The SWPPP must include BMPs, among other management measures, BMPs to control erosion at the source, such as through minimizing soil disturbance, preserving existing vegetation where feasible, and stabilizing and revegetating disturbed areas as soon as possible after grading or construction activities. Temporary soil stabilization measures/practices that could be utilized include covering disturbed areas with mulch, temporary seeding, soil stabilizers, binders, fiber rolls or blankets, temporary vegetation, and permanent seeding (SWRCB 2022). Additionally, the SWPPP may include sediment control measures, which would be used to capture any soil that becomes eroded. This may include perimeter control measures, such as installing silt fences or placing straw waddles below slopes, sediment basins and active treatment systems to remove sediment prior to storm water releases (SWRCB 2022). Wastewater and cement washout and cleanout areas or structure, secondary containment facilities, hazardous materials spill plans and other hazardous materials control measures to preclude discharge of toxic construction related pollutants in storm water runoff must also typically be included in the SWPPP (SWRCB 2022). Permittees are further required to conduct annual and precipitation related monitoring and reporting to ensure that BMPs are correctly implemented and that they are effective in controlling the discharge of construction-related pollutants.

Project applicability: The Project would disturb greater than 1 acre of land; therefore, it would need to obtain coverage under the Construction General Permit. To comply with the Construction General Permit, Valley Water will need to prepare and implement a SWPPP <u>that would be applicable to construction activities outside of the reservoir.</u>

Municipal Regional Stormwater NPDES Permit

The Municipal Regional Stormwater NPDES permit (Order R2-2022-0018) (San Francisco Bay RWQCB 2022) covers municipal stormwater discharges from the majority of Bay Area counties and cities. The permit is applicable to Valley Water, Santa Clara County, the City of San José, and other cities and storm water management agencies within the county that have joined together to form the SCVURPPP. The Municipal Regional Stormwater NPDES permit establishes discharge prohibitions, annual reporting requirements, construction site controls, water quality monitoring, pesticides toxicity control, trash load reductions, and provisions to address existing TMDLs established for the Bay. The continuous monitoring requirements include triggers that indicate the need for further study. The temperature trigger is defined as any of the following:

a) MWAT exceeds 17 °C for a steelhead stream, or 20 percent of the instantaneous results exceed 24 °C

b) 20 percent of instantaneous pH results are less than 6.5 or greater than 8.5

c) 20 percent of instantaneous specific conductance results are greater than 2000µS, or there is a spike in readings with no obvious natural explanation

d) 20 percent of instantaneous DO results are less than 7 mg/L in a cold water fishery stream

When results at one sampling station (e.g., along Coyote Creek) exceed the applicable temperature or DO trigger or demonstrate a spike in temperature or drop in dissolved oxygen with no obvious natural explanation, the Permittees l must identify the sample site as a candidate SSID project. SSID projects are intended to be oriented toward taking action(s) to alleviate stressors and reduce sources of pollutants.

The purposes of the measures included in the Municipal Regional Stormwater NPDES Permit are to control and reduce the levels of pollution in both stormwater and non-stormwater runoff discharges from storm drains into watercourses or features that are waters of the state or waters of the United States; gather concentration and loading information for a number of pollutants of concern; and ensure the implementation of appropriate source control, site design, and stormwater treatment measures in new development and redevelopment projects the discharge runoff into storm water management systems that concentrate and discharge runoff to jurisdictional waters. The permit was recently amended to refine development categories and low-impact development specifications.

Stormwater runoff that is concentrated within and enters Anderson Reservoir and Coyote Creek through storm water management system outfall pipes and similar facilities is covered under the provisions of the NPDES permit, which include prohibiting certain discharges, such as solid wastes, and discharges that cause or contribute to a violation of any receiving water limitation or applicable water quality standard (San Francisco Bay RWQCB 2022).

Project applicability: The Project would expand a road and parking lot and would comply with applicable Municipal Regional Stormwater NPDES permit requirements.

3.14.2.3 Local Laws, Policies, and Regulations

City of Morgan Hill General Plan, 2017 ~~2016~~

The City of Morgan Hill 2035 General Plan (2017 ~~2016~~) contains the following goals and policies relevant to water quality and the Project:

Open Space, Hillsides, and Scenic Features

Goal NRE-5: Preservation and reclamation of streams and riparian areas as open space.

Policy NRE-5.2: Other Agencies and Environmental Review. Coordinate with jurisdictional agencies, as required, as part of the environmental review process for development projects.

Policy NRE-5.3: Natural State of Streamside and Riparian Areas. Retain natural streamside and riparian areas in their natural state in order to preserve their value as percolation and recharge areas, natural habitat, scenic resources, and recreation corridors, and to stabilize banks. (South County Joint Area Plan 15.08).

Policy NRE-5.4: Development Impacts in Riparian Areas. Consider development impacts upon wildlife in riparian areas and mitigate those environmental impacts.

Policy NRE-5.5: Flood Control Projects. Where flood control projects are needed to protect existing development, minimize disruption of streams and riparian systems, maintaining slow flow and stable banks through design and other appropriate mitigation measures. (South County Joint Area Plan 15.08)

Policy NRE-5.6: Stream Channel Protection. Protect existing stream channels and riparian vegetation by requiring buffering or landscaped setbacks and storm runoff interception as specified in **Table NRE-1** and consistent with the Santa Clara Valley Habitat Plan.

Table NRE-1. Morgan Hill Stream Channel Protection

	Category 1 Streams (Water Present Year-Round During Normal Rain Years)		**Category 2 Streams (Water Present During the Wet Season Only During Normal Rain Years)**
Slope	Inside Urban Service Area	Outside Urban Service Area	Inside/Outside Urban Service Area
0-30%	100 feet	150 feet	35 feet
>30%	150 feet	200 feet	

Environmental Hazards

Goal SSI-5: The least possible damage to persons and property from flooding.

Policy SSI-5.2: Private Development in Flood-Prone Areas. If development is allowed in flood-prone areas, provide flood control facilities or appropriate flood-proofing prior to or in conjunction with development at developers' expense. (South County Joint Area Plan 12.05)

Policy SSI-5.9: Riparian Natural Functions. Restore and maintain the natural functions of riparian corridors, creeks, and channels to reduce flooding, convey stormwater flows, and improve water quality.

Policy SSI-5.10: New Development in Dam Inundation Areas. Consider risk of dam inundation in new development proposals within the Anderson, Chesbro, and Coyote Dam inundation areas.

Goal SSI-6: Adequate, safe, and environmentally responsible drainage and flood control.

Policy SSI-6.1: Flood Control Projects. Minimize disruption of natural riparian areas by flood control projects needed to protect presently existing development by maintaining slow flow and stable banks through design and other appropriate mitigation measures. (South County Joint Area Plan 15.08)

Policy SSI-6.3: Existing and Planned Development. Areas which are developed or planned for development should be protected by the construction of flood control facilities. (South County Joint Area Plan 12.00)

Envision San José 2040 General Plan, 2023 ~~2011~~

The Envision San José 2040 General Plan (2023 ~~2011, Revised in 2020~~) contains the following goals and policies relevant to water quality and the Project:

Goal MS-20: Ensure that all water in San José is of the highest quality appropriate for its intended use.

Policy MS-20.3: Protect groundwater as a water supply through flood protection measures and the use of stormwater infiltration practices that protect groundwater quality. In the event percolation facilities are modified for infrastructure projects, replacement percolation capacity will be provided.

Goal ER-9: Protect water resources because they are vital to the ecological and economic health of the region and its residents.

Policy ER-9.1: In consultation with the Valley Water, other public agencies and the Valley Water Water Resources Protection Guidelines and Standards (2006 or as amended), restrict or carefully regulate public and private development in streamside areas so as to protect and preserve the health, function, and stability of streams and stream corridors.

Policy ER-9.4: Work with Valley Water to preserve water quality by establishing appropriate public access and recreational uses on land adjacent to rivers, creeks, wetlands, and other significant water courses.

Policy ER-9.5: Protect groundwater recharge areas, particularly creeks and riparian corridors.

3.14.3 Methodology and Approach to Impact Analysis

This impact analysis evaluates impacts on water quality that will occur as a result of the following activities:

- Seismic Retrofit Construction
- Conservation Measures Construction
- Construction Monitoring
- Seismic Retrofit Post-Construction Operations and Maintenance
- Conservation Measures Post-Construction Operations and Maintenance
- Post-Construction FAHCE Adaptive Management

Baseline conditions used for this impact analysis vary depending on the activity analyzed. For construction of the Seismic Retrofit and Conservation Measures, the Pre-FERC Order Baseline is used, which reflects the conditions that existed prior to implementation of the FERC Order. For some construction impact analyses, the existing conditions baseline (conditions following FOCP implementation) is also used. The post-construction operations and maintenance analyses also use the Pre-FERC Order Conditions Baseline. The future conditions baseline is also used for post-construction operations and maintenance, representing how Valley Water would manage Anderson Dam releases in the absence of FAHCE, but taking into account future water demand and imported water availability. For this analysis, impacts are considered both qualitatively and quantitatively depending on the types of data available and the nature of the impact being examined.

Regulated Water Quality Parameters Analyzed

The evaluation of the water quality impacts in this analysis focuses on the following constituents of concern that would be impacted by the Project:

- Temperature
- Turbidity
- DO
- <u>PAHs (fuel, oil, lubricants)</u>

- Hazardous materials
- Trash
- pH

Reservoir levels and releases from Anderson Reservoir directly affect these parameters and the parameter directly correlate with the ability of Anderson Reservoir and Coyote Creek to support their designated beneficial uses. In addition to these parameters, water quality impacts of hazardous materials that may be used during construction and maintenance activities are generally evaluated.

The following specific constituents of concern, although subject to regulations, are not expected to be affected by the Project and are not specifically analyzed:

Mercury and PCBs: Anderson Reservoir is listed as impaired for mercury and PCBs; however, recent sampling of the sediments on the bottom of Anderson Reservoir found that the sediments have low readings (below sediment screening values) for both mercury and PCBs (Stillwater Sciences 2024 ~~Valley Water 2023d~~). Mercury and PCBs have not been detected in any near-surface water samples of Anderson Reservoir in recent years (2004-2019) (Valley Water n.d.), and PCBs have never been detected in outflow from Anderson Reservoir (Valley Water 2021b ~~2021e~~). The sites where Conservation Measures would be constructed in or near Coyote Creek (Ogier Ponds, North Channel Reach ~~Extension~~, and Phase 2 Coyote Percolation Pond) did not support industrial uses in the past that could suggest mercury or PCBs in soils or sediments and Coyote Creek is not impaired by Mercury or PCBs. Mercury concentrations in Coyote Creek meet TMDL thresholds for San Francisco Bay (McKee & ~~L.J.~~ Leatherbarrow~~, J.E.,~~ 2005). Given the low occurrence of mercury and PCBs in the reservoir and creek channel, it is unlikely that erosion and release of sediments from the reservoir would contain levels that would impact Coyote Creek or downstream uses.

Trash and Diazinon Pesticides: Coyote Creek is listed as impaired by ~~trash and~~ pesticides (diazinon, bifenthrin, cypermethrin, and pyrethroids). South San Francisco Bay is impaired by pesticides (chlordane, and dieldrin). The Project would not require use of these banned and restricted-use pesticides. Available monitoring data indicate low levels of diazinon in reservoir sediments. Therefore, the Project is not likely to ~~generate trash or diazinon or~~ result in banned or restricted pesticides ~~in trash or diazinon~~ entering the creek. Anderson Reservoir is not a source of these materials and would not contribute to the impairments downstream. Limited quantities of legal pesticides could be used during construction and are addressed in the impact analysis.

~~Chlordane, DDT, dieldrin, dioxin~~ Dioxin compounds, furan compounds, DDT, ~~invasive species,~~ and selenium: South San Francisco Bay is impaired by ~~chlordane,~~ DDT, ~~dieldrin,~~ dioxin compounds, furan compounds, ~~invasive species, mercury, PCBs,~~ and selenium. The Project is not likely to generate these water quality pollutants or change their concentrations in south San Francisco Bay.

Invasive Species: South San Francisco Bay is impaired by invasive species. Invasive species are addressed in Section 3.4, *Biological Resources- Fisheries Resources*, and in Section 3.5, *Biological Resources – Wildlife and Terrestrial Resources*, and are therefore not addressed in this section.

