred to as a "trip" and a round trip (going from the WCSG facility to their customers and the return trip by the on-road truck back to the facility) is referred to as a "load" (two one-way trips).

3.17.3 Regulatory Setting

The Project is subject to a variety of land use regulatory requirements and designations, which are discussed fully in the sections to follow.

3.17.3.1 Federal

There are no federal transportation regulations that directly affect the Project.

3.17.3.2 State

Caltrans: Transportation Concept Reports

The California Department of Transportation (Caltrans) has prepared a number concept reports for State Routes, Interstate Routes, and U.S. Routes for each of its California Districts. Tulare County is located in Caltrans District 06. The concept reports that apply to the proposed Project include State Route (SR) 63 and SR 201.

Caltrans Guide for the Preparation of Traffic Impact Studies

Caltrans has developed this "Guide for the Preparation of Traffic Impact Studies" in response to a survey of cities and counties in California. The purpose of that survey was to improve the Caltrans local development review process (also known as the Intergovernmental Review/California Environmental Quality Act or IGR/CEQA process). The survey indicated that approximately 30 percent of the respondents were not aware of what Caltrans required in a traffic impact study (TIS).

Senate Bill (SB) 743

The California legislature enacted Senate Bill (SB) 743 in 2013, which required, among other things, that the Office of Planning and Research (OPR) adopt the new CEQA Guidelines Section 15064.3 – Determining the Significance of Transportation Impacts for assessing transportation impacts. OPR has replaced roadway capacity and vehicle delay measures, often displayed as Level of Service (LOS), with VMT, which estimates the total distance people drive by vehicle. Additionally, the Natural Resources Agency adopted revisions to the CEQA Guidelines, which included updates to the Appendix G, Environmental Checklist Form. The revisions were approved by the Office of Administrative Law and filed with the Secretary of State on December 28, 2018. This DEIR section includes the new Appendix G questions for the transportation impact area.

OPR developed interim guidance in December 2018 entitled, "Technical Advisory on Evaluating Transportation Impacts in CEQA" (Technical Advisory) for automobile VMT (i.e., light-duty vehicles). The OPR Technical Advisory provides non-binding technical advice, and is not a formal administrative regulation, like the CEQA Guidelines. However, it does provide a reasonable framework for lead agencies as they implement the updated transportation CEQA Guidelines. This VMT analysis applies the thresholds provided in this OPR Technical Advisory document.

3.17.3.3 Local

Tulare County Transportation Control Measures (TCM)

Transportation Control Measures (TCM) are designed to reduce vehicle miles traveled, vehicle idling, and/or traffic congestion in order to reduce vehicle emissions. Currently, Tulare County is a nonattainment region under the Federal Clean Air Act (CAA) and the California Clean Air Act (CCAA). Both of these acts require implementation of TCMs. These TCMs for Tulare County are as follows:

- Rideshare Programs;
- Park and Ride Lots;
- Alternate Work Schedules;
- Bicycle Facilities;
- Public Transit;
- Traffic Flow Improvement; and
- Passenger Rail and Support Facilities.

Tulare County Association of Governments (TCAG)

The Regional Transportation Plan is a long-range plan that every Metropolitan Planning Organization (MPO) is required to complete. The plan is meant to provide a long-range, fiscally constrained guide for the future of Tulare County's transportation system. The long-range plan extends to the year 2042 in its scope. The plan accomplishes its goals by forecasting future growth, identifying regional priorities, and planning for infra-structure improvements. This plan is required to include four elements; those elements include: the policy element, the sustainable community element, the action element and the financial element. These elements have been mandated by law, but do not keep MPOs from including more

elements to their plan de-pending on local characteristics. Tulare County's 2018 RTP/SCS also includes chapters on goods movement and valley wide characteristics in addition to the required plan elements. The RTP/SCS is not the only plan in effect dealing with transportation issues, but is the holistic plan that integrates more specific plans into a larger framework for the county. The Tulare County Association of Government has prepared the 2018 Regional Transportation Plan.

Tulare County General Plan

The Project site is located in a semi-rural area on unincorporated Tulare County, upon lands zoned "AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)", with a General Plan designation of "Valley Agriculture". The Project is also located within a designated Mineral Resource Area (MRZ-2b) as determined by the California Department of Conservation (Department of Conservation, 1997) and referenced in County General Plan (Tulare County, 2012).

The Tulare County General Plan has a number of policies that apply to projects within County of Tulare. General Plan policies that potentially relate to the proposed Project are listed below.

LU-7.3 Friendly Streets: *The County shall encourage new streets within UDBs to be designed and constructed to not only accommodate traffic, but also serve as comfortable pedestrian and cyclist environments. These should include, but not be limited to:*

1. *Street tree planting adjacent to curbs and between the street and sidewalk to provide a buffer between pedestrians and automobiles, where appropriate,*
2. *Minimize curb cuts along streets,*
3. *Sidewalks on both sides of streets, where feasible,*
4. *Bike lanes and walking paths, where feasible on collectors and arterials, and*
5. *Traffic calming devices such as roundabouts, bulb-outs at intersections, traffic tables, and other comparable techniques.*

LU-7.4 Streetscape Continuity: *The County shall ensure that streetscape elements (e.g., street signs, trees, and furniture) maintain visual continuity and follow a common image for each community.*

LU-7.6 Screening: *The County shall require landscaping to adequately screen new industrial uses to minimize visual impacts.*

TC-1.14 Roadway Facilities: *As part of the development review process, new development shall be conditioned to fund, through impact fees, tonnage fees, and/or other mechanism, the construction and maintenance of roadway facilities impacted by the project. As projects or locations warrant, construction or payment of pro-rata fees for planned road facilities may also be required as a condition of approval.*

TC-1.15 Traffic Impact Study: *The County shall require an analysis of traffic impacts for land development projects that may generate increased traffic on County roads. Typically, applicants of projects generating over 100 peak hour trips per day or where LOS "D" or worse occurs, will be required to prepare and submit this study. The traffic impact study will include impacts from all vehicles, including truck traffic.*

TC-1.16 County Level of Service (LOS) Standards: *The County shall strive to develop and manage its roadway system (both segments and intersections) to meet a LOS of "D" or better in accordance with the LOS definitions established by the Highway Capacity Manual.*

TC-5.3 Provisions for Bicycle Use: *The County shall work with TCAG to encourage local government agencies and businesses to consider including bicycle access and provide safe bicycle parking facilities at office buildings, schools, shopping centers, and parks.*

TC-5.4 Design Standards for Bicycle Routes: *The County shall utilize the design standards adopted by Caltrans and as required by the Streets and Highway Code for the development, maintenance, and improvement of bicycle routes.*

TC-5.8 Multi-Use Trails: *The County shall encourage the development of multi-use corridors (such as hiking, equestrian, and mountain biking) in open space areas, along power line transmission corridors, utility easements, rivers, creeks, abandoned railways, and irrigation canals.*

HS-1.9 Emergency Access: *The County shall require, where feasible, road networks (public and private) to provide for safe and ready access for emergency equipment and provide alternate routes for evacuation.*

Complete Streets Policies

Complete Street Goals

The purpose of the RMA Complete Streets Policy is to create a comprehensive and uniform Complete Streets vision and policy for Tulare County. This will allow the implementing entities to incorporate Complete Streets guidelines and standards into both development and redevelopment actions. The County's goals are:

- *Tulare County's transportation network will be supported through a variety of feasible transportation choices, which allows for sustainable growth.*
- *The livability of neighborhoods and commercial centers located along the County's transportation corridors will be enhanced by a safe and inviting pedestrian environment.*
- *The design of multimodal roadway facilities will not compromise the needs of larger vehicles such as transit vehicles, fire trucks and freight delivery trucks.*
- *Inclusion of Complete Streets design elements will allow for design flexibility on different street functions and neighborhood contexts.*
- *Inclusion of Complete Streets design elements will improve the integration of land use and transportation, while encouraging economic revitalization through infrastructure improvements.*

Complete Streets Objectives

- *To create an integrated and connected transportation network that supports transportation choices and sustainable growth.*
- *To ensure that all transportation modes are accommodated to the extent possible in all public roadway facilities in the County.*
- *To develop and use the latest design standards and guidelines in the design of Complete Streets.*
- *To provide flexibility in the implementation of this policy so that streets chosen for implementation of Complete Streets elements can be developed to fit within the context of their*

principal purpose and surroundings without compromising the safety of users and needs of larger vehicles.

Tulare County General Plan Policies

The Tulare County General Plan Update (2030) in complying with AB 1358 calls for 4 Complete Streets related principles including:

- *Principle 1: County-wide Collaboration - Support countywide transportation plans that provide choices in travel modes.*
- *Principle 2: Connectivity - Emphasize connectivity among cities, communities, and hamlets to ensure County residents have access to jobs and services.*
- *Principle 3: Community Circulation - Anticipate and provide transit, traffic, and roadway connections that support the interconnectivity of all communities.*
- *Principle 4: Pedestrian and Bicycle Facilities - Plan for the development and expansion of pedestrian paths and bicycle facilities that provide residents with alternative modes of travel.*

These principles are expressed mainly in following policies including:

- *TC-1.6 Intermodal Connectivity*
- *TC-1.7 Intermodal Freight Villages*
- *TC-5.1 Bicycle/Pedestrian Trail System*
- *TC-5.2 Non-motorized Modes in Planning and Development*

3.17.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Transportation" a project is considered to have a significant impact on the environment if it would:

a) *Conflict with program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities (CEQA Appendix G Threshold (a))?*

b) *Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b) (CEQA Appendix G Threshold (b))?*

c) *Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) (CEQA Appendix G Threshold (c))?*

d) *Result in inadequate emergency access (CEQA Appendix G Threshold (d))?*

3.17.5 Methodology of Analysis

The following points were considered in the Transportation evaluation:

- The Project would create a water storage reservoir which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies.

- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.
- The Project will be managed such that there will be no increase in the production rate of aggregates from the baseline level. Therefore, the number of trucks traveling offsite on public roads will not increase from existing baseline levels.
- The number of employees will not exceed the number of employees required for previous aggregate operations (baseline).
- The number of delivery and other non-aggregate trucks would be included in the total number of trucks coming/going from the site such that the total number of trucks would not exceed baseline.

3.17.6 Project-Level Impacts and Mitigation Measures

3.17.6.1 Conflict With Program Plan

Impact Statement

Impact TRAN-1: *Would the Project conflict with program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

Because the production rate of marketable aggregate would not increase from baseline, the number of on-road haul trucks transporting product offsite on public roadways would not be increased. The Project operations (excavation of the site, construction of the reservoir and reservoir operations) would be managed such that the number of on-road haul trucks, delivery trucks and/or service vehicles would not result in an increase to the baseline. In addition, the number of employees required at the site would be less than baseline, thus reducing the number of employee vehicles on public roads. Therefore, the Project would not interfere with transportation or result in an increase of local traffic. The routine operation of the reservoir would be conducted remotely from TIDs offsite office and would not result in a significant increase in TID employees.

The distance or vehicle mile traveled (VMT) to and from the site to deliver product to WCSG's customers in the region would not significantly change from the VMT associated with the Seaborn operations.

The Project would not include design features that would increase hazards on the public roads. The existing access road has been and would continue to provide adequate emergency access to and from the Project site.

Therefore, the Project would have no impact on transportation or traffic. Refer to the traffic report prepared by ATE and the VMT analysis prepared by Sespe which provide additional detail and analysis to

support the determination that there would be no Project impacts related to transportation and/or traffic (Appendix I).

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.17.6.2 Inconsistent with CEQA Guidelines Section 15064.3

Impact Statement

Impact TRAN-2: *Would the Project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

As discussed above and in the VMT analysis prepared by Sespe (Appendix I2), because the production rate of marketable aggregate would not increase from baseline, the number of on-road haul trucks transporting product offsite on public roadways would not be increased. The Project operations (excavation of the site, construction of the reservoir and reservoir operations) would be managed such that the number of on-road haul trucks, delivery trucks and/or service vehicles would not result in an increase to the baseline. In addition, the number of employees required at the site would be less than baseline, thus reducing the number of employee vehicles on public roads. Therefore, the Project would not interfere with transportation or result in an increase of local traffic. The routine operation of the reservoir would be conducted remotely from TIDs offsite office and would not result in a significant increase in TID employees. Additionally, the distance or vehicle mile traveled (VMT) to and from the site to deliver product to WCSG's customers in the region would not significantly change from the VMT associated with the Seaborn operations.

In accordance with Section 15064.3 of the CEQA Guidelines, as well as the requirements of SB 743 described above, the Tulare County advisory provides "screening thresholds" for identifying whether a land use project should be expected to result in a less than significant transportation impact under CEQA. Projects meeting one or more of these criteria would not be required to undergo a detailed VMT analysis. One of the screening thresholds is described as "Small Projects". Small projects are presumed to have a less than significant transportation impact. The County guidelines define a small project to be a project that generates less than 500 trips per day.

The proposed Project would fall within the small project category since the Project is expected to generate 24 daily automobile trips on peak days, which is less than the 500-trip threshold. Therefore, the project would "screen out", and be expected to have less than significant transportation impacts.

For these reasons, the Project would have no impact on transportation or traffic. Refer to the traffic report prepared by ATE and the VMT analysis prepared by Sespe to support the determination that there would be no impact related to transportation and/or traffic (Appendix I2).

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.17.6.3 Substantially Increase Hazards Due to a Geometric Design

Impact Statement

Impact TRAN-3: *Would the Project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?* **(CEQA Guidelines – Appendix G Threshold Criteria (c))**

Impact Analysis

Because the production rate of marketable aggregate would not increase from baseline, the number of on-road haul trucks transporting product offsite on public roadways would not be increased. The Project operations (excavation of the site, construction of the reservoir and reservoir operations) would be managed such that the number of on-road haul trucks, delivery trucks and/or service vehicles would not result in an increase to the baseline. In addition, the number of employees required at the site would be less than baseline, thus reducing the number of employee vehicles on public roads. Therefore, the Project would not interfere with transportation or result in an increase of local traffic.

The Project would not include design features that would increase hazards on the public roads. Access for employees and service vehicles would be via Road 222 through the Seaborn site to the entrance to the Project site (Figure 2-5 – Project Excavation Site Plan in Section 2.0 – Project Description). There are no proposed or required changes to existing public roadways, intersections, or other public access points. The existing access road has been and would continue to provide adequate emergency access to and from the Project site.

For these reasons, the Project would have no impact on transportation or traffic.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.17.6.4 Inconsistent with CEQA Guidelines Section 15064.3

Impact Statement

Impact TRAN-4: *Would the Project result in inadequate emergency access?* **(CEQA Guidelines – Appendix G Threshold Criteria (d))**

Impact Analysis

See responses to CEQA Criteria *a)* through *c)* above. Because the production rate of marketable aggregate would not increase from baseline, the number of on-road haul trucks transporting product offsite on public roadways would not be increased. The Project operations (excavation of the site, construction of the reservoir and reservoir operations) would be managed such that the number of on-road haul trucks, delivery trucks and/or service vehicles would not result in an increase to the baseline. In addition, the number of employees required at the site would be less than baseline, thus reducing the number of employee vehicles on public roads. Therefore, the Project would not interfere with transportation or result in an increase of local traffic. The routine operation of the reservoir would be conducted remotely from TIDs offsite office and would not result in a significant increase in TID employees.

As discussed above, the Project would not include design features, nor would it alter any existing roadways or access points that would increase hazards on the public roads. Access for employees and service vehicles would be via Road 222 through the Seaborn site to the entrance to the Project site. The existing access road has been and would continue to provide adequate emergency access to and from the Project site.

Therefore, the Project would have no impact on transportation or traffic. A traffic report was prepared by ATE to support the determination that there would be no impact related to transportation and/or traffic (Appendix I).

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.17.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3-1 – Cumulative Projects List and their location provided in Figure 3-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Therefore, these projects are not considered to have a potential cumulative impact related to land use and planning.

As discussed in this Section, the Project was determined to be consistent with the County General Plan and Zoning designations for the Project site, and with the County's General Plan policies. The Project impacts are less than significant. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to transportation.

THIS PAGE IS INTENTIONALLY BLANK

3.18 TRIBAL CULTURAL RESOURCES

3.18.1 Introduction

This section of the DEIR addresses potential effects that may cause a substantial adverse change in the significance of a tribal cultural resource as required by the California Public Resource Code (PRC) section 21074, commonly referred to as Assembly Bill (AB) 52. AB 52 requires a lead agency (in this instance, the Tulare Irrigation District) to evaluate a project's potential to impact tribal cultural resources and establishes a consultation process for California Native American Tribes that are traditionally and culturally affiliated with the geographic area of certain proposed projects. The lead agency must initiate the formal AB 52 consultation process if requested in writing by the tribe. This section of the DEIR describes the AB 52 process that TID has conducted in consultation with the County, and the response(s) from potentially affected tribes.

Tribal cultural resources are also discussed in a more generally in DEIR Section 3.3 – Cultural Resources.

3.18.2 Environmental Setting

As discussed in Section 3.3 – Cultural Resources, cultural resources consist of remains and sites associated with past human activities. These include prehistoric Native American archaeological sites, historic archaeological sites, and historic sites, buildings, structures or objects. They also include traditional cultural properties or areas such as Native American sacred sites that have been, and often continue to be, of special economic and/or religious significance.

The distinction between Cultural Resources and Tribal Cultural Resources (TCR) is that Cultural Resources are generally considered as archaeological or paleontological resources which are typically beneath the surface of the ground and are discovered or uncovered through disturbance of the site, whereas TCRs are described as a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place or object with cultural value to a Native American tribe. TCRs are not necessarily visible or archaeological and are often religious or spiritual in nature. In addition, a tribe that may have TCRs that could be affected and may not be located near a proposed project site. The appropriate regional and project setting to be included in the evaluation of TCRs is determined by discussions and interactions between the County, the Native American Heritage Commission (NAHC) and Tribes as identified by the NAHC.

3.18.2.1 Regional Setting

The Project is located on the north side of the confluence of the St. Johns River and the Lower Kaweah River, near Woodlake in Tulare County. The Kaweah River flows from a canyon in the Sierra Nevada approximately 3 miles to the northeast. The Kaweah is one of a number of rivers (including the Kern, Tule, and Kings) that deposit low-gradient fans along the eastern San Joaquin Valley and drain the western slopes of the Sierra Nevada range.

Regionally, natural conditions and resources have greatly influenced human occupation and resource utilization. The presence of archaeological and historic resources, including TCRs, would generally be most likely along rivers and streams and in other areas with ground cover or other features which could have invited and sustained habitation. Extensive accounts of California and local prehistory, ethnography, and history are provided below and in the Cultural Resource Investigation (Applied EarthWorks, Inc., 2021) in Appendix E.

As discussed in Section 3.3 – Cultural Resources, the Project area is within the homeland of the Gáwea (or Kaweah) Yokuts (Kroeber 1976: 480; Latta 1999:187–188), one of the many autonomous tribes that make up the Southern Valley Yokuts ethnolinguistic group. At the time of first contact with the Spanish missionaries, the Yokuts people, including northern valley and foothill groups, collectively inhabited the San Joaquin Valley as well as the eastern foothills of the Sierra Nevada from the Calaveras River southward to the Kern River (Wallace 1978a, 1978b). The Yokuts language belongs to the broader Penutian family, which subsumes a relatively diverse assemblage of languages, including Miwok, Costanoan, Maiduan, and Wintuan (Silverstein 1978). Compared to other Penutian languages, however, Yokuts shows considerable internal linguistic homogeneity, especially given the extent of its geographic distribution. Dialects differ minimally and were mutually intelligible, at least among individuals from contiguous groups. This relative lack of linguistic differentiation suggests that ancestors of the Yokuts entered California after the arrival and subsequent radiation of the more linguistically diverse Penutian groups such as the Miwok and Costanoan (Moratto 1984:554).

The basic unit of Yokuts society was the nuclear family, which was identified with a totem symbol specific to the paternal line. Within each tribe, lineage totems were further grouped into one of two moieties, designated by the overarching symbols of the eagle and coyote (Wallace 1978b:453). The basic political unit was the tribe or tribelet, which encompassed a single village or several settlements (Kroeber 1976).

Tulare Lake and its tributary rivers, including the Kaweah and the St. Johns, were a central part of Southern Valley Yokuts subsistence, providing food, building material, and avenues of travel for small watercraft. Not surprisingly, most Yokuts villages were situated near major waterways or around Tulare Lake (Wallace 1978b:448). For example, the main Gáwea village, also known as Gáwea, was situated on the north side of the Kaweah River at the current location of Terminus Dam (Latta 1999:188). The rivers provided fish, waterfowl, and other game attracted to the fresh water. The tule stalk was used in the manufacture of mats, baskets, and other goods (Wallace 1978b:451).

Most flaked stone artifacts were fashioned from obsidian and other imported material (Wallace 1978b:452). Ground stone artifacts, inclusive of handstones and milling slabs/slicks as well as mortars and pestles, were manufactured of granitic and metavolcanics rock. Where suitable outcrops were available, milling slicks and bedrock mortars were manufactured on bedrock. Where bedrock was not available, portable mortars and slabs manufactured from large cobbles and small boulders were used.

At the broader interregional level, the villages of the Southern Valley Yokuts profited from the east-west trade of goods that flowed between the Pacific coast and the high Sierra and Great Basin (Davis 1961).

The Yokuts bartered their local staples (e.g., freshwater fish, acorns, and tule reeds) to obtain such goods as Olivella beads and other shell material from the west as well as obsidian from the east.

As with other Indian groups in California, the lifeways of the Yokuts were dramatically altered as a result of contact with Spanish explorers and missionaries, miners, ranchers, and other immigrants who entered the San Joaquin Valley after 1700. In 1856, the Tule River Indian Reservation was established for the Koyeti and Yaudanchi tribes. The reservation was moved from its original site just east of Porterville, designated as State Historical Landmark #388, to its present location in 1873 (Tule River Indian Tribe 2011). As late as 1926, adobe ruins from the original reservation were still present (Small 1926:469). The introduction of European culture and new diseases proved devastating to the native population. In the 1860s, smallpox decimated Indians living at the Cobble Lodge site (CA-TUL-145) near Lake Kaweah (Moratto 1984:331).

There are several Native American tribal groups with ancestral ties to the Project area, including the Santa Rosa Rancheria Tachi Yokut Tribe, Tule River Indian Tribe, and the Wuksache Indian Tribe/Eshom Valley Band. Several Southern Valley Yokuts tribes have survived the effects of colonization. Yokuts today have developed language apprenticeship programs and early childhood education centers to serve tribal members, including the Wukchumne of the Tule-Kaweah near Porterville, Choynimni speakers of the Kings River tribes, Chukchansi at the Picayune and Table Mountain rancherias near Fresno, and Yawelmani speakers of the Tule River Reservation (Golla 2011:154). Several Yokuts tribal groups are governed by elders' councils and operate auxiliary departments that serve local tribal populations in areas of healthcare, education, and cultural resource management.

3.18.2.2 Vicinity Setting

As described in Section 3.3 – Cultural Resources, Applied EarthWorks, Inc. (*Æ*) conducted various records searches to determine the presence of prehistoric or historic resources, including Native American cultural resources, on and in the vicinity of the Project. Specifically, a cultural resources records search, additional research, intensive-level pedestrian field survey, and a Sacred Lands File Search with the Native American Heritage Commission were conducted. Extensive accounts of California and local prehistory, ethnography, and history are provided in the Cultural Resources Survey (Applied EarthWorks, Inc., 2021), which is provided in Appendix E, and should be consulted for more detailed information. The results of these searches and field surveys are described in Sections 3.18.2.2 and 3.18.5 below.

3.18.2.3 Project Site Setting

As described in Section 3.3 – Cultural Resources, the existing Project site and surrounding survey area is currently used as a cow pasture and is covered in seasonal grasses with a sparse scatter of live oaks, maples, and cottonwood trees. Cattle have recently eaten most of the grass cover, and mineral soil is visible throughout the proposed reservoir locations. Vegetation is dense in the reserved habitat area in the southeastern portion of the Project area. Approximately 90 percent of the survey area exhibited 60 percent or better ground visibility. The one exception is the westernmost end of the reserved habitat area, where dense berry vines and oak and maple trees resulted in poor ground visibility and prevented systematic transects. At these locations, the crew walked existing cattle trails, venturing into denser

vegetation where feasible to look for features and artifacts. Ground visibility in the western portion of the reserved habitat area was approximately 10 percent.

Æ archaeologists conducted a detailed pedestrian survey of the Project area using 15- to 20-meter transects on October 7 and 11, 2013. A follow up pedestrian survey of the Project area was conducted by *Æ* on January 12, 2021. The approximately 175-acre survey area encompassed the 168 acres proposed for the Project, including the reservoir locations and habitat area (Figure 3.3-1). *Æ* also surveyed the banks of the St. Johns River adjacent to the Project's southern boundary.

To determine the potential presence of prehistorical and TCR at or near the Project site, *Æ* archaeologists conducted intensive-level pedestrian field survey(s) of the Project area using 15- to 20-meter transects in 2013 and subsequently in 2021. The approximately 175-acre survey area encompassed the 168 acres proposed for the Project, including the reservoir locations and habitat area. *Æ* also surveyed the banks of the St. Johns River adjacent to the Project's southern boundary (see the Cultural Resource Investigation in Appendix E). *Æ*'s survey for the Project resulted in the discovery of two (2) isolated artifacts – one (1) from the historic era (P-54-005095/AE-2193-2) and one (1) that is prehistoric P-54-005096 (AE-2193-3). P-54-005096 is an isolated basalt flake (Figure 3.3-2 through Figure 3.3-8 in Section 3.3 – Cultural Resources). The flake is 4.5 centimeters long by 1.3 centimeters wide by 0.8 centimeters thick. It appears to be a secondary core reduction flake with no cortex. Three flake scars are present on its dorsal side.

According to *Æ*'s report (Appendix E), this isolated basalt flake is not considered a TCR. Isolates by definition lack association with other artifacts or features and cannot typically be associated with specific individuals or historic events. There were no other potential TCRs discovered within or near the Project site.

3.18.3 Regulatory Setting

3.18.3.1 Federal

Native American Graves Protection and Repatriation Act

The Native American Graves Protection and Repatriation Act (NAGPRA) (25 U.S.C. § 3001-3013) describes the rights of Native American lineal descendants, Indian tribes, and Native Hawaiian organizations with respect to the treatment, repatriation, and disposition of Native American human remains, funerary objects, sacred objects, and objects of cultural patrimony (referred to collectively as cultural items), with which they can show a relationship of lineal descent or cultural affiliation.

One of the major purposes of the statute is to provide greater protection for Native American burial sites and more careful control over the removal of Native American human remains, funerary objects, sacred objects, and items of cultural patrimony on Federal and tribal lands. The kinds of remains and the artifacts covered by provisions of the statute are: (1) human remains and associated funerary objects; (2) unassociated funerary objects; (3) sacred objects; and (4) objects of cultural patrimony. NAGPRA requires that Indian tribes or Native Hawaiian organizations be consulted whenever archeological investigations encounter, or are expected to encounter, Native American cultural items or when such items are

unexpectedly discovered on Federal or tribal lands (Sec. 3). Excavation or removal of any such items also must be done under procedures required by the Archaeological Resources Protection Act (Sec. 3 (c)(1)).

3.18.3.2 State

California Public Resources Code Sections 5020-5029

As discussed in Section 3.3 – Cultural Resources, the California Public Resources Code (PCR) Sections 5020-5029 (inclusive) provide the regulatory framework for State agencies regarding the inventory, evaluation and protection of historical properties and resources of significance. The Code states:

> "*No state agency shall alter the original or significant historical features or fabric, or transfer, relocate, or demolish historical resources on the master list maintained pursuant to subdivision (d) of Section 5024 without, early in the planning process, first giving notice and a summary of the proposed action to the State Historic Preservation Officer (SHPO) who shall have 30 days after receipt of the notice and summary for review and comment."* (Public Resources Code § 5024.5a)

Resources listed in, or determined to be eligible for listing in, the California Register of Historical Resources (CRHR) are resources that are required to be given consideration in the CEQA process. A resource listed in, or eligible for listing in, the CRHR is presumed to be historically or culturally significant: this includes listed archaeological resources. The CRHR is an authoritative guide to the State's historical resources, and listed properties are considered significant for purposes of CEQA. The CRHR includes resources listed in or formally determined eligible for listing in the National Register of Historic Places (NRHP), as well as some California State Landmarks and Points of Historical Interest. Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts), or that have been identified in a local historical resources inventory may be eligible for listing in the CRHR and are presumed to be significant resources for purposes of CEQA, unless a preponderance of evidence indicates otherwise (Pub. Resources Code § 5024.1, 21084.1, 14 CCR § 15064.5).

However, a resource does not need to have been identified previously either through listing or survey, to be considered significant under CEQA. In addition to assessing whether historical resources potentially impacted by a proposed project are listed or have been identified in a survey process, lead agencies have a responsibility to evaluate them against the CRHR criteria prior to making a finding as to a proposed project's impacts to historical resources (Pub. Resources § 21084.1, 14 CCR § 15064.5(3)). Generally, a resource will be considered by the lead agency to be "historically significant" if it meets the criteria for listing on the CRHR (Pub. Resources Code § 5024.1, Title 14 CCR 4852) including the following:

- Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- Is associated with the lives of persons important in our past;
- Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- Has yielded, or may be likely to yield, information important in prehistory or history.

Historic resources eligible for listing in the CRHR must meet one of the criteria of significance described above and, like the NRHP, must retain enough of their historic character to be recognizable and to convey the reasons for their significance. Integrity is evaluated with regard to the retention of location, design, setting, materials, workmanship, feeling, and association. It must also be judged with reference to the particular criteria under which a resource is proposed for eligibility. Alterations over time to a resource or historic changes in its use may themselves have historical, cultural, or architectural significance. It is possible that historical resources may not retain sufficient integrity to meet the criteria for listing in the NRHP, but they may still be eligible for listing in the CRHR. A resource that has lost its historic character or appearance may still have sufficient integrity for the CRHR, if it maintains the potential to yield significant scientific or historical information or specific data.

California Health and Safety Code Section 7050.5 (b) – Human Remains

As discussed in Section 3.3 – Cultural Resources, in accordance with California Health and Safety Code Section 7050.5 (b), if human remains are discovered during ground disturbing activities, the County Coroner must be notified. Section 7050.5 (b) states that "*there shall be no further excavation or disturbance of the site or any nearby area reasonably expected to overlie adjacent remains*" until the coroner has made certain determinations as required by California Government Code, commencing with Section 27460. Health and Safety Code Section 7050.5 (c) states: "*If the coroner determines that the remains are not subject to his or her authority and if the coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission (NAHC).*"

Upon notification by the coroner, the NAHC must comply with Public Resources Code § 5097.98:

(a) Whenever the commission receives notification of a discovery of Native American human remains from the county coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code:

1. *It shall immediately notify those persons it believes to be most likely descended from the deceased Native American.*
2. *The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the site of the discovery of the Native American human remains and may recommend… means for treatment or disposition, with appropriate dignity, of the human remains and any associated grave goods. The descendants shall complete their inspection and make recommendations or preferences for treatment within 48-hours of being granted access to the site.*

(b) Upon the discovery of Native American remains, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in this section, with the most likely descendants regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. The landowner

shall discuss and confer with the descendants all reasonable options regarding the descendants' preferences for treatment.

Public Resources Code Sections 21074, 5024.1 – AB 52

On September 25, 2014 Governor Brown signed Assembly Bill No. 52 (AB 52), which among other things, created a new category of environmental resources, specifically TCRs, which must be considered under CEQA. The law went into effect on July 1, 2015. AB 52 created new requirements for consultation with tribal governments regarding projects that may affect TCRs. As discussed in Section 3.18.2 above, AB 52 includes a definition of TCRs, a tribal consultation process and identification of mitigation measures as agreed upon with tribal representatives.

Under AB 52, California tribes have the ability to establish, through a formal notice letter, a standing request to consult with a Lead Agency regarding any proposed project subject to CEQA in the geographic area with which the tribe is traditionally and culturally affiliated. Upon receiving a request letter from a tribe, an agency may first contact the NAHC to verify that the requesting group is a California Native American tribe and that the agency potentially has lead decision-making authority over a project(s) in that tribe's area of traditional and cultural affiliation (PRC § 21080.3.1(c)). Once this has been verified, the Lead Agency would then add the tribe to the agency's notice list and make sure that all staff are aware of the agency's AB 52 notice and consultation obligations to that tribe regarding CEQA projects for which the agency serves a lead that have potential cultural resource impacts.

California law defines consultation as the "meaningful and timely process of seeking, discussing, and considering carefully the views of others, in a manner that is cognizant of all parties' cultural values and, where feasible, seeking agreement" (Gov. Code § 65352.4). AB 52 also allows for the possibility of project applicant participation in the consultation process, but agencies should not view this as an opportunity to delegate their consultation duties to the applicant (PRC § 21080.3.2(d)). AB 52 requires Lead Agencies to remain fully responsible for the consultation process.

A Lead Agency must provide written notification to requesting tribes on its notice list within 14 days of a decision to undertake a project or a determination that a project application is complete. Notice to the tribes must include a brief project description, the project location, and the lead agency's contact information. A tribe then has 30 days to request consultation. If the tribe does not respond in that period or writes to decline consultation, the lead agency has no further obligation. If the tribe requests consultation, the lead agency must begin the consultation within 30 days and prior to the release of a CEQA document for that proposed project (PRC § 21080.3.1). This timeline allows the agency to consider the information it receives during consultation in determining the proposed project's impacts and the appropriate level of CEQA review.

Senate Bill (SB) 18

Similar to AB 52 described above, SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of

a general plan or a specific plan, or the designation of open space (Gov. Code §65352.3). If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space, it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. Consultation should be concluded at the point in which: (a) The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or (b) Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005)).

3.18.3.3 Local

Tulare County General Plan – 2030 Update

As discussed previously in Section 3.3 – Cultural Resources, the Tulare County General Plan (Tulare County, 2012) includes goals and policies directed toward protecting TCRs in the County. Policies found in the Planning Framework (Section 2) and Environmental Resources Management (Section 8) sections seek to preserve the tribal cultural and archeological resources located in the County through consultation and coordination with affected tribal entities. Select goals and policies relevant to this analysis are listed below.

Section 2.6 – Coordination and Cooperation

Goal PF-6: To work with agencies, districts, utilities, and Native American tribes to promote consistency with the County's General Plan.

Policy PF-6.1 – Plans for Jurisdictions, Agencies, District, Utilities, and Native American Tribes: The County shall work with Tulare County cities; adjacent counties and cities; Federal, State, and regional agencies; local districts; utility providers; Native American tribes; and the military to ensure that their plans are consistent with Tulare County's General Plan to the greatest extent possible.

Policy PF-6.2 – Intergovernmental Coordination: The County shall work with Federal, State, and regional agencies; local districts; utility providers; Native American tribes; and the military to ensure that the County and the public are involved, as appropriate, throughout any planning process and that agency and public input is requested.

Goal ERM-6 – Evaluation of Cultural and Archaeological Resources: The County shall participate in and support efforts to identify its significant cultural and archaeological resources using appropriate State and Federal standards.

Policy ERM-6.2 – Protection of Resources with Potential State or Federal Designations: The County shall protect cultural and archaeological sites with demonstrated potential for placement on the National

Register of Historic Places and/or inclusion in the California State Office of Historic Preservation's California Points of Interest and California Inventory of Historic Resources. Such sites may be of Statewide or local significance and have anthropological, cultural, military, political, architectural, economic, scientific, religious, or other values as determined by a qualified archaeological professional.

Policy ERM-6.3 – Alteration of Sites with Identified Cultural Resources: When planning any development or alteration of a site with identified cultural or archaeological resources, consideration should be given to ways of protecting the resources. Development can be permitted in these areas only after a site specific investigation has been conducted pursuant to CEQA to define the extent and value of resource, and mitigation measures proposed for any impacts the development may have on the resource.

Policy ERM-6.4 – Mitigation: If preservation of cultural resources is not feasible, every effort shall be made to mitigate impacts, including relocation of structures, adaptive reuse, preservation of facades, and thorough documentation and archival of records.

Policy ERM-6.5 – Cultural Resources Education Programs: The County should support local, State, and national education programs on cultural and archaeological resources.

Policy ERM-6.6 – Historic Structures and Sites: The County shall support public and private efforts to preserve, rehabilitate, and continue the use of historic structures, sites, and parks. Where applicable, preservation efforts shall conform to the current Secretary of the Interior's Standards for the Treatment of Historic Properties and Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings.

Policy ERM-6.7 – Cooperation of Property Owners: The County should encourage the cooperation of property owners to treat cultural resources as assets rather than liabilities, and encourage public support for the preservation of these resources.

Policy ERM-6.8 – Solicit Input from Local Native Americans: The County shall continue to solicit input from the local Native American communities in cases where development may result in disturbance to sites containing evidence of Native American activity and/or to sites of cultural importance.

Policy ERM-6.9 – Confidentiality of Archaeological Sites: The County shall, within its power, maintain confidentiality regarding the locations of archaeological sites in order to preserve and protect these resources from vandalism and the unauthorized removal of artifacts.

Policy ERM-6.10 – Grading Cultural Resources Sites: The County shall ensure all grading activities conform to the County's Grading Ordinance and California Code of Regulations, Title 20, § 2501 et. seq.

Tulare County Code

The Tulare County Code does not contain any regulations or requirements specific to TCRs.

3.18.4 Significance Thresholds

3.18.4.1 Appendix G Thresholds from the State CEQA Guidelines

Appendix G of the State CEQA Guidelines provides thresholds of significance for determining whether a project could have a significant effect on the environment. According to Appendix G, a project could have a potentially significant impact on TCRs if the project would:

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

3.18.4.2 Additional Thresholds of Significance

Requirements identified in the County policies and plans are addressed by the CEQA Appendix G significance criteria above. There are no additional thresholds of significance related to the topical environmental issue.

3.18.5 Methodology of Analysis

This analysis is based on the review of applicable Federal, State and local requirements, Project design features, BMP's, operating practices, previously identified mitigation measures identified in this DEIR and other environmental protection measures that have been incorporated into the Project to minimize potential impacts on the environment.

Impacts to TCRs are assessed based on the potential for a project to adversely affect existing known and unknown cultural and archaeological resources. This requires an analysis of whether there are significant TCRs that could be affected by the Project that would result in a substantial adverse change (i.e., physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings) in the significance of a resource. This also requires consultation with local tribes who have a historical connection to the Project area to determine if development of the site would potentially impact resources of tribal significance. The significance of TCRs is defined in Section 3.18.6.

Æ prepared the Cultural Resource Investigation, presented in Appendix E, based on accepted professional practices and standards in the fields of cultural and archaeology history. The Cultural Resource Investigation was completed under the provisions of CEQA, the Public Resources Code (PRC) Chapter 2.6,

Section 21083.2, and California Code of Regulations (CCR) Title 14, Chapter 3, Article 5, Section 15064.5. While the Cultural Resource Investigation does not directly address tribal consultation and outreach program under AB 52, relevant results of Æ's site survey and records search are included in this section.

In accordance AB 52, and in coordination with the County, TID conducted tribal consultation and outreach with the potentially affected tribes with historical ties to the Project area. Refer to Section 3.18.5.5 below.

3.18.5.3 Records Search

As previously discussed in Section 3.3 – Cultural Resources, Æ requested records searches from the California Historical Resources Information System Southern San Joaquin Valley Information Center (SSJVIC) at California State University, Bakersfield in October 2013 and November 16, 2020. These searches encompassed all land within a 0.5-mile radius of the Project area. Sources consulted included archaeological site and survey base maps, reports of previous investigations, cultural resource records, the listings of the National Register of Historic Places, the Historic Property Data File (3/18/2013), the California Historical Landmarks, the California Register of Historical Resources, the California Inventory of Historic Resources, the California Points of Historical Interest, and the Built Environment Resources Directory (see Appendix E).

Æ's record search revealed one (1) prehistoric habitation site located across the Kaweah River (P-54-000316). The site record describes P-54-000316 as a "village site" but provides no information regarding the site constituents. Documentation of the records searches is included in Appendix E. The records search did not identify any formally recorded TCRs of tribal significance within the Project area.

Tribal Cultural Resources

Æ contacted the NAHC requesting a Sacred Lands File search and Native American contacts list. On October 2, 2013, the NAHC responded to Æ's request and stated that the Sacred Lands File did not indicate the presence of sacred sites in the Project area. The NAHC provided Æ with a list of individuals and organizations to be contacted regarding information on Native American cultural resources in the Project area. Æ sent a letter soliciting concerns about the Project to the each of the individuals and tribes on October 2, 2013. Follow-up phone calls were made and emails sent on October 14, 2013. No further outreach was undertaken in 2020. The TID, in coordination with the County, are responsible for government-to-government Native American consultation pursuant to CEQA and AB 52.

In 2013, Æ received responses from two of the seven individuals contacted. The responses received in 2013 are summarized in Table 3.18-1 below. A copy of Æ's Native American outreach log is provided in Appendix E.

Table 3.18-1. Excerpt from the Native American Outreach Log

Individual / Organization	Contact	Comments	Date Received
Santa Rosa Rancheria Tachi Yokut Tribe	Shana Brum	Shana Brum stated that the Project is in a highly sensitive area and requested an on-site meeting and Native American monitoring during ground-disturbing activities. Brum further recommended that the Project proponent contact the Wukchumni Tribe.	10/7/13
Wuksache Tribe	Johnny Sartuche	Johnny Sartuche stated that the Project area is sensitive for cultural resources and requested that he be notified of any resources identified. He further recommended that the Project not proceed due to the sensitivity of the area.	10/14/13

3.18.5.4 Field Surveys

As discussed in Section 3.3 – Cultural Resources and above, Æ conducted an intensive-level cultural resources field survey of the Project site on October 7 and 11, 2013, and subsequently on January 12, 2021. The pedestrian cultural resources site surveys were intended to locate and document previously recorded or new cultural resources, including TCRs. Please see Appendix E for more details regarding Æ's field surveys and related methodology.

During the cultural resource pedestrian surveys, Æ archaeologists examined the Project site for TCRs (e.g., flaked stone tools, tool-making debris, stone milling tools, fire-affected rock), soil discoloration that might indicate the presence of a cultural midden, soil depressions, and features indicative of the former presence of structures or buildings (e.g., postholes, foundations) or historic debris (e.g., metal, glass, ceramics). Æ did not identify any TCRs during the field surveys of the Project site.

3.18.5.5 Tribal Consultation PRC Section 21074 – AB 52

As the Lead Agency under CEQA and in compliance with PRC 21074 – AB 52, TID is responsible for contacting the California Native American tribes in the vicinity of a proposed project. TID also worked closely with the County to complete appropriate tribal consultation pursuant to AB 52. If a tribe requests formal consultation regarding the proposed project, the lead agency shall proceed with consultation per the requirements of PRC 21074 – AB 52. In accordance with both AB 52 and SB 18, in September 2021 TID contacted the NAHC and various California Native American tribes that the County and the NAHC indicated are traditionally and culturally affiliated with the geographic area of the Project. Of the seven tribal entities notified about the Project by TID, one response was received; a voicemail from the Dunlap Band of Mono Indians, indicated that their tribal organization had no further comments nor would they request further consultation. In addition to these specific tribes, an informational response letter was also received from the NAHC.

In accordance PRC Section 21074 – AB 52, the TID contacted the following tribes, summarized in Table 3.18-2 below, to obtain their input and concern with potential impacts to TCR as a result of the Project.

As discussed in Section 3.18.6.2 below, to date TID has only received one formal response from the tribes contacted under PRC Section 21074 – AB 52, specifically from the Dunlap Band of Mono Indians indicating they had no comments and would not request further consultation on the Project.

Table 3.18-2. Tribes Consulted (PRC Section 21074 – AB 52)

Date Notified	Tribe	Status/Response
9/16/2021	Big Sandy Rancheria of Western Mono Indians	Formal notification was sent by certified mail on 9/16/2021, and TID received a mailing receipt/delivery confirmation on 9/20/2021. No response or request for further consultation was received from this tribal entity.
9/16/2021	Kern Valley Indian Community – Kawaiisu Tubatulabal	Formal notification was sent by certified mail on 9/16/2021, and TID received a mailing receipt/delivery confirmation on 9/24/2021. No response or request for further consultation was received from this tribal entity.
9/16/2021	Dunlap Band of Mono Indians	Formal notification was sent by certified mail on 9/16/2021, and TID received a mailing receipt/delivery confirmation on 9/17/2021. Dirk Charlie of the Dunlap Band of Mono Indians contacted TID via phone/voicemail and indicated that tribe had no comments on the proposed Project, nor would they request further consultation.
9/16/2021	Santa Rosa Rancheria Tachi Yokut Tribe	Formal notification was sent by certified mail on 9/16/2021, and TID received a mailing receipt/delivery confirmation on 9/20/2021. No response or request for further consultation was received from this tribal entity.
9/16/2021	Tubatulabals of Kern Valley	Formal notification was sent by certified mail on 9/16/2021, and TID received a mailing receipt/delivery confirmation on 10/4/2021. No response or request for further consultation was received from this tribal entity.
9/16/2021	Tule River Indian Tribe	Formal notification was sent by certified mail on 9/16/2021, and TID received a mailing receipt/delivery confirmation on 9/21/2021. No response or request for further consultation was received from this tribal entity.
9/16/2021	Wuksache Indian Tribe/Eshom Valley Band	Formal notification was sent by certified mail on 9/16/2021, and TID received a mailing receipt/delivery confirmation on 9/20/2021. No response or request for further consultation was received from this tribal entity.

3.18.5.6 Human Remains

During the field surveys, Æ also looked for any evidence of human remains and none were identified.

3.18.5.7 Project Design Features, BMPs and Environmental Protection and Minimization Measures

As discussed in Section 2.4.13, numerous design features, BMPs, operating practices and other environmental protection measures have been incorporated into the Project to minimize potential impacts on the environment. The environmental protective measures that were considered during this evaluation include, but are not limited to, the following:

- Employee training programs will be conducted to educate personnel of sensitivity issues including but not limited to cultural resources.
- Blasting would not be used for the mining operations.

3.18.6 Project-Level Impacts and Mitigation Measures

3.18.6.1 Issues Found to Have No Impact

All identified thresholds and potential effects were evaluated as described in Section 3.18.6.2 below.

3.18.6.2 Tribal Cultural Resources

Impact Statement

Impact TCR-1: *Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:*

i. Would the Project cause a substantial adverse change in the significance of a tribal cultural resource, that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?

ii. Would the Project cause a substantial adverse change in the significance of a tribal cultural resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe? ***(CEQA Guidelines Threshold Criteria (a))***

Impact Analysis

As discussed above, during the field survey Æ carefully inspected the Project site for TCRs and none were identified. While the Æ study/cultural surveys have not indicated sensitivity for TCRs within the Project site, ground disturbing activities always have the potential to reveal buried deposits not observed on the surface during previous surveys.

In accordance PRC Section 21074 – AB 52, TID in coordination with the County contacted seven tribes, summarized in Table 3.18-2 above, to obtain their input and concern with potential impacts to TCR as a result of the Project. As discussed above, of the seven tribes contacted, only the one tribe responded,

specifically Dirk Charlie with the Dunlap Band of Mono Indians, contacted TID via phone/voicemail and indicated that the Dunlap Band of Mono Indians did not have any comments on the Project as proposed, and would not require further tribal consultation. To date, no other responses or input has been received from the other tribes consulted through PRC Section 21074 – AB 52. As such, the Project impacts to TCRs would be less than significant, with no mitigation required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.18.7 Cumulative-Level Impacts and Mitigation Measures

The geographical context for the analysis of potentially cumulative impacts to TCRs is the geographical area where the Project is located and includes the County of Tulare, as well as the nearby City of Woodlake.

The destruction and/or loss of such resources could be cumulatively significant if not collectively addressed by individual projects. All the cumulative projects are required to comply with local, State, and Federal regulations and policies, including PRC section 21074 – AB 52. The County General Plan includes policies requiring the identification and mitigation of tribal cultural and archeological resources on a project-by-project basis as a means of protecting those resources countywide. Therefore, overall cumulative impacts associated with TCRs are considered less than significant.

Additionally, the Project design features, BMPs and mitigation measures would prevent impacts to tribal cultural and archeological resources from becoming significant at the project level. Therefore, the Project's contribution would also be cumulatively less than considerable. No additional mitigation measures are necessary. For these reasons, the Project would not contribute to cumulatively significant impacts related to TCRs.

THIS PAGE IS INTENTIONALLY BLANK

3.19 UTILITIES AND SERVICE SYSTEMS

3.19.1 Introduction

This section of the DEIR presents a discussion of utilities and service systems. A review of potential Project impacts is provided in the following analysis.

3.19.2 Environmental Setting

3.19.2.1 Regional and Local Setting

Historically, the Project site has been used for cattle grazing under lease arrangements. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately 1.0 miles to the northeast of the Project site. The Kaweah River Rock aggregate mining and processing facility is located immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately 1.0 mile to the southwest of the Project site (Figure 2-2 – Project Site and Surrounding Land Use Map in Section 2.0 – Project Description). Figures in Section 2.0 – Project Description illustrate how adjacent lands to the north, northeast, southwest, and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are primarily used for agricultural and, to a limited extent, for rural residential purposes.

Most of the Project site is vegetated with non-native grasses except for a small portion of ground along the adjacent Kaweah River above McKay Point, which is vegetated by native trees and shrubs. The surface soil at the Project site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. The Project site topography is relatively level with a depression in the southeast corner. Site surface drainage is generally to the south and southeast toward the Kaweah River and generally to the south and southwest toward the St. Johns River. The Project site elevation decreases from approximately 472-feet above mean sea level (amsl) on the northeastern end of the property, to approximately 454-feet amsl on the southwestern end.

Because of the existence of high-quality aggregate in the alluvial soils in the area of the Project site there are also aggregate mining operations and processing facilities adjacent to the Project and throughout the immediate area.

3.19.3 Regulatory Setting

The Project is subject to a variety of land use regulatory requirements and designations, which are discussed fully in the sections to follow.

3.19.3.1 Federal

There are no federal utility or service system regulations that directly affect the Project.

3.19.3.2 State

State Water Quality Control Board

The State Water Resources Control Board (State Water Board) was created by the Legislature in 1967. The joint authority of water allocation and water quality protection enables the State Water Board to provide comprehensive protection for California's waters. The State Water Board consists of five full-time salaried members, each filling a different specialty position. Board members are appointed to four-year terms by the Governor and confirmed by the Senate. The task of protecting and enforcing the many uses of water, including the needs of industry, agriculture, municipal districts, and the environment is an ongoing challenge for the State and Regional Water Quality Control Boards.

Regional Water Quality Control Board (RWQCB)

There are nine Regional Water Quality Control Boards (Regional Boards). The mission of the Regional Boards is to develop and enforce water quality objectives and implementation plans that will best protect the State's waters, recognizing local differences in climate, topography, geology and hydrology. Each Regional Board has seven part-time members appointed by the Governor and confirmed by the Senate. Regional Boards develop "basin plans" for their hydrologic areas, issue waste discharge requirements, take enforcement action against violators, and monitor water quality. The task of protecting and enforcing the many uses of water, including the needs of industry, agriculture, municipal districts, and the environment is an ongoing challenge for the State and Regional Water Quality Control Boards.

State NPDES General Construction Permit

The State National Pollutant Discharge Elimination System (NPDES) General Construction Permit requires development and implementation of a Storm Water Pollution Prevention Plan (SWPPP) that uses storm water "Best Management Practices" to control runoff, erosion and sedimentation from the site both during and after construction. The SWPPP has two major objectives: (1) to help identify the sources of sediments and other pollutants that affect the quality of storm water discharges; and (2) to describe and ensure the implementation of practices to reduce sediment and other pollutants in storm water discharges.

3.19.3.3 Local

County of Tulare Solid Waste Services

Tulare County operates two active landfills: Visalia and Teapot Dome. The Visalia landfill has enough capacity to provide at least 140 years (2014-2154) of disposal capacity (Scott Pfanstiel, Solid Waste Department; retired).

Assembly Bill 939 (AB 939) requires cities and counties to reduce their solid waste volumes by 25 percent by 1995 and 50 percent by the year 2000. To achieve this reduction in volume, AB 939 requires local entities to devise a materials recovery facility by composting organic materials; recycling paper, metal, glass, and plastic; and by diverting household hazardous waste to the Kettlemen Hills waste facility.

Tulare County General Plan

The Project site is located in a semi-rural area on unincorporated Tulare County, upon lands zoned "AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)", with a General Plan designation of "Valley Agriculture". The Project is also located within a designated Mineral Resource Area (MRZ-2b) as determined by the California Department of Conservation (Department of Conservation, 1997) and referenced in County General Plan (Tulare County, 2012).

The Tulare County General Plan has a number of policies that apply to projects within County of Tulare. General Plan utility and service system policies that potentially relate to the proposed Project in this resource are listed as follows.

- ***PFS-2.1 Water Supply:*** *The County shall work with agencies providing water service to ensure that there is an adequate quantity and quality of water for all uses, including water for fire protection, by, at a minimum, requiring a demonstration by the agency providing water service of sufficient and reliable water supplies and water management measures for proposed urban development.*
- ***PFS-2.2 Adequate Systems:*** *The County shall review new development proposals to ensure that the intensity and timing of growth will be consistent with the availability of adequate production and delivery systems. Projects must provide evidence of adequate system capacity prior to approval.*
- ***PFS-2.3 Well Testing:*** *The County shall require new development that includes the use of water wells to be accompanied by evidence that the site can produce the required volume of water without impacting the ability of existing wells to meet their needs.*
- ***PFS-2.4 Water Connections:*** *The County shall require all new development in UDBs, UABs, Community Plans, Hamlet Plans, Planned Communities, Corridor Areas, Area Plans, existing water district service areas, or zones of benefit, to connect to the community water system, where such system exists. The County may grant exceptions in extraordinary circumstances, but in these cases, the new development shall be required to connect to the water system when service becomes readily available.*
- ***PFS-2.5 New Systems or Individual Wells:*** *Where connection to a community water system is not feasible per PFS-2.4: Water Connections, service by individual wells or new community systems may be allowed if the water source meets standards for quality and quantity.*
- ***PFS-3.1 Private Sewage Disposal Standards:*** *The County shall maintain adequate standards for private sewage disposal systems (e.g., septic tanks) to protect water quality and public health.*
- ***PFS-3.2 Adequate Capacity:*** *The County shall require development proposals to ensure the intensity and timing of growth is consistent with the availability of adequate wastewater treatment and disposal capacity.*
- ***PFS-3.3 New Development Requirements:*** *The County shall require all new development, within UDBs, UABs, Community Plans, Hamlet Plans, Planned Communities, Corridor Areas, Area Plans, existing wastewater district service areas, or zones of benefit, to connect to the wastewater*

system, where such systems exist. The County may grant exceptions in Tulare County General Plan. The Tulare County General Plan has a number of policies that apply to projects within County of Tulare. General Plan policies that relate to the proposed Project in this resource are listed as follows.

- ***PFS-2.1 Water Supply:*** *The County shall work with agencies providing water service to ensure that there is an adequate quantity and quality of water for all uses, including water for fire protection, by, at a minimum, requiring a demonstration by the agency providing water service of sufficient and reliable water supplies and water management measures for proposed urban development.*
- ***PFS-2.2 Adequate Systems:*** *The County shall review new development proposals to ensure that the intensity and timing of growth will be consistent with the availability of adequate production and delivery systems. Projects must provide evidence of adequate system capacity prior to approval.*
- ***PFS-2.3 Well Testing:*** *The County shall require new development that includes the use of water wells to be accompanied by evidence that the site can produce the required volume of water without impacting the ability of existing wells to meet their needs.*
- ***PFS-2.4 Water Connections:*** *The County shall require all new development in UDBs, UABs, Community Plans, Hamlet Plans, Planned Communities, Corridor Areas, Area Plans, existing water district service areas, or zones of benefit, to connect to the community water system, where such system exists. The County may grant exceptions in extraordinary circumstances, but in these cases, the new development shall be required to connect to the water system when service becomes readily available.*
- ***PFS-2.5 New Systems or Individual Wells:*** *Where connection to a community water system is not feasible per PFS-2.4: Water Connections, service by individual wells or new community systems may be allowed if the water source meets standards for quality and quantity.*
- ***PFS-3.1 Private Sewage Disposal Standards:*** *The County shall maintain adequate standards for private sewage disposal systems (e.g., septic tanks) to protect water quality and public health.*
- ***PFS-3.2 Adequate Capacity:*** *The County shall require development proposals to ensure the intensity and timing of growth is consistent with the availability of adequate wastewater treatment and disposal capacity.*
- ***PFS-3.3 New Development Requirements:*** *The County shall require all new development, within UDBs, UABs, Community Plans, Hamlet Plans, Planned Communities, Corridor Areas, Area Plans, existing wastewater district service areas, or zones of benefit, to connect to the wastewater system, where such systems exist. The County may grant exceptions in control non-point source water pollution contained in the U.S. Environmental Protection Agency National Pollution Discharge Elimination System (NPDES) program.*
- ***PFS-5.1 Land Use Compatibility with Solid Waste Facilities:*** *The County shall ensure that solid waste facility sites (for example, landfills) are protected from the encroachment by sensitive and/or incompatible land uses.*

- ***PFS-5.3 Solid Waste Reduction:*** *The County shall promote the maximum feasible use of solid waste reduction, recycling, and composting of waste, strive to reduce commercial and industrial waste on an annual basis, and pursue financing mechanisms for solid waste reduction programs.*
- ***PFS-5.4 County Usage of Recycled Materials and Products:*** *The County shall encourage all industries and government agencies in the County to use recycled materials and products where economically feasible.*
- ***PFS-5.8 Hazardous Waste Disposal Capabilities:*** *The County shall require the proper disposal and recycling of hazardous materials in accordance with the County's Hazardous Waste Management Plan.*
- ***PFS-5.9 Agricultural Waste:*** *The County shall investigate waste disposal and reuse needs for agricultural wastes for energy and other beneficial uses and shall change County plans accordingly.*

3.19.4 Significance Thresholds

Under the Appendix G of the CEQA Guidelines category of "Utilities and Service Systems" a project is considered to have a significant impact on the environment if it would:

a) *Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects (CEQA Appendix G Threshold (a))?*

b) *Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years (CEQA Appendix G Threshold (b))?*

c) *Result in a determination by the wastewater treatment provider, which serves or may serve the project, that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments (CEQA Appendix G Threshold (c))?*

d) *Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructures, or otherwise impair the attainment of solid waste reduction goals (CEQA Appendix G Threshold (d))?*

e) *Comply with federal, state, and local management and reduction statutes and regulations related to solid waste (CEQA Appendix G Threshold (e))?*

3.19.5 Methodology of Analysis

The following points were considered in the Utilities and Service Systems evaluation:

- The Project would create a water storage reservoir, which would allow for the enhanced management of surface water supplies by increasing the long-term availability of irrigation supplies, and groundwater recharge supplies.
- The land underlying the Project is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a General Plan designation of Valley Agriculture. The Project site is also located within a

designated MRZ-2b zone, as determined by the California Department of Conservation and referenced in the County General Plan.

- The Project will be managed such that there will be no increase in the production rate of aggregates from the baseline level. Therefore, the number of trucks traveling offsite on public roads will not increase from baseline.
- The number of employees will not exceed the number of employees required for previous aggregate operations (baseline).
- The number of delivery and other non-aggregate trucks would be included in the total number of trucks coming/going from the site such that the total number of trucks would not exceed baseline.

3.19.6 Project-Level Impacts and Mitigation Measures

3.19.6.1 Relocation or Construction of New/Expanded Utilities

Impact Statement

Impact UTL-1: *Would the Project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects?* **(CEQA Guidelines – Appendix G Threshold Criteria (a))**

Impact Analysis

Because the production rate of aggregate would not increase from baseline, the requirements for services such as utilities would not significantly change during reservoir excavation, and the subsequent construction phase would require less utilities than the excavation phase. The reservoir operation would be manned remotely from the TID office and would not result in a change in the TID office utility and service system requirements. The Project would not result in an increase of onsite employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. Other than a small/temporary extension of an existing Southern California Edison (SCE) electrical connection to accommodate the onsite processing equipment during the reservoir construction phase, the Project would not require the relocation or construction of new or expanded electric power or telecommunication facilities. The Project would not generate significant amount of waste that would exceed the capacity of the local landfills. Portable toilet facilities would be provided at the site and waste disposed of at an approved facility. The Project would not rely on existing storm water drainage systems, nor would it require the construction of new or expanded storm water drainage systems. As discussed in Section 3.7 – Hydrology and Water Quality, the Project would have sufficient water supplies available to use for dust suppression during excavation, construction and operations.

Therefore, the Project would have no impact on utilities and services systems.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.19.6.2 Sufficient Water Supplies

Impact Statement

Impact UTL-2: *Would the Project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?* **(CEQA Guidelines – Appendix G Threshold Criteria (b))**

Impact Analysis

As discussed above, because the production rate of aggregate would not increase from baseline, the requirements for services such as utilities would not significantly change during reservoir excavation, and the subsequent construction phase would require less utilities than the excavation phase. The reservoir operation would be manned remotely from the TID office and would not result in a change in the TID office utility and service system requirements. The Project would not result in an increase of onsite employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. As discussed in Section 3.7 – Hydrology and Water Quality, the Project would have sufficient water supplies available to use for dust suppression during excavation, construction and operations.

Therefore, the Project would have no impact on utilities and services systems.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.19.6.3 Wastewater Treatment

Impact Statement

Impact UTL-3: *Would the Project result in a determination by the wastewater treatment provider, which serves or may serve the project, that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?* **(CEQA Guidelines – Appendix G Threshold Criteria (c))**

Impact Analysis

As discussed above, because the production rate of aggregate would not increase from baseline, the requirements for services such as utilities would not significantly change during reservoir excavation, and the subsequent construction phase would require less utilities than the excavation phase. The reservoir operation would be manned remotely from the TID office and would not result in a change in the TID office utility and service system requirements. Portable toilet facilities would be provided at the site and waste disposed of at an approved facility.

Therefore, the Project would have no impact on utilities and services systems.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.19.6.4 Solid Waste

Impact Statement

Impact UTL-4: *Would the Project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructures, or otherwise impair the attainment of solid waste reduction goals?* **(CEQA Guidelines – Appendix G Threshold Criteria (d))**

Impact Analysis

As discussed above, because the materials extraction and the processing/production rate of aggregate would not increase from baseline, the requirements for services such as utilities would not significantly change during reservoir excavation, and the subsequent construction phase would require less utilities than the excavation phase. The reservoir operation would be manned remotely from the TID office and would not result in a change in the TID office utility and service system requirements. The Project would not result in an increase of onsite employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. The Project would not generate significant amounts of waste

that would exceed the capacity of the local landfills. Portable toilet facilities would be provided at the site and waste disposed of at an approved facility. The Project would not rely on existing storm water drainage systems, nor would it require the construction of new or expanded storm water drainage systems.

Therefore, the Project would have no impact on utilities and services systems.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.19.6.5 Management, Reduction Statutes, and Regulations Related to Solid Waste

Impact Statement

Impact UTL-5: *Would the Project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?* **(CEQA Guidelines – Appendix G Threshold Criteria (e))**

Impact Analysis

As discussed above, because the production rate of aggregate would not increase from baseline, the requirements for services such as utilities would not significantly change during reservoir excavation, and the subsequent construction phase would require less utilities than the excavation phase. The reservoir operation would be manned remotely from the TID office and would not result in a change in the TID office utility and service system requirements. The Project would not result in an increase of onsite employees, a change in the number of on-road haul trucks or the energy consumption from the baseline conditions. The Project would not generate significant amount of waste that would exceed the capacity of the local landfills. Portable toilet facilities would be provided at the site and waste disposed of at an approved facility. The Project would not rely on existing storm water drainage systems, nor would it require the construction of new or expanded storm water drainage systems.

Therefore, the Project would have no impact on utilities and services systems.

Level of Significance before Mitigation

No Impact.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.19.7 Cumulative-Level Impacts and Mitigation Measures

Cumulative impacts are determined to be considerable if the incremental effects of an individual project are considerable when viewed in connection with the effects of past, present, and reasonably foreseeable probable future projects within the vicinity of the proposed project (CEQA Guidelines Section 15065(a)(3). A list of proposed projects that are considered reasonably foreseeable and located in the general vicinity of the Project was obtained from the Tulare County Resource Management Agency (RMA) and City of Woodlake's respective websites. In addition, the cumulative impacts associated with the existing and/or approved mining projects in the immediate vicinity of the Project have been included in the cumulative analysis. The cumulative projects are listed in Table 3-1 – Cumulative Projects List and their location provided in Figure 3.0-1.

The majority of the cumulative projects within the County and City of Woodlake are located some distance from the Project and involve activities that are not similar to the Project such as minor divisions of land, rezoning, or amendments to the General Plan. Therefore, these projects are not considered to have a potential cumulative impact related to land use and planning.

As discussed in Section 3.8 – Land Use and Planning, the Project was determined to be consistent with the County General Plan and Zoning designations for the Project site, and with the County's General Plan policies. The Project impacts are less than significant. Therefore, the Projects contribution to potential cumulative impacts would not be considerable, and there would be no significant cumulative impacts related to utilities and service systems.

3.20 WILDFIRE

3.20.1 Introduction

This section of the DEIR describes the local and regional wildfire conditions that occur in the vicinity of and at the Project site. Potential resources and impacts related to wildfire are identified within the Project area, the potential effects that the Project may have on these resources and/or wildfire risks are discussed, and mitigation measures to address potentially significant impacts are identified.

3.20.2 Environmental Setting

3.20.2.1 Regional Setting

The Project site is located in a semi-rural area of unincorporated Tulare County, near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east. The Project site is drained by the Kaweah River, which drains to the ephemeral Tulare Lake in the southern end of the San Joaquin Valley, and by the St. Johns River, which becomes Cross Creek, before draining into the Tulare Lake bottom near Corcoran.

The *Foothill Growth Management Plan Element* of the *Tulare County General Plan* (Tulare County, 2012) describes the area climate as typical of the foothill region, with cool rainy winters having a mean daily temperature ranging from 40° to 50° Fahrenheit (F) and hot dry summers where daytime temperatures can exceed 100° F.

During the summer months, a high-pressure system off the west coast of California prevents precipitation from occurring in the foothills. During the winter, this high-pressure system is intermittent, allowing Pacific storms to bring rainfall to the foothills. Rainfall increases with elevation in the foothills and ranges from approximately 10 inches at the base to 25 inches at 3,000-feet. Most of this precipitation occurs between the months of November and April.

During daytime there is a dominant southeasterly wind flow pattern towards the Tehachapi Mountains. At night, this flow is reversed by winds that flow from the Sierra mountains and foothill canyons.

Biological resources in the region have been modified by past and present land uses. Prior to human settlement, this region was dominated by riparian vegetation within the floodplains, with stands of valley oak and interior live oak on higher ground. Herbaceous wetland bottoms and upland native grassland communities were common in this vegetation mosaic. The extensive oak forests and riparian/wetland habitats hosted a diverse and abundant wildlife community. Cattle grazing and deforestation of the oaks in the early- to mid-1800s for agriculture substantially altered both the floodplain and channel vegetation.

Currently in the foothills, the vegetation ranges from annual grasses in open areas to dense shrubs and trees. Much of the native vegetation in the area has been replaced by introduced species or has been

eliminated by cultivation and overgrazing. Agriculture is currently the main land use in the region, although narrow strips of riparian vegetation grow along remnant tributaries.

3.20.2.2 Vicinity Setting

Surrounding land uses adjacent to the Project site include aggregate mining and auxiliary facilities, as well as open space/agricultural land and scattered rural residences. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately 1.0 miles to the northeast of the Project site. The Kaweah River Rock aggregate mining and processing facility has been operating immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately 1.0 miles to the southwest of the Project site (Figure 2-2 – Project Site and Surrounding Land Use Map).

The Project is located in unincorporated Tulare County, 1.0 miles northwest of the community of Lemon Cove and 2.5 miles southeast of the community of Woodlake (Figure 1-1 – Location Map). The Owners propose to construct and operate the Project on the north side of the divergence of the Lower Kaweah River and St. Johns River (North Parcel) adjacent to and downstream of McKay Point (Figure 2-2 – Project Site and Surrounding Land Use). The area around the Project site has historically been used for agriculture, cattle grazing and aggregate mining. The Project site itself has primarily been used for cattle grazing under lease agreement.

3.20.2.3 Project Site Setting

The majority of the Project site is vegetated with non-native grasses except for a small portion of ground adjacent to the Kaweah River above McKay Point, which is vegetated by oak woodlands trees and shrubs. The surface soil at the Project site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. Grasses and small trees are present and these increase in density with proximity to the nearby rivers. In addition, some of these existing plant communities are dry and stressed due to years of drought conditions, creating an area that contains tinder and kindling making it potentially prone to wildfires.

The Project site topography is relatively level with a depression in the southeast corner. Site surface drainage is generally to the south and southeast toward the Kaweah River and generally to the south and southwest toward the St. Johns River. The Project site elevation decreases from approximately 472-feet above mean sea level (amsl) on the northeastern end of the property, to approximately 454-feet amsl on the southwestern end. Figure 2-2 and 2-4 in Section 2.0 – Project Description show the vicinity setting and layout of the proposed Project.