Toxicity: Coyote Creek and South San Francisco Bay are impaired by toxicity. The RWQCB has established an Diazinon and Pesticide-Related Toxicity in Urban Creeks ~~Dioxin Pesticide Toxicity~~

TMDL (San Francisco Bay RWQCB 2005). The Bay Plan requires that all waters shall be maintained free of toxic substances in concentrations that are lethal to or that produce other detrimental responses in aquatic organisms. A study by SCVURPPP found that over a period of 14 years, sediment toxicity in Coyote Creek has been decreasing and sediment toxicity is generally not present in Coyote Creek (SCVURPPP 2020). The Project is unlikely to affect levels of toxicity in Coyote Creek or South San Francisco Bay.

~~pH: The Bay Plan requires that pH not be depressed below 6.5 nor raised above 8.5. This encompasses the pH range usually found in waters within the basin. Controllable water quality factors cannot cause changes greater than 0.5 units in normal ambient pH levels. Prior to implementation of the FERC Order, pH ranged between 7.4–8.8 in the reservoir, with an average of approximately 8.1. More recent pH readings have been similar (average of 8.0 for the period of December 1, 2021 to December 15, 2021) (Valley Water 2021f). Values for pH measured at the three sites in Coyote Creek downstream of Ogier Ponds during WYs 2017 and 2018 did not exceed their respective SSUD triggers for pH. In addition, pH has not been a parameter of concern for fisheries habitat in Coyote Creek and the Project is unlikely to cause a discernable change to the pH of the water.~~

3.14.3.1 Seismic Retrofit Project Construction

Potential construction-related water quality effects within Anderson Reservoir and in Coyote Creek downstream of Anderson Dam were evaluated both qualitatively and quantitatively for the potential to impair beneficial uses of surface waters; violate any applicable water quality standards or waste discharge requirements, or otherwise substantially degrade surface water quality; and/or conflict with or obstruct implementation of the San Francisco Bay Basin Plan. Potential water quality impacts of the Project were characterized by comparing them to water quality data from Anderson Reservoir and Coyote Creek collected by Valley Water.

Prior to the FERC Order, the maximum allowable storage elevation of Anderson Reservoir (according to DSOD restrictions) was 592.9, which corresponds to a volume of 52,416 AF,[1] which is considered the baseline condition of the reservoir for this analysis Following FOCP, the reservoir was left at deadpool which is the existing conditions baseline, which is also used for certain analyses. The Seismic Retrofit construction is planned to occur over a 7-year duration, as described in Chapter 2, and the timing of specific activities with respect to the overall construction schedule is considered in the impact analysis. Work would begin by dewatering the reservoir to elev. 450 ~~467~~ feet during Year 1~~ and to elev. 450 feet during Year 2~~. Discharge of stored water would occur through the existing Stage 1 Diversion System (previously built as part of the FOCP). The reservoir would be maintained at elev. 450 feet during Years 2 and 3. The reservoir would be filled to elev. 556 feet in Year 4, elev. 556 feet in Year 5, and elev. 657 feet in Year 6. ~~Dewatering of the reservoir to elev. 453 feet during~~ To maintain the reservoir level during Years 2, 3, 4, 5, and 6, diversion of flows would occur through the Stage 2 Diversion System.

During the construction period all inflows into Anderson Reservoir would be passed through the Stage 1 and Stage 2 Diversion System to maintain the target water surface elevation. If inflow is not sufficient to maintain flows downstream in Coyote Creek for water supply, groundwater

[1] Note that during large storm events, the inflow to the reservoir can exceed its existing outlet capacity, in which case the reservoir elevation and storage may exceed these amounts.

recharge, and environmental benefits, imported water may be used to augment flows. Chillers at the CDL may be used to chill imported water (up to 10 cfs) with the goal of keeping releases at or below 16 °C.

Historical operating conditions of the reservoir were considered as a point of comparison, such as past dewatering events during which the entire reservoir was dewatered in 1961 and 1987. This analysis also looks at impacts of using increased volumes of imported water to supplement stream flows during dam construction.

Impacts to water quality during construction were largely based on the findings presented in: 1) sediment modeling studies conducted by URS in 2020 and 2021 that consider the potential for the ADTP and the Project to mobilize sediment within Anderson Reservoir and downstream in Coyote Creek (URS 2020~~, 2021~~), which are included in Appendix K to this EIR and 2) the *Biological Resources-Fisheries Technical Report* (Appendix F to this EIR), which includes quantitative analysis of suspended sediment, water temperature, and other Project impacts.

3.14.3.2 Conservation Measures Construction

Conservation Measures to be constructed would include the Ogier Ponds CM, Phase 2 Coyote Percolation Dam CM, Maintenance of the North Channel Reach ~~Extension~~, Sediment Augmentation Program, and Maintenance of the Spawning and Gravel and Rearing Habitat Improvements in the Live Oak Restoration Reach. While the Conservation Measures are intended to benefit fish habitat, water quality, groundwater recharge, and water supply, their construction could have short-term impacts on water quality in Coyote Creek, Ogier Ponds, the Coyote Percolation Ponds, and the San Francisco Bay. This analysis considered potential impacts from the removal of vegetation or channel material during construction of Conservation Measures, and impacts of adding cobble, gravel, and sediment to reaches downstream of the dam.

The Ogier Ponds CM would restore approximately 6,500 linear feet of river channel and connect the channel to the floodplain. Construction activities include creating a defined creek channel by separating the existing hydraulic connection between Coyote Creek and Ogier Ponds, returning the creek to a riverine channel, and adding ecological enhancements to the channel and floodplain. Construction of the Ogier Ponds CM would involve routing creek flows through diversion pipelines around the construction area and placing fill in multiple ponds. Ponds 1 and 5 would be filled completely and Ponds 2 and 4 ~~5~~ would be partially filled. Separating the Ogier Ponds from Coyote Creek would improve water quality by lowering temperatures in the creek downstream of the ponds. Although a managed hydrological connection (through weirs) would be maintained between the Creeks and the ponds to avoid degradation of pond water quality, the Ogier Ponds CM would allow the full CWMZ as defined in the FAHCE *Settlement Agreement* to function. Because the ponds would no longer result in the significant warming of the creek flow, the existing elevated temperature of creek water downstream of the CWMZ would also be colder which would further benefit beneficial uses in Coyote Creek. Construction of the Ogier Ponds CM would begin in Year 6 and end in Year 8, which would minimize overlap of this ~~project~~ conservation measure with Seismic Retrofit construction. Construction would occur over a three-year period during the dry season work window. Construction of the Ogier Ponds CM would require dewatering of the pond areas to be filled, diversion of creek flow around the work area, and control of groundwater to minimize expected seepage into the work areas, which would be implemented annually during the dry season work window.

~~Construction~~ Maintenance activities ~~associated with~~ in the North Channel Reach ~~Extension~~ would occur during the dry season work window ~~of Year 1~~ and would include minor and intermittent maintenance activities (e.g., vegetation management, replanting, and maintenance of the wetland bench). These activities may require minor and localized dewatering ~~and grading in the channel. The re-opening of the historical Coyote Creek Channel (north channel) would increase the total stream habitat available downstream of Anderson Dam and avoid hardening the south channel. The reopened channel bed would be lined with an engineered fill, and the channel banks would be lined with a biotechnical lining that will allow the growth of vegetation. Linings in the north channel would be designed to remain stable during a flow of 6,000 cfs that has the potential to occur, albeit with a low likelihood, after construction of the Stage 2 Diversion. A revegetation plan would be prepared that will include details on planting in the channel banks and riparian zone, as well as the installation of habitat improvement features.~~

Sediment augmentation activities would improve geomorphic processes that create and maintain steelhead habitat (sediments and spawning gravels) and reduce channel incision that is typical in Coyote Creek downstream of the dam. ~~This program would consist of stockpiling approximately 55,000 cy of suitable sediment from the exposed reservoir. Sediment used from an onsite source would be washed and sorted prior to placing it in Coyote Creek.~~ Initially, following Project construction approximately 500 cy of sediment would be delivered downstream of the dam, near the confluence of the North and South Channels within the Live Oak Restoration Reach ~~or Ogier Ponds~~. Additional sediment augmentation would occur within the Live Oak Restoration Reach and/or within the Ogier Ponds CM Restoration Reach at least every 5 years in an amount up to 500 cy, as necessary and pursuant to the Project and FAHCE Adaptive Management Program. If high flow events during construction mobilize all the injected sediment within the Live Oak Restoration Reach, additional sediment would be added to a location determined based on monitoring and in coordination with the AMT. Over the long-term, Valley Water would, maintain and adaptively manage implementation of the Sediment Augmentation Program to address sediment supply and transport effects of construction and operation of Anderson Dam, and support elements of steelhead critical habitat that are maintained by sediment and geomorphic processes, including spawning gravel quality and availability and rearing habitat.

The Phase 2 Coyote Percolation Dam CM would build upon the Phase 1 design from FOCP to improve upstream and downstream passage at the Coyote Percolation Dam area. Phase 1 improvements are part of the existing conditions baseline and they include 1) replacing the existing steel flashboard dam with an inflatable bladder dam, 2) constructing a portion of a roughened channel to provide upstream and downstream fish passage routes over the dam when the bladder dam is deflated (i.e., Dam-Down conditions), 3) upgrading the approach channel to the fish ladder to a roughened channel that better meets fish passage hydraulic criteria, and 4) upgrading portions of the fish ladder to meet fish passage hydraulic criteria over an increased range of flows. Phase 2 would build on these improvements to meet the most recent applicable CDFW (Love and Bates 2009) and NMFS (NMFS 2022) design criteria for anadromous fish passage across the entire range of design flows. Phase 2 improvements would include 1) constructing a roughened channel over the dam to provide improved upstream and downstream fish passage at higher flows, 2) replacing the radial gates next to the fish ladder with bypass weirs to provide more suitable conditions for downstream passage, and 3) other facility modifications to meet the most recent applicable CDFW (Love and Bates 2009) and NMFS (2022) fish passage design criteria. Therefore, the updated Coyote Percolation Dam after the completion of Phase 2 will allow fish passage at a wider range of flows, including across all

CDFW (Love and Bates 2009) and NMFS (2022) design flows, with less delay and safer downstream passage.

3.14.3.3 Construction Monitoring

The Construction Monitoring component of the Project includes measures to monitor the effects of the Project on the environment and reduce those effects through the avoidance and minimization of impacts. Construction monitoring includes the monitoring of Coyote Creek downstream from Anderson Dam for flow, water quality parameters (including temperature, DO turbidity, and pH), suspended sediment, sediment deposition, and steelhead habitat quality including conditions, migration, migration flows, spawning, and juvenile rearing. As described in Chapter 2, *Project Description,* water temperature, DO, turbidity, and pH have been monitored during FOCP as part of the Condition 2 Plan and will continue to be monitored throughout construction of the Project. The water quality monitoring procedures would be documented in a Water Quality Sampling Plan. In addition, data would be collected for stormwater and runoff discharges from construction areas outside of the reservoir pursuant to a SWPPP developed in accordance with requirements set forth in the statewide Construction General Permit. The SWPPP, including construction discharge turbidity and pH monitoring that complies with the Construction General Permit, would be prepared and implemented to address construction stormwater discharges associated with out-of-reservoir seismic retrofit improvement construction activities

Valley Water prepared a Sediment Deposition Monitoring Plan in Coyote Creek Downstream of Anderson Dam for the FOCP, which Valley Water would continue to implement through construction of the Project. Sediment deposition monitoring would evaluate available habitat conditions for steelhead (spawning gravel, and monitoring sites for spawning gravel quality, egg incubation, juvenile rearing, and fish migration) using the Habitat Criteria Mapping (HCM) approach within the Coyote Creek FCWMZ. ~~suspended~~ Suspended sediment monitoring would also be implemented in accordance with Valley Water's Sediment Monitoring Plan prepared for the FOCP (Valley Water 2021e ~~2021b~~), including monitoring of suspended sediment discharges from Anderson Reservoir through completion of Project construction activities as well as the effects of the discharges on Coyote Creek downstream of the dam. Continuous turbidity monitoring equipment (15-minute intervals), suspended sediment concentration (daily intervals), and suspended load (daily intervals) would be used to evaluate the effect of the discharges on Coyote Creek fisheries habitat and Coyote Creek baylands habitat downstream of the dam. This suspended sediment monitoring data would be used together with the data collected under the Sediment Deposition Monitoring Plan to assess and confirm the anticipated the impacts from sediment released during FOCP and Project construction on spawning habitat quantity and quality and guide the implementation of CMs to offset those effects. ~~would collect turbidity data which will be used, in combination with habitat assessment monitoring information and sediment deposition data collected as part of sediment deposition monitoring, to develop a sediment rating curve at several locations on Coyote Creek. This information will be used to guide the post-construction sediment augmentation program designed to assure that the project delivers a benefit to fisheries habitat and related beneficial uses.~~

Implementation of the construction monitoring measures will involve small numbers of people visiting a number of areas throughout the Project area. Those people and their vehicles and equipment may result in minor, localized, and temporary disturbance of sediment, bank material, and vegetation in aquatic, wetland, and riparian areas. However, such monitoring would help minimize impacts on water quality during construction by identifying adverse effects requiring remediation.