The California Department of Forestry and Fire Protection (CalFire) publishes Fire Hazard Severity Zones (FHSZ) maps which designated areas of the state determined to pose a significant wildfire hazard risk based on fuel availability, terrain, weather and other relevant factors (https://calfire.ca.gov). CalFire's FHSZ maps for Tulare County were reviewed, and the Project site is not located in a State Responsibility Area (SRA) or a designated Very High Fire Hazard Severity Zone (VHFHSZ)" area. However, a designated SRA "High FHSZ" is located approximately 0.6 miles north/northeast of the Project site

(https://osfm.fire.ca.gov/media/6830/fhszs_map54.pdf). Additionally, the southern portion of the Project is located within a Local Responsibility Area (LRA), specifically a designated LRA "Moderate FHSZ" as designated by CalFire. There are no high-voltage power lines located on or near the Project site.

3.20.3 Regulatory Setting

3.20.3.1 Federal

There are no federal regulations applicable to the Project with regard to wildfire hazards.

3.20.3.2 State

Senate Bill 1241

California's increasing population and the expansion of development into previously undeveloped areas has created more "wildland-urban interface" issues with a corresponding increased risk of loss to human life, natural resources and economic assets associated with wildland fires. Additionally, the changing climate, specifically rising temperatures and increasing temporal variability of water availability has substantially increased wildfire risk in many areas around the State. To address these State-wide concerns, Senate Bill (SB) 1241 (Kehoe, 2012) was passed in September 2013 which required the Office of Planning and Research (OPR), the Natural Resource Agency, and CalFire to develop "*amendments to the initial study checklist of the [CEQA Guidelines] for the inclusion of questions related to fire hazard impacts for projects located on lands classified as state responsibility areas (SRAs), as defined in Section 4102, and on lands classified as very high fire hazard severity zones (VHFHSZ), as defined in Subdivision (i) of Section 51177 of the Government Code.*" (Public Resources Code, § 21083.01).

SB 1241 also requires that the Safety Elements of local general plans be revised, upon the next update to the Housing Element, to address SRAs and VHFHSZs. The revisions must include information about wildfire hazards, as well as goals, policies, and objectives and feasible implementation measures for the protection of the community from the unreasonable risk of wildfire.

California Department of Forestry and Fire Protection

CalFire protects the people of California from fires, responds to emergencies, and protects and enhances forest, range, and watershed values providing social, economic, and environmental benefits to rural and urban citizens. The Office of the State Fire Marshal supports CalFire's mission by focusing on fire prevention. It provides support through a wide variety of fire safety responsibilities including by regulating buildings in which people live, congregate, or are confined; by controlling substances and products which may, in and of themselves, or by their misuse, cause wildfire related accidents; by providing statewide direction for fire prevention in wildland areas; by regulating hazardous liquid pipelines; by reviewing regulations and building standards; and by providing training and education in fire protection methods and responsibilities.

California Fire Plan

The California Fire Plan is the statewide plan for reducing the risk of wildfire. The plan's basic principles are as follows: involve the community in the fire management planning process; assess public and private resources that could be damaged by wildfire; and develop pre-fire management solutions and implement cooperative programs to reduce the community's potential wildfire losses.

One of the more important objectives of the California Fire Plan pertains to pre-fire management solutions. Included within the scope of pre-management solutions are fuel breaks, the establishment of wildfire protection zones, and prescribed fires to reduce the availability of fire fuels. In addition, the plan recommends that clearance laws, zoning, and related fire safety requirements implemented by State and local authorities address fire-resistant construction standards, hazard reduction near structures, and infrastructure.

The California Fire Plan does not contain any specific requirements or regulations. It acts as an assessment of current fire management practices and standards and recommends methods for how to best improve the practices and standards in place.

California Fire Code

The 2016 California Fire Code (Title 24, Part 9 of the California Code of Regulations) establishes regulations to safeguard against the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises. The Fire Code also establishes requirements intended to provide safety for and assistance to firefighters and emergency responders during emergency operations. The provisions of the California Fire Code apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal, and demolition of every building or structure throughout California. The California Fire Code includes regulations regarding fire-resistance-rated construction, fire protection systems such as alarm and sprinkler systems, fire service features such as fire apparatus access roads, means of egress, fire safety during construction and demolition, and wildland-urban interface areas. Additionally, The County has adopted various requirements found within the California Fire Code through their current Ordinance Code and implements these standards through its permitting process.

California Public Resources Code

Sections 4201-4204

Public Resources Code (PRC) Sections 4201–4204 and Government Code Sections 51175–51189 direct CalFire to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors. These zones, referred to as Fire Hazard Severity Zones (FHSZ), define the application of various mitigation strategies to reduce risk associated with wildland fires. As described in Section 3.11.2.3, the Project site is located near (approximately 0.6 miles away) a State-designated FHSZ.

Section 4290

PRC Section 4290 was adopted to establish minimum wildfire protection standards in conjunction with building, construction, and development in SRAs. Under Section 4290, the future design and construction of structures, subdivisions, and developments in SRAs must provide for basic emergency access and specified perimeter wildfire-protection measures. These measures include road standards for emergency access; signing and building numbering; water supply reserves; and fuel breaks and greenbelts. Local standards that exceed those of PRC Section 4290 supersede the measures presented therein.

Section 4291

PRC Section 4291 applies to a person who owns, leases, controls, operates, or maintains a building or structure in, upon, or adjoining a mountainous area; lands covered by forest, brush, or grass; or land that is covered with flammable material. If a structure is located in a SRA, Section 4291 states the owner is responsible for ensuring their property is in compliance with California's building and fire codes that call for homeowners to take proactive steps to protect their property from a wildfire. Section 4291 mandates that those who own homes and business in wildland areas maintaining defensible space of 100-feet from each side of the structure, but not beyond the property line. The amount of fuel modification necessary must also account for the flammability of the structure as affected by building material, building standards, location, and type of vegetation.

3.20.3.3 Local

Tulare County Multi-Jurisdictional Local Hazard Mitigation Plan

The intent of Tulare County's 2017 Multi-Jurisdictional Local Hazard Mitigation Plan (MJLHMP) is to assess the natural, technological, and human-caused risks to County communities, and to reduce the potential impact of the hazards by creating mitigation strategies. Hazard mitigation is defined by the Federal Emergency Management Agency (FEMA) as "*any action taken to reduce or eliminate the long-term risk to human life and property from natural hazards.*" FEMA also defines a "hazard" as "any event or condition with the potential to cause fatalities, injuries, property damage, infrastructure damage, agricultural loss, environmental damage, business interruption, or other loss."

The County's 2017 MJLHMP represents the County's commitment to create a safer, more resilient community by taking actions to reduce risk and by committing resources to lessen the effects of hazards on the people and property of the County. The County MJLHMP is a "living document" that is reviewed, monitored, and updated to reflect changing conditions and new information. As required by law, the MJLHMP is updated every five years to remain in compliance with regulations and federal mitigation grant conditions. The current County MLJHMP was approved by the County's Board of Supervisors and subsequently by FEMA in March 2018.

Tulare County Ordinance Code

The Tulare County Ordinance Code contains various provisions related to fire prevention and wildfire abatement. The provisions found in County Code, Chapter 11 (Fire Hazardous Weeds and Rubbish) are

meant to "*protect the lands, fields, lots, buildings and homes within this County from the danger of fire, which may spread from one property to another.*" (Tulare County Code, Part IV, Chapter 11 – Section 4-11-1005). Specifically, the County Code states that "*It is the duty of every owner of private property within the unincorporated areas of Tulare County to prevent a nuisance from arising on, or existing upon, his or her property.*" (Tulare County Code, Part IV, Chapter 11 – Section 4-11-1075), where "nuisance" is defined as "*Weeds, grass, rank growths and combustible rubbish growing or accumulating upon private property which do, or will when dry, create a fire hazard and which by virtue thereof constitute a danger to neighboring property or the health or welfare of residents of the vicinity.*" (Tulare County Code, Part IV, Chapter 11 – Section 4-11-1065).

As discussed in Section 3.11.6 below, certain requirements found in Chapter 11 of the Tulare County Code do not apply to this Project. Chapter 11 and associated General Plan goals and policies are further discussed in Section 3.11.6.

Tulare County Fire Hazard Abatement Program

The Tulare County Fire Department's Hazard Abatement Program outlines specific fire abatement standards for property owners within the designated County LRA areas in the valley and the SRA areas in the foothills. The primary function of the Hazard Abatement Program is to reduce the risk of fires within these areas by proactively establishing defensible space and reducing/removing flammable materials (e.g., weeds, grass, rubbish, etc.) on applicable properties. The County's hazard abatement standards are not a one-time observance, but rather property owners would likely need to have their property addressed more than once during the year in order to meet the standards. Although required throughout the year, it is extremely critical that properties be maintained during the high fire months, usually from April through October. Applicable property owners are required to demonstrate compliance with the Hazard Abatement Program through submittal of online forms on an annual basis. Additionally, County Fire conducts compliance checks throughout the year, and issues corrective actions for those properties that do not meet the applicable hazard abatement standards.

Tulare County General Plan

The Health and Safety element (Chapter 10) of the Tulare County General Plan – 2030 Update (Tulare County, 2012) outlines goals and policies to achieve community protection from risks associated with natural and man-made hazards, including wildfire hazards. The General Plan contains general hazard and risk reduction strategies and policies to minimize potential dangers to residents, workers, and visitors; reduce the level of property loss resulting from potential disasters; and identify ways to respond and evacuate during crisis situations. Relevant General Plan wildfire goals and policies that potentially apply to the proposed Project are listed below.

Section 10.6 – Urban and Wildland Fire Hazards

Goal HS-6: To minimize the exposure of County residents, visitors, and public and private property to the effects of urban and wildland fires.

Policy HS-6.1 – New Building Fire Hazard: The County shall ensure that all building permits in urban areas, as well as areas with potential for wildland fires, are reviewed by the County Fire Chief. The following minimum requirements should be met to review developments or uses within areas of varying fire hazards:

a. Very High Hazard – Extreme caution should be used in allowing development, particularly critical facilities.
b. High Hazard – Strict compliance with existing State statutes and local ordinances should provide adequate fire protection.
c. Moderate Hazard – Development should be allowed, with recommendations for mitigation of hazard by Fire Warden.

Policy HS-6.2 – Development in Fire Hazard Zones: The County shall ensure that development in very high or high fire hazard areas is designed and constructed in a manner that minimizes the risk from fire hazards and meets all applicable State and County fire standards. This shall include promoting the use of fire-resistant materials designed to reduce fire vulnerability within high or very high fire hazard areas through use of Article 86-A of the 2001 California Fire Code, SRA Fire Safe Regulations, and other nationally recognized standards, as may be updated periodically. Special consideration shall be given to the use of fire-resistant-materials and fire-resistant construction in the underside of eaves, balconies, unenclosed roofs and floors, and other similar horizontal surfaces in areas with steep slopes. Ensure new development proposals contain specific fire protection plans, actions, and codes for fire engineering features for structures in Very High Fire Hazard Safety Zones including automatic sprinklers as required by applicable codes.

Policy HS-6.3 – Consultation with Fire Service Districts: The County shall consult the appropriate fire service district in areas identified as subject to high and very high fire hazard, for particular regulations or design requirements prior to issuance of a building permit or approval of subdivisions.

Policy HS-6.5 – Fire Risk Recommendations: The County shall encourage the County Fire Chief to make recommendations to property owners regarding hazards associated with the use of materials, types of structures, location of structures and subdivisions, road widths, location of fire hydrants, water supply, and other important considerations regarding fire hazard that may be technically feasible but not included in present ordinances or policies.

Policy HS-6.6 – Wildland Fire Management Plans: The County shall require the development of wildland fire management plans for projects adjoining significant areas of open space that may have high fuel loads.

Policy HS-6.7 – Water Supply System: The County shall require that water supply systems be adequate to serve the size and configuration of land developments, including satisfying fire flow requirements. Standards as set forth in the subdivision ordinance shall be maintained and improved as necessary.

Policy HS-6.9 Fuel Modification Programs: The County shall actively support fuel modification and reduction programs on public and private lands throughout the County, including vacant residential lots and greenbelts and, with the relevant partners, on adjacent private wildlands or federal lands with fire hazards that threaten the entity's jurisdiction as feasible and appropriate.

Policy HS-6.12 Weed Abatement: The County shall continue to encourage weed abatement programs throughout the County in order to promote fire safety.

Policy HS-6.20 – Fire Suppression Defense Zones: The County shall support the creation of wildfire defense zones for emergency services, including fuel breaks or other staging areas where WUI firefighting tactics could be most effectively deployed as appropriate consistent with the strategies identified in the Multi-Jurisdictional Local Hazard Mitigation Plan.

Tulare County Emergency Operations Plan

The Tulare County Emergency Operations Plan (EOP) was prepared to outline response activities in the event of a large-scale emergency or disaster. The EOP identifies existing conditions and infrastructure, identifies threats and hazards, and then describes the process and roles for the response and recovery actions. The EOP also implements the California Standardized Emergency Management System (SEMS), and provides organizational structure and functional guidance through the Initial Response, Extended Response, and Recovery phases of emergency operations.

The EOP provides a comprehensive, single source of guidance and procedures for the County to prepare for and respond to significant or catastrophic natural, environmental or conflict-related risks that produce situations requiring coordinated response. It further provides guidance regarding management concepts relating to response and abatement of various emergencies, identifies organizational structures and relationships, and describes responsibilities and functions necessary to protect life and property.

Tulare County Zoning Ordinance

As discussed in Section 2.0 – Project Description, the Project site is located in a semi-rural area on unincorporated Tulare County, upon lands zoned "AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum)". The County Zoning Ordinance contains both "General Provisions (Chapter 3, Section 15)" applicable to all land uses, as well as requirements specific to areas zoned "AE-20 (Chapter 3, Section 9.6)" such as the Project site. Please see Section 3.11.6 below for further discussion of the requirements of the Tulare County Zoning Ordinance specific to wildfire risks and applicable to the Project.

3.20.4 Significance Thresholds

3.20.4.1 Appendix G Thresholds from the State CEQA Guidelines

According to Appendix G of the State CEQA Guidelines, a Project may have a potentially significant impact related to wildfire if it occurs in or near a State Responsibility Area (SRA) or lands classified as Very High Fire Hazard Severity Zones (VHFHSZ). Because the Project site is located near a SRA areas classified as a

"High FHSZ" (located approximately 0.6 miles to the north/northeast of the Project site), the Project would have a significant effect if it would:

a) Substantially impair an adopted emergency response plan or emergency evacuation plan?

b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of wildfire?

c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

d) Expose people or structures to significant risk, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

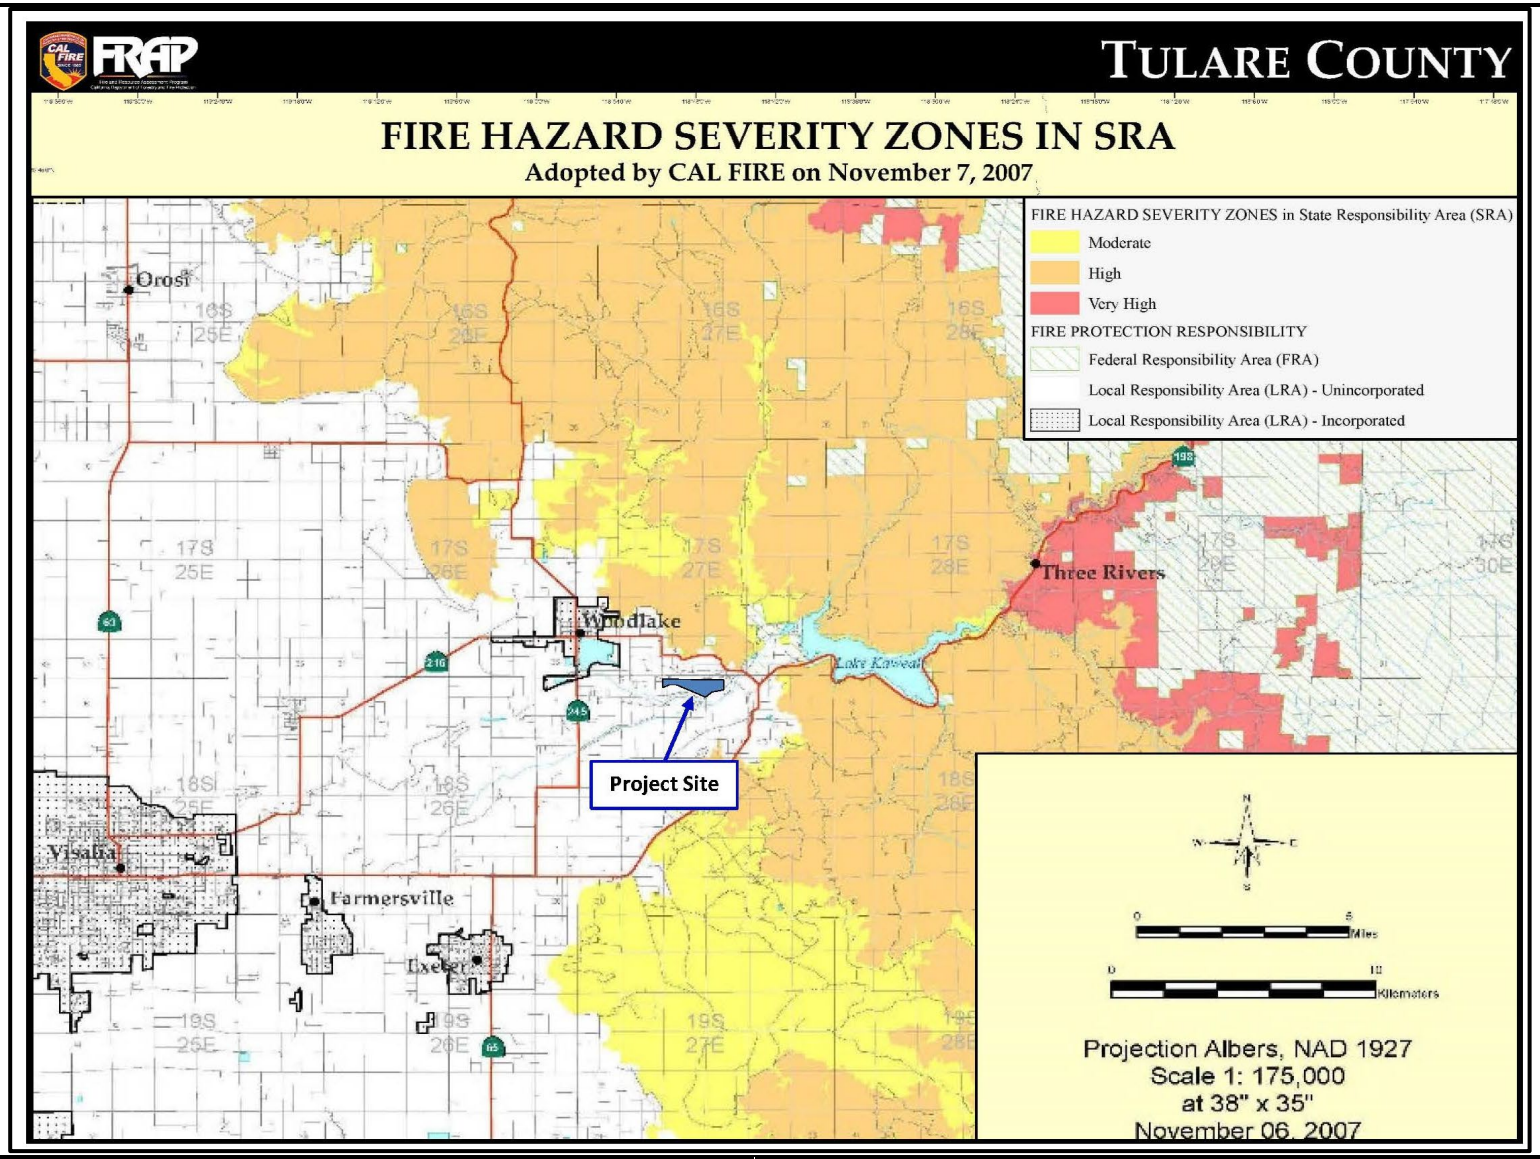
3.20.4.2 Additional Thresholds of Significance

There are no additional thresholds of significance related to the wildfire environmental issue. Requirements identified in the applicable Tulare County policies, plans and ordinances are addressed by the significance criteria above.

3.20.5 Methodology of Analysis

The analysis is based on the review of applicable federal, state and local requirements, Project design features, best management practices (BMPs), operating practices and other environmental protection measures that have been incorporated into the Project to minimize potential impacts on the environment.

As discussed in Section 3.11.4.1 above, the CEQA Appendix G criteria related to wildfire only apply to project's "*located in or near a state responsibility area or lands classified as very high fire hazard severity zones.*" As shown in Figure 3.11-1, per the most recent Fire Hazard Severity Zone map for Tulare County adopted by CalFire on November 7, 2007, the Project site is located near (approximately 0.6 miles away) a "state responsibility area (SRA)" designated as a "high fire hazard severity zone (FHSZ)" and is therefore subject to the CEQA wildfire criteria (see Section 3.11.6 for more detail).



Although not subject to CEQA, the southern portion of the Project is located within a Local Responsibility Area (LRA), specifically an "Moderate" FHSZ as designated by CalFire. There are no areas on or near the Project site that have been designated "very high fire hazard severity zone (VHFHSZ)" by CalFire. The closest VHFHSZ is located approximately 7.0 miles away to the east, near the unincorporated community of Three Rivers.

3.20.5.3 Project Design Features and Environmental Protection Measures

Numerous design features, BMPs, operating practices and other environmental protection measures have been incorporated into the Project to minimize potential impacts on the environment. The environmental

protective measures that were considered in the evaluation of impacts related to wildfire include, but are not limited to, the following:

- Excavation equipment would be inspected, maintained and repaired to ensure that the equipment is operating properly, and leaks are prevented to the maximum extent feasible.
- Major maintenance and repairs of equipment and vehicles would be conducted off-site.
- Hazardous materials and hazardous waste would be managed in accordance with applicable local, state and federal regulations. Any hazardous waste generated at the site would be disposed of at a permitted off-site facility.
- Blasting would not be used for the reservoir excavation operations.

Figure 3.11-1 FHSZs & SRAs – Tulare County

3.20.6 Project-Level Impacts and Mitigation Measures

3.20.6.4 Impair Emergency Response/Evacuation Plan

Impact Statement

Impact WI-1: *Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?* **(CEQA Guidelines Threshold Criteria (a))**

Impact Analysis

As discussed in Section 3.11.3.3, the Project is subject to the applicable requirements outlined in adopted emergency response and evacuation plans for the area. Additionally, the Tulare County General Plan and County Code of Ordinances contains various goals, policies, and maps that specify emergency response procedures, evacuation routes, etc.

As discussed in Section 1.0 – Introduction, the Project would not increase traffic on public roadways, specifically on-road haul trucks and employee/contractor vehicles, above the current baseline levels associated with the adjacent Seaborn facility. On-road haul trucks and employee vehicles would enter onto and exit the Project site via the existing access road through the Seaborn facility, which connects to Road 222. Because the Project has been designed to not exceed the historical Seaborn site activities and existing access roads would continue to be utilized, implementation of the Project would not result in an increase in on-road haul trucks/vehicles on public roads or a change the manner in which on-road haul trucks have historically accessed the adjacent Seaborn site.

The ingress and egress route to the Project site is in the western portion of the Project site, connecting to the existing Seaborn facility which connects to Road 222. Figure 2-2 in Section 2.0 – Project Description shows the location of this existing access road. This road would continue to serve as the single ingress and egress point for the Project and would be used by on-road haul trucks as well as the employees and other small work trucks and vehicles. In the event a wildfire threatens the Project site, evacuation from the Project site would occur from this access point to Road 222 to the west.

According to the Tulare County General Plan Figure 10-2 - Fire Threat (Tulare County, 2012), the Project site and adjacent areas are designated as either “Non-Fuel” or “Moderate” fire threat areas, which are the lowest County-designated risk levels. Although the wildfire threat is considered low per the County General Plan, because the Project is a mining/excavation operation and new structures or buildings are proposed (i.e., reservoir/dam structures), determined that many of the general development standards in County General Plan may apply. Notwithstanding, the Project is consistent with the applicable general development standards, as discussed below.

Per General Plan Policies HS-6.1 and HS-6.5, because the Project site is in a County-designated “Moderate Hazard” fire threat zone, the Project will be reviewed by the County Fire Chief prior to the issuance of any building permits associated with the reservoir structures. If needed, mitigations related to wildfire hazard recommended by the County Fire Chief/Warden as part of their Project review would be implemented

onsite. Potential recommendations provided by the County Fire Chief could include use of materials, types of structures, location of structures and subdivisions, road widths, location of fire hydrants, water supply, and other important considerations regarding fire hazard that may be technically feasible but not included in present other County ordinances or policies. Additionally, if determined necessary by the County per General Plan Policy HS-6.6, the Owners would develop a wildland fire management plans for the Project.

Although only specifically required for sites located in the County's Foothill and Mountain Plan Areas (the Project is located in the County's "Valley Region"), the County/Fire Department also recommends that vegetation and flammable materials be removed to maintain a minimum 100-foot-wide defensible space around homes and structures. As discussed previously, the site would be cleared of vegetation during the majority of excavation and reservoir construction/maintenance operations. Based on the design of the Project, including the excavation pit and the reservoir structures, the site is not expected to present an increased wildfire risk compared to existing conditions (e.g., undeveloped grassland, stressed/dry plant communities, etc.). Additionally, no Project construction activities, operations or revegetation planting would occur within 100-feet of an existing structure, residence or proposed development. Accordingly, the Project would be considered consistent with the County's fuel break/defensible space provisions.

In the event of an emergency or wildfire that would require evacuation of the Project site, the existing access road connecting to the adjacent Seaborn site and Road 222 to the west would be utilized. Due to the limited number of haul trucks and associated employees and/or guests/vendors (approximately 4-8) that would be onsite and need to be evacuated from McKay Point site at any given time , and that potential wildfire hazards would most likely originate from the undeveloped foothills/open space areas north and east of the Project site (Figure 3.11-1), the use of a single evacuation point in the western portion of the Project site connecting to the Seaborn facility would be considered consistent with the County's evacuation route and emergency evacuation requirements.

While Tulare County has not designated specific evacuation routes, State Route (SR) 216 located approximately 0.5 miles north of the Project site is considered the main arterial roadway/evacuation route that would serve the Project area in the event of a wildfire. The Project access road connects to Road 222, which eventually connects to SR-216 to the north, and Project employees would travel this route in the event of a wildfire evacuation. The existing access road from the Project site, Road 222 and SR-216 have sufficient capacity to safely evacuate the small number of onsite employees and/or visitors in a timely manner. Additionally, none of the physical improvements or site design features proposed by the Project would adversely affect these existing evacuation routes along Road 222/SR-216 (e.g., reduce visibility, impact existing traffic flow, etc.) or impede evacuations from surrounding agricultural, industrial and residential areas.

As discussed in Section 3.11.3.3, the County's Emergency Operations Plan (EOP) provides a comprehensive, single source of guidance and procedures for the County to prepare for and respond to significant or catastrophic natural, environmental or conflict-related risks that produce situations requiring coordinated response. It further provides guidance to County agencies and first responders

regarding management concepts relating to response and abatement of various emergencies, identifies organizational structures and relationships, and describes responsibilities and functions necessary to protect life and property.

For the reasons outlined above, the Project would not create any new impediments to existing evacuation routes or result in unsafe conditions in the event of a wildfire. The existing access point on the western boundary of the Project site, as well as the existing access road through the Seaborn facility, would allow for the safe evacuation of onsite employees and guests/vendors onto Road 222 and SR-216. Additionally, the Project would not conflict with any of the applicable emergency response or evacuation plans, policies and procedures found in the County's General Plan/Ordinance Code or other emergency plans, nor would it impede evacuation of people and vehicles originating from neighboring properties. Therefore, the Project would have a less than significant impact with no mitigation required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.20.6.5 Exacerbate Wildfire Risks & Expose Occupants to Uncontrolled Wildfire

Impact Statement

Impact WI-2: *Would the project, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of wildfire?* **(CEQA Guidelines Threshold Criteria (b))**

Impact Analysis

As shown on Figure 3.11-1, the Project site is located near (approximately 0.6 miles away) SRAs areas designated as "high" FHSZs. Although the Project site is not within a State- or County-designated fire hazard zone, past land uses (i.e., cattle grazing) have resulted in most of the existing Project site being converted to non-native grassland and disturbed natural plant communities. These plant communities are also currently stressed due to years of drought conditions, resulting in an area that contains a substantial amount of tinder and kindling. Thus, existing conditions at the Project site are highly prone to wildfires and present a fire hazard.

Through development of the site (i.e., excavation and construction of the reservoir), the Project site would be cleared and residual debris would be removed in accordance with local, state and federal regulations.

The site would also be completely cleared of existing vegetation, and no landscaping or revegetation of the site is proposed. Other than the reservoir structures (e.g., check dams, channels, weirs, etc.), all of which would be constructed of non-flammable concrete, there will be no large permanent buildings or structures installed within the McKay Point site that would create or exacerbate a fire hazard. A 10,000-gallon diesel aboveground storage tank (AST) will be installed in the southern portion of the Project site; however, this tank will be reinforced and installed within a protective structure. Additionally, as shown on Figure 2-4, the diesel AST will be installed on the southern portion of the Project site adjacent to the St. Johns and Kaweah Rivers, away from adjacent open spaces where wildfires may originate. Ultimately, because the site will be cleared of all existing stressed vegetation, the 10,000-gallon diesel AST will be properly protected, and no other flammable structures would be constructed onsite, the Project is expected to decrease wildfire risk to Project personnel and surrounding properties compared to the existing onsite conditions.

In addition, the Project site would have steep pit walls as reservoir excavation progresses to a final pit depth of 60-feet below ground surface (bgs). Cleared and excavated mining areas would be barren soil, devoid of vegetation, and would therefore serve as a barrier between the agricultural areas and associated residences within the community of Lemon Cove to the south and west in the event of a wildfire originating from the open spaces/foothills located farther to the north and east. As discussed above, existing conditions onsite conditions include drought stressed vegetation. These existing conditions present more of a fire hazard than would the proposed Project. Conversely, once the Project site is excavated and the concrete reservoir structures constructed, the site would act as a "fire break" or "safe zone" minimizing the spread of a fire. Thus, the Project would potentially reduce the risk of wildfire hazards to nearby areas compared to the conditions that currently exist onsite.

During operation of the Project, flammable materials would be managed in accordance with applicable federal, state, and local regulations.

The fire station closest to the Project site is Tulare County Fire Department Station #13 located at 32490 CA-198, Lemon Cove, California 93244, approximately 1.2 miles to the southeast. Additionally, the Project site could receive fire response assistance from the City of Woodlake's Fire Department Headquarters (located at 216 E. Naranjo Boulevard, Woodlake, California 93286), approximately 2.5 miles to the northwest through the County's mutual aid/response agreements with various cities through Tulare County. In the unlikely event of a fire originating on or near the Project site, response time to the Project site would typically be within 5 minutes.

For these reasons, the Project would result in a less than significant impact and is not expected to exacerbate a wildfire risk or expose Project personnel and vendors to increased risk due to uncontrolled wildfire.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.20.6.6 Require Installation of Infrastructure that may Exacerbate Fire Risk

Impact Statement

Impact WI-3: *Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?* **(CEQA Guidelines Threshold Criteria (c))**

Impact Analysis

The only permanent buildings or structures proposed within the Project site would be the various reservoir structures (e.g., channels, chutes, weirs, etc.) the majority of which would be constructed with concrete. Additionally, a 10,000-gallon diesel AST would be installed onsite at the beginning of the reservoir operations phase, but this AST would be built to code, using nonflammable materials and with all applicable safety devices. Early in the reservoir excavation, the portable screen/wash plant and the crushing/recycle plant would also be installed in the bottom of the excavation pit. The plants would be constructed of nonflammable materials. Once excavation operations are complete, these temporary structures would be dismantled and removed.

Electrical service required for the onsite aggregate processing plant would be provided by Southern California Edison (SCE) and obtained from the existing electrical infrastructure/connections located along the northern boundary of the Project site. The electrical demand for the aggregate processing operations at the McKay Point site during reservoir excavation would be consistent with the historical electrical demand associated with the adjacent Seaborn facility. Other than the proposed SCE connection for the aggregate processing plants, no other utility infrastructure (natural gas, sewer, etc.) would be located within the Project site.

During the reservoir excavation phase, a mobile fuel and/or maintenance truck may be brought onsite to conduct minor maintenance and refuel mobile equipment. As discussed in Section 3.6 – Hazards and Hazardous Materials, a site-specific Storm Water Pollution Prevention Plan (SWPPP) and BMPS would be prepared for the Project. The SWPP will specifically address the prevention and, if needed, response to onsite spills of hazardous materials, including fuels and flammable materials (e.g., use of catch trays, cleanup measures in the event of a spill, etc.). Additionally, due to the installation of the 10,000-gallon diesel AST, a site-specific Spill Prevention, Control, and Countermeasure (SPCC), which would also outline preventative and cleanup measures related to oil storage and spill cleanup. Implementation of the

procedures outlined in these plans would mitigate the potential for fires due to hazardous releases during equipment fueling and maintenance.

The clearing of the site to allow for excavation of the reservoir basin would result in a type of "fire break" or "safe zone" that would help prevent the spread of a wildfire originating from areas adjacent to the Project site. In addition, existing draught-stressed vegetation and grassland onsite would be would be cleared to allow for the proposed Project; thus, further reducing a potential fire hazard onsite. Therefore, in addition to having a less than significant impact, the Project would also minimize the potential of hazards associated with a wildfire.

Since the Project would not involve the installation of any permanent new infrastructure that may exacerbate fire risk, and because installation/maintenance of the diesel AST as well as mobile equipment fueling and maintenance within the Project site would be conducted in accordance with the safety and spill prevention plans (e.g., SWPPP, SPCC, HMBP, etc.), the Project would have a less than significant impact in terms of potential to generate onsite fires due to concerns related to installation of new infrastructure or exacerbating risks due to ongoing Project activities. Therefore, impacts are considered less than significant with no mitigation required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.20.6.7 Expose People or Structures to Significant Risks due to Post-Fire Instability

Impact Statement

Impact WI-4: *Would the project expose people or structures to significant risk, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?* **(CEQA Guidelines Threshold Criteria (d))**

Impact Analysis

As discussed in Section 3.11.6.6 above, other than construction of the concrete reservoir structures and installation of the diesel AST, implementation of the Project would not involve the placement of permanent structures on the Project site. Now of these structures would be occupied, therefore the Project would not expose people or structures onsite to significant risks. In addition, the pit/basin resulting from the reservoir excavation operations would direct any flood waters, drainage and/or

landslides into the bottom of the excavated pit away from people and structures located offsite. Furthermore, the reservoir itself would help contain potential flooding due to any runoff or post-fire instability originating upstream (i.e., Kaweah River). The excavated Project site and reservoir structures would therefore act as a barrier that would contain any post-fire instability, such as changes to drainage and/or generation of landslide materials. The excavated Project site would also minimize impacts to the rural-residences/residential neighborhoods to the south resulting from upstream post-fire events, such as flooding, runoff and landslides originating from Lake Kaweah or the Kaweah River. For these reasons, the Project would not expose people or structures to significant risks associated with flooding or landslides. Conversely, the Project could potentially reduce the risk to people and structures in the surrounding areas compared to existing conditions. The Project would have a less than significant impact related to runoff, post-fire instability, or drainage after wildfires.

In addition, as discussed in Section 3.4 – Geology and Soils, the pit slopes would comply with the Surface Mining and Reclamation Act (SMARA) slope stability requirements and the slopes would be inspected by a California Certified Engineering Geologist (CEG) for unsafe slope conditions following a natural disaster, such as wildfire, prior to restarting excavation and/or reservoir construction activities. Due to the stability of the proposed pit design (i.e., 3H:1V [horizontal to vertical] slopes) and proposed ongoing slope inspections/maintenance, the Project would ensure that safe onsite slope conditions would be maintained following the unlikely event of a wildfire, and no additional mitigation is required.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance after Mitigation

Not applicable.

3.20.7 Cumulative-Level Impacts and Mitigation Measures

Table 3-1 identifies the other projects that were identified on the County and the City of Woodlake webpage that could be considered cumulative projects in regard to potential cumulative impacts. In addition, the existing and approved mining projects in the immediate vicinity of the Project were considered in the cumulative analysis. As noted in Table 3-1, none of the cumulative projects meet the criteria to be further evaluated in relation to cumulative impacts associated with wildfire hazards.

The context for cumulative impacts for wildfire impacts is the immediate area encompassing the site vicinity (1- to 3-mile radius from the Project site). As discussed in the impact analysis, specifically Section 3.11.6.5 through Section 3.11.6.8 above, the Project was determined to have either no impact or a less

than significant impact. Since the Project would present less than significant impacts related to wildfire, there would be no cumulative impact in conjunction with the other cumulative projects.

THIS PAGE IS INTENTIONALLY BLANK

4.0 ALTERNATIVES

This section describes a range of Project alternatives and compares the associated potential environmental impacts of alternatives considered to those of the Project. Section 4.1 discusses the California Environmental Quality Act (CEQA) requirements for considering alternatives to the Project, Section 4.2 provides a summary of the Project objectives, Section 4.3 discusses the alternatives considered but rejected from further analysis, Sections 4.4 and 4.5 provide analyses of the alternatives as compared to the Project, and Section 4.6 identifies the environmentally superior alternative, as required by CEQA.

4.1 CEQA Requirements for Analysis of Alternatives

As discussed in Section 1.10, the CEQA Guidelines specify that an Environmental Impact Report (EIR) must describe a reasonable range of alternatives to a project, or to the location of a project, which could feasibly attain most of the basic project objectives (Guidelines §15126.6(a)). The EIR must focus on alternatives that are capable of eliminating or substantially reducing the significant adverse impacts caused by a project (Guidelines §15126.6(c)), and alternatives to the "whole of the project" rather than the project's component parts. An EIR must include an alternatives analysis even if the EIR concludes that a project will not cause any significant adverse impacts.

The "no project" alternative, which considers impacts that would occur if existing conditions continue, must be considered (Guidelines §15126.6(e)), and the EIR must also identify the environmentally superior alternative. If the "no project" alternative is the environmentally superior alternative, the EIR must identify an environmentally superior alternative from among the other alternatives (Guidelines §15126.6(e)(2)). The EIR should not consider alternatives "*whose effect cannot be reasonably ascertained and whose implementation is remote and speculative*" (Guidelines §15126.6(f)(3)). An EIR need not evaluate an alternative that is considered speculative, theoretical, or unreasonable. Not every potentially feasible alternative need be considered; rather, the relevant test is whether a "reasonable range" of feasible alternatives is considered for that particular project (Guidelines §15126.6(a)).

4.2 Project Objectives

As discussed in Section 1.2, the Owners' objectives in proposing the Project include the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners at the proposed Project site.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners at the proposed Project site.

- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests at the proposed Project site.
- Constructing the reservoir at the proposed Project site in such a way that revenue can be obtained to offset a portion of the construction and development costs.
- Locating the reservoir adjacent to and north of the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines as part of the proposed Project.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet as part of the proposed Project.
- Deliver water back to the Lower Kaweah River or the St. Johns River using an electrically operated weir channel and pump(s), as needed.
- Provide additional storage capacity at the proposed Project site for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Enter into a lease agreement with West Coast Sand and Gravel (WCSG) to excavate at the proposed Project site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset a portion of the construction and development costs.

Once the reservoir is constructed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies and groundwater recharge supplies via water re-regulation. As a result, the Project would provide multiple benefits, including:

- Flow re-regulation for better surface water utilization.
- New water yield for irrigation purposes by capturing damaging and unutilized floodwater and returning it to the rivers to be used by water users served by the Owners or other Kaweah and St. Johns River Association Units. This includes the ability to increase groundwater recharge efforts.
- Flood control by capturing and temporarily holding damaging floodwater at times when downstream interests, including the City of Visalia, may otherwise see damaging flood flows.

4.3 Alternatives Considered and Rejected from Further Analysis

CEQA Guidelines Section 15126.6(c) requires that an EIR identify alternatives that were considered and rejected as infeasible, and briefly explain the reasons for rejection. Among the factors that may be used to eliminate alternatives from detailed consideration in any EIR are: (1) failure to meet most of the basic project objectives; (2) infeasibility; or (3) inability to avoid significant environmental impacts. The following alternatives were initially considered but were eliminated from further consideration in this EIR because they do not meet project objectives and/or were infeasible.

4.3.1 Alternative Location

CEQA Guidelines Section 15126.6(f)(2)(b) states the following:

> *"If the lead agency concludes that no feasible alternative locations exist, it must disclose the reasons for this conclusion, and should include the reasons in the EIR. For example, in some cases there may be no feasible alternative locations for a geothermal plant or mining project which must be in close proximity to natural resources at a given location."* (Guidelines 15126.6(f)(2)(b)).

The Project needs to be located in immediate proximity to the McKay Point Check Structures and where the Kaweah River diverges into the Lower Kaweah River and St. Johns River in order to achieve the Project objectives of capturing and re-regulating released from Lake Kaweah. For this reason, alternative locations are considered infeasible and were not considered further.

4.3.2 Reduced Reservoir Depth Alternative

CEQA Guidelines Section 15126.6(f)(1) states that one of the factors that may be taken into account when addressing the feasibility of alternatives is "*economic viability*". Additionally, CEQA Guidelines Section 15126.6(f)(2)(a) states that only alternatives "*that would avoid or substantially lessen any of the significant effects of the project need be considered for inclusion in the EIR*".

Depth is of particular importance in that it permits reservoir construction to occur in such a way as to minimize groundwater inflows to the reservoir through seepage when the reservoir is dry, and corresponding reservoir outflows when the reservoir is full. If sufficient depth is not achieved, the reservoir cannot be operated without high levels of bi-directional seepage, which would not realize Project objectives. Regardless of reservoir depth, the slurry wall would need to be constructed to the appropriate design depth to reduce seepage. This is because a slurry wall constructed to an incorrect depth would not properly control seepage, since water would pass into and out of the reservoir under the slurry wall. Were that to occur, it would likely result in regulatory issues and/or significant impacts related to water quality. Refer to the Hydrology and Water Quality Technical Study (SLR, 2022) in Appendix G for additional detail related to the prescribe slurry wall design.

A reservoir's volume is three-dimensional, which means changes in depth result in significant changes in total reservoir storage capacity as well as the total volume of material to be excavated. A portion of the

high cost of construction of the slurry wall and other reservoir structures is expected to be offset by the royalties received for the excavated material. Since a lesser depth would not provide the volume nor the royalties needed to offset a larger portion of the reservoir construction costs, this alternative is economically infeasible.

A shallower reservoir would also significantly reduce the storage volume, which in turn would minimize the effectiveness of storm water layoff, flood prevention, and ability to capture and re-regulate water released from Lake Kaweah, all of which areas directly related to the depth and resulting storage volume of the proposed reservoir.

For these reasons, an alternative reservoir (reduced or lesser) depth is considered technically and economically infeasible and was not evaluated further.

4.3.3 Reduced Reservoir Size Alternative

Size is also an important consideration directly tied to depth for determining Project feasibility, as the resulting storage capacity corresponds to the captured flood flows when water is released from Terminus Dam. A much larger project had been considered to maximize use of the Owners' property, but was reduced to the proposed size (approximately 110 acres) in order to retain most of the mixed oak-riparian woodland which occur in the southeastern portion of the Project site, and additional lands along the river (Figure 3.4-1 – Biological Study Area in Section 3.4 – Biological Resources).

As discussed above, a reservoir's volume is three-dimensional, which means reducing reservoir size would result in significant changes in storage capacity and excavated volume. The high cost of construction of the slurry wall and other reservoir infrastructure is expected to be partially offset by the royalties the Owners will receive from WCSG for the excavated material. Since a lesser size would not provide the volume nor the royalties needed to offset a larger portion of the overall construction costs, including those associated with the slurry wall, this alternative is economically infeasible.

A smaller reservoir would also significantly reduce the storage volume, which in turn would minimize the effectiveness of storm water layoff, flood prevention, and ability to capture and re-regulate water released from Lake Kaweah), all of which areas directly related to the depth and resulting storage volume of the proposed reservoir.

For these reasons, similar to the “Reduced Reservoir Depth Alternative” described in Section 4.3.2, an alternative reservoir (reduced or lesser) size is considered technically and economically infeasible and was not evaluated further.

4.4 Alternatives Considered for Evaluation

The following Project alternatives are analyzed in this DEIR and are described in more detail below:

- No Project Alternative;
- Wet Excavation Method Alternative; and
- Clay Liner Installation Alternative.

4.4.1 Mitigation Measures Common to Project Alternatives

Except for the "No Project Alternative", all of the mitigation measures identified throughout Section 3.0 of the DEIR apply to the alternatives presented below. Upon implementation of these mitigation measures, potentially significant impacts identified therein would be mitigated to less than significant levels, unless otherwise noted.

4.5 Analysis of the Project Alternatives

The analyses of alternatives presented below disclose the differences identified in the impacts associated with each alternative, when compared to those identified for the Project throughout Section 3.0 as listed below.

- Air Quality (Section 3.3);
- Biological Resources (Section 3.4);
- Cultural Resources (Section 3.5);
- Geology/Soils (Section 3.7);
- Greenhouse Gas Emissions (Section 3.8);
- Hazards and Hazardous Materials (Section 3.9);
- Hydrology/Water Quality (Section 3.10);
- Land Use and Planning (Section 3.11);
- Noise (Section 3.13);
- Tribal Cultural Resources (Section 3.18); and
- Wildfire (Section 3.20).

In most instances, the impacts were the same. The differences that were identified are described both below, within the discussion of each alternative, and within the individual resource analyses throughout Section 3.0. With the exception of the "No Project Alternative", each of the alternatives discussed below would meet Project objectives.

4.5.1 No Project Alternative

The discussion and evaluation of a "No Project (No Development) Alternative" is required by the CEQA Guidelines. The "no project" alternative compares the environmental impacts of the Project with the environmental impacts of not approving the Project. (Guidelines § 15126.6(e)(1). According to the CEQA Guidelines:

> The "no project" analysis shall discuss the existing conditions at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, as well as what would be ***reasonably expected to occur in the foreseeable future if the project were not approved***, based on current plans and consistent with available infrastructure and community services. (Guidelines § 15126.6(e)(2) [emphasis added].)

The "no project" analysis differs depending on the proposed project. For development projects on identifiable property, such as the current Project:

> [T]he "no project" alternative is the circumstance under which the project does not proceed. Here the discussion would compare the environmental effects of the property remaining in its existing state against environmental effects which would occur if the project is approved. If disapproval of the project under consideration would result in predictable actions by others, such as the proposal of some other project, this "no project" consequence should be discussed. However, where failure to proceed with the project will not result in preservation of existing environmental conditions, the analysis should identify the practical result of the project's non-approval and not create and analyze a set of artificial assumptions that would be required to preserve the existing physical environment. (Guidelines § 15126.6(e)(3)(B)

Because the Project is a development project on identifiable property, this "no project" analysis compares the environmental effects of the property remaining in its existing state against environmental effects which would occur if the Project is approved. If the Project is not approved, the existing conditions are reasonably expected to occur into the foreseeable future, as the Owners have no other plans for the Project site, and no other development plans for the Project site exist. The only predictable consequence of Project disapproval is the continuation of the existing environment at the Project site.

Under the "No Project Alternative", the Project site would remain in its relatively undisturbed and undeveloped condition. The "No Project Alternative" would be considered environmentally superior because it would have no site impacts to Air Quality; Biological Resources; Cultural Resources; Geology/Soils; and Noise.

However, the "No Project Alternative", by definition, would not meet the Owners' Project objectives, nor would it result in the Project benefits as described in Section 4.2. Furthermore, as required by CEQA Guidelines Section 15126.6(e)(2), "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives." As discussed below in Section 4.6 below, the environmentally superior alternative is the "Project".

4.5.2 Wet Excavation Method Alternative

Under the "Wet Excavation Method Alternative", the slurry wall installation would be deferred until the majority of the excavation is completed. This would allow groundwater seepage to flow into the pit which would require the use of "wet excavation" methods. Draglines would most likely be used to remove the aggregate from the pit. Additionally, material processing (i.e., processing/wash plant and portable crush/recycle plant) directly within the excavation pit would no longer be feasible, and excavated material would have to be transported offsite for processing.

Key construction differences under the "Wet Excavation Method Alternative" as compared to the Project include the following:

- Seepage would be allowed to flow into the excavation pit until equilibrium is reached with the surrounding aquifer.
- Excavation would occur below the water elevation using "wet excavation" equipment and techniques (i.e., underwater dredging).
- Excavated material would have to be transported offsite for processing.
- No dewatering would be conducted until wet excavation is completed.
- Slurry wall installation would be deferred until the end of the excavation phase.
- Upon completing wet excavation, dewatering would be implemented to create the conditions needed required to complete reservoir excavation by conventional methods.
- Dewatering would involve the pumping of approximately 3,500 acre-feet back into the aquifer via one of the following measures:
    - A series of onsite infiltration galleries consisting of ditches located on the Project site that would be covered with granular materials to minimize evaporation;
    - Infiltration at one or more of the immediately adjacent ponds and/or infiltration galleries on the CEMEX facility (north of the Project site); and/or
    - Infiltration at one or more of the immediately adjacent ponds on the Seaborn facility (west of the Project site).
- After dewatering, the slurry wall would be installed and seepage would be the same as described for the Project.

Potential changes in environmental impacts associated with this "Wet Excavation Method Alternative" as compared to the Project are summarized below.

Air Quality: The "Wet Excavation Method Alternative" would result in the same air quality impacts as those described for the Project in Section 3.3, except for the following:

- Although short-term equipment combustion emissions resulting from construction of the slurry wall early in the excavation phase would be avoided under the "Wet Excavation Method

Alternative", ultimately wet excavation methods (e.g., using a dragline), would result in greater combustion emissions over the life of the Project. This is because the excavated material contains water, which is not present in materials derived from dry excavation methods. The weight of the additional water requires more engine horsepower (HP) to both lift the material out of the excavation pit and to transport it to the onsite processing plant(s). This would result in greater emissions of ozone precursors (e.g., NOx) and diesel particulate matter (PM), which is the primary toxic air contaminant of concern for this Project. Risk of health effects would be greater for the "Wet Excavation Method Alternative" than for the Project due to increased diesel PM emissions. However, this increase is expected to result in less than significant impacts. Prior to the material drying after being excavated, there would be less fugitive dust emissions during excavation.

Additionally, material processing using the processing/wash plant and portable crush/recycle plant directly within the excavation pit would not be feasible, as the pit would be partially inundated with groundwater due to seepage. As such, excavated material would have to be transported offsite using haul trucks for processing. Similar to the use of the dragline, this would also result in greater combustion emissions and diesel fuel consumption during the excavation phase of the Project, due to the increased use and travel distances of haul trucks.

As shown in Table 3.3-31 in Section 3.3, health risk from the Project is less than significant at all receptors except. However, the acute and chronic non-cancer health risks were assessed for dry mining conditions where wet excavation methods using a dragline and increase haul truck activity would not occur. As was the case for the Project, the "Wet Excavation Method Alternative's" health risk impacts are expected to be less than significant; however, due to the increase in NOx emissions, which is the primary toxic air contaminant of concern, the "Wet Excavation Method Alternative" is expected to result in higher health risk impacts to nearby receptors compared to the Project.

Biological Resources: Because the "Wet Excavation Method Alternative" would have the same footprint of disturbance (approximately 110 acres) as the Project, this alternative would result in the same biological resource impacts as those described for the Project in Section 3.4.

Cultural Resources: Because the "Wet Excavation Method Alternative" would have the same footprint of disturbance (approximately 110 acres) and would reach the same final depth (60- to 80-feet below ground surface [bgs]) as the Project, the "Wet Excavation Method Alternative" would result in the same cultural resource impacts as those described for the Project in Section 3.5.

Geology and Soils: The "Wet Excavation Method Alternative" would result in the same impacts to geology and soil resources as those described for the Project in Section 3.7, except for the following:

- ***Slope Stability:*** The factor of safety for the "Wet Excavation Method Alternative" was calculated to be 2.0 under static conditions, which is in excess of the stability criterion established at 1.5. The pseudo-static factor of safety was calculated to be 1.1 under a seismic coefficient of 0.1 g (half the peak ground acceleration [PGA] for the 2,475-year event), meeting the minimum

criterion of 1.1. The factor of safety under saturated or drawdown conditions was calculated to be 1.3, meeting the stability criterion 1.3. This means the "Wet Excavation Method Alternative" meets or exceeds factor of safety threshold criteria under all conditions. As such, it was determined that the "Wet Excavation Method Alternative" would be stable and safe as designed. In addition, the relatively massive alluvial deposits have a low susceptibility to landsliding or lateral spreading due to the lack of geologic structures such as joints, contacts, and bedding, which may present preferred shear surfaces. The "Wet Excavation Method Alternative" is expected to result in less than significant impacts related to the slope stability, on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse during reservoir excavation, construction, and operation (SLR, 2015).

Greenhouse Gas Emissions: The "Wet Excavation Method Alternative" would result in the same greenhouse gas emissions impacts as those described for the Project in Section 3.8, except for the following:

- Wet excavation methods, using a dragline, would result in greater combustion emissions and fewer dust emissions. This is because the excavated material contains water, which is not present in materials derived from dry excavation methods. The weight of the additional water requires more engine HP to lift the material out of the excavation and to transport it to the onsite processing plant(s). Additionally, excavated material would have to be transported offsite using haul trucks for processing, which would also result in greater combustion emissions and diesel fuel consumption during the excavation phase of the Project, due to the increased use and travel distances of haul trucks. These changes would result in greater emissions of carbon dioxide, which is the primary greenhouse gas emitted by such a Project. However, because these emissions are fairly minor when compared to overall Project emissions and the baseline (see Section 3.8), this increase is expected to result in less than significant impacts.

Hazards and Hazardous Materials: The "Wet Excavation Method Alternative" would not require the use of additional hazardous materials, nor would wet mining operations generate additional hazardous wastes compared to the Project. Therefore, this alternative would result in the same hazards and hazardous waste impacts as those described for the Project in Section 3.9.

Hydrology/Water Quality: The "Wet Excavation Method Alternative" would result in the same impacts to hydrology and water quality resources as those described for the Project in Section 3.10, except for the following:

- ***Evaporation:*** Groundwater discharging into the excavation would be exposed to the atmosphere, whereas minimal exposure occurs when the groundwater is within the pore spaces of the subsurface. Water in the excavation would therefore be subject to more evaporation than under baseline conditions. As water evaporates from the excavation, more groundwater would discharge into the excavation to maintain equilibrium. An estimated 580 acre-feet (AF) per year (equivalent to approximately 360 gallons per minute [gpm]) of evaporation would occur while the excavation maintains equilibrium through groundwater discharge. This rate is minimal (less than

0.005%) compared to the groundwater in storage within the Kaweah Subbasin (to a depth of 300-feet) of 11,600,000 AF (DWR, 2003). This rate is also negligible (less than 0.07%) compared to the 862,000 AF (699,000 AF of which is groundwater) delivered annually by TID to their customers for irrigation purposes (Fugro, 2007).

Under the "Wet Excavation Method Alternative", an incremental loss of up to 580 AF per year could occur through evaporation under this Project alternative. This is the maximum estimated evaporation using wet excavation methods, which is based on the full lateral extent of the excavation being reached. This incremental loss would not be permanent, and would cease by the time reservoir operations begin (approximately 20 years). Because this loss is minimal compared to the total storage in the basin and compared to the amount of water delivered for irrigation purposes in Tulare County/TID's region, the "Wet Excavation Method Alternative" is expected to result in negligible incremental groundwater losses. As such, the "Wet Excavation Method Alternative" is expected to result in less than significant impacts on groundwater evaporation.

Land Use and Planning: Because the "Wet Excavation Method Alternative" would have the same footprint of disturbance (approximately 110 acres) and would not involve any changes to the land uses/land uses designations considered under the Project, this alternative would result in the same land use and planning impacts as those described for the Project in Section 3.11.

Noise: The "Wet Excavation Method Alternative" would result in the same noise impacts as those described for the Project in Section 3.13, except for the following:

- Short-term equipment noise impacts resulting from construction of the slurry wall early in the excavation phase would be avoided under the "Wet Excavation Method Alternative". However, wet excavation methods, using a dragline, would result in increased long-term equipment noise because the excavated material contains water, which is not present in materials derived from dry excavation methods. The weight of the additional water requires more engine HP to lift the material out of the excavation, which in turn produces increase noise impacts. Additionally, the majority of dredging equipment would operate at-grade without any natural noise attenuation provided by the excavation pit walls, as would be the case under the Project.

Tribal Cultural Resources: Because the "Wet Excavation Method Alternative" would have the same footprint of disturbance (approximately 110 acres) and would reach the same final depth (60- to 80-feet below ground surface [bgs]) as the Project, the "Wet Excavation Method Alternative" would result in the same impacts to undiscovered tribal cultural resources as those described for the Project in Section 3.18. Additionally, implementation of this alternative would not alter the tribal consultation process considered under the Project. Therefore, this alternative would result in the same impacts to tribal cultural resources as those described for the Project in Section 3.18.

Wildfire: The "Wet Excavation Method Alternative" would have the same footprint of disturbance (approximately 110 acres) as the Project and would not create and/or avoid any Project-related impacts

to wildfire resources or related hazards. The "Wet Excavation Method Alternative" would result in the same wildfire impacts as those described for the Project in Section 3.20.

4.5.3 Clay Liner Installation Alternative

Under the "Clay Liner Installation Alternative", the site would be developed in the same manner as the Project with one notable change. Specifically, under this alternative, early as feasible in the excavation phase, clay liners would be installed in lieu of the slurry walls around the perimeter of the excavation pit/reservoir to minimize groundwater seepage into/out of the reservoir, and to maintain conditions dry enough to continue excavation activities. Due to the nature of the clay material present at the Project site, a clay liner could feasibly be used as an alternative to a slurry wall and is expected to keep the infiltration rate below the required 500 gpm. As with the slurry walls, the clay liner would consist of below-grade barriers that restrict groundwater flow or support excavations and structures, using bentonite clay generated by excavation operations and collected onsite.

As with the slurry wall, clay liner construction would require clearing and grubbing of approximately 26 acres, and excavating approximately 109,000 cubic yards of native soil to form the trench where the clay liner would be installed. However, rather than importing bentonite and other silty/clay materials to the Project site, as is proposed with the slurry wall, these materials would be generated onsite to construct the clay liner. Specifically, excavated soils would be screened and mix onsite for use in the clay liner, to generate the appropriate mixture of bentonite, silty/clay fines and native soil needed to construct the appropriate clay liner. The clay liner material would be placed into the trench. A final native soil cap consisting of approximately 10,000 cubic yards would be placed on top of the clay liner.

Key construction differences under the "Clay Liner Installation Alternative" as compared to the Project include the following:

- Bentonite, silty/clay fines and native soil would be generated onsite to construct the clay liner. No material would need to be imported/delivered to the Project site.
- Depending on the quantity of bentonite and silty/clay generated during reservoir excavation, timing of the installation of the clay liner would potentially be deferred when compared to the slurry wall.
    - The clay liner could not be fully constructed until a sufficient quantity of material is extracted and processed onsite.
    - This might necessitate the use of supplemental dewatering techniques (e.g., pumping, infiltration galleries/ponds, etc.) and/or the use if wet excavation equipment and techniques (i.e., underwater dredging) until the clay liner is complete.
- Depending on the properties of the excavated material/soil used to construct the clay liner, additional slope stability measures, such as the use of soil amendments and/or other reinforcing structures, may be required.

Potential changes in environmental impacts associated with this "Clay Liner Installation Alternative" as compared to the Project are summarized below.

Air Quality: The "Clay Liner Installation Alternative" would result in the same air quality impacts as those described for the Project in Section 3.3, except for the following:

- Because the clay liner could not be fully constructed until a sufficient quantity of bentonite and silty/clay material is extracted and processed onsite, installation of the clay liner would be deferred when compared to the slurry wall under the Project. This would most likely necessitate the use of wet mining or dewatering techniques to ensure the excavation pit remains dry until the clay liner can be fully constructed. Both of these scenarios would result in greater combustion emissions, either due to use of a dragline and/or use of supplemental dewatering pumps. Risk of health effects would also be greater for the "Clay Liner Alternative" than for the Project due to increased diesel PM and ozone precursors (e.g., NOx) emissions. As a result, although the air quality impacts for the "Clay Liner Installation Alternative" is expected to result in less than significant impacts, total emissions are expected to be higher when compared to those of the Project.

Biological Resources: Because the "Clay Liner Installation Alternative" would have the same footprint of disturbance (approximately 110 acres) as the Project, the "Clay Liner Installation Alternative" would result in the same impacts to biological resources as those described for the Project in Section 3.4.

Cultural Resources: Because the "Clay Liner Installation Alternative" would have the same footprint of disturbance (approximately 110 acres) and would reach the same final depth (60- to 80-feet bgs) as the Project, the "Clay Liner Installation Alternative" would result in the same impacts to cultural resources as those described for the Project in Section 3.5.

Geology and Soils: The "Clay Liner Installation Alternative" would result in the same geology and soils impacts as those described for the Project in Section 3.7, except for the following:

- ***Slope Stability:*** The factor of safety for the "Clay Liner Installation Alternative" is expected to be similar to those calculated for the "Wet Excavation Method Alternative" discussed in Section 4.5.2 above; however, this would be depended upon the timing of the installation of the clay liner. Although the clay liner would stabilize the excavation slopes sooner than under the wet excavation scenario, the use of a slurry wall early in the excavation phase, as contemplated under the Project, would provide greater slope stability.

  Additionally, the quality and quantity of bentonite and silty/clay underlying the Project site is unknown. Depending on the properties of the excavated material/soil used to construct the clay liner, additional slope stability measures, such as the use of soil amendments and/or other reinforcing structures, may be required, which have the potential to result in increased slope stability concerns.

Greenhouse Gas Emissions: The "Clay Liner Installation Alternative" would result in the same greenhouse gas emissions impacts as those described for the Project in Section 3.8, except for the following:

- Depending on the timing and availability of onsite bentonite and silty/clay, installation of the clay liner may necessitate the use of a dragline and/or dewatering pumps, which would increase associated combustion emissions. Therefore, the impact on greenhouse gases is expected to slightly increase for the "Clay Liner Installation Alternative" when compared to the Project.

Hazards and Hazardous Materials: The "Clay Liner Installation Alternative" would not require the use of additional hazardous materials, nor would installation of a clay liner generate additional hazardous wastes compared to the Project. Therefore, this alternative would result in the same impacts as those described for the Project in Section 3.9.

Hydrology/Water Quality: The "Clay Liner Installation Alternative" would result in the same impacts to hydrology and water quality resources as those described for the Project in Section 3.10. However, depending on the timing of the installation, specifically if the clay liner is constructed late in the excavation process, negligible incremental groundwater losses due to evaporation could occur under this Project alternative. See discussion in Section 4.5.2 above for more detail.

Land Use and Planning: Because the "Clay Liner Installation Alternative" would have the same footprint of disturbance (approximately 110 acres) and would not involve any changes to the land uses/land uses designations considered under the Project, this alternative would result in the same land use and planning impacts as those described for the Project in Section 3.11.

Noise: The "Clay Liner Installation Alternative" would result in the same noise impacts as those described for the Project in Section 3.13, except for the following:

- Installation of the clay liner, in lieu of the slurry wall, may require increased dragline and/or dewatering pump activity at the beginning of the excavation phase, and therefore additional noise impacts from dewatering equipment compared to the Project may result. However, the type, number, and operating hours of the excavation equipment is not expected to differ drastically from the Project, and therefore any increase in dragline/dewatering equipment noise for this Alternative is expected to be overall negligible. As a result, the "Clay Liner Installation Alternative" is expected to result in less than significant impacts.

Tribal Cultural Resources: Because the "Clay Liner Installation Alternative" would have the same footprint of disturbance (approximately 110 acres) and would reach the same final depth (60- to 80-feet below ground surface [bgs]) as the Project, the "Clay Liner Installation Alternative" would result in the same impacts to undiscovered tribal cultural resources as those described for the Project in Section 3.18. Additionally, implementation of this alternative would not change the tribal consultation process considered under the Project. Therefore, this alternative would result in the same impacts to tribal cultural resources as those described for the Project in Section 3.18.

Wildfire: The "Clay Liner Installation Alternative" would have the same footprint of disturbance (approximately 110 acres) as the Project and would not create and/or avoid any Project-related impacts to wildfire resources or related hazards. The "Clay Liner Installation Alternative" would result in the same wildfire impacts as those described for the Project in Section 3.20.

4.5.4 Summary of the Alternatives Analyzed

Table 4.5-1 provides a comparison of the environmental resource impacts of each Project alternative, when compared to the impacts disclosed for the Project throughout DEIR Section 3.0.

Table 4.5-1. Summary of Potential Impacts Before Mitigation

	No Project	Wet Excavation Method	Clay Liner Installation
Air Quality	Less	**More**	**More**
Biological Resources	Less	Similar	Similar
Cultural Resources	Less	Similar	Similar
Geology and Soils	Less	Similar	Similar
Greenhouse Gas Emissions	Less	**More**	**More**
Hazards and Hazardous Materials	Less	Similar	Similar
Hydrology and Water Quality	Less	**More**	**More**
Land Use and Planning	Similar	Similar	Similar
Noise	Less	**More**	**More**
Tribal Cultural Resources	Less	Similar	Similar
Wildfire	Less	Similar	Similar
Mandatory Findings of Significance	Similar	Similar	Similar

4.6 Environmentally Superior Alternative

The "No Project Alternative" is identified as the environmentally superior alternative. However, when the No Project Alternative is the environmentally superior alternative, CEQA requires that an EIR further identify an alternative other than the No Project Alternative as the environmentally superior alternative.

Under the "Wet Excavation Method", although certain short-term and temporary impacts early in the excavation phase, primarily air quality and noise, associated with construction of the slurry wall would be eliminated, long-term impacts associated with the use of a dragline and/or dewatering equipment is expected to increase air and greenhouse gas emissions and noise impacts when compared to the Project. Additionally, under the "Wet Excavation Method" there is an increased potential for groundwater loss through evaporation, as groundwater would be exposed throughout much of the excavation phase. Similar impacts may result if the "Clay Liner Alternative" were implemented; however, depending on the quality of the material extracted and the timing of the installation of the clay liner, certain impacts related

to air quality and slope stability may result. Thus, the TID determined that since the Wet Excavation Method and Clay Liner Installation Alternatives would potentially result in increased air quality, greenhouse gas, water quality, and noise impacts over those associated with the Proposed project, that the Project is the environmentally superior alternative.

Furthermore, implementation of the "Wet Excavation Method" and/or "Clay Liner Installation" alternatives do not necessarily guarantee the excavation pit remains dry throughout the entire excavation phase. WCSG has indicated that maintaining a dry excavation pit, as would occur with the installation of a slurry wall early in the excavation phase under the Project, would allow for the most operational efficiency. Although wet mining methods are feasible and have been used by WCSG in the past, these would most likely increase the operational costs and result in delays during reservoir excavation, which in turn may reduce the economic benefit (that is, royalties) received by TID to help offset the cost of reservoir construction.

THIS PAGE IS INTENTIONALLY BLANK

5.0 OTHER CEQA REQUIRED IMPACT ANALYSIS

This section includes consideration and discussion of other Project-related impacts that must be evaluated in the DEIR as described in CEQA Guidelines Section 15126.2 and Section 15130, including (1) cumulative impacts; (2) growth-inducing impacts; (3) summary of the Project impacts, including significant and unavoidable impacts; and (4) significant irreversible environmental changes.

5.1 Cumulative Impacts

5.1.1 CEQA Analysis Requirements

CEQA requires that impacts of cumulative projects be considered in the EIR. The project may have environmental effects that are individually limited, but cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects and the effects of probable future projects (CEQA Guidelines § 15065(a)(3)).

The identification of reasonably foreseeable future projects is based on the standards of practicality and reasonableness. Reasonably foreseeable future projects include unapproved projects that were undergoing environmental review at the time that the Notice of Preparation (NOP) was submitted.

CEQA Guidelines Sections 15130(a) and (b) state:

(a) An EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable, as defined in Section 15065(a)(3). Where a Lead Agency is examining a project with an incremental effect that is not "cumulatively considerable," a Lead Agency need not consider that effect significant, but shall briefly describe its basis for concluding that the incremental effect is not cumulatively considerable.

(1) As defined in Section 15355, a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts. An EIR should not discuss impacts which do not result in part from the project evaluated in the EIR.

(2) When the combined cumulative impact associated with the project's incremental effect and the effects of other projects is not significant, the EIR shall briefly indicate why the cumulative impact is not significant and is not discussed in further detail in the EIR. A lead agency shall identify facts and analysis supporting the Lead Agency's conclusion that the cumulative impact is less than significant.

(3) An EIR may determine that a project's contribution to a significant cumulative impact will be rendered less than cumulatively considerable and thus is not significant. A project's contribution is less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact. The Lead Agency shall identify facts and analysis supporting its conclusion that the contribution will be rendered less than cumulatively considerable.

(b) The discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The discussion should be guided by standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects which do not contribute to the cumulative impact. The following elements are necessary to an adequate discussion of significant cumulative impacts:

(1) Either:

(A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency; or

(B) A summary of projections contained in an adopted local, regional, or statewide plan, or related planning document, that describes or evaluates conditions contributing to the cumulative effect. Such plans may include: a general plan, regional transportation plan, or plans for the reduction of greenhouse gas emissions. A summary of projections may also be contained in an adopted or certified prior environmental document for such a plan. Such projections may be supplemented with additional information such as a regional modeling program. Any such document shall be referenced and made available to the public at a location specified by the lead agency.