Continued implementation of the Wetland and Riparian Habitat Dryback Monitoring Plan throughout Seismic Retrofit construction would also help identify any adverse water quality effects that creek dryback may be having. If any adverse dryback conditions are noted, Valley Water would augment creek flow if feasible. Implementation of this type of monitoring would involve the same types of activities and effects as the other construction monitoring described above.

3.14.3.4 Seismic Retrofit Post-Construction Operations and Maintenance

Post-construction Anderson Dam facilities operations assume elimination of reservoir ~~seismic~~ restrictions on water storage and behind-dam elevations, and implementation of FAHCE rule curve flows for the benefit of steelhead. Operational activities include operation of Anderson Dam using the FAHCE operational rule curves to guide the timing and volume of flows released from Anderson Dam and the use of the new outlet works that allow for releases of cooler water to Coyote Creek. Due to the elimination of DSOD and FERC elevation restrictions on water storage in Anderson Reservoir, water levels in the reservoir would be maintained at higher elevations than under the Pre-FERC Order Conditions Baseline.

As described above for construction impacts, potential post-construction operations related water quality effects were evaluated qualitatively and quantitatively. The proposed outlet works would increase the outlet flow capacity of the dam to 6,720 cfs. Post-construction releases from Anderson Reservoir would be governed by the FAHCE rule curves.

Post-construction operations and maintenance-related water quality effects are evaluated qualitatively and quantitatively. The analysis of post-construction operations water quality impacts is based on the WEAP model results, and results presented in the *Sediment Deposition in Coyote Creek above Ogier Ponds and Discharge to Estuary (*Appendix K) and the *Biological Resources Fisheries-Technical Report* (Appendix F).

Post-construction flows based on elimination of reservoir storage restrictions and implementation of FAHCE releases were analyzed in comparison to two baselines: the Pre-FERC Order Conditions Baseline representing the way Valley Water managed Anderson Dam releases prior to the FERC Order, and the future conditions baseline representing how Valley Water would manage Anderson Dam releases in the absence of FAHCE, but taking into account future water demand and imported water availability. In general, FAHCE flows may entail slightly lower flows in winter and summer, due to retention of water in the reservoir to provide increased spring pulse flows, than either of the two baseline conditions, punctuated by the increased spring pulse flow releases. Moderately high flows of greater than or equal to 500 cfs or 1,000 cfs could occur more frequently in response to precipitation events relative to the Pre-FERC Order Conditions Baseline due to an increase in the capacity of the dam outlets. The effects of such changes may differ in different parts of Coyote Creek depending on groundwater recharge rates and natural climate conditions.

There is substantial uncertainty regarding the temperature WQO in the San Francisco Bay Basin Plan, both based on the lack of a definition of “natural receiving water” and given that some scientific research has shown that southern populations of salmonids may have adapted to warmer temperatures. To determine the potential for significant temperature impacts, average daily temperatures exceeding 71.6 °F (22 °C) in the CWMZ were selected as the significance criterion ~~threshold~~. USEPA has indicated that temperatures between 71.6 °F and 75.2 °F (22 °C and 24 °C) could begin to change salmonid behavior in response to increased temperature and limit salmonid distribution (USEPA 1999a and 2003, as cited in Carter 2008), with numerous reports citing juveniles present at temperatures of approximately 72 °F (22 °C) (NCRCD 2014, SCWA 2003, Smith, J. 2018). Temperatures exceeding 71.6 °F (22 °C) would have a higher likelihood of altering salmonid behavior, reducing fitness, and approaching increased potential for mortality (depending on duration of exposure). Therefore, average daily temperatures exceeding 71.6 °F (22 °C) in the CWMZ are considered a significant impact in this EIR. It should be noted that this temperature is likely conservative for salmonids found in California, as research indicates that they may be locally acclimated to even warmer conditions. Juvenile CCC steelhead have been observed in streams with temperatures as high as 75.2 °F to 78.8 °F (24 °C to 26 °C) (Hayes et al. 2008, Kubicek and Price 1976). These temperatures align with those reported from controlled studies that showed CCC steelhead could maintain 95 percent of their aerobic scope at temperatures as high as 76.3 °F (24.6 °C) (Verhille et al. 2016). Taken together, these studies provide evidence that steelhead in central California can tolerate temperatures greater than 75.2 °F (24 °C), although thermal variances occur with some populations having higher or lower thermal tolerance (Myrick & Cech ~~2000,~~ 2001; Beakes et al. 2010; Chen et al. 2015).

It should be noted that the FAHCE Program identifies 64.4°F (18°C) in the Coyote Creek CWMZ as the temperature objective that best supports certain species' life cycles. However, based on the above discussion, exceeding this temperature in the CWMZ would not necessarily constitute a substantial adverse effect on salmonids in Coyote Creek, so it was not used as EIR significance criteria.

Additionally, the analysis focuses on Project temperature impacts in the CWMZ because this is the area specifically identified in the Settlement Agreement and historically perennial, and is also where Valley Water operations have the most direct influence on water temperatures through reservoir releases. This is consistent with the San Francisco Bay Basin Plan's emphasis on "controllable water quality factors" when considering achievement of WQOs.

In post-construction conditions, Valley Water would continue to release imported water to the downstream end of the CWMZ via the Cross Valley Pipeline Extension, if stream flow from Anderson Dam does not reach the Cross Valley Pipeline Extension outfall and a dryback is present downstream. There is no temperature limitation for use of imported water in this manner because dryback is present at the release location (i.e., there are no natural receiving waters or temperature limitations as a result). This allows for managed aquifer recharge and meets minimum in-stream flow requirements. This would result in flows in Coyote Creek, and the maintenance of groundwater levels, that would help support multiple beneficial uses.

With respect to post-construction Anderson dam maintenance activities, Valley Water would maintain all Project-constructed features and facilities to ensure their proper function. Valley Water would maintain the newly retrofitted Anderson Dam and Reservoir per Valley Water's existing DMP. Maintenance of Anderson Dam facilities was previously evaluated in the Final DMP Program EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). The DMP includes BMPs and mitigation measures to minimize water quality impacts. For example, Valley Water would minimize the negative impacts of reservoir dewatering on water quality or sediment quality through implementation of DMP Mitigation Measure General-3, which requires the development a dam-specific reservoir dewatering plan for each dewatering event. BMPs HM-1 and HM-4 through HM-8, and DMP Mitigation Measures Water Quality-1 and **Wildlife-4** all deal with minimizing impacts to water quality from herbicides, pesticides, and rodenticides. For most water quality impacts, the Project's post-construction maintenance activities would not differ substantially from those impacts identified in the DMP EIR. Furthermore, previously identified DMP impacts would not be exacerbated with implementation of the Project.

3.14.3.5 Post-Construction Conservation Measures Operations and Maintenance

The Conservation Measures components includes the Ogier Ponds CM, Phase 2 Coyote Percolation Dam, Maintenance of the North Channel Reach ~~Extension~~, Sediment Augmentation Program, and Maintenance of Spawning Gravel and Rearing Habitat Improvements in the Live Oak Restoration Reach, all which focus on improving fish habitat.

As part of the Ogier Ponds CM, the creek channel would be widened and separated from the Ogier Ponds by weir and berms, and Coyote Creek would flow around the Ogier Ponds in normal circumstances. Eliminating creek flow through the ponds under general conditions via the creek pond separation project is a key element of improving summer temperatures and reducing predation within the Ogier Ponds Reach of Coyote Creek for the benefit of steelhead. The spillway structure would be designed to divert flows from the restored channel to the ponds to protect the integrity of the channel when flows exceed 2,000 cfs. Water in the ponds would be generally maintained by groundwater seepage. Changes in water quality may occur due to creek channel/pond separation as necessary to improve temperature and other steelhead habitat conditions within Coyote Creek include reduction in DO (particularly in summer) and surface water changes. Creek flows through the ponds would only occur via operation of spillway. High flows would flow into Pond 2 through spillway, then travel through Ponds 3 and 4, until flows exit Pond 4 and flow back into the creek via a culvert that will have fish screens to prevent predation. Monthly inspections would be conducted to monitor water quality changes. To maintain or improve DO in the ponds during normal conditions in the absence of creek flow-through, solar powered floating aerators would be installed to maintain or improve DO as compared to existing conditions. Other water quality best management practices may also be deployed, if necessary as indicated by pond water quality monitoring results to maintain or improve upon existing water quality conditions in the ponds. Maintenance of Ogier Ponds would include vegetation management, vegetation restoration, and inspection and repair of the berms, weirs, vegetation and habitat enhancement, and erosion protection.

Maintenance of the North Channel Reach would include maintaining the constructed wetland bench, maintaining design flow capacity through the North Channel, and replacing restoration plantings, as needed. ~~The North Channel Extension would accept most flows discharged from Anderson Reservoir. Maintenance of the North Channel Extension component would include removal of debris or vegetation from the channel, and possibly dewatering and grading the channel, if necessary, so that the channel maintains positive drainage.~~

The Sediment Augmentation Program would include continued inspection and placement of additional gravel/sediment, ~~ranging from 5 to~~ in an amount up to 500 cy at least every 5 years, as needed to support and maintain steelhead habitat throughout Coyote Creek.

The Phase 2 Coyote Percolation Dam CM would provide improved fish passage over the Coyote Percolation Dam. Within 13 months of completion of the Phase 2 Coyote Percolation Dam design (completion of design anticipated ~~in~~ prior to Year 1 ~~4~~), Valley Water will prepare a Phase 2 Coyot~~e~~ Percolation Dam Operations Plan in coordination with the regulatory agencies. The objectives of the Operations Plan will be to continue to provide sufficient groundwater recharge, while improving conditions for smolt migration. Maintenance would include periodic removal of sediment, vegetation management, repair of rock slope protection, and replacement of any in-channel bio-engineered habitat enhancements, as needed.

Within the Live Oak Reach, maintenance would include vegetation management and replacement of any in-channel bio-engineered habitat enhancements, as needed.

In-stream maintenance activities for the Conservation Measures would be conducted consistent with Valley Water’s existing SMP, which includes BMPs and avoidance and minimization measures to minimize potential impacts to water quality.

3.14.3.6 Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of Project ~~project~~ flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys).

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from of the original Conservation Measure construction.

Impacts of monitoring and adaptive actions are considered here at a programmatic level because the detailed characteristics, timing, and/or locations of the proposed adaptive measures are not known at the time of EIR preparation. Project-specific CEQA review would be undertaken in the future, as necessary, when specific projects are proposed, and project-specific details are available.

3.14.3.7 Applicable Avoidance and Minimization Measures, Best Management Practices, and VHP Conditions

Valley Water BMPs and VHP conditions and AMMs incorporated into the Project are described in Appendix A. Measures applicable to water quality are listed below and described in the impact discussions as applicable. The following BMPs would serve to minimize impacts on water quality from the Project:

- AQ-1 - Use Dust Control Measures
- HM-1 - Comply with All Pesticide Application Restrictions and Policies
- HM-2 - Minimize Use of Pesticides
- HM-4 - Comply with All Pesticide Usage Requirements
- HM-5 - Comply with Restrictions on Herbicide Use in Upland Area
- HM-6 - Comply with Restrictions on Herbicide Use in Aquatic Areas
- ~~HM-7 - Restrict Vehicle and Equipment Cleaning to Appropriate Locations~~
- HM-8 - Ensure Proper Vehicle and Equipment Fueling and Maintenance
- HM-9 - Ensure Proper Hazardous Materials Management
- HM-10 - Utilize Spill Prevention Measures
- WQ-1 - Conduct Work from Top of Bank
- WQ-2 - Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms
- WQ-3 - Limit Impact of Pump and Generator Operation and Maintenance
- WQ-4 - Limit Impacts From Staging and Stockpiling Materials
- WQ-5 - Stabilize Construction Entrances and Exits
- WQ-6 - Limit Impact of Concrete Near Waterways
- WQ-8 - Minimize Hardscape in Bank Protection Design
- WQ-9 - Use Seeding for Erosion Control, Weed Suppression, and Site Improvement
- WQ-11 - Maintain Clean Conditions at Work Sites
- WQ-15 - Prevent Water Pollution
- WQ-16 - Prevent Stormwater Pollution
- GEN-1 - In-Channel Work Window
- GEN-20 - Erosion and Sediment Control
- GEN-21 - Staging and Stockpiling
- GEN-26 - Spill Prevention and Response
- GEN-30 - Vehicle Maintenance
- GEN-31 - Vehicle Cleaning
- GEN-32 - Vehicle Fueling
- GEN-35 - Pump/Generator Operations and Maintenance
- VEG-1 - Minimize Local Erosion Increase from In-Channel Vegetation Removal
- BANK-1 - Bank Stabilization Design to Prevent Erosion Downstream

- BANK-2 - Concrete Use Near Waterways
- BANK-3 - Bank Stabilization Post-Construction Maintenance
- REVEG-1 - Seeding

Additionally, the following VHP conditions would serve to minimize impacts on water quality from the Project:

- ~~VHP~~ Condition 3 - Maintain Hydrologic Conditions and Protect Water Quality
- ~~VHP~~ Condition 4 - Avoidance and Minimization for In-Stream Projects
- ~~VHP~~ Condition ~~-~~5 - Avoidance and Minimization Measures for In-Stream Operations and Maintenance
- ~~VHP~~ Condition 7 - Rural Development Design and Construction Requirements
- ~~VHP~~ Condition ~~11~~ - Stream and Riparian Setbacks
- ~~VHP~~ Condition 12 - Wetland and Pond Avoidance and Minimization

Additionally, the following VHP ~~conditions~~ AMMs related to conditions 3, 4, and 5 would serve to minimize impacts on ~~hydrology~~ water quality from the Project ~~(refer to Appendix A for the full text of VHP conditions)~~:

2: Remove pollutants from surface runoff.