5.1.2 Geographic Scope

The potential for Project-generated impacts to contribute to a significant cumulative impact would arise if the other projects are located within the same geographic area. This geographic area may vary, depending upon the issue and the geographic extent of the potential impact. For example, the geographic area associated with noise impacts would be limited to local areas directly affected by noise, whereas the geographic area that could be affected by air emissions may include the larger regional airshed as well as the local area.

5.1.3 Project Timing

In addition to the geographic scope, cumulative impacts are determined by timing of the other projects relative to the Project. For example, for a group of projects to generate cumulative construction impacts, they must be nearby projects that will occur approximately in the same timeframe. The related projects identified on Table 3-1 may or may not occur simultaneously with the Project, depending upon the schedule of each individual project. Although the timing of the projects is likely to fluctuate due to schedule changes or other unknown factors, this cumulative analysis assumes the identified related projects would be implemented concurrently with implementation of the Project.

5.1.4 Threshold of Significance

CEQA Guidelines Section 15355 defines cumulative impacts as "*two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.*" The Guidelines further state:

(a) The individual effects may be changes resulting from a single project or a number of separate projects.

(b) The cumulative impact from several projects is the change in the environment, which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.

5.1.5 Description of Cumulative Projects and Cumulative Impacts

Table 3-1 provides a list and a brief summary of the projects that were evaluated in regards to potential cumulative impacts. The table also identifies whether the projects meet the criteria to be considered in the cumulative analysis and if so, what resources may be impacted. Of the eleven projects listed in Table 3-1, it was determined that none of the projects have the potential to generate cumulative effects when evaluated together with the McKay Point Reservoir Project. The projects considered include three industrial projects, two utility projects, three community plan updates, two commercial project, and one residential project. Three of the applicable projects considered are mining projects. Other than the Kaweah South Facility, none of the projects considered are operational. Two of the projects are currently inactive. One of the projects has completed the entitlement phase and is currently under construction. The remaining seven projects are in the permitting/entitlement/environmental review phases.

As discussed in Section 3.0 – Environmental Impact Analysis, specifically Table 3-1, none of the cumulative projects in the area meet the criteria to be considered in the cumulative analysis. Generally, cumulative projects within 1- to 3- miles of the Project site would be considered for the cumulative analysis. However, due to the lack of active and proposed potential cumulative projects identified by TID, the County and City of Woodlake near the McKay Point Project site, the geographical scope has been expanded beyond the typical 1-mile to 3-mile radius. Other than the three existing mining projects within the vicinity of the Project site, the remaining eight cumulative projects were located to far outside of the geographical criteria to be considered a potential cumulative project.

In addition to cumulative projects within the County and City of Woodlake, existing mining operations within the vicinity of the McKay Point site were also considered. CEMEX's Lemon Cove and related Stillwell facilities are located within 1-mile of the Project site; however, both facilities have been inactive since 2006, and will remain so into the foreseeable future.

Santa Fe Aggregates Facility, also known as the Seaborn Facility, is located within 1-mile of the Project site. As discussed throughout the DEIR, Santa Fe no longer operates at this facility, and this site is now idle. The Seaborn site is now owned by TID and their partners (Owners). West Coast Sand and Gravel's

(WCSG's) operations (e.g., production rate, truck traffic, etc.) during the Project's excavation phase, including processing of aggregate materials, would not exceed the processes (baseline) historically achieved at the adjacent Seaborn site. Because the Seaborn site is now inactive, and because the Project has been designed to not exceed historical operations at Seaborn, there would be no potential cumulative effects.

Lastly, the Kaweah South Facility is a mining operation located within 1-mile of the Project site. This facility is currently active, and would operate concurrently with the McKay Point Project. As discussed in Table 3-1, Kaweah South was previously analyzed under CEQA (i.e., EIR), assuming that the Santa Fe's Seaborn Facility would also be operating simultaneously. Because the Seaborn Facility has been purchased by the Owner's, and historical operations here have been attributed to the McKay Point Project and would not be exceeded, there would be no cumulative impacts, as the combined effects from the Kaweah South operations and the Project were already evaluated, accounted for, and properly mitigated within the Kaweah South EIR (SCH# 2002051039).

Please see Table 3-1 in Section 3.0 for the full list and a brief summary of the projects considered for the cumulative evaluation. Also see Figure 3-1, which identifies where each of the eleven projects identified on Table 3-1 and discussed above are located in relation to the Project.

5.2 Growth-Inducing Impacts

This section evaluates the potential for the Project to affect economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment.

There are two types of growth inducing impacts that a project may have: direct and indirect. To assess the potential for growth-inducing impacts, the Project's characteristics that may encourage and facilitate activities that individually or cumulatively affect the environment must be evaluated.

Direct growth inducing impacts occur when the development of a project imposes new burdens on a community by directly inducing population growth, or by leading to the construction of additional developments in the same area. Also included in this category are projects that remove physical obstacles to population growth, such as a new road into an undeveloped area or a wastewater treatment plant with excess capacity that could allow additional development in the service area. Construction of these types of infrastructure projects cannot be considered isolated from the development they facilitate and serve. Projects that physically remove obstacles to growth, or projects that indirectly induce growth are those, which may provide a catalyst for future unrelated development in an area such as a new residential community that requires additional commercial uses to support residents.

As discussed in Section 2.0 – Project Description of this document, the Project proposes to develop the approximately 110-acre McKay Point Reservoir on a 200-acre property. Once constructed, the Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies and groundwater recharge supplies via water re-regulation. The

Project would not involve the development of residential land uses or infrastructure. Additionally, although aggregate and other building materials would be produced as a result of reservoir excavation, these materials would supplement existing regional aggregate supplies in direct response to the Tulare County region's demand for construction grade aggregates for infrastructure and other development projects. In other words, growth will occur whether or not the Project is implemented. Accordingly, the Project is not considered growth inducing, but rather growth dependent and will only respond to the existing and future needs of both TID's irrigation customers as well as WCSG's aggregate/construction industry customers. Therefore, implementation of the Project would not induce growth not already envisioned by the County of Tulare.

5.3 Summary of Impacts Including Significant and Unavoidable Impacts

The following provides a summary of the Project impacts, including significant and unavoidable impacts. A DEIR must disclose the significant and unavoidable impacts that will result from implementation of a proposed project. Moreover, CEQA Guidelines Section 15126.2(b) states that a Draft EIR should explain the implications of such impacts and the reasons why the project is being proposed, notwithstanding such impacts. Implementation of the Project would result in the alteration of the physical environment.

No Impact or Less Than Significant Impact

The Project has been determined through analysis in this EIR to have no impact or less than significant impact in the environmental resource areas listed below.

Aesthetics CEQA Guidelines Thresholds:

a) Would the Project have a substantial adverse effect on a scenic vista?

No Impact

b) Would the Project substantially damage scenic resources, including but not limited to trees, rock outcroppings and historic buildings within a state scenic highway?

No Impact

c) Would the Project in non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). Would the project in an urbanized area conflict with applicable zoning and other regulations governing scenic quality?

No Impact

d) Would the Project create a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?

No Impact

Agriculture and Forestry Resources CEQA Guideline Thresholds:

a) Would the Project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact

b) Would the Project conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact

c) Would the Project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact

d) Would the Project result in the loss of forest land or conversion of forest land to non-forest use?

No Impact

e) Would the Project involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use, or conversion of forest land to non-forest use?

No Impact

Air Quality CEQA Guidelines Thresholds:

a) Would the Project conflict with or obstruct implementation of an applicable air quality plan?

Impact AQ-1, Less Than Significant Impact

***c)* Would the Project expose sensitive receptors to substantial pollutant concentrations?**

Impact AQ-3, Less Than Significant Impact

d) Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Impact AQ-4, Less Than Significant Impact

Biological Resources CEQA Guidelines Thresholds:

d) Would the Project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Impact BIO-4, Less Than Significant Impact

e) Would the Project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Impact BIO-5, Less Than Significant Impact

f) Would the Project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional or state habitat conservation plan?

Impact BIO-6, No Impact

Energy CEQA Guidelines Thresholds:

a) Would the Project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

No Impact

b) Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

No Impact

Geology and Soils CEQA Guidelines Thresholds:

a) Would the Project directly or indirectly potential substantial adverse effects, including the risk of loss, injury, or death involving:

I. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zone Map issued by the State Geologist for the area or based on other substantial evidence of known fault;

II. Strong seismic ground shaking;

III. Seismic-related ground failure, including liquefaction; or

IV. Landslides? (Impact GS-1, Less Than Significant Impacts)

Impact GS-1, Less Than Significant Impact

b) Would the Project result in substantial soil erosion or the loss of topsoil?

Impact GS-2, Less Than Significant Impacts

c) Would the Project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Impact GS-3, Less Than Significant Impacts

d) Would the Project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Impact GS-4, Less Than Significant Impacts

e) Does the Project have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

Impact GS-5, No Impact

Greenhouse Gases/Climate Change CEQA Guidelines Thresholds:

a) Would the Project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Impact GHG-1, Less Than Significant Impacts

b) Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impact GHG-2, Less Than Significant Impacts

Hazards and Hazardous Materials CEQA Guidelines Thresholds:

a) Would the Project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Impact HAZ-1, Less Than Significant Impacts

a) *Would the Project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?*

Impact HAZ-2, Less Than Significant Impacts

b) Would the Project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within 0.25 miles of an existing or proposed school?

Impact HAZ-3, No Impact

c) Would the Project be located on a site which is included on a list of hazardous material sites compiled pursuant to Government Code §65962.5 and, as a result, would it create a significant hazard to the public or environment?

Impact HAZ-4, No Impact

d) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project result in a safety hazard for people residing or working in the Project area?

Impact HAZ-5, Less Than Significant Impacts

e) Would the Project impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?

Impact HAZ-6, Less Than Significant Impacts

f) Would the Project expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

Impact HAZ-7, Less Than Significant Impacts

Hydrology and Water Quality CEQA Guidelines Thresholds:

a) Would the Project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Impact HWQ-1, Less Than Significant Impacts

b) Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Impact HWQ 2, Less Than Significant Impacts

c) Would the Project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:

I. result in substantial erosion or siltation on- or offsite;

II. substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;

III. create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or

IV. impede or redirect flood flows?

Impact HWQ-3, Less Than Significant Impacts

d) Would the Project if located in a flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Impact HWQ-4, Less Than Significant Impacts

e) Would the Project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Impact HWQ-5, Less Than Significant Impacts

Land Use and Planning CEQA Guidelines Thresholds:

a) Would the Project physically divide an established community?

Impact LUP-1, No Impact

b) Would the Project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Impact LUP-2, No Impact

Mineral Resources CEQA Guidelines Thresholds:

a) Result in the loss of availability of a known mineral resources that would be of value to the region and the residents of the state?

No Impact

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Impact

Noise and Vibration CEQA Guidelines Thresholds:

b) Would the Project result in generation of excessive groundborne vibration or groundborne noise levels?

Impact NO-2, Less Than Significant Impacts

c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the Project expose people residing or working in the Project area to excessive noise levels?

Impact NO-3, No Impact

Population and Housing CEQA Guidelines Thresholds:

a) Would the Project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

No Impact

b) Would the Project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?

No Impact

Public Services CEQA Guidelines Thresholds:

a) Would the Project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:

I. Fire protection?

II. Police protection?

III. Schools?

IV. Parks?

V. Other public facilities?

No Impact

Recreation CEQA Guidelines Thresholds:

a) Would the Project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

No Impact

b) Does the Project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

No Impact

Transportation CEQA Guidelines Thresholds:

a) Would the Project conflict with program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

No Impact

b) Would the Project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

No Impact

c) Would the Project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

No Impact

d) Would the Project result in inadequate emergency access?

No Impact

Tribal Cultural Resources CEQA Guidelines Thresholds:

a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

I. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k); or

II. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe? (Less Than Significant Impact)

Impact TCR-1, Less Than Significant Impacts

Utilities and Services CEQA Guidelines Thresholds:

a) Would the Project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

No Impact

b) Would the Project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

No Impact

c) Would the Project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

No Impact

d) Would the Project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

No Impact

e) Would the Project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

No Impact

Wildfire CEQA Guidelines Thresholds:

a) Would the Project Substantially impair an adopted emergency response plan or emergency evacuation plan?

Impact WI-1, Less Than Significant Impact

b) Would the Project due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or uncontrolled spread of a wildfire?

Impact WI-2, Less Than Significant Impact

c) Would the Project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

Impact WI-3, Less Than Significant Impact

d) Would the Project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

Impact WI-4, Less Than Significant Impact

Less Than Significant Impact after Mitigation

It has been determined through analyses provided in this EIR that the impacts in the following topical environmental resource areas can be feasibly mitigated below levels of significance:

Air Quality CEQA Guidelines Thresholds:

b) Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Impact AQ-2, Less Than Significant Impact with Mitigation

Biological Resources CEQA Guidelines Thresholds:

a) Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Impact BIO-1, Less Than Significant Impact with Mitigation

b) Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Impact BIO-2, Less Than Significant Impact with Mitigation

c) Would the Project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

Impact BIO-3, Less Than Significant Impact with Mitigation

Cultural Resources CEQA Guidelines Thresholds:

a) Would the Project cause a substantial adverse change in the significance of a historical resource pursuant to §15064.5?

Impact CUL-1, Less Than Significant Impact with Mitigation

b) Would the Project cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?

Impact CUL-2, Less Than Significant Impact with Mitigation

c) Would the Project disturb any human remains, including those interred outside of dedicated cemeteries?

Impact CUL-3, Less Than Significant Impact with Mitigation

Geology and Soils CEQA Guidelines Thresholds:

f) Would the Project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature? (No Impact)

Impact GS-6, Less Than Significant Impact with Mitigation

Noise and Vibration CEQA Guidelines Thresholds:

a) Would the Project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Impact NO-1, Less Than Significant Impacts with Mitigation

5.4 Significant Irreversible Environmental Changes

CEQA Guidelines Section 15126.2(c) requires discussion of significant irreversible environmental changes which would be caused by the Project should it be implemented, for example, when a project includes future commitments to non-renewable resources during construction or operation. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

The environmental effects of the Project are discussed in Section 3.0 – Environmental Impact Analysis, of this document. Implementation of the Project would require the long-term commitment of natural resources as described below.

Mineral Resources

The State of California classified the Project site as MRZ-2 zone. MRZ-2 zones are areas where adequate information indicates that significant mineral deposits are present, or where it is judged that there is a high likelihood of their presence. Tulare County incorporated the MRZ-2 classification into the General Plan and Zoning/Code of Ordinances. Through the MRZ-2 designation, the State of California has also recognized the Project site and surrounding area as having construction grade aggregate deposits that are of regional significance.

The Project is the development of a water storage reservoir, where aggregate would be extracted from site in order to develop the reservoir basin as well as utilize the onsite mineral resource. While the aggregate/mineral resources removed and sold during the reservoir excavation phase is considered to be a non-renewable resource, this material would be used to meet the existing construction material needs of the Tulare County region.

Other Irreversible Changes

Approval and implementation of the Project would result in an irretrievable commitment of other non-renewable resources such as energy supplies. Specifically, non-renewable energy resources would be committed primarily in the form of fossil fuels, and would include diesel fuel, oil, natural gas, and gasoline used by vehicles and equipment associated with the construction/excavation and operation of the Project.

However, as described in Section 2.0 – Project Description, The Project would not result in an increase of employees or a change in the mining, processing and related operations that have historically occurred at the adjacent Seaborn Facility, other than relocating the operations to the adjacent McKay Point site. The energy consumption rates, including fossil fuels, for the Project would not change from what has historically been consumed by the Seaborn Facility, but the Project would extend these baseline operations for an additional 20+/- years. Additionally, the electrical services required for the aggregate processing plant/system would be obtained from the existing connection located along the northern boundary of the Project site, provided by Southern California Edison (SCE). Ultimately, during the reservoir excavation phase, the Project would provide a local source of aggregate to the region, minimizing the need to import aggregate from further away, thus reducing cumulative fuel consumption associated with transportation on a regional basis. Although the Project would consume a certain quantity of non-renewable fossil fuels onsite, the Project is expected to create a cumulative benefit by reducing the need to import aggregate from further away, thereby reducing potential fuel consumption.

Implementation of the Project (i.e., extraction of the reservoir basin and development of permanent water storage reservoir) would result in alterations to the physical environment. If the Project is approved, and subsequently implemented, new structures (e.g., reservoir facilities, concrete structures, etc.) would be built, additional utilities may be constructed (i.e., water well, electrical connection to the processing equipment), and onsite circulation improvements (i.e., perimeter access road) would be made to allow people and equipment to move throughout the Project site. However, the development of the Project is necessary and in direct response to the region's growing population and agricultural water supply needs. In other words, growth will occur in the Tulare County region whether or not the Project is implemented. As a direct result of the Project, available aggregate deposits will be mined and energy supplies will be used for extraction and reservoir construction activities, transportation of products and building equipment, and processing aggregate material. The commitment of resources and the levels of consumption associated with the Project are an appropriate allocation of said resources to ensure the reservoir can be constructed in an economically sound manner and that meets the needs of the Owners and the surrounding community.

To: Maya Rohr <mrohr@sespeconsulting.com>
Cc: John Hecht <jhecht@sespe.com>; Graham Stephens <gstephens@sespeconsulting.com>

Hi Maya,

I met with Bill a few years ago. He was very helpful by providing some information on the Lemon Cove well. That information should be in the file, but we may want to follow up with him to provide updated levels and maybe even some water quality. We will always have the folks that view this as a mining operation, however with TID and CPDC out in the lead we want them to understand we need the surface water storage and this is a means to get that.

Also, I am still trying to get water level data. I talked with Ken Schmidt and he said he will look around. I was also thinking we could ask the County for the annual reports from the surrounding mining operations. Should I reach out to the County and see if I can get the annual reports? Or do you have a way to get them?

Thanks

Aaron Fukuda

> I received a call yesterday afternoon from Bill Penzar (not sure of spelling) from the Lemon Cove Water Company. His primary questions/comments were:
>
> - "Didn't we already do all this?"
> - "Have you considered the impact on their GW well across the river from the Project site?"
> - General questions regarding the aggregate processing location and changes. He was under the impression it would be going to the Kawaeh South Facility.
> - He is going to resubmit his letter that he sent during scoping last time – main concern being their well.
> - He shared that many folks look at the Project that this is a sneaky way to get another aggregate operation permitted. He did not feel that way. He thought it was a good

project as long as it does not impact his well.

I feel I addressed all his questions and he is personally fine with the Project. If you have any questions about the call / our discussion, just let me know.

Thanks

Maya

Maya,

My email box filled up after I sent the message forwarded here.

If you sent an “undelivered” reply, would you please send it again?

Will you please also add my name and email address to the interested parties list?

Thank you,

John Kirkpatrick

Ms. Maya Rohr
Sespe Consulting, Inc.
3990 Old Town Avenue, Suite A203
San Diego, California 92110

Subject: McKay Point Reservoir Project, Notice of Preparation, SCH No. 2014011078

Location: Tulare County

Dear Ms. Rohr,

Central Valley Flood Protection Board (Board) staff has reviewed the subject document and provides the following comments:

The proposed project is within the vicinity of the Kaweah River and St. Johns River, regulated streams under Board jurisdiction and may require a Board permit prior to construction.

The Board's jurisdiction covers the entire Central Valley including all tributaries and distributaries of the Sacramento and San Joaquin Rivers, and the Tulare and Buena Vista basins south of the San Joaquin River.

Under authorities granted by California Water Code and Public Resources Code statutes, the Board enforces standards set forth in California Code of Regulations, Title 23, Division 1 (Title 23) for the construction, maintenance, and protection of adopted plans of flood control, including the federal-State facilities of the State Plan of Flood Control, regulated streams, and designated floodways.

Pursuant to Title 23, Section 6 (a), a Board permit is required prior to working within the Board's jurisdiction for the placement, construction, reconstruction, removal, or abandonment of any landscaping, culvert, bridge, conduit, fence, projection, fill, embankment, building, structure, obstruction, encroachment, excavation, the planting, or removal of vegetation, and any repair or maintenance that involves cutting into the levee.

Board staff have reviewed the subject document and provides the following comments on the potential environmental effects within the Board's jurisdiction:

DocuSign Envelope ID: 4BBFF600-7C04-4D0E-BEFD-327C0D0695DD

Ms. Maya Rohr
October 13, 2020

Hydrologic Impacts

According to page 3 “To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet.
- Deliver water back to either the Lower Kaweah River or the St. Johns River, as needed.”

An encroachment permit application may be required for the Project as it is located within the regulated streams including the Kaweah River and St. Johns River. An encroachment permit may also be required to include any existing works that predate permitting into compliance with Title 23, or where it is necessary to establish the conditions normally imposed by permitting. The circumstances include those where responsibility for the works has not been clearly established or ownership and use have been revised.

Other federal (including U.S. Army Corps of Engineers Section 10 and 404 regulatory permits), State and local agency permits may be required and are the applicant’s responsibility to obtain.

Board permit applications and Title 23 regulations are available on our website at http://www.cvfpb.ca.gov/. Maps of the Board’s jurisdiction are also available from the California Department of Water Resources website at http://gis.bam.water.ca.gov/bam/.

Encroachment permit applications received on or after July 1, 2019 are subject to fees, additional information is available on the Board’s website at http://cvfpb.ca.gov/fees-2019/.

Please contact James Herota at (916) 574-0651, or via email at James.Herota@CVFlood.ca.gov if you have any questions.

Sincerely,

Andrea Buckley

Subject: Comment letter - McKay Point Reservoir Project, Notice of Preparation, SCH No. 2014011078

Greetings,

Please accept this electronic submission of the Central Valley Flood Protection Board – Responsible agency comments (enclosed) on the following project:

SCH Number: 2014011078
Lead Agency: Tulare Irrigation District
Document Title: McKay Point Reservoir Project
Type: Notice of Preparation

Please contact me if you have any questions.

Lemon Cove Water Company

Aaron

I received a call yesterday afternoon from Bill Penzar (not sure of spelling) from the Lemon Cove Water Company. His primary questions/comments were:

- "Didn't we already do all this?"
- "Have you considered the impact on their GW well across the river from the Project site?"
- General questions regarding the aggregate processing location and changes. He was under the impression it would be going to the Kawaeh South Facility.
- He is going to resubmit his letter that he sent during scoping last time – main concern being their well.
- He shared that many folks look at the Project that this is a sneaky way to get another aggregate operation permitted. He did not feel that way. He thought it was a good project as long as it does not impact his well.

I feel I addressed all his questions and he is personally fine with the Project. If you have any questions about the call / our discussion, just let me know.

Thanks

Maya

Lemon Cove-TID Response Could You Lease Acknowledge Receipt- Thank You

RE: NOTICE OF PREPARATION FOR McKAY POINT RESERVOIR PROJECT

Regarding the request for input on the above referenced N.O.P., the Board of the Lemon Cove Sanitary District appreciates receiving notice and being given the opportunity to express our views on the scope of the study for the proposed project.

The County of Tulare and the Lemon Cove Sanitary District/Lemon Cove Water Co. operate a jointly held water system which has a well sited on a parcel located less than 800 feet south of your proposed project. That well is the sole source of water for the community of Lemon Cove. Needless to say, we are concerned. We would appreciate further investigation into any potential impacts on the quality and quantity of our source, and serious consideration given to mitigation measures, as needed, to maintain same. It is hoped that the same requirements of SMARA will be afforded to this iteration of the project, as we also have some concerns regarding failure to complete. Should the project be started and not completed, or otherwise be stalled, what safe guards will be put in place to restore or remediate the site?

Thank you for your consideration. You may telephone (559)597-2504 if necessary.

Michael Lampman
President, Board of Directors

William F. Pensar
Secretary, Board of Directors

Laboratory Report

Introduction: This report package contains total of 10 pages divided into 3 sections:

Case Narrative	(2 pages)	: An overview of the work performed at FGL.
Sample Results	(2 pages)	: Results for each sample submitted.
Quality Control	(6 pages)	: Supporting Quality Control (QC) results.

Case Narrative

This Case Narrative pertains to the following samples:

Sample Description	Date Sampled	Date Received	FGL Lab ID #	Matrix
STW-1	01/14/2019	01/14/2019	VI 1940146-001	DW

Sampling and Receipt Information: The sample was performed by FGL using the following methods (where applicable):

Bacteriological Sampling	- SOP:200900141
Grab sampling for liquids	- SOP:200900137
Composite sampling for liquids	- SOP:200900139
Grab sampling for solids	- SOP:200900142
Composite sampling for solids	- SOP:200900143

All samples were received, prepared and analyzed within the method specified holding times. All samples arrived on ice. All samples were checked for pH if acid or base preservation is required (except for VOAs). For details of sample receipt information, please see the attached Chain of Custody and Condition Upon Receipt Form.

Quality Control: All samples were prepared and analyzed according to the following tables:

Inorganic - Metals QC

Definition

ICV : Initial Calibration Verification - Analyzed to verify the instrument calibration is within criteria.

ICB : Initial Calibration Blank - Analyzed to verify the instrument baseline is within criteria.

CCV : Continuing Calibration Verification - Analyzed to verify the instrument calibration is within criteria.

CCB : Continuing Calibration Blank - Analyzed to verify the instrument baseline is within criteria.

Blank : Method Blank - Prepared to verify that the preparation process is not contributing contamination to the samples.

LCS : Laboratory Control Standard/Sample - Prepared to verify that the preparation process is not affecting analyte recovery.

MS : Matrix Spikes - A random sample is spiked with a known amount of analyte. The recoveries are an indication of how that sample matrix affects analyte recovery.

MSD : Matrix Spike Duplicate of MS/MSD pair - A random sample duplicate is spiked with a known amount of analyted. The recoveries are an indication of how that sample matrix affects analyte recovery.

BS : Blank Spikes - A blank is spiked with a known amount of analyte. It is prepared to verify that the preparation process is not affecting analyte recovery.

BSD : Blank Spike Duplicate of BS/BSD pair - A blank duplicate is spiked with a known amount of analyte. It is prepared to verify that the preparation process is not affecting analyte recovery.

Lemon Cove Water/Sanitary Dist. Customer : 4-11120

Quality Control - Inorganic

Definition	
Dup	: Duplicate Sample - A random sample with each batch is prepared and analyzed in duplicate. The relative percent difference is an indication of precision for the preparation and analysis.
MSRPD	: MS/MSD Relative Percent Difference (RPD) - The MS relative percent difference is an indication of precision for the preparation and analysis.
BSRPD	: BS/BSD Relative Percent Difference (RPD) - The BS relative percent difference is an indication of precision for the preparation and analysis.
ND	: Non-detect - Result was below the DQO listed for the analyte.
DQO	: Data Quality Objective - This is the criteria against which the quality control data is compared.

Inter-Laboratory Condition Upon Receipt (Attach to COC)

Sample Receipt at: STK CC CH (VI)

1. Number of ice chests/packages received: 1 Shipping tracking # F.S.
2. Were samples received in a chilled condition? Temps: 5° / ____ / ____ / ____ / ____
   Surface water SWTR bact samples: A sample that has a temperature upon receipt of >10° C, whether iced or not, should be flagged unless the time since sample collection has been less than two hours.

3.	Do the number of bottles received agree with the COC?	(Yes)	No	N/A
4.	Were samples received intact? (i.e. no broken bottles, leaks etc.)	(Yes)	No	
5.	VOAs checked for Headspace?	Yes	No	(N/A)
6.	Were sample custody seals intact?	Yes	No	(N/A)
7.	If required, was sample split for pH analysis?	Yes	No	(N/A)
8.	Were all analyses within holding times at time of receipt?	(Yes)	No	
9.	Verify sample date, time and sampler name	(Yes)	No	

Sign and date the COC, place in a ziplock and put in the same ice chest as the samples.
Sample Receipt Review completed by (initials): CS

Sample Receipt at SP:

1. Were samples received in a chilled condition? Temps: 3 / 1 / ____ / ____ / ____
   Acceptable is above freezing to 6 C. If many packages are received at one time check for tests/H.T.'s/rushes/
2. Shipping tracking numbers: 543436072 | 82

3.	Do the number of bottles received agree with the COC?	(Yes)	No	N/A
4.	Were samples received intact? (i.e. no broken bottles, leaks etc.)	(Yes)	No	
5.	Were sample custody seals intact?	Yes	No	(N/A)

Sign and date the COC, obtain LIMS sample numbers, select methods/tests and print labels.

Sample Verification, Labeling and Distribution:

1.	Were all requested analyses understood and acceptable?	(Yes)	No		
2.	Did bottle labels correspond with the client's ID's?	(Yes)	No		
3.	Were all bottles requiring sample preservation properly preserved? [Exception: Oil & Grease, VOA and CrVI verified in lab]	(Yes)	No	N/A	FGL
4.	VOAs checked for Headspace?	Yes	No	(N/A)	
5.	Have rush or project due dates been checked and accepted?	Yes	No	(N/A)	
6.	Were all analyses within holding times at time of receipt?	(Yes)	No		

Attach labels to the containers and include a copy of the COC for lab delivery.
Sample Receipt, Login and Verification completed by (initials): TC

GENERAL NOTES

1. Construction contractor agrees that in accordance with generally accepted construction, construction contractor will be required to assume sole and complete responsibility for job site conditions during the course of construction of the project, including safety of all persons and property; that this requirement shall be made to apply continuously and not be limited to normal working hours, and construction contractor further agrees to defend, indemnify and hold design professional harmless from any and all liability, real or alleged, in connection with the performance of work on this project, excepting liability arising from the sole negligence of design professional.
2. In accordance with the provisions of California Public Contract Code Section 3300, the District has determined that the Contractor shall possess a valid Class A (General Engineering) Contractor license at the time the contract is awarded. Failure to possess the specified license shall render the bid as non-responsive and shall act as a bar to award of the contract to any bidder not possessing said license at the time of award.

To: Maya Rohr <mrohr@sespeconsulting.com>
Subject: Question re: McKay Point Reservoir Project

Maya,

I hope this finds you well. I am the Regional Water Rights Coordinator for California Department of Fish and Wildlife, Central Region (Region 4), and am reviewing the current NOP for the McKay Point Reservoir Project (SCH #2014011078). The Project description states that the objectives include capturing and re-regulating water and water entitlements. I am wondering if you would please clarify what is meant by "re-regulating" in the context of the project's objectives.

Please feel free to let me know if you have any questions regarding this correspondence.

Thank you,

Annette Tenneboe

Subject: TID McKay Point Project

Maya Rohr,

In connection with the Tulare Irrigation District McKay Point Reservoir project Notice of Preparation, Scoping, CEQA proceedings and related information, I have a couple of questions and requests listed below:

1. Could you please provide the list of agencies and interested parties to whom the NOP was sent?
2. If an Initial Study (IS) was prepared, will you please provide a copy of it? (It would be useful to have the IS, or similar documentation, in order to reduce comment duplication of potential environmental and economic impacts that may have already identified.)

I am a member of the Tulare County Farm Bureau Land Use Committee. The committee has scheduled a Thursday afternoon (10/29/20) informational meeting with Aaron Fukuda. The TCFB Executive Director, Tricia Stever-Blattler has been on vacation until today. I am confident she would appreciate obtaining the requested information before the Thursday meeting if that would be possible.

Sincerely,

John Kirkpatrick

Tulare County Farm Bureau Land Use Presentation

Aaron Fukuda <akf@tulareid.org>

Thu 10/29/2020 9:40 PM

To: James Silva <jsilva@cpdc1874.org>; Ed DeBoer <edeboer@wcsg.com>; Dan Reyneveld <dreyneveld@wcsg.com>; Alex Peltzer <apeltzer@prlawcorp.com>; John Hecht <jhecht@sespe.com>; Maya Rohr <mrohr@sespeconsulting.com>; Graham Stephens <gstephens@sespeconsulting.com>

Hi Guys,

Late last week the Executive Director reached out to me regarding numerous calls she received from John Kirkpatrick regarding our project. I told her I would be willing to update any of her various committees on the projects, specifically the ones that John sat on. She asked me to present today at the Land Use Committee. In attendance were:

Tricia Stivers-Blatner - TCFD Executive Director
Kurt Schmidt - UC Coop. Ext.
Greg Galloway
George Clausen (lives just north of the Lemon Cove Plant)
Byron Fox
Nancy Lang (lives near George Clausen)
Mile Gordon
Craig Knudsen
John Kirkpatrick

I gave a revised presentation based upon what we used at the Scoping Sessions. Most of the comments centered around understanding how we were addressing groundwater and protecting the local groundwater. They were happy to hear Ken Schmidt was working with us but concerned about using Ian, only because they do not know who he is. They also will want to make sure we address groundwater issues in a cumulative impact analysis and the potential for evaporation. Lastly, regarding water related issues, there were questions about the Lemon Cove site and how we might use that property.

John Kirkpatrick is concerned about releasing water by gravity down the St. Johns River and using the McKay Point gate structures to back water up the river. He thinks there will be impacts. Again he reiterated that he is not happy with how the County has handled Reclamation Plans.

There were some concerns about West Coast Sand and Gravel and their assurances to complete the mining operation. I noted that we were pursuing an agreement, but could not divulge details. They seemed to be satisfied that there was an agreement being developed.

In general, they supported the project. Even those that made some comments highlighted the need to get this project built to develop storage. Nancy Lang even asked how she could potentially purchase some supplies or benefit from the project.

Thanks

RE: *McKay Point Reservoir Project: Input*

Dear Mr. Fukuda,

I am writing to follow up my zoom questions that I asked in the scoping meeting held on October 29, 2020.
My citrus ranch, my farm house, and tenant's farmhouse are located north of the proposed project. My APNs are: 064-100-019; 064-110-028; 064-110-034. Not only do I have domestic wells for the houses but have irrigation wells for the 52 acres I farm. I do not have any surface water rights, and am 100% dependent on my domestic and irrigation wells.
I am all for more water storage and generally approve of the plans to use the mining pits for water diversion and storage. But I am aware of the negative impacts that sand and gravel mining can have on nearby wells. As I expressed on the zoom meeting, I am concerned on negative impacts on my wells and my neighbor's wells. There has been great deal of mining in the area, with the Stillwell site and also the Cemex sites that are in my direct vicinity. The Cemex site has basically no reclamation plan for the site once the mine is abandoned. This has been a long time concern of mine.

I hope that the Reservoir project EJR will take into account the water dynamics of the whole mined region and assess if there could be some kind of domino effect or interaction from the mining activity in the adjoining area, not just proposed the water storage site. Since groundwater flows throughout the whole area, there could be interactions from the excavating of the proposed site with existing mining sites.
From what I gathered from the scoping meeting, the proposed water storage will help the water balance in the Greater and Mid Kaweah GSAs and the farms in those GSAs, but not the farms located in the East Kaweah GSA. My property lies in the East Kaweah GSA, on the border with the Greater Kaweah. If the storage only benefits the other GSAs and negatively affects the East Kaweah farms there should be some way to make the East Kaweah GSA benefit too.
I would like to see if EIR predicts that there could be negative impacts on our wells, that some arrangement be made for us in this situation to have some "water credit" for the potential water losses.

I want it to be noted in the record that I am concerned about having my wells negatively impacted by the water diversion.

Sincerely, Nancy Lange

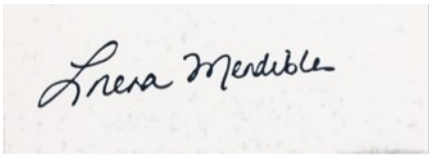
MCKAY POINT RESERVOIR PROJECT

SENT VIA EMAIL

Maya Rohr
Project Manager
Sespe Consulting, Inc.
3990 Old Town Avenue, Suite A203
San Diego, CA 92110

Dear Ms. Rohr:

Thank you for the opportunity to review the Notice of Preparation of a Draft Environmental Impact Report for the McKay Point Reservoir Project. The project proposes to develop approximately 200 acres within the 500- acre McKay Point property into a surface water storage and re-regulation reservoir. The project is located in Tulare County.



The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. The Local Development -Intergovernmental Review (LD-IGR) Program reviews land use projects and plans through the lenses of our mission and state planning priorities of infill, conservation, and travel-efficient development. To ensure a safe and efficient transportation system, we encourage early consultation and coordination with local jurisdictions and project proponents on all development projects that utilize the multimodal transportation network.

Caltrans provides the *following comments* consistent with the State's smart mobility goals that support a vibrant economy and sustainable communities:

1. Based on the information submitted, Caltrans believes that the above referenced project will not have a significant impact on the State Highway System. However, Caltrans requests the opportunity to review any future proposed development that has the potential to impact the State Highway System.

If you have any other questions, please contact Lupita Mendoza, Transportation Planner, at (559) 488-4260 or at lupita.mendoza@dot.ca.gov.

Sincerely,

LORENA MENDIBLES, Chief
Transportation Planning –South

State Water Resources Control Board

Dear Ms. Rohr:

COMMENTS ON NOTICE OF PREPARATION OF DRAFT ENVIRONMENTAL IMPACT REPORT FOR TULARE IRRIGATION DISTRICT'S MCKAY RESERVOIR PROJECT

Thank you for the opportunity to comment on the Notice of Preparation (NOP) for the proposed Draft Environmental Impact Report (Draft EIR) for Tulare Irrigation District's McKay Reservoir Project. The NOP states the Project Owners consist of Tulare Irrigation District, the Consolidated Peoples Ditch Company, and the Visalia and Kaweah Water Company. The McKay Reservoir Project as described by the NOP involves the Tulare Irrigation District's development of a surface water storage and re-regulation reservoir. In addition, the NOP indicates the reservoir would also be used to optimize groundwater recharge in the Project Owners' service area.

Projects which will divert water from a surface water or subterranean stream flowing through known and definite channels using any of the following methods require a valid water right:

- Diversion through a pipe, canal or other means for direct use (including non-consumptive uses) and/or storage in a reservoir
- Diversion through well pumping from a subterranean stream
- Collection of water in a reservoir located on a stream
- Diversion onto farm fields, groundwater recharge facilities or by other means for groundwater banking (also known as groundwater storage)
- Diversion of flood flows, peak flows, storm flows or surplus flows for beneficial use, such as providing an alternate water supply for domestic, municipal or irrigation purposes
- Diversion of a spring which would otherwise flow off the property from which it originates at any time during the year

In addition, there are other types of projects which may require modification to an existing water right or approval through a petition process. These are:

- Projects that will transfer water under water right permits or licenses
- Projects that will dedicate water to instream flow purposes
- Projects that will modify a water right permit or license by any of the terms or conditions, such as changing the place of use, point of diversion, or purpose of use
- Projects that will change the point of discharge, place of use, or purpose of use of treated wastewater

A valid water right is required to divert from any stream system, even if the stream flows for only limited periods during or shortly after storm events, and even where the stream shows only limited signs of channelization, such as a swale on a topographic map. The NOP states the Project Owners are all members of the Kaweah and St. Johns Waters Association which oversees surface water rights and diversion operations on the Kaweah River. If the McKay Reservoir Project will involve changes to existing surface water rights and/or new water rights, the Division of Water Rights (Division) requests that the Draft EIR include information and analyses related to potential changes in streamflow and related effects on instream resources that may result from the project. The Draft EIR will need to be sufficient for the Division to rely on as a responsible agency when acting on requests for changes to existing water rights or issuance of new water rights related to the project.

For your reference and further information, below are links to our Water Rights Petitions and Applications websites.

Petitions:
https://www.waterboards.ca.gov/waterrights/water_issues/programs/petitions/

Applications:

Hi Tricia

We have added the County Farm Bureau to our mailing list and you will be receiving all notices regarding the DEIR including the notification of the 45 day public comment period and future public meetings. We will review and address your concerns in the DEIR and/or directly in communications with you. In addition, your concerns and letters (emails) will be part of the Administrative Record for the Project.

Public participation is an important part of the CEQA process. So thank you for taking the time to provide us with input on the Project.

November 3, 2020

Dear Ms. Rohr,
We would like to be placed on the notification list for all future correspondence related to the McKay Point Reservoir project. Please make certain Tulare County Farm Bureau receives notification for the Draft EIR please.

We are pleased to see the project moving forward after many years. We last received a presentation on the project in August 2013 at our Land Use Committee meeting. We appreciate that Aaron Fukuda took time to provide a great overview of the project to our committee on October 29, 2020 to bring us up to date. I encourage you to also review and update the MckayPoint.com website to make sure the public can utilize the website for relevant and up to date details related to the project.

Our committee is generally supportive of advancements for a project that would bring more surface water storage to the region, being mindful of neighboring property owner's rights and responsibilities and continuing to ensure access to the groundwater resources in the area for all users surrounding the new project.

The Farm Bureau took a neutral position many years back on the Stillwell DEIR, but requested Tulare County bring its Mineral Resources Policy up to date. That was done through formation of the Mineral Resources Policy Advisory Committee (MrPAC) on which a large number of citizens, industry and RMA Staff devoted huge amounts of time and energy. The resulting policy was good, but its application and code enforcement since then have been disappointing. We urge your study and future implementation of the proposed project consider the importance of ensuring the County has adequate measures in place to address failures of the past, and that enforcement of the permits and remediation guidelines for this site are appropriately developed, monitored and consistently adhered to during the course of this project. This will make the project more favorable to surrounding landowners, neighbors, and Farm Bureau in general.

The main considerations that were voiced in our discussions with Aaron are noted below.

The McKay Point reservoir draft EIR should be certain to address and study:

1. The hydrogeological effects of the project and the surrounding area. Mining to bedrock and sealing the resulting reservoir basin must be fully evaluated, diligently monitored, mitigated and modified if unexpected negative events occur or are identified;
2. While hydrologic benefits are very attractive, there may be some downsides, such as possible catastrophic pit capture and channelizing of flood waters;
3. Real time and cumulative evaporation from surface waters must also be evaluated.
4. Hydrology studies should include what happens if water pushes back up the river.

Some of the general comments/questions asked of TID about the project at our Land Use Meeting were:

1. How will the local Groundwater Sustainability Agencies of Kaweah sub-basin benefit from this reservoir? Or will they?
2. Who will be the consulting hydrologists on the project?
3. Are you studying cumulative impacts within the EIR, specifically evaporation from surface water?

4. What facility will be used for the new partner's crushing site?
5. What will be the approximate size of the finished reservoir?

We look forward to reviewing the draft EIR when notified of its release.

Thank you.

Hi Doug,

On our website (www.tulareid.org), you can download the Notice of Preparation (NOP) document and a list of those notified of the NOP. While I completely trust that you did not get the notice, our records show that we sent it to Santa Fe Aggregates at 22400 Avenue 335.

If you prefer the future notices to be sent to another location, please let me know.

Again, please feel free to contact me if you have any questions or concerns.

Thanks

Subject: **McKay Point Reservoir Project (Project)**
Notice of Preparation (NOP)
State Clearinghouse No.: 2014011078

Dear Ms. Rohr:

The California Department of Fish and Wildlife (CDFW) received an NOP for an Environmental Impact Report (EIR) from Tulare Irrigation District (Tulare ID), which is the Lead Agency for the Project pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.[1]

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, CDFW appreciates the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

While the comment period may have ended, CDFW would appreciate if you will still consider our comments.

CDFW ROLE

CDFW is California's **Trustee Agency** for fish and wildlife resources and holds those resources in trust by statute for all the people of the State (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a)). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (*Id.*, § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public

[1] CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources. CDFW is also submitting comments as a **Responsible Agency** under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 *et seq*.). Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 *et seq*.), related authorization as provided by the Fish and Game Code will be required.

CDFW has jurisdiction over fully protected species of birds, mammals, amphibians and reptiles, and fish, pursuant to Fish and Game Code sections 3511, 4700, 5050, and 5515. Take of any fully protected species is prohibited and CDFW cannot authorize their incidental take.

The use of unallocated stream flows are subject to appropriation and approval by the State Water Resources Control Board (SWRCB) pursuant to Water Code section 1225. CDFW, as Trustee Agency, is consulted by the SWRCB during the water rights process to provide terms and conditions designed to protect fish and wildlife prior to appropriation of the State's water resources. Certain fish and wildlife are reliant upon aquatic ecosystems, which in turn are reliant upon adequate flows of water. CDFW therefore has a material interest in assuring that adequate water flows within streams for the protection, maintenance, and proper stewardship of those resources. CDFW provides, as available, biological expertise to review and comment on environmental documents and impacts arising from project activities.

PROJECT DESCRIPTION SUMMARY

Proponent: The Tulare ID is the Lead Agency for the Project. The Project proponents are Tulare ID, the Consolidated People's Ditch Company (CPDC), and the Visalia and Kaweah Water Company (VKWC).

Proposed Project: The Project would develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir. The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River, and would consist of the following phases: excavation of the site for the reservoir, construction of the reservoir, and operation of the reservoir.

The Project would divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point. The reservoir would provide a water storage capacity of approximately 4,600 acre-feet

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

and deliver water back to either the Lower Kaweah River or the St. Johns River, as needed. The Project would provide additional storage capacity for storm water layoff and flood prevention. The reservoir would also be used to optimize groundwater recharge within the service areas for Tulare ID, CPCD, and VKWC.

Objectives: The Project objectives include capturing and re-regulating water made available to the Project proponents during flood releases from Lake Kaweah; capturing and re-regulating water entitlements belonging to the Project proponents released from Lake Kaweah; capturing and re-regulating water released for the Project proponents during peak power enhancement flows from the Terminus Hydropower Plant (Lake Kaweah); capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Project proponents; allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Project proponents; allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Project proponents and Kaweah/St. Johns water rights interests; constructing the reservoir in such a way that revenue can be obtained to offset the construction and development costs; and locating the reservoir adjacent to the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines.

Location: The Project site includes portions of the following Assessor's Parcel Numbers: 113-070-016-000, 113-080-005-000, 113-080-008-000, 113-090-001-000, and 113-100-002-000.

The Project is located in Tulare County, California, between and to the south of both Lake Kaweah (2.5 miles northeast of the site) and Bravo Lake (1.5 miles northwest of the site); 1.0 miles northwest of the community of Lemon Cove; and 2.5 miles southeast of the community of Woodlake. The Project site is located approximately 1.0 mile west-southwest of the intersection of State Highways 216 and 198, in Sections 3 and 4, Township 18 South, Range 27 East, Mount Diablo Base and Meridian.

Timeframe: No timeframe given.

COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations below to assist Tulare ID in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions may also be included to improve the document.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Based on a review of aerial imagery, the Project description, and a review of California Natural Diversity Database (CNDDB) records, several special status species and habitat types could potentially be impacted by Project activities. Project-related construction activities within the Project alignment and surrounding area could impact the State threatened and federally endangered San Joaquin kit fox (*Vulpes macrotis mutica*); the State threatened Swainson's hawk (*Buteo swainsoni*); the State and federally endangered least Bell's vireo (*Vireo bellii pusillus*); the State threatened tricolored blackbird (*Agelaius tricolor*); the State threatened and fully protected Bald eagle (*Haliaeetus leucocephalus*); the State fully protected golden eagle (*Aquila chrysaetos*); the State endangered foothill yellow-legged frog (*Rana boylii*); the State candidate endangered Crotch bumble bee (*Bombus crotchii*); the State endangered and federally threatened San Joaquin adobe sunburst (*Pseudobahia peirsonii*); the California rare plant rank 1B.2 recurved larkspur (*Delphinium recurvatum*), spiny-sepaled button-celery (*Eryngium spinosepalum*), and calico monkeyflower (*Diplacus pictus*); and the State species of special concern American badger (*Taxidea taxus*), western pond turtle (*Emys marmorata*), pallid bat (*Antrozous pallidus*), western mastiff bat (*Eumops perotis californicus*), western red bat (*Lasiurus blossevillii*), burrowing owl (*Athene cunicularia*), Northern California legless lizard (*Anniella pulchra*), and western spadefoot (*Spea hammondii*).

Vegetation communities and habitats in the Project vicinity includes Valley sacaton grassland, Great Valley oak riparian forest, sycamore alluvial woodland, irrigated row crops, vineyards, orchards and field crops, non-native annual grassland, ruderal disturbed areas, and barren unvegetated areas including levee roads. Aquatic features in and near the Project area include the Kaweah and St. Johns Rivers and associated riparian and fresh emergent wetlands, recharge basins, detention basins, agricultural ditches and canals, and agricultural ponds.

Please note that the CNDDB is populated by and records voluntary submissions of species detections. As a result, species may be present in locations not depicted in the CNDDB but where there is suitable habitat and features capable of supporting species. Therefore, a lack of an occurrence record in the CNDDB is not tantamount to a negative species finding.

The NOP acknowledges the potential to adversely affect special status species. CDFW recommends that the following modifications and/or edits be incorporated into the EIR.

I. Mitigation Measure or Alternative and Related Impact Shortcoming

Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or the United States Fish and Wildlife Service (USFWS)?

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

COMMENT 1: San Joaquin Kit Fox (SJKF)

Issue: SJKF occurrences have been documented within the Project area (CDFW 2020). Review of recent aerial imagery shows suitable habitat for SJKF in the Project area. SJKF den in right-of-ways, agricultural and fallow/ruderal habitat, dry stream channels, and canal levees, etc., and populations can fluctuate over time. SJKF are also capable of occupying urban environments (Cypher and Frost 1999). SJKF may be attracted to project areas due to the type and level of ground-disturbing activities and the loose, friable soils resulting from intensive ground disturbance. SJKF will forage in fallow and agricultural fields and utilize streams and canals as dispersal corridors. As a result, there is potential for SJKF to occupy all suitable habitat within the Project boundary and surrounding area.

Specific impact: Without appropriate avoidance and minimization measures for SJKF, potential significant impacts associated with construction include habitat loss, den collapse, inadvertent entrapment, reduced reproductive success, reduction in health and vigor of young, and direct mortality of individuals.

Evidence impact is potentially significant: Habitat loss resulting from land conversion to agricultural, urban, and industrial development is the primary threat to SJKF (Cypher *et al*. 2013). Tulare and Kern Counties support relatively large areas of high suitability habitat and one of the largest remaining populations of SJKF (Cypher *et al*. 2013). The Project area is within and bordered by this remaining highly suitable habitat, which is otherwise intensively managed for agriculture. Therefore, subsequent ground-disturbing activities have the potential to significantly impact local SJKF populations.

Recommended Potentially Feasible Mitigation Measures
To evaluate potential impacts to SJKF associated with subsequent land conversion, ground disturbance and construction, CDFW recommends conducting the following evaluation of project areas and implementing the following mitigation measures.

Recommended Mitigation Measure 1: SJKF Habitat Assessment

For all Project-specific components including construction and land conversion, CDFW recommends that a qualified biologist conduct a habitat assessment in advance of project implementation, to determine if the Project area or its immediate vicinity contains suitable habitat for SJKF.

Recommended Mitigation Measure 2: SJKF Surveys and Avoidance

CDFW recommends assessing presence/absence of SJKF by having qualified biologists conducting surveys of Project areas and a 500-foot buffer of Project areas

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

to detect SJKF and their sign. CDFW also recommends following the USFWS "Standardized recommendations for protection of the San Joaquin kit fox prior to or during ground disturbance" (2011).

Recommended Mitigation Measure 3: SJKF Take Authorization

SJKF detection warrants consultation with CDFW to discuss how to avoid take or, if avoidance is not feasible, to acquire an Incidental Take Permit (ITP) prior to ground-disturbing activities, pursuant to Fish and Game Code section 2081 subdivision (b).

COMMENT 2: Swainson's Hawk (SWHA)

Issue: Review of recent aerial imagery indicates that trees capable of supporting nesting SWHA occur along the streams and canals within the Project boundary. Landscape trees may also provide suitable nesting habitat. In addition, grassland and agricultural land in the surrounding area provide suitable foraging habitat for SWHA, increasing the likelihood of SWHA occurrence within the vicinity.

Specific impact: Without appropriate avoidance and minimization measures for SWHA, potential significant impacts associated with Project activities include loss of forging and/or nesting habitat, nest abandonment, reduced reproductive success, and reduced health and vigor of eggs and/or young.

Evidence impact would be significant: Lack of suitable nesting habitat in the San Joaquin Valley limits the local distribution and abundance of SWHA (CDFW 2016). The trees and riparian habitat within the Project area represent some of the only remaining suitable nesting habitat in the local vicinity. Depending on the timing of construction, activities including noise, vibration, and movement of workers or equipment could affect nests and have the potential to result in nest abandonment, significantly impacting local nesting SWHA. In addition, agricultural cropping patterns can directly influence distribution and abundance of SWHA. For example, SWHA can forage in grasslands, pasture, hay crops, and low growing irrigated crops; however, other agricultural crops such as orchards and vineyards are incompatible with SWHA foraging (Estep 2009, Swolgaard *et al*. 2008).

Recommended Potentially Feasible Mitigation Measures
To evaluate potential impacts to SWHA associated with subsequent development, CDFW recommends conducting the following evaluation of Project areas and implementing the following mitigation measures.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Mitigation Measure 4: Focused SWHA Surveys

To evaluate potential Project-related impacts, CDFW recommends that a qualified wildlife biologist conduct surveys for nesting SWHA following the entire survey methodology developed by the SWHA Technical Advisory Committee (2000) prior to Project initiation.

Recommended Mitigation Measure 5: SWHA Nest Avoidance

CDFW recommends that if Project activities will take place during the SWHA nesting season (March 1 through August 31) and active SWHA nests are present, a minimum ½-mile no-disturbance buffer be maintained around each nest until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival, to prevent nest abandonment and other take of SWHA as a result of Project activities.

Recommended Mitigation Measure 6: SWHA Take Authorization

If implementation of a ½-mile no-disturbance nest buffer around active nests is not feasible, consultation with CDFW is warranted to determine if the Project can avoid take. If SWHA cannot be avoided, acquisition of an ITP pursuant to Fish and Game Code section 2081 subdivision (b) prior to the start of Project activity is warranted to comply with CESA.

Recommended Mitigation Measure 7: SWHA Tree Replacement

CDFW recommends that the removal of known SWHA or other raptor nest trees, even outside of the nesting season, be replaced with an appropriate native tree species planting at a ratio of 3:1 at or near the Project area or in another area that will be protected in perpetuity. This mitigation would offset the temporal impacts of nesting habitat loss.

COMMENT 3: Least Bell's Vireo (LBV)

Issue: Review of aerial imagery indicates the presence of riparian woodland vegetation suitable to support LBV, within the Project site and its vicinity

Specific impact: Without appropriate avoidance and minimization measures for LBV, potential significant impacts associated with Project development include nest abandonment, reduced reproductive success, and reduced health and vigor of eggs and/or young.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Evidence impact is potentially significant: LBV were abundant and widespread in the United States until the 1950s (Grinnell and Miller 1944). By the 1960s, they were considered scarce (Monson 1960), and by 1980 there were fewer than 50 pairs remaining (Edwards 1980), although this number had increased to 2,500 by 2004 (Kus and Whitfield 2005). The primary cause of decline for this species has been the loss and alteration of riparian woodland habitats (USFWS 2006). Fragmentation of their preferred habitat has also increased their exposure to brown- headed cowbird (*Molothrus ater*) parasitism (Kus and Whitfield 2005). Current threats to their preferred habitat include colonization by non-native plants and altered hydrology (diversion, channelization, etc.) (USFWS 2006).

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to LBV, CDFW recommends conducting the following evaluation of the Project site, incorporating the following mitigation measures into the EIR, and that these measures be made conditions of approval for the Project.

Recommended Mitigation Measure 8: LBV Habitat Assessment

CDFW recommends that a qualified biologist conduct a habitat assessment in advance of Project implementation, to determine if the Project site or its immediate vicinity contains suitable habitat for LBV.

Recommended Mitigation Measure 9: LBV Avoidance

CDFW recommends that Project activities be timed to avoid the typical bird breeding season (February 1 through September 15).

Recommended Mitigation Measure 10: LBV Surveys

If Project activities must take place during the typical bird breeding season, and suitable LBV habitat is detected during habitat assessments, CDFW recommends assessing presence/absence of LBV by conducting surveys following the USFWS "Least Bell's Vireo Survey Guidelines" (2001) in advance of the start of Project implementation, to evaluate presence/absence of LBV nesting in proximity to Project activities, and to evaluate potential Project-related impacts and permitting needs.

Recommended Mitigation Measure 11: LBV Take Authorization

LBV detection warrants consultation with CDFW to discuss how to avoid take, or if avoidance is not feasible, to acquire an ITP prior to Project activities, pursuant to Fish and Game Code section 2081 subdivision (b).

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

COMMENT 4: Tricolored Blackbird (TRBL)

Issue: TRBL are known to occur in the Project vicinity (CDFW 2020, UC Davis 2020). Review of aerial imagery indicates that the Project boundary includes flood-irrigated agricultural land, which is an increasingly important nesting habitat type for TRBL, particularly in the San Joaquin Valley (Meese *et al*. 2017).

Specific impact: Without appropriate avoidance and minimization measures for TRBL, potential significant impacts associated subsequent development include nesting habitat loss, nest and/or colony abandonment, reduced reproductive success, and reduced health and vigor of eggs and/or young.

Evidence impact would be significant: As mentioned above, flood-irrigated agricultural land is an increasingly important nesting habitat type for TRBL, particularly in the San Joaquin Valley (Meese *et al*. 2014). This nesting substrate is present within the Project vicinity. TRBL aggregate and nest colonially, forming colonies of up to 100,000 nests (Meese *et al*. 2014). Approximately 86% of the global population is found in the San Joaquin Valley (Kelsey 2008, Weintraub *et al*. 2016). In addition, TRBL have been forming larger colonies that contain progressively larger proportions of the species' total population (Kelsey 2008). In 2008, for example, 55% of the species' global population nested in only two colonies, which were located in silage fields (Kelsey 2008). Nesting can occur synchronously, with all eggs laid within one week (Orians 1961). For these reasons, depending on timing, disturbance to nesting colonies can cause nest entire colony site abandonment and loss of all unfledged nests, significantly impacting TRBL populations (Meese *et al*. 2014).

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to TRBL associated with subsequent development, CDFW recommends conducting the following evaluation of Project areas and implementing the following mitigation measures.

Recommended Mitigation Measure 12: TRBL Surveys

CDFW recommends that Project activities be timed to avoid the typical bird-breeding season of February 1 through September 15. If Project activity that could disrupt nesting must take place during that time, CDFW recommends that a qualified wildlife biologist conduct surveys for nesting TRBL no more than 10 days prior to the start of implementation to evaluate presence/absence of TRBL nesting colonies in proximity to Project activities and to evaluate potential Project-related impacts.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Mitigation Measure 13: TRBL Colony Avoidance

If an active TRBL nesting colony is found during preactivity surveys, CDFW recommends implementation of a minimum 300-foot no-disturbance buffer, in accordance with CDFW's "Staff Guidance Regarding Avoidance of Impacts to Tricolored Blackbird Breeding Colonies on Agricultural Fields in 2015" (CDFW 2015), until the breeding season has ended or until a qualified biologist has determined that nesting has ceased and the young have fledged and are no longer reliant upon the colony or parental care for survival. It is important to note that TRBL colonies can expand over time and for this reason, CDFW recommends that an active colony be reassessed to determine its extent within 10 days prior to Project initiation.

Recommended Mitigation Measure 14: TRBL Take Authorization

In the event that a TRBL nesting colony is detected during surveys, consultation with CDFW is warranted to discuss whether the Project can avoid take; if take avoidance is not feasible, to acquire an ITP pursuant to Fish and Game Code section 2081 subdivision (b), prior to any Project activities.

COMMENT 5: Nesting Bald Eagle (BAEA) and Golden Eagle (GOEA)

Issue: Nesting BAEA and GOEA have the potential to occur in the Project area and its vicinity, including the Kaweah River and St. Johns River corridors.

Specific impact: Without appropriate avoidance and minimization measures, potentially significant impacts associated with the Project's construction include loss of foraging and/or nesting habitat, nest abandonment, reduced reproductive success, and reduced health and vigor of eggs and/or young.

Evidence impact would be significant: Without appropriate survey methods, eagles nesting in the vicinity of a project can remain undetected resulting in avoidance and minimization measures not being effectively implemented (American Eagle Research Institute 2010). In addition, human activity near nest sites can cause reduced provisioning rates of GOEA chicks by adults (Steidl *et al*. 1993 *in* Kochert *et al*. 2002). Depending on the timing of construction, Project activities including noise, vibration, odors, and movement of workers or equipment could affect nests and also have the potential to result in nest abandonment, significantly impacting local nesting raptors.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Potentially Feasible Mitigation Measures
To evaluate potential impacts to roosting or nesting eagles associated with Project construction, CDFW recommends conducting the following evaluation of the Project area and including the following mitigation measures as conditions of approval.

Recommended Mitigation Measure 15: Focused Surveys for Nesting Eagles

CDFW recommends that a qualified wildlife biologist conduct surveys for nesting raptors following the Protocol for Golden Eagle Occupancy, Reproduction, and Prey Population Assessment (Driscoll 2010), and the Protocol for Evaluating Bald Eagle Habitat and Populations in California (Jackman and Jenkins 2004). If ground-disturbing activities take place during the typical bird breeding season (February 1 through September 15), CDFW recommends that additional pre-construction surveys for active nests be conducted by a qualified biologist no more than 10 days prior to the start of construction.

Recommended Mitigation Measure 16: Nesting Eagle Avoidance

If an active raptor nest is found, CDFW recommends implementation of a minimum ½-mile no-disturbance buffer until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival. If nesting raptors are detected and the ½-mile no-disturbance nest buffer is not feasible, consultation with CDFW is warranted to determine if the Project can avoid take. Please note that BAEA and GOEA are State fully protected species and no take, incidental or otherwise, of those species can be authorized by CDFW.

COMMENT 6: Burrowing Owl (BUOW)

Issue: BUOW occur within and in the vicinity of the Project area (CDFW 2020). BUOW inhabit open grassland containing small mammal burrows, a requisite habitat feature used by BUOW for nesting and cover. Habitat both within and bordering the Project supports grassland habitat.

Specific impact: Potentially significant direct impacts associated with Project development include habitat loss, burrow collapse, inadvertent entrapment, nest abandonment, reduced reproductive success, reduction in health and vigor of eggs and/or young, and direct mortality of individuals.

Evidence impact is potentially significant: BUOW rely on burrow habitat year-round for their survival and reproduction. Habitat loss and degradation are considered the greatest threats to BUOW in California's Central Valley (Gervais *et al*. 2008). The Project area contains remnant undeveloped land but is otherwise

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

intensively managed for agriculture; therefore, subsequent ground-disturbing activities associated with subsequent constructions have the potential to significantly impact local BUOW populations. In addition, and as described in CDFW's "*Staff Report on Burrowing Owl Mitigation*" (CDFG 2012), excluding and/or evicting BUOW from their burrows is considered a potentially significant impact under CEQA.

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to BUOW associated with subsequent development, CDFW recommends conducting the following evaluation of Project areas and implementing the following mitigation measures.

Recommended Mitigation Measure 17: BUOW Habitat Assessment and Surveys

CDFW recommends that a qualified biologist conduct a habitat assessment in advance of Project implementation, to determine if the Project area or its vicinity contains suitable habitat for BUOW. If suitable habitat is present on or in the vicinity of the Project area, CDFW recommends assessing presence/absence of BUOW by having a qualified biologist conduct surveys following the California Burrowing Owl Consortium's "*Burrowing Owl Survey Protocol and Mitigation Guidelines*" (1993) and CDFW's *Staff Report on Burrowing Owl Mitigation*" (CDFG 2012). Specifically, these documents suggest three or more surveillance surveys conducted during daylight with each visit occurring at least three weeks apart during the peak breeding season (i.e., April 15 to July 15), when BUOW are most detectable. In addition, CDFW advises that surveys include a minimum 500-foot buffer around the Project area.

Recommended Mitigation Measure 18: BUOW Avoidance

CDFW recommends that no-disturbance buffers, as outlined in the "*Staff Report on Burrowing Owl Mitigation*" (CDFG 2012), be implemented prior to and during any ground-disturbing activities. Specifically, CDFW's Staff Report recommends that impacts to occupied burrows be avoided in accordance with the following table unless a qualified biologist approved by CDFW verifies through non-invasive methods that either: 1) the birds have not begun egg laying and incubation; or 2) that juveniles from the occupied burrows are foraging independently and are capable of independent survival.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Location	Time of Year	Level of Disturbance		
		Low	Med	High
Nesting sites	April 1-Aug 15	200 m*	500 m	500 m
Nesting sites	Aug 16-Oct 15	200 m	200 m	500 m
Nesting sites	Oct 16-Mar 31	50 m	100 m	500 m

* meters (m)

Recommended Mitigation Measure 19: BUOW Passive Relocation and Mitigation

If BUOW are found within these recommended buffers and avoidance is not possible, it is important to note that according to the Staff Report (CDFG 2012), excluding owls from burrows is not a take avoidance, minimization, or mitigation method and is instead considered a potentially significant impact under CEQA. If it is necessary for Project implementation, CDFW recommends that burrow exclusion be conducted by qualified biologists and only during the non-breeding season, before breeding behavior is exhibited and after the burrow is confirmed empty through non-invasive methods, such as surveillance. CDFW recommends replacement of occupied burrows with artificial burrows at a ratio of 1 burrow collapsed to 1 artificial burrow constructed (1:1) to mitigate for evicting BUOW and the loss of burrows. BUOW may attempt to colonize or re-colonize an area that will be impacted; thus, CDFW recommends ongoing surveillance at a rate that is sufficient to detect BUOW if they return.

COMMENT 7: Foothill Yellow-Legged Frog (FYLF)

Issue: FYLF are primarily stream dwelling and require shallow, flowing water in streams and rivers with at least some cobble-sized substrate. (Thomson *et al*. 2016). FYLF have been documented to occur in the vicinity of the Project site (CDFW 2020). The Project site contains habitat that could support this species.

Specific impact: Without appropriate avoidance and minimization measures for FYLF, potentially significant impacts associated with Project activities could include burrow collapse, inadvertent entrapment, reduced reproductive success, reduction in health and vigor of eggs, larvae and/or young, and direct mortality of individuals.

Evidence impact would be significant: FYLF populations throughout the State have experienced ongoing and drastic declines and many have been extirpated; historically, FYLF occurred in mountain streams from the San Gabriel River in Los Angeles County to southern Oregon west of the Sierra-Cascade crest (Thomson *et al*. 2016). Habitat loss from growth of cities and suburbs, invasion of nonnative plants, impoundments, water diversions, stream maintenance for flood control,

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

degraded water quality, and introduced predators, such as bullfrogs are the primary threats to FYLF (Thomson *et al*. 2016).

Recommended Potentially Feasible Mitigation Measures
To evaluate potential impacts to FYLF, CDFW recommends conducting the following evaluation of the Project site, incorporating the following mitigation measures into the EIR, and that these measures be made conditions of approval for the Project.

Recommended Mitigation Measure 20: FYLF Surveys

CDFW recommends that a qualified wildlife biologist conduct surveys for FYLF in accordance with the USFWS *"Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog"* (USFWS 2005) to determine if FYLF are within or adjacent to the Project area. While this survey is designed for California red-legged frog, the survey may be used for FYLF with focus on stream/river habitat.

Recommended Mitigation Measure 21: FYLF Avoidance

CDFW recommends that initial ground-disturbing activities be timed to avoid the period when FYLF are most likely to be moving through upland areas (i.e., November 1 through March 31). If ground-disturbing activities must take place between November 1 and March 31, CDFW recommends that a qualified biologist monitor construction activity daily for FYLF.

Recommended Mitigation Measure 22: FYLF Take Authorization

If through surveys or monitoring it is determined that FYLF occupies or has the potential to occupy the Project site and take cannot be avoided, take authorization would be warranted prior to initiating ground-disturbing activities, through issuance of a State ITP, pursuant to Fish and Game Code section 2081 subdivision (b), prior to any Project activities.

COMMENT 8: Crotch's Bumble Bee (CBB)

Issue: On June 28, 2019, the Fish and Game Commission published findings of its decision to advance CBB to candidacy as endangered. Pursuant to Fish and Game Code section 2074.6, CDFW has initiated a status review report to inform the Commission's decision on whether listing of CBB pursuant to CESA is warranted. During the candidacy period, consistent with CEQA Guidelines, section 15380, the status of the CBB as an endangered candidate species under CESA (Fish and G. Code, § 2050 *et seq*.) qualifies it as an endangered, rare, or threatened species under CEQA.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

CBB have been documented to occur within the vicinity of the Project area (CDFW 2020). Suitable CBB habitat includes areas of grasslands and upland scrub that contain requisite habitat elements, such as small mammal burrows. CBB primarily nest in late February through late October underground in abandoned small mammal burrows, but may also nest under perennial bunch grasses or thatched annual grasses, under brush piles, in old bird nests, and in dead trees or hollow logs (Williams *et al*. 2014; Hatfield et *al*. 2015). Overwintering sites utilized by CBB mated queens include soft, disturbed soil (Goulson 2010), or under leaf litter or other debris (Williams *et al*. 2014). Therefore, ground disturbance and vegetation removal associated with Project implementation has the potential to significantly impact local CBB populations.

Specific impact: Without appropriate avoidance and minimization measures for CBB, potentially significant impacts associated with ground- and vegetation-disturbing activities associated with construction of the Project include loss of foraging plants, changes in foraging behavior, burrow collapse, nest abandonment, reduced nest success, reduced health and vigor of eggs, young and/or queens, in addition to direct mortality.

Evidence impact is potentially significant: CBB was once common throughout most of the central and southern California; however, it now appears to be absent from most of it, especially in the central portion of its historic range within California's Central Valley (Hatfield *et al*. 2014). Analyses by the Xerces Society *et al*. (2018) suggest that there have been sharp declines in relative abundance by 98% and persistence by 80% over the last 10 years.