7: Prevent the accidental release of chemicals, fuels, lubricants, and non-storm drainage water into channels.

8: Spill prevention kits shall always be in close proximity when using hazardous materials.

9: Personnel shall implement measures to ensure that hazardous materials are properly handled and the quality of water resources is protected by all reasonable means when removing sediments from streams.

11: Vehicles shall be washed at approved areas.

12: No equipment servicing shall be done in the stream channel or immediate floodplain.

66: Control sediment runoff using sandbag barriers or straw wattles.

67: No stockpiling or placement of erodible materials shall occur in waterways or along areas of natural stormwater flow.

68: Stabilize stockpiled soil with geotextile or plastic covers.

72: Equipment storage, fueling, and staging areas will be sited on disturbed areas or non-sensitive habitat outside of a stream channel.

75: Dispose of all construction waste in designated areas and prevent stormwater from flowing onto or off of these areas.

76: Prevent spills and clean up spilled materials.

84: Appropriate erosion control measures (e.g., fiber rolls, filter fences, vegetative buffer strips) will be used on site.

87: Vehicles operated within and adjacent to streams will be checked and maintained daily to prevent leaks.

97: Erosion control measures shall be in place at all times during construction.

100: Potential contaminating materials must be stored in covered storage areas or secondary containment impervious to leaks and spills.

3.14.3.8 Thresholds of Significance

For the purposes of this EIR, consistent with *CEQA Guidelines* Appendix G, the Project would result in a significant impact to water quality if it would:

- **WQ-1a:** Impair beneficial uses of surface waters (criterion a).
- **WQ-1b:** Violate any applicable surface water quality standards or waste discharge requirements, or otherwise substantially degrade surface water quality (groundwater quality is assessed in Section 3.12, *Groundwater Resources*) (criterion b).
- **WQ-1c:** Conflict with or obstruct implementation of a water quality control plan (criterion c)

Rather than looking at each impact criterion individually, the impact analysis below considers whether the Project would result in a significant impact for criteria a, b, and c collectively, under Impact WQ-1. This is because these criteria are closely linked and separate analyses for each would lead to repetition and heavily overlapping discussions. For example, the same changes in water quality can result in the violation of water quality standards and impairment of beneficial uses. Additionally, the analysis of beneficial uses in Impact WQ-1a and water quality standards in Impact WQ-1b inherently identifies conflicts with the Basin Plan (WQ-1c) to the extent that impairments of beneficial uses or violations of applicable water quality standards would also conflict with the Basin Plan.

3.14.4 Impact Analysis

Impact WQ-1: Impair beneficial uses of surface waters OR violate any applicable surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality OR conflict or obstruct implementation of a water quality control plan **(Significant and Unavoidable)**

Seismic Retrofit Construction

Project construction activities would involve drawdown and dewatering of the reservoir, excavation of soils within or near the reservoir and creek, placement of fill within or near the reservoir or creek to construct dam improvements, potential sediment transport to water bodies from large-scale earth-moving activities, vehicle travel on unpaved access/haul roads, exposed unvegetated work sites and staging areas, uncovered stockpiles, dewatering of construction sites and excavated areas (such as tunnels), and mining/borrow activities. In addition, construction of temporary bridges may require construction within the creek channel. All these construction activities may cause the release of sediment, and pollutants adhered to sediment, in construction site storm water and runoff, which in turn may increase receiving water turbidity and sedimentation, and impact beneficial uses that are sensitive to increased turbidity. Particularly reservoir dewatering would periodically result in temporary, but substantial releases of sediment to Coyote Creek from the reservoir, particularly during and immediately following large storm events (greater than 2- to 5-year storms), during the construction period. These sediment releases would increase turbidity in Coyote Creek and may mobilize other pollutants adhered to sediment and release them into Coyote Creek~~, such as diazanon, dieldren, and other COCs for Coyote Creek~~. In addition, clearing, grading, and filling for construction of Seismic Retrofit facilities could mobilize sediment and pollutants adhered to sediment~~ (including, for example, mercury, PCBs, diazinon, dieldrin, and DDT)~~, which are then released to surface waters in construction site storm water and runoff. As discussed previously, while Anderson Reservoir is impaired for mercury and PCBs, recent sampling of the sediments on the bottom of Anderson Reservoir found that the sediments have low readings for both mercury and PCBs. Anderson Reservoir is not impaired for diazinon or other constituents of concern for Coyote Creek or San Francisco Bay, and the sediment testing indicated low levels of diazinon in reservoir sediments. As such, there is low potential for these pollutants to be released along with mobilized sediment.

In addition, reservoir releases during drawdown construction related conditions could increase water temperatures in Coyote Creek downstream because the reservoir pool from which water is released would be smaller and shallower.

Both in-reservoir and out-of-reservoir construction ~~Construction~~ activities would also involve the use of hazardous materials and petroleum products, which could accidentally be released into the environment, resulting in adverse effects on water quality. These issues are discussed separately below.

Seismic Retrofit construction also involves significant use of concrete in the form of shotcrete and poured form concrete to rebuild the dam and outlet facilities. Exposure of uncured concrete to precipitation or use of excessive water in placing concrete can result in the release of concrete constituents in runoff that affect the pH of receiving waters. In addition, cleaning and maintenance of equipment used to shoot and pour concrete into place can result in release of concrete constituents that affect pH of receiving waters.

Construction sites with multiple workers may also generate trash that is mobilized and discharges in storm water or runoff. Release or trash not only increases that pollutant, but trash can consist of substances that affect DO in receiving waters.

Reservoir Dewatering and Releases

As discussed in Chapter 2, *Project Description,* while water levels within Anderson Reservoir have been substantially reduced as part of the FOCP (presently maintained at deadpool), the reservoir would need to be fully dewatered for construction of the Seismic Retrofit component and kept low for the duration of construction. The dewatering would follow a multi-step process, whereby dewatering of the reservoir to elev. 450 ~~467~~ feet would occur during Year 1 of construction ~~and to elev. 450 feet during Year 2~~. The reservoir would be maintained at elev. 450 feet during Years 2 and 3. The reservoir would be filled to elev. 556 feet in Year 4, elev. 556 feet in Year 5, and elev. 657 feet in Year 6. ~~The reservoir would be maintained at elev. 453 feet during Years 3, 4, 5, and 6.~~ Flows would be released to lower the reservoir in a controlled manner that avoids downstream erosion and takes advantage of groundwater recharge in Coyote Creek.

Once dewatered, all inflow to the reservoir would be passed through the dam during construction through the Stage 1 Diversion System in Year 1 and 2, and through the Stage 2 Diversion System in Years 3, 4, 5, and 6. Outflow from the reservoir during construction is expected to range from 6 to 10 cfs in summer months and 8 to 600 cfs in the winter, depending on the water year type (Valley Water 2023b ~~2023c~~). Peak flows during storms would be greater.

Within-Reservoir Effects

With respect to the impacts on water quality within the reservoir itself, the dewatering under Seismic Retrofit component construction would exacerbate adverse effects which will have already occurred as compared to Pre-FOCP baselines conditions due to the partial dewatering (i.e., to deadpool) under FOCP. The further lowering of water levels within the reservoir would increase water temperature, turbidity (especially following storms), and potentially concentrate other pollutants that be present within the water column. When fully or partially dewatered, beneficial uses associated with the reservoir would be impaired; in particular, Commercial and Sport Fishing (COMM), Cold Freshwater Habitat (COLD), Fish Spawning (SPWN), Warm Freshwater Habitat (WARM), Wildlife Habitat (WILD), Non-contact Water Recreation (REC-2), and Water Contact Recreation (REC-1), since the reservoir pool would be substantially reduced and Anderson Lake County Park would continue to be closed to the public, such that none of the identified beneficial uses would be possible or fully achievable. While some fish and wildlife habitat would remain in the small pool of water (roughly 500 AF) that may remain behind the cofferdam during the dry season, and the larger pool of water that could potentially accumulate despite fully open outlets during the wet seasons during Seismic Retrofit component construction, the habitat quality and extent would be substantially reduced compared to the Pre-FERC Order Baseline and the existing conditions baseline. As noted above, elevated temperatures and turbidity would occur in the remaining reservoir pool during Seismic Retrofit component construction, which would have adverse effects on fish and other aquatic wildlife and related beneficial uses within the reservoir. At the conclusion of construction, the reservoir would be allowed to refill, temperature and turbidity would be expected to return to Pre-FERC Order Conditions, and all beneficial uses would be restored. Impacts to Municipal and Domestic Supply and Groundwater Recharge (GWR), which are beneficial uses that are realized primarily through releases from Anderson Reservoir to Coyote Creek downstream (where percolation to groundwater then occurs), are discussed in more detail below and in Section 3.12, *Groundwater Resources*.

Based on the above analysis, construction phase water quality impacts within the reservoir are significant, and an unavoidable consequence of reservoir dewatering. As the reservoir must be maintained at a low storage level throughout construction, there are no additional measures to reduce the impact and it is significant and unavoidable.

Impacts of Sediment Releases on Coyote Creek

Due to lower reservoir levels and the direct release of reservoir inflows to the Creek through the Stage 1 Diversion System and Stage 2 Diversion System, releases from Anderson Reservoir to Coyote Creek during Seismic Retrofit component construction would have elevated suspended sediment/turbidity levels and temperatures since:

1. Exposed sediment in the reservoir basin would be more prone to erosion/suspension/ entrainment following large storm events (greater than 2- to 5-year storm events).
2. Rain events could suspend sediment from stockpile areas in, and around, the reservoir, and transport it downstream.

3. The smaller reservoir pool will settle out less suspended sediment prior to downstream release of flows.
4. Inflowing waters into the creek will be shallow and largely unshaded, and discharged from at or near the surface of the reservoir, as compared to having cooler deeper waters released at times when greater reservoir storage is allowed.
5. Releases during localized dewatering would enter Coyote Creek without treatment.

Suspended Sediment and Turbidity

During the first construction season (Year 1), when the reservoir is empty (Scenario 3 in the sediment transport modeling memorandums),[2] sediment models show that suspended sediment concentration[3] released from the reservoir to the Creek could hit 5,200 mg/L during flows of 500 cfs, which would be associated with precipitation events that are more frequent than the 2-year rain event. Suspended sediment concentration levels may reach values of 39,000 mg/L following a 2-year rain event (URS 2023, Valley Water 2023c). During construction seasons Year 2 though Year 6 (Scenario 4), the presence of a small pool above the interim dam would allow some suspended sediment to settle out prior to flows exiting the dam, leading to lower (but still elevated) modeled suspended sediment concentration in releases from the dam. Refer to Section 3.11, *Hydrology*, for a detailed discussion of the suspended sediment modeling results. As described therein, larger rain events would not necessarily lead to higher suspended sediment concentration as the reservoir would gradually fill while release flows would be limited by the capacity of the diversion system. **Table 3.11-5** in Section 3.11 shows that peak TSS[4] concentrations associated with reservoir releases would generally attenuate further downstream along Coyote Creek (with the exception of the 2-year inflow under Scenario 3, where TSS concentrations would spike back up over 30,000 mg/L at Milpitas). **Table 3.14-5** summaries the 2-year inflow would result in the following peak TSS concentrations at locations along Coyote Creek. Preliminary FOCP monitoring of suspended sediment concentrations suggests that the URS models overestimate suspended sediment concentrations and therefore adverse suspended sediment impacts described below may be overestimated (Stillwater Sciences 2024).

[2] The sediment transport modeling memoranda (URS 2020, ~~2021~~) considered two scenarios related to the Seismic Retrofit component construction: Scenarios 3 and 4. Under Scenario 3, the water level in the reservoir would be at El. 450 feet and the outlet works would be comprised of the ADTP, capable of releasing 2,000 cfs. This scenario would only last approximately 3 months during Year 1 of construction. Under Scenario 4, the water level in the reservoir would be at elev. 467 feet and the Stage 2 Diversion System would be in place, capable of releasing roughly 6,850 cfs. These conditions would last approximately 4 years during the Seismic Retrofit component construction period. Refer to Appendix K ~~J~~ for detailed description of the scenarios considered in the sediment transport modeling.

[3] Suspended sediment concentration is the concentration of sediment particles suspended in water, usually measured in mg/L. Turbidity is a measure of water clarity (how much light is scattered in a liquid). Turbidity is related to suspended sediment and is usually measured in NTUs. Turbidity is easier to measure in the field and is often used as a proxy for relative levels of suspended sediment concentration.

[4] Suspended sediment concentration is a measure of the amount of organic and inorganic particles in water. TSS which is ~~the~~ also a measure of the concentration of ~~all~~ organic and inorganic particles in water is ~~also~~ used sometimes instead of suspended sediment concentration. TSS only measures the weight of solids captured on a filter which can result in larger particles not being measured, therefore suspended sediment concentration is generally considered more accurate. The EIR uses suspended sediment concentration but ~~suspended sediment concentration correlates with~~ TSS also measures particles in water so either one could be used when discussing impacts to fish.

Table 3.14-5. Sediment Releases in 2-Year Flow During Seismic Retrofit Construction

Scenario 3 (Year 1 Construction) Peak TSS from 2-year flow	Scenario 4 - (Years 2 through 6) Peak TSS from 2-year flow
Released from Reservoir: 39,140 mg/L	Released from Reservoir: 30,470 mg/L
Upstream of Ogier Ponds: 32,492 mg/L	Upstream of Ogier Ponds: 26,437 mg/L
Downstream of Metcalf Ponds: 18,117 mg/L	Downstream of Metcalf Ponds: 18,145 mg/L
Near Upper Penitencia Creek Confluence: 16,055 mg/L	Near Upper Penitencia Creek Confluence: 16,521 mg/L
At Milpitas: 30,617 mg/L	At Milpitas: 16,547 mg/L

The modeling also shows that the elevated suspended sediment concentration <u>in water releases from the reservoir</u> would be relatively short-lived following the modeled storm events, as shown in **Figure 3.14-3** and **Figure 3.14-4**. Note that only the model results for the 2-year inflow event are shown since these generally result in the highest TSS concentrations; refer to Appendix K for the entirety of the model results, including other storm frequencies modeled (e.g., constant inflow, 5-year inflow, one-half of 2-year inflow). As seen in **Figure 3.14-3**, the elevated TSS levels under Scenario 3 dissipate relatively rapidly and, generally, the concentrations above 10,000 mg/L last for less than 2 days at all modeled locations along Coyote Creek. Based on the flow in the creek and into the reservoir, this may be due to erosion within the reservoir being most pronounced at the beginning of a storm/inflow event; whereas, once the reservoir fills to some degree, the inundation prevents further erosion from occurring and provides an opportunity for entrained sediment to settle out in the reservoir prior to discharge. A similar pattern is observed in **Figure 3.14-4**, where the elevated TSS concentrations at various downstream locations last for a short period following the 2-year storm event. At all locations modeled, the TSS levels over 10,000 mg/L last for less than a day.