Recommended Potentially Feasible Mitigation Measures
To evaluate potential impacts to CBB associated with the Project, CDFW recommends incorporating the following mitigation measures into the EIR prepared for this Project and implementing the following mitigation measures as a condition of approval for the Project.

Recommended Mitigation Measure 23: CBB Surveys

CDFW recommends that a qualified biologist conduct focused surveys for CBB and their requisite habitat features to evaluate potential impacts resulting from ground- and vegetation-disturbance associated with the Project, and potential impacts resulting from vegetation removal and discing.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Mitigation Measure 24: CBB Take Avoidance

If surveys cannot be completed, CDFW recommends that all small mammal burrows and thatched/bunch grasses be avoided by a minimum of 50 feet to avoid take and other potentially significant impacts.

COMMENT 9: Special-Status Bat Species

Issue: Western mastiff bat have been documented to occur in the vicinity of the Project area (CDFW 2020). In addition, habitat features that have the potential to support Western mastiff bat, Western red bat, pallid bat, and other bat species are present within the Project area.

Specific impact: Without appropriate avoidance and minimization measures for special-status bat species, potential significant impacts resulting from ground- and vegetation-disturbing activities associated with Project construction include habitat loss, inadvertent entrapment, roost abandonment, reduced reproductive success, reduction in health and vigor of young, and direct mortality of individuals.

Evidence impact is potentially significant: Western mastiff bat and pallid bat are known to roost in buildings, caves, tunnels, cliffs, crevices, trees. (Lewis 1994). Western red bat is highly associated with riparian habitat (Peirson *et al*. 2006). Project activities have the potential to affect habitat upon which special-status bat species depend for successful breeding and have the potential to impact individuals and local populations.

Recommended Potentially Feasible Mitigation Measure(s)
CDFW recommends that the EIR include the following measures and that these be made conditions of approval for the Project.

Recommended Mitigation Measure 25: Bat Roost Habitat Assessment

CDFW recommends that a qualified biologist conduct a habitat assessment well in advance of Project implementation to determine if the Project area or its immediate vicinity contains suitable roosting habitat for special-status bat species.

Recommended Mitigation Measure 26: Bat Surveys

If suitable habitat is present, CDFW recommends assessing presence/absence of special-status bat roosts by conducting surveys during the appropriate seasonal period of bat activity. CDFW recommends methods such as through emergence surveys or bat detectors to determine whether bats are present.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Mitigation Measure 27: Bat Roost Disturbance Minimization and Avoidance

If bats are present, CDFW recommends that a 100-foot no-disturbance buffer be placed around the roost and that a qualified biologist who is experienced with bats monitor the for signs of disturbance to bats from Project activity. If a bat roost is identified and work is planned to occur during the breeding season, CDFW recommends that no disturbance to maternity roosts occurs and that CDFW be consulted to determine measures to prevent breeding disruption or failure.

COMMENT 10: Western Pond Turtle (WPT)

Issue: WPT are documented in the vicinity of the Project (CDFW 2020), and a review of aerial imagery shows requisite habitat features that WPT utilize for nesting, overwintering, dispersal, and basking occur in the Project area. These features include aquatic and terrestrial habitats such as rivers, lakes, reservoirs, ponded areas, irrigation canals, riparian and upland habitat. WPT are known to nest in the spring or early summer within 100 meters of a water body, although nest sites as far away as 500 meters have also been reported (Thomson *et al*. 2016).

Specific impact: Without appropriate avoidance and minimization measures for WPT, potentially significant impacts associated with Project activities could include nest reduction, inadvertent entrapment, reduced reproductive success, reduction in health or vigor of eggs and/or young, and direct mortality.

Evidence impact is potentially significant: WPT are known to nest in the spring or early summer within 100 meters of a water body, although nest sites as far away as 500 meters have also been reported (Thomson *et al*. 2016). Noise, vegetation removal, movement of workers, construction and ground disturbance as a result of Project activities have the potential to significantly impact WPT populations.

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to WPT, CDFW recommends conducting the following evaluation of the Project site, and to including the following measures in the EIR.

Recommended Mitigation Measure 28: WPT Surveys

CDFW recommends that a qualified biologist conduct focused surveys for WPT within ten10 days prior to Project implementation. In addition, CDFW recommends that focused surveys for nests occur during the egg-laying season (i.e., March through August).

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Mitigation Measure 29: WPT Avoidance and Minimization

CDFW recommends that any WPT nests that are discovered remain undisturbed with a no-disturbance buffer maintained around the nest until the eggs have hatched and neonates are no longer in the nest or Project areas. If WPT individuals are discovered at the site during surveys or Project activities, CDFW recommends that they be allowed to move out of the area on their own volition without disturbance or harm.

COMMENT 11: Special-Status Plants

Issue: Special-status plants meeting the definition of rare or endangered under CEQA section 15380 are known to occur in the vicinity of the Project. The State endangered and federally threatened San Joaquin adobe sunburst and California rare plant rank 1B.2 recurved larkspur, spiny-sepaled button-celery, and calico monkeyflower have been documented within the Project area.

Specific impact: Without appropriate avoidance and minimization measures for special-status plants, potential significant impacts associated with subsequent construction include loss of habitat, loss of reduction of productivity, and direct mortality.

Evidence impact would be significant: San Joaquin adobe sunburst, recurved larkspur, spin-sepaled button-celery, and calico monkeyflower are threatened by grazing and agricultural, urban, and energy development. Many historical occurrences of these species are presumed extirpated (California Native Plant Society 2020). Though new populations have recently been discovered, impacts to existing populations have the potential to significantly impact populations of plant species.

Recommended Potentially Feasible Mitigation Measures
To evaluate potential impacts to special-status plants associated with subsequent development, CDFW recommends conducting the following evaluation of Project areas and implementing the following mitigation measures.

Recommended Mitigation Measure 30: Special-Status Plant Surveys

CDFW recommends that individual Project sites be surveyed for special-status plants by a qualified botanist following the “Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities” (CDFW 2018). This protocol, which is intended to maximize detectability, includes the identification of reference populations to facilitate the likelihood of field investigations occurring during the appropriate floristic period.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Mitigation Measure 31: Special-Status Plant Avoidance

CDFW recommends that special-status plant species be avoided whenever possible by delineating and observing a no-disturbance buffer of at least 50 feet from the outer edge of the plant population(s) or specific habitat type(s) required by special-status plant species. If buffers cannot be maintained, then consultation with CDFW may be warranted to determine appropriate minimization and mitigation measures for impacts to each special-status plant species.

Recommended Mitigation Measure 32: Special-Status Plant Take Authorization

If a State-listed plant species is identified during botanical surveys, consultation with CDFW is warranted to determine if the Project can avoid take. If take cannot be avoided, take authorization would be warranted. Take authorization would occur through issuance of an ITP by CDFW, pursuant to Fish and Game Code section 2081 subdivision (b).

COMMENT 12: Other State Species of Special Concern

Issue: Western spadefoot, Northern California legless lizard, and American badger can inhabit grassland and upland scrub habitats (Thomson *et al*. 2016, Williams 1986). These special status species have been documented to occur in the vicinity of the Project boundary, which supports requisite habitat elements for these species (CDFW 2020).

Specific impact: Without appropriate avoidance and minimization measures for these species, potentially significant impacts associated with ground disturbance include habitat loss or nest/den/burrow abandonment, which may result in reduced health or vigor of individuals and direct mortality.

Evidence impact is potentially significant: Habitat loss threatens of the species mentioned above (Thomson *et al*. 2016, Williams 1986). Habitat within and adjacent to the Project represents some of the only remaining undeveloped land in the vicinity, which is otherwise intensively managed for agriculture. Ground- and vegetation-disturbing activities associated with the Project have the potential to significantly impact local populations of these species.

Recommended Potentially Feasible Mitigation Measures
To evaluate potential impacts to special-status species associated with subsequent development, CDFW recommends conducting the following evaluation of project areas and implementing the following mitigation measures.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

Recommended Mitigation Measure 33: Special-Status Species Habitat Assessment

CDFW recommends that a qualified biologist conduct a habitat assessment in advance of project implementation, to determine if project areas or their immediate vicinity contain suitable habitat for the species mentioned above.

Recommended Mitigation Measure 34: Special-Status Species Surveys

If suitable habitat is present, CDFW recommends that a qualified biologist conduct focused surveys for applicable species and their requisite habitat features prior to the start of Project activity to detect individuals that could be impacted from ground- and vegetation-disturbance.

Recommended Mitigation Measure 35: Special-Status Species Avoidance or Minimization

Avoidance whenever possible is encouraged via delineation and observance of a 50-foot no-disturbance buffer around dens of mammals like the American badger, as well as the entrances of burrows that can provide refuge for small mammals, reptiles, and amphibians.

Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS?

COMMENT 13: Wetland and Riparian Habitats

Issue: The Project area contains numerous waterways and riparian and wetland areas. Development within the Project has the potential to involve temporary and permanent impacts to these features.

Specific impact: Project activities have the potential to result in the loss of riparian and wetland vegetation, in addition to the degradation of wetland and riparian areas through grading, fill, and related development.

Evidence impact is potentially significant: The Project area includes stream and wetland features within an agricultural landscape that also maintains undeveloped habitats. Riparian and associated floodplain and wetland areas are valuable for their ecosystem processes such as protecting water quality by filtering pollutants and transforming nutrients; stabilizing stream banks to prevent erosion and sedimentation/siltation; and dissipating flow energy during flood conditions, thereby spreading the volume of surface water, reducing peak flows downstream, and

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

increasing the duration of low flows by slowly releasing stored water into the channel through subsurface flow. Within the San Joaquin Valley, modifications of streams to accommodate human uses has resulted in damming, canalizing, and channelizing of many streams, though some natural stream channels and small wetland or wetted areas remain (Edminster 2002). The Fish and Game Commission policy regarding wetland resources discourages development or conversion of wetlands that results in any net loss of wetland acreage or habitat value. Construction activities within these features also has the potential to impact downstream waters as a result of Project site impacts leading to erosion, scour, and changes in stream morphology.

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to wetland and riparian habitats, CDFW recommends conducting the following evaluation of Project areas and implementing the following mitigation measures.

Recommended Mitigation Measure 37: Stream and Wetland Mapping

CDFW recommends that formal stream mapping and wetland delineation be conducted by a qualified biologist or hydrologist, as warranted, to determine the baseline location, extent, and condition of streams (including any floodplain) and wetlands within and adjacent to the Project area. Please note that while there is overlap, State and Federal definitions of wetlands differ, and complete stream mapping commonly differs from delineations used by the U.S. Army Corps of Engineers specifically to identify the extent of Waters of the U.S. Therefore, it is advised that the wetland delineation identify both State and Federal wetlands in the Project area as well as the extent of all streams including floodplains, if present, within the Project area. CDFW advises that site map(s) depicting the extent of any activities that may affect wetlands, lakes, or streams be included with any Project site evaluations, to clearly identify areas where stream/riparian and wetland habitats could be impacted from Project activities.

Recommended Mitigation Measure 38: Stream and Wetland Habitat Mitigation

CDFW recommends that the potential direct and indirect impacts to stream/riparian and wetland habitat be analyzed according to each Project activity. Based on those potential impacts, CDFW recommends that the EIR include measures to avoid, minimize, and/or mitigate those impacts. CDFW recommends that impacts to riparian habitat (i.e., biotic and abiotic features) take into account the effects to stream function and hydrology from riparian habitat loss or damage, as well as potential effects from the loss of riparian habitat to special-status species already identified herein. CDFW recommends that losses to stream and wetland habitats be offset with corresponding riparian and wetland habitat restoration incorporating native vegetation to replace the value to fish and wildlife provided by the habitats lost

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

from Project implementation. If on-site restoration to replace habitats is not feasible, CDFW recommends offsite mitigation by restoring or enhancing in-kind riparian or wetland habitat and providing for the long-term management and protection of the mitigation area, to ensure its persistence.

II. Editorial Comments and/or Suggestions

Federally Listed Species: CDFW recommends consulting with the USFWS regarding potential impacts to federally listed species including, but not limited to, SJKF, LBV, and San Joaquin adobe sunburst. Take under the Federal Endangered Species Act (FESA) is more broadly defined than CESA; take under FESA also includes significant habitat modification or degradation that could result in death or injury to a listed species by interfering with essential behavioral patterns such as breeding, foraging, or nesting. Consultation with the USFWS in order to comply with FESA is advised well in advance of any Project activities.

Lake and Streambed Alteration: Project activities have the potential to substantially change the bed, bank, and channel of waterways onsite. Jurisdictional Project activities are subject to the notification requirement of Fish and Game Code section 1602, which requires an entity to notify CDFW prior to commencing any activity that may (a) substantially divert or obstruct the natural flow of any river, stream, or lake; (b) substantially change or use any material from the bed, bank, or channel of any river, stream, or lake (including the removal of riparian vegetation); (c) deposit debris, waste or other materials that could pass into any river, stream, or lake. "Any river, stream, or lake" includes those that are ephemeral or intermittent as well as those that are perennial. CDFW is required to comply with CEQA in the issuance of a Lake or Streambed Alteration Agreement (Agreement); therefore, if the CEQA document approved for the Project does not adequately describe the Project and its impacts, a subsequent CEQA analysis may be necessary for Agreement issuance. For additional information on notification requirements, please contact staff in the Central Region Lake and Streambed Alteration Program at (559) 243-4593 or R4LSA@willife.ca.gov, of the Program website: https://wildlife.ca.gov/Conservation/LSA.

Nesting birds: CDFW has jurisdiction over actions with potential to result in the disturbance or destruction of active nest sites or the unauthorized take of birds. Fish and Game Code sections that protect birds, their eggs and nests include sections 3503 (regarding unlawful take, possession or needless destruction of the nest or eggs of any bird), 3503.5 (regarding the take, possession or destruction of any birds-of-prey or their nests or eggs), and 3513 (regarding unlawful take of any migratory nongame bird).

CDFW encourages Project implementation to occur during the bird non-nesting season; however, if Project activities must occur during the breeding season (February through mid-September), the Project proponent is responsible for ensuring that implementation

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

of the Project does not result in violation of the Migratory Bird Treaty Act or relevant Fish and Game Codes as referenced above.

To evaluate Project-related impacts on nesting birds, CDFW recommends that a qualified wildlife biologist conduct pre-activity surveys for active nests no more than 10 days prior to the start of each Project activity to maximize the probability that nests that could potentially be impacted by the Project are detected. CDFW also recommends that surveys cover a sufficient area around the work site to identify nests and determine their status. A sufficient area means any area potentially affected by a project. In addition to direct impacts (i.e. nest destruction), noise, vibration, and movement of workers or equipment could also affect nests. Prior to initiation of construction activities, CDFW recommends that a qualified biologist conduct a survey to establish a behavioral baseline of all identified nests. Once construction begins, CDFW recommends that a qualified biologist continuously monitor nests to detect behavioral changes resulting from the project. If behavioral changes occur, CDFW recommends that the work causing that change cease and CDFW be consulted for additional avoidance and minimization measures.

If continuous monitoring of identified nests by a qualified wildlife biologist is not feasible, CDFW recommends a minimum no-disturbance buffer of 250 feet around active nests of non-listed bird species and a 500-foot no-disturbance buffer around active nests of non-listed raptors. These buffers are advised to remain in place until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival. Variance from these no-disturbance buffers is possible when there is compelling biological or ecological reason to do so, such as when the construction area would be concealed from a nest site by topography. CDFW recommends that a qualified wildlife biologist advise and support any variance from these buffers and notify CDFW in advance of implementing a variance.

Indirect and Cumulative Riparian Impacts from Surface Water Diversions: Project-related diversions may impact riparian, wetland, fisheries, and terrestrial (i.e., upland) wildlife species and habitats downstream of the Project location by reducing the amount of surface flow in the active stream channel at the discharge location and downstream, as well as reducing the amount of subsurface flow from percolation

Watershed and habitat protection are vital to CDFW's management of California's diverse fish, wildlife, and plant resources. The riparian zone of the Kaweah and St. Johns Rivers in the vicinity of the Project supports mature riparian woodland habitat and may potentially support several sensitive species listed as threatened or endangered under CESA and FESA, as well as several State Species of Special Concern, including those species listed above. The proposed Project could result in direct and cumulative adverse impacts to these fish and wildlife and other public trust resources.

DocuSign Envelope ID: 8814B58A-F4E7-48EB-85C5-0989B914FF65

The Sequoia Riverlands Trust manages the Kaweah Oaks Preserve located downstream of the proposed Project. The Kaweah Oaks Preserve is 344 acres and contains some of the last remaining Valley oak riparian forests in the San Joaquin Valley. Project-related activities resulting in surface water diversion may potentially impact these properties and sensitive habitats and special-status plant and wildlife species including Valley sacaton grassland, Great Valley oak riparian forest, least Bell's vireo, Swainson's hawk, tricolored blackbird, and numerous other special-status species (CDFW 2020).

Surface flow diversion may impact the riparian woodland habitat located downstream by reducing the amount of water available in the active channel to native plant species within the riparian woodland. This may subsequently lead to a reduction in the native plant species composition of the riparian woodland, which would allow adjacent nonnative plant species to invade and colonize the habitat, reducing the quality of habitat for and presence of sensitive species.

CDFW recommends that the EIR include 1) an analysis of the proposed acquisition of surface water and any potential direct, indirect, and cumulative biological impacts to fish and wildlife species and their habitats, as well as to properties permanently conserved to protect those resources; and 2) a hydrologic study to determine if the production of the watershed is sufficient to reduce the discharge flows, as proposed, without having significant adverse impacts to riparian and aquatic resources of watershed downstream, including the invasion and establishment of nonnative plant species and change in habitat type.

Water Rights: The Project will divert surface flow from the Kaweah and St. Johns Rivers. CDFW recommends that the draft EIR include a detailed description of the water rights and water entitlements for the points of diversion and places of use that pertain to the proposed Project. CDFW recommends including information on the historic and current water rights and water use agreements/contracts including pre-1914 and appropriative rights, riparian rights, prescriptive rights, and adjudications.

CDFW recommends that the draft EIR address whether the Project proponents will be filing a change petition or a new application for additional surface water. As stated previously, CDFW, as Trustee Agency, is consulted by the SWRCB during the water rights process to provide terms and conditions designed to protect fish and wildlife prior to appropriation of the State's water resources. Given the potential for significant impacts to sensitive species and their habitats, it is advised that required consultation with CDFW occur well in advance of the SWRCB water right application process.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database, which may be used to make subsequent or supplemental environmental determinations (Pub. Resources Code, § 21003, subd. (e)). Accordingly, please report any special status species and natural communities detected during Project surveys to the CNDDB. The CNDDB field survey form can be found at the following link: http://www.dfg.ca.gov/biogeodata/cnddb/pdfs/CNDDB_FieldSurveyForm.pdf. The completed form can be mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. The types of information reported to CNDDB can be found at the following link: http://www.dfg.ca.gov/biogeodata/cnddb/plants_and_animals.asp.

FILING FEES

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

CONCLUSION

CDFW appreciates the opportunity to comment on the NOP to assist the Tulare ID in identifying and mitigating Project impacts on biological resources. Questions regarding this letter or further coordination should be directed to Annette Tenneboe, Senior Environmental Scientist (Specialist), at (559) 243-4014 extension 231 or by email at annette.tenneboe@wildlife.ca.gov.

Sincerely,

RE: Tulare Irrigation District Process and NOP

Dear Ms. Rohr and Mr. Fakuda:

As Legal Counsel and on behalf of our client Santa Fe Aggregates, Inc. ("SFA") and Waterford Properties, LLC. both wholly owned subsidiaries of Teichert, Inc., it recently came to our attention that scoping meetings were held, and a Notice of Preparation had been circulated for Tulare Irrigation District's McKay Point Reservoir Project. As Tulare Irrigation District ("TID") is aware, our client SFA is extremely disappointed with the way that TID handled its California Environmental Quality Act ("CEQA") obligations for the McKay Point Reservoir project (the "Project") to this point. To begin, TID failed to send the notice of preparation ("NOP"), which means that SFA was unable to provide meaningful comment on the scope of the environmental impact report ("EIR"). TID also failed to provide copies of all CEQA and other notices related to the Project, further impacting SFA's ability to meaningfully participate in the Project's CEQA process as a member of the public. SFA's interest in this project is well known by TID. SFA has been in regular contact with TID over the past year, so the failure to notify them of the meetings or NOP is unacceptable. Waterford Properties LLC, an adjacent landowner and sister company to SFA was also not provided notice.

Once made aware of the NOP by an outside party, SFA obtained a copy of the NOP from TID's website. In their abbreviated review of the NOP several issues were found that we expect to be carefully considered and reviewed by TID.

The NOP notes that TID had contracted with West Coast Sand and Gravel ("WCSG") to perform excavation for the Project. There is no mention of any competitive bidding or proposal process.

As a special district, TID is required to follow California law when contracting for public works and/or the use of TID owned land for mining purposes. California's Public Contract Code and Public Resources Code both have competitive bidding/proposal requirements applicable to TID for such contracting. The purpose for these competitive bidding/proposal requirements is to protect the public's finances and prevent TID officials from engaging in favoritism. The consequences for failing to follow these required procedures are severe. To be clear, TID's failure to comply with California law means any contract or arrangement between TID and WCSG for the Project is void and unenforceable under California law.

To demonstrate, below are the requirements governing TID's contract with WCSG that are found in the Public Contract Code and Public Resources Code. Keep in mind, TID has complied with neither.

The Public Contract Code Requires Competitive Bidding for the Project

TID has the express power to construct the necessary works, which includes a reservoir. (Water Code §§ 20530, 22226). The Public Contract Code requires TID to follow competitive bidding procedures for the construction of any works paid for with the proceeds of the sale of bonds or a limited assessment. (Public Contract Code § 20560 et seq.)

Alternatively, if, as previously reported in 2014, TID intends to finance the Project using royalties shared between TID and WCSG for processing the excavated materials at the adjacent Seaborn facility, the outcome does not change. Any arrangement between TID and WCSG to process excavated materials can only occur as the result of a publicly noticed competitive proposal process found in the Public Resources Code.

The Project's October 2, 2020, Notice of Preparation and Scoping Meeting(s) Notice (the "NOP") describes the Project as the development of "approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir . . . located on the north side of the divergence of the Lower Kaweah River and St. Johns River." (NOP, page 2, Project Summary). This description clearly establishes that the Project is a "works" as defined by the Water Code. (Water Code § 20530).

The NOP indicates that TID intends to "contract with West Coast Sand and Gravel ("WCSG") to excavate the site to allow for the construction of the reservoir." (NOP, page 2, Project Summary). There was no mention of any competitive bid

process. Failure to conduct competitive bidding prior to contracting with WCSG means that any existing agreement with WCSG is void and unenforceable.

The Public Resources Code Requires Competitive Proposals for the Project

TID may enter into operating agreements, leasing agreements, and all other types of agreements related to the mining of minerals on its lands if, in its judgment, doing such will not substantially interfere with the public use of the lands. (Water Code § 22501, Public Resources Code § 7051).

However, prior to such agreements, TID must follow the procedures set forth in the Public Resources Code, which include requesting competitive proposals and require TID to award such agreement to the highest bidder in a public session. (Public Resources Code § 7053). To ensure the public has adequate notice of TID's intended mineral mining arrangement, TID must, before the date of such meeting, publish certain information once a week for three successive weeks in one or more newspapers of general circulation in the county where the property is situated. (Public Resources Code § 7052).

Aside from TID's November 15, 2017, correspondence thanking SFA for the time and effort in preparing and submitting an expression of interest in the Project, TID provided no notice for any resolution inviting proposals, no public notification posted, no public meeting posting or advertisement, no newspaper publication notifying the public of TID's intended arrangement, or any information related to the mining of minerals on TID's land as set forth in the NOP for the Project.

Put simply, TID quietly negotiated WCSG's use of public land for profit without public input, or compliance with California law. Not only has TID attempted to dispose of the public's property (royalties from processing Project site minerals) by circumventing the required public procedure but doing so exposes the public to additional risk resulting from the void and unenforceable contract with WCSG.

Permitting Process

SFA is the current operator, permit holder, and lessee on the Seaborn property. As such they have detailed knowledge of the Seaborn site, permits, and reclamation plan. The NOP states that the "mining and processing" activities at Seaborn are not part of the project. However, the existing mining permits issued for the Seaborn site are for the parcels noted on each permit. A permit was never granted, and environmental analysis has not been completed that provides for a permanent processing plant on the site to be used with material mined from other properties. The Seaborn site is almost out of reserves and is set to close and be reclaimed to open space in compliance with the SMARA. Continued use of the site for processing and selling aggregate must be studied as a new project.

A comprehensive EIR was completed for SFA's nearby Kaweah South site, which is a mining, aggregate distribution, and reservoir project very similar in scope to McKay Point. The analysis in that document was completed on the premise that the Kaweah North (Seaborn) site was closing. A slight overlap of approximately 5 years was anticipated. SFA is on track with this anticipated closing and final reclamation of Seaborn now that the Kaweah South site is open. The EIR for the Kaweah South site therefore utilized the baseline impacts of Seaborn in its analysis. These baselines cannot be utilized again for the McKay Point project.

Since mining and processing would cease and the Seaborn site would be reclaimed to open space without the McKay Point project, the EIR for McKay point needs to study all impacts associated with the processing and sale of aggregate material from the Seaborn site.

The NOP states that overburden and excess fines from McKay will be stored on the Seaborn site. This comingles the two sites and would change the approved reclamation of the Seaborn site, thus requiring a new reclamation plan be developed and approved for the entire Seaborn site. The NOP also states that pumped water from the McKay site would be stored and recirculated at the Seaborn site. Again, this comingles the two sites and the impacts on the Seaborn site of these actions would need to be studied.

CEQA Analysis

The California Environmental Quality Act (CEQA) is California's broadest environmental law. CEQA helps to guide all Agencies during the issuance of permits and approval of projects. Courts have interpreted CEQA to afford the fullest protection of the environment within the reasonable scope of the statutes. CEQA applies to all discretionary projects proposed to be conducted or approved by a California public agency requiring discretionary government approval. The purpose of CEQA is to disclose to the public the significant environmental effects of a proposed discretionary project, through the preparation of an Environmental Impact Report (EIR) as well as prevent or minimize damage to the environment through development of project alternatives, mitigation measures, and mitigation monitoring and disclose to the public the agency decision making process utilized to approve discretionary projects through findings, including public participation in the environmental review process through scoping meetings, public notice, public review, hearings, and the judicial process. Environmental impact reports (EIRs) shall be used to provide full public disclosure of the environmental impacts of a proposed project. EIRs shall include identification of all significant effects, alternatives, and potential mitigation measures.

Failure to comply with CEQA to provide full disclosure of information during the CEQA process, which would result in relevant information not being presented to

the public agency, would constitute prejudicial abuse of discretion leaving the project proponent open to possible lawsuits.

As noted above, we were not provided the opportunity to comment on the NOP. Had we had the opportunity we would have noted that CEQA requires that environmental considerations not be separated or concealed by focusing on isolated parts of a project, to avoid overlooking the effect of the whole project in its entirety. As has been a precedent within the County and by TID specifically, a review of the "whole" of a project and a full and adequate CEQA document must be required to avoid unexpected delays or challenges to the Project. As noted in the NOP, TID acknowledges that each separate part of the McKay Reservoir Project is a foreseeable consequence of the other, which requires accurate view of the Project as a "whole". This Project may not be divided into smaller individual subprojects to avoid considering the environmental impact of the Project as a whole. Given such, we expect that TID will adequately analyze issues that include, but are not limited to, the following:

- Consistency with Plans and Programs including identified existing permits;
- Compliance with appropriate guidance regarding geographic scope of biological analysis;
- The sufficiency and scope of technical studies supporting the Project's EIR, such as a health risk assessment for toxic air contaminants; traffic impacts; water quality impacts;
- Whether sufficient water supplies are available for the Project;
- Whether other proposed projects must be considered probable future projects for purposes of a cumulative impact analysis;
- The characteristics of the Project's multiple phases;
- That the Project is consistent with the approved plans and specifications;
- Obtaining required agency approval of appropriate permits for the Project; and
- Identification of responsible agencies with authority over the Project and parties with interest in the Project.

CONCLUSION

As you can see, the conduct of TID in the matter of the WCSG contract, if not corrected, will result in financial harm to the public. It also creates a risk of damaging public trust if illegal contracts are issued on a Project with significant

public interest. We ask that TID carefully consider the information set forth in this letter. TID acted beyond the scope of its power under California law when contracting with WCSG. However, TID can remedy these contracting issues by conducting a fair and comprehensive publicly noticed bid or proposal procedure for the work contemplated by the WCSG contract, as is required by law. We expect that the other concerns noted in the letter will be addressed in any future environmental documents put forward for the Project.

If you should have any questions, please feel free to contact me directly at (209) 601-3915.

We look forward to and welcome the opportunity to participate in the Project. We again request SFA to be included as an Interested Party and be provided with all Notices and Documents related or considered as part of the "whole" of the project as soon as they become available.

Very truly yours,

ROD A. ATTEBERY
Attorney at Law

NOTICE OF PREPARATION AND SCOPING MEETING(S) NOTICE

FROM: Tulare Irrigation District
6826 Avenue 240
Tulare, CA 93274

TO: Interested Agencies, Organizations, and Individuals

DATE: October 2, 2020

SUBJECT: Notice of Preparation of a Draft Environmental Impact Report

The Tulare Irrigation District (TID), as the Lead Agency under the California Environmental Quality Act (CEQA), will be coordinating the preparation of an Environmental Impact Report (EIR) for the proposed McKay Point Reservoir Project. The Proposed Project is located on approximately 500 acres adjacent to the Lower Kaweah River and St. Johns River. TID is requesting identification of environmental issues and information that you or your organization believes should be considered in the EIR.

Project Title: McKay Point Reservoir Project

Project Applicant: Project joint owners – Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC), and the Visalia and Kaweah Water Company (VKWC).

Assessor's Parcel Number(s): The Project site is comprised of portions of the following Assessor's Parcel Numbers (APN's): 113-070-016-000, 113-080-005-000, 113-080-008-000, 113-090-001-000, 113-100-002-000.

Project Location: Located in Tulare County, California, the Project site lies between and to the south of both Lake Kaweah (2.5 miles northeast of the site) and Bravo Lake (1.5 miles northwest of the site); 1.0 miles northwest of the community of Lemon Cove; and 2.5 miles southeast of the community of Woodlake. The Project site is located approximately 1.0 mile west-southwest of the intersection of State Highways 216 and 198, in Sections 3 and 4, Township 18 South, Range 27 East, Mount Diablo Base and Meridian.

The surrounding land uses in the Project area are mining, agricultural, and residential. The adjacent lands to the north, northeast, southwest and west are currently being used for aggregate

mining operations, and the areas south and east of the Project site are used intensively for agricultural and, to a limited extent, for rural residential purposes.

Project Background: TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Project Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code. Together they are the Owners of the Project.

Project Summary: The Owners propose to develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir (the Proposed Project). The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River.

The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and operation of the reservoir. The Owners would contract with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir would be used as a surface water storage / re-regulation reservoir. The reservoir would also be used to optimize groundwater recharge within the Owners service areas.

Discretionary approvals would be required for the Project; therefore, the Project is subject to CEQA. TID is the Project Applicant on behalf of the Owners and is the CEQA Lead Agency.

The Owners' objectives in proposing the Project include the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah.
- Capturing and re-regulating water released for the Owners during peak power enhancement flows from the Terminus Hydropower Plant (Lake Kaweah).
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests.
- Constructing the reservoir in such a way that revenue can be obtained to offset the construction and development costs.

- Locating the reservoir adjacent to the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet.
- Deliver water back to either the Lower Kaweah River or the St. Johns River, as needed.
- Provide additional storage capacity for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Contract with WCSG to excavate the site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset the construction and development costs.

Potential Environmental Effects: An EIR will be prepared to evaluate the Proposed Project's environmental impacts and analyze Project alternatives. The topic areas anticipated to be analyzed in detail in the EIR include Air Quality, Greenhouse Gas Emissions, Health Risks, Biological Resources, Cultural Resources, Geology and Soil, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Tribal Cultural Resources, and Wildfire.

Public Review Period: October 2, 2020 and ends on November 2, 2020.

Responses and Comments: Please send your responses and comments by November 2, 2020 to the following address or email:

Scoping Meeting: TID will hold two scoping meetings for the Proposed Project to receive comments on the scope and content of the EIR. In accordance with the Governor's Executive Order (N-29-20) and the declared State of Emergency, including social distancing directives as a result of the COVID-19 virus, these Scoping Meetings will be held remotely. There will not be a physical location for these meetings. Members of the public may participate in the Scoping Meetings remotely via the scheduled dates, times, and following options. The scoping meeting is scheduled as follows:

Scoping Meeting 1

Date:	October 15, 2020
Time:	5:30 p.m. – 8:30 p.m.
Place:	Online (WebEx)
WebEx Link:	https://bit.ly/343WV9a
Meeting Number:	126 477 3382
Meeting Password:	McKay (62529 for phone systems)

Agencies: In accordance with California Code Regulations, Title 14, Section 15082 (b), the TID requests your agency's view on the scope and content of the environmental information relevant to your agency's statutory responsibilities in connection with the Proposed Project. Your agency may need to use the EIR prepared by the TID when considering any permits that your agency must issue, or other approvals for the Proposed Project.

If you have additional information please contact Maya Rohr, Project Manager, at (805) 275-1515 or via email at mrohr@sespe.com.

Document Availability: This Notice of Preparation and a detailed Project Description can be viewed on the TID website at: https://tulareid.org/engineering-capital-projects. The notice is also posted in the outside noticing box located in front of the Tulare Irrigation District office at the following address: 6826 Avenue 240 – Tulare, CA 93274.

If you have additional information please contact Maya Rohr, Project Manager, at (805) 275-1515 or via email at mrohr@sespe.com.

McKay Point Reservoir

Affordable new storage

Flood control

Clean energy

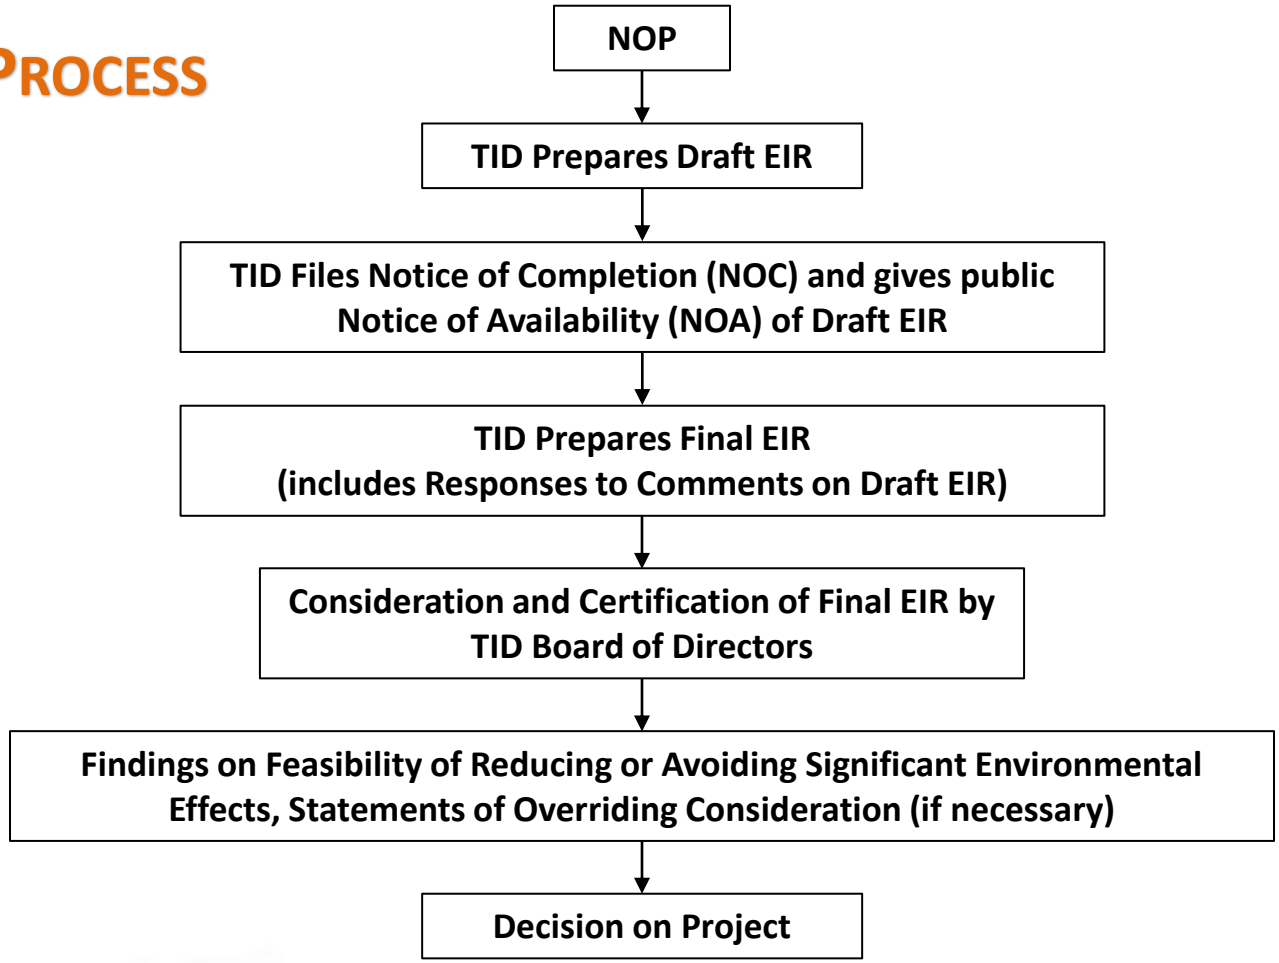
AGENDA

- Introductions - TID
- CEQA Process – Sespe, Inc.
- Proposed Project- TID
- Public Scoping Comments
- Meeting Format
  - Session will be **RECORDED**
  - Public Scoping Comments
    - 2-3 minutes per speaker
    - Moderator will cue speakers

The Purpose of this Public Scoping Meeting

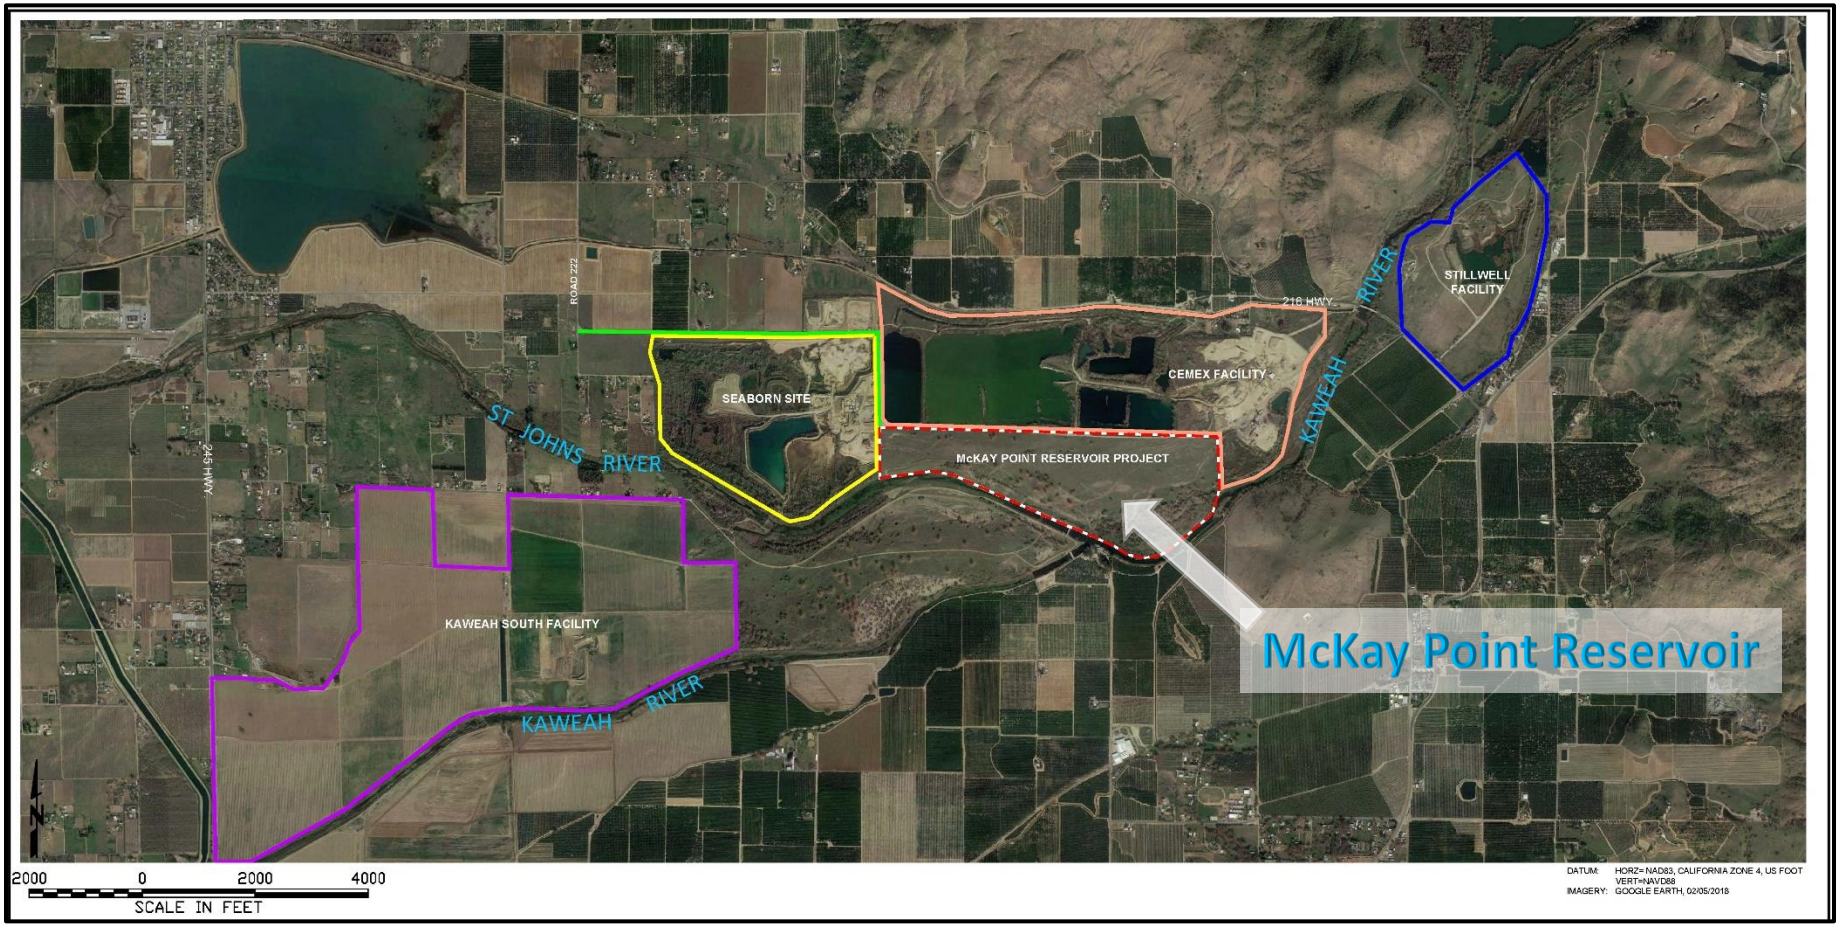
- The California Environmental Quality Act (CEQA) requires analysis and public disclosure of environmental impacts associated with proposed projects.
- Public involvement is an integral part of the environmental analysis.
- This Scoping Meeting is to provide the public with information on the proposed McKay Point Reservoir.
- Public comments will be considered and addressed as appropriate in the Draft EIR.

Future McKay Point Reservoir



The EIR Process

- A proposed Project requires a discretionary decision/approval.
- Identify the Lead Agency – Tulare Irrigation District (TID).
- Public scoping process.
- Draft Environmental Impact Report (EIR).
- Public review of the Draft EIR.
- Lead Agency addresses public comments in a Final EIR.
- Lead Agency determination/approval.



THE EIR PROCESS

Project Highlights

- Create new water storage.
- Provide flood control.
- Allow for more efficient water distribution to agriculture.
- Allow for the generation of electricity when it is most needed.
- Employ the latest technologies to minimize groundwater impacts.

McKay Point Property Location

LEGEND

- PROJECT SITE BOUNDARY
- SEABORN SITE
- ACCESS ROAD
- KAWEAH SOUTH FACILITY
- STILLWELL FACILITY
- CEMEX FACILITY

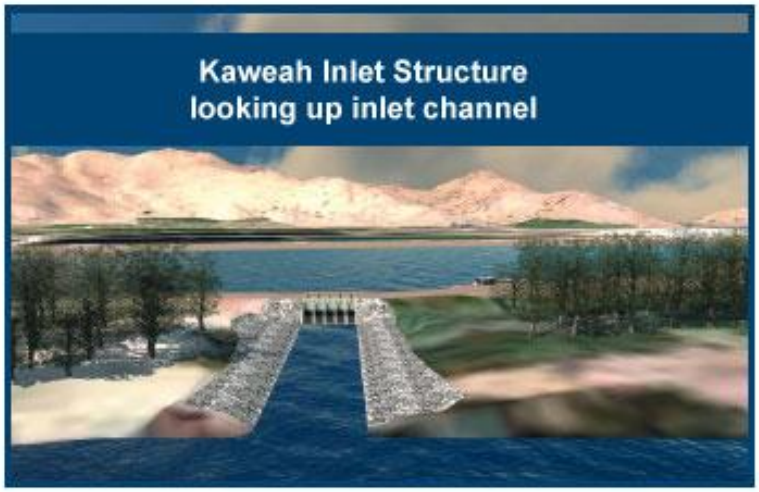
Innovative Approach

- Three phases of the Project:
  1. Excavation of site;
  2. Construction of reservoir and facilities; and
  3. Operation of reservoir.

- Excavation of the site will generate usable building material (aggregate) to support the infrastructure of our local communities.

- A local supply of building materials reduces air pollution related to transportation of building materials.

- The sale of the building materials will provide revenue to help pay for the construction of the reservoir.



Phase 1 - Excavation

- TID partnered with West Coast Sand and Gravel (WCSG) to excavate the site in preparation for reservoir construction.
- The County of Tulare is the lead agency for compliance with California's Surface Mining and Reclamation (SMARA) Act.
- Excavation is expected to begin in 2022 and be completed in 2042 (based upon market demand for building materials).
- SMARA Reclamation Plan – end use is the reservoir.

Phase 2 – Reservoir Construction

- Barriers (slurry wall or equivalent) will be installed early to protect groundwater and neighboring wells.
- Reservoir is designed to minimize intrusion of groundwater to 500 gallons per minute.
- Depth of the reservoir would reach an impervious layer or bedrock – approximately 60 feet below ground surface.
- Reservoir construction is estimated to be completed in the 2040's (depending on market demand).

Phase 3 – Reservoir Operations

Kaweah Inlet Structure
looking southwest

- Off-stream storage of approximately 4,000 acre-feet.
- 500 cubic feet per second inlet capacity from Kaweah River.
- 160 cubic feet per second pumping capacity back to Lower Kaweah River.
- 900 cubic feet per second return capacity to St. Johns River.

Reservoir Benefits Summary

- New water storage.
- Improved water management to support agriculture.
- Enhanced flood control.
- Optimized energy generation during peak demand.
- Locally sourced building materials, which reduces emissions and costs.

Contact Us/Submit Comments

- The NOP established a formal 30-day public comment period through November 4, 2020.

- Please submit your comments to:

NOTICE OF PREPARATION AND SCOPING MEETING(S) NOTICE

FROM: Tulare Irrigation District
6826 Avenue 240
Tulare, CA 93274

TO: Interested Agencies, Organizations, and Individuals

DATE: October 2, 2020

SUBJECT: Notice of Preparation of a Draft Environmental Impact Report

The Tulare Irrigation District (TID), as the Lead Agency under the California Environmental Quality Act (CEQA), will be coordinating the preparation of an Environmental Impact Report (EIR) for the proposed McKay Point Reservoir Project. The Proposed Project is located on approximately 500 acres adjacent to the Lower Kaweah River and St. Johns River. TID is requesting identification of environmental issues and information that you or your organization believes should be considered in the EIR.

Project Title: McKay Point Reservoir Project

Project Applicant: Project joint owners – Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC), and the Visalia and Kaweah Water Company (VKWC).

Assessor's Parcel Number(s): The Project site is comprised of portions of the following Assessor's Parcel Numbers (APN's): 113-070-016-000, 113-080-005-000, 113-080-008-000, 113-090-001-000, 113-100-002-000.

Project Location: Located in Tulare County, California, the Project site lies between and to the south of both Lake Kaweah (2.5 miles northeast of the site) and Bravo Lake (1.5 miles northwest of the site); 1.0 miles northwest of the community of Lemon Cove; and 2.5 miles southeast of the community of Woodlake (Figure 1). The Project site is located approximately 1.0 mile west-southwest of the intersection of State Highways 216 and 198, in Sections 3 and 4, Township 18 South, Range 27 East, Mount Diablo Base and Meridian.

The surrounding land uses in the Project area are mining, agricultural, and residential. The adjacent lands to the north, northeast, southwest and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are used intensively for agricultural and, to a limited extent, for rural residential purposes.

Project Background: TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Project Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code. Together they are the Owners of the Project.

Project Summary: The Owners propose to develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir (the Proposed Project). The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River.

The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and operation of the reservoir. The Owners would contract with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir would be used as a surface water storage / re-regulation reservoir. The reservoir would also be used to optimize groundwater recharge within the Owners service areas (Figure 2).

Discretionary approvals would be required for the Project; therefore, the Project is subject to CEQA. TID is the Project Applicant on behalf of the Owners and is the CEQA Lead Agency.

The Owners' objectives in proposing the Project include the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah.
- Capturing and re-regulating water released for the Owners during peak power enhancement flows from the Terminus Hydropower Plant (Lake Kaweah).
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests.

- Constructing the reservoir in such a way that revenue can be obtained to offset the construction and development costs.
- Locating the reservoir adjacent to the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet.
- Deliver water back to either the Lower Kaweah River or the St. Johns River, as needed.
- Provide additional storage capacity for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Contract with WCSG to excavate the site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset the construction and development costs.

A detailed Project Description is attached to this NOP.

Potential Environmental Effects: An EIR will be prepared to evaluate the Proposed Project's environmental impacts and analyze Project alternatives. The topic areas anticipated to be analyzed in detail in the EIR include Air Quality, Greenhouse Gas Emissions, Health Risks, Biological Resources, Cultural Resources, Geology and Soil, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Tribal Cultural Resources, and Wildfire.

Public Review Period: October 2, 2020 and ends on November 2, 2020.

Responses and Comments: Please send your responses and comments by November 2, 2020 to the following address or email:

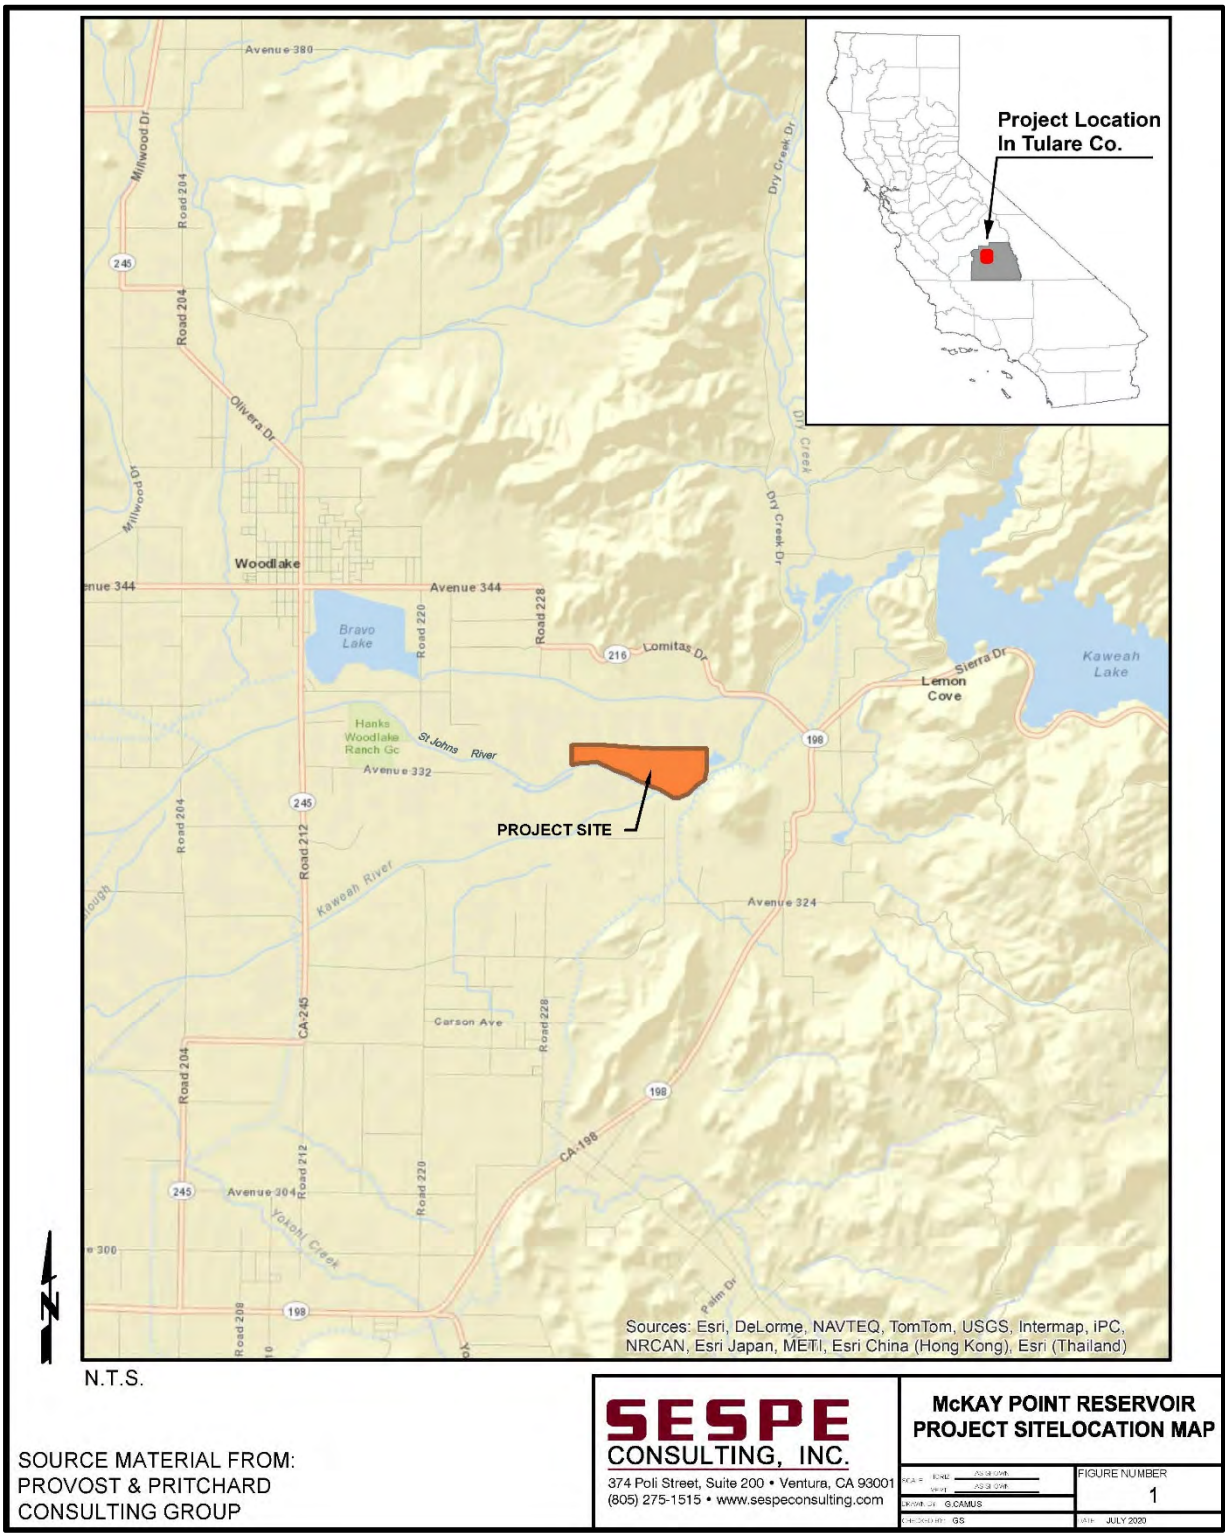
PROJECT DESCRIPTION

1.0 PROJECT DESCRIPTION

1.1 Project Overview



Tulare Irrigation Distract (TID), the Consolidated Peoples Ditch Company (CPDC) and the Visalia and Kaweah Water Company (VKWC) are the Owners of approximately 500 acres of land adjacent to the Lower Kaweah River and St. Johns River in Tulare County, California, referred to as the McKay Point property. Together, the Owners are the holders of pre-1914 and post-1919 appropriative water rights on the Kaweah and/or the St. Johns Rivers, and they own storage capacity rights in Lake Kaweah formed by the impoundment of water behind the Terminus Dam.

TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah and St. Johns River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code.

The Owners propose to develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir (the proposed Project). The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River. The surrounding land uses are mining, agricultural, and residential (Figure 1 – Project Site Location Map, Figure 2 – Project Site and Surrounding Land Use).

The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and, operation of the reservoir. The Owners would contract with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir would be used as a surface water storage/re-regulation reservoir. The reservoir would also be used to optimize groundwater recharge within the Owners service areas.

Discretionary approvals would be required for the Project; therefore, the Project is subject to the California Environmental Quality Act (CEQA). TID is the Project Applicant on behalf of the Owners and is the CEQA Lead Agency.

1.2 Project Objectives

The Owners' objectives in proposing the Project include the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah.
- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah.
- Capturing and re-regulating water released for the Owners during peak power enhancement flows from the Terminus Hydropower Plant (Lake Kaweah).
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests.
- Constructing the reservoir in such a way that revenue can be obtained to offset the construction and development costs.
- Locating the reservoir adjacent to the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet.
- Deliver water back to either the Lower Kaweah River or the St. Johns River, as needed.
- Provide additional storage capacity for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Contract with WCSG to excavate the site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset the construction and development costs.

1.3 Environmental Setting

1.3.1 Regional Setting

The Project site is located near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east. The Project site is drained by the Kaweah River, which drains to the ephemeral Tulare Lake in the southern end of the San Joaquin Valley, and by the St. Johns River, which becomes Cross Creek, before draining into the Tulare Lake bottom near Corcoran.

The *Foothill Growth Management Plan Element* of the *Tulare County General Plan* describes the area climate as typical of the foothill region, with cool rainy winters having a mean daily temperature ranging from 40° to 50° F and hot dry summers where daytime temperatures can exceed 100° F.

During the summer months, a high-pressure system off the west coast of California prevents precipitation from occurring in the foothills. During the winter, this high-pressure system is intermittent, allowing Pacific storms to bring rainfall to the foothills. Rainfall increases with elevation in the foothills and ranges from approximately 10 inches at the base to 25 inches at 3,000 feet. Most of this precipitation occurs between November and April.

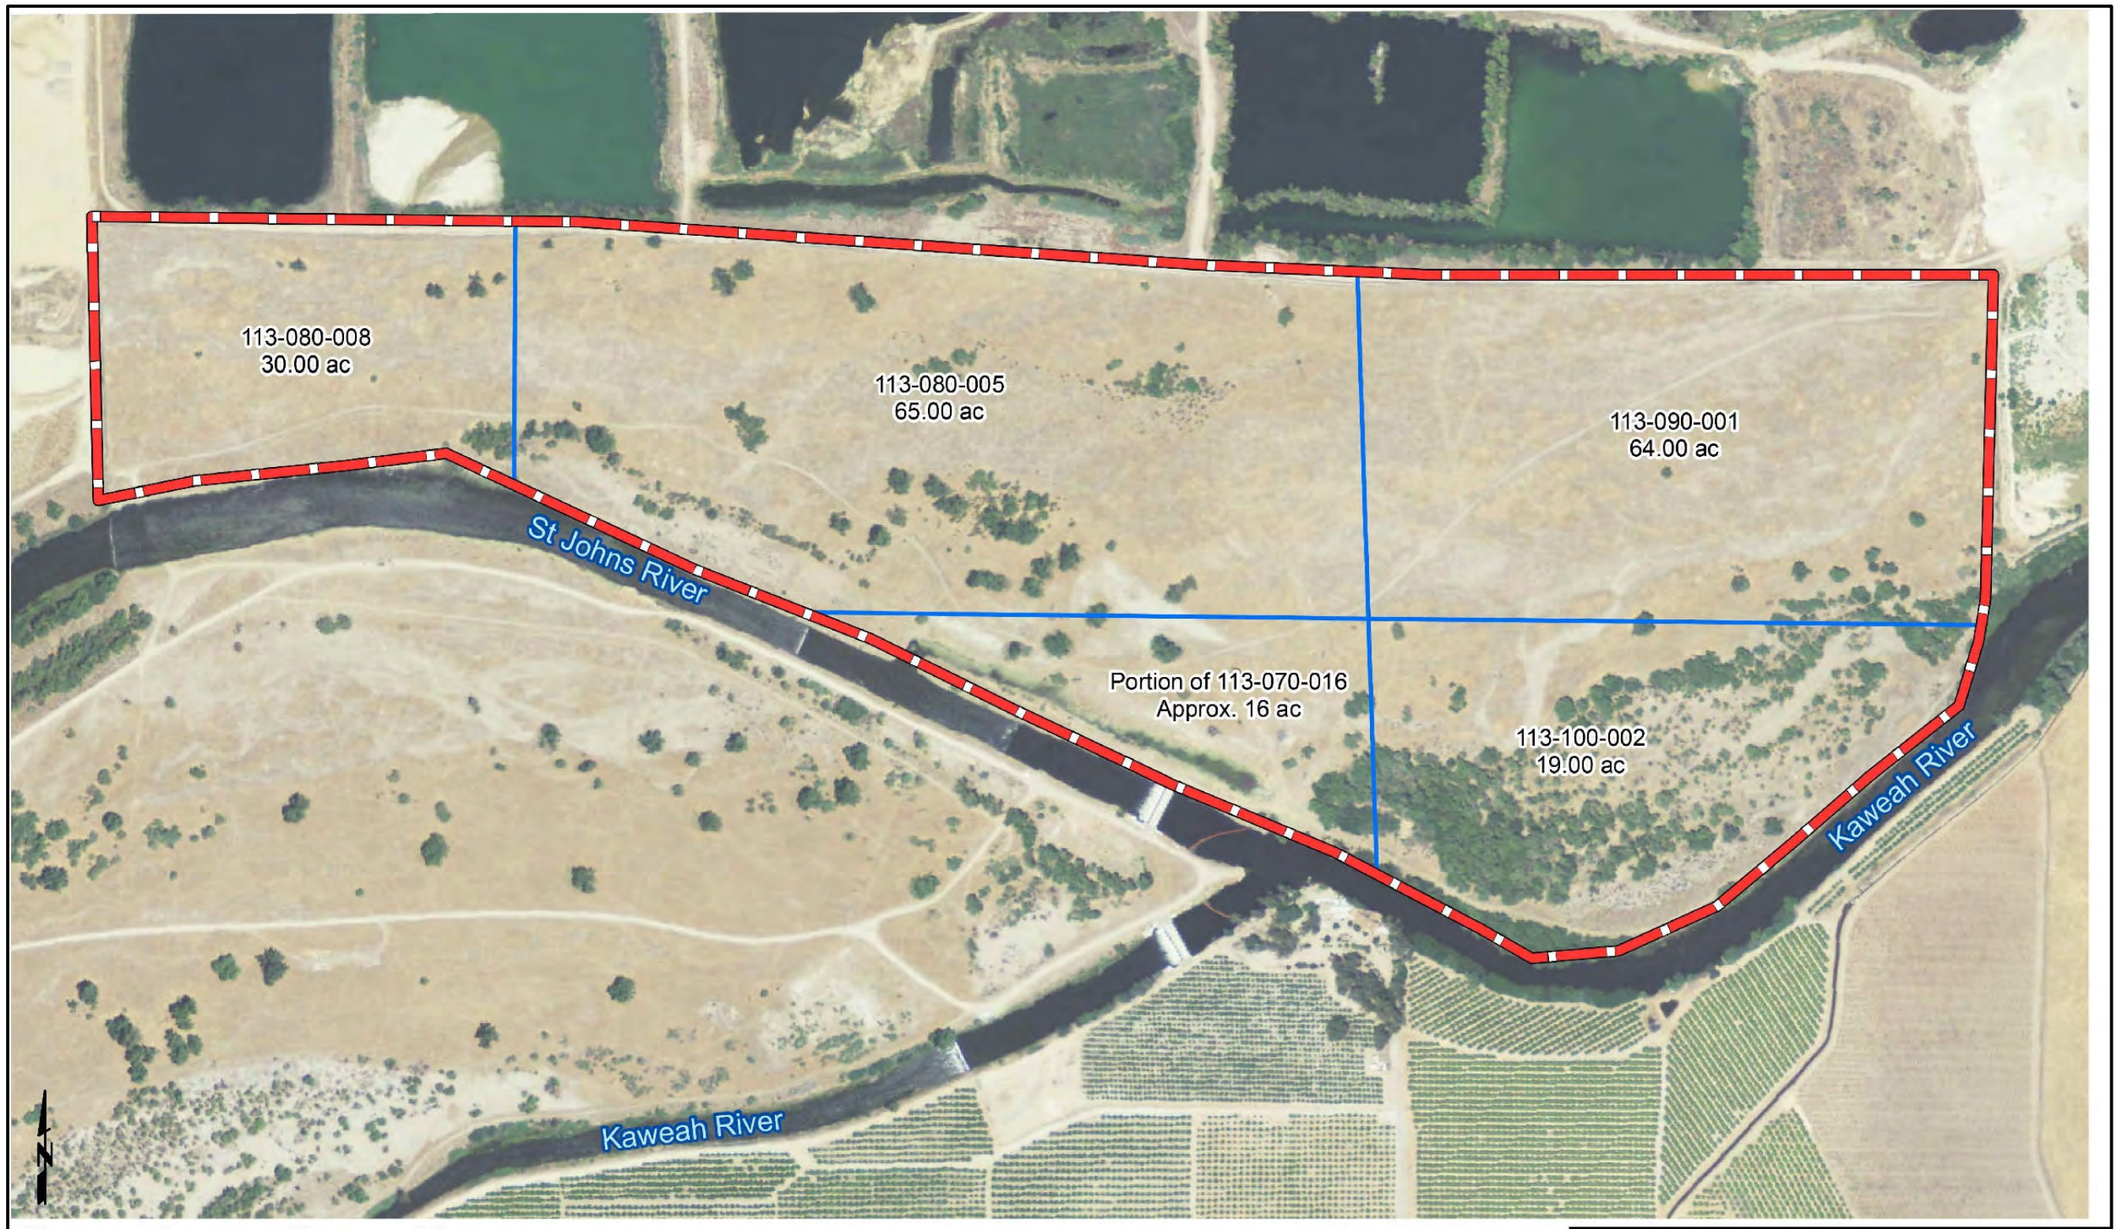
During daytime there is a dominant southeasterly wind flow pattern towards the Tehachapi Mountains. At night, this flow is reversed by winds that flow from the Sierra mountain and foothill canyons.

Biological resources in the region have been modified by past and present land uses. Prior to human settlement, this region was dominated by riparian vegetation within the floodplains, with stands of valley oak and interior live oak on higher ground. Herbaceous wetland bottoms and upland native grassland communities were common in this vegetation mosaic. The extensive oak forests and riparian/wetland habitats hosted a diverse and abundant wildlife community. Cattle grazing and deforestation of the oaks in the early- to mid-1800s for agriculture substantially altered both the floodplain and channel vegetation.

Currently in the foothills, the vegetation ranges from annual grasses in open areas to dense shrubs and trees. Much of the native vegetation in the area has been replaced by introduced species or has been eliminated by cultivation and overgrazing. Agriculture is currently the main land use in the region, although narrow strips of riparian vegetation grow along remnant tributaries.

1.3.2 Project Site Setting

Historically, the Project site has been used for cattle grazing under lease arrangements. The CEMEX Lemon Cove aggregate facility is immediately to the north, and their Stillwell Aggregate Mine is approximately 1.0 miles to the northeast of the Project site. The Kaweah River Rock aggregate mining and processing facility is located immediately to the west on the Seaborn site, and the Kaweah South Project lies approximately 1.0 miles to the southwest of the Project site (Figure 2 – Project Site and Surrounding Land Use). These figures illustrate how adjacent lands to the north, northeast, southwest, and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are used for agricultural and, to a limited extent, for rural residential purposes.



Most of the Project site is vegetated with non-native grasses except for a small portion of ground along the adjacent Kaweah River above McKay Point, which is vegetated by native trees and shrubs. The surface soil at the Project site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. Grasses and trees are present and these increase in density with proximity to the nearby rivers. The Project site topography is relatively level with a depression in the southeast corner. Site surface drainage is generally to the south and southeast toward the Kaweah River and generally to the south and southwest toward the St. Johns River. The Project site elevation decreases from approximately 472-feet above mean sea level (amsl) on the northeastern end of the property, to approximately 454-feet amsl on the southwestern end.