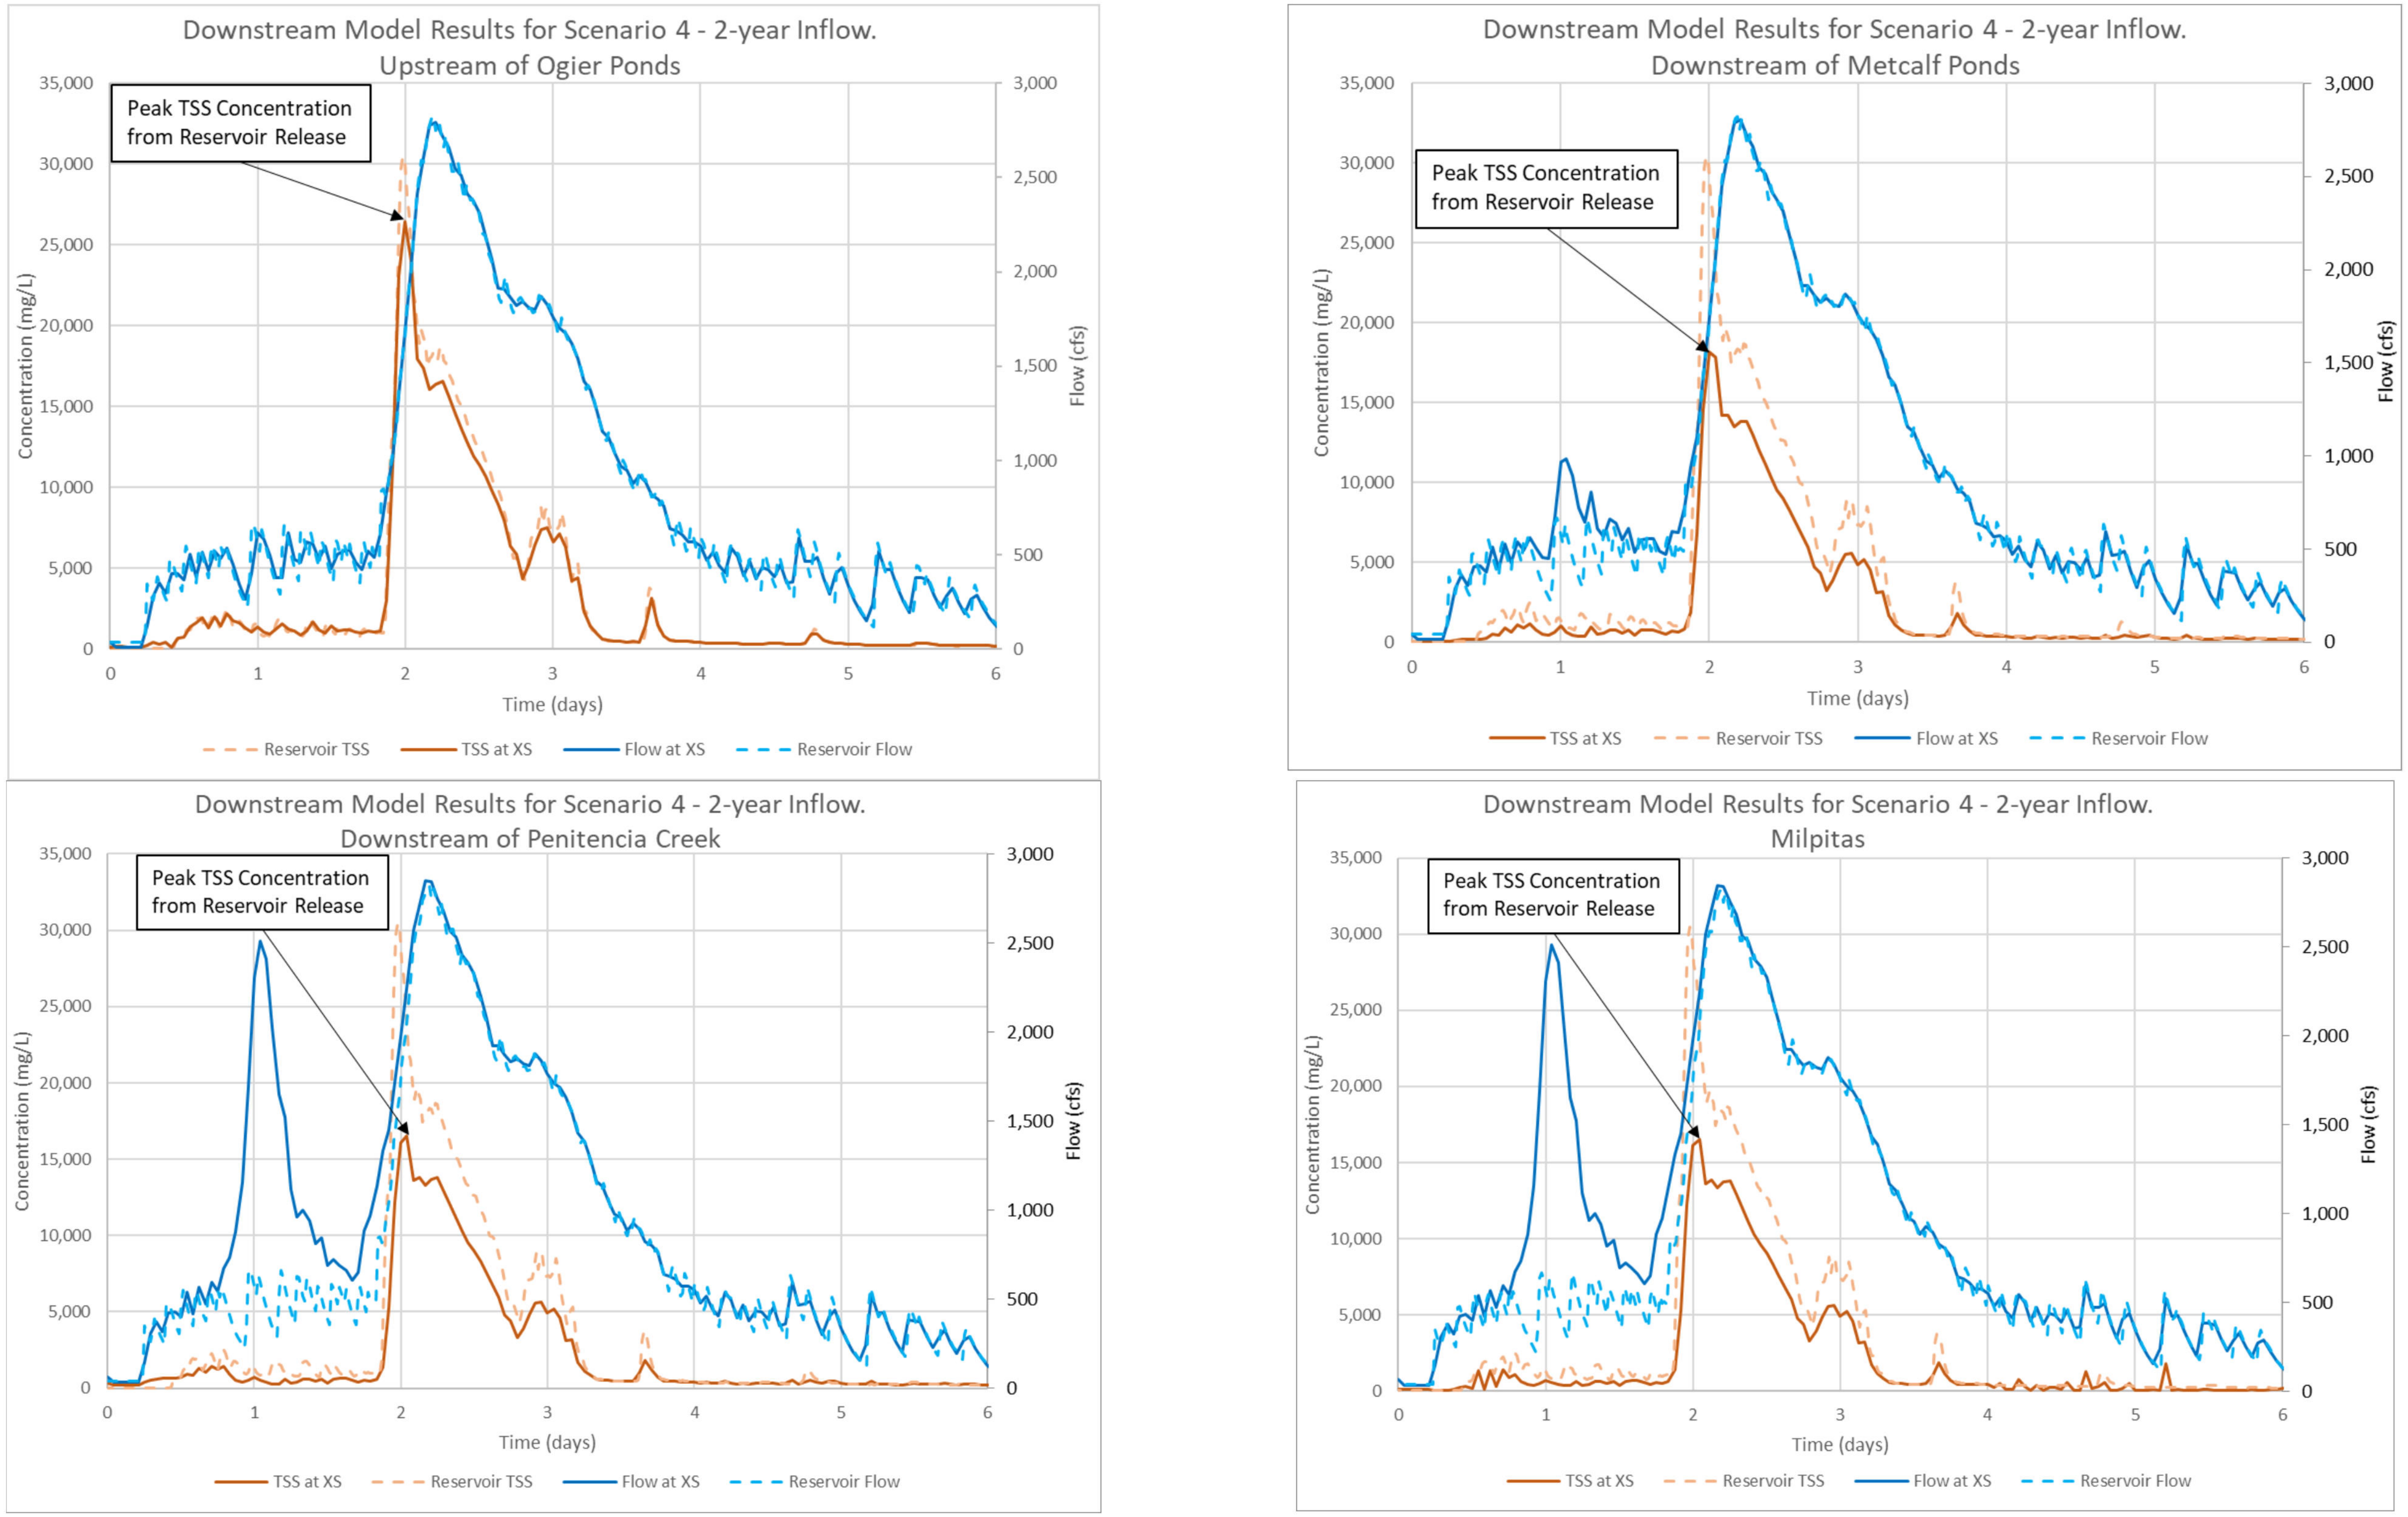
Source: URS 2020

1 **Figure 3.14-4. Downstream Sediment Transport Model Results for Locations Along Coyote Creek – Scenario 4, 2-Year Inflow**



2 *Source: URS 2020*

Increased suspended sediment and turbidity (which is related to suspended sediment) in Coyote Creek would potentially result in short-term, periodic impacts to multiple beneficial uses of the creek relating to recreation, fishing, and fish habitat. As shown in **Table 3.14-4**, the nontidal portion of Coyote Creek is designated as having existing beneficial uses for GWR, COMM, COLD, fish migration (MIGR), preservation of rare and endangered species (RARE), SPWN, WARM, WILD, water contact recreation (REC-1), and non-contact water recreation (REC-2) (San Francisco Bay RWQCB 2019 ~~2023~~). As described in Section 3.14.2.2, the San Francisco Bay Basin Plan does not include numerical WQOs for sediment, although it indicates that the San Francisco Bay RWQCB is working on developing these. Rather, the Basin Plan provides a narrative WQO for sediment, as follows: "The suspended sediment load and suspended sediment discharge rate of surface waters shall not be altered in such a manner as to cause nuisance and adversely affect beneficial uses. Another WQO provides that increases from normal background light penetration or turbidity relatable to waste discharge shall not be greater than 10 percent in areas where natural turbidity is greater than 50 NTU" (San Francisco Bay RWQCB 2019 ~~2023~~). Conversion of suspended sediment concentration or TSS to NTUs, and vice versa, is not completely straightforward and may depend on specific characteristics of the water body and suspended material; nevertheless, TSS levels over 10,000 mg/L, as seen in the sediment transport modeling for the Project, would be well over 50 NTU. As a result, sediment releases during and for a short term after precipitation events are expected to exceed water quality objectives.

The elevated suspended sediment concentration associated with releases from Anderson Reservoir following storms (e.g., greater than 2-year or 5-year events) would potentially temporarily cause nuisance and adversely affect certain beneficial uses for the short-term following precipitation events, thereby resulting in a short-term exceedance of the sediment load and ~~suspended sediment~~ turbidity WQO. For GWR, the issue is with respect to fine sediment deposition, as recharge operations can be limited by excessive suspended sediment or turbidity that can clog the surface of recharge pits, basins, or wells (San Francisco Bay RWQCB 2019 ~~2023~~). The impacts caused by sediment deposition are discussed further below. For recreation (REC-1, REC-2) beneficial uses elevated suspended sediment concentration within the water column would be detrimental for short period of times during and immediately following precipitation events thereby causing an exceedance of the suspended sediment WQO, but recreation during these periods is not consistent with public health and safety.

Sediment releases may result in potential short term adverse effects on fish and aquatic species habitat/protection beneficial uses (COLD, MIGR, RARE, SPWN, WARM, WILD) based on the potential to reduce in egg survival for spawning fish species, including steelhead, thereby resulting in a short-term exceedance of the suspended sediment WQO. As discussed in Section 3.4, *Biological Resources – Fisheries Resources*, the primary adverse effect for fish species resulting from suspended sediment releases during the 2-year, one-half 2-year, or 5-year event (refer to **Table 3.11-5** in Section 3.11, *Hydrology*), would be the potential to harm incubating eggs. Steelhead redds and incubating eggs of other sensitive migratory and winter spawning fish species (e.g., Pacific lamprey) could experience up to 20 percent mortality in response to sediment releases during 2-year and 5-year precipitation events. Overall, the increased suspended sediment concentration during Seismic Retrofit construction would decrease the productivity of the steelhead population in Coyote Creek. Although this impact would not be substantial for the population in the watershed as a whole, this would constitute a temporary adverse effect on the fish species-related beneficial uses that would occur only during certain-sized storm events and constitute an exceedance of the suspended sediment WQO. In terms of direct effects of construction phase sediment releases on beneficial uses (rather than the potential for exceedance of the suspended sediment WQO), effects would be short term (during and following precipitation events exceeding the 2-year event as described above, and may over the long-term, actually be indiscernible or may benefit certain beneficial uses.

Short term adverse effects on recreation beneficial uses (REC-1, REC-2, COMM) would occur, but be less pronounced, since (1) recreationists would be less likely to utilize Coyote Creek when the suspended sediment concentration effects would be most substantial (i.e., during the wet season, during or immediately following storms), and (2) the suspended sediment concentration effects would not pose a risk to human health (e.g., waterborne disease transmission). Within a short time (in most cases predicted by modeling to be less than 1 day) sediment effects within Coyote Creek are not detectable. The increased suspended sediment concentration, particularly following storm events (greater than 2-year and 5-year events), would temporarily adversely affect the aesthetic qualities of the water, which are important for the recreation beneficial uses, but would not result in a longer-term effect that precludes recreation after a sufficient period of time following the storm event. Further, such impacts occur in the existing condition baseline and Pre-FERC Order Baseline.

With respect to ~~Beneficial~~ beneficial uses in the tidally-influenced portion of Coyote Creek (i.e., Coyote Slough) and South San Francisco Bay, the suspended sediment concentration effects associated with reservoir releases during Seismic Retrofit construction would be less substantial. Generally, the elevated suspended sediment concentrations tend ~~tends~~ to attenuate or otherwise become reduced further downstream from Anderson Dam. As shown in **Figure 3.14-3** and **Figure 3.14-4**, TSS concentrations are typically lower at Milpitas than locations further upstream (with the one notable exception being under Scenario 3 for the 2-year inflow, where TSS levels spike at Milpitas from other sources). As indicated in **Table 3.14-4**, Coyote Slough is designated as having the following beneficial uses: estuarine habitat (EST), preservation of RARE, WILD, water contact recreation (REC-1), and non-contact water recreation (REC-2) (San Francisco Bay RWQCB 2019 ~~2023~~). South San Francisco Bay is designated as having all the same beneficial uses, plus industrial service supply (IND), ocean, COMM, shellfish harvesting (SHELL), MIGR, SPWN, and navigation (NAV) (San Francisco Bay RWQCB 2019 ~~2023~~).

For certain beneficial uses in Coyote Slough and South San Francisco Bay, the short-term impacts of elevated suspended sediment concentration on the achievement of the beneficial uses would be limited. For example, for IND, most industrial service supplies have essentially no water quality limitations except for gross constraints, such as freedom from unusual debris (San Francisco Bay RWQCB 2019 ~~2023~~). Thus, elevated suspended sediment concentration (primarily limited to brief periods during or following storms) would not substantially affect such industrial service supplies. Similarly, for the NAV beneficial use, where water is used for shipping, travel, or other transportation by private, military, or commercial vessels, elevated suspended sediment concentrations in the water column would not substantially affect achievement of the use (the potential for sediment deposition to affect NAV is discussed below). For other beneficial uses related to fishing, fish and wildlife protection and habitat, and recreation, elevated suspended sediment concentrations would generally result in similar short-term impacts, similar but greater than occur in the existing baseline and Pre-FERC Order Baseline.

The impacts of elevated suspended sediment on biological resources are discussed further in Section 3.4, *Biological Resources – Fisheries Resources* and Section 3.5, *Biological Resources—Wildlife and Terrestrial and Resources,* As detailed in that section, despite the short-term adverse effects of sediment mobilization and release from Anderson Reservoir during Seismic Retrofit component construction, the transport of this sediment downstream to lower Coyote Creek and San Francisco Bay would be beneficial for these downstream ecosystems and habitats and related beneficial uses because the system has historically been deprived of sediment.

Stormwater accumulating in the downstream excavation area of the dam, at spillway and outlet works construction, and at the BHBA would be collected and pumped to an ATS prior to release into Coyote Creek (Section 2.5.4.2) or used for dust control. In staging areas and stockpile areas located in these areas without access to existing infrastructure, stormwater would be managed using Valley Water's BMPs, as listed in Section 2.11 and included in Appendix A, *Best Management Practices and Santa Clara Valley Habitat Plan Conditions, Avoidance and Minimization Measures, and Mitigation Measures*, and also would be managed in accordance with the SWPPP prepared to comply with the Construction General Permit. ~~To reduce the volumes of erosion from active construction areas and stockpiles Valley Water would use an ATS to treat dry season construction site dewatering releases as described in Chapter 2, *Project Description*.~~ However, releases from the reservoir would greatly exceed the volume of runoff that is feasible to treat ~~treated~~ via the ATS following rain events.

Valley Water would implement a Water Quality Sampling Plan and Sediment Monitoring Plan to continuously monitor turbidity and suspended sediment discharges from Anderson Reservoir through completion of Project construction activities, and the Sediment Deposition Monitoring Plan to monitor the effect of releases carrying in-reservoir suspended sediment on Coyote Creek downstream of the dam. The Water Quality Sampling Plan and Sediment Monitoring Plan were ~~was~~ created as part of the FOCP and would continue to be followed during the Seismic Retrofit construction. ~~Monitoring~~ Continuous monitoring would take place at the Madrone Gage (USGS11170000), Edenvale Gage (USGS 11171500), Coyote Ranch Road Gage (USGS 11170450), and Highway 237 Gage (USGS 11172175). ~~Serpentine Trail Pedestrian Bridge , Valley Water Gage Station #50824, Coyote Ranch Road, and USGS Gage Station #11172175.~~ Supplemental turbidity and total suspended sediment concentrations would be collected near the dam outlet following storm events.

The Sediment Monitoring Plan would use monitoring results to inform adaptive management of measures[5] to minimize the discharge of suspended sediment (Valley Water 2021b). However, if sediment is entrained in reservoir releases ~~and is the result of natural conditions~~, adaptive management options to prevent sediment from being released from the reservoir are limited, primarily because the FERC 2020 Interim Flood Risk Reduction Measures prohibit storing and settling storm related runoff behind the dam until the retrofit is complete due to the heightened risk to public health and safety. Therefore, methods that rely on runoff detention to reduce sediment in runoff releases, e.g., sediment curtains, or runoff detention and passive or active treatment to settle sediment out of flow, cannot be deployed. Also, other conventional erosion controls would be inundated and therefore ineffective ~~other than temporarily halting reservoir releases~~ (Valley Water 2021b). Refer to Section 3.11, *Hydrology*, for more detailed discussion.