The long-term water-level measurements for wells in the area indicate a stability of groundwater levels, except for temporary declines during drought periods. Test borings within the Project site indicate depth to groundwater ranges from 20- to 7-feet below ground surface (bgs), with corresponding groundwater level elevations ranging from 438- to 459-feet amsl.

Table 1 lists the Assessor's Parcels occupied by the Project site and provides the parcel size, Tulare County General Plan Designation, Zoning, and Mineral Resources designation for each assessor's parcel numbers (APN). Figure 3 – Project Parcels identifies where the parcels are located on the Project site.

Table 1 Assessor's Parcel Numbers, General Plan, Zoning and Mineral Resources

McKAY POINT RESERVOIR PROJECT PARCELS

FIGURE NUMBER 3

DRAWN BY: G.CANUS
CHECKED BY: GB
DATE: JULY 2020

1.4 Regulatory Setting

TID is the Lead Agency for purposes of administering the requirements of the CEQA, and for preparing the Project EIR. TID is also the Project Applicant on behalf of the Owners. The County is a Responsible Agency under CEQA.

Because WCSG would process material taken from the Project site during excavation of the reservoir as a marketable product (construction grade aggregate), TID would be required to comply with the Surface Mining and Reclamation Act (SMARA) and obtain the County's approval of a Surface Mining Permit, Reclamation Plan, and Financial Assurance Cost Estimate. The Tulare County Code and Zoning Ordinance states that a Special Use Permit would not be required in addition to the surface mining permit.

1.5 Reservoir Operations

1.5.1 Overview

The Owners would utilize the reservoir and its facilities to manage their surface water supplies to increase the long-term availability of irrigation supplies, groundwater recharge supplies, and power enhancement via water re-regulation. As a result, the Project would provide multiple benefits, including:

- Flow re-regulation for better surface water utilization.
- New water yield for irrigation purposes by capturing damaging and unutilized floodwater and returning it to the rivers to be used by water users served by the Owners or other Association Units. This includes the ability to increase groundwater recharge efforts.
- Flood control by capturing and temporarily holding damaging floodwater at times when downstream interests, including the City of Visalia, may otherwise see damaging flood flows.
- Seasonal flow re-regulation for increased hydroelectric power generation and revenue production by extending the power generation season.
- Optimize the capture of water released during peak power enhancement flows from the Terminus Hydropower Plant (at Lake Kaweah) for later release when needed downstream.

1.5.1.1 McKay Point Check Structures

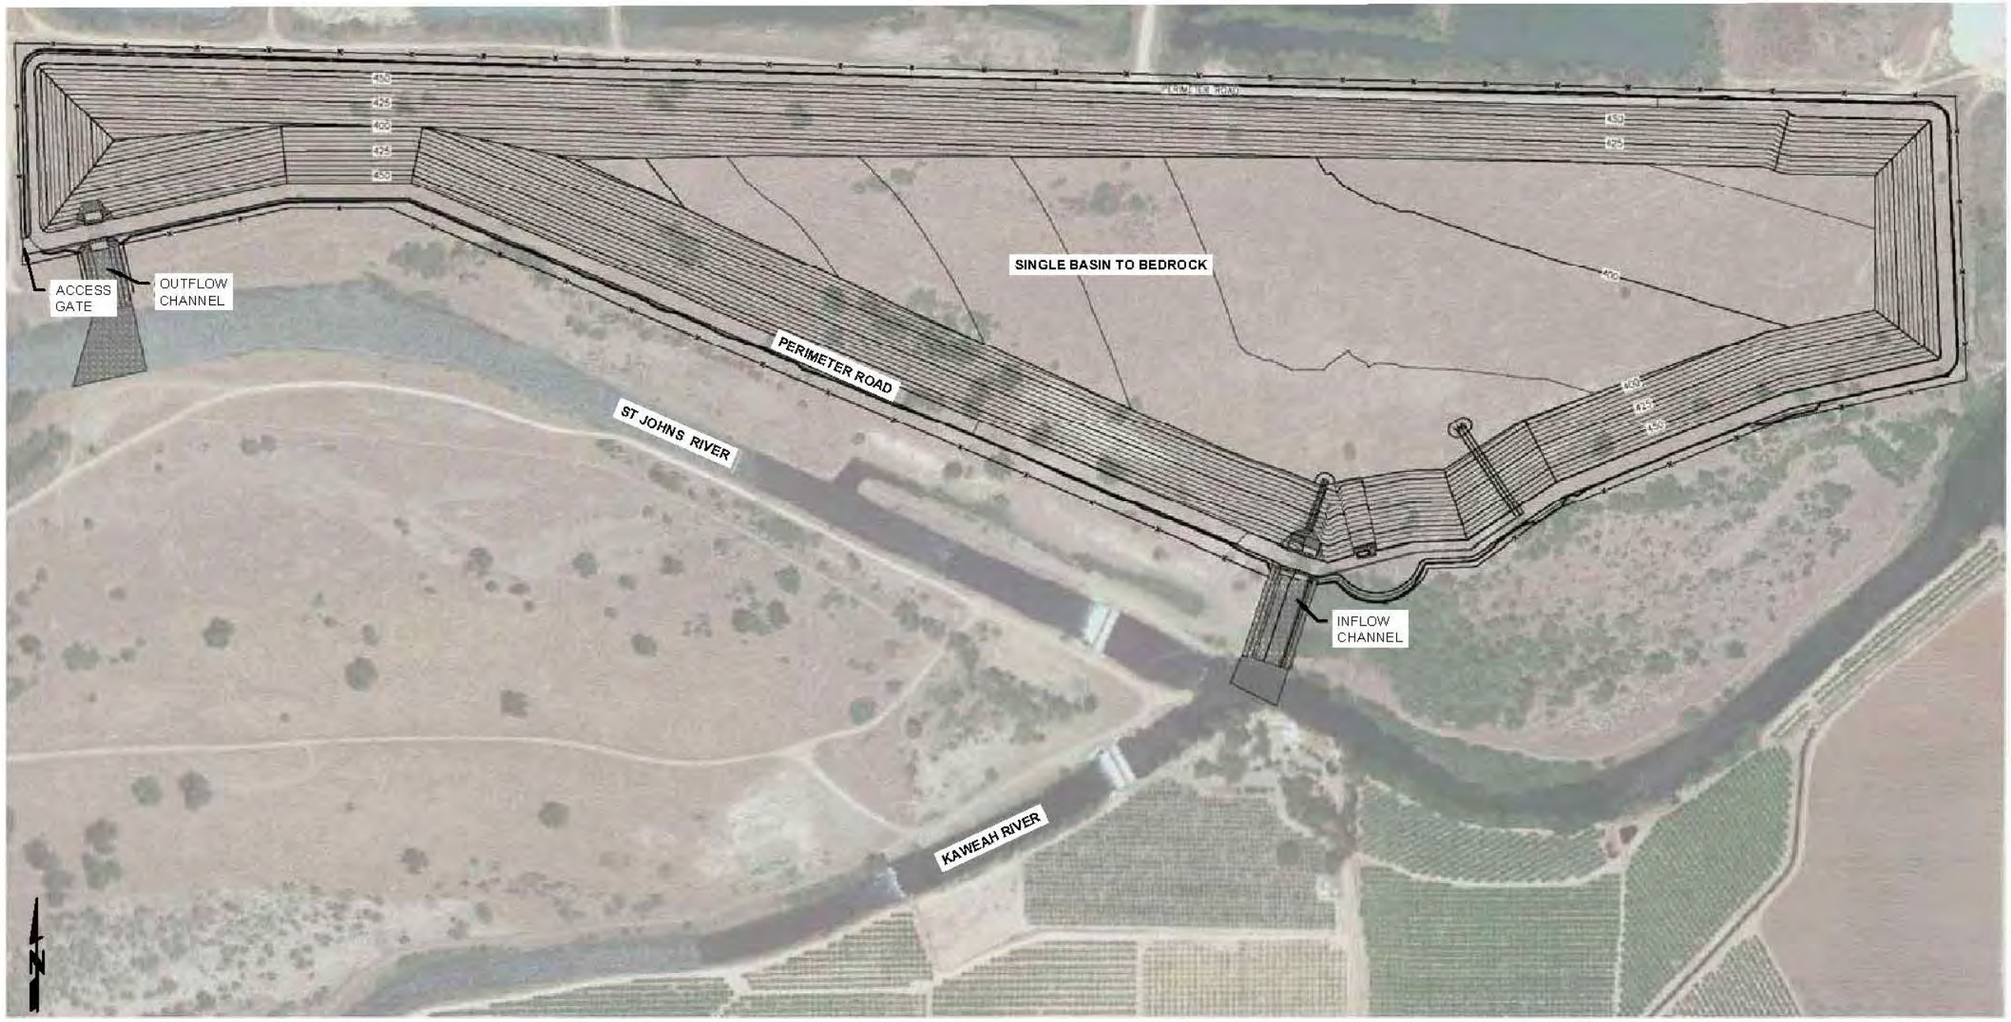
The existing McKay Point Check Structures include the water control facilities owned and operated by the Kaweah Delta Water Conservation District and the Kaweah and St. Johns Rivers Association. The structures consist of two check structures, one on the St. Johns River and one on the Lower Kaweah River, each with nine automated gates. The structures can be operated such that the gates on the St. Johns River side can be raised, therefore shunting more flows down the Lower Kaweah River. Because CPDC, VKWC, and TID hold many of the rights to the waters of the Kaweah River system, water released from the reservoir and shunted into the Lower Kaweah River in this manner would serve CPDC and VKWC customer needs, as well as TID customer needs if necessary.

In a similar manner, the McKay Point Check Structures can be operated such that the gates on the Kaweah River side can be raised, therefore shunting more flows down the St. Johns River. Because TID holds rights to waters of the St. Johns River, water released via the outflow channel would serve TID customer needs.

1.5.1.2 Inflow Channel Management

The inflow and outflow channels would be constructed perpendicular to the Lower Kaweah River and St. Johns River (Figure 4 – Final Reservoir Site Plan). The inflow channel would provide flow into the reservoir via a reinforced concrete control structure. The control structure would include an approach apron, reinforced concrete floor, a flow/level control gate, walls, and a deck on top of the structure. The bottom of the river channel and the banks of the inflow channel would be rip-rapped to prevent erosion.

To receive river water into the reservoir, the electrically operated weir on the inflow channel would be lowered. The water level in the Kaweah River can also be raised at the same time, by raising the gates at the McKay Point Check Structures. Water would flow by gravity into the reservoir up to a maximum flow rate of 500 cubic feet per second (cfs) via the inflow channel. Upon achieving water level equilibrium between reservoir and river, the electrically operated weir would be raised. As the level of the river recedes, either by the passing of the flood peak, or by lowering the gates on the McKay Point Check Structures, the electrically operated weir would serve to hold water in the reservoir.



1.5.1.3 Outflow Channel Management

1.5.1.3.1 *Gravity-Flow Water Delivery into the St. Johns River and Kaweah River*

When the St. Johns River water level is lower than that of the reservoir, lowering the electrically operated weir on the outflow channel would deliver water by gravity flow into the St. Johns River up to a maximum flow capacity of 900 cfs. The average flow rate of return would approximate 125 to 150 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approaches the level of the outflow channel.

When the Kaweah River water level is lower than that of the reservoir, lowering the electrically operated weir on the inflow channel would deliver water by gravity flow into the Kaweah River at a flow capacity of 500 cfs. This would be done in concert with the raising of the St. Johns River control structure, since the inflow channel is upstream of the divergence of the St. Johns River from the Kaweah River. The average flow rate of return would approximate 125 to 150 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approached the level of the inflow channel.

The outflow channel would provide flow out of the reservoir via a reinforced concrete control structure. The control structure would include a reinforced concrete floor, flow/level control gate, walls, and a deck on top of the structure. The bottom of the river channel and the banks of the Outflow Channel would be rip-rapped to prevent erosion.

McKAY POINT RESERVOIR
FINAL RESERVOIR
SITE PLAN

SCALE: HORIZ. AS SHOWN
VERT. AS SHOWN
DRAWN BY: G.CARLOS
CHECKED BY: GS
DATE: JULY 2020

FIGURE NUMBER
4

The inflow channel could also be used in reverse as an outflow facility to deliver releases to the Kaweah River. When the Kaweah River water level is lower than that of the reservoir, lowering the electrically operated weir on the inflow channel would deliver water by gravity flow into the Kaweah River at a flow capacity of 500 cfs. The average flow rate of return would be approximately 125 to 150 cfs because the flow rate would reduce gradually to zero as the level of the reservoir approached the level of the inflow channel

Water delivery in this manner is limited by the amount of water being stored at a level higher than that of the inflow channel (i.e., approximately 15-feet of additional storage). Once the level of the reservoir falls below that of the inflow channel, the floating barge pump and its related piping would be used as described below.

1.5.1.3.2 *Pumped Water Delivery into the St. Johns River or Lower Kaweah River*

To release water to the St. Johns River or the Lower Kaweah River when the river water levels are higher than that of the reservoir, and the reservoir is lower than the Inflow or outflow channels, the water would be pumped from the reservoir, via an electrical pump, and discharged into the Kaweah River, upstream of the McKay Point Check Structures. The pump, or series of pumps, would have an approximate maximum flow rate of 160 cfs. When this is done, the McKay Point Check Structures would be operated to direct flow into the St. Johns River or the Lower Kaweah River.

1.5.1.4 Supervisory Control and Data Acquisition

Supervisory Control and Data Acquisition (SCADA) equipment would be used to:

- Monitor Reservoir and river levels;
- Monitor and operate the inflow channel, outflow channel, and floating barge pump; and
- Monitor and coordinate with the automated gates of the McKay Point Check Structures with the Kaweah Delta Water Conservation District and the Kaweah and St. Johns River Association.

SCADA equipment would permit remote monitoring, control, and operations by TID operators from TID's offsite office. In addition, TID operators would have the ability to set the control gates in either a condition of flow control or level control. In flow or level control, the gates would autonomously operate to maintain a desired flow, or a desired elevation, respectively, in the river channels.

1.5.1.5 Flood Control/Storm Water Management During Operations

The Project's water turnout facilities would allow the diversion of up to 500 cfs. With 4,600 acre-feet of total capacity, the reservoir could go from empty to full in just 5 days. This relatively short time span coincides with most of the local peak rain/flood events. The local peak rain/flood events are also of relatively short duration, with much of the flood water coming from the uncontrolled Dry Creek, which enters Kaweah River midway between the Project site and the Terminus Dam Reservoir (a distance of approximately 1.1 miles upstream from the Project site). The ability to capture 500 cfs of floodwater is significant, considering that such a flow might otherwise impact the levees protecting the City of Visalia.

1.5.1.6 Distribution of Stored Water/Reduced Energy Use and Greenhouse Gases

Although there would be no hydroelectric power generation at the Project site, the Project would have the ability to re-regulate releases made from Lake Kaweah. This would allow the Terminus Hydropower Plant outlets to produce more peak period power and some ability to generate more energy overall. The Kaweah River Power Authority is engaged in the planning and design for another hydropower unit at Terminus Dam. Such an additional generator adds to the potential for the Project to be useful to optimize energy generation.

If requested, the Project would be able to increase the instantaneous flow rate through the Terminus Hydropower Plant hydroelectric generators in order to release more water than is needed by downstream interests. For example, during on-peak power generation periods from noon to 6:00 p.m., releases from Lake Kaweah can be increased, thereby enhancing the ability to meet peak power generation demands and the generation of additional revenues. Releases from Lake Kaweah would then be reduced during off-peak hours and make-up irrigation deliveries would be made out of captured water within the Project. The ability to re-regulate flows in an "after-bay" facility associated with, and downstream of, the Terminus Hydropower Plant could provide a constant and consistent flow to downstream interests. One of the benefits of the Project is that the reservoir would have the ability to provide such an “after-bay” function.

The Project also serves to extend the generation season by allowing the releases from Lake Kaweah through the hydroelectric generators to be made during a shorter period of time, but at higher flow rates. This would allow the hydroelectric generators to function when they would otherwise be shut off because they do not have enough flow through them to operate.

The Kaweah River Power Authority (an entity comprised of the Kaweah Delta Water Conservation District and TID) owns the hydroelectric generation facilities at Terminus Dam on Lake Kaweah. It is envisioned that agreements would be developed to compensate the Owners for the power generation and revenue enhancement created by the Project. Any additional kilowatt-hours of energy generated, including that during on-peak hours, would aid in reducing greenhouse gas emissions from alternative traditional power sources.

1.5.1.7 Re-regulation for More Efficient Water Utilization

When flood control releases are required from Lake Kaweah, or when Dry Creek or Yokohl Creek are running, water must be diverted to groundwater recharge basins or otherwise disposed. This is because there is reduced irrigation demand from the Owners' water users during periods of heavy rainfall. The Project would allow flood releases to be diverted and stored temporarily until the demand for irrigation water resumes or groundwater recharge facilities located downstream have capacity to receive more surface water. When diverted and stored, such water would be sold/delivered directly to irrigation users, thereby saving the significant amount of energy otherwise consumed through groundwater recharge and subsequent recovery.

1.5.1.8 New Yield

The Project would have the ability to capture some of this floodwater, and it would be held in the reservoir until it can be safely returned to the Lower Kaweah River and St. Johns River for direct use or recharge. The reservoir could fill and empty multiple times during wet years when there is sufficient dry time to safely,

effectively and beneficially return the water to the Lower Kaweah River and St. Johns River. Through this floodwater recapture it is estimated the Project could provide approximately 4,600 acre-feet per year of new yield.

1.5.1.9 Water Management within the Excavation/Completed Reservoir

During long-term operations as a water management facility, it is intended that the reservoir remain relatively empty and void of local groundwater in order to provide maximum space to receive Kaweah River water as directed by the Owners. A slurry wall installed around the reservoir, is intended to minimize the groundwater inflows to approximately 500 gallons per minute (gpm). This would serve to keep the reservoir in a near dry condition when not being used for storage. If needed, de-watering would be conducted to maintain dry conditions. Seepage into the excavation would be captured at a designated location within the reservoir, and would then promptly be placed back into the aquifer via an infiltration gallery consisting of onsite ditches that could be covered with granular materials to minimize evaporation.

1.5.1.10 Operational Control

During Project operations and management, the Owners would have daily control over the reservoir and related facilities, which include the use of the SCADA equipment to monitor and control the facility remotely. TID staff would also perform routine onsite inspections to ensure the reservoir is operating properly.

1.5.1.11 Traffic During Operations

The routine operation of the Project would be conducted from TID's offsite office; therefore, the number of employees routinely driving to the site would be minimal. Operation and maintenance of the Project would generate only nominal traffic primarily associated with maintenance operations.

1.5.1.12 Mobile Equipment Used During Operations

During the operations and maintenance of the reservoir, there would be limited equipment usage, but equipment could be needed to perform minor grading of the access road and to remove any debris that collects in the bottom of the reservoir. The following equipment would be used annually for a singular maintenance operation:

- Grader
- Loader
- Diesel Aboveground Storage Tank (AST)
- Dump Truck
- Generators

1.5.1.13 Onsite Hazardous Materials During Operations

A diesel AST (approximately 10,000 gallons), diesel generators, and a generator building near the inflow chute would be used during operations. The diesel generators would provide power to the floating pump station. The Owners are currently evaluating the cost-effectiveness of a direct power supply from a power company and other options for power. These activities would be done in compliance with the requirements of a Hazardous Materials Business Plan (HMBP), Storm Water Pollution Prevention Plan (SWPPP), Spill Prevention, Control, and Countermeasure (SPCC) Plan and with the hazardous waste generator and AST regulations as described in Chapter 4.10 of the EIR.

1.5.1.14 Utilities During Operations

Electrical power would be provided by Southern California Edison (SCE) from nearby power lines.

1.5.1.15 Lighting During Operations

Except for the security lighting, no nighttime lighting is proposed and/or required.

1.5.1.16 Administration, Security, and Public Safety During Operations

The perimeter of the reservoir site would be fenced and all facilities secured. Random and frequent visits from Owners staff would provide added security.

1.6 Project Phases

Prior to the operational phase of the Project, the site must be prepared. The preparation of the site includes the excavation of a pit with sufficient capacity to meet the Project needs for water storage. After the pit has been prepared, the reservoir would be constructed. Therefore, the Project would have the following three distinct phases: Reservoir Excavation, Reservoir Facility Construction, and Reservoir Operations. The operation of the McKay Point Reservoir is described above in Section 1.5. The following sections discuss the phases of the Project that are required to construct the reservoir.

1.6.1 Reservoir Excavation

In order to construct the reservoir, the site must be excavated to a depth and surface area that meet the Project's water storage capacity requirements. This would be done by WCSG. WCSG would likely begin the reservoir excavation in the western portion of the Project site and would progress eastward. The excavated area would result in an open pit with a surface area of approximately 110 acres and a depth of approximately 60 feet bgs. Final slopes are anticipated to be approximately 3:1, horizontal:vertical (h:v) in order to minimize any bank erosion from the wind and water. Because the excavated material would be taken offsite to be processed at the adjacent WCSG facility as a marketable product, the County considers the excavation of the Project site subject to SMARA requirements for surface mining. Therefore, all activities associated with the reservoir excavation would be conducted in accordance with SMARA requirements (Figure 4 – Final Reservoir Site Plan).

Overburden is the material located above the aggregate. Initial testing indicates that the overburden would be between 6- to 12-feet deep, comprised primarily of very sandy material (60 to 80 percent) in the top 20-feet. Below 20-feet, the material is comprised largely of gravel (40 percent) and sand (40 to 48 percent), and lesser amounts of silts and clays (12 to 20 percent).

Excavation is expected to proceed at an approximate rate of 920,000 gross tons per year but could vary based on market demand. The excavation and storage of aggregate would be coordinated with WCSG such that the historical maximum production rate of the processed aggregate by WCSG would not be exceeded. Once processed, approximately 70 percent of the excavated materials would be of marketable quality, which is referred to as net tons. This means a year's excavation of 920,000 gross tons would produce approximately 644,000 net tons of marketable construction-grade aggregate.

The gross volume calculations are based on the excavation of approximately 110 acres to a depth of 60-feet bgs at the deepest point of the reservoir. The gross volume of excavated material is estimated to be 9.3 million cubic yards, of which approximately 73,200 cubic yards of material would be used as fill in association with the construction of the perimeter road. Net of fill, the Project would excavate a gross volume of approximately 9.2 million cubic yards. At an assumed density of 1.5 tons per cubic yard, this equates to 13.8 million gross tons and 9.66 million net tons of excavated material as presented in Table 2 below. This volume of excavated material is derived by comparing final basin design with pre-excavated topography. Additional cut/fill volumes would be associated with reservoir facility construction in the form of backfill against the slurry wall to achieve 3:1 final slopes. Figure 4 shows the final reservoir site plan and contours. Table 2 provides a summary of the excavation.

Table 2 Excavation Phase Summary

Gross Tons	Net Tons [1]	Area (acres)
13.8 million	9.66 million	110

[1] Net tons are the marketable construction-grade aggregate derived through processing. Net tons equate to approximately 70 percent of the gross tons processed.

1.6.1.1 Disposition of Excavated Materials

Approximately 70 percent of the excavated material is expected to be PCC-grade aggregate which can be used as aggregate and in aggregate-containing products, such as concrete and asphalt. Excavated materials would be transported by off-road trucks or a conveyor system to the adjacent Seaborn site where WCSG would process it into marketable Portland cement concrete (PCC)-grade construction materials. WCSG would also have the ability to bring a mobile processing plant onto the Project site.

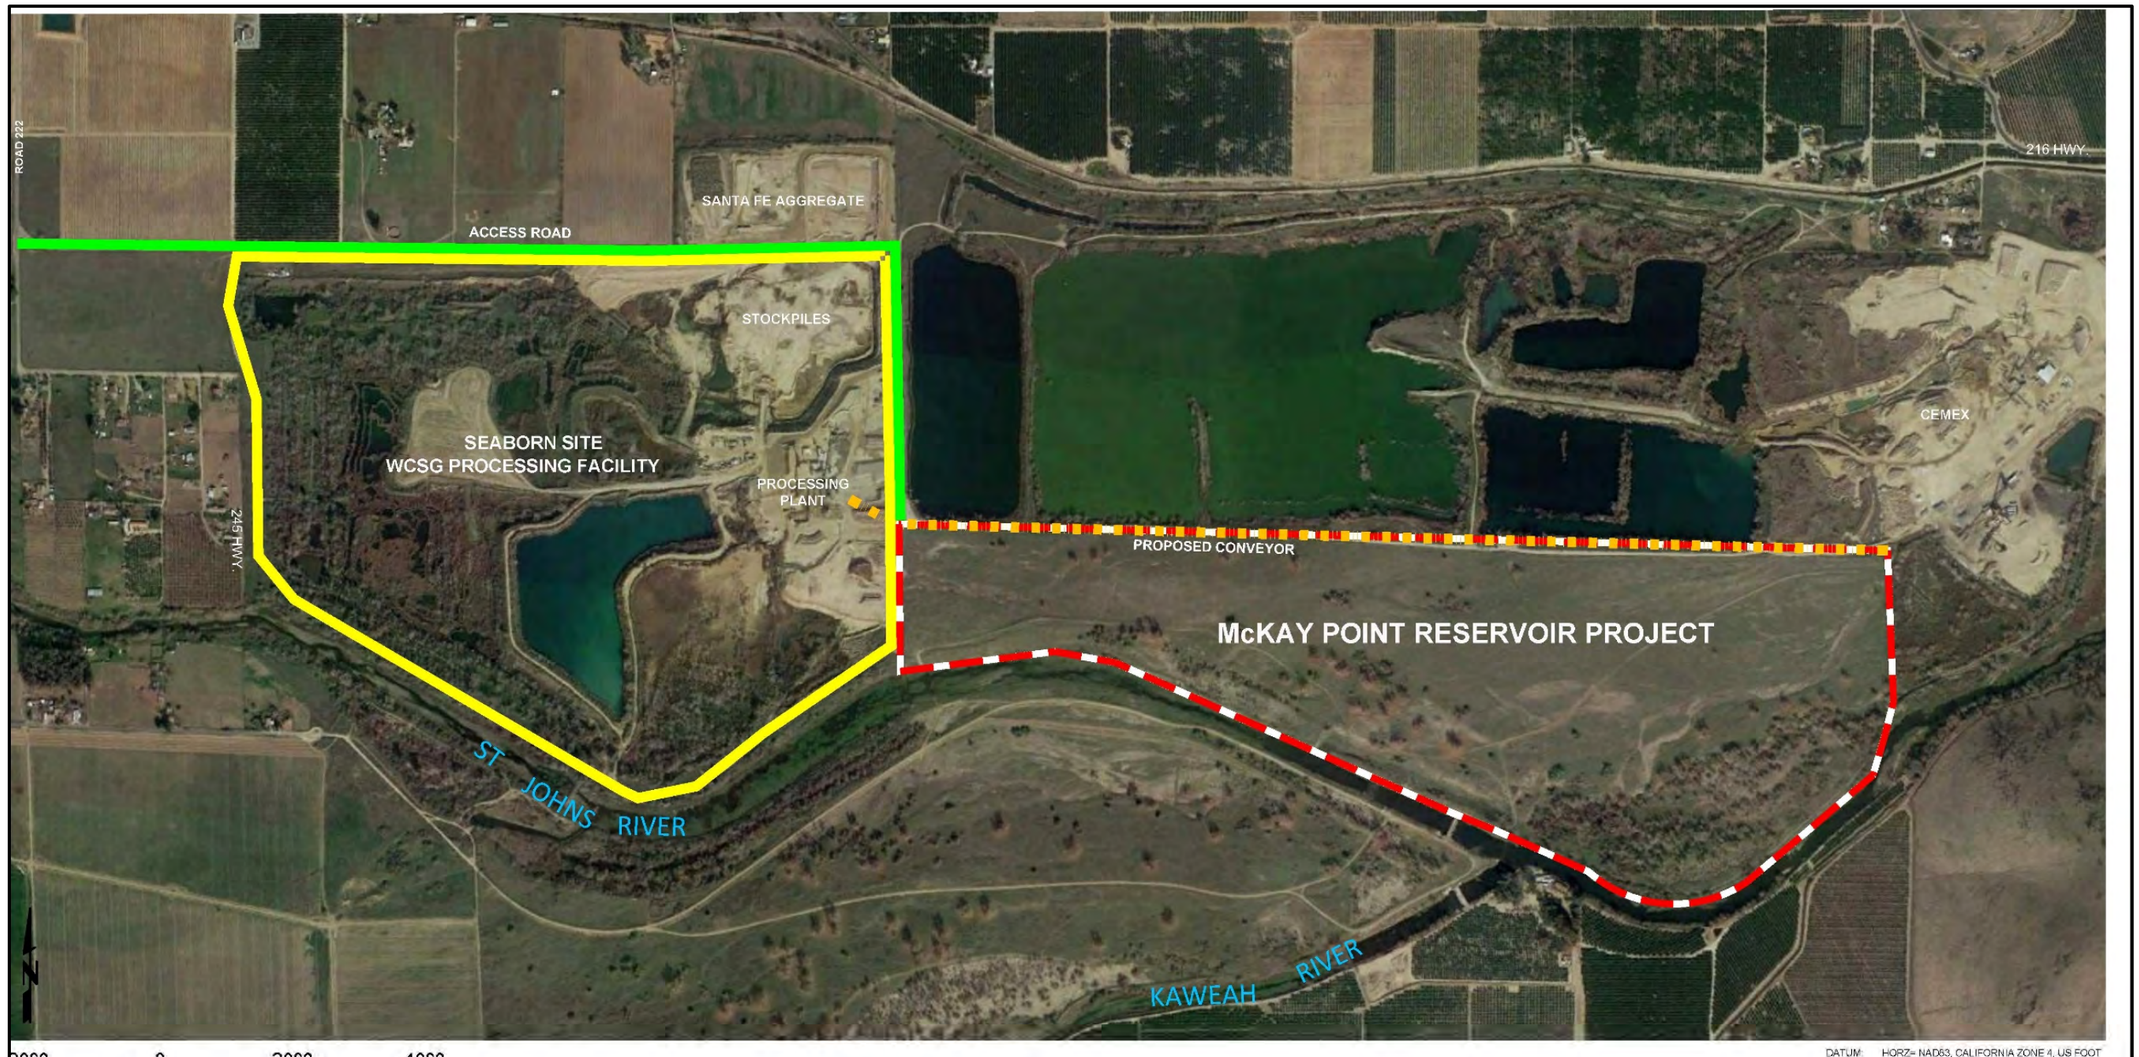
Although the mining and processing activities at the Seaborn site are not part of this Project, the potential environmental impacts associated with the processing of the material excavated at the Project site in order to construct the reservoir would be considered indirect impacts.

Sand and gravel (aggregate) mining and processing activities have been conducted at the Seaborn site since the late 1940's. The WCSG production rate of the Project's excavated aggregate would not exceed the historical aggregate processing production rate (baseline) at the Seaborn site of an average of 500,000 tons per year (TPY) and a maximum of 650,000 TPY as achieved in 2005. Therefore, the number of on-road trucks transporting the material offsite on public roads to WCSG's customers would not result in an increase to the baseline number of trucks.

The overburden and excess fines resulting from the excavation of the reservoir would be stored on the Seaborn site such that the Project site could be excavated to maximum extent possible allowing for maximum water storage in the reservoir (Figure 5 – Project Site and WCSG Processing Facility). The remainder of the fines could be sold by WCSG as slurry used in nonstructural concrete or as miscellaneous fill material, as WCSG has done in the past with overburden and fines resulting from their mining activities.

1.6.1.2 Water Use and Management During Reservoir Excavation

Because the groundwater table on the Project site is at a depth of seven to 20 feet below the ground surface, water within the excavated areas would be dewatered to allow access to the excavation area by wheeled equipment. Pumped water would be stored or recirculated in ponds at the adjacent Seaborn site and/or recirculated in onsite infiltration galleries, consisting of ditches that could be covered with granular materials, where it would percolate back to groundwater. If needed, towards the end of the excavation, a slurry wall could be installed around the facility to keep the reservoir in a near dry condition. However, due to the nature of the clay material present at the site, alternatives to a slurry wall that keep the infiltration below 500 gpm may be considered.



Water used at the Project site would primarily be to control fugitive dust and would be drawn from within the onsite excavation, or an adjacent pond on the Seaborn site, by pumps and applied by a water truck. Total water consumption during excavation activities would average 3.5 million gallons per year (i.e., approximately 11 acre-feet per year). The amount used daily would vary, depending on season, wind and soil conditions.

1.6.1.3 Days and Hours of Operation and Employment During Reservoir Excavation

Approximately 7 to 12 employees would be required during the excavation of the reservoir site. Excavation would occur between 4:00 a.m. (or dawn if later) and 6:00 p.m., Monday through Saturday, and continue until the desired depth and extent of excavation achieves reservoir design.

1.6.1.4 Traffic During Reservoir Excavation

Excavated materials would either be transported to the adjacent Seaborn site by off-road haul trucks or by a conveyor system. There would be no use of public roads. Once the aggregate is at the WCSG processing plant on the Seaborn site it would be processed in accordance with the regulatory requirements that apply to the Seaborn site and WCSG operations (i.e., SMARA regulations, San Joaquin Valley Air Pollution Control District (SJVAPCD) permitting and prohibitory rules). The material would be transported offsite to WCSG's customers by on-road trucks. The number of trucks on public roads associated with WCSG's sale of the processed excavated material from the Project site would not increase from the baseline level of truck traffic (160 trips per day) leaving the Seaborn site. This is because the rate that WCSG processes the Project's excavated material would not be allowed to exceed the baseline production rate from the previous operations at the Seaborn site of an average of 500,000 TPY and a maximum of 650,000 TPY as achieved in 2005.

McKAY POINT RESERVOIR PROJECT SITE AND WCSG PROCESSING FACILITY
FIGURE NUMBER
5
DRAWN BY: E.CAMUS
JOB NO.: GIS
DATE: JULY 2020

The excavation phase of the Project would require only 7 to 12 employees and access would be through the Seaborn site entrance to the Project site. This would be consistent with the baseline number of employees previously required during the mining and processing activities at the Seaborn site. For evaluation purposes, it is assumed that each employee would make 2 trips per day (inbound and outbound). This would result in a maximum of 24 trips on peak days, assuming all 12 employees are onsite as compared to the 35 employee trips per day during mining and processing activities at the Seaborn site. As a result, the Project would generate only nominal traffic on public roadways, which would not result in a significant increase from baseline operations at the Seaborn site.

Access for employees and service vehicles would be via Road 222 through the Seaborn site to the entrance to the Project site (Figure 5 – Project Site and WCSG Processing Facility).

Note that a single-way trip is referred to as a "trip" and a round trip (going from the WCSG facility to their customers and the return trip by the truck back to the facility) is referred to as a "load" (two one-way trips).

1.6.1.5 Mobile Equipment Used During Reservoir Excavation

Excavated material would either be transported to the Seaborn site for processing by a conveyor system or off-road trucks. The equipment used during the excavation of the site would include:

- Excavator
- Off-road Haul Trucks
- D9 Dozer
- Loader
- Portable Generator
- Grader
- Water Truck
- Scraper
- Back Hoe
- Pneumatic Pumps

1.6.1.6 Onsite Hazardous Materials During Reservoir Excavation

During excavation, there would be no significant quantities of hazardous materials stored on the Project site. Fueling by use of fuel trucks and minor maintenance may occur onsite. These activities would be done in compliance with the requirements of the site SWPPP and with the hazardous material and waste generator regulations (California Code of Regulations (CCR) Title 22).

1.6.1.7 Administration, Security, and Public Safety During Reservoir Excavation

The office and restroom facilities at the adjacent Seaborn site would be used in addition to onsite portable toilets, if necessary. Security personnel would monitor the Project site during nighttime and during the weekends. The perimeter of the excavation site would be fenced and all facilities secured.

1.6.2 Reservoir Facility Construction

Construction of the reservoir would create a storage capacity of approximately 4,600 acre-feet, and would include the following components illustrated in Figure 4 – Final Reservoir Plan:

- Inflow channel – 500 cfs capacity.
- Electrically operated weir for the Inflow Channel control.

- Inflow chute.
- Energy dissipation pool - Based upon the drilling logs, it is expected bedrock would be encountered at the proposed final elevation. However, if the excavation does not get down to bedrock, installation of an energy dissipation pool at the base of the Inflow Chute would prevent the potential scouring effects of the water entering the reservoir.
- Floating barge pump – 160 cfs capacity to deliver into the Kaweah River upstream of the existing McKay Point Check Structures.
- Above-ground diesel tank, generators and generator building.
- Floating barge pump discharge piping.
- Outflow Channel – up to 900 cfs capacity gravity flow into the St. Johns River.
- Electrically operated weir for the outflow channel control.
- Slurry wall to cut off groundwater seepage into/out of the reservoir (to be installed towards the end of excavation).
- Access gate.
- Perimeter berm, perimeter road and truck turnaround (the inflow and outflow channels will pass under the perimeter road in concrete structures).

The inflow and outflow structures would require excavation and grading to prepare the site for installation. Inflow/outflow grading would consist of clearing and grubbing of approximately 3 acres, excavation of 20,000 cubic yards, and the placement of approximately 9,000 cubic yards of rip-rap. Construction of the in/out-flow building would consist of finish grading and minor excavation of approximately 600 cubic yards and the placement of approximately 1,100 cubic yards of concrete. Construction of the reservoir is further discussed in Chapter 4.3.5.4 – Construction Phase Emissions in the DEIR.

The Department of Water Resources (DWR), Division of Safety of Dams has jurisdiction over projects that create a dam over 25-feet in height or will have an impounding capacity of 50 acre-feet or more (Water Code Section 6002). However, artificial barriers less than 6-feet in height, or that have a storage capacity of less than 15 acre-feet are not considered dams subject to DWR jurisdiction (Water Code Sections 6003, 6025). The retention of water within the reservoir would be below grade and would not require the use of artificial barriers greater than 6-feet in height. Therefore, the Project does not exceed these criteria and is not regulated as a dam. The excavation of the pit for the construction of the reservoir would meet the engineering and safety requirements as set forth in SMARA.

1.6.2.1 Slurry Walls

Depending upon the amount of groundwater seepage, towards the end of the excavation process, a slurry wall may need to be installed around the reservoir's perimeter to minimize groundwater seepage into/out of the reservoir. Slurry walls are below-grade walls that restrict groundwater flow or support excavations and structures, using soil-bentonite or cement-bentonite. If needed, a slurry wall would be installed to slow or eliminate groundwater from flowing into the reservoir during construction, and to maintain an evacuated

state as part of the long-term operations (i.e., a full reservoir has limited water re-regulation value). However, due to the nature of the clay material present at the site, alternatives to a slurry wall that keep the infiltration below 500 gpm may be considered.

Once the slurry wall is installed around the reservoir, the Owners would minimize the dewatering flows to approximately 500 gpm during reservoir facility construction and long-term reservoir operation. The slurry wall would be a permanent fixture of the reservoir facility and would serve as an essential feature to maintain dewatered storage space to receive water diversions by the Owners.

Slurry wall construction consists of clearing and grubbing approximately 26 acres, excavating approximately 109,000 cubic yards of native soil, and poring of the slurry wall into the excavated trench. Excavated soils would be hauled to an onsite screening/mixing site and screened for use in the slurry wall mix. Approximately 4,000 dry tons of bentonite and 56,000 tons of silty/clay fines would be delivered to the site for use in the slurry wall. Excess native soils would either be spread or stored onsite. Construction slurry consisting of a bentonite-water slurry would be pumped into the trench to hold the sides of the trench open during construction. A mixture of bentonite, imported silty/clay fines and native soil would be used for the final slurry wall. The slurry wall material would be hauled from the mixing site and placed into the trench. A final native soil cap consisting of approximately 10,000 cubic yards would be placed on top of the slurry wall. Chapter 4.3.5, Table 4.3-15 – Slurry Wall Excavation and Installation in the DEIR provides additional detail on the construction of the slurry wall.

1.6.2.2 Days and Hours of Operation and Employment During Construction

Approximately 7 to 12 employees would be required during the construction of the reservoir facilities, which would occur between 4:00 a.m., or dawn if later, and 6:00 p.m., Monday through Saturday, until completed. Nighttime construction activities are not proposed.

1.6.2.3 Traffic During Construction

The Project would only require 7 to 12 employees during the construction of the reservoir; therefore, the number of employees traveling to the site would be minimal and consistent with the baseline number of employees previously required during the mining activities at the Seaborn site. Each employee is assumed to make 2 trips per day (inbound and outbound), which would result in a maximum increase of 24 trips on peak days, assuming all 12 employees are onsite. Access for reservoir facility construction employees and service vehicles would be via Road 222, through the Seaborn site entrance to the Project site. As a result, the Project would generate only nominal traffic on public roadways, which would be comparable to that being experienced during the Seaborn site mining and processing operations.

1.6.2.4 Mobile Equipment Used During Construction

The equipment used for the construction of the reservoir facilities, such as inlet and outlet features, includes:

- Excavator
- Backhoe
- Water Truck
- Loader
- Compactor
- Cement Trucks
- Cranes
- Trenchers
- Portable Generators

- Grader
- Cement Pumps
- Pneumatic Pumps

1.6.2.5 Onsite Hazardous Materials During Construction

During construction, there would not be significant quantities of hazardous materials stored on the Project site. Fueling by use of fuel trucks and minor maintenance may occur onsite. These activities would be done in compliance with the requirements of a site SWPPP and with the hazardous material and hazardous waste generator regulations.

1.6.2.6 Utilities During Construction

Electrical power would be provided by SCE from nearby power lines.

1.6.2.7 Lighting During Construction

Except for the security lighting, no nighttime lighting is proposed and/or required.

1.6.2.8 Administration, Security, and Public Safety During Construction

The office and restroom facilities at the adjacent Seaborn site would be used in addition to onsite portable toilets, if necessary. Security personnel would monitor the Project site during the weekends and at night. The perimeter of the excavation site would be fenced and all facilities secured.

1.6.3 Background and Relationship to the Seaborn Site and WCSG Processing Facility

As discussed above, the material excavated from the Project would be transported to the adjacent Seaborn site where the aggregate would be processed by WCSG. Off-road haul trucks or a conveyor system located on the Project site would be used to transport excavated material to the Seaborn site. The transportation of material to the WCSG processing facility would not require the any haul trucks to use public roads. The Project would not result in additional haul trucks on public roadways.

Surface mining and the processing of aggregates has occurred at the Seaborn site since 1948. The first use permit for the Seaborn site was issued by the County in 1958. Subsequent expansions to the mine site were approved in 1963 (M-2 UP#63-21) and in 1966 (M-2 UP#66-11). Following the adoption of SMARA, a Surface Mining Reclamation Plan (PMR 79-04) was approved for the Seaborn site in 1980. The 1980 Reclamation Plan described the reclaimed end use of the property as a lake with stable slopes and vegetation along the banks. In 2001, an amendment to the approved Reclamation Plan was granted by the County authorizing the use of an additional 20 acres to the north of the Seaborn site for the storage of processed aggregate, rock crusher parts and heavy equipment storage. The 2001 amendment only modified the PMR 79-04 to address the 20-acre stockpile area and described final reclamation of the 20-acre area as the removal of all equipment and product stockpiles, followed by a return to its pre-site disturbance use of irrigated pasture.

The mining, processing and reclamation activities at the Seaborn site are not part of this Project. However, the potential impacts associated with the transportation to and processing of the aggregate excavated to construct the Project reservoir are evaluated in this DEIR. The previous production rates and traffic records from the Seaborn processing activities have been reviewed and are used in this CEQA evaluation to identify

the existing environmental baseline for comparison purposes to determine the change from baseline and potential impacts that this Project would have.

1.7 Reclamation Plan

As discussed above, because the excavated material taken from the Project site would be sold as a marketable product, the excavation phase of the Project would require a Surface Mining Permit and the preparation and County approval of a Reclamation Plan in accordance with the requirements of SMARA and the Tulare County Zoning Ordinance, Chapter 25 (Surface and Mining Reclamation). Section 7-25-1085 of the County Ordinance Code (Permit) states as follows:

> *Except as provided in sections 7-25-1090 and 7-25-1095 of this Article, any person who proposes to engage in surface mining operations within the unincorporated area of Tulare County shall, prior to the commencement of such operations, obtain a permit to mine,* approval of a reclamation plan and approval of financial assurances in accordance with the provisions of this Chapter*, the Act and the regulations.* (emphasis added)

A Reclamation Plan was prepared for review and comment by the Division of Mine Reclamation (DMR), and review and approval by the County as the SMARA Lead Agency. The Reclamation Plan was developed in compliance with the reclamation standards set forth in SMARA Regulations (14 CCR Sections 3700 to 3713). The identified end use of the excavation is the creation of the McKay Point Reservoir to be used as a surface water storage/re-regulation reservoir. The reservoir can also be used to optimize groundwater recharge within the Owners service areas.

NOTICE OF AVAILABILITY (NOA) / NOTICE OF INTENT (NOI) TO ADOPT A DRAFT EIR (EIR) FOR THE MCKAY POINT RESERVOIR PROJECT (SCH #2014011078)

DATE: March 1, 2024

TO: Interested Agencies, Organizations, and Individuals

FROM / LEAD AGENCY: Tulare Irrigation District
6826 Avenue 240
Tulare, CA 93274

SUBJECT: Notice of Availability and Public Comment Period of a Draft Environmental Impact Report

The Tulare Irrigation District (TID), as the Lead Agency under the California Environmental Quality Act (CEQA), has prepared a Draft Environmental Impact Report (Draft EIR) that identifies and evaluates the environmental impacts of the proposed McKay Point Reservoir Project. The proposed Project is located on approximately 500 acres adjacent to the Lower Kaweah River and St. Johns River. TID releases this Notice of Availability (NOA) / Notice of Intent (NOI) to open the 45-day public comment period for the EIR, in accordance with CEQA.

Project Title: McKay Point Reservoir Project

Project Applicant: Project joint owners – Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC), and the Visalia and Kaweah Water Company (VKWC).

Assessor's Parcel Number(s): The Project site is comprised of portions of the following Assessor's Parcel Numbers (APN's): 113-070-016-000, 113-080-005-000, 113-080-008-000, 113-090-001-000, 113-100-002-000.

Project Location: Located in Tulare County, California, the Project site lies between and to the south of both Lake Kaweah (2.5 miles northeast of the site) and Bravo Lake (1.5 miles northwest of the site); 1.0 miles northwest of the community of Lemon Cove; and 2.5 miles southeast of the community of Woodlake. The Project site is located approximately 1.0 mile west-southwest of the intersection of State Highways 216 and 198, in Sections 3 and 4, Township 18 South, Range 27 East, Mount Diablo Base and Meridian.

The surrounding land uses in the Project area are mining, agricultural, and residential. The adjacent lands to the north, northeast, southwest and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are used intensively for agricultural and, to a limited extent, for rural residential purposes.

Project Background: TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Project Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code. Together they are the Owners of the Project.

Project Summary: The Owners propose to develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir (the proposed Project). The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River.

The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and operation of the reservoir. The Owners would contract with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir would be used as a surface water storage / re-regulation reservoir. The reservoir would also be used to optimize groundwater recharge within the Owners service areas.

TID is the Project applicant on behalf of the Owners and is the CEQA Lead Agency. The Owners' objectives in proposing the Project include the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah at the proposed Project site.

- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners at the proposed Project site.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners at the proposed Project site.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests at the proposed Project site.
- Constructing the reservoir at the proposed Project site in such a way that revenue can be obtained to offset a portion of the construction and development costs.
- Locating the reservoir adjacent to and north of the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines as part of the proposed Project.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet as part of the proposed Project.
- Deliver water to the Lower Kaweah River or the St. Johns River using an electrically operated weir channel and pump(s), as needed.
- Provide additional storage capacity at the proposed Project site for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Enter into a lease agreement with WCSG to excavate at the proposed Project site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset a portion of the construction and development costs.

A detailed Project Description can be found within the Draft EIR.

Public Review and Comment Period: The circulation of the Draft EIR is to disclose information and encourage written public comments. TID invites public comments on the Draft EIR during a 45-day public comment period, beginning on March 1, 2024, and ending on April 15, 2024. When providing comments, please include your name, the name of your agency or organization (if applicable), and contact information.

The Draft EIR can be obtained electronically at the following website: https://tulareid.org/. Physical copies of the Draft EIR can also be accessed Monday-Friday, 8:00 a.m. to 5:00 p.m. at the following location:

Tulare Irrigation District
6826 Avenue 240
Tulare, CA 93274

Comments on the Draft EIR may be submitted via e-mail to gstephens@sespe.com, or via U.S. mail to:

Sespe Consulting, Inc.
Attn: Graham Stephens
374 Poli Street, Suite 200
Ventura, CA 93001

If you have questions or require additional information, please contact Graham Stephens, Project Manager, at (805) 275-1515 or via email at gstephens@sespe.com.

Public Hearing: TID will schedule a public hearing to consider adoption of the EIR at a future date. In advance of the hearing date, TID will distribute a separate notice regarding that hearing.

Lead agencies may include 15 hardcopies of this document when submitting electronic copies of Environmental Impact Reports, Negative Declarations, Mitigated Negative Declarations, or Notices of Preparation to the State Clearinghouse (SCH). The SCH also accepts other summaries, such as EIR Executive Summaries prepared pursuant to CEQA Guidelines Section 15123. Please include one copy of the Notice of Completion Form (NOC) with your submission and attach the summary to each electronic copy of the document.

SCH #: 2014011078

Project Title: McKay Point Reservoir Project

Lead Agency: Tulare Irrigation District

Contact Name: Aaron Fukuda

Email: akf@tulareid.org Phone Number: (559) 686-3425

Project Location: Near the unincorporated communities of Lemon Cove and Woodlake, in Tulare County

City *County*

Project Description (Proposed actions, location, and/or consequences).

The Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC) and the Visalia & Kaweah Water Company (VKWC), as joint owners (Owners), propose to construct and operate the McKay Point Reservoir on the north side of the divergence of the Lower Kaweah and St. Johns rivers near McKay Point in Tulare County, California. The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and operation of the reservoir. The Owners would contract with West Coast Aggregate Supply, Inc. (WCA) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir reservoir would be used as a surface water storage and re-regulation reservoir and would: 1) receive water immediately upstream of the divergence of the St. Johns and Kaweah rivers, 2) provide a water storage capacity of approximately 4,600 acre-feet, 3) deliver water to the St. Johns River or the Lower Kaweah River, as needed; and, 4) provide additional storage capacity for storm water layoff and flood prevention. The reservoir would also be used to optimize groundwater recharge within the Owners service areas. See Section 2.0 of the Draft EIR for additional detail.

Identify the project's significant or potentially significant effects and briefly describe any proposed mitigation measures that would reduce or avoid that effect.

Project environmental factors/resource areas found to have either "no impact" or "less than significant impact" with no mitigation necessary include the following:

- Aesthetics	- Agriculture and Forestry Resources	- Energy
- Greenhouse Gases	- Hazards and Hazardous Materials	- Hydrology and Water Quality
- Land Use and Planning	- Mineral Resources	- Population and Housing
- Public Services	- Recreation	- Transportation
- Tribal Cultural Resources	- Utilities and Service Systems	- Wildfire

Project environmental factors/resource areas found to have a "less than significant impact with the implementation of mitigation measures" include the following:

- Air Quality: Mitigation measure for fugitive dust control.
- Biological Resources: Standard mitigation measures for various plant and wildlife species, and jurisdictional waters.
- Cultural Resources: Standard mitigation measures for managing a find of cultural resources.
- Geology and Soils: Mitigation measures for managing a find of a paleontological resource.
- Noise and Vibration: Mitigation measure for short-term construction and onsite material processing noise.

If applicable, describe any of the project's areas of controversy known to the Lead Agency, including issues raised by agencies and the public.

The following list provides a brief summary of the areas of known controversy or issues of concern based on the comments received during the scoping period (10/02/2020 - 11/04/2020):
- Reclamation Plan;
- Potential impacts to real estate and quality of life;
- Permit requirements, specifically Central Valley Flood Protection Board encroachment permit and US Army Corp of Engineers 404 permit;
- Details of the excavation of the pit for the construction of the reservoir;
- Drought conditions and water supply; and
- Impacts to local groundwater wells.

Two (2) public scoping meetings were also held on October 15 and 16, 2020. Complete copies of the letters/emails received during the scoping period are provided in the Scoping Report (Appendix A in the Draft EIR). These comments will be incorporated into the EIR Administrative Record for the Project and are addressed in the Draft EIR, as appropriate.

Provide a list of the responsible or trustee agencies for the project.

Federal Agencies:
- U.S. Army Corps of Engineers
- U.S. Fish and Wildlife Service

State Agencies:
- California Department of Conservation (DOC), Division of Mine Reclamation (DMR)
- Water Quality Control Board, Central Valley (Region 5)
- California Department of Fish and Wildlife (CDFW)
- California Department of Transportation (Caltrans)

NOTICE OF AVAILABILITY (NOA) / NOTICE OF INTENT (NOI) TO ADOPT A DRAFT EIR (EIR) FOR THE MCKAY POINT RESERVOIR PROJECT (SCH #2014011078)

DATE: March 1, 2024

TO: Interested Agencies, Organizations, and Individuals

FROM / LEAD AGENCY: Tulare Irrigation District
6826 Avenue 240
Tulare, CA 93274

SUBJECT: Notice of Availability and Public Comment Period of a Draft Environmental Impact Report

The Tulare Irrigation District (TID), as the Lead Agency under the California Environmental Quality Act (CEQA), has prepared a Draft Environmental Impact Report (Draft EIR) that identifies and evaluates the environmental impacts of the proposed McKay Point Reservoir Project. The proposed Project is located on approximately 500 acres adjacent to the Lower Kaweah River and St. Johns River. TID releases this Notice of Availability (NOA) / Notice of Intent (NOI) to open the 45-day public comment period for the EIR, in accordance with CEQA.

Project Title: McKay Point Reservoir Project

Project Applicant: Project joint owners – Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC), and the Visalia and Kaweah Water Company (VKWC).

Assessor's Parcel Number(s): The Project site is comprised of portions of the following Assessor's Parcel Numbers (APN's): 113-070-016-000, 113-080-005-000, 113-080-008-000, 113-090-001-000, 113-100-002-000.

Project Location: Located in Tulare County, California, the Project site lies between and to the south of both Lake Kaweah (2.5 miles northeast of the site) and Bravo Lake (1.5 miles northwest of the site); 1.0 miles northwest of the community of Lemon Cove; and 2.5 miles southeast of the community of Woodlake. The Project site is located approximately 1.0 mile west-southwest of the intersection of State Highways 216 and 198, in Sections 3 and 4, Township 18 South, Range 27 East, Mount Diablo Base and Meridian.

The surrounding land uses in the Project area are mining, agricultural, and residential. The adjacent lands to the north, northeast, southwest and west are currently being used for aggregate mining operations, and the areas south and east of the Project site are used intensively for agricultural and, to a limited extent, for rural residential purposes.

Project Background: TID is a public agency organized and existing pursuant to Division 11 of the California Water Code. CPDC and VKWC are mutual water companies organized and existing pursuant to Division 3 of the California Corporations Code. The Project Owners are all members of the Kaweah and St. Johns Waters Association (Association), which oversees the surface water rights and diversion operations on the Kaweah River. VKWC is also a mutual water company formed under Section 200 of the California Corporations Code. Together they are the Owners of the Project.

Project Summary: The Owners propose to develop approximately 200 acres within the 500-acre McKay Point property into a surface water storage and re-regulation reservoir (the proposed Project). The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River.

The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and operation of the reservoir. The Owners would contract with West Coast Sand and Gravel (WCSG) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir would be used as a surface water storage / re-regulation reservoir. The reservoir would also be used to optimize groundwater recharge within the Owners service areas.

TID is the Project applicant on behalf of the Owners and is the CEQA Lead Agency. The Owners' objectives in proposing the Project include the following:

- Capturing and re-regulating water made available to the Owners during flood releases from Lake Kaweah at the proposed Project site.

- Capturing and re-regulating water entitlements belonging to the Owners released from Lake Kaweah at the proposed Project site.
- Capturing and re-regulating any other water sources on the Kaweah River that may be made available to the Owners at the proposed Project site.
- Allowing other entities with water rights on the Kaweah River to capture and/or re-regulate flows when designated by the Owners at the proposed Project site.
- Allowing other entities to capture and/or re-regulate flows of the Lower Kaweah River and St. Johns River for purposes of storm water runoff and flood prevention with permission of the Owners and Kaweah/St. Johns water rights interests at the proposed Project site.
- Constructing the reservoir at the proposed Project site in such a way that revenue can be obtained to offset a portion of the construction and development costs.
- Locating the reservoir adjacent to and north of the Kaweah River to allow for off-stream access to surface water storage, thus minimizing the need for pipelines as part of the proposed Project.

To accomplish these objectives, the Owners propose to construct and operate the Project to:

- Divert and receive water immediately upstream of the divergence of the Lower Kaweah River and St. Johns River, commonly referred to as McKay Point.
- Provide a water storage capacity of approximately 4,600 acre-feet as part of the proposed Project.
- Deliver water to the Lower Kaweah River or the St. Johns River using an electrically operated weir channel and pump(s), as needed.
- Provide additional storage capacity at the proposed Project site for storm water layoff and flood prevention.
- Coordinate all such diversions and deliveries to and from the reservoir with the Kaweah Delta Conservation District and the Kaweah and St. Johns River Association.
- Enter into a lease agreement with WCSG to excavate at the proposed Project site for the reservoir and process the excavated material into a marketable product (primarily construction grade aggregate). TID would receive revenue from the sale of the excavated material that could be used to offset a portion of the construction and development costs.

A detailed Project Description can be found within the Draft EIR.

Public Review and Comment Period: The circulation of the Draft EIR is to disclose information and encourage written public comments. TID invites public comments on the Draft EIR during a 45-day public comment period, beginning on March 1, 2024, and ending on April 15, 2024. When providing comments, please include your name, the name of your agency or organization (if applicable), and contact information.

The Draft EIR can be obtained electronically at the following website: https://tulareid.org/. Physical copies of the Draft EIR can also be accessed Monday-Friday, 8:00 a.m. to 5:00 p.m. at the following location:

Tulare Irrigation District
6826 Avenue 240
Tulare, CA 93274

Comments on the Draft EIR may be submitted via e-mail to gstephens@sespe.com, or via U.S. mail to:

Sespe Consulting, Inc.
Attn: Graham Stephens
374 Poli Street, Suite 200
Ventura, CA 93001

If you have questions or require additional information, please contact Graham Stephens, Project Manager, at (805) 275-1515 or via email at gstephens@sespe.com.

Public Hearing: TID will schedule a public hearing to consider adoption of the EIR at a future date. In advance of the hearing date, TID will distribute a separate notice regarding that hearing.

Form F

Lead agencies may include 15 hardcopies of this document when submitting electronic copies of Environmental Impact Reports, Negative Declarations, Mitigated Negative Declarations, or Notices of Preparation to the State Clearinghouse (SCH). The SCH also accepts other summaries, such as EIR Executive Summaries prepared pursuant to CEQA Guidelines Section 15123. Please include one copy of the Notice of Completion Form (NOC) with your submission and attach the summary to each electronic copy of the document.

SCH #: 2014011078

Project Title: McKay Point Reservoir Project

Lead Agency: Tulare Irrigation District

Contact Name: Aaron Fukuda

Email: akf@tulareid.org Phone Number: (559) 686-3425

Project Location: Near the unincorporated communities of Lemon Cove and Woodlake, in Tulare County

City *County*

Project Description (Proposed actions, location, and/or consequences).

The Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC) and the Visalia & Kaweah Water Company (VKWC), as joint owners (Owners), propose to construct and operate the McKay Point Reservoir on the north side of the divergence of the Lower Kaweah and St. Johns rivers near McKay Point in Tulare County, California. The Project would consist of the following phases: excavation of the site for the reservoir; construction of the reservoir; and operation of the reservoir. The Owners would contract with West Coast Aggregate Supply, Inc. (WCA) to excavate the site to allow for the construction of the reservoir. After the excavation and construction of the reservoir, the McKay Point Reservoir reservoir would be used as a surface water storage and re-regulation reservoir and would: 1) receive water immediately upstream of the divergence of the St. Johns and Kaweah rivers, 2) provide a water storage capacity of approximately 4,600 acre-feet, 3) deliver water to the St. Johns River or the Lower Kaweah River, as needed; and, 4) provide additional storage capacity for storm water layoff and flood prevention. The reservoir would also be used to optimize groundwater recharge within the Owners service areas. See Section 2.0 of the Draft EIR for additional detail.

Identify the project's significant or potentially significant effects and briefly describe any proposed mitigation measures that would reduce or avoid that effect.

Project environmental factors/resource areas found to have either "no impact" or "less than significant impact" with no mitigation necessary include the following:

- Aesthetics	- Agriculture and Forestry Resources	- Energy
- Greenhouse Gases	- Hazards and Hazardous Materials	- Hydrology and Water Quality
- Land Use and Planning	- Mineral Resources	- Population and Housing
- Public Services	- Recreation	- Transportation
- Tribal Cultural Resources	- Utilities and Service Systems	- Wildfire

Project environmental factors/resource areas found to have a "less than significant impact with the implementation of mitigation measures" include the following:

- Air Quality: Mitigation measure for fugitive dust control.
- Biological Resources: Standard mitigation measures for various plant and wildlife species, and jurisdictional waters.
- Cultural Resources: Standard mitigation measures for managing a find of cultural resources.
- Geology and Soils: Mitigation measures for managing a find of a paleontological resource.
- Noise and Vibration: Mitigation measure for short-term construction and onsite material processing noise.

If applicable, describe any of the project's areas of controversy known to the Lead Agency, including issues raised by agencies and the public.

The following list provides a brief summary of the areas of known controversy or issues of concern based on the comments received during the scoping period (10/02/2020 - 11/04/2020):
- Reclamation Plan;
- Potential impacts to real estate and quality of life;
- Permit requirements, specifically Central Valley Flood Protection Board encroachment permit and US Army Corp of Engineers 404 permit;
- Details of the excavation of the pit for the construction of the reservoir;
- Drought conditions and water supply; and
- Impacts to local groundwater wells.

Two (2) public scoping meetings were also held on October 15 and 16, 2020. Complete copies of the letters/emails received during the scoping period are provided in the Scoping Report (Appendix A in the Draft EIR). These comments will be incorporated into the EIR Administrative Record for the Project and are addressed in the Draft EIR, as appropriate.

Provide a list of the responsible or trustee agencies for the project.

RECLAMATION PLAN

Tulare Irrigation District – McKay Point Reservoir
Tulare County, California
CA Mine ID No. – TBD

July 2023

1.0 INTRODUCTION

The Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC) and the Visalia and Kaweah Water Company (VKWC), referred to herein as the "Owners", own approximately 500 acres of land adjacent to the Lower Kaweah River and St. Johns River in Tulare County ("County"), California, commonly referred to as the McKay Point property. Together, the Owners are the holders of pre-1914 and post-1919 appropriative water rights on the Kaweah and the St. Johns Rivers.

The Owners propose to develop approximately 130 acres within the 200-acre McKay Point property into a surface water storage and re-regulation reservoir, referred to herein as the McKay Point Reservoir. The reservoir would be located on the north side of the divergence of the Lower Kaweah River and St. Johns River. The reservoir would allow for better management of surface water by providing approximately 4,600 acre-feet of water storage capacity to support water demands during dry seasons, additional flood control, and storm water management during the wet season. Please see Figure 1 which shows the location of the McKay Point site.

In order to develop the reservoir, the site must be excavated to a sufficient depth and surface area that meets the Owner's water storage capacity requirements. Specifically, the excavated area would result in an open pit with a surface area of approximately 115 acres and a depth of approximately 60- to 75-feet below ground surface (bgs). The Owners would contract with West Coast Aggregate Supply, Inc. (WCA) to excavate the site. WCA would excavate and process material onsite into marketable products (primarily construction-grade aggregate). The Owners would receive revenue from WCA's sale of the excavated material, which would be used to offset the eventual construction and operational costs of the reservoir. Once excavation operations are complete, the McKay Point site would be reclaimed to a condition readily adaptable for future use as a water storage reservoir.

The Surface Mining and Reclamation Act (SMARA) of 1975 provides a comprehensive set of regulations for surface mining operations in California to ensure that adverse environmental and safety impacts are minimized and that mined lands are reclaimed to a usable and safe condition. The requirements of SMARA apply to any entity engaged in "any surface mining operations in California" which disturb more than one (1) acre or removes more than 1,000 cubic yards of material. Excavation of the McKay Point site would disturb approximately 115 acres and would excavate approximately 16.5 million tons (gross) of

material total. Therefore, the County has determined that the excavation of the reservoir basin and post-excavation site reclamation/stabilization activities are subject to SMARA. As such, the mining operator, WCA, is required to obtain the County's approval of a Surface Mining Permit and Reclamation Plan, and a Financial Assurance Cost Estimate (FACE). This Reclamation Plan has been prepared to address the SMARA requirements associated with the excavation and reclamation activities on the McKay Point site. This Reclamation Plan is being submitted to the County as part of the "Surface Mining Permit and Reclamation Plan" application package. The County is the "lead agency" for SMARA approvals and compliance, while TID is the lead agency for California Environmental Quality Act (CEQA) evaluation.

The McKay Point site lies within the Kaweah River Mineral Resource Zone (MRZ), which is included in the 1997 Mineral Land Classification of Concrete Aggregate Resources in the Tulare County Production-Consumption Region, California (Department of Conservation, 1997). The Project site and adjacent areas are classified as MRZ-2a and MRZ-2b, and are designated as having concrete-grade aggregate deposits of regional significance. The mineral resource classification and designation of MRZ areas is incorporated into the Environmental Resource Management Element of the County's 2030 General Plan (Tulare County, 2012).

This Reclamation Plan was prepared in compliance with the following:

- California Surface Mining and Reclamation Act of 1975 (SMARA), as amended (Public Resources Code, Section 2710 et. seq.) (Department of Conservation);
- California Code of Regulations (Title 14, Division 2, Chapter 8, Subchapter 1, Section 3500 et seq.);
- Tulare County Ordinance Code, Part VII, Chapter 25 – Surface Mining and Reclamation (Tulare County);
- Tulare County General Plan 2030 Update (Tulare County, 2012); and
- Tulare County – Surface Mining Permits and Reclamation Plan Application/Requirements.

1.1 Site Location

The McKay Point site is located unincorporated Tulare County, near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. As discussed above, the McKay Point Reservoir excavation site is located on the north side of the divergence of the Lower Kaweah River and St. Johns River (refer to Figure 1 and Figure 2). The site is located in a portion of Sections 3 and 4, Township 18 South, Range 27 East, Mount Diablo Baseline and Meridian. It is depicted on the United States Geological Survey (USGS) Woodlake, California (2018) 7.5-minute topographic quadrangle. The approximate site coordinates are at latitude 36.39° N and longitude 119.04° W.

Surrounding land uses near the McKay Point site include existing and/or historical mining operations, agricultural land, rural residences and open space. The Lower Kaweah River and St. Johns River run east to west along the southern boundary of the site. Figure 1 and Figure 2 shows the site location and adjacent land uses.

The existing McKay Point site is currently undeveloped open space. Historically, the Project site has been used for cattle grazing under lease arrangements. There are no developed uses or buildings on the site. Most of the site is vegetated with non-native grasses except for a small portion of ground along the adjacent Kaweah River above McKay Point, which is vegetated by a mixed oak-riparian woodland. The site is drained by the Kaweah River, which drains to the ephemeral Tulare Lake in the southern end of the San Joaquin Valley, and by the St. Johns River, which becomes Cross Creek, before draining into the Tulare

Lake bottom near Corcoran. Figure 2 shows an aerial of the existing McKay Point site and the regional environmental setting.

The identified end use of the reclaimed McKay Point site is an excavated pit and ancillary features (e.g., perimeter road) that is suitable and adaptable for future construction of a water storage and re-regulation reservoir (i.e., McKay Point Reservoir). The final reclaimed pit with stable slopes would not include large above-grade structures or landforms. Please see Figure 1 through Figure 4 which depicts the property and reclamation boundaries of the McKay Point site. Table 1 below summarizes general land use information for the McKay Point site.

Table 1: Site Information

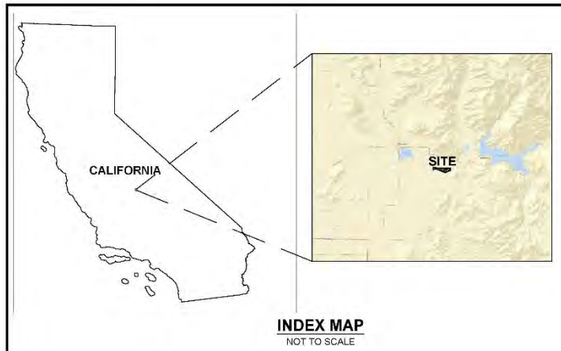
General Plan/Community Plan & Zoning Designation(s)	**General Plan:** Valley Agricultural (VA) **Zoning:** Exclusive Agricultural Zone – 20 Acre Minimum (AE-20)
Site Size	**Property Boundary:** Approximately 200 acres **Reclamation Boundary:** Approximately 130 acres **Limits of Excavation:** Approximately 115 acres
Current Use & Development	Undeveloped Grazing Land/Open Space
Adjacent County Land Use Designations	**North:** Exclusive Agricultural Zone – 20 Acre Minimum (AE-20) **South:** Exclusive Agricultural Zone – 40 Acre Minimum (AE-40) **East:** Exclusive Agricultural Zone – 40 Acre Minimum (AE-40) Exclusive Agricultural Zone – 20 Acre Minimum (AE-20) **West:** Exclusive Agricultural Zone – 20 Acre Minimum (AE-20)
Access	Vehicular access to the McKay Point site would use the existing access road located on the Seaborn site, which is adjacent to the western boundary of the McKay Point site. This point would serve as the single ingress and egress point for haul trucks, employees and other work vehicles. See Figure 2 for the McKay Point site plan.

Public Services / Utilities	– Material generated during reservoir excavation would be processed onsite using a processing wash/screen plant, and intermittently using a portable crush/recycle plant. Other than connecting the processing plant to the existing electrical infrastructure located on the north boundary of the site, no major changes to the current utility or public services systems are required at the McKay Point site. The portable crush/recycle plant would be powered by a diesel generator. – Water would be provided by a groundwater well to be constructed on the northern portion of the site (see Figure 3). Approximately 1,500 gallons per minute of water would be used onsite for materials processing and fugitive dust control during reservoir excavation. – The site would operate with portable sanitation facilities, which would be brought onsite once operations commence. – Electrical service would be provided by Southern California Edison (SCE) from existing power lines located along the north boundary of the site (see Figure 3). Other than connecting to these existing powerlines, no additional electrical infrastructure or power lines would be necessary. – No natural gas or propane would be utilized at the site. – No fixed landline telephone service is required. Employees would continue to utilize cellular phones around the site. – Trash would be collected onsite and disposed of by USA Waste (Waste Management).

1.2 Background & Permit History

1.2.1 McKay Point Site

As discussed above, historically the McKay Point site has been used for cattle grazing under lease arrangements. Biological resources in the region have historically been modified by past and present land uses. Prior to human settlement, this region was dominated by riparian vegetation within the floodplains, with stands of valley oak and interior live oak on higher ground. Cattle grazing and deforestation of the oaks in the early- to mid-1800s for agriculture substantially altered both the floodplain and channel vegetation. Much of the native vegetation in the area has been replaced by introduced species or has been eliminated by cultivation and overgrazing.



The existing McKay Point site is relatively flat and undeveloped, with no existing buildings or notable features. The property has no existing land use permits or entitlements. Please see Figure 1 which shows the extent of the Owners holdings in relation to the McKay Point site.

1.2.2 Seaborn Site

The Seaborn site is located adjacent to the west boundary of the McKay Point site and has been used for the excavation and processing of aggregate since 1948. The first use permit for the Seaborn site was issued by the County in 1958. Subsequent expansions to the mine site were approved in 1963 (M-2 UP#63-21) and in 1966 (M-2 UP#66-11). Following the adoption of SMARA, a Surface Mining Reclamation Plan (PMR 79-04) was approved for the Seaborn site in 1980. The 1980 Reclamation Plan described the reclaimed end use of the property as a lake with stable slopes and vegetation along the banks. In 2001, an amendment to the approved Reclamation Plan was granted by the County authorizing the use of an

additional 20 acres to the north of the Seaborn site for the storage of processed aggregate, rock crusher parts and heavy equipment storage. The 2001 amendment modified PMR 79-04 to address the 20-acre stockpile area and described final reclamation of the 20-acre area as the removal of all equipment and product stockpiles, followed by a return to its pre-site disturbance use as irrigated pasture.

The Owners purchased the Seaborn site to provide access to the McKay Point site. During excavation and reclamation activities at the McKay Point site, the Seaborn site would be used primarily for ingress and egress for haul trucks, work and delivery vehicles and employee vehicles via the existing access road which connects to Road 222. The extraction and processing of aggregate at the McKay Point site has been designed not to exceed the average and maximum production rates achieved at the Seaborn site operations. Section 1.3 provides more detail regarding the estimated material quantities, and excavation and processing rates.

GEOLOGIC DESCRIPTION

GEOLOGIC SETTING

THE MCKAY POINT SITE IS LOCATED IN CALIFORNIA'S CENTRAL VALLEY, NEAR THE WESTERN BOUNDARY IN THE LOW FOOTHILLS OF THE SIERRA NEVADA GEOMORPHIC PROVINCE OF CALIFORNIA. THE SOUTHERN SAN JOAQUIN VALLEY BOUNDS THIS PART OF THE SIERRA NEVADA TO THE WEST AND THE GREAT BASIN TO THE EAST. THE FOLLOWING EXCERPTS FROM THE GEOLOGY AND SOILS TECHNICAL STUDY (SLR CONSULTING, DECEMBER 2021) PROVIDE A BRIEF SUMMARY OF THE REGIONAL AND SITE GEOLOGIC SETTING. SEE ALSO SECTION 3.1 OF THE RECLAMATION PLAN AND THE COMPLETE SLR CONSULTING REPORT IN RECLAMATION PLAN APPENDIX A.

REGIONAL GEOLOGY

THE MCKAY POINT SITE IS LOCATED IN THE SAN JOAQUIN VALLEY, WHICH IS THE SOUTHERN PORTION OF THE CENTRAL VALLEY OF CALIFORNIA. THE CENTRAL VALLEY FORMED BY MILLIONS OF YEARS OF DEPOSITION OF QUATERNARY SEDIMENTS DERIVED FROM THE UPLIFTED SIERRA NEVADA AND COAST RANGES, WHICH BOUND THE CENTRAL VALLEY ON ITS EAST AND WEST. THE CENTRAL VALLEY IS AN ALLUVIAL PLAIN APPROXIMATELY 50 MILES WIDE AND 400 MILES LONG (NORTH TO SOUTH). SEDIMENTS HAVE BEEN DEPOSITED INTO THE CENTRAL VALLEY FOR THE LAST 160 MILLION YEARS, AND CAN BE THOUSANDS OF FEET THICK IN CERTAIN AREAS.

NUMEROUS RIVERS AND STREAMS ORIGINATING IN THE HIGHER ELEVATIONS OF THE SIERRA NEVADA, INCLUDING THE KAWEAH RIVER, FLOW WESTWARD INTO THE CENTRAL VALLEY, DEPOSITING QUATERNARY ALLUVIAL SEDIMENTS UPON WHICH THE SITE IS LOCATED. THIS ALLUVIUM IS UNDERLAIN BY A SEQUENCE OF MARINE AND CONTINENTAL SEDIMENTARY ROCKS CONSISTING OF SHALE, SILTSTONE, SANDSTONE, AND LOCALLY GRANITIC ROCK UNDERLYING THE ALLUVIUM AT THE SITE. BENEATH THESE ROCKS LIES AN IMPERMEABLE BASEMENT COMPLEX OF IGNEOUS AND METAMORPHIC ROCKS THAT EXTEND AS DEEP AS 13,000-FEET BELOW GROUND SURFACE (BGS). THESE BASEMENT ROCKS ARE A SUBSURFACE EXTENSION OF THE SAME ROCKS THAT OCCUR IN THE SIERRA NEVADA.

SITE GEOLOGY

THE MCKAY POINT SITE IS AT AN ELEVATION OF APPROXIMATELY 460- TO 470-FEET ABOVE MEAN SEAL LEVEL (AMSL) AND IS LOCATED IN THE EASTERN PORTION OF KAWEAH SUB-BASIN OF THE SAN JOAQUIN VALLEY GROUNDWATER BASIN. THIS AREA IS UNDERLAIN BY YOUNG UNCONSOLIDATED ALLUVIAL DEPOSITS (SANDS AND GRAVELS) FROM THE NEARBY SIERRA-NEVADA MOUNTAINS. THESE MODERATELY TO HIGHLY PERMEABLE SANDS AND GRAVELS EXTEND TO DEPTHS OF SEVERAL HUNDRED FEET OR MORE. THE SITE VICINITY IS DRAINED BY THE KAWEAH RIVER AND ST. JOHNS RIVERS, WHICH DEPOSITED THESE SEDIMENTS.

THE SURFACE SOIL AT THE MCKAY POINT SITE PRIMARILY CONSISTS OF LOOSE, MEDIUM" GRAINED SAND WITH OCCASIONAL GRAVEL AND COBBLES. THE THICKNESS OF FLUVIAL SEDIMENTS AT THE SITE RANGES BETWEEN APPROXIMATELY 40- AND 100-FEET BGS. ALLUVIAL DEPOSITS AT THE MCKAY POINT SITE CONSIST OF SAND THAT IS ABOUT 15- TO 20-FEET THICK. COBBLES, BOULDERS WITH SAND, CLAY AND SILT ARE COMMON BELOW THIS SAND INTERVAL. THESE DEPOSITS EXTENDED TO A DEPTH OF ABOUT 40-FEET BGS ON THE EASTERN PORTION OF THE SITE, AND TO ABOUT 100-FEET BGS ON THE WESTERN. THE BEDROCK ENCOUNTERED IS LIKELY MESOZOIC GRANITIC ROCKS OF THE SIERRA-NEVADA BATHOLITH, WHICH HAS BEEN MAPPED AS OUTCROPS AT HIGHER ELEVATIONS WITHIN ABOUT A MILE TO THE NORTH, EAST, AND SOUTH OF SITE. THE SURROUNDING HILL AND OUTCROP FEATURES SUGGEST BEDROCK COULD GET DEEPER TO THE WEST AND SOUTHWEST, TOWARDS THE VALLEY. AVAILABLE BORINGS ENCOUNTERED BEDROCK IN THE EASTERLY PORTION OF THE SITE AT APPROXIMATELY 77-FEET BGS. IN THE WESTERLY PORTION OF THE SITE, BEDROCK WAS NOT ENCOUNTERED WITHIN THE EXPLORED DEPTHS OF ABOUT 90-FEET BGS, INDICATING IT WOULD BE DEEPER THAN THAT.

WEATHERED OR DECOMPOSED BEDROCK ZONES AND SOME DISCONTINUOUS INTRUSIONS OF CLAY OR CLAYEY SAND MAY ALSO EXIST. THERE IS AN APPROXIMATE 10- TO 15-FOOT-THICK MANTLE OF VERY DENSE SILTY, CLAYEY SAND OVERLYING THE BEDROCK. THIS LAYER GENERALLY FOLLOWS THE TOP OF ROCK, LIKEWISE DIPPING DOWN TO THE WEST. BOTH THE BEDROCK AND THE OVERLYING MANTLE OF VERY DENSE SOILS ARE EXPECTED TO BE LESS PERVIOUS THAN THE OVERLYING ALLUVIAL MATERIALS AND THEREFORE PROVIDE A GOOD OPPORTUNITY TO KEY-IN A SLURRY WALL TO ACHIEVE THE DESIRED HYDRAULIC BARRIER.

Plot Date: C:\Users\Pearce.Swerdfeger\Trinity Consultants, Inc\Tulare Irrigation – Documents\CA Tulare County\08 Reclamation Plan\CAD\TID-McKayPt-RecPlan2023-v2.0.dwg Jun 15, 2023, 9:46am Pearce.Swerdfeger

1.3 Summary of Mining & Reclamation Activities

This Reclamation Plan has been prepared because the excavation of the pit for the construction of the McKay Point Reservoir is considered a surface mining operation and is therefore subject to SMARA. The end use of the mining pit is the preparation and stabilization of the pit such that it would be adaptable for use as a water storage reservoir. Section 4.0 provides more details on the reservoir excavation/mining operation, and Section 5.0 provides specifics related to post-mining reclamation.

The site must be excavated to a depth and surface area that meets the necessary water storage capacity requirements for the reservoir. WCA would begin the excavation in the western portion of the McKay site and progress eastward. As with most mine sites, development staging may vary based on operational factors encountered during mining. Ultimately, the excavated area would result in an open pit with a surface area of approximately 115 acres and a final depth of approximately 60- to 75-feet bgs (anticipated depth to bedrock). Final slopes are anticipated to be approximately 3H:1V (horizontal:vertical) in order to minimize any bank erosion from the wind and water. A slurry wall would also be constructed early in the excavation process around the entire perimeter of the excavation area to minimize groundwater seepage into the pit; therefore, allowing for dry mining operations. See Figure 2 which shows the design for the excavation pit.

The mining operations would be typical of surface aggregate mining operations and mining would involve the use of mobile equipment to excavate material and processing plants to process, wash and crush (if necessary) the material into marketable sand and gravel (i.e., aggregate). Excavated material would be transferred to the processing plants by haul truck. Once processed, material would be loaded into haul trucks at an onsite loading area and delivered to WCA customers or to WCA's other permitted facilities throughout the region as needed. Haul trucks would enter and exit the McKay Point site through the existing access road located on the Seaborn site (see Figure 3). Concrete may also be brought to the site for recycling using the portable crush/recycle plant. Depending upon customers required specifications, additives may also be brought onsite and added to the excavated materials during processing. Blasting would not be required to conduct the mining operations. Figure 2 through Figure 4 show the mine plan, reclamation plan and the cross-sections.

It is estimated that a total of 16.5 million (gross) tons of material and 11.5 million (net) tons of marketable material would be excavated to create the final pit. Approximately 920,000 gross tons of material would be excavated from the pit per year, depending on market demand. The gross volume calculations are based on the excavation of approximately 115 acres to a depth of approximately 60- to 75-feet bgs. It is estimated that 30% of the material extracted would be waste rock, therefore approximately 650,000 net tons per year of marketable quality aggregate is expected to be produced onsite. WCA would manage the excavation and processing of the aggregate such that the average and maximum annual production of marketable products sent offsite would not exceed the production rates previously achieved at the adjacent Seaborn site. Specifically, the average annual production rates of approximately 500,000 tons per year and the maximum annual production rate of 650,000 tons per year would not be exceeded.

Excavation is estimated to commence in 2024, and continue for up to 20-years (estimate final reclamation/site stabilization commence in 2044) depending on market demand. WCA's operations would provide a high-quality source of local aggregate materials to serve the regional market.

The major components of the excavation and reclamation activities include the following (see Figure 2 through Figure 4):

- Open-pit surface mining;
- Processing – screening, washing, and crushing (if necessary) of material;
- Import and recycling of imported concrete;
- Temporary stockpiles of excavated and processed materials;
- Ancillary mining equipment and processes;
- Construction of an onsite well;
- Installation of a perimeter slurry wall to minimize groundwater seepage into the excavation pit and allow for dry mining;
- Addition of additives to excavated materials as needed to meet customers specifications;
- Material loadout into haul trucks;
- Construction of infiltration galleries, if necessary;
- Use of additives to excavated materials to meet customer specifications;
- Various site improvements for access, safety, and other requirements;
- Reclamation of the site adaptable for use as a reservoir;
- Import of material for recycling; and
- Backfilling of excavation to bring side slopes from 1H:1V to 3H:1V as needed for the end use (reservoir).

- PERIMETER ROAD

MINING NOTES

1. THE MAXIMUM EXCAVATED PIT WILL HAVE A DEPTH OF 60 TO 90 FEET BELOW THE EXISTING GROUND SURFACE. PIT SLOPES WILL NOT EXCEED 1.5H:1V (HORIZONTAL TO VERTICAL).
2. DURING THE INITIAL LIMITED EXCAVATION AND MATERIAL PROCESSING STAGE, AN IMPERMEABLE SLURRY WALL WILL BE CONSTRUCTED AROUND THE EXACTION AREA TO LIMIT THE AMOUNT OF GROUNDWATER FLOW INTO THE EXCAVATION AS FUTURE EXCAVATION PROGRESSES BELOW THE WATER TABLE. THE SLURRY WALL WILL BE DESIGNED BY A QUALIFIED PROFESSIONAL AND CONSTRUCTED BY A QUALIFIED CONTRACTOR WITH EXPERIENCE IN INSTALLING SIMILAR FACILITIES. CONSTRUCTION WILL INCLUDE THE FOLLOWING FACILITIES:
   - A PERIMETER ACCESS ROAD THAT WOULD ALSO SERVE AS A LEVELING SURFACE FOR THE CONSTRUCTION OF THE SLURRY WALL. THE ROAD MAY VARY IN WIDTH FROM APPROXIMATELY 30 TO 50 FEET AND WILL BE BUILT ON FILL UP TO 8 FEET IN HEIGHT.
   - AN APPROXIMATELY 60- TO 90-FOOT-DEEP SLURRY WALL SURROUNDING THE EXCAVATION AREA. ITS ACTUAL DEPTH WILL BE DETERMINED DURING DESIGN AND VERIFIED DURING CONSTRUCTION BASED ON SUBSURFACE INFORMATION, TO PROVIDE THE REQUIRED REDUCTION IN GROUNDWATER INFLOW. THE SLURRY WALL WOULD BE CONSTRUCTED THROUGH THE PERIMETER ROAD AND CAPPED OFF WITH A DURABLE GRAVEL LAYER.
   - AN APPROXIMATELY 5-FOOT-DEEP WATER INFILTRATION TRENCH ALONG THE NORTHERN BORDER OF THE ULTIMATE RESERVOIR AREA.
3. THE OVERBURDEN AND EXCESS FINES RESULTING FROM THE EXCAVATION OF THE PIT AND PROCESSING OF MATERIALS WOULD BE PRIMARILY USED ONSITE TO CONSTRUCTED THE SERVICE ROAD AROUND THE PERIMETER OF THE PIT OR AS BACKFILL AGAINST THE PIT WALLS TO ACHIEVE DESIRED 3H:1V (HORIZONTAL:VERTICAL) FINAL SLOPES. ADDITIONALLY, OVERBURDEN MAY ALSO BE STORED IN VARIOUS TEMPORARY STOCKPILES LOCATED THROUGHOUT THE SITE OR AT THE BOTTOM OF THE EXCAVATION PIT AS NEEDED. NOTE THAT TOPSOIL AND SUBSOIL STORAGE IS NOT A REQUIRED ELEMENT OF THE MINE PLAN.
4. MINING SETBACKS WILL BE 30 FEET FROM THE EXTERIOR PROPERTY BOUNDARIES, 50 FEET FROM THE BANKS OF THE ADJACENT WATER BODIES, AND 50 FEET FROM THE OAK-RIPERIAN WOODLAND ON THE SOUTHEASTERN PORTION OF THE PROPERTY.
5. THE OPERATOR WILL COMPLY WITH THE CONCLUSIONS AND RECOMMENDATIONS PRESENTED BY SLR IN THE *GEOLOGY AND SOILS TECHNICAL STUDY FOR THE MCKAY POINT RESERVOIR PROJECT* (REPORT DATE: DECEMBER 2021).
6. BEST MANAGEMENT PRACTICES (BMPs) TO PREVENT EROSION, SEDIMENT, AND WINDBLOWN DUST WILL BE IMPLEMENTED AS DESCRIBED IN THE SITE-SPECIFIC STORM WATER POLLUTION PREVENTION PLAN (SWPPP). DUST WILL BE CONTROLLED THROUGHOUT THE SITE/ON UNPAVED ROADS USING A MOBILE WATER TRUCK.
7. THERE ARE NO EXISTING PUBLIC ROADS, RAILROADS, OR WATER WELLS WITHIN 500-FEET OF THE SITE. ACCESS TO THE PROJECT SITE WILL BE THROUGH THE ADJACENT SEABORN SITE TO THE WEST, WHICH CONNECTS TO ROAD 222.
8. EXISTING SOUTHERN CALIFORNIA EDISON (SCE) POWER LINES RUN ALONG THE NORTHERN PERIMETER OF THE SITE. THE PROPOSED WASH/SCREEN PLANT WILL CONNECT TO THESE EXISTING UTILITIES. NO OTHER UTILITIES (GAS TELEPHONE, WATER, ETC.) EXISTING WITHIN 500 FEET OF THE SITE.

CONCEPTUAL LOCATIONS OF THESE DESIGN ELEMENTS ARE SHOWN ON THE FIGURE BELOW, AND PROPOSED CONCEPTUAL DESIGN LAYOUTS ARE DEPICTED ON SECTION A ON FIGURE 4.

2.0 GENERAL OWNERSHIP / OPERATION INFORMATION

2.1 Mine Operator & Property Owner Information

MINE NAME: McKay Point Reservoir

CA MINE ID NUMBER: TBD

LOCATION OF MINE: The site has no physical address per the Tulare County Office of Assessor. The site is located approximately 1.0 mile east of Road 222/Avenue 335 in unincorporated Tulare County, CA 93286.

ASSESSOR PARCEL NUMBERS (APN): The McKay Point Reservoir lies on portions of multiple APNs shown in Table 2 below.

Table 2: APN's & Acreages

Parcel Number	Property Owner	Zoning Designation	Acreage
113-070-016-000 (portion)	Tulare Irrigation District P.O. Box 1920 Tulare, CA 93275-1920	Exclusive Agriculture Zone – 20 Acre Minimum (AE-20)	16.0
113-080-005-000	Tulare Irrigation District P.O. Box 1920 Tulare, CA 93275-1920	Exclusive Agriculture Zone – 20 Acre Minimum (AE-20)	65.0
113-080-008-000	Tulare Irrigation District P.O. Box 1920 Tulare, CA 93275-1920	Exclusive Agriculture Zone – 20 Acre Minimum (AE-20)	30.0
113-090-001-000	Tulare Irrigation District P.O. Box 1920 Tulare, CA 93275-1920	Exclusive Agriculture Zone – 20 Acre Minimum (AE-20)	64.0
113-100-002-000	Tulare Irrigation District P.O. Box 1920 Tulare, CA 93275-1920	Exclusive Agriculture Zone – 20 Acre Minimum (AE-20)	19.0
		Total Acres:	**194.0**

COUNTY USE PERMIT: Surface Mining Permit and Reclamation Plan (No. TBD)

MINE OPERATOR: West Coast Aggregate Supply, Inc.

OPERATOR TELEPHONE NUMBER: (559) 802-1150

OPERATOR MAILING ADDRESS: 7715 Avenue 296
Visalia, California 93291

OWNERS OF POSSESSORY INTEREST: Tulare Irrigation District
Consolidated Peoples Ditch Company
Visalia and Kaweah Water Company

LEGAL DESCRIPTION: Portions of Sections 3 and 4, Township 18 South, Range 27 East, Mount Diablo Baseline and Meridian

2.2 Lead Agency Information

LEAD AGENCY: County of Tulare, Resource Management Agency (RMA)

STAFF CONTACT: Hector Guerra
Chief Environmental Planner

TELEPHONE NUMBER: (559) 624-7000

MAILING ADDRESS: 5961 South Mooney Boulevard
Visalia, California 93277

2.3 General Operation Information

START-UP DATE: Estimated 2025

MINERAL RESOURCE ZONE (MRZ): Mineral Resource Zone 2 (MRZ-2)

Table 3: Excavation Operation Information

Component	Proposed Plan
Mineral Commodity	Sand and Gravel
Estimated Gross Material Excavated (tons)	16.5 million tons
Estimated Net Aggregate Production (tons) [1]	11.55 million tons
Estimated Maximum Annual Material Excavated (tons/year) [2]	920,000 tons/year
Estimated Maximum Annual Aggregate Production (tons/year) [2]	650,000 tons/year
McKay Point Reservoir Property (acres)	200 acres (approximate)
Area of Disturbance from Excavation Operations (acres)	115 acres (approximate)
Reclamation Boundary (includes the perimeter road/setbacks)	130 acres (approximate)
Anticipated Depth of Excavation Pit (feet bgs)	60- to 75-feet bgs (approximate)
Total Duration of Excavation	20 years (approximate)
Estimated Excavation Initiation Date	2024 (approximate)
Estimated Excavation Completion Date	2044 (approximate)
Estimated Reclamation Completion Date	2046 (approximate)
Estimated Reclamation Monitoring Date	2049 (approximate)

"bgs" = below ground surface
1 – Net tons are the marketable construction-grade aggregate derived through processing. Net tons equate to approximately 70 percent of the gross tons of material excavated.
2 – Based on maximum extraction and production rate(s) at the adjacent Seaborn facility.

3.0 ENVIRONMENTAL SETTING, CCR §3502 (B)(1)

The McKay Point site covers approximately 200 acres, of which approximately 115 acres would be disturbed by excavation operations and 130 acres is included within the reclamation boundary, located within the County of Tulare, on the north side of the divergence of the Lower Kaweah River and St. Johns River. Access to the McKay Point site for haul trucks, work delivery trucks and employee vehicles would come via the existing haul road on the Seaborn site. Figure 1 shows an aerial of the existing site, Figure 2 which shows the layout of the McKay Point site excavation, and Figure 4 shows the cross-sections.

3.1 Geologic Setting

The McKay Point site is located in California's Central Valley, near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east. The following sections provide a brief summary of the regional and site geologic setting. Also see the geologic, soils, and geotechnical report located in Appendix B which provides additional detail.

3.1.1 Regional Geology

The McKay Point site is located in the San Joaquin Valley, which is the southern portion of the Central Valley of California. The Central Valley formed by millions of years of deposition of Quaternary sediments derived from the uplifted Sierra Nevada and Coast Ranges, which bound the Central Valley on its east and west. The Central Valley is an alluvial plain approximately 50 miles wide and 400 miles long (north to south). Sediments have been deposited into the Central Valley for the last 160 million years, and can be thousands of feet thick in certain areas.

Numerous rivers and streams originating in the higher elevations of the Sierra Nevada, including the Kaweah River, flow westward into the Central Valley, depositing Quaternary alluvial sediments upon which the site is located (SLR, 2021). This alluvium is underlain by a sequence of marine and continental sedimentary rocks consisting of shale, siltstone, sandstone, and locally granitic rock underlying the alluvium at the site. Beneath these rocks lies an impermeable basement complex of igneous and metamorphic rocks that extend as deep as 13,000-feet bgs. These basement rocks are a subsurface extension of the same rocks that occur in the Sierra Nevada (SLR, 2021).

3.1.2 Site Geology

The McKay Point site is at an elevation of approximately 460- to 470-feet above mean seal level (amsl) and is located in the eastern portion of Kaweah Sub-basin of the San Joaquin Valley Groundwater Basin. This area is underlain by young unconsolidated alluvial deposits (sands and gravels) from the nearby Sierra-Nevada Mountains. These moderately to highly permeable sands and gravels extend to depths of several hundred feet or more. The site vicinity is drained by the Kaweah River and St. Johns Rivers, which deposited these sediments.

The surface soil at the McKay Point site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. Site surface drainage is generally to the south and southeast toward the Kaweah River and generally to the south and southwest toward the St. Johns River. The site elevation falls from approximately 472-feet amsl on the northeastern end of the property, to approximately 454-feet amsl on the southwestern end (SLR, 2022).

To quantify the local geology of the McKay Point site, a total of six (6) soil borings were conducted at the site in November 2011 (BSK Associates, 2011). Based on these borings, the thickness of fluvial sediments at the site ranges between approximately 40- and 100-feet bgs. Alluvial deposits at the McKay Point site consist of sand that is about 15- to 20-feet thick. Luhrdorff and Scalmani (1995) describe these sediments as Younger Alluvium. Cobbles, boulders with sand, clay and silt are common below this sand interval. These deposits extended to a depth of about 40-feet bgs on the eastern portion of the site, and to about 100-feet bgs on the western. Luhrdorff and Scalmani (1995) describe these sediments as Older Alluvium. Geologic cross-sections for the McKay Point site have been prepared by Schmidt (2012) and SES (2012), which are included in SLR's Geology and Soils Technical Study (see Appendix B).

The bedrock encountered is likely Mesozoic granitic rocks of the Sierra-Nevada batholith, which has been mapped as outcrops at higher elevations within about a mile to the north, east, and south of site. The surrounding hill and outcrop features suggest bedrock could get deeper to the west and southwest, towards the valley. Available borings encountered bedrock in the easterly portion of the site at approximately 77-feet bgs. In the westerly portion of the site, bedrock was not encountered within the explored depths of about 90-feet bgs, indicating it would be deeper than that (SLR, 2021).

Available photos of the bedrock cores indicate hard, granitic rock where it was encountered, as shown in Appendix B. Weathered or decomposed bedrock zones and some discontinuous intrusions of clay or clayey sand may also exist. There is an approximately 10- to 15-foot-thick mantle of very dense silty, clayey sand overlying the bedrock. This layer generally follows the top of rock, likewise dipping down to the west. Both the bedrock and the overlying mantle of very dense soils are expected to be less pervious than the overlying alluvial materials and therefore provide a good opportunity to key-in a slurry wall to achieve the desired hydraulic barrier (SLR, 2022).

Faults and Seismicity

The McKay Point site is located in an area of relatively moderate seismicity for California. The site area is centrally located between two (2) zones of significant seismicity: the Eastern Sierra Seismic Zone, located approximately 50 miles to the east, and the San Andreas Fault Zone located approximately 80 miles to the west. There are no active or potentially active faults within 30 miles of the McKay Point site. A map and list of active faults and their respective distances from the site can be found within SLR's Geology and Soils Technical Study (SLR, 2021) in Appendix B.

The nearest potentially active fault is the Independence Fault located approximately 48 miles east. This fault is part of the Owens Valley Fault Zone which is capable of producing large earthquakes, such as the Owens Valley Earthquake of 1872, which is estimated to have been a magnitude 7.4 event.

3.2 Hydrology & Climate

3.2.1 Climate

The Tulare County 2030 General Plan (Tulare County, 2012) and SLR's Hydrology and Water Quality Technical Study (SLR, 2022) both describe the regional climate as typical of the foothill region of California's Central Valley, with cool rainy winters having a mean daily temperature ranging from 40° to 50° Fahrenheit (F), and hot dry summers where daytime temperatures can exceed 100° F.

During the summer months, a high-pressure system off the west coast of California prevents precipitation from occurring in the foothills. During the winter, this high-pressure system is intermittent, allowing

Pacific storms to bring rainfall to the foothills. Rainfall increases with elevation in the foothills and ranges from approximately 10 inches at the base to 25 inches at 3,000-feet. Most of this precipitation occurs from November through April.

3.2.2 Surface Water & Hydrology

As discussed above, the McKay Point site is located in California's Central Valley near the western boundary in the foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east.

The site vicinity is drained by the Kaweah River and by the St. Johns River, which drain ultimately to the Tulare Lake bed in the southern end of the San Joaquin Valley. In 1962, Lake Kaweah, located upstream from the McKay Point site, was created by the construction of Terminus Dam on the Kaweah River. Renovations of this dam in 2004 significantly reduced flooding at the McKay Point site and surrounding area.

The east side of the San Joaquin Valley consists of a broad plain formed by coalescing alluvial fans associated with streams draining the western slopes of the Sierra Nevada. The southern end of the San Joaquin Valley is known as the Tulare Basin. The Tulare Basin is hydrologically closed. Instead of flowing to the ocean, streams from the Sierra Nevada flowing into the Tulare Basin terminate at depressions, the largest of which is the Tulare Lakebed.

The primary natural surface water bodies in the vicinity of the McKay Point site are the Kaweah and St. Johns Rivers, which forms portions of the eastern and southern site boundaries. The Kaweah River flows westward from its headwaters in the Sierra Nevada. Along the southern site perimeter at a location referred to as McKay Point, the Kaweah diverges into two rivers, forming the St. John River and the Lower Kaweah River. Several ponds is located north of the McKay Point site at the adjacent CEMEX aggregate mining operations. A pond is also located on the Kaweah River Rock property to the west of the site. These ponds consist of exposed groundwater, created by previous mining beneath the groundwater elevation.

Downstream of the McKay Point site, the Kaweah River naturally branches into eight (8) or ten (10) shallow channels that overflow during high flows, creating marshlands. These shallow channels were later integrated into irrigation channels and ditches for the delivery of irrigation water in support of agricultural irrigation. The channels still carry non-irrigation flow to Tulare Lakebed during periods of extraordinary precipitation or snowmelt (SLR, 2022).

As discussed in Appendix B, before the Terminus Dam was constructed, extraordinary storm events in December 1955 resulted in an estimated peak flood discharge at McKay Point of 87,000 cubic feet per second (cfs), which is the largest peak runoff from the Kaweah River watershed in the 20th century. Since the construction of Terminus Dam in 1962, most flooding concerns for areas downstream of the dam were greatly alleviated. For example, the peak average daily inflow to Lake Kaweah during the 1966 flood was 105,000 cfs, whereas the maximum release from the dam was 5,666 cfs. Lake Kaweah is operated with an objective of maintaining a flow of less than 5,500 cfs at McKay Point, which includes flow from undammed tributaries such as Dry Creek. Above this flow rate, flood damage can occur to downstream properties, infrastructure, and municipalities (U. S. Army Corps of Engineers, 1990).

The Terminus Dam height was increased by approximately 21 feet in 2004, which further reduced flooding

in the area (U. S. Army Corps of Engineers, 2005). It is estimated that currently the dam provides protection for a design flood event of 50-year return period (FEMA, 2009).

FEMA has prepared a flood hazard map for the area including the site (see Appendix B for FEMA's current flood map). FEMA has calculated base flood elevations for the Kaweah and St. Johns Rivers, but only for stretches downstream of McKay Point. The map indicates that the 100-year flood level near the McKay Point site along the St. Johns River is approximately 465-feet amsl. During most flooding conditions, major and minor flooding in the area is dissipated by diversions to the network of irrigation ditches, irrigation diversions, channel percolation, and evapotranspiration (U. S. Army Corps of Engineers, 1990).

The annual flows vary significantly and since 2001 have ranged from 43,815 acre -feet (AF) per year to 922,247 AF per year. The gauged values are summarized in Appendix B. In approximately 30% of the years the flow is above average, and in the remaining 70% of the years, below average (SLR, 2022).

As discussed above, flows arriving at McKay point are divided between the St. John and Kaweah Rivers by the McKay Point Structure which consists of two (2) flow control structures, one in the St. Johns and one in the Kaweah River. These water control facilities are owned and operated by the Kaweah Delta Water Conservation District and the Kaweah & St. Johns Rivers Association. Both check structures are located immediately downgradient of McKay Point (see Figure 1). The check structures can be closed or opened to control flow rates in the St. Johns and Kaweah Rivers.

Dry Creek flows into the Kaweah River between Terminus Dam and McKay Point, and is the largest source of runoff below Terminus Dam. Dry Creek flows southward from its headwaters and joins the Kaweah River approximately 1.0 mile down from Terminus Dam. Water supply diversions begin immediately downstream of the dam through Hawkeye, Lemoncove, and Foothill ditches, and flows diverted are less than 10,000 acre-feet (AF) per year total. Farther downriver, Washtumna ditch diverts water into Bravo Lake, a 4,000 AF reservoir (SLR, 2022).

Site Drainage

Most of the McKay Point site's surface area is flat, undeveloped open space with few features and no buildings. Site surface drainage east of the river split is generally to the south and southeast toward the Kaweah River and west of the river split generally to the south and southwest toward the St. Johns River. The site elevation slopes from approximately 472-feet amsl at the northeastern end of the property, downward to approximately 454-feet amsl at the southwestern end. The site is bordered by the existing Seaborn facility to the west, and the existing CEMEX Lemon Cove aggregate facility to the north and east. The McKay Point site is not expected to receive significant local run-on from the surrounding areas, or generate significant runoff during storm events, due to existing topography and adjacent land uses. Minimal run-on may originate from the north, but existing drainage and topography features along CEMEX's Lemon Cove facility generally direct flows away from the site. Similarly, as discussed below, the site itself generally contains stormwater onsite and does not result in significant runoff onto adjacent properties during storm events.

Given current site topography, typical storm precipitation is generally contained and thus infiltrates into the ground. In the event of a large storm, surface runoff may occur as sheet flow to the south and into the adjacent Kaweah and St. Johns Rivers. As discussed above, The Kaweah and St. Johns Rivers ultimately drain to the Tulare Lake bed in the southern end of the San Joaquin Valley. Figure 1 provides more details regarding the existing site topography as well as onsite and adjacent area drainage features.

Development of the McKay Point site (i.e., excavation and reclamation) would not create large areas of impermeable surfaces and, would not result in increased rates of surface runoff. Conversely, development of the reservoir pit would serve to capture rainfall, thereby reducing surface runoff compared to existing conditions. Additionally, geologic materials exposed in the reservoir would consist of natural sediments which do not contain deleterious materials or chemical constituents capable of degrading surface water quality. Process water would not be generated or discharged to groundwater or surface water as part of the reservoir excavation. The operator (i.e., WCA) will also obtain coverage under the Industrial General Permit (IGP), as required, and storm water runoff from the project area would be managed through proper implementation of Best Management Practices (BMPs) such as sediment and erosion control measures that will be outlined in the site-specific Stormwater Pollution Prevention Plan (SWPPP). Ultimately, completion of mining and post-reclamation development at the McKay Point site is not expected to produce additional runoff or convey pollutants to surrounding waterbodies, as the lowered excavation pit would retain onsite rainfall compared to current site conditions. Sections 4.6 and 5.12 provides more detail.

3.3 Groundwater System

3.3.1 Regional Hydrogeology

The shallow groundwater aquifer underlying the McKay Point site is composed of the alluvial fan deposits associated with the local rivers. In some areas near the site where overlying sediments are relatively thin, such as CEMEX's adjacent Lemon Cove to the north and east and Lindmore areas south of the site, weathered bedrock rocks form the predominant aquifer. For example, one Lemon Cove public supply well is screened in the bedrock aquifer. Additionally, most of the groundwater production south of the Kaweah River is from the bedrock interval (SLR, 2022).

Regionally, groundwater flows generally toward the west from the recharge areas of the Sierra Nevada mountains to the center of the valley. Groundwater elevations in the region vary from around 400-feet amsl near the McKay Point site, to around 250-feet amsl near the City of Visalia (SLR, 2022). Groundwater is pumped extensively in the area for agricultural and urban uses.

The McKay Point site is located in the Kaweah Subbasin, within the Tulare Lake Hydrologic Region (SLR, 2022). The site is also near the eastern boundary of the KDWCD. Approximately 265,000 acres of the KDWCD is irrigated for agriculture, and about 45,000 acres is urbanized. Numerous public and private entities within the KDWCD boundaries divert water from the Kaweah River and its distributaries mainly for irrigation. In addition, almost all of the land served by the KDWCD receives irrigation water obtained from groundwater, often as a supplement to surface water (SLR, 2022).

The KDWCD and surrounding areas have been in long-term groundwater overdraft. Specifically, the KDWCD wide overdraft for the period 2007 to 2017 was estimated at approximately 78,000 AF per year. Most of the overdraft occurs in the western portion of the KDWCD; not the McKay Point vicinity (SLR, 2022).

3.3.2 Site Groundwater Conditions

The long-term water level measurements for wells in the immediate McKay Point area indicate stable water levels, except for temporary declines during drought periods. Eleven (11) monitor wells at the adjacent CEMEX Lemon Cove operation have been monitored since 1994, hydrographs from which indicate that the water levels have been mostly stable, with temporary declines in response to drought

conditions (see Appendix C). Seasonal water level fluctuations in the Project site vicinity have generally varied by less than 20-feet for the last 50 years (SLR, 2022).

Approximate groundwater level elevations range from 463-feet amsl near the east edge of the CEMEX Lemon Cove Facility, located directly north of the McKay Point site, to less than 430-feet amsl in the western part of the CEMEX excavations. The CEMEX excavations have exposed groundwater as the result of the existing permitted surface mining on that site. Groundwater level elevations ranged from about 418- to 438-feet amsl in the area immediately north of the McKay Point site. Soil borings within the McKay Point site indicate depth to water ranges from 20- to 7-feet, with corresponding water level elevations ranging from 438- to 459-feet amsl. See Appendix B for additional detail.

Groundwater elevation measurements on the McKay Point site collected from six (6) onsite soil borings, and the nearby CEMEX wells during November and December 2011, indicate that the groundwater gradient in the immediate vicinity of the McKay Point site was toward the northwest. The CEMEX excavations located immediately to the north of the site, have exposed groundwater because of the permitted surface mining on that site. As presented in Appendix B, groundwater level elevations have ranged from about 438- to 443-feet amsl in the area immediately northwest of the site, to between 456- to 460-feet to the northeast of the site in the 2008 to 2010 period (SLR, 2022).

The main source of recharge to the aquifers in the Site area is groundwater flow from the east. Localized groundwater gradient suggests that the Kaweah River and St. Johns River lose some of their flow to infiltration, and that these rivers are sources of localized groundwater recharge. Other sources of groundwater recharge in the McKay Point site vicinity include infiltration of water used for irrigation, and infiltration from local irrigation ditches in the area and from seasonal surface water flow.

As described previously, excavation on the McKay Point site would commence in the northwest corner of the site, reaching a final depth of approximately 60- to 75-feet bgs (depending on the depth to bedrock). Per the Hydrology and Water Quality Technical Study completed by SLR, groundwater is expected to occur at depths of approximately 20- to 7-feet bgs. Therefore, to inhibit groundwater from entering the excavation pit/reservoir basin, a slurry wall would be installed around the perimeter of the pit early in the excavation process to decrease incoming groundwater seepage. The slurry wall would decrease the amount of groundwater seepage into the reservoir, but some amount of seepage remains likely. If needed, dewatering of this seepage from the reservoir may be necessary. The water extracted to dewater the excavation would be pumped to the northern edge of the excavation and re-injected into a gravel fill infiltration gallery along and outside of the northern border of the slurry wall as shown on Figure 2. Please see Section 4.4 below and Appendix C for additional details regarding the slurry wall and onsite groundwater management.

3.4 Soils, Erosion, & Slope Stability

3.4.1 Soils

Soils underlying the McKay Point site were assessed and discussed in the Geology and Soils Technical Study (SLR, 2021). As described above, the McKay Point site is essentially flat, sloping gently downward to the south and west. The site is undeveloped, so erosion is minimal and there are no known slope failures at the site. Soil erosion is limited to the relatively steep slopes facing the Kaweah River at the southern portion of the site, and select portions of the few man-made dirt roads at the site. Other than these small areas, the McKay site is almost entirely covered with existing vegetation.

The upper 5- to 10-feet of the onsite soil consists of poorly-graded sand with increasing gravel at depth. Below 15-feet, the soil consists of sandy and silty gravel of increasing size and rounded cobbles to approximately 30- to 35-feet bgs. At greater depth, silty clayey sand and silty clay/low plasticity clay are predominant before bedrock is encountered (SLR, 2021).

Generally, where a reclamation plan calls for revegetation of areas disturbed by surface mining, SMARA regulations (§3711) require salvage of topsoil and other suitable growth media (subsoil) prior to mining for redistribution in areas to be revegetated once mining operations are complete. However, SMARA also states that revegetation efforts, including salvage of topsoil and subsoil, might not be necessary if the approved reclaimed end use of a site is not consistent with the revegetation requirements of SMARA. Specifically, SMARA Section 3705 (Performance Standards for Revegetation) states "revegetation shall be part of the approved plan, *unless* it is not consistent with the approved end use" (§3705). As stated previously, the proposed reclaimed end use of the McKay Point site is an excavation pit prepared and stabilized such that it can be readily adaptable into a water storage and re-regulation reservoir. Because of the reservoir's capacity needs, combined with the various other design criteria required for reservoir construction (i.e., slurry wall, inlet and outlet structures, a perimeter maintenance road and related areas for auxiliary structures/activities), there would not be a feasible way to revegetate the site in a manner that meets the SMARA revegetation success criteria, nor would it be beneficial as the site would be developed into a water storage reservoir immediately following cessation of mining/completion of reclamation. Specifically, the reservoir and support structures would require the use of virtually the entire 110-acre area disturbed by excavation/surface mining, and the 130-acre shown within the site reclamation boundary (see Figure 2 through Figure 4). Therefore, the provisions of SMARA related to the salvage of topsoil and other suitable growth media/subsoil (§3711) as well as revegetation (§3705) are not applicable. See Section 4.2 and Section 5.11 provide additional detail.

3.4.2 Erosion, Sediment Transport, & Windblown Dust

Erosion is the removal of soils and rocks due to natural processes such as flow of water and wind. Erosion has the potential to occur within the McKay Point site as a result of excavation, but would generally only occur within the center of the excavation pit, and not at the native ground surface (i.e., outside the site perimeter/operational boundary).

Erosion, sediment transport and windblown dust would be controlled by implementation of the storm water BMPs, ongoing compliance with San Joaquin Valley Air Pollution Control District (SJVAPCD) applicable rules and regulations, and site-specific protocols/inspections conducted by the operator. BMPs which manage off-site sediment transport during operations and rain events would be outlined in the site-specific SWPPP. The SJVAPCD rules found under Regulation IV (Prohibitions) and Regulation VIII (Fugitive PM_{10} Prohibitions) prescribe measures for the management of windblown dust. Sections 4.6 and 5.12 provide summaries of storm water and air quality BMPs to be implemented onsite that would control erosion and dust.

Stability and erosion of the excavation pit slopes would also be controlled by the construction of a slurry wall early in the excavation process, as well as by the placement of riprap in areas above the slurry wall to further minimize erosion. Figure 2 shows the proposed locations of the perimeter slurry wall and riprap stabilization within the excavation pit. Also see Section 4.4 below for additional detail related to the slurry wall which would help ensure erosion is minimized.

3.5 Vegetation & Biological Resources

Biological surveys were conducted on the McKay Point site by Bumgardner Biological Consulting (BBC) in 2013 and 2021. The biological technical reports are provided in Appendix D. The following sections provide a summary of the field survey results.

3.5.1 Vegetation Communities

The pre-development condition of the McKay Point site was characterized by BBC in 2013 and in 2021. As described in BBC's reports, the existing McKay property is flat and has been used most recently to support cattle grazing. There are no developed uses on the existing McKay site. Much of the onsite vegetation consists of nonnative annual grassland. Specifically, most of the vegetation consists of nonnative annual grasses (e.g., wild oat [*Avena fatua*]), but also herbaceous species such as lamb's-quarters (*Chenopodium album*), wild cucumber (*Marah* sp.), and deer weed (*Acmispon glaber*). Small, scattered stands of mule fat (*Baccharis salicifolia*) also occur within the non-native annual grassland. However, these latter stands are not significant enough in size to warrant mapping as a discernible vegetation community.

There is a mixed oak riparian woodland located in the southeast of the McKay Point property; however, this area is located outside the area of disturbance from the mine/reclamation plan. Woody species that are associated with the mixed oak-riparian woodland include willows (*Salix* spp.), Fremont's cottonwood (*Populus fremontii*), western sycamore (*Platanus racemosa*), tamarisk (*Tamarix* sp.), tree tobacco (*Nicotiana glauca*), blue elderberry (*Sambucus mexicana*), and interior live oak (*Quercus wislizeni*). California wild grape (*Vitis californica*) occurs as a liana growing into the canopy of the woody species. The canopy cover in this stand of vegetation varies between approximately 20% and 100% and is best described as interrupted woodland.

Approximately 39.8 acres of elderberry savannah-riparian woodland (a sensitive vegetation community tracked by the California Department of Fish and Wildlife [CDFW]) occurs adjacent to the mixed oak-riparian woodland, and extends west along the southern border of the McKay Point site. The dominant species in the elderberry savannah-riparian woodland is blue elderberry. However, scattered Fremont's cottonwoods and willows also occur in this vegetation community. The onsite elderberry shrubs/clumps are large and old with many stems and likely represent the remnants of a formerly more contiguous community. See BBC's biological technical reports in Appendix D for additional detail.

3.5.2 Wildlife

Plant communities provide foraging habitat, nesting/denning sites, and shelter from adverse weather or predation. Specifically, the site and surrounding habitat have the potential to support a variety of reptilian, avian and mammalian species. Additionally, the site provides suitable foraging, nesting, and cover habitat for a variety of resident and migrant bird species. The surveys completed by BBC in 2013 and in 2021 within and adjacent to the McKay Point site resulted in the documentation of relatively low wildlife diversity (i.e., two (2) species of amphibians, one (1) species of reptile, fourteen (14) species of birds, and five (5) species of mammals). The biological technical reports are included in Appendix D and provide a comprehensive list of wildlife species that could potentially occur within the McKay Point site (Bumgardner Biological Consulting, 2021).

As noted in BBC's reports, other wildlife species probably occur on or near the McKay Point site, but would not likely be found in one-day reconnaissance-level surveys. These other species include, but are not limited to, southern alligator lizard (*Elgaria multicarinata*), western skink (*Plestiodon skiltonianus*),

common kingsnake (*Lampropeltis getula*), Pacific gopher snake (*Pituophis catenifer*), northern pacific rattlesnake (*Crotalus oreganus*), several species of small mammals, several species of oak or riparian-associated passerines (i.e., songbirds), red-tailed hawk (*Buteo jamaicensis*), American kestrel (*Falco sparverius*), and great horned owl (*Bubo virginianus*).

3.5.3 Special-Status Species

The biological resources reports prepared by BBC evaluated conditions of the habitat(s) within and immediately adjacent to the McKay Point site to determine if the existing plant communities, at the time of the surveys, had the potential to provide suitable habitat(s) for special-status plant and wildlife species. Special-status plant and wildlife species were evaluated for their potential to occur within the site based on habitat requirements, availability and quality of suitable habitat, and known distributions. No special-status plant species and only two (2) wildlife species were observed within the McKay Point site during BBC's surveys. Refer to the biological resource reports (Appendix D) for a detailed special-status plant and wildlife species analysis.

Special-Status Plants

No special-status plant taxa were observed on or immediately adjacent to the McKay Point site during the surveys. In addition, no special-status plant taxa that have been documented in the region are considered to have any potential to occur on the McKay Point site given the onsite conditions (i.e., lack of suitable habitat for and/or known distribution of the species).

Special-Status Wildlife

Only two (2) special-status wildlife species were observed on the McKay Point site during the surveys. One of these species (i.e., Nuttall's woodpecker) is a likely year-round resident in the mixed oak-riparian woodland in the southeastern portion of the site. The second species (i.e., willow flycatcher) was only observed during the September 18, 2013 survey and is considered a migrant that passes through the area (including the McKay site). Furthermore, this latter species is only considered a special-status species when nesting (typically in dense willow scrub in the Sierra Nevada).

Sixteen (16) special-status wildlife species that have been documented in the McKay Point site region (see Table 1 in Appendix D) are considered to have some potential to occur on or near McKay Point site. The special-status wildlife summaries are presented in the biological resource reports (Appendix D).

4.0 MINING PLAN, CCR §2772, §3502, §3503

4.1 Mining Operations, CCR §2772(c)(3)-(4), (6)

As previously described, in order to prepare the McKay Point site for future uses as a surface water storage and re-regulation reservoir (i.e., McKay Point Reservoir), the site would first need to be excavated to a sufficient depth and surface area that meets the necessary water storage capacity requirements. Ultimately, the excavated area would result in an open pit/basin with a total surface area of approximately 115 acres and a final depth of approximately 60- to 75-feet bgs (depending on the depth to bedrock). Excavation of the McKay Point site and processing of the extracted material would be completed by WCA.

WCA anticipates that excavation of the reservoir would commence in 2024. Excavation of the site would occur in one (1) single phase, beginning in the western portion of the McKay Point site and progressing eastward until the final depth (i.e., 60- to 75-feet bgs) and surface area (i.e., 115 acres) is achieved (see Figure 2). Final slopes are anticipated to be approximately 3H:1V (horizontal to vertical) in order to minimize any bank erosion from the wind and water; however, the slopes would be over-excavated to a maximum 1H:1V slope and then backfilled to the final 3H:1V slope condition. To ensure the excavation pit remains dry and the interim slopes remain stable, a slurry wall would be built around the perimeter of the 115-acre excavation pit area early in the excavation process. Once installed, the slurry wall would minimize groundwater seepage to allow for dry mining operations (i.e., no need for draglines), as well as further protect the pit slopes from wind and water erosion. Riprap would be placed along the top portion of the excavation pit walls to further protect the slopes from erosion. Other ancillary structures (e.g., perimeter earthen road, perimeter fencing, etc.) would also be constructed and installed during site excavation. Reservoir excavation activities would be conducted in accordance with applicable SMARA requirements. Figure 2 and Figure 4 shows the design of the reservoir excavation site.

Material would be extracted from the McKay Point site by WCA using mobile equipment (excavators, loaders, etc.). Excavated material would be processed onsite, primarily with an aggregate processing plant (i.e., wash/screen) and intermittently with a portable crush/recycle plant (crush/recycle). Haul trucks would be used for transfer to the onsite aggregate processing plants. WCA would also import concrete rubble for recycling at the crush/recycle plant. Soil amendments would be brought onsite to be blended with the processed aggregate to meet their customers specifications. Once processed, material would be loaded directly into haul trucks and delivered to WCA's customers, or to their other permitted facilities throughout the region as needed (see Figure 2).

It's estimated that approximately 70% of the excavated materials would be of marketable quality, which is referred to as net tons. An estimated total of approximately 11.55 million tons of saleable (net) aggregate would be extracted over approximately 20-years excavation. The gross extraction of all material would be approximately 16.5 million tons, which includes the removal of the overburden and waste rock (unusable aggregate). Additionally, it's estimated approximately 100,000 tons per year of recyclable concrete materials and other soil amendments would be brought onsite for processing.

The overburden and excess fines resulting from the excavation of the pit and processing of materials would be primarily used onsite to construct the service road around the perimeter of the reservoir pit/basin or as backfill to achieve desired 3H:1V (horizontal: vertical) final slopes. Additionally, overburden may also be stored in various temporary stockpiles located throughout the bottom of the excavation pit as needed (see Figure 2). The excess overburden and/or fines may be sold by WCA as soil amendments or a slurry used in nonstructural concrete or as miscellaneous fill material, as WCA has done in the past with overburden and fines resulting from their mining activities. Excess overburden and/or fines may also

be delivered to WCA's other permitted facilities throughout the region as needed, consistent with their existing permitted operations.

It is estimated that surface mining/reservoir excavation operations in the McKay Point site would cease by approximately the end of 2044, at which time the site would be reclaimed to a condition suitable for future use as a water storage reservoir. It is estimated that the McKay site, including reservoir pit/slopes and perimeter road, would be fully stabilized and reclaimed by 2049.

4.1.1 History of McKay Point Site Area, CCR §3502 (b)(1)

The Owners jointly own approximately 500 acres of land adjacent to the Lower Kaweah River and St. Johns River in Tulare County, California, referred to as the McKay Point property (i.e., McKay Point site). Together, the Owners are the holders of pre-1914 and post-1919 appropriative water rights on the Kaweah and/or the St. Johns Rivers. The Owners are proposing to develop approximately 200 acres of property within the larger 500-acre McKay Point property into a surface water storage and re-regulation reservoir (i.e., the McKay Point Reservoir). As discussed above, to prepare the site for future development of the McKay Point Reservoir, onsite excavation would develop an open pit with a surface area of approximately 115 acres and a depth of approximately 60- to 75-feet bgs (depending on the depth to bedrock).

Historically, the McKay Point site has been used for cattle grazing under lease arrangements. There is no history of surface mining within the McKay Point site, and there are no existing buildings or features found onsite; however, the adjacent Seaborn site has been an active aggregate surface mining and processing facility since the 1950's. Most of the McKay Point site is vegetated with non-native grasses except for a small portion of ground along the adjacent Kaweah River above McKay Point, which is vegetated by native trees and shrubs.

The land underlying the McKay Point site is zoned AE-20 (Exclusive Agriculture Zone – 20 Acre Minimum), with a Tulare County General Plan designation of "Valley Agriculture". Additionally, the site is within a "Mineral Resource Area (MRZ-2b)" as designated by the California Geological Survey (CGS) and County General Plan (Tulare County, 2012). The State Geologist, in accordance with the State Board's Guidelines for Classification and Designation of Mineral Lands, has classified the underlying land as MRZ-2b, which includes:

> *Areas underlain by mineral deposits where geologic data indicate that significant inferred resources are present. Areas classified MRZ-2b contain discovered mineral deposits that are either significant inferred resources or indicated reserves. Land included in MRZ-2b is of importance because it contains potential economic mineral deposits.*

Within the AE-20 zone, Tulare County permits mining and the extraction of minerals, upon approval of a Reclamation Plan and Financial Assurance Cost Estimate (FACE). Because the excavation of the pit for the reservoir is a surface mining activity, as defined in SMARA, WCA is required to comply with SMARA and obtain the County's approval of a Surface Mining Permit, Reclamation Plan, and Financial Assurance Cost Estimate (FACE).

As discussed previously, the Owners also purchased the Seaborn site, directly adjacent to the west of the McKay Point site, to provide access to the McKay Point site. The mining and processing activities being conducted on the Seaborn site have been discontinued by the Owners, and excavation activities would transfer over to the McKay Point site following approval of this Reclamation Plan and related financial

assurances by the County. During excavation and reclamation activities at the McKay Point site, the Seaborn site would be used primarily for ingress and egress for haul trucks and worker vehicles via the existing access road which connects to Road 222. The extraction and processing of aggregate at the McKay Point site has been designed not to exceed the maximum production rate historically achieved at the Seaborn site operations. Due to this design feature, the number of haul trucks and vehicles on public roadways would also not increase above existing levels as a result of reservoir excavation operations at McKay Point.

4.1.2 Site Preparation

Prior to initiating mining, WCA would clear the western portion of the site of any rubbish or debris and remove the area of vegetation using mobile equipment (i.e., scrapers, dozers, and excavators). Topsoil and subsoil may also be removed in this area and stored for separately for later use to construct the perimeter access road (see Figure 2). Excess topsoil and subsoil fines removed from the site may also be sold by WCA as slurry to be used in nonstructural concrete or miscellaneous fill material. Once the initial mining area in the northwest portion of the McKay Point site is prepared, normal excavation operations would commence.

4.1.3 Mining Operations

Excavation of the reservoir pit would commence in the western portion of the McKay Point site. Excavation operations would be typical of surface aggregate mining operations in dry conditions. WCA would extract construction grade aggregate (sand and gravel) from the site in one (1) single mining phase. WCA would initially mine to a final depth of 60- to 75-feet bgs (estimate depth to bedrock) in this area. Once the final depth is reached in this area, mining would progress to the east/south until the entire 115-acre reservoir basin has been fully excavated (estimated to take 20 years). The excavation pit would eventually result in a basin with a 115-acre surface area, a final depth of 60- to 75-feet bgs, and finished side slopes with a maximum a maximum 3H:1V (horizontal to vertical) gradient. Figure 2 shows the McKay Point excavation site/mine design.

Aggregate would be excavated using the mobile equipment summarized below. Excavated material will be transferred by haul truck or other equipment to the portable processing plants (i.e., wash/screen and/or crush/recycle [if necessary]) located within the excavation pit. As excavation progresses, the portable plant(s) would be relocated as necessary to reduce the distance excavated materials would need to be transported for processing. Temporary stockpiles of materials would also be located in various areas throughout the site as needed, depending on the location of excavation and processing. Additionally, electricity for the aggregate processing plant would be provided by Southern California Edison (SCE) through existing electrical infrastructure located in the northern area of the McKay property (see Figure 2). When operating onsite, the portable crush/recycle plant would be powered by portable diesel generator. The mobile equipment used during the excavation of the site would include the following:

- Excavator
- Off-road Haul Trucks
- D9 Dozer
- Loader
- Portable Generator
- Grader
- Water Truck
- Scraper
- Backhoe
- Pneumatic Pumps

Once processed onsite, material would then be loaded into haul trucks for transport to WCA's customers or to their other permitted facilities throughout the region as needed. The haul trucks would enter and exit the site through the existing access road connecting to the Seaborn site to the west, and would enter the pit using a stabilized access ramp as shown on Figure 2. Because the annual production rate would not exceed the rate historically achieved at the adjacent Seaborn facility, the number of haul trucks on public roadways would also not increase beyond the number associated with the mining operations on the Seaborn site.

Approximately seven (7) to twelve (12) onsite employees would be required during excavation of the reservoir site. Employee vehicle access to the McKay site would also be through the existing Seaborn site access road. Excavation would occur between 4:00 a.m. (or dawn if later) and 6:00 p.m., Monday through Saturday, and continue until the desired depth and extent of excavation is achieved required for the final reservoir design. Nighttime construction activities are not proposed.

4.1.4 Buffer Zones/Setbacks

No excavation of material would take place within 30-feet from adjacent property lines. Excavation would also be setback a minimum of 50-feet from the banks of the Lower Kaweah and St. Johns Rivers. In addition, the mixed oak-riparian woodland located to the east would also not be disturbed, and a minimum 50-foot buffer would be maintained around the woodland area. Other than installation of small ancillary structures, such as the perimeter wire fence, no other construction would occur within these setbacks. Figure 2 shows the various McKay Point site setbacks and buffer zones.

Due to the isolated nature of the McKay Point site, and that fact that there are no developed residential areas adjacent to the site other than one residence owned by TID located across the Kaweah River south of McKay Point, screening or buffering to prevent offsite noise and/or visual impacts is not proposed. Specifically, no perimeter berms, screens, landscaping, etc. are proposed during excavation. Additionally, the majority of excavation and processing operations would occur below grade (approximately 60- to 75-feet bgs), and would therefore not be visible from adjacent areas.

4.2 Mine Wastes, CCR §2772 (c)(8)(A)

The only potential mining waste that may be produced during reservoir excavation, as defined in Section 2772 of the Public Resources Code, would be excess soils, waste rock, and/or overburden. The overburden and excess fines resulting from the excavation of the reservoir would be stored on the site and used onsite as feasible in the construction of the perimeter road around the pit and other auxiliary structures (e.g., slurry wall, riprap, etc.). Additionally, excess soils and overburden would be stored on the site for use in backfilling the pit walls to a safe slope as required by SMARA, specifically to backfill the excavation slopes to a final 3H:1V (horizontal: vertical) slope configuration. The remainder of the fines could be sold by WCA as slurry used in nonstructural concrete or as miscellaneous fill material, or transferred to WCA's other permitted facilities for storage, as WCA has done in the past with overburden and fines resulting from their mining activities at other facilities in Tulare County. There would not be any tailings, slag, and other processed waste material, associated with the excavation and processing activities at the McKay Point site.

Additionally, the site is currently undeveloped with no debris and/or buildings currently present onsite that would need to be demolished or disposed of prior to excavation, nor would any onsite structures need to be demolished or removed as part of reclamation.

4.3 Material Processing

Excavated materials would be processed into marketable materials onsite using a wash/screen plant and a portable crush/recycle plant, as necessary. If needed, WCA would bring a portable crush/recycle plant on site to break up oversized pieces of rock prior to screening in the processing/wash plant. The crush/recycle plant could also be used to recycle used concrete and asphalt brought in from offsite. WCA may also import materials to be blended with the aggregate if required by their customers. Processed material would be stockpiled adjacent to the plant(s), and loaded into haul trucks for delivery to WCA's customers or to their other permitted facilities as needed.

4.4 Slurry Wall

As discussed previously, because the groundwater table on the McKay Point site is at a depth of approximately 7- to 20-feet below the native ground surface, a slurry wall would be constructed around the inside perimeter of the pit. Slurry walls are below-grade walls that restrict groundwater flow or support excavations and structures, using soil-bentonite or cement-bentonite. A slurry wall would be installed early during the excavation phase to slow or eliminate groundwater from flowing into the pit during excavation and construction phases and to maintain an evacuated state as part of the long-term operations (i.e., a full reservoir has limited water re-regulation value).

The slurry wall would be a permanent fixture of the reservoir facility that would remain post-excavation and site reclamation, and would serve as an essential feature to maintain dewatered storage space to receive water diversions by the Owners once the full reservoir is constructed and operational. Specifically, the dewatering flows would be minimized to approximately 500 gallons per minute (gpm) during reservoir excavation, and reservoir facility construction and long-term reservoir that would occur post-reclamation.

Early in the excavation phase, slurry wall construction would consist of clearing and grubbing approximately 26 acres around the perimeter of the excavation area, excavating approximately 109,000 cubic yards of native soil, and poring of the slurry wall soil-bentonite or cement-bentonite mixture into the excavated trench. Approximately 4,000 dry tons of bentonite and 56,000 tons of silty/clay fines would be delivered to the site for use in the slurry wall. The bentonite-water slurry would be pumped into the trench to hold the sides of the trench open during the construction of the slurry wall. A mixture of bentonite, silty/clay fines and native soil would be used for the final slurry wall. A final native soil cap consisting of approximately 10,000 cubic yards would be placed on top of the slurry wall once constructed.

4.5 Groundwater/Production Water

4.5.1 Groundwater

As discussed above, because the groundwater table under the McKay Point site is expected at an approximate depth of 7- to 20-feet bgs, a slurry wall would be constructed around the inside perimeter of the 115-acre pit. area early in the excavation process to minimize groundwater seepage into the pit and allow for dry mining techniques (i.e., no draglines). This would maintain the pit in a relatively dry condition such that dry mining methods could be used. If there is some groundwater seepage or accumulation of stormwater, the water would be pump from the pit and stored onsite to be recycled in the processing plant, used for dust control, or recirculated in the infiltration galleries constructed along the northern perimeter of the pit. The infiltration galleries would consist of appropriately designed ditches that are covered with granular materials allowing water to percolate back to groundwater. See Figure 2 which shows the location and design of the slurry wall and infiltration galleries.

As discussed in Section 1.1, one (1) groundwater well would be installed within the northern portion of the McKay site prior to excavation. The primary use of water at the Project site would be to control fugitive dust. Water would also be used for onsite material processing (i.e., aggregate wash/screen plant and portable crush/recycle plant). The water would be obtained either by pumping it from the pit or drawn from an onsite groundwater well. Total water consumption during excavation and reclamation activities would average 3.5 million gallons per year (i.e., approximately 11 acre-feet per year).

The proposed onsite groundwater well would draw from the San Joaquin Valley Groundwater Basin – Kaweah Subbasin, which underlies the site. The Kaweah Subbasin is designated a "high-priority subbasin" per the California Sustainable Groundwater Management Act of 2014 (SGMA), and is managed by the Greater Kaweah Groundwater Sustainability Agency (GSA). As identified in the Groundwater Sustainability Plan – Greater Kaweah Groundwater Sustainability Agency (Greater Kaweah Groundwater Sustainability Agency, 2020), beneficial uses of groundwater within the basin's jurisdiction primarily include agricultural, industrial, and municipal and domestic supply wells.

The shallow aquifer in the vicinity of the McKay Point site is unconfined (Schmidt, 2012) and water levels are significantly higher than the minimum threshold and measurable objective levels. The long-term water-level measurements for wells in the McKay Point area indicate a stability of groundwater levels, except for temporary declines during drought periods. Seasonal water level fluctuations in the site vicinity have generally varied by less than 20-feet for the last 50 years (Fugro, 2007). Test borings within the McKay site indicate depth to groundwater ranging from 20- to 7-feet below bgs, with corresponding groundwater level elevations ranging from 438- to 443-feet amsl in the area immediately northwest of the site, to between 456- to 460-feet to the northeast of the site in the 2008 to 2010 period. Because the proposed excavation depth (i.e., 60- to 75-feet bgs) is below the groundwater table (20- to 7-feet bgs), the slurry wall would be installed around the reservoir slopes to ensure groundwater inflows are kept to a minimum of approximately 500 gpm. Ultimately, through the construction of the slurry wall and the use of infiltration galleries, the McKay site is expected to increase groundwater recharge potential in the area compared to existing conditions. Please see SLR's Hydrology and Water Quality Technical Study in Appendix C for more detail.

4.5.2 Fresh Water

During site excavation operations, water would primarily be utilized for dust control and material processing (i.e., washing aggregate material in the plant[s]) within the McKay Point site. No landscaping that would require irrigation is proposed onsite. Water would be provided by a water well, proposed to be installed in the northern portion of the McKay Point site (see Figure 1). Water for dust suppression and material processing would either be directly piped from the well to the processing plant(s), or pumped to a mobile water truck and transported and applied throughout the McKay site as needed.

As summarized in Section 4.5.1, total water consumption during excavation activities would average 3.5 million gallons per year (i.e., approximately 11 acre-feet per year). WCA also estimates that the aggregate plant would require up to approximately 1,500 gallons per minute (gpm) of water, while and estimated 12,000 gallons per hour (gph) would be required for dust control. The amount of fresh water used onsite on an hourly and daily basis would vary, depending on season, wind and soil conditions.

Water that falls on the McKay Point site, either due to dust suppression applications or as a result of storm events, would be contained onsite within the pit and/or naturally evaporate or infiltrate into the ground. As discussed in Section 3.2.2, no permanent waterways, streams, or diversions channels currently exist

on the McKay Point site. The final reclaimed pit would have a maximum gradient of 3H:1V (horizontal:vertical) and has been designed to minimize any bank erosion from the wind and water. Additionally, prior to initiation of onsite excavation activities, a site-specific SWPPP would be developed that would outline specific erosions control measures and BMP's to be installed onsite to further prevent erosion and discharge during storm events. Additionally, the upper portions of the pit slopes for several feet above will be covered with suitable riprap from natural stone sources or processed construction concrete debris to prevent erosion. Due to these measures, excavation of the pit would not impact the adjacent rivers or other surface water bodies in the area (i.e., Lower Kaweah River and St. Johns River). Please see the Hydrology and Water Quality Technical Study in Appendix C for more detail regarding onsite drainage and erosion controls.

4.5.3 Wastewater

No wastewater would be generated during excavation operations. Minimal quantities of wash water would be generated during the aggregate washing operations at the onsite processing plant(s). This water would either be recycled in the plant or used for dust control onsite. A mobile water truck would be utilized onsite for dust suppression, and water applied to the site for this purpose would either naturally evaporate or infiltrate into the ground.

The Project would not use septic tanks or alternative wastewater treatment systems. Temporary portable toilets would be placed at the McKay Point site. The portable toilets would be placed within secondary containment, and would be regularly maintained by a local contractor. Operations at the McKay Point Reservoir would not produce any industrial or domestic wastewater discharges onsite.

Diesel, gasoline and/or lubricating oil would be used in equipment and vehicles operating onsite. If there is a need to store minor amounts of hazardous materials, such as fuels, oils, and other routine maintenance materials, these materials would be stored in secondary containment and spill response equipment would be located on site as required by local, state and federal hazardous materials/waste regulations. The following good housekeeping measures for vehicle storage and minor maintenance would be implemented at the site:

- Prevent oil, grease, or fuel leaks to the ground, storm drains or surface waters.
- Place equipment and vehicles that are to be fueled, maintained, or stored in designated areas with appropriate BMPs installed.
- Clean up spills and leaks immediately and dispose of spilled material and spill cleanup materials properly.