Implementation of the Water Quality Sampling Plan, Sediment Monitoring Plan, and Sediment Deposition Monitoring Plan would measure impacts to water quality associated with elevated suspended sediment concentration in the water column as a result of releases from Anderson

[5] Note that this is different from the adaptive management that would be implemented in the post-construction Project period as part of the FAHCE AMP.

Dam during Seismic Retrofit component construction. Data derived from the Sediment Monitoring Plan and Sediment Deposition Monitoring Plan would guide implementation of the Live Oak Restoration Reach Maintenance, Ogier Ponds design, and implementation of the Sediment Augmentation Program to restore and enhance habitat to offset any adverse effects and retain habitat benefits of construction phase sediment releases from the reservoir. In addition, construction scheduling of the Ogier Ponds CM, Phase 2 Coyote Percolation Dam CM would allow capture of fine sediments during the reservoir drawdown period. Those Conservation Measures—as well as the Sediment Augmentation Program and Maintenance of the Spawning and Gravel and Rearing Habitat Improvements in the Live Oak Restoration Reach—would provide longer-term enhancements for fisheries-related and other beneficial uses.

Given that TSS could be as high as 39,140 mg/L during construction (prior to coffer dam construction, following a 2-year storm event; refer to Section 3.11), the numerical WQO for turbidity of 10 percent greater than background conditions would be temporarily and periodically exceeded, a significant water quality impact. However, the impact on beneficial use impairment would be less than significant given the temporary and periodic nature of the turbidity impact, and the ability of Conservation Measures to minimize and offset this impact over the short- and long-term, and the benefits to habitat complexity and structure provided by sediment releases. Regarding the fisheries-related beneficial uses, Section 3.4, *Biological Resources – Fisheries Resources* demonstrates why temporary increases in turbidity during construction would not cause significant adverse effects on special-status fish populations and habitat.

As discussed in the "Significance Conclusion Summary" below, other options are limited to address erosion and sedimentation that would occur during storms when the reservoir is in a dewatered state. Therefore, the water quality objective violation with respect to suspended sediment discharges to Coyote Creek from the reservoir during Seismic Retrofit construction would be a significant and unavoidable water quality impact.

Sediment Deposition

As described in Section 3.11, *Hydrology*, the reaches of Coyote Creek between Anderson Dam and Ogier Ponds, and between Ogier Ponds and Metcalf Ponds, are net erosional under the scenarios and flow conditions modeled in the *Update to April 30, 2021 Memo on Sediment Deposition in Coyote Creek above Ogier Ponds and Discharge to Estuary* (see Appendix K). A substantial portion of sediment discharged from Anderson Reservoir would settle in Ogier Ponds which would have multiple ponds intentionally filled in, or partially filled in, later in Project construction as part of the Ogier Ponds CM, and a lesser amount in Metcalf Ponds. As shown in **Table 3.11-6** in Section 3.11, *Hydrology*, under Scenario 3, 3.4 inches (27,941 tons) of sediment could be deposited in Ogier Ponds during/following the 2-year inflow event. At Metcalf Ponds (which includes the Coyote Percolation Pond), the most deposition would occur under Scenario 4 during the 5-year event, when 0.5 inches (2,450 tons) could be deposited. The greatest proportion would make its way all the way to the estuary. As shown in **Table 3.11-7** in Section 3.11, up to 147,498 tons of sediment would be discharged to the estuary (representing 88 percent of the total sediment load from Anderson Reservoir) under Scenario 4 during a 5-year event. Lesser amounts would be discharged/deposited under Scenario 4 during a 2-year event (72,091 tons), and under Scenario 3 during a 2-year event (57,723 tons) (URS 2023).

The modeling results shown in **Table 3.11-7** indicate that the reaches of Coyote Creek between Anderson Dam and Ogier Ponds, and between Ogier Ponds and the Coyote Percolation Ponds, would maintain sediment transport conditions during the inflow conditions modeled. Under all scenarios and flow conditions, these reaches would experience a net loss in sediment (i.e., erosion would exceed deposition); refer to Section 3.11, *Hydrology*, for detailed discussion. For the reach of Coyote Creek between the Coyote Percolation Ponds and the estuary, deposition would occur, with up to 14,449 tons of sediment being deposited during the 2-year event under Scenario 4.

Valley Water would implement a Sediment Deposition Monitoring Plan during construction of the Seismic Retrofit components. The Sediment Deposition Monitoring Plan would evaluate data from the Sediment Monitoring Plan together with evaluation of available habitat conditions for steelhead within the Coyote Creek FCWMZ (Valley Water 2020c). This monitoring would be conducted annually and would inform the implementation of the Sediment Augmentation Program~~, which would be maintained during the Seismic Retrofit component~~ following the ADSRP construction period. Valley would also use this information specifically to maintain spawning and rearing habitat immediately downstream of Anderson Dam as part of the Maintenance of Spawning Gravel and Rearing Habitat Improvements in Live Oak Restoration Reach CM. As such, spawning gravels and sediment would be replaced, as needed, based on the monitoring and in accordance with Conservation Measures, thereby minimizing potential impacts on fish habitat. The information would also inform design and construction of the Ogier Ponds CM.

As described in Section 3.12, *Groundwater Resource*, the fine sediment that could be deposited in the Coyote Percolation Ponds could potentially decrease the porosity of the pond bottom (e.g., by filling in interstitial spaces) and thus adversely affect groundwater recharge operations (i.e., the GWR beneficial use). However, continued implementation of Valley Water's existing maintenance program at the Coyote Percolation Ponds, which includes discing or removal of accumulated sediment, as needed to maintain recharge/percolation rates, would minimize this potential effect, and therefore they would be less than significant.

The amount of sediment reaching South San Francisco Bay as a result of Seismic Retrofit construction would represent a small fraction of the total sediment discharged to the Bay in any given year, and would not, on its own, substantially affect achievement of the NAV beneficial use. Nevertheless, the portion of sediment released during Seismic Retrofit component construction that does reach the estuary would likely have the beneficial impact of delivering sediment to marshes, mud flats, and former salt ponds being restored to marshes, making them more resilient to impacts of sea level rise. The long-term effects of sediment releases from Anderson Reservoir during Seismic Retrofit component construction would be largely beneficial. Although deposition of fine sediment within ponds and within the Coyote Creek channel downstream of Coyote Percolation Pond could have temporary adverse effects on fish habitat and groundwater recharge, the movement of trapped sediment behind Anderson Dam to the San Francisco Bay estuary would be beneficial and consistent with goals in planning documents. For example, the San Francisco Estuary Project (of which the San Francisco RWQCB is an active participant), has identified goals for sediment management in its Comprehensive Conservation and Management Plan ("San Francisco Estuary Blueprint"; San Francisco Estuary Partnership 2022). Action 6 of the Plan, which supports Living Resources, Resilience, and Stewardship goals, seeks to "Manage fine and coarse sediments and upland soils on a watershed and regional scale to enhance Estuary habitats and shoreline flood protection efforts through research to inform policy, evaluation of methodology, development of management tools and convening structures, and identification of funding opportunities for regional sediment coordination for beneficial reuse" (San Francisco Estuary Partnership 2022). The Plan further acknowledges:

> "Sediment provides the fundamental building material for estuarine ecosystems, habitat restoration, and shoreline protection. While watersheds naturally transport sediment with stream and river flows, human activities such as channeling, damming, and developing shorelines have led to a dramatic decrease in the Estuary's sediment supply. Moreover, most dredged sediment is not beneficially reused – this critical issue must be resolved for the region to meet its restoration goals and to adapt to sea level rise."

Thus, despite the short-term adverse effects of sediment mobilization and release from Anderson Reservoir during Seismic Retrofit component construction, the transport of this sediment out to the Bay would support wetland ecosystems and help the region adapt to sea level rise over the long run. Overall, the water quality effects of Seismic Retrofit component construction with respect to sediment deposition would be less than significant.

Temperature and Dissolved Oxygen

Based on recent experience with FOCP, and given that Conservation Measures would be implemented, water temperatures during construction of the Seismic Retrofit component released from the reservoir outlet are unlikely to exceed the temperature criterion ~~threshold~~ 71.6 °F/22 °C) established for the FCWMZ and would not differ substantially from the Pre-FERC Order or existing conditions baselines. Additionally, DO levels in reservoir discharges during Seismic Retrofit component construction are unlikely to be substantially reduced relative to the Pre-FERC Order and Existing Conditions Baselines. Water released to the creek, from the reservoir or imported water, is oxygenated when discharged through the outlet. Valley Water has collected temperature and DO data for the first 3 years of FOCP. During that time, temperatures have not become unsuitable for steelhead and only in July and August 2021 (a very warm summer in the middle of a 3-year drought) came close to the upper limit of suitable rearing conditions for juvenile steelhead at the Madrone Gage 5082 in the FCWMZ. Valley Water has also previously documented steelhead successfully rearing through the summer despite times of temperatures above the "suitable" range (Valley Water 2021c, 2021d, 2023). These temperatures were recorded for releases from the dam and/or CDL prior to the installation of the chillers; therefore, Valley Water would have greater ability to manage the temperature of releases to the FCWMZ during the Seismic Retrofit component construction after implementation of chillers is completed.

As described in Chapter 2, *Project Description*, during the Seismic Retrofit component construction, Valley Water would use chillers that were installed as part of the FOCP to reduce the temperature of unsuitably warm imported water to 64 °F/18 °C or less prior to releasing into the FCWMZ in Coyote Creek. In addition to the use of chillers, Valley Water would continue to monitor temperatures and DO at the base of the dam, Madrone Gage 5082, upstream of Ogier Ponds, and downstream of the FCWMZ. The use of chillers would ensure that water temperatures in the FCWMZ associated with Seismic Retrofit component construction flows are not higher than the conditions than the existing conditions or Pre-FERC Order Baselines.

Valley Water would monitor for rearing juveniles between the CDL and Ogier Ponds, migrating adults at the Coyote Percolation Dam, and eDNA in the FCWMZ. This will provide Valley Water with insight on the distribution of steelhead in the reach. According to the Fish Rescue and Relocation Plan Supplement (Stillwater Sciences 2021 ~~2020~~), fish rescue would be initiated if a MWAT of 75 °F (24 °C) is reached in the entire FCWMZ. Other factors, such as DO levels of less than 7 mg/L would also be considered in determining the need for a fish rescue (Stillwater Sciences 2021 ~~2020~~), which is consistent with the WQO for DO in cold water habitat. In general, the water quality data gathered prior to and during the Seismic Retrofit component construction would be used Technical Working Group discussions to balance the risks of capture and relocation with the risks of allowing steelhead to remain in the FCWMZ under suboptimal conditions. Refer to Section 3.4, *Biological Resources – Fisheries Resources*, for detailed discussion of potential impacts to fish from temperature and DO changes brought about by the Project.

Given the distance from Anderson Reservoir and the Coyote Percolation Pond and other tributary waters that join Coyote Creek, and that the Project is not likely to have a substantial effect of temperature or DO against the Pre-FERC Order and existing conditions baselines, as discussed above, Seismic Retrofit components construction would not substantially affect temperature or DO between Coyote Percolation Pond and San Francisco Bay.

Overall, the temperature and DO of waters released from Anderson Reservoir are not expected to differ substantially from the existing conditions baseline or the Pre-FERC Order Baseline. Should increased temperatures be observed from water quality monitoring Coyote Creek flows can be supplemented with chilled imported water during Seismic Retrofit component construction. The water quality impacts of reservoir dewatering activities with respect to water temperature and DO in Coyote Creek would be less than significant.

Seismic Retrofit Construction Work Area Localized Dewatering

Maintaining a dry work area between the cofferdam and Anderson Dam would require ongoing pumping and discharge of natural seepage throughout Seismic Retrofit component construction. Construction of the proposed low- and high-level outlet tunnels would also require pumping and discharge of natural seepage to complete construction work. Excavation and processing of dam fill materials would involve the use of water that would be treated and subsequently discharged from the Project area. The excavation of soils and materials from the dam and placement of fills would also loosen soils that could subsequently be entrained in seepage or runoff water and then be discharged to Coyote Creek. As described in Chapter 2, *Project Description,* the effluent from the dam excavation areas, and any related staging areas and access roads would be treated via an ATS. The ATS would have the ability to treat 6.4 cfs, and would remove sediment, reduce turbidity, and balance pH from these waters prior to release into Coyote Creek, downstream of the dam. Therefore, impacts to water quality from elevated suspended sediment levels and other impairments in dewatering effluent from construction work areas (i.e., dam excavation and fill areas) would be less than significant.

Sediment Discharges via Other Mechanisms Associated with Construction Activities

Apart from reservoir dewatering and releases, construction activities, including construction work area dewatering, may transport sediment ~~may be transported~~ to Coyote Creek by wind erosion, stormwater runoff, or spills from construction vehicles (e.g., pickup trucks hauling fill material). Project grading, excavation, equipment staging, stockpiles, placement of clean fills to support Project improvements, haul roads, and sediment disposal areas would be susceptible to these types of sediment transport. Additionally, uncovered stockpiles of fill material and unpaved haul roads would be susceptible to wind erosion and stormwater runoff.

Surface runoff water, especially during storm events, can pick up soil particles from all work areas, stockpiles, access roads and other Project construction areas, transport them in overland flows, and deposit them into receiving waters. This action can result in the exceedance of WQOs and impact biological resources and supporting habitats in the receiving waters (Anderson Reservoir and Coyote Creek downstream of the dam). This potential impact would occur during the wet season between construction years. Clearing of riparian vegetation for construction of the temporary construction bridge may also result in increased surface runoff water into Coyote Creek.

Blasting for excavation of borrow materials could result in sediment discharges into Coyote Creek and Anderson Reservoir through wind transport or transport in runoff water used for material processing. However, the ATS would be used to treat stormwater accumulating in the BHBA, which would reduce the potential impacts on water quality from these types of discharges.

As described in Section 3.11, *Hydrology*, the Project would disturb greater than one acre of land and therefore would be subject to the Construction General Permit <u>for construction activities outside of the reservoir</u>. This permit requires that an applicant prepare and implement a SWPPP, which would include BMPs to prevent soil erosion and discharge of sediment and other construction-related pollutants to surface waters. Measures may include those to control erosion at the source (e.g., minimizing soil disturbance, preserving existing vegetation where feasible, and stabilizing and revegetating disturbed areas as soon as possible after grading or construction activities) as well as those for sediment control (e.g., perimeter control measures such as installing silt fences or placing straw waddles below slopes). Refer to Section 3.11, *Hydrology*, for additional discussion.

In addition to the SWPPP BMPs, Valley Water would implement <u>applicable Valley Water</u> BMPs, which would serve to reduce potential impacts related to <u>pollutants associated with out-of-reservoir construction activities mobilized via</u> stormwater discharges. Implementation of Valley Water BMPs GEN-21 and WQ-4 will limit water quality impacts from staging areas and stockpiling materials by restricting where staging areas and ~~project~~ <u>Project</u> material stockpiles are located and by controlling runoff from those areas. BMP WQ-5 will protect water quality by ensuring construction entrances and exits are stabilized, reducing the risk of track out and sediment runoff. BMP WQ-9 will protect water quality by ensuring erosion is controlled in all work areas by seeding disturbed areas as soon as is appropriate. WQ-11 will protect water quality by maintaining clean conditions at work sites and helping prevent debris and materials from entering storm drains or waterways. WQ-15 will protect water quality by preventing water pollution and establishing limits on turbidity increases due to activities to construct Project improvements BMP AQ-1 will require dust control measures to minimize the creation of dust that could end up in adjacent water bodies. BMPs GEN-20 and WQ-16 will prevent stormwater pollution by ensuring exposed soils are seeded and stabilized through the use of erosion control measures such as silt fencing, straw bales, sediment basins, etc. Implementation of BMPs WQ-1 and GEN-1 will limit equipment use in channels during the wet season or when flows are present and work can be completed from the top of the bank; decreasing the risk of sediment being resuspended by equipment. Additionally, implementation of BMP VEG-1 will minimize the potential effect of localized erosion by ensuring as much vegetation is left intact in the channel as possible, particularly along the toe of the bank.

VHP Conditions and AMMs, which would be implemented as applicable during construction of the Seismic Retrofit component, would also serve to limit potential impacts. For example, VHP Condition 7 would entail minimizing ground disturbance and vegetation removal, stabilizing soil to avoid erosion and sedimentation, and revegetating with native plants or other appropriate plants. VHP conditions 3, 4, 5, 7, 11, and 12 would reduce the potential for and magnitude of impacts on water quality by minimizing impacts on stream, wetland, and pond habitats. These conditions require implementation of numerous AMMs (summarized in **Table 3.5-8** in the Wildlife and Terrestrial Biology chapter); these AMMs, including AMM-66, 67, 68, 84, and 97, include limiting the footprint of activities, reducing the potential for pollutants to impact these aquatic habitats and avoiding erosion and sediment impacts on these habitats.

Whether included in the SWPPP for out-of-reservoir construction activities pursuant to the Construction General Permit, implemented in accordance with Valley Water's BMP Handbook, or in compliance with the VHP, the Seismic Retrofit construction activities would incorporate erosion and sediment control measures to minimize the prospect of substantial erosion that could affect water quality in the reservoir and Coyote Creek. These measures would assure that the Project's extensive disturbance areas during construction would not cause substantial erosion or siltation, and this impact would be less than significant.

Petroleum Based Products and Hazardous Materials Releases Associated with In-Reservoir and Out-of-Reservoir Construction Activities

As discussed in Section 3.11, *Hydrology*, (refer to Impact HYD-1, subsection iii.), due to the use of petroleum based products and hazardous materials during construction of Seismic Retrofit improvements (e.g., fuel, oil, lubricants, etc. contained in construction equipment) in areas such as the exposed bottom of Anderson Reservoir and lands adjacent to the reservoir and Coyote Creek, there would be the potential for discharge of polluted runoff if such materials were handled, stored, or disposed of improperly and/or if any accidental releases were to occur. Seismic Retrofit construction would require a wide range of equipment, much of which would contain hazardous materials. This equipment could potentially leak during its operation if it is not maintained properly; additionally, hazardous materials could spill during re-fueling or maintenance/servicing activities that may be necessary during the construction period. Hazardous materials stored onsite at staging areas or temporarily at work areas could also spill if proper protocols are not followed and containment measures are not implemented. Refer to Section 3.10, *Hazards and Hazardous Materials,* for additional discussion of these issues.

Such releases of hazardous materials, if they were to occur, could result in transport of pollutants to Anderson Reservoir and Coyote Creek if the spilled materials were not adequately cleaned up prior to a precipitation event. Note that such releases of hazardous materials could also adversely impact groundwater quality (e.g., seepage through the soil to the groundwater aquifer below); however, these impacts are evaluated in Section 3.12, *Groundwater Resources*.

Implementation of the SWPPP for construction activities outside of the reservoir, in compliance with the Construction General Permit, along with applicable Valley Water BMPs, VHP Conditions, and AMMs, would reduce the potential for accidental releases of hazardous materials during Seismic Retrofit component construction, as well as limit the potential for impacts in the event of such releases. The SWPPP would include good housekeeping measures that would likely include secondary containment for any hazardous materials that are stored at the construction site. Additionally, Valley Water ~~BMPs HM-7 and~~ ~~BMP~~ HM-8 reduces the risk of vehicle-related pollutants from impacting water quality by ensuring vehicles and equipment are ~~cleaned in appropriate locations and that they are~~ properly fueled and maintained, reducing the risk of fuel or other leaks entering waterways. BMP WQ-6 limits the impact of concrete, and therefore effects on receiving water pH, near waterways. Implementation of BMPs HM-9 and HM-10 also will protect water resources by ensuring proper management of petroleum based products and hazardous materials and the implementation of spill prevention measures. Additionally, BMPs GEN-26 (Spill Prevention and Response), GEN-33 (Vehicle Maintenance) GEN-31 (Vehicle Cleaning), GEN-32 (Vehicle Fueling), and WQ-11 (Maintain Clean Conditions at Work Sites), as well as VHP AMMs 2, 7, 8, 9, 11, 12, 72, 75, 76, 87, 88, and 100 will also include measures that would reduce potential impacts on water quality from petroleum based products and hazardous materials.

Banned and restricted-use pesticides that contribute to the downstream water quality impairments would not be used. For any legal pesticides that may be needed during the Seismic Retrofit component construction, BMPs HM-1 (Comply with All Pesticide Application Restrictions and Policies), HM-2 (Minimize Use of Pesticides), HM-4 (Comply with All Pesticide Usage Requirements), HM-5 (Comply with Restrictions on Herbicide Use in Upland Areas), and HM-6 (Comply with Restrictions on Herbicide Use in Aquatic Areas) will help protect water quality by ensuring that applicable pesticide application restrictions, usage requirements, and policies are followed (in both upland and aquatic areas) and by evaluating the use of alternative pest control methods and pesticides. These BMPs are taken from the Valley Water DMP and SMP and have been previously evaluated under that DMP EIR and SMP EIR (Valley Water 2012).

~~Compliance~~ Implementation of the SWPPP in compliance with the Construction General Permit for out-of-reservoir construction and implementation of applicable Valley Water BMPs, VHP Conditions, and AMMs would reduce potential impacts during Seismic Retrofit component construction associated with the release of petroleum based products and hazardous materials ~~tso~~ so that they are less than significant. With these measures in place, substantial releases of petroleum-based products, and hazardous materials would not occur during construction activities; however, if minor releases were to occur, spill cleanup materials would be available, and protocols would be in place to limit potential subsequent impacts to water quality.

Use of Imported Water

During Seismic Retrofit construction, the proportion of imported water released to the reaches of Coyote Creek downstream of the dam outfall, the CDL and through the Cross Valley Pipeline Extension may increase, due to the supplementation of local flows with imported water that would be implemented to maintain adequate flow for groundwater recharge and for fish, as described in Chapter 2, *Project Description*. If a greater proportion imported water is used for Coyote Creek flows, it could alter the water quality profile downstream of the discharge point. A rough comparison between **Table 3.14-1** and **Table 3.14-3** shows that imported water from San Luis Reservoir has had similar water quality parameters to Anderson Reservoir (temperature, turbidity, and pH). However, note that the readings in **Table 3.14-1** for Anderson Reservoir are for near-surface samples, which may not be representative of water quality deeper in Anderson Reservoir (especially when the reservoir is stratified, such as during the summer season), where releases to Coyote Creek typically originate. Imported water generally water meets regulatory standards (Valley Water n.d. ~~Undated 2~~); however, water quality problems occasionally occur in

San Luis Reservoir (e.g., blue green algae) (DWR 2022)—at which time Valley Water typically relies on other sources for water supply.

The data for Anderson Reservoir is from 2004-2019, so it is representative of the Pre-FERC Order Conditions Baseline, rather than the Existing Conditions Baseline. Under the Existing Conditions Baseline the reservoir is at deadpool and temperature and turbidity are likely higher. Temperature during the warmer months is likely elevated (due to the reduced water depth and surface area) and turbidity may also be elevated (since there is more erodible sediment exposed in areas outside the deadpool inundation area and there would be less water in the reservoir to allow for settling of suspended sediment), in comparing the Pre-FERC Order Conditions to the existing conditions baseline.

Nevertheless, the data in **Table 3.14-1** and **Table 3.14-3** show that water quality in Anderson Reservoir (under the Pre-FERC Order Conditions Baseline) and San Luis Reservoir is generally similar and acceptable under Basin Plan parameters for turbidity, temperature, pH, and DO. The turbidity of imported water is typically low, as is that in Anderson Reservoir except following large rain events. As mentioned in Chapter 2, the primary concern with the increased use of imported water is temperature, as imported water tends to be warmer than water historically released from lower levels of the reservoir. The ability to use chillers to cool imported water would decrease this impact. The average (2020-2021) temperature of imported water for August (20.3 °C) is lower than the average (2004-2019) for Anderson Reservoir surface water (23.8 °C), but again, this may not be a fair comparison as water from Anderson Reservoir is discharged from lower in the water column which has colder water than the surface. The use of chillers would reduce any temperature effects from imported water.

Overall, the increased use of imported water during Seismic Retrofit component construction to supplement local flows in the reaches of Coyote Creek downstream of the dam, CDL and CVP extension is unlikely to substantially adversely affect water quality and beneficial uses in Coyote Creek. Imported water is used periodically to supplement Coyote Creek flows under the existing conditions baseline and the Pre-FERC Order Conditions Baseline and was also stored in Anderson Reservoir under the Pre-FERC Order Conditions Baseline. Thus, the degree of impact, to the extent that it exists, would only be the difference between the impacts that could be occurring under both baselines) associated with imported water use.

Therefore, given the use of chillers, the increased use of imported water to supplement Coyote Creek flows downstream of Anderson Dam would not impair water quality standards or otherwise substantially adversely affect water quality in Coyote Creek. The water quality impact from increased use of imported water would be less than significant.

Pollutants from Blasting