Any potentially hazardous wastes generated during cleanup of accidental spills and/or equipment repairs would be properly disposed of in accordance with local, state, and federal regulations.

4.6 Erosion & Sediment Control, CCR §3503(a), §3503(e), §3506

Excavation of the McKay Point site would be subject to the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Industrial Activities (Industrial General Permit). Prior to commencement of excavation, a site-specific SWPPP would be prepared that complies with the Industrial General Permit (IGP). The SWPPP would include specific prohibitions, effluent limitations, source identification, practices to reduce pollutants, assessment of pollutant sources, materials inventory, preventative maintenance program, spill prevention and response

procedures, general storm water BMPs, training, record keeping, sampling procedures and a description of the monitoring program. The SWPPP is considered a living document and would be updated as needed to address changing conditions on the site through the excavation and reclamation project phases.

As discussed previously, a slurry wall would be constructed around the pit walls early in the excavation process to protect the slopes from erosion. The top portions of the pit walls would also be protected from erosion using riprap. Table 4 summarizes potential erosion control BMPs to be implemented at the site. These BMPs would also be incorporated into the site-specific SWPPP, which would be prepared at a later date prior to commencement of mining operations.

Table 4: Summary of Erosion BMPs

Industrial Activity/Material	Potential Pollutants	BMPs Implemented	Required Equipment & Tools
Excavation and transfer of aggregate materials	Sediment	Erosion control; Sediment control; Stormwater containment.	Silt fencing and fiber rolls; Bulldozer for berm maintenance as needed.
	Dust	Wind erosion control; Erosion control; Sediment control; Tracking control.	Water truck; Soil binders.
Equipment and vehicle maintenance	Oil & Grease Hydrocarbons Gross Pollutants Trace Metals	Good housekeeping; Spill prevention & maintenance; Interior berms as needed to direct surface flows to pit; Secondary containment.	Covered trash bin; Spill kit; Mobile equipment for BMP maintenance.

Temporary stockpiling of raw excavated material and processed aggregate is anticipated. For example, temporary stockpiles may be formed adjacent to active excavation areas and/or the processing plant(s). Temporary stockpile locations would vary throughout the site as excavation operations progress from west to east; however, the stockpiles would be placed within the bottom of the excavation pit, and therefore stockpile erosion would not migrate offsite. BMPs, such as sandbags, fiber rolls, or silt fencing, would be installed around the stockpiles as needed, primarily prior to storm events, to prevent erosion.

4.7 Blasting

Due to the nature of the material to be excavated (i.e., sand and gravel) found on the McKay Point site, blasting is not required. The sand and gravel resources at the McKay Point site will be extracted using conventional earth moving equipment, without the need for disaggregation. Therefore, no explosives would be stored and/or utilized within the site area during reservoir excavation.

5.0 RECLAMATION PLAN

The following section has been prepared and organized pursuant to the requirements outlined within the SMARA and the County's requirements. The California Code of Regulations (CCR) citations presented within each titled section reference specific SMARA statutes applicable to each section (also see the "Table of Compliance for SMARA Requirements" at the beginning of this Reclamation Plan).

Once surface mining (i.e., reservoir excavation) operations are completed, the McKay Point site would be reclaimed in accordance with SMARA and County standards. The proposed reclaimed end use for the McKay Point site would be a stabilized pit/basin (approximately 110-foot surface area, with a 60- to 75-foot bgs final depth) with 3H:1V (horizontal:vertical) side slopes, and ancillary structures (e.g., perimeter access road, slurry wall, infiltration galleries, riprap, etc.), that would be readily adaptable for future use as a surface water storage and re-regulation reservoir. The following sections provide additional details related to site reclamation.

5.1 Existing & Proposed Land Uses, CCR §2772 (c)(7), §3502 (b)(1)

Existing land uses near the McKay Point site include the existing Seaborn facility located immediately west, and the CEMEX Lemon Cove aggregate facility located immediately to the north and east. The divergence of the Lower Kaweah River and St. Johns River is located immediately south of the site. Various open space areas, agricultural lands and scattered rural residences (one of which is owned by the TID) are located further south across the Lower Kaweah and St. Johns Rivers. See Figure 1 which displays the site setting, as well as Table 5 below which further describes the nearby land uses. Also see Figure 3 which show the layout and design of the reclaimed McKay Point Reservoir post-mining, and Figure 4 which shows the final site cross-sections.

Table 5: Surrounding Land Uses

Direction	Land Use	Distance from Site (feet)
North	Aggregate Facility (CEMEX)	Adjacent
South	Open Space / Agricultural Land / TID-Owned Residence	Approximately 200-feet (across Lower Kaweah and St. Johns Rivers)
East	Aggregate Facility / Open Space	Adjacent / Approximately 225-feet (across Lower Kaweah River)
West	Aggregate Facility (Seaborn)	Adjacent

As discussed in Section 1.2, the existing McKay Point property is currently undeveloped, and has been previously disturbed due to historical use for cattle grazing under lease arrangements. Other than minimal vegetation, there are no permanent buildings or topographical features found on the existing site that would need to be removed prior to reservoir excavation and/or site reclamation.

As discussed previously, the McKay Point site is zoned AE-20 (Exclusive Agriculture Zone – 20-Acre Minimum), with a General Plan designation of Valley Agriculture. The site is also located within a State-designated Mineral Resource Area (MRZ-2b). Subject to approval of a Surface Mining Permit and Reclamation Plan and a FACE, the County permits mining and the extraction of minerals (i.e., reservoir excavation) within the AE-20 zone.

Additionally, per the California Resources Agency, Division of Land Resource Protection, the entire McKay Point site is designated as “Grazing Land”, which, among other definitions, includes "land on which the existing vegetation is suited to the grazing." The site is not designated Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance, nor is it under a Williamson Act contract. Additionally, there are no forestlands on or near the McKay Point site. Excavation and reclamation of the site would also not result in the cancellation of an open space contract pursuant to the California Land Conservation Act of 1965, or Farmland Security Zone Contract pursuant to Public Resources Code § 15206(b)(3).

As discussed above, following excavation of the reservoir, reclamation of the McKay Point site would result in a stable and dry basin that would be readily adaptable into the McKay Point Reservoir (i.e., surface water storage/re-regulation reservoir). The stabilized reservoir basin is the proposed reclaimed end use pursuant to SMARA. The reservoir has been designed to complement the existing surrounding environmental setting, including the Seaborn facility immediately west. Please note, because the entirety of the reclaimed site would remain a reservoir basin with a perimeter access road, topsoil/subsoil salvage and revegetation of the site is not feasible as part of site reclamation, nor would it be appropriate or adaptable for the site’s final end use. Please see Section 5.2 below for additional detail.

5.2 Visibility, CCR §3502 (b)(1), (2)

The McKay Point site is located in a semi-rural area of unincorporated Tulare County, California. Surrounding land uses near the site are described in Section 5.1 and summarized in Table 5 above.

As discussed previously, the existing topography within and immediately adjacent to the McKay Point property is generally flat. The site is located near the western boundary in the low foothills of the Sierra Nevada Geomorphic Province of California. Prominent public roadways located in close proximity to the McKay Point Reservoir site are summarized in Table 6 below.

Table 6: Surrounding Roadways

Direction	Roadway	Distance from Site
North	State Route 216 (SR-216) / Lomitas Drive	0.7 miles
South	State Route 198 (SR-198) / Sierra Drive	1.8 miles
East	State Route 198 (SR-198) / Sierra Drive	0.8 miles
West	State Route 245 (SR-245) / Road 212	1.8 miles

While the areas surrounding the site are mostly flat with little existing topographic features, the slight north-south slope of the site and the existing vegetation and agricultural orchards that surround the site on all sides generally obscures views of the site from both nearby and distant viewpoints, public and private. For this reason, the McKay site viewshed is generally limited as there are no publicly accessible areas and roadways adjacent to the perimeter of the site. Therefore, excavation and reclamation areas at the McKay site would not be publicly accessible or visible, and no visual screening, perimeter berms, or landscaping is proposed. Please see Section 5.2.1 below for more detail.

5.2.1 Berms & Screens

As discussed above, the McKay Point property is located in an isolated area and is generally not visible from publicly accessible locations. The only areas within the vicinity of the site that would be potentially accessible to the public are the Kaweah and St. Johns Rivers, which could be used for recreational

purposes. The McKay Point site is set back from the river's banks, and excavation and reclamation of the site would not involve any large above-grade structures that would be clearly visible from the river. Because dry mining techniques would be used during the Project excavation, there would be no need for draglines. Additionally, the majority of reservoir excavation and reclamation activities would occur below grade as mining progresses within the final 60- to 75-feet bgs deep excavation pit, which would further reduce visibility.

For these reasons, no perimeter berms, screening or landscaping is proposed to be installed onsite as part of the excavation or reclamation phases. Additionally, because the proposed end use for the McKay Point site is an excavated basin that would be adapted into a water storage reservoir post-reclamation, revegetation and related topsoil/subsoil storage is not proposed as part of reclamation (see Section 5.6 below).

5.2.2 Fencing

The entire perimeter of the McKay Point Reservoir site would be fenced with 4-foot-high wire fencing. The existing entrance gate located at the northwest corner of the McKay site connecting to the Seaborn facility, as well as the existing Seaborn entrance gate connecting to Road 222, would both be maintained and locked during non-operating hours. Signs would be placed at the access road(s) and as necessary on the perimeter fencing identifying the site as private property (in English and Spanish, as necessary) to prohibit public access. Please see Figure 3 which shows the location of perimeter fencing and entrance gate.

5.2.3 Lighting

Although not anticipated, lighting for nighttime operations and/or security may be provided as needed. If installed, lighting within the McKay Point site would be portable/temporary, and installed in a manner so as to minimize glare onto adjacent properties. The lights would comply with applicable County standards and industry practices. High pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association [IDA]-approved fixtures) would be used instead of mercury-vapor fixtures for any required nighttime lighting. The lighting would also be designed to confine illumination to the site/within the property boundaries and/or to areas that do not include light-sensitive uses.

5.3 Existing Vegetation, CCR §3502 (b)(1), §3503 (c), §3703

As described in Section 3.5, the McKay Point Reservoir site is located immediately north of the divergence of the Kaweah and St. Johns rivers. The site is flat and has been used most recently to support cattle grazing. There are no developed uses on the site (Bumgardner Biological Consulting, 2021).

As described in the Biological Resources Report prepared by BBC (Bumgardner Biological Consulting, 2021), most of the existing onsite vegetation consists of non-native annual grasses [e.g., wild oat (*Avena fatua*)], but also includes herbaceous species such as lamb's-quarters (*Chenopodium album*), wild cucumber (*Marah* sp.), and deer weed (*Acmispon glaber*). Small, scattered stands of mule fat (*Baccharis salicifolia*) also occur within the non-native annual grassland, but these latter stands are not significant enough in size to warrant mapping as a discernible vegetation community (Bumgardner Biological Consulting, 2021).

Mixed oak-riparian woodland occurs in the southeastern portion of the McKay Point site. Woody species that are associated with this stand of vegetation include willows (*Salix* spp.), Fremont's cottonwood

(*Populus fremontii*), western sycamore (*Platanus racemosa*), tamarisk (*Tamarix* sp.), tree tobacco (*Nicotiana glauca*), blue elderberry (*Sambucus mexicana*), and interior live oak (*Quercus wislizeni*). California wild grape (*Vitis californica*) occurs as a liana growing into the canopy of the woody species. The canopy cover in this stand of vegetation varies between approximately 20% and 100% and is best described as interrupted woodland (Bumgardner Biological Consulting, 2021).

Approximately 39.8 acres of elderberry savannah-riparian woodland (a sensitive vegetation community tracked by the CDFW) occurs adjacent to the mixed oak-riparian woodland, but also extends west along the southern border of the site. The dominant species in the elderberry savannah-riparian woodland is blue elderberry. However, scattered Fremont's cottonwoods and willows also occur in this vegetation community. The onsite elderberry shrubs/clumps are large and old with many stems and likely represent the remnants of a formerly more contiguous community (Bumgardner Biological Consulting, 2021). As shown on Figure 2 and Figure 3, onsite excavation and reclamation activities have been designed to not impact this riparian area. See the Biological Resources Reports in Appendix D, prepared by BBC in 2013 and 2021, for additional detail.

5.3.1 Special-Status Plant Species

As discussed in Section 3.5.3, no special-status plant taxa were observed on or immediately adjacent to the McKay Point site during BBC's biological surveys. Additionally, no special-status plant taxa that have been documented in the region are considered to have any potential to occur on the McKay Point site given the onsite conditions (i.e., lack of suitable habitat for and/or known distribution of the species). See the biological resources reports (Bumgardner Biological Consulting, 2021) in Appendix D for more detail.

5.4 Wildlife, CCR §3503 (c), §3703

As described in Section 3.5.2, the biological surveys within and adjacent to the McKay Point site resulted in the documentation of relatively low wildlife diversity (i.e., 2 species of amphibians, 1 species of reptile, 14 species of birds, and 5 species of mammals). Please see the 2013 and 2021 biological resources reports prepared by BBC (Bumgardner Biological Consulting, 2021) in Appendix D for a more detail.

5.4.1 Special-Status Wildlife Species

As discussed in Section 3.5.3, only two (2) special-status wildlife species were observed on the McKay Point site during BBC's surveys. One (1) of these species (i.e., Nuttall's woodpecker) is a likely year-round resident in the mixed oak-riparian woodland in the southeastern portion of the McKay site. The second species (i.e., willow flycatcher) was only observed during the September 18, 2013, survey and is considered a migrant that passes through the area (including the site). Furthermore, this latter species is only considered a special-status species when nesting (typically in dense willow scrub in the Sierra Nevada).

In addition to the two (2) special-status bird species found on the McKay Point site, although not observed directly, BBC determined that various special-status have the potential to occur within the site region. Specifically, sixteen (16) special-status wildlife species (i.e., 3 special-status species of insect, 1 special-Specifically, status species of reptile, 10 special-status species of bird, and 1 special-status species of mammal) that have been documented in the region are considered to have some potential to occur on or near the McKay Point site; however, none of these species were directly observed on or near the site during BBC's various biological resource surveys. See Appendix D for additional detail.

To ensure development (i.e., excavation and reclamation) of the McKay Point site does not adversely impact any special-status wildlife species, BBC recommended mitigation measures which are described in the Environmental Impact Report (EIR) prepared for the project pursuant to the California Environmental Quality Act (CEQA). Specifically, avoidance and minimization measures, including pre-disturbance site surveys, would be implemented to ensure onsite activities would not adversely affect native nesting birds, nesting raptors, western pond turtles, Moestan blister beetle, Morrison's blister beetle, Crotch bumble bee, Tulare cuckoo wasp, and San Joaquin kit fox. Additionally, any fencing installed onsite would be designed to ensure fencing would not injure or impact wildlife in the area. Lastly, the Owners, although the project has been designed to avoid the oak-riparian area to the south of the excavation/reclamation area (see Figure 3), an Oak-Riparian Habitat Management Plan prepare and implement to ensure impacts to that area are prevented. These measures would be implemented during mining (i.e., reservoir excavation) and reclamation activities on the McKay Point site to ensure impacts to wildlife species are avoided. See Appendix D for additional detail.

5.5 Reclamation Specifics & Schedule, CCR §2772 (c)(8)

5.5.1 Reclamation Slopes, CCR §3502 (b)(3), §3704

Once the reservoir excavation is complete (estimated 2044), an open pit with a surface area of approximately 115-acres and a final depth of 60- to 75-feet bgs will remain. The excavation pit walls would have a final slope of 3H:1V (horizontal: vertical). Additionally, the slurry wall installed around the entirety of reservoir pit walls to minimize groundwater intrusion would also remain. The slurry wall would be a permanent fixture, and would remain post-reclamation as an essential feature to maintain dewatered storage space once the reservoir is operation and begins receiving water diversions by the Owners.

As discussed previously, the majority of excavated material would be processed onsite and sold offsite as aggregate products. Once excavation is complete, where required backfilling of the pit would be limited to placement of a nominal quantity of material against the reservoir pit walls to achieve the desired 3H:1V (horizontal: vertical) final slopes, or to facilitate completion of the perimeter access road, which would also remain post-reclamation for use as part of the future reservoir operations. No excess material (e.g., tailings, overburden, sediment, waste rock) would be generated and/or stored within McKay Point site during or following reclamation.

A Geology and Soils Technical Report (SLR, 2021) for the McKay Point Reservoir was prepared by SLR. A copy of the report is provided in Appendix B. As discussed in Section 3.4, SLR completed slope stability analyses of the complete reservoir pit, with either a slurry wall or clay liner installed. SLR's analysis also evaluated the stability of slopes that would be created through backfilling to a final slope condition of 3H:1V, a final depth of 60- to 75-feet bgs. See Figure 3 and Figure 4 above, which show the final reclaimed site conditions, as well as the future design of the reservoir to be constructed post-reclamation, which were prepare by Provost & Pritchard. This represents the final reclaimed landform that would remain post-reclamation.

The static factor of safety of various interim mining slopes as well as the final reclaimed slope(s), both with and without the slurry wall in place, was calculated by SLR within the Geology and Soils Technical Study (SLR, 2021). Factors of Safety were estimated for both static (steady state) and pseudostatic (seismic) conditions.

As stated above, during excavation activities, the desired excavation slopes would generally be targeted to achieve the steepest safe gradient. For most applications, this would be in the range of 1.5H:1V to no

steeper than 1H:1V. Depending on site-specific conditions and the localized variations in the exposed conditions, various measures are then implemented as excavation proceeds. Some of these measures may include varying the slope gradients, using benches, providing additional drainage and dewatering systems, and if needed, installing additional structural support systems. Per SLR's report, a generally acceptable factor of safety value for temporary excavation slopes is of the order of 1.25. See SLR's Geology and Soils Technical Study (SLR, 2021) in Appendix B for additional detail.

Upon completion of excavation, the cut slopes will be backfilled to a permanent gradient of 3H:1V to use the completed excavation pit as a reservoir post-reclamation. Once constructed, the reservoir will be subject to various cycles of filling and emptying. Therefore, SLR's slope stability analysis for the final slopes conservatively took into account steady state, rapid drawdown, and seismic (pseudostatic) conditions, which are described below (also see Appendix B for additional detail):

- **Steady State:** Steady state seepage conditions were incorporated in the model using the groundwater boundary conditions for the final configuration, using the estimated hydraulic conductivities of subsurface layers and the properties of the slurry wall cutoff system.
- **Rapid Drawdown:** The rapid drawdown conditions are applicable when the reservoir is emptied. Emptying the reservoirs is expected to occur over approximately 2 weeks which would allow some of the water pressure in the slope to dissipate. However, the analyses performed conservatively assumed no pressure dissipation, which is an extreme worst-case condition.
- **Pseudostatic:** Seismic slope stability has been evaluated by considering an equivalent horizontal ground acceleration corresponding to a pseudostatic seismic coefficient of 0.1.

The estimated factor of safety for different excavation slope scenarios are summarized in SLR's Geology and Soils Technical Study (SLR, 2021) in Appendix B. SLR found that the factors of safety for each of the permanent reclamation condition scenarios are considered acceptable for the proposed site design features and considered representative of stable slope configurations. Note that all the reclamation slope conditions, including the rapid drawdown factor of safety value, reflect conservative analyses compared to the actual reclaimed conditions, where slopes would be 3H:1V and therefore factors of safety would be higher than those summarized in Appendix B. As such, there is no significant difference in factor of safety values for a 3H:1V slope placed on different reclamation slope gradients. This is as expected since the overall stability of the permanent slope is largely governed by the wedge of compacted fill placed over the temporary excavation slopes. See SLR's full geotechnical report in Appendix B as well as the discussion in Section 3.4 above for more detail.

5.5.2 Reclamation Backfilling, CCR §3502 (b)(4), §3704

As discussed above, once excavation is complete and the basin has reached the target depth of 60- to 75-feet bgs (dependent upon depth to bedrock), the overburden and excess fines resulting from the excavation would be used to backfill the pit walls to achieve the desired 3H:1V (horizontal: vertical) final reservoir slopes. Additionally, minimal quantities of silty/clay fines may be placed on the excavation slopes as needed to complete/stabilize the slurry wall. Design aspects of the proposed reclamation backfilling, specifically to flatten the excavation slopes from 1.5H:1V to 3H:1V, is shown on the figures developed by SLR and presented in Appendix B. Any backfilling conducted as part of reclamation would utilize suitable materials that has both sufficient strength and is relatively free draining, as the final reclaimed slopes would have to remain stable once the reservoir is eventually developed and in operation. Backfilling would be conducted from the bottom up in compacted layers of suitable thickness. Specifically, the slopes would first be benched, and the reservoir slope fill would be keyed into the wedge of native

slope materials in front of the slurry wall. If needed, additional slanted chimney drain zones may be provided while the slope fill is being placed from the bottom up. The figures developed by SLR, and presented in the Geology and Soils Technical Study in Appendix B, shows visual example of the first layer of the backfill being placed along the east side of the excavation. As discussed in Section 5.5.1 above, the reclaimed backfilled slopes would be stable under static and pseudostatic conditions.

As discussed above, the final reclaimed site would remain an excavation pit (110-foot surface area, 60- to 75-foot depth bgs) with a perimeter road (see Figure 3) for future use as water storage reservoir. The reservoir basin and perimeter unpaved roadway would encompass the entirety of the reclaimed McKay Point site. Therefore, based on the reclamation site design and proposed end-use, revegetation of the site would not be feasible. Therefore, topsoil and subsoil removed from the site would not be salvaged, stored, or backfilled as part of site reclamation. The majority of excavated material, including topsoil, subsoil or overburden, would either be used to construct the perimeter access road or be processed onsite and sold offsite as aggregate products. Please see Section 5.9 below for more detail.

5.5.3 Proposed Time Schedule of Reclamation, CCR §2772 (c)(6)

Excavation of the McKay Point Reservoir basin would occur in one (1) phase followed by reclamation. Excavation of the site is estimated to commence in 2024. Assuming excavation commences in 2024, it is estimated that excavation activities at McKay Point would terminate by approximately the end of 2044 (approximate 20-year excavation phase). Other than installation of the slurry wall, which would occur early in the construction phase and remain post-reclamation, or construction of the perimeter access road as needed, concurrent reclamation/stabilization of the site during reservoir excavation activities would not be practical or feasible.

Once excavation of the reservoir basin is complete, the McKay Point site would be reclaimed in a manner consistent with the eventual use as a surface water storage/re-regulation reservoir. Specifically, the final reclaimed end-use of the site would be a basin with a 115-acre excavation footprint, a final depth of 60- to 75-feet bgs, and stabilized side slopes with a 3H:1V gradient. Other ancillary structures such as the perimeter road would also remain post-reclamation. Final site reclamation/stabilization is estimated to take no more than approximately two (2) years to complete following termination of excavation (estimated 2046). Activities complete during this period include formation of final slope conditions/stabilization of landforms (e.g., backfilling), completion of the slurry wall (if not complete), completion of the perimeter roadway, removal of any remaining stockpiles, and removal of mobile and stationary excavation and processing equipment. Once the site is reclaimed, TID would continue to monitor the reclaimed site for up to an additional three (3) years to ensure the site is stable, with final site reclamation monitoring completed in 2049; however, it is the Owner intention to initiate construction as soon as the County has deemed the site reclaimed pursuant to this Reclamation and the provisions of SMARA. Until reclamation is deemed complete, during this period TID would continue to regularly monitor the overall stability of the reservoir pit and perimeter road, as well as the groundwater intrusion rate to ensure the appropriate SMARA success criteria is met. If the groundwater intrusion rate within the reservoir pit exceeds the design criteria of 500 gallons per minute (gpm), TID may implement additional measures to ensure the groundwater intrusion rate remains less than this target. Please see Table 7 below, which summarizes the estimated McKay Point excavation and reclamation schedule.

Table 7: General Project Schedule

Phase/Activity	Approximate Size (Acres)	Anticipated Schedule [1]		Land Use/End Use
		Time Start	Time End	
Reservoir Excavation	115.0	January 2024	January 2044	Excavation Pit / Perimeter Road
Reclamation – Final Site Preparation	130.0	February 2044	February 2046	Empty Dry Basin / Perimeter Road
Reclamation – Final Monitoring	130.0	March 2046	December 2049	Stable Dry Basin / Perimeter Road
Note: Dates and corresponding timeframes shown above are estimations, and may change depending on market demands, etc.				

5.6 Revegetation Plan, CCR §3703 (g), §3705

As discussed above, the proposed reclaimed end use for the McKay Point site would be an excavated pit/basin (approximate 110-foot surface area, 60- to 75-foot depth bgs, 3H:1V [horizontal:vertical]) with a perimeter access road (see Figure 3). The goal is for the basin to be readily adaptable for future use as a water storage reservoir. As shown on Figure 3, the reservoir basin, unpaved perimeter roadway and ancillary structures (e.g., slurry wall, perimeter fencing, etc.) would encompass the entirety of the reclaimed McKay Point site. Therefore, based on the reclamation site design and proposed end-use, and because ultimately the entirety of the site would eventually serve as a water storage basin post-reclamation, revegetation of the site would not be feasible or required per SMARA. Specifically, as discussed in Section 3.4.1, SMARA Section 3705 (Performance Standards for Revegetation) states "revegetation shall be part of the approved plan, unless it is not consistent with the approved end use" (§3705). Because of the reservoir's capacity needs, combined with the various other design criteria required for reservoir construction (i.e., slurry wall, inlet and outlet structures, a perimeter maintenance road and related areas for auxiliary structures/activities), there would be no feasible way to revegetate the site in a manner that meets the SMARA revegetation success criteria, nor would it be beneficial as the site would be developed into a water storage reservoir immediately following cessation of mining/completion of reclamation (i.e., once the reservoir is developed, the majority of the site would be submerged underwater).

For these reasons, a revegetation plan (e.g., test plots, reference areas, seed mixes, success criteria, etc.) in accordance with SMARA Sections 3703 and 3705 has not been prepared as part of this Reclamation Plan. Please see Figure 3 which shows the layout of the final reclaimed reservoir basin and perimeter access road.

5.7 Site Cleanup, CCR §3502 (b)(5)

5.7.1 Building Structure & Equipment Removal, CCR §3709

Other than the excavated reservoir basin, the perimeter access road and other ancillary structures, such as the slurry wall, riprap and perimeter wire fence (see Figure 3), there are no permanent buildings or structures proposed within McKay Point that would remain post-reclamation. Temporary structures and equipment, such as those associated with the proposed processing plant(s), would be dismantled and removed during final reclamation. Any remaining material stockpiles would either used to backfill the excavation slopes to achieve the desired 3H:1V gradient, or removed from the site and sold to local

customers as miscellaneous fill material. No other temporary and/or permanent structures that would require specific reclamation would be installed on the McKay Point site.

Additionally, all mobile equipment (e.g., loaders, dozers, scrappers, water truck, etc.) would be removed following the completion of reclamation activities. Any residual wastes (debris, materials, excess vegetation/overburden, etc.) would also be removed and properly disposed of in accordance with applicable health and safety regulations and/or local ordinances.

5.7.2 Tailing & Mine Waste Management, CCR §3712

As described previously, no mine wastes and/or tailings would be generated by excavation or reclamation operations at the McKay Point site. The majority of the overburden or excess fines generated during excavation would either be used to construct the perimeter access road. The remainder of the unsaleable materials would either be used as backfill against the reservoir pit walls to achieve desired 3H:1V (horizontal: vertical) final slope, or sold as miscellaneous fill material. For example, any excess fines not used as part of onsite reclamation may be sold by WCA as slurry used in nonstructural concrete or as miscellaneous fill material, as WCA has done in the past with overburden and fines resulting from their mining activities. No tailings and/or mine waste would be generated that would require offsite disposal as part of reclamation.

5.7.3 Closure of Surface Openings, CCR §3713

As discussed in Section 4.5, a water production well would be installed in the northern portion of the McKay Point site during site excavation (see Figure 3). The proposed water well is the only surface opening that would require closure and abandonment in accordance with SMARA. Prior to closure, the well head would be fenced off and gated with a lock to ensure members of the public do not inadvertently access the well area. The proposed well would be abandoned in accordance with applicable local and state regulations. No other drill holes, monitoring wells, or other underground workings (e.g., portals, shafts, tunnels, etc.) that would require closure are proposed within the McKay Point site.

5.8 Post-Reclamation & Future Mining, CCR §2772 (c)(7)

As discussed previously, the proposed end use of the final reclaimed McKay Point site would be a stabilized excavation pit/reservoir basin with sufficient capacity to meet the Owners needs for future (i.e., post-reclamation) development of a water storage reservoir. Final reclaimed side-slopes would be 3H:1V (horizontal:vertical), and would therefore exceed the minimum SMARA slope gradient criteria of 2H:1V. Ancillary structures, specifically the perimeter access road and the slurry wall, would also remain post-reclamation, as these would be used as part of the future reservoir.

The reclaimed McKay Point Reservoir would be compatible with adjacent properties, including the existing Seaborn facility to the west and CEMEX's existing Lemon Cove facility to the north. Please see Figure 3 and Figure 4, which displays the final design of the reclaimed McKay Point site.

5.8.1 Impact of Reclamation on Future Mining, CCR §2772 (c)(9)

The proposed end use of the final reclaimed McKay Point site would be an open excavation pit/basin that would be adaptable for future construction of a water storage reservoir post-reclamation. It is expected the development of the reservoir pit/basin would excavate all feasibly accessible aggregate material from the site, as the target basin depth is the underlying bedrock (estimated at 60- to 75-feet bgs). Additionally, it is presumed that future construction of the McKay Point Reservoir would preclude any future mining

on the McKay site. While development of the reservoir itself could eventually prevent future mining on the McKay Point site, reclamation/development of the site would not directly impact future mining onsite or within the adjacent areas (i.e., existing adjacent aggregate operations to the west, north and east).

5.9 Slopes & Slope Treatment, CCR §3502 (b)(3)

5.9.1 Backfilling, Regrading, Slope Stability, and Recontouring, CCR §3704

As discussed in Section 5.5.2 above, once the basin is fully excavated, nominal quantities of remain onsite material would be used as backfill and placed back onto the pit slopes to achieve the final reservoir basin slopes of 3H:1V. As discussed above, during active mining operations, the pit slopes would be over-excavated to a maximum 1H:1V, and then backfilled to the final 3H:1V slope condition during reclamation. Therefore, once excavation is complete, the final reclaimed site would remain a 60- to 75-foot-deep reservoir basin, with 3H:1V side slopes, reinforced by the perimeter slurry wall which would also remain post-reclamation.

In addition to the backfilling described above, minimal regrading/re-contouring of the pit walls may also be required. The reclaimed side slopes would also be stabilized as needed through installation of a supplemental slurry wall liner, in addition to the existing perimeter slurry wall that would be installed early in the excavation phase, which would also prevent groundwater intrusion.

As discussed in Section 5.5.1, as part of the Geology and Soils Technical Study completed by SLR (SLR, 2021), a slope stability analysis was performed for both the proposed excavation and reclamation slope designs. The final reclaimed basin side slopes would not exceed a maximum inclination of 3H:1V, and are therefore presumed to be stable as they exceed the minimum 2H:1V gradient prescribed under SMARA. Nonetheless, SLR performed a detailed slope stability analysis performed (SLR, 2021), the results of which are summarized in this Reclamation Plan. Also see the full Geology and Soils Technical Study in Appendix B for more detail.

Materials Properties

The McKay Point site is essentially flat, sloping gently downward to the south and west. The site is currently undeveloped, so erosion is minimal and there are no obvious slope failures on the McKay Point property. Onsite material properties were characterized by SLR using available subsurface information collected at the site through six (6) borings, performed by BSK Associates in November 2011. These borings provide descriptions of the subsurface strata, which have been generalized into five (5) strata as described below and used in the slope stability modeling(SLR, 2021):

- **Moist Sand:** In the available borings, this light colored, moist, sand layer generally exists from the ground surface down to depths ranging from 7- to 15-feet bgs. It has a typical thickness of 12-feet. It is expected to have little to no cohesion and is expected to be medium-dense. The bottom of this layer is at or slightly above the groundwater levels noted in the borings.
- **Wet Sand, Gravel, Cobbles:** This is a water-bearing layer of olive-gray colored sand, gravel, cobbles, with an approximate thickness ranging from 15- to 25-feet bgs. In the easterly portion of the site, groundwater was noted at the top of or close to the top of this strata. In the easterly portion of the site, groundwater is noted to gradually dip to the mid-depth or slightly below the mid-depth of this layer. This stratum is also expected to have little or no cohesion, but with higher friction angles than the sandy layer above it, due to the presence of gravel and cobbles.

- **Wet Clayey Sand, Gravel, Cobbles:** The top of this yellow-brown to olive-brown, wet, clayey sand, gravel, cobble layer is generally at approximate elevation 430-feet amsl. It rises to an approximate elevation 440-feet amsl near the east end of the site. The thickness of this layer is of the order of 20- to 50-feet, generally increasing to the west, as the underlying bedrock and the dense soil mantle over the bedrock dip down to the west. This layer is expected to have both cohesion due to its clay content, and relatively high friction angle due to its sand, gravel, and cobble components.
- **Dense Silty Clayey Sand:** This layer consists of mixtures of gray, olive-gray, bluish-gray, olive-brown. It is described as moist to dry, indicating that it is a 'tight' formation since it is dry despite being below groundwater. In some zones, the boring logs note hard to very hard drilling. This layer is expected to have a higher strength, with properties of a stiffer cohesive material intermixed with frictional material. This layer generally tends to follow the bedrock surface as a mantle with thickness of 20-feet or more. Towards the west end of the site, bedrock was not encountered at a depth of 90-feet. The thickness of this layer may increase towards the west.
- **Granitic Bedrock:** Dry, granitic bedrock was encountered at its shallowest, at elevation 400-feet amsl or 67-feet bgs in the easterly quadrant of the site. Based on an approximate extension of the bedrock surface profile to the west, the top of bedrock can be estimated to be in the range of 100 to 120 feet bgs, under the westerly portions of the site. Borings in this area did not encounter bedrock withing their maximum exploration depths of 90-feet bgs. For slope stability modeling purposes, bedrock has been assigned a very high strength and is not considered to be an influencing factor in the stability calculations.

In addition to the native materials found onsite described above, the site would incorporate both the slurry wall as well as compacted backfill into the final reclamation design. As such, the following conditions were also accounted for the in the slope stability analysis completed by SLR (see Appendix B):

- **Slurry Wall:** This is expected to be a low-permeability barrier consisting of either a soil-bentonite mix or a soil- cement-bentonite mix, depending on the design details. Two types of walls were conceptually evaluated by SLR as part of their slope stability analyses: one with an approximate equivalent cohesion value of 400 psf, referred to as the 'low strength wall; and another with an approximate equivalent cohesion value of about 2,000 psf, referred to as the 'moderate strength wall'. In practice, an increase in the shear resistance values for the slurry wall would be achieved by adjusting the cement content of the slurry mix.
- **Compacted Backfill:** Backfill to create the 3H to 1V final reclaimed slopes is expected to consist of excavated onsite materials which will likely be a blend of granular and fine materials obtained from the pit. For stability purposes, the excavation slope would also be benched and the backfill material will be placed against the slope in horizontal lifts. The backfill material would generally be compacted to 90% relative compaction. Based on SLR's experience, SLR assumed the compacted fill consisting of a blend of granular and fine materials is assumed to have strength parameters of 200 psf cohesion and 33 degrees friction angle.

See SLR's complete Geology and Soils Technical Study (SLR, 2021) in Appendix B for additional detail related to the onsite materials properties.

Slope Stability & Landslides

Static conditions evaluate long-term open cut excavation slope configurations and pseudo-static conditions evaluate the effect of a seismic event on the open excavation slope configuration. County and SMARA regulations require that static and pseudo-static factors of safety for excavation and fill slopes are suitable for the proposed end use and conform to the surrounding topography and uses (see 14 CCR § 3704(d)).

As discussed in Section 5.5.1, SLR analyzed the slope stability conditions of both the interim excavation slopes (i.e., 1.5H:1V, 1.25H:1V, and 1H:1V) as well as the final reclaimed condition pit/reservoir basin. Conservatively, SLR also assessed the final reclaimed slopes assuming both some level of seepage/intrusion through the slurry wall (i.e., steady state model) as well as future conditions when the reservoir were fully operational (i.e., rapid drawdown model). The results of these models are conservative to when applied to the final reclaimed conditions of the site, as the presumed level of erosion would be far less than if the site were an active reservoir as the final claimed site condition would simply be a dry basin with 3H:1V slopes.

As discussed in Section 5.5.1, the slope stability factor of safety values for each of the permanent condition scenarios are all within their respective acceptable factor of safety values. Additionally, the rapid drawdown factor of safety value, which was also acceptable under static and pseudostatic conditions, reflects a conservative overestimation of the final reclaimed 42conditions and therefore actual reclamation slopes conditions would likely be more stable and therefore acceptable. There is no significant difference in factor of safety values for a 3H:1V slope placed on different excavation slope gradients, as modelled by SLR. This is as expected since the overall stability of the permanent slope is largely governed by the wedge of compacted fill placed over the temporary excavation slopes. Therefore, SLR evaluated the stability of the proposed slopes under the anticipated reclaimed conditions (i.e., reservoir basin/pit), and found them to be acceptable under both static and pseudostatic conditions. See SLR's complete geotechnical report in Appendix B for additional detail.

As discussed previously, a series of slurry walls would be installed around the perimeter of the reservoir pit. Groundwater seepage through the slurry walls into the pit would be designed to ensure a maximum rate of 500 gallons per minute (gpm) is maintained. Due to this design feature, it is anticipated that the slopes during excavation and post-reclamation would be moist near the wall and dry near the open face. Therefore, SLR evaluated the slope stability of the McKay Point site under both moist and dry conditions.

A finite element model analysis was performed by SLR for the case of the slurry wall behind the permanent 3H:1V slope of the reclaimed site. The input for the analysis was based on the geotechnical characteristics of the materials in the excavation area, assessed from available boring logs. For the conditions analyzed, the slurry wall extends from the ground surface behind the top of the outer slope, down to approximately 10-feet below the bottom of the final reclaimed basin/pit, into the low permeability native materials. Taking the slurry wall into account. for the completed basin with 3H:1V slopes and empty condition (i.e., the reclaimed condition), SLR's calculated factor of safety exceeded the generally accepted value of 1.5.

For rapid drawdown conditions, which represents emptying of the reservoir without allowing adequate time for dissipation of water from the soil within the slope, SLR determined the factor of safety exceeds the generally accepted values which range from 1.25 to 1.40. For pseudostatic (seismic) conditions, the factor of safety also exceeds the generally accepted value of 1.1. Therefore, based upon SLR's analysis, results show that the proposed slopes are sufficiently stable, including during earthquake conditions. The

slope and slurry wall deformation analyses that demonstrate that the slopes and slurry wall deformations would be tolerable with adequate safety. See Appendix B for a full copy of SLR's slope stability analysis.

In summary, based on the slope stability calculations presented above, reclaimed slopes at the McKay Point site do not exceed factors of safety criteria under anticipated operational conditions. As such, it was determined the McKay Point site would be stable and safe as designed. In addition, the relatively massive alluvial deposits have a low susceptibility to block land-sliding or lateral spreading due to the lack of geologic structures such as joints, contacts, and bedding, which may present preferred shear surfaces. See the Geology and Soils Technical Study presented in Appendix B, as well as the discussion in Section 5.5.1 above, for additional details.

5.10 Ponds, Reservoirs, Tailings & Mine Waste Management, CCR §3706, §3712

Other than small settling basins used to store fines from the aggregates plant, no ponds, tailings, or mine waste basins or impoundments would be present within the McKay Point Reservoir site during reservoir excavation or post-reclamation. As previously noted, during reclamation water in the settling basins will be allowed to naturally infiltrate and evaporate. Other deleterious materials including fines as previously discussed and overburden will be placed onto the pit walls as needed for backfill. Additionally, no dams, embankments, or foundations would be present onsite. For these reasons, excavation and reclamation activities on the McKay Point site would not result in any disposals or discharges of mine waste subject to Article 1, Subchapter 1, Chapter 7 of Title 27, California Code of Regulations.

5.11 Soil & Fine Textured Waste

Please see Section 3.1, which describes the site geology and soils found within the McKay Point site. The following section describes how topsoil and other fine soils would be managed as part of site reclamation.

5.11.1 Topsoil Salvage, Maintenance, & Redistribution, CCR §3711

As discussed in Section 5.6, revegetation or cultivation of the land disturbed by the development of the McKay Point excavation operations would not be compatible with the proposed reclamation end use, which would be an empty basin/pit that would be readily adaptable into a future water storage reservoir post-reclamation. As discussed previously, prior to the initiation of onsite mining, topsoil and subsoil removed from the site in a single layer and would be stored within the perimeter of the site, specifically utilized to construct the perimeter access road, which would remain post-reclamation. Any excess fines may also be sold by WCA as slurry used in nonstructural concrete or as miscellaneous fill material, or moved to WCA's other permitted sites in Tulare County to support reclamation objectives, consistent with their existing operations/protocols at other excavation site within the local area. Additionally, after final grading of the excavation pit/basin during reclamation, minimal quantities of topsoil and subsoil may also be redistributed along pit slopes to help facilitate stabilization and ensure the basin slopes do not exceed the required 3H:1V design gradient, which would remain post-reclamation. If excess topsoil or subsoil remains once the final reclamation landform is achieved at the McKay Point site, WCA may also transport excess fines and topsoil to their other permitted facilities throughout the region to support reclamation objectives at those sites.

5.12 Drainage & Erosion Controls

5.12.1 Drainage, Diversion Structures, Waterways & Erosion Control, CCR §3706

As discussed previously, the Owner's objective is to develop a dry excavation pit/basin that would be readily adaptable into a water storage reservoir. A Hydrology and Water Quality Technical Study was prepared by SLR and is provided in Appendix C. Additionally, a SWPPP which outlines site-specific erosion controls and water quality BMPs, would be prepared prior to initiation of reservoir excavation.

The proposed surface mining and reclamation activities have been designed to protect onsite and downstream beneficial water uses, and would be conducted in accordance with the Porter-Cologne Water Quality Control Act, Section 13000 et seq. of the State Water Code, and the Federal Clean Act, 33 U.S.C §1251, et seq. As discussed in Section 4.6 above, reservoir excavation/reclamation activities would be subject to the Industrial General Permit (IGP). Therefore, prior to commencement of mining/excavation, a site-specific SWPPP would be prepared that complies with the IGP. The SWPPP would include the following: specific prohibitions, effluent limitations, source identification, practices to reduce pollutants, assessment of pollutant sources, materials inventory, preventative maintenance program, spill prevention and response procedures, general storm water BMPs, training, record keeping, sampling procedures and a description of the monitoring program. Additionally, the SWPPP is considered a living document, and would be updated as needed to address changing conditions on the site. Measures implemented per the SWPPP would ensure surface mining and reclamation activities do not impact nearby surface waters, specifically the Lower Kaweah River and St. Johns River located to the south of the McKay site.

During reservoir excavation, and as necessary during and/or post-reclamation, energy dissipaters would be installed, such as sediment catchment basins or sumps, rock dams, and berms. These would serve to reduce erosion, trap sediment, and minimize the potential for erosions, sedimentation, and off-site transport of pollutants. As discussed above, BMPs (e.g., berms, silt fences, other erosion control measures, etc.) outlined within the SWPPP would be implemented through our excavation and reclamation to minimize erosions and offsite discharge during storm events. Additionally, the perimeter road would be graded to direct runoff into the reservoir pit or onsite detention areas (i.e., infiltration galleries) instead of toward the adjacent Lower Kaweah and St. John Rivers.

As discussed in Section 3.2.2, the existing McKay site has no natural surface waters, including drainages, streams or lakes, that would be covered, restricted, rerouted, or otherwise impact due to excavation and reclamation activities at the McKay Point site. Specifically, this Reclamation Plan covers the excavation of the reservoir pit (i.e., surface mining) and stabilization of the reservoir basin (i.e., reclamation) for future development of a water storage reservoir. Construction and operation of the reservoir itself, which would potentially occur in the future and would involve diversion of the adjacent Lower Kaweah and St. John Rivers, construction of any future reservoir structures is not subject to SMARA and is therefore not covered within this Reclamation Plan.

5.12.2 Stream Protection, Including Surface Water, & Groundwater, CCR §3710

A Hydrology and Water Quality Technical Study was prepared by SLR (SLR, 2022) and is provided in the Appendix C. SLR's study concluded that excavation and reclamation activities within the McKay Point site would not have significant impacts on surface or groundwater quality.

The site-specific SWPPP to be prepared prior to excavation and reclamation operations, would outline BMPs and the methods and means for onsite protection of surface water and groundwater quality.

Approved BMPs to protect the surface water quality of areas surrounding McKay Point Project site will be identified in the site-specific SWPPP, which will be prepared and submitted to the Water Board for approval prior to onsite operations. Additionally, per the Hydrology and Water Quality Technical Study (Appendix C), mining and reclamation activities within the McKay site would not directly encroach into the adjacent Kaweah and St. Johns River waterways or existing floodplain(s). The approved BMPs that will be identified in the SWPPP, as well as those BMP's outlined in the Hydrogeology and Water Quality Technical Study in Appendix C, would be implemented at the Project site to prevent runoff and control erosion that could impact nearby surface waters (i.e., Kaweah River, St. Johns River).

Other agencies would be consulted prior to initiating activities that may require additional permits or authorization.

As discussed previously, groundwater is expected to occur at depths below 7- to 12-feet bgs. The final reservoir depth of excavation is anticipated to be 60- to 75-feet bgs; therefore, dewatering of the excavation pits may be required. However, once the slurry wall is installed around the perimeter of the reservoir basin, which would occur early in the excavation phase of the project, dewatering using pumps would not be required so long as into the basin are limited to approximately 500 gpm. The slurry wall would be a permanent fixture of the McKay site and would serve as an essential feature to maintain a dewatered basin post-reclamation. The slurry wall would be maintained to ensure that both onsite excavation and reclamation activities do not adversely affect local groundwater.

5.13 Public Health & Safety, CCR §3502 (b)(2)

As discussed previously, vehicles would access the McKay Point site using the existing access road in the northwest corner of the site (see Figure 3), which connects to the adjacent Seaborn facility. This access point would serve as the single ingress and egress point for all haul trucks, employees and other work vehicles, which includes small work trucks, and employee/visitor passenger vehicles. A security gate with required signage would be located on the access road at the boundary of the McKay site, and would be locked during non-working hours.

Public access to both the existing Seaborn facility and McKay Point site would also be restricted with perimeter fencing and the existing locked entrance gates, including the existing entrance gate along Road 222. The gates would have signs reading "NO TRESPASSING." The 4-foot-high perimeter fence and gates would restrict access to foot traffic and motor vehicles from the public roads, and would remain in place during mining and post-reclamation reclamation activities.

Mining and reclamation activities would comply with all Federal Mine Safety and Health Administration (MSHA) and State Occupational Safety and health Administration (OSHA) mine safety regulations concerning operating standards and operation of equipment.

Workers, including contract labor, would be trained in mine safety and first aid. Refresher courses would be conducted periodically in accordance with applicable regulations.

Site operators would carry portable cellular phones for offsite communication. All visitors, outside vendors, and truck drivers would be required to check-in and check-out with the site manager before entering or leaving the McKay Point site. Conditions affecting safety would be continually monitored by onsite operations personnel.

The McKay Point site is private property. During excavation and reclamation operations, as well as post-reclamation once the site is stabilized, the general public would not be admitted to these lands without prior permission of the Owners and/or onsite manager.

When mining has concluded and reclamation is complete, there would be no open shafts or any hazardous materials associated with the mining operations remaining on the reclaimed lands.

5.13.1 Control of Potential Contaminants & Non-Marketable Material, CCR §2772 (c)(8)

As discussed previously, other than nominal quantities of fuels and greases for the fueling/servicing of mobile equipment, the excavation and reclamation activities would not require the transport, storage, use, and/or disposal of hazardous materials. During excavation, onsite fuels would be temporarily stored within a portable 4,000-gallon diesel tank. Fuel and/or lubricant spills could result in the accidental release of hazardous materials into the environment; however, the Owners/WCA would ensure fuel storage utilizes appropriate secondary containment, and spill kits would be maintained onsite at all times. The use, storage, transport, and disposal of hazardous materials would be done in strict accordance with Federal, State, and County laws, ordinances, and regulations, including but not limited to hazardous waste generator requirements as well as provisions outlined within the site-specific SWPPP. BMPs identified in the SWPPP would be implemented to minimize erosion and the transport of sediment.

As discussed previously, overburden/soil and excess fines generated during reservoir excavation would be managed onsite. Non-marketable material would primarily be utilized to construct/maintain the perimeter access road, which would remain post-reclamation. Excess fines may also be used as backfill to complete the slurry wall and/or to ensure the pit walls maintain the desired 3H:1V slope. The remainder of the fines could be sold as miscellaneous fill material. Specifically, excess fines may also be sold by WCA as slurry used in nonstructural concrete or as miscellaneous fill material, as WCA has done in the past with overburden and fines resulting from their mining activities.

5.14 Monitoring, Maintenance, & Reporting

Performance monitoring would include both qualitative and quantitative assessment. Qualitative monitoring would occur during periodic inspections of the full McKay Point site/reclamation areas. These inspections would be conducted by the onsite reclamation specialist, and would generally occur more frequently (approximately every month) during the first year of reclamation, and less often in subsequent years. Quantitative monitoring would typically occur annually, beginning during the first year of reclamation following excavation (i.e., estimated to commence in 2044). Reclamation inspection data would be provided to the County upon request.

5.14.1 Reclamation Monitoring

Qualitative monitoring methods used by the onsite reclamation specialist would include visual observation and photo documentation. There are no specific performance criteria associated with this monitoring.

During annual monitoring events required under SMARA, the SMARA inspector would document the conditions and potential issues (i.e., vandalism, fence damage, slope failures, erosion, etc.), and recommended actions would be documented in a field memo. Copies of all field memos would be included in each year's annual SMARA report, which would be submitted to the County for review.

Annual photographs of revegetation areas would be taken from preset photo stations during data collection events. Additional photographs would be taken of any potential problem areas. All photographs would be logged and included in each annual report.

As noted previously, because the reclaimed site would be a dry basin, perimeter road, and slurry wall that could be readily adaptable for future use as a water storage reservoir, revegetation of the site would be incompatible with the proposed end-use. Because revegetation would not be implemented onsite during reclamation, quantitative monitoring of revegetation success would also not be required. Nonetheless, both the Owners and the County would conduct annual inspections, and the results of ongoing site reclamation would be reviewed annually to ensure the site remains in a stable/clean condition, and that applicable SMARA standards/success criteria continue to be met.

5.14.2 Annual Monitoring Reports

Annual monitoring reports would be prepared that include a summary of the reclamation efforts, site conditions, any issues encountered, evaluation of the data collected and success achieved, and recommendations for meeting the SMARA performance criteria. Reports would be prepared and submitted to the County annually for review and approval.

5.15 Reclamation Assurance, CCR §2773.1 (a)

A detailed Financial Assurance Cost Estimate (FACE) would be prepared prior to commencement of operations at the McKay Point site. Per SMARA requirements, the FACE would include detailed descriptions and spreadsheets estimating the cost for reclamation of the site to the specifications established in this Reclamation Plan.

A performance bond payable to the County and, in the alternative, the California Department of Conservation (DOC), Division of Mine Reclamation (OMR), would be provided to the County in the amount of the estimated cost of reclamation. Alternatively, if provided for by future regulations, other forms of equivalent surety may be substituted.

Please see Section 8.0 below for more detail.

6.0 OTHER SMARA RECLAMATION STANDARDS

6.1 Protection of Fish and Wildlife Habitat, CCR §3503(c)

As discussed in Sections 3.5 and 5.4, a biological resources surveys were performed by BBC in 2013 and 2021 (Bumgardner Biological Consulting, 2021). Please see the previous sections, as well as the biological resource reports prepared by BBC (Appendix D) for more detail.

As discussed previously, much of the onsite vegetation consists of nonnative annual grassland. No special-status plant taxa were observed on or immediately adjacent to the McKay Point site during the surveys. Additionally, no special-status plant taxa that have been documented in the region are considered to have any potential to occur on the McKay Point site given the onsite conditions (i.e., lack of suitable habitat for and/or known distribution of the species).

As discussed previously, approximately 39.8 acres of elderberry savannah-riparian woodland (a sensitive vegetation community tracked by the California Department of Fish and Wildlife [CDFW]) occurs adjacent to the mixed oak-riparian woodland, but also extends west along the southern border of the McKay Point site; however, as shown on Figure 1 through Figure 3, excavation and reclamation activities on the McKay Point site has been designed to avoid this area, and would therefore not impact this riparian area as this riparian area is located outside the areas of disturbance.

As discussed in Section 3.5.3, only two (2) special-status wildlife species were observed on the McKay Point site during the surveys. One of these species (i.e., Nuttall's woodpecker) is a likely year-round resident in the mixed oak-riparian woodland in the southeastern portion of the project site. The second species (i.e., willow flycatcher) was only observed during the September 18, 2013 survey and is considered a migrant that passes through the area (including the McKay site). Furthermore, this latter species is only considered a special-status species when nesting (typically in dense willow scrub in the Sierra Nevada). Although not observed onsite, BBC determined that one (1) special-status reptile, ten (10) special-status birds, and one (1) special-status mammal have the potential to occur on the McKay Point site.

As discussed in Section 5.4.1, BBC recommend mitigation measures to ensure development of the McKay Point Reservoir does not adversely impact any special-status wildlife species. Specific measures would be implemented during excavation and reclamation activities including avoidance and minimization measures related to nesting birds, preconstruction surveys, installation of exclusionary fencing, etc. The biological resources report in Appendix D provides a detailed discussion of the wildlife and the CEQA EIR identifies the wildlife protection measures, which were developed by BBC, to be implemented onsite.

6.1.1 Wildlife Habitat

SMARA requires that "wildlife habitat shall be established on disturbed land in a condition at least as good as that which existed before the lands were disturbed by surface mining operations, unless the proposed end use precludes its use as wildlife habitat or the approved reclamation plan establishes a different habitat type than that which existed prior to mining" (SMARA §3703(c)). Because the entirety of the reclaimed site would remain a dray basin with a perimeter access road/slurry wall to be adapted into a future water storage reservoir, revegetation and reestablishment of habitat similar to existing conditions would not be feasible or preferable, as entirety of the site would be underwater in the future.

Additionally, as discussed previously, the existing habitat consists of nonnative annual grassland that has been disturbed by historical cattle grazing, and is not of local or regional importance. The project has also

been designed to completely avoid elderberry savannah-riparian woodland located to the south of the area pf disturbance. For these reasons, development of the site would not eliminate any existing habitat designated as sensitive or special-status per the County of CDFW.

6.1.2 Wetlands

As discussed in BBC's reports (Appendix D), wetlands or other waters of the United States are identified based on three (3) criteria:

(1) Soil characteristics;
(2) Hydrology; and
(3) Plant species.

The U.S. Army Corps of Engineers (USACE) has developed a procedure and manual for delineating wetlands that requires comprehensive evaluation of these three criteria during field environmental assessments. No waters that are subject to the jurisdiction of the USACE, CDFW, or Regional Water Quality Control Board (RWQCB) occur on the McKay Point site. While the Kaweah and St. Johns Rivers, which occur on or immediately adjacent to the site, are jurisdictional waters, as discussed previously the excavation and reclamation within the McKay Point site would not impact these waterbodies. Please see Figure 1 through Figure 3, which show the design and footprint of the excavation and reclamation areas, which are outside the jurisdictional waters.

6.2 Prime Agricultural Land Reclamation, CCR §3707

Per the California Department of Conservation's Farmland Mapping and Monitoring Program, the proposed McKay Point site is not located within Prime Agricultural land.

The California Resources Agency, Division of Land Resource Protection maintains information pertaining to, and the mapping of, farmland. The entire McKay Point site is designated as Vacant or Disturbed Land, which, among other definitions, includes "open field areas that do not qualify for an agricultural category." Historically, the site has experienced only marginal agricultural use in the form of seasonal livestock grazing. As such, excavation and reclamation activities on the McKay Point site would have no impact on any category of important farmland.

6.3 Other Agricultural Land Reclamation, CCR §3708

The reclaimed McKay site would be a stabilized excavation pit/basin suitable and adaptable for future development of a water storage reservoir. There are no agricultural uses proposed, nor would any be feasible, post-reclamation.

6.4 Other Lead Agency Requirements, CCR §2772(c)(11)

In addition to the SMARA requirements addressed in this Reclamation Plan, the following Tulare County zoning/land use requirements and California Environmental Quality Act (CEQA) requirements are applicable to the McKay Point site:

- Tulare County Ordinance Code, Part VII, Chapter 25 – Surface Mining and Reclamation (Tulare County).
- Tulare County General Plan 2030 Update (Tulare County, 2012).
- CEQA Appendix G Environmental Checklist and subsequent CEQA documents.

7.0 STATEMENT OF RESPONSIBILITY, CCR §2772(C)(10)

As required by Public Resources Code §2772 (c)(10), the owner and operator accept responsibility for reclaiming the mined lands in accordance with the provisions of this Reclamation Plan.

I, the undersigned, hereby acknowledge that all of the provisions of said permit and reclamation plan, and any and all conditions appended thereto will be faithfully performed and completed within the time therein provided, or within any additional time as may be allowed pursuant to the Surface Mining Ordinance Code of the lead agency and with the applicable requirements of Articles 1 and 9 (commencing with section 3500 et seq., respectively) of Chapter 8, Division 2, Title 14, of the California Code of Regulations, the Surface Mining and Reclamation Act of 1975 (SMARA), as amended (Section 2710 et seq. of the Public Resources Code) which are incorporated herein by reference.

I, the undersigned, hereby agree to perform and complete the provisions of said permit and/or plan, including any and all conditions appended thereto, shall be subject to the provisions of said Ordinance Code and SMARA and the State Mining and Geology Board's implementing regulations and guidelines.

That the place of performance by the undersigned of the covenants herein, shall be the area managed by the lead agency in the State of California.

That, pursuant to Public Resources Code section 2774.1 (a) notice procedures, any notice required to be given, or otherwise given to the undersigned may be by personal service or by certified mail.

8.0 FINANCIAL ASSURANCES, CCR §2773.1 (A)

A Financial Assurance Cost Estimate (FACE) would be prepared for the McKay Point Reservoir site and this Reclamation Plan. This FACE would be reviewed annually and updated accordingly.

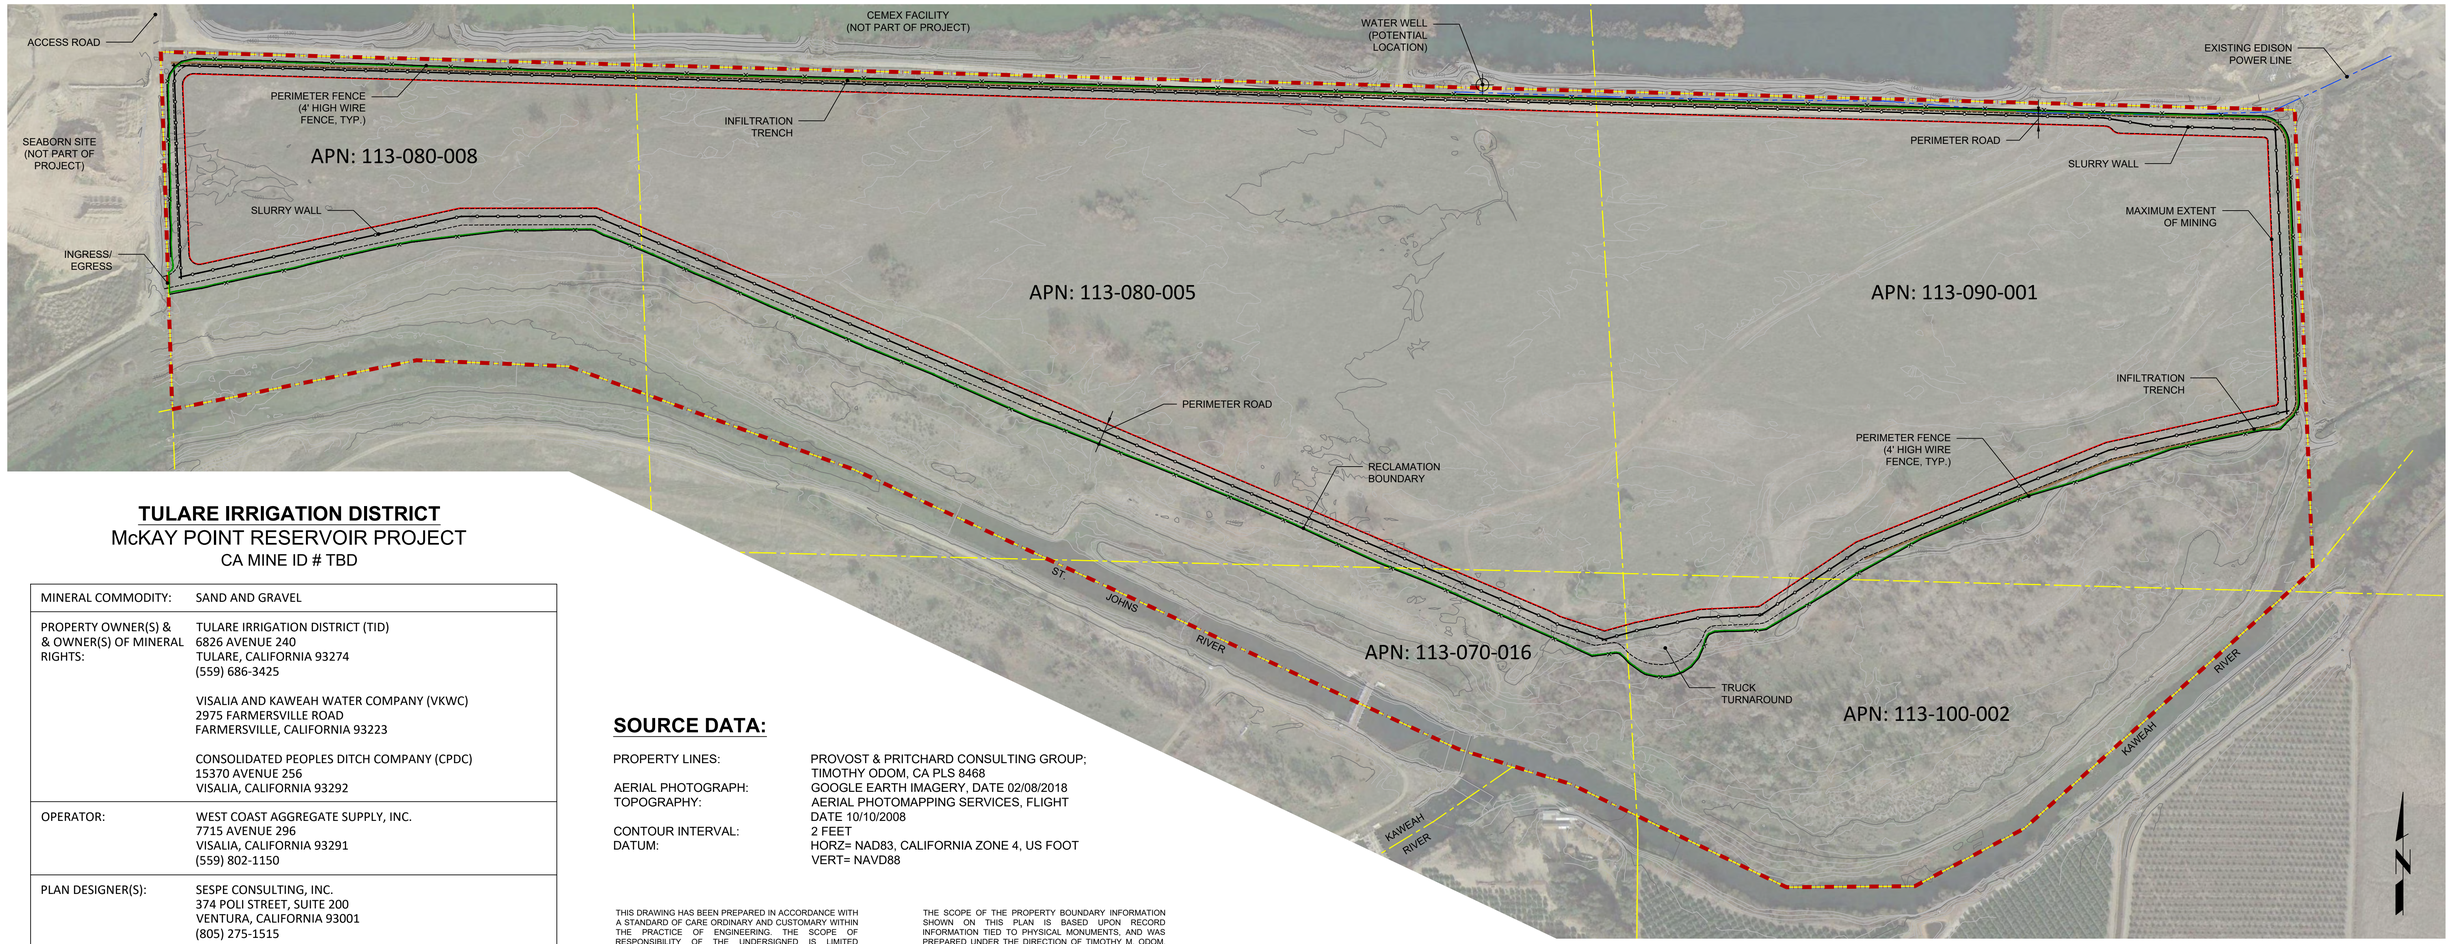
GEOLOGIC DESCRIPTION

GEOLOGIC SETTING

THE MCKAY POINT SITE IS LOCATED IN CALIFORNIA'S CENTRAL VALLEY, NEAR THE WESTERN BOUNDARY IN THE LOW FOOTHILLS OF THE SIERRA NEVADA GEOMORPHIC PROVINCE OF CALIFORNIA. THE SOUTHERN SAN JOAQUIN VALLEY BOUNDS THIS PART OF THE SIERRA NEVADA TO THE WEST AND THE GREAT BASIN TO THE EAST. THE FOLLOWING EXCERPTS FROM THE GEOLOGY AND SOILS TECHNICAL STUDY (SLR CONSULTING, DECEMBER 2021) PROVIDE A BRIEF SUMMARY OF THE REGIONAL AND SITE GEOLOGIC SETTING. SEE ALSO SECTION 3.1 OF THE RECLAMATION PLAN AND THE COMPLETE SLR CONSULTING REPORT IN RECLAMATION PLAN APPENDIX A.

REGIONAL GEOLOGY

THE MCKAY POINT SITE IS LOCATED IN THE SAN JOAQUIN VALLEY, WHICH IS THE SOUTHERN PORTION OF THE CENTRAL VALLEY OF CALIFORNIA. THE CENTRAL VALLEY FORMED BY MILLIONS OF YEARS OF DEPOSITION OF QUATERNARY SEDIMENTS DERIVED FROM THE UPLIFTED SIERRA NEVADA AND COAST RANGES, WHICH BOUND THE CENTRAL VALLEY ON ITS EAST AND WEST. THE CENTRAL VALLEY IS AN ALLUVIAL PLAIN APPROXIMATELY 50 MILES WIDE AND 400 MILES LONG (NORTH TO SOUTH). SEDIMENTS HAVE BEEN DEPOSITED INTO THE CENTRAL VALLEY FOR THE LAST 160 MILLION YEARS, AND CAN BE THOUSANDS OF FEET THICK IN CERTAIN AREAS.



NUMEROUS RIVERS AND STREAMS ORIGINATING IN THE HIGHER ELEVATIONS OF THE SIERRA NEVADA, INCLUDING THE KAWEAH RIVER, FLOW WESTWARD INTO THE CENTRAL VALLEY, DEPOSITING QUATERNARY ALLUVIAL SEDIMENTS UPON WHICH THE SITE IS LOCATED. THIS ALLUVIUM IS UNDERLAIN BY A SEQUENCE OF MARINE AND CONTINENTAL SEDIMENTARY ROCKS CONSISTING OF SHALE, SILTSTONE, SANDSTONE, AND LOCALLY GRANITIC ROCK UNDERLYING THE ALLUVIUM AT THE SITE. BENEATH THESE ROCKS LIES AN IMPERMEABLE BASEMENT COMPLEX OF IGNEOUS AND METAMORPHIC ROCKS THAT EXTEND AS DEEP AS 13,000-FEET BELOW GROUND SURFACE (BGS). THESE BASEMENT ROCKS ARE A SUBSURFACE EXTENSION OF THE SAME ROCKS THAT OCCUR IN THE SIERRA NEVADA.

SITE GEOLOGY

THE MCKAY POINT SITE IS AT AN ELEVATION OF APPROXIMATELY 460- TO 470-FEET ABOVE MEAN SEAL LEVEL (AMSL) AND IS LOCATED IN THE EASTERN PORTION OF KAWEAH SUB-BASIN OF THE SAN JOAQUIN VALLEY GROUNDWATER BASIN. THIS AREA IS UNDERLAIN BY YOUNG UNCONSOLIDATED ALLUVIAL DEPOSITS (SANDS AND GRAVELS) FROM THE NEARBY SIERRA-NEVADA MOUNTAINS. THESE MODERATELY TO HIGHLY PERMEABLE SANDS AND GRAVELS EXTEND TO DEPTHS OF SEVERAL HUNDRED FEET OR MORE. THE SITE VICINITY IS DRAINED BY THE KAWEAH RIVER AND ST. JOHNS RIVERS, WHICH DEPOSITED THESE SEDIMENTS.

THE SURFACE SOIL AT THE MCKAY POINT SITE PRIMARILY CONSISTS OF LOOSE, MEDIUM GRAINED SAND WITH OCCASIONAL GRAVEL AND COBBLES. THE THICKNESS OF FLUVIAL SEDIMENTS AT THE SITE RANGES BETWEEN APPROXIMATELY 40- AND 100-FEET BGS. ALLUVIAL DEPOSITS AT THE MCKAY POINT SITE CONSIST OF SAND THAT IS ABOUT 15- TO 20-FEET THICK. COBBLES, BOULDERS WITH SAND, CLAY AND SILT ARE COMMON BELOW THIS SAND INTERVAL. THESE DEPOSITS EXTENDED TO A DEPTH OF ABOUT 40-FEET BGS ON THE EASTERN PORTION OF THE SITE, AND TO ABOUT 100-FEET BGS ON THE WESTERN. THE BEDROCK ENCOUNTERED IS LIKELY MESOZOIC GRANITIC ROCKS OF THE SIERRA-NEVADA BATHOLITH, WHICH HAS BEEN MAPPED AS OUTCROPS AT HIGHER ELEVATIONS WITHIN ABOUT A MILE TO THE NORTH, EAST, AND SOUTH OF SITE. THE SURROUNDING HILL AND OUTCROP FEATURES SUGGEST BEDROCK COULD GET DEEPER TO THE WEST AND SOUTHWEST, TOWARDS THE VALLEY. AVAILABLE BORINGS ENCOUNTERED BEDROCK IN THE EASTERLY PORTION OF THE SITE AT APPROXIMATELY 77-FEET BGS. IN THE WESTERLY PORTION OF THE SITE, BEDROCK WAS NOT ENCOUNTERED WITHIN THE EXPLORED DEPTHS OF ABOUT 90-FEET BGS, INDICATING IT WOULD BE DEEPER THAN THAT.

WEATHERED OR DECOMPOSED BEDROCK ZONES AND SOME DISCONTINUOUS INTRUSIONS OF CLAY OR CLAYEY SAND MAY ALSO EXIST. THERE IS AN APPROXIMATE 10- TO 15-FOOT-THICK MANTLE OF VERY DENSE SILTY, CLAYEY SAND OVERLYING THE BEDROCK. THIS LAYER GENERALLY FOLLOWS THE TOP OF ROCK, LIKEWISE DIPPING DOWN TO THE WEST. BOTH THE BEDROCK AND THE OVERLYING MANTLE OF VERY DENSE SOILS ARE EXPECTED TO BE LESS PERVIOUS THAN THE OVERLYING ALLUVIAL MATERIALS AND THEREFORE PROVIDE A GOOD OPPORTUNITY TO KEY-IN A SLURRY WALL TO ACHIEVE THE DESIRED HYDRAULIC BARRIER.

MINING NOTES

1. THE MAXIMUM EXCAVATED PIT WILL HAVE A DEPTH OF 60 TO 90 FEET BELOW THE EXISTING GROUND SURFACE. PIT SLOPES WILL NOT EXCEED 1.5H:1V (HORIZONTAL TO VERTICAL).
2. DURING THE INITIAL LIMITED EXCAVATION AND MATERIAL PROCESSING STAGE, AN IMPERMEABLE SLURRY WALL WILL BE CONSTRUCTED AROUND THE EXACTION AREA TO LIMIT THE AMOUNT OF GROUNDWATER FLOW INTO THE EXCAVATION AS FUTURE EXCAVATION PROGRESSES BELOW THE WATER TABLE. THE SLURRY WALL WILL BE DESIGNED BY A QUALIFIED PROFESSIONAL AND CONSTRUCTED BY A QUALIFIED CONTRACTOR WITH EXPERIENCE IN INSTALLING SIMILAR FACILITIES. CONSTRUCTION WILL INCLUDE THE FOLLOWING FACILITIES:
   - A PERIMETER ACCESS ROAD THAT WOULD ALSO SERVE AS A LEVELING SURFACE FOR THE CONSTRUCTION OF THE SLURRY WALL. THE ROAD MAY VARY IN WIDTH FROM APPROXIMATELY 30 TO 50 FEET AND WILL BE BUILT ON FILL UP TO 8 FEET IN HEIGHT.
   - AN APPROXIMATELY 60- TO 90-FOOT-DEEP SLURRY WALL SURROUNDING THE EXCAVATION AREA. ITS ACTUAL DEPTH WILL BE DETERMINED DURING DESIGN AND VERIFIED DURING CONSTRUCTION BASED ON SUBSURFACE INFORMATION, TO PROVIDE THE REQUIRED REDUCTION IN GROUNDWATER INFLOW. THE SLURRY WALL WOULD BE CONSTRUCTED THROUGH THE PERIMETER ROAD AND CAPPED OFF WITH A DURABLE GRAVEL LAYER.
   - AN APPROXIMATELY 5-FOOT-DEEP WATER INFILTRATION TRENCH ALONG THE NORTHERN BORDER OF THE ULTIMATE RESERVOIR AREA.
3. THE OVERBURDEN AND EXCESS FINES RESULTING FROM THE EXCAVATION OF THE PIT AND PROCESSING OF MATERIALS WOULD BE PRIMARILY USED ONSITE TO CONSTRUCTED THE SERVICE ROAD AROUND THE PERIMETER OF THE PIT OR AS BACKFILL AGAINST THE PIT WALLS TO ACHIEVE DESIRED 3H:1V (HORIZONTAL:VERTICAL) FINAL SLOPES. ADDITIONALLY, OVERBURDEN MAY ALSO BE STORED IN VARIOUS TEMPORARY STOCKPILES LOCATED THROUGHOUT THE SITE OR AT THE BOTTOM OF THE EXCAVATION PIT AS NEEDED. NOTE THAT TOPSOIL AND SUBSOIL STORAGE IS NOT A REQUIRED ELEMENT OF THE MINE PLAN.
4. MINING SETBACKS WILL BE 30 FEET FROM THE EXTERIOR PROPERTY BOUNDARIES, 50 FEET FROM THE BANKS OF THE ADJACENT WATER BODIES, AND 50 FEET FROM THE OAK-RIPERIAN WOODLAND ON THE SOUTHEASTERN PORTION OF THE PROPERTY.
5. THE OPERATOR WILL COMPLY WITH THE CONCLUSIONS AND RECOMMENDATIONS PRESENTED BY SLR IN THE *GEOLOGY AND SOILS TECHNICAL STUDY FOR THE MCKAY POINT RESERVOIR PROJECT* (REPORT DATE: DECEMBER 2021).
6. BEST MANAGEMENT PRACTICES (BMPs) TO PREVENT EROSION, SEDIMENT, AND WINDBLOWN DUST WILL BE IMPLEMENTED AS DESCRIBED IN THE SITE-SPECIFIC STORM WATER POLLUTION PREVENTION PLAN (SWPPP). DUST WILL BE CONTROLLED THROUGHOUT THE SITE/ON UNPAVED ROADS USING A MOBILE WATER TRUCK.
7. THERE ARE NO EXISTING PUBLIC ROADS, RAILROADS, OR WATER WELLS WITHIN 500-FEET OF THE SITE. ACCESS TO THE PROJECT SITE WILL BE THROUGH THE ADJACENT SEABORN SITE TO THE WEST, WHICH CONNECTS TO ROAD 222.
8. EXISTING SOUTHERN CALIFORNIA EDISON (SCE) POWER LINES RUN ALONG THE NORTHERN PERIMETER OF THE SITE. THE PROPOSED WASH/SCREEN PLANT WILL CONNECT TO THESE EXISTING UTILITIES. NO OTHER UTILITIES (GAS TELEPHONE, WATER, ETC.) EXISTING WITHIN 500 FEET OF THE SITE.

RECLAMATION NOTES

1. THE FINAL, RECLAIMED PIT WILL HAVE A DEPTH OF 60 TO 75 FEET BELOW THE EXISTING GROUND SURFACE. FINAL SLOPES WILL BE CONSTRUCTED AT 3H:1V (HORIZONTAL TO VERTICAL).
2. THE IMPERMEABLE SLURRY WALL, PERIMETER ACCESS ROAD, AND WATER INFILTRATION TRENCH CONSTRUCTED AT THE INITIATION OF THE PROJECT WILL REMAIN IN PLACE FOLLOWING MINING AND RECLAMATION. CONCEPTUAL LOCATIONS OF THESE DESIGN ELEMENTS ARE SHOWN ON THE FIGURE, AND PROPOSED CONCEPTUAL DESIGN LAYOUTS ARE DEPICTED ON SECTIONS ON FIGURE 4.
3. THE OVERBURDEN AND EXCESS FINES RESULTING FROM THE EXCAVATION OF THE PIT AND PROCESSING OF MATERIALS WOULD BE PRIMARILY USED ONSITE TO CONSTRUCTED THE SERVICE ROAD AROUND THE PERIMETER OF THE PIT OR AS BACKFILL AGAINST THE PIT WALLS TO ACHIEVE DESIRED 3H:1V (HORIZONTAL:VERTICAL) FINAL SLOPES.
4. THE OPERATOR WILL COMPLY WITH THE CONCLUSIONS AND RECOMMENDATIONS PRESENTED BY SLR IN THE *GEOLOGY AND SOILS TECHNICAL STUDY FOR THE MCKAY POINT RESERVOIR PROJECT* (REPORT DATE: DECEMBER 2021).

1. INTRODUCTION

1.1. BACKGROUND

The Tulare Irrigation District (TID), the Consolidated Peoples Ditch Company (CPDC) and the Visalia & Kaweah Water Company (VKWC) are joint owners (**Owners**) of approximately 500 acres of land adjacent to the Kaweah and St. Johns Rivers in Tulare County, California, commonly referred to as the McKay Point property (**Site**). The Site location is shown in **Figures 1 and 2**.

The Owners propose to develop approximately 200 acres of the total 500-acre McKay Point property on the north side of the divergence of the Kaweah and St. Johns Rivers into a surface water storage and reregulation Reservoir (**Reservoir**).

West Coast Aggregate (WCA) will excavate the Reservoir in accordance with plans and specifications to be developed (**Excavation**). WCA intends to process the resulting aggregate materials (i.e., rock, sand, and gravel) within the Site (**Figures 2 and 3**). WCA would then sell the processed materials.

The Excavation of a pit that will be used for the construction of the reservoir and the Construction / Operation of the Reservoir are the phases collectively referred to as the **Project**. The Reservoir phase of the Project will entail storage and release of surface water only. To minimize groundwater from entering the Excavation and the Reservoir, a subsurface groundwater barrier system (**Slurry Wall**) will be installed around the perimeter to minimize groundwater inflow. While some amount of groundwater inflow will occur during periods when the Reservoir is not full, this inflow will be pumped out and returned to nearby groundwater. The Slurry Wall will also minimize stored water losses from the Reservoir to groundwater when it is full.

The potential impacts of the Project are evaluated from a geotechnical engineering and geology perspective, based on the California Environmental Quality Act (**CEQA**). This report includes an evaluation of impacts related to the Excavation, Reservoir, and Slurry Wall components of the Project. Impact analyses for these elements are based on computer models and other evaluation methods to address the stability of temporary and permanent slopes, dewatering considerations, regional and local geologic conditions, and seismicity.

This report is organized to provide technical input for CEQA document preparation. It includes sections on the environmental setting, general Site conditions, available subsurface information on soils and groundwater, regional and local geology, seismicity, and faulting. The impact of the proposed project on the current conditions are then evaluated, based on our engineering analyses, professional opinions, and our geotechnical engineering related construction know-how. This information is then applied to the proposed development concept and its likely construction scenarios applicable to the different stages of its development. The report concludes by addressing each CEQA significance criteria related to geology and soils. Figures are provided at the end of the report. Further technical details are presented in the Appendices.

1.2. PROJECT OVERVIEW

The overview of the Project and the geology and soils conditions of the Site is based on our review of documents provided by TID (**Applicant**) or their representatives and consultants, as well as publicly available data and reports. The reviewed documents provide information on geotechnical conditions (BSK, 2011) and groundwater conditions (SLR, 2021; Schmidt, 2012; SES, 2012). Information from other documents listed in the References have also been reviewed and evaluated as part of this assessment.

The Owners propose to construct and operate the Reservoir on the north side of the divergence of the Lower Kaweah and St. Johns Rivers near McKay Point in Tulare County, California (**Figures 2 and 3**).

The Reservoir capacity is expected to be 4,600-acre feet. Its depth is expected to range from approximately 60 to 80 feet. The material excavated during construction will consist of resource-grade aggregate and will be processed at the WCA facility to be setup within the excavation area.

The Excavation and the Reservoir will extend vertically below the groundwater levels. The Applicant will implement dry mining methods to recover the aggregate and to create the Reservoir. Dewatering of the excavated area will be conducted, as necessary to allow for dry mining techniques.

Upon completion of the Reservoir excavation, water will be diverted from the Kaweah River and stored in the Reservoir. When completed, the Reservoir will serve as a surface water storage/re-regulation facility.

2. ENVIRONMENTAL SETTING

2.1. REGIONAL SETTING

The Site is in California's Central Valley near the western boundary in the foothills of the Sierra Nevada Geomorphic Province of California. The southern San Joaquin Valley bounds this part of the Sierra Nevada to the west and the Great Basin to the east. The Central Valley is one of the most productive agricultural regions in the world.

This region is underlain by young and old unconsolidated fluvial deposits (sandy and silty gravels, clayey sand and cobbles, and silty and clayey sands) that originated from the nearby Sierra-Nevada Mountains. These moderately to highly permeable silts, sands and gravels generally extend to depths of several hundred feet or more.

The Site vicinity is drained by the Kaweah River and by the St. Johns River, which drain ultimately to the Tulare Lakebed in the southern end of the San Joaquin Valley. In 1962, Lake Kaweah, located upstream from the Site, was created by the construction of Terminus Dam on the Kaweah River. Renovations of this dam in 2004 significantly reduced flooding at the Site and the surrounding area.

2.2. LOCAL SETTING

The Site is currently undeveloped and has been used for cattle grazing under lease arrangements. Most of the Site is vegetated with native grasses. Immediately to the north is CEMEX's Lemon Cove Facility. The Kaweah River Rock aggregate mining and processing facility is located immediately to the west. Adjacent lands to the south and east are used intensively for agricultural and, to a limited extent, for rural residential purposes.

The surface soil at the Site primarily consists of loose, medium-grained sand with occasional gravel and cobbles. Site surface drainage east of the river split is generally to the south and southeast toward the Kaweah River and west of the River split generally to the south and southwest toward the St. Johns River. The Site elevation slopes from approximately 472 feet above mean sea level (msl) at the northeastern end of the property, downward to approximately 454 feet above msl at the southwestern end.

3. BASELINE GEOLOGIC AND SOIL CONDITIONS

3.1. REGIONAL AND LOCAL GEOLOGY

The Central Valley has been formed by millions of years of deposition of Quaternary sediments derived from the uplifted Sierra Nevada and Coast Ranges, which bound the Central Valley on its east and west (**Figure 1**). The Central Valley is an alluvial plain approximately 50 miles wide (E-W) and 400 miles long (N-S). Sediments have been deposited into the Central Valley for the last 160 million years and can be thousands of feet thick in certain areas.

Numerous rivers and streams originating in the higher elevations of the Sierra Nevada, including the Kaweah River, flow westward into the Central Valley, depositing Quaternary alluvial sediments upon which the Site is located (Mathews and Burnett, 1965). This alluvium is underlain by a sequence of marine and continental sedimentary rocks consisting of shale, siltstone, and sandstone and locally granitic rock underlying the alluvium at the Site. Beneath the sedimentary rocks lie an impermeable basement complex of igneous and metamorphic rocks that extend as deep as 13,000 feet bgs. These basement rocks are a subsurface extension of the same rocks that occur in the Sierra Nevada (Faunt et al., 2009). A geologic map of the region is included as **Figure 4**.

The subsurface stratigraphy of the site has been previously explored, evaluated, and reported in several studies, as cited in the References. Excerpts from available documents is reproduced in Appendix A. A total of 6 soil borings were conducted at the Site in November 2011 (BSK, 2011). Based on these borings and hydrogeologic interpretations by Schmidt (2012), the thickness of fluvial sediments within the Reservoir area ranges between approximately 40 and 100 feet bgs. Alluvial deposits at the Site consist of sand that is about 15-20 feet thick. Luhrdorff and Scalmanini (1995) describe these upper alluvial sediments as Younger Alluvium. Below this, cobbles, boulders with sand, silt, and clay are common. These deposits extended to a depth of about 40 feet bgs on the eastern portion of the Site, and to about 100 feet bgs on the western portion. Luhrdorff and Scalmanini (1995) describe these lower alluvial sediments as Older Alluvium.

Geologic cross-sections for the Site have been prepared previously and included in **Attachment A** (Available Subsurface Information). The SLR geologic cross-sections depict a generalized view of the subsurface strata in the E-W and N-S directions across the Site (Attachment A). These generalized depictions are suitable for planning-level studies but are not intended for design, which will require additional subsurface explorations at the Site. The profiles shown are based on information at discrete locations and depths and actual subsurface condition variations across the site will vary. Section 5 of this report describes the subsurface stratigraphy in further detail in terms of engineering characteristics of the materials, for use in slope stability and slurry wall evaluation purposes.

The bedrock encountered is likely Mesozoic granitic rocks of the Sierra-Nevada batholith, which has been mapped as outcrops at higher elevations within about a mile to the north, east, and south of Site. The surrounding hill and outcrop features suggest bedrock could get deeper to the west and southwest, towards the valley. Available borings encountered bedrock in the easterly portion of the site, at approximately 77 ft bgs. In the westerly portion of the site, bedrock was not

encountered within the explored depths of about 90 feet bgs, indicating it would be deeper than that.

Available photos of the bedrock cores indicate hard, granitic rock where it was encountered, as shown in **Figure 5**. Weathered or decomposed bedrock zones and some discontinuous intrusions of clay or clayey sand may also exist. There is an approximate 10- to 15-foot thick mantle of very dense silty, clayey sand overlying the bedrock. This layer generally follows the top of rock, likewise dipping down to the west. Both the bedrock and the overlying mantle of very dense soils are expected to be less pervious than the overlying alluvial materials and therefore provide a good opportunity to key-in a slurry wall to achieve the desired hydraulic barrier.

3.2. GROUNDWATER

Regionally, groundwater flows generally toward the west from the recharge areas of the Sierra Nevada mountains to the center of the valley (SLR, 2021). Groundwater elevations in the region vary from around 460 feet amsl near the Site, to around 250 ft amsl near the City of Visalia (DWR, 2014). Groundwater is pumped extensively in the area for agricultural and urban uses.

The Site is in the Kaweah Subbasin, within the Tulare Lake Hydrologic Region (DWR, 2003). The long-term water level measurements for wells in the immediate Site area indicate relatively stable water levels, with a slight downward trend in recent years. Seasonal water level fluctuations in the Site vicinity have generally varied by less than 20 feet for the last 50 years (Fugro, 2007).

Based on available soil borings within the Site, the depth to groundwater ranges from 7 to 20 feet bgs. Further information on known groundwater levels and trends in and around the vicinity of the Site are provided in the Hydrology Report (SLR, 2021). The groundwater levels will fluctuate over time, with seasonal variations, and other factors.

3.3. FAULTS AND SEISMICITY

The Site is located in an area of relatively moderate seismicity for California. This area is centrally located between two zones of significant seismicity: the Eastern Sierra Seismic Zone, located approximately 50 miles to the east, and the San Andreas Fault Zone located approximately 80 miles to the west. There are no active or potentially active faults within 30 miles of the Site. A map of active faults in the area is provided in **Figure 6**. A list of active faults and their respective distances to the Site is provided in **Table 1**.

The nearest potentially active fault is the Independence Fault located approximately 48 miles east. This fault is part of the Owens Valley Fault Zone which is capable of producing large earthquakes, such as the Owens Valley Earthquake of 1872, which is estimated to have been a magnitude 7.4 event.

Table 1. Active Faults in the Area

Source	Distance (km)		Deterministic Magnitude	Fault Mechanism	Dip Angle
	(km)	(miles)			
Independence	77.0	47.9	7.2	Normal	50
Birch Creek	89.6	55.7	6.6	Normal	50
Owens Valley	90.5	56.2	7.3	Strike Slip	90
Great Valley 14 (Kettleman Hills)	90.7	56.3	7.2	Reverse	22
So Sierra Nevada	96.2	59.7	7.5	Normal	50
Great Valley 13 (Coalinga)	100.6	62.5	7.1	Reverse	15
Round Valley	101.5	63.1	7.1	Normal	50
White Mountains	104.1	64.7	7.4	Strike Slip	90
San Andreas Creeping Section Gridded	106.2	66.0	6	Strike Slip	90
Hunter Mountain Connected	111.1	69.1	7.6	Strike Slip	90
Hunter Mountain-Saline Valley	111.1	69.1	7.2	Strike Slip	90
Little Lake	117.4	72.9	6.9	Strike Slip	90
Great Valley 12	117.6	73.0	6.401	Reverse	15

Note: Data obtained from EZ-FRISK, Source: USGS 2008

Earthquakes on active or potentially active faults, depending on magnitude and distance from the Site, can produce a range of ground-shaking intensities. Although there are no active faults within the immediate vicinity of the Site, distant earthquakes have historically caused strong ground-motion in the Site vicinity. The most significant example is perhaps the aforementioned Owens Valley Earthquake which occurred in March of 1872. The epicenter was approximately 56 miles east of the Site, but this earthquake is estimated to have caused strong (Mercalli Intensity, MM VI) shaking intensities in the area (Hough and Hutton, 2008).

The current state of practice to determine the seismic hazard at a given location is to perform a Probabilistic Seismic Hazard Analysis (PSHA), from which the probability of exceeding a specific ground motion parameter (typically the Peak Ground Acceleration (PGA)) within a time period is calculated. Typically evaluated sets of probability and time-period are seismic events with 10% probability of occurrence in 50 years, and those with 2% probability of occurrence in 50 years. These probabilities correspond to return periods of 475 and 2,475 years respectively. The probability of exceedance of the ground motion parameter is calculated based on the following input parameters:

- Seismic sources that can generate ground shaking at the Site;
- Characteristics of each seismic source: length, rate of ruptures, maximum magnitude, earthquake occurrence;
- The ground motion parameter versus distance attenuation relationships appropriate for each seismic source and Site conditions.

Seismic sources include active and potentially active faults (or fault zones) in the vicinity of the Site. Active faults are those that have experienced displacement within Holocene time (the past

11,000 years) whereas potentially active faults are those that have experienced displacement within Quaternary times (approximately past 1.6 million years).

The United States Geological Survey (USGS) website provides tools that are commonly used to identify the active and potentially active faults that could generate ground shaking at sites located in the United States. These tools are also used to perform the probabilistic seismic hazard analysis to estimate the level of ground shaking a given site may experience. These tools are based on the user defined location coordinates of the site, and a user defined radius of influence selected based on the general level of seismicity of the site. A typical radius used for such evaluations is on the order of 100 km (67 miles).

The peak ground acceleration (PGA) was estimated using the USGS seismic hazard analysis calculator with the following parameters:

- Exceedance Probability of 10% in 50 years (return period of 475 years) and 2% in 50 years (return period of 2,475 years);
- Shear velocity of the deposit over the top 30 m (100 ft) of 450 m/s (1,355 ft/s) corresponding to a sandy gravelly deposit; and
- Latitude and longitude of 36.4° and -119.04° respectively.

The maximum PGAs for the Site were estimated to be 0.1 g for a return period of 475 years and 0.2 g for a return period of 2,475 years. PSHA outputs are included as **Attachment B**. It is noted that these PGA values are not equivalent to the seismic coefficient used in the pseudostatic slope stability analysis. Guidelines for Evaluating and Mitigating Seismic Hazards in California, SP-117 (California Geological Survey, 2008) states PGA should not be used as a pseudostatic coefficient, as that would result in overly conservative factor of safety (FS). The generally accepted value for pseudostatic coefficient is 0.1, with an acceptable FS of the order of 1.1.

The Site may be subjected to moderate to strong shaking based on correlations between PGA and the Modified Mercalli Intensity chart relating perceived shaking to PGA (Trifunac and Brady, 1975), provided by the USGS (**Table 2**).

Table 2. Modified Mercalli Intensity and Peak Ground Acceleration

PERCEIVED SHAKING	NOT FELT	WEAK	LIGHT	MODERATE	STRONG	VERY STRONG	SEVERE	VIOLENT	EXTREME
Potential Damage	None	None	None	Very light	Light	Moderate	Moderate-Heavy	Heavy	Very heavy
Peak Acc (% g)	<0.17	0.17-1.4	1.4-3.9	3.9-9.2	9.2-18	18-34	34-65	65-124	>124
Peak Vel (cm/s)	<0.1	0.1-1.1	1.1-3.4	3.4-8.1	8.1-16	16-31	31-60	60-116	>116
Instrumental Intensity	I	II-III	IV	V	VI	VII	VIII	IX	X+

3.4. SOILS AND EROSION

The baseline conditions at the Site is essentially flat, sloping gently downward to the south and west. The Site is undeveloped, so erosion is minimal and there are no known slope failures at the Site. Soil erosion is limited to the relatively steep slopes facing the Kaweah River at the southern portion of the Site, and select portions of the few man-made dirt roads at the Site. Other than these small areas, the Site is almost entirely covered with vegetation.

The upper 5-10 feet of the onsite soil consists of poorly-graded sand with increasing gravel at depth. Below 15 feet, the soil consists of sandy and silty gravel of increasing size and rounded cobbles to approximately 30 to 35 feet bgs. At greater depth, silty clayey sand and silty clay/low plasticity clay are predominant before bedrock is encountered (BSK, 2011).

4. PROJECT SETTING

4.1. INTRODUCTION

The project consists of the following key components / stages of work:

- Installation of a perimeter slurry wall system to reduce water inflow and initial limited excavation until the complete slurry wall system is in service;

- Excavation of the pit that will be used for reservoir with temporary slopes, and production of aggregate;

- Placement of permanent slopes over the excavation slopes, and the construction of the Reservoir.

Each of these project phases are discussed in the following sections. The existing and proposed topography of the Site are shown in **Figure 7**.

4.2. SLURRY WALL AND INITIAL LIMITED EXCAVATION

During the initial limited excavation and material processing stage, an impermeable slurry wall will be constructed around the exaction area to limit the amount of groundwater flow into the excavation as future excavation progresses below the water table. This initial, relatively shallow excavation area is estimated to be approximately sufficient for a 6-month supply of processed material, while the slurry wall is constructed.

The slurry wall will be designed by a qualified professional and constructed by a qualified contractor with experience in installing similar facilities. Construction would include the following facilities:

- A perimeter access road that would also serve as a leveling surface for the construction of the slurry wall. The road would vary in width from approximately 30 to 50 feet and be built on fill up to 8 foot in height.

- An approximately 60- to 90-foot-deep slurry wall surrounding the excavation/Reservoir area. Its actual depth will be determined during design and verified during construction based on subsurface information, to provide the required reduction in groundwater inflow. As shown on **Figure 3**, the slurry wall would be constructed through the perimeter road and capped off with a durable gravel layer

- An approximately 5-foot-deep water infiltration trench along the northern border of the ultimate Reservoir area.

A conceptual layout of the project elements and on-site facilities applicable to this stage of work is shown in **Figure 8**. A typical section showing the Slurry Wall, slope, access road, and the infiltration trench is provided in **Figure 9**.

After completion of the slurry wall, the following facilities would be demobilized from the site:

- Vehicle and equipment parking areas for the slurry wall operations.
- Fill material stockpiles.
- Equipment storage facilities.
- The bentonite slurry mixing pond(s) (see further discussion below on the slurry wall construction activities).
- The slurry wall backfill mixing area, which would be repositioned as the slurry wall construction progresses, to be in close proximity of the segment being excavated.

The general sequence of slurry wall construction activities would include:

- Surface clearing, grading, and filling to create a sufficiently long section of the perimeter road.
- Excavation of the slurry wall trench (**Figure 9**) through the road. Grading of the road would also provide a relatively level surface to install the slurry wall from and contain the slurry. The trench would be excavated to its full depth and then extended in length.
- Filling the trench with a bentonite slurry (bentonite clay and water mix) to support the sides of the excavation and prevent caving of the trench. The bentonite slurry would be pre-mixed in slurry mixing pond(s) and pumped by pipeline into the excavated trench.
- The soils that are excavated from the trench would be placed in a nearby slurry wall backfill mixing area, for use in preparing the backfill. If the excavated materials are unsuitable, they would be hauled to the WCA operations area for processing, as appropriate. If additional suitable materials are needed, they would be obtained from the WCA operations or imported from off-site.
- As the trench is extended in length, backfilling would commence. The backfill mix would be prepared on-site, in the backfill mixing area(s). Backfill would typically include granular soils, mixed with bentonite, cement (if needed according to design), and water, to create a low permeability material of desired engineering properties. The mix design would be established based on various studies and tests which would be conducted during the design phase.
- Once mixed, the backfill would be pushed into the trench by a dozer or equivalent, from the narrow end of the trench at the opposite end of the trench that is being excavated. The backfill materials would form a slope inside the trench and displace the bentonite slurry. The operation would march in a similar manner, going around the perimeter of the Site. The backfill material in the trench would eventually consolidate and form a low permeability wall.

- The length of the slurry wall is approximately 13,400 feet. Its width would be about 3 feet. It could be wider, depending on the design. If the excavation depth is more in some segments of the wall, the trench width and/or the mix design may be adjusted according to design. Generally, using a uniform width and mix design may be preferred.

- As the wall is completed and gravel cap is placed over the top of the backfilled trench, it will form part of the perimeter road as shown in **Figure 9**.

- A safety berm would be constructed along the inside edge of the road, facing the excavation area.

It should be noted the above discussion is for illustration purposes and actual construction techniques will vary based on the approved means and methods the contractor selects, and possible future technology advances in slurry wall construction.

4.3. EXCAVATION

Excavation is expected to proceed over an estimated period of 15 to 23 years, at an average rate of approximately 920,000 gross tons per year of silts, sands, and gravels. This rate will vary in any given year.

Excavation will be done by West Coast Aggregate (WCA). WCA would also receive, stockpile, and recycle concrete construction debris materials. A conceptual depiction of the anticipated WCA operations is shown in **Figure 8** and a longitudinal cross-section of the reservoir excavation progress over time is shown in **Figure 10**.

The excavation equipment, the material processing plant, and the associated settling pond would be located within the pit footprint. Different areas of the excavation pit bottom would be lowered in stages and the process equipment would be relocated as appropriate. As the excavation of the pit is deepened, an access ramp would be constructed in the excavated slope, as shown in **Figure 11**.

The excavated materials would be processed to produce a specified range of granular construction materials for sale. This phase of the project would include the following key facilities:

- A security fence that surrounds the excavation and eventual Reservoir area.

- A controlled access gate along the west side of the excavation area.

- A scale hose near the entrance gate to provide for weighing recycle materials coming into the site and construction materials being shipped from the site.

- A haul truck unloading and loading area.

- Portable crusher and recycle plant.

- Portable diesel fuel tank for on-site refueling (4,000 gallon).

- An aggregated production (wash/screen) plant and a crushing/ recycling plant.
- A stockpile area, or areas.
- A slurry wall
- A settling pond for clarifying/recycling process and wash water for reuse.

As shown on **Figure 7**, the excavations would occur within the footprint of the Project site. The size and depth of the excavated area would vary over time.

The excavation slope will be of the order of 1.5H: 1V (1.5 Horizontal to 1 Vertical), though other gradients and/or benched slope configurations may be developed during design, based on further geotechnical investigations, analyses, and site-specific conditions exposed during excavation. Section 5 of this report addresses the currently estimated safety factors for different scenarios.

The facilities and their layout shown on **Figures 8 or 11** are for illustrative purposes only. WCA and the design team will refine and adjust these elements as necessary, at the start of the excavation phase. All operations facilities would be kept within the excavation/ pit footprint.

During excavation phase, the area would be dewatered by using wells, trenches, or sumps according to field conditions, as described in Section 5.3.2.1. The dewatering system would drawdown the water table to near or below the excavation floor. The groundwater extraction rates would initially be minimal and increase to their maximum, as the excavation is depended to the maximum depth. The planning-level estimates of dewatering rates and other pertinent information are provided in the Hydrology Report (SLR, 2021).

The water extracted to dewater the excavation would be pumped to the northern edge of the excavation and re-injected into a gravel-filled infiltration gallery along and outside of the northern border of the slurry wall as shown on **Figures 8 and 9**.

The estimated material balance from Excavation is as shown in **Table 3**.

Table 3. Estimated Material Balance from Excavation

ITEM	ESTIMATED QUANTITY	REMARKS
Material Generated from Excavation	16.4 million tons (11,049,300 cy)	1.5H:1V Slope
Exported as product	11.5 million tons	
Use for on-site fill	2.4 million tons	3H: 1V Slope
Use for Road Construction	0.1 million tons	
Use for Slurry Wall	0.2 million tons	

Waste and Shrinkage	2.2 million tons	

4.4. RESERVOIR

The final stage of the excavation is the earthwork required to provide suitable conditions for the construction of the Reservoir. The preparation of the pit for the reservoir is referred to as "earthwork". After the excavation phase is finished, including the earthwork for preparation of the reservoir, the reservoir itself will be constructed. These stages are described below:

- Earthwork: Backfilling of the excavation slopes to flatten them from 1.5H: 1V to 3H:1V. This is shown in **Figures 9**, **10 and 11**. The backfill would be of suitable materials that has both sufficient strength and is relatively free draining. It would be constructed from the bottom up in compacted layers of suitable thickness. The Excavation slopes will be benched, and the reservoir slope fill would be keyed into the wedge of native slope materials in front of the Slurry Wall. If needed, additional slanted chimney drain zones can be provided while the slope fill is being placed from the bottom up. **Figure 11** shows the first layer of the backfill being placed along the east side of the excavation.

- Reservoir: The construction of the Reservoir to include the channels, pumps, pipelines, power supply system, and the monitoring system. A conceptual plan of the Reservoir is shown in **Figure 12**.

5. GEOTECHNICAL STABILITY ANALYSIS

5.1. INTRODUCTION

This section describes the geotechnical objectives in order to achieve the desired Excavation and Reservoir performance. It includes a discussion of the initial excavation and final construction of the Reservoir, the design of the excavation, slurry wall and the final Reservoir operational condition. It provides the planning level technical basis to demonstrate the feasibility of the project form a slope stability and the slurry wall cutoff points of view.

5.2. MATERIAL PROPERTIES

Available subsurface information at the site consists of six (6) borings B-1 through B-6, performed by BSK Associates in November 2011. These borings provide descriptions of the subsurface strata, which have been generalized into five strata as described below and used in the slope stability modeling.

5.2.1. MOIST SAND

In the available borings, this light colored, moist, SAND layer generally exists from the ground surface down to depths ranging from 7 to 15 feet below ground surface (bgs). It has a typical thickness of 12 feet. It is expected to have little to no cohesion and is expected to be medium-dense. The bottom of this layer is at or slightly above the groundwater levels noted in the borings.

In the slope stability analysis material layers as depicted in the output figures (slope stability profiles) provided in **Attachment C**, this layer is shown in yellow.

5.2.2. WET SAND, GRAVEL, COBBLES

This is a water-bearing layer of olive-gray colored SAND, GRAVEL, COBBLES, with an approximate thickness ranging from 15 to 25 feet. In the easterly portion of the site (Borings B-3, B-4, B-5, B-6), groundwater was noted at the top of or close to the top of this strata. In the easterly portion of the site (Borings B-1 and B-2), groundwater is noted to gradually dip to the mid-depth or slightly below the mid-depth of this layer. This stratum is also expected to have little or no cohesion, but with higher friction angles than the sandy layer above it, due to the presence of gravel and cobbles.

In the slope stability profiles, this layer is shown in gray.

5.2.3. WET CLAYEY SAND, GRAVEL, COBBLES

The top of this yellow-brown to olive-brown, wet, CLAYEY SAND, GRAVEL, COBBLE layer is generally at approximate elevation 430 feet MSL (Borings B-1 through B-5). It rises to approximate elevation 440 feet MSL near the east end of the site (Boring B-6). The thickness of this layer is of the order of 20 to 50 feet, generally increasing to the west, as the underlying

bedrock and the dense soil mantle over the bedrock dip down to the west. This layer is expected to have both cohesion due to its clay content, and relatively high friction angle due to its sand, gravel, and cobble components.

In the slope stability profiles, this layer is shown in orange.

5.2.4. DENSE SILTY CLAYEY SAND

This layer consists of mixtures of gray, olive-gray, bluish-gray, olive-brown colored SILTY CLAYEY SAND. It is described as moist to dry, indicating that it is a 'tight' formation since it is dry despite being below groundwater. In some zones, the boring logs note hard to very hard drilling. This layer is expected to have a higher strength, with properties of a stiffer cohesive material intermixed with frictional material. This layer generally tends to follow the bedrock surface as a mantle with thickness of 20 feet or more. Towards the west end of the site, bedrock was not encountered at a depth of 90 feet. The thickness of this layer may increase towards the west.

In the slope stability profiles, this layer is shown in purple.

5.2.5. GRANITIC BEDROCK

Dry, granitic bedrock was encountered at its shallowest, at elevation 400 feet MSL or 67 feet bgs in the easterly quadrant of the site (B-4). Based on an approximate extension of the bedrock surface profile to the west, the top of bedrock can be estimated to be in the range of 340 to 360 feet MSL, or 100 to 120 feet bgs, under the westerly portions of the site. Borings B-1 and B-2 in this area did not encounter bedrock withing their maximum exploration depths of 90 feet bgs. For slope stability modeling purposes, bedrock has been assigned a very high strength and is not considered to be an influencing factor in the stability calculations.

In the slope stability profiles, this layer is shown in green.

The man-placed materials related to our analysis include the following:

5.2.6. SLURRY WALL

This is expected to be a low-permeability barrier consisting of either a soil-bentonite mix or a soil-cement-bentonite mix, depending on the design details. Two types of walls have been conceptually evaluated here: one with an approximate equivalent cohesion value of 400 psf, referred to as the 'low strength wall; and another with an approximate equivalent cohesion value of about 2,000 psf, referred to as the 'moderate strength wall'. In practice, an increase in the shear resistance values for the slurry wall would be achieved by adjusting the cement content of the slurry mix.

5.2.7. COMPACTED BACKFILL

Backfill to create the 3 to 1 reservoir slope is expected to consist of excavated on-site materials which will likely be a blend of granular and fine materials obtained from the pit. For stability

purposes, the excavation slope would be benched and the backfill material will be placed against the slope in horizontal lifts. The backfill material would generally be compacted to 90% relative compaction. Based on experience, compacted fill consisting of a blend of granular and fine materials is assumed to have strength parameters of 200 psf cohesion and 33 degrees friction angle.

5.2.8. SUMMARY

The material parameters relevant to the slope stability analysis are listed in **Table 4**.

Laboratory test data is not available but presumed soil strength parameters can reasonably be assigned based on the available descriptions and professional judgement. The values assigned to each generalized strata as well as the future backfill and slurry wall materials are as summarized in **Table 4**. The permeability values listed in Table 4 are the same as those used in the Hydrology Study (SLR, 2021).

During design, additional geotechnical investigations and laboratory testing would be performed to confirm or modify these parameters as appropriate.

Table 4. Material Properties for Slope Stability Analysis

Material	Unit Weight γ (lbs/ft^3)	Cohesion c (psf)	Friction Angle Φ (°)	Permeability (ft/s)
SAND (SP)	115	0	35	5E-05 (1.5E-3)
SAND, GRAVEL, COBBLES (GP)	125	0	38	7E-04 (2E-2)
CLAYEY SAND, GRAVEL, COBBLES (SC/SM)	120	200	36	2E-06 (6E-5)
SILTY CLAYEY SAND (SC/CL)	120	400	28	5E-08 (1.5E-6)
GRANITIC BEDROCK	135	“INFINITE” STRENGTH		3E-06 (9E-5)
SLURRY WALL	130	varies	0	3E-11 9E-10
COMPACTED BACKFILL	120	200	33	2E-06 (6E-5)

5.3. SLOPE STABILITY ANALYSIS

5.3.1. LIMIT EQUILIBRIUM METHOD

Slope stability analysis has been performed using the Slide2 geotechnical software by RocScience. Slide2 is a two-dimensional limit equilibrium slope stability analysis program for estimating the slope Factor of Safety (FS) by various methods of slices. Circular surfaces were used in the analyses to identify the critical failure surface having the lowest FS for each assumed scenario.

5.3.2. EXCAVATION SLOPE STABILITY

This portion of the evaluation pertains only to the Excavation conditions until permanent reservoir slopes are constructed at a shallower gradient. Throughout the duration of excavation, dewatering systems will be in place to allow safe operation inside the pit. This requires a dewatering system capable of maintaining the groundwater water levels at or below the lowest excavation level in the pit, as excavation progresses. This would be accomplished by the combination of the perimeter slurry wall outside and interior dewatering systems inside the pit. The critical slope condition would be at the maximum excavation depth.

The desired excavation slopes would generally be targeted to achieve the steepest safe gradient. For most applications, this would be in the range of 1.5H: 1V to 1H: 1V. Depending on site-specific conditions and the localized variations in the exposed conditions, various measures are then implemented as excavation proceeds. Some of these measures may include varying the slope gradients, using benches, providing additional drainage and dewatering systems, and if needed, installing additional structural support systems.

Our analysis aimed to evaluate the feasibility of the project based on the soil parameters summarized in Section 5.2.8, without relying on additional stabilizing measures such as benches. Further evaluation and verification of these parameters will be undertaken during design and additional safeguards would be implemented during construction to address the specific conditions.

A generally acceptable FS value for temporary excavation slopes is of the order of 1.25. For relatively longer temporary excavation durations involved here, an additional margin may be desirable, though not mandated.

5.3.2.1. Dewatering Scenarios

For the fully excavated condition, the groundwater levels between the toe of the excavation slopes and front of the slurry wall system would depend on the type and location of the dewatering systems to be used, as well as the slurry wall properties, the permeability of the materials beneath the slurry wall, and the base of the excavation. The assumed permeability values based on generalized subsurface material types are as provided in Table 4. The slurry wall configuration is

as shown in the various slope stability outputs. During design and construction, further details and verification would take place.

For our evaluation, the dewatering system effectiveness between the toe of slope and the slurry wall has been assumed in three categories. In all cases, the dewatering would have to bring the groundwater levels to no higher than the toe of slope. For groundwater levels projected under the slope, three different conditions have been presumed. These are shown in the output figures of Attachment C, as part of the different slope stability analysis scenarios. From a typical construction practice point of view, these three dewatering levels may consist of the following methods:

- **Dewatering by Wells:** Groundwater assumed at or below the bottom of the excavation level between the toe of slope and the front of the slurry wall;
- **Dewatering by Continuous Trenches at the Base and Perimeter of the Excavation:** Groundwater assumed to rise from the toe of slope to + 10 feet at the front face of the slurry wall;
- **Dewatering by Intermittent Sumps:** Groundwater assumed to rise from the toe of slope to + 20 feet at the front face of the slurry wall.

The nomenclature used here for differing categories of dewatering aggressiveness is only intended as a descriptive tool, it does not to imply the application of a specific dewatering system. The suitability and the details of any dewatering system would be developed during design and construction.

5.3.2.2. Slope Gradient Scenarios

For each of these three dewatering categories, three different slope gradients have been evaluated, for a total of nine (9) scenarios. The results of these scenarios are briefly described below and summarized in **Table 5.**

- **1.5H: 1V Slope:** The estimated FS for an excavation slope of 1.5H: 1V is satisfactory for each of the dewatering scenarios considered. The FS values range from 1.4 (with trench or sump dewatering) to 1.5 (with well dewatering). A 1H: 1V slope gradient provides an additional margin above the minimum 1.25 FS value for each of the scenarios analyzed.
- **1.25H: 1V Slope:** The estimated FS for an excavation slope of 1.25H: 1V is adequate with trench or sump dewatering. An added margin can be achieved if a more aggressive dewatering well system is used. It may be possible to achieve higher FS values with this slope with other dewatering methods, depending on the results of further explorations, additional field and laboratory tests, and refinements that can be made during design and construction.
- **1H: 1V Slope:** The estimated FS values for an excavation slope of 1H: 1V range from 1.1 (with sump dewatering) to 1.2 (with trench or well dewatering). These findings may vary depending on the results of further studies. Unless additional studies indicate otherwise, a 1H: 1V excavation gradient is not considered to be suitable under the current assumptions.

5.3.2.3. Summary oof Excavation Slope Stability Scenarios

The estimated Factor of Safety (FS) for different excavation slope scenarios is summarized in Table 5.

Table 5. Estimated Factor of Safety for Different Excavation Scenarios

Excavation Slope Gradient	Condition Analyzed		
	Excavation dewatered from toe of slope to slurry wall	Excavation dewatered from toe of slope to +10 feet at slurry wall	Excavation dewatered from toe of slope to +20 feet at slurry wall
1.5H: 1V (33°)	1.5	1.4	1.4
1.25H: 1V (39°)	1.4	1.3	1.3
1H: 1V (45°)	1.2	1.2	1.1

5.3.3. RESERVOIR SLOPE STABILITY

Upon completion of excavation, the cut slopes will be backfilled to a permanent gradient of 3H: 1V to use the facility as a reservoir. The reservoir will be subject to various cycles of filling and emptying. The results of the slope stability analysis for this long-term use condition are summarized in **Table 6.**

The analysis for reservoir slopes have included steady state, rapid drawdown, and seismic (pseudostatic) conditions. A commonly used dynamic slope stability analysis method is pseudostatic analysis. This method applies a simulated equivalent acceleration acting on the mass of a potential slide mass, using limit equilibrium analysis methods. The ground motion parameter used in a Pseudostatic analysis is referred to as the seismic coefficient “k”, which is different than the peak ground acceleration values.

Steady State:

Steady state seepage conditions were incorporated in the model using the groundwater boundary conditions for the final configuration, using the estimated hydraulic conductivities of subsurface layers and the properties of the slurry wall cutoff system.

Rapid Drawdown:

The rapid drawdown conditions are applicable when the reservoir is emptied. Emptying the reservoirs is expected to occur over approximately 2 weeks which would allow some of the water pressure in the slope to dissipate. However, the analyses performed conservatively assumed no pressure dissipation, which is an extreme worst-case condition.

Pseudostatic:

Seismic slope stability has been evaluated by considering an equivalent horizontal ground acceleration corresponding to a pseudostatic seismic coefficient of 0.1.

Table 6. Estimated Factor of Safety for Different Reservoir Conditions

3H:1V Backfill Placed Over	Condition Analyzed		
	Steady State	Rapid Drawdown	Pseudostatic
1.5H: 1V (33°)	1.6	1.3	1.1
1.25H: 1V (39°)	1.6	1.3	1.1
1H: 1V (45°)	1.5	1.3	1.1

The slope stability FS values for each of the permanent condition scenarios are all within their respective acceptable FS values. The rapid drawdown FS value reflects a conservative assumption and actual conditions would likely be higher. There is no significant difference in FS values for a 3H: 1V slope placed on different excavation slope gradients. This is as expected since the overall stability of the permanent slope is largely governed by the wedge of compacted fill placed over the temporary excavation slopes.

5.4. SLURRY WALL STABILITY ANALYSIS

5.4.1. FINITE ELEMENT METHOD

The analysis method aimed to assess the displacements which would develop in the slurry wall as the strength and stiffness parameters of the wall were varied over an expected range that can be achieved. Analysis was carried out using the finite element modelling software RS2, developed by Rocscience. RS2 is a 2D finite element program for soil and rock applications, with the ability to carry out slope stability analysis using the shear strength reduction method.

The developed slope model was meshed using a graded mesh with 6-noded triangles. The boundaries were fixed both in the x and y plane. Groundwater was set at a total head condition of 5 feet bgs. The typical model configuration and output graphics are provided in **Attachment D**.

The limit equilibrium method such as that used in Section 5.3, evaluates the different failure conditions of the slope system, but does not provide information on ground movements within the system. On the other hand, the fine element model evaluates the ground deformations within the system.

The FS value in limit equilibrium is based on the ratio of resisting forces in relation to the sliding forces. In the finite element method, an equivalent FS is obtained by reducing the soil strength until the deformations become excessive and the computation becomes unstable (failure). The ratio of actual soil strength in relation to the reduced strength for failure is called the Strength Reduction Factor (FRS). The FRS and FS values for a given slope would be similar, but not necessarily identical.

5.4.2. MATERIAL PROPERTIES

The basic soil strength parameters are as established in Section 5.2.8 (Table 4). These values were supplemented with elastic properties corresponding to each layer. The expanded soil material properties are as summarized in **Table 7** below.

Table 7. Additional Soil Properties for Finite Element Model (FEM)

GEOTECHNICAL DOMAIN	UNIT WEIGHT (LBS/FT3)	COHESION (PSF)	FRICTION ANGLE (DEGREES)	ELASTIC MODULUS (PSI)	POISSON'S RATIO	HYDRAULIC CONDUCTIVITY FT/SEC (CM/SEC)
SP	115	0	35	3625	0.3	5.25E-5 (1.60E-3)
GP	125	0	38	10877	0.3	7.38E-5 (2.25E-3)
SC/SM	120	200	36	5076	0.3	3.28E-8 (1E-6)
SC/CL	120	400	28	2175	0.25	3.28E-9 (1E-7)
Bedrock	135	Infinite Strength				-

The slurry wall parameters were varied to explore the deformation pattern variations for progressively stronger slurry wall compositions. **Table 8** summarizes the two different slurry wall strength and elastic properties used in the model.

Table 8. Slurry Wall Material Properties for FEM

SLURRY WALL	UNIT WEIGHT (LBS/FT3)	EQUIVALENT COHESION (PSF)	FRICTION ANGLE (DEGREES)	ELASTIC MODULUS (KSI)	POISSON'S RATIO	HYDRAULIC CONDUCTIVITY FT/SEC (CM/SEC)
Low Strength	130	400	0	1.4	0.3	3.28E-10 (1E-8)
Moderate Strength		2000		6.5		

The low strength value (400 psf cohesion) is intended to approximate a typical soil-bentonite mix. Soil-bentonite mix is commonly used in balanced pressure or modest differential-pressure situations. For detailed design purposes, the engineering properties of different slurry wall mix

designs using on-site materials will be established based on specific sampling and testing to be done.

In the case of uneven earth and substantial hydrostatic pressure differentials across a slurry wall, a more robust system may be needed, depending on several factors that will be considered during design. The moderate strength value of approximately 2 ksf cohesion, is intended to represent a soil-cement-bentonite system which is a more robust slurry wall.

5.4.3. SLURRY WALL STABILITY FOR EXCAVATION

In the FEM scenarios studied, the slurry wall and the slope have the same layout as in Section 5.3. The analyses were conducted for a 3-foot-wide slurry wall, located behind the top of the excavated slope. A slope of 1.5H:1V was applied to all Excavation scenarios since this is the most realistic case. The total excavation depth for all scenarios is 76 feet bgs.

The excavation progress in front of the slurry wall was modeled for the interim stages of excavation. The models were staged to simulate the excavation in approximate depth increments of 3.8 feet, representing a typical annual production rate, to reach the total excavation depth of 76 feet in 20 years.

Outputs from the RS2 finite element model for the various scenarios discussed here are provided in Attachment D.

For each scenario, the deflections of the slurry wall were estimated as provided in **Figures 13 and 14**. The strength reduction method was applied to obtain the critical SRF (FS) for each slurry wall strength scenario at the full excavation stage. A summary of the results for the four scenarios are provided in **Table 9.**

Table 9. Summary of FEM Results for Different Slurry Wall Scenarios

SCENARIO	ESTIMATED MAX. DISPLACEMENT (INCHES)	ESTIMATED ANNUAL DISPLACEMENT (INCHES)	SRF (FS)
Low Strength Slurry Wall (400 psf)	5.2	0.3	1.20
Moderate Strength Slurry Wall (2 ksf)	3.8	0.2	1.26

5.4.4. SLURRY WALL STABILITY FOR RESERVOIR

A finite element model analysis was performed for the case of the slurry wall behind the permanent 3H:1V slope of the Reservoir. The input for our analysis is based on the geotechnical characteristics of the materials in the excavation area, that are assessed from available boring logs.

For the conditions analyzed, the slurry wall extends from the ground surface behind the top of the outer slope, down to approximately 10 feet below the bottom of the Reservoir, into the low permeability native materials.

For the completed Reservoir with 3H:1V slopes and empty condition, which is more critical for slope stability, the calculated FS exceeds the generally accepted value of 1.5.

For rapid drawdown conditions which represents emptying of the reservoir without allowing adequate time for dissipation of water from the soil within the slope, the FS exceeds the generally accepted values which range from 1.25 to 1.40.

For pseudostatic (seismic) conditions, the FS exceeds the generally accepted value of 1.1.

Results show that the proposed slopes are sufficiently stable, including during earthquake conditions. The slope and slurry wall deformation analyses that demonstrate that the slopes and slurry wall deformations would be tolerable with adequate safety.

Further analysis during design will establish a suitable slurry wall mix design to provide the desired performance of the system.

The key design aspects of the slurry wall are the mix designs for both the bentonite slurry that is used to support the trench during excavation and for the backfill soil-bentonite mixture that forms the slurry wall. The details of these mixes would be established during the detailed design process discussed below and would incorporate the following essential design bases and criteria.

- The bentonite slurry mix, which is predominantly a bentonite-water mixture is designed to have sufficient viscosity and density to support the trench walls during excavation.
- The soil-bentonite backfill mix is designed to have a low permeability, be sufficiently ductile to adjust to deformations in the excavation slopes, and to resist the hydraulic pressures that will develop behind the wall as the Excavation is dewatered or the Reservoir is emptied.
- A key parameter in the design is to ensure the grain size of the soil materials are sufficiently large so that the water pressure cannot force them to migrate through the adjacent natural soils to prevent what is known as “piping”. Use of a soil-cement-bentonite mix could further improve the resistance to piping.

These types of walls are frequently constructed and therefore there is a sound basis for assessing appropriate mix designs that will meet the above requirements.

5.5. DESIGN AND CONSTRUCTION CONSIDERATIONS

5.5.1. SUBSURFACE INFORMATION

During design, additional boings will be performed to obtain relevant design information. Groundwater and in-situ permeability of the subsurface strata as well as the likely performance of slurry wall mix materials will also be evaluated in the design phase of the project. The slurry wall embedment depth and having an adequate cutoff depth while avoiding excess penetration into

bedrock, will be based on the soil profile variations along the slurry wall alignment. Subsurface investigations, field tests, laboratory tests, and detailed engineering evaluations will be conducted during design.

5.5.2. SLOPES

5.5.2.1. Excavation Slopes

During excavation, the slope gradients and the types and locations of dewatering elements will be adjusted by the Contractor, in consultation with professionals specialized in this type of work. There are many possible variations which would be implemented during construction. Some of these include adjusting the temporary slope gradients and the layout of benches, and the installation of temporary slope stabilization measures.

5.5.2.2. Reservoir Slopes

The permanent 3H:1V slopes will be placed over the temporary excavation slope face. This will involve benching into the Excavation slope and placement of an engineered fill buttress on the slope, in compacted lifts. Appropriate provisions for drainage and scour prevention will be made during design of the permanent Reservoir slopes.

5.5.3. SLURRY WALL

5.5.3.1. Variations in Design:

The evaluations presented in this document demonstrate that the proposed project concept is feasible. There are several variables that can be adjusted during design to achieve the desired performance. For example, a lower strength slurry wall with a greater width can achieve similar results as a higher strength wall with a narrower width. Also, the design parameters can be adjusted for different segments of the wall if the excavation depths or other demands (subsurface condition variations) require such adjustments.

5.5.3.2. Slurry Wall Materials:

The performance of the slurry wall mix materials will be further evaluated during design. The use of Soil-Bentonite (S-B) versus Soil-Cement-Bentonite (S-C-B) will be determined. While S-B wall is less expensive, it is prone to higher levels of differential settlements as well as higher lateral and cyclic deflections under uneven loading patterns. Design will evaluate the wall materials to achieve the desired long-term performance.

The percentage of fines available in the excavated soils will vary with depth and along the wall alignment. Bentonite addition, and if needed, importing borrow soils will help achieve the required hydraulic conductivity of the backfill mix.

A geotechnical investigation program may include evaluation of likely borrow source areas in the project area. A geotechnical laboratory testing program will provide information on the mix design

and its hydraulic conductivity, consolidation, and strength characteristics. Typically, different mix designs would be prepared and tested to meet the desired characteristics. Also, the mix design would attempt to maximize the use of on-site soils.

5.5.3.3. Slurry Trench Stability:

The open excavation trench would be stabilized by using a bentonite slurry. Design and construction will need to address trench stability through the water-bearing gravelly zones in the upper alluvium. In such conditions, the mix design may need to be adjusted and/or other protective measures, such as trench shields, may be needed. When appropriately designed and constructed, gravel intermixed with other finer materials can help reduce the amount of consolidation settlement of the slurry wall.

The bentonite-water slurry material will provide trench stability and caking on the sidewalls. The slurry material properties (viscosity, density, filtration, pH) will be checked during construction at the mixing point and in the trench with a submerged sampler to facilitate sampling from different depths.

5.5.3.4. Construction Quality Control:

A comprehensive construction quality control and testing program would verify that the parameters intended during design are achieved during construction. Items to be checked during construction may include:

- Various properties of the slurry and backfill materials;
- Adjustments to those properties based on conditions encountered;
- Checking, sampling and testing of the advancing backfill slope (gradient, slump, density, fines content, hydraulic conductivity);
- Checking the cleanliness of the trench bottom;
- Noting the amount of consolidation of the slurry backfill materials;
- Performing other observations, tests, collecting monitoring data, and timely use of such information to make adjustments as the work progresses.

Remedial measures (such as topping off consolidated zones) would be implemented based on the monitoring data collected, and other observations.

After construction is completed, event-based monitoring could include inspections and monitoring data evaluations after significant seismic and storm events.

5.5.3.5. Resiliency Considerations:

During Excavation, the slurry wall will be subject to considerable differential hydraulic gradients between the back and the front of the slurry wall. There will be some differential earth pressures due to level ground on one side and slope on the other. There may also be moisture condition variations due to changes in groundwater conditions, seasonal and climatic variations, dewatering patterns, and non-uniform layering with different water retention properties of soils. Such factors can introduce wetting-drying cycles and/or loading-unloading cycles. Under such conditions, it is normal for fissures to develop in the slurry wall. However these are not anticipated to affect the

performance of the Slurry Wall, as it will still be capable of minimizing inflow in conjunction with appropriate dewatering elements.

During permanent use, the permanent slope will provide a substantial buttressing benefit. During permanent use, multiple cycles of filling and emptying of the reservoir as well as the seasonal and climatic factors may introduce some wetting and drying of the slurry wall, but this will be of a much-reduced nature due to the added soil cover in front of the slurry wall. Also, the load-unload cycles will have a much less significant influence on the slurry wall due to the buttressing effect of the fill. The deflection patterns felt at the slurry wall will diminish during permanent use, which is also evidenced by the Finite Element Modelling results.

5.5.3.6. Monitoring and Verification of Wall Performance:

A monitoring program will need to be implemented to check the performance of the completed wall. Monitoring would include groundwater levels at different locations on either side of the slurry wall, as well as the settlement of the slurry wall. Additional monitoring details related to the slurry wall performance would be developed as recommended by the designer.

5.6. CONCLUSION

The project is feasible from a geotechnical point of view. Additional studies will provide the necessary information needed as the project progresses into its design and construction phases.

6. EVALUATION OF POTENTIAL IMPACTS

6.1. CEQA SIGNIFICANCE CRITERIA

Geology and Soils impacts are described in subsequent sections based on an evaluation of geotechnical, geological, and conditions, and consideration of potential changes to ground conditions due to the Project. A geology and soils impact is considered significant if it would result in any of the following, adapted from the CEQA Guidelines:

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

   i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known active fault trace;

   ii. Strong seismic ground shaking;

   iii. Seismic-related ground failure, including liquefaction;

   iv. Landslides.

b) Result in substantial soil erosion or loss of topsoil.

c) Located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse.

d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.

6.2. IMPACT GS 1 (CRITERION "A"): SEISMIC HAZARDS

The majority of Tulare County is free of the faults noted on the Alquist-Priolo Earthquake Fault Zoning Map. Such faulting is noted only along the eastern-most boundary with Inyo County. As such, there is no known active earthquake fault in or within 30 miles of the Project site. Risks associated with different manifestations of seismic hazards are addressed below.

6.2.1. Fault Rupture (Criterion "A.i")

Earthquake surface rupture is the physical displacement of surface deposits, either laterally or vertically, along a fault trace. Surface rupture is the surface expression of the subsurface fault movement and generally only occurs along or within a few hundred feet of the fault trace that moves during an earthquake. Not all large earthquakes have a surface expression or co-seismic surface rupture (e.g. blind thrust faulting associated with the 1994 Northridge, M_W6.7 earthquake).

The proposed Project is in Tulare County which is not a designated Alquist-Priolo Earthquake Zone (APEZ) as issued in Special Publication 42 by the California Geological Survey (2007). Geographic areas are designed as APEZ if they encompass potentially active or active faults.

A review of the 2014 fault activity map for California shown on **Figure 6** and tabulated on Table 1 indicates that no active faults cross the Site. The closest faults to the Site are the Independence Fault, the Owens Valley Fault Zone, and the San Andreas Fault Zone at least 35 miles from the Site. Because the Site is not located within or near and APEZ, the potential for surface fault rupture at the Site is considered to be insignificant.

6.2.2. Ground Shaking (Criterion "A.ii")

Ground Shaking Intensity:

The estimated ground shaking (acceleration) at the Site does not pose a potentially significant impact because Project's proposed design accounts for the estimated ground acceleration and therefore ground shaking is expected to pose a less than significant impact. The proposed slopes into the quarry are at an inclination of 3:1 (Horizontal to Vertical) corresponding to an angle of 18.5 degrees. The materials at the site range from silty sand to sandy gravel with shear resistance characterized by friction angles which, for that type of material, ranges from 30 to 38 degrees. Stability analyses were carried out for these conditions and the applicable pseudostatic coefficient. The calculated FS values as discussed in Section 5, meet the necessary stability criteria.

Ground Shaking Induced Seiche:

Seismic events can create hazards with their impact on water bodies. One such phenomenon is Tsunami, which would not apply here since the Site is not near the coast. A seiche is a standing wave that can occur in small water bodies such as basins, swimming pools, and lakes as a result of ground shaking. The wave can reduce water levels at one end of the water body and increase the water level on the other, similar to the "sloshing" of water back and forth.

The risk of seiche developing in the proposed reservoir as a result of ground shaking during an earthquake has been evaluated and the results indicate this to be unlikely.

The occurrence of a seiche and the amplitude of the wave are controlled by the natural period of the reservoir and that of the earthquake. If the two periods are similar, resonance can occur, thus amplifying the wave.

The natural period of the reservoir can be calculated using the Merian formula assuming a rectangular basin (USNRC, 2011).

$$\mathrm{T} = \frac{2\,L}{\sqrt{gh}}$$

Where L is the length of the basin, g the acceleration of gravity (32.2 cm/sec^2), and h the depth of water. Combining a representative value of 600 ft as the average width of the basin and a depth of water h of 70 ft, the natural period of the reservoir is estimated to be:

$$T = \frac{(2)(600)}{\sqrt{(32.2)(70)}} = 25\ s$$

This natural period is to be compared to that of the earthquake that may shake the site. The typical range of period for strong ground motion is between 0 and 5.0 seconds, with the dominant period for the site-specific event being on the order of 0.2 second (USGS, http://geohazards.usgs.gov/hazardtool/application.php). Therefore, the difference in period between the reservoir and the design earthquake is two orders of magnitude.

An empirical formula is provided in HAZUS (FEMA, 2003) to estimate the peak wave height of the seiche as:

$$H = \sqrt{\frac{A}{L\,(\pi f)^2}}$$

Where H is peak height, A the acceleration in, g's, f the frequency of the lake, and L the wavelength (5.12/ft^2). Using the PGA calculated for the 2,475 year event of 0.20 g, the maximum wave height a seiche is estimated to be 0.06 cm.

The estimated value of the peak wave for the seiche at the site is extremely low and for practical purposes, insignificant. In addition, the ratio between the reservoir and the natural period of the seismic event that could occur on site indicates that a possible resonance condition is unlikely.

6.2.3. Ground Failure, Liquefaction, Lateral Spreading (Criterion "A.iii")

Soil liquefaction is a condition in which saturated granular soils undergo a substantial loss of strength and deformation due to increased pore pressure resulting from cyclic stress application induced by earthquakes. During liquefaction, the soil becomes sufficiently mobile to permit both horizontal and vertical movements if the soil mass is not confined. Soils most susceptible to liquefaction are sand deposits that are saturated, loose, clean, uniformly-graded, and fine-grained. If liquefaction occurs, foundations resting on or within the liquefiable layer may undergo differential settlement. This will result in reduction of foundation stiffness and capacity. When this occurs, the structure can settle, tip, or even become buoyant and shift upwards. Liquefaction and associated failures could damage foundations, roads, underground cables and pipelines, and disrupt utility service.

Earthquake induced liquefaction typically occurs within the top 50 ft of liquefaction-prone soil, if those soils are saturated. A review of the logs associated with borings advanced at the Site (BSK, 2011) indicates that the water table is at an average depth of 15 ft below grade (Attachment A). The saturated soils below that depth are classified as silty sand to poorly-graded sandy silt and cobbles. While some of the layers are susceptible to liquefaction, the required dewatering will lower the groundwater levels and reduce the risk of liquefaction.

Settlement of the ground surface can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of compaction and settling of loose subsurface materials Given the geologic setting of the Site and generally competent materials, seismically-induced settlement is not considered to be a significant hazard.

Seismically induced lateral spreading involves lateral movement of earth materials laying over potentially liquefiable layers. Lateral spreading is characterized by near-vertical cracks with predominantly horizontal movement of the soil mass. Because the potential for liquefaction at the Site is generally considered to be low and groundwater suppression has to be in effect, the potential for lateral spreading is considered to be low. Pseudostatic slope stability analysis indicates adequate slope stability FS.

6.2.4. Seismically Induced Landslides (Criterion "A.iv")

Slope stability under Site baseline conditions does not present a significant hazard. There are currently no significant slopes or other topographic features at the Site that appear susceptible to slope failure. The California Geologic Survey has produced a series of landslide inventory and landslide hazard maps for unstable areas of the State. The Site and the vicinity are not mapped as having pre-existing or future slope stability hazards.

Static and seismic stability of slopes to be created for the Project are addressed in Section 5 and Attachments C and D of this report.

6.3. IMPACT GS 2 (CRITERION "B"): SOIL EROSION OR LOSS OF TOPSOIL

Erosion is the removal of soils and rocks due to natural process such as flow of water and wind. Erosion is expected to occur within the Project site as a result of excavation, but not at the ground surface (i.e., outside the Project perimeter); therefore, ground erosion is considered to be a less than significant impact.

Vegetation and topsoil will be removed during the initial site preparation and excavation the Project site. Topsoil removed will be stockpiled for use in reclamation/revegetation of the Project site, and/or the adjacent CEMEX Lemon Cove Facility site in accordance with the SMARA-approved Reclamation Plan. The reservoir slopes would be designed to include appropriate scour prevention measures.

6.4. IMPACT GS 2 (CRITERION "C"): GROUND INSTABILITY

This CEQA criterion seeks to answer if the Site is located on a geologic unit or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse. The seismically induced risk of ground instability (liquefaction, lateral spreading) has been addressed in Section 5. Ground instability related to project activities are addressed in this Section. The project is considered feasible and capable of containing such risks by applying proper design and construction practices. Evaluation of different ground instability factors are addressed below.

Stability of Existing Ground Conditions:

There are no known existing geologic conditions or natural slopes that would impact the stability of existing ground conditions.

Stability of Project Slopes:

The Project involves excavation of a reservoir. The anticipated depth of the reservoir is approximately 75 ft with slopes out at 3:1 (Horizontal to Vertical).

A slurry wall will be installed around the perimeter of the pit. The subsoil conditions at the Site were established based on existing onsite soil boring logs and the grain size analyses performed on samples recovered during the drilling operations (BSK, 2011). The subsoil conditions generally consist of sand, sandy gravel, and clayey sand with cobbles. For the purpose of our slope stability evaluation, a representative cross-section was developed and slope stability analyses were performed as discussed in Section 5 of the report. Supporting analysis details are provided in Attachments C and D.

Based on our analysis, the project slopes have adequate FS values.

6.5. IMPACT GS 2 (CRITERION "D"): EXPANSIVE SOILS

The soils in the area are predominately classified as granular materials such as sand, gravel and cobbles, with some silt and occasional clay lenses. None of those soils are subject to expansion when wetted. Therefore, there is no risk to life or property from expansive soils and this hazard is considered less than significant.

6.6. IMPACT GS 2 (CRITERION "E"): SUPPORT OF WASTEWATER SYSTEMS

There are no permanent habitable facilities involved in this Project. Hence, this item is not applicable (N/A).

7. CONCLUSION

As described in previous sections, SLR has conducted a review of baseline and Project related conditions and has evaluated potential Project related impacts relating to Geology and Soils based on CEQA Appendix G criteria. Based on our evaluation, the project is feasible from a geologic and geotechnical engineering point of view. We have identified no significant impacts.
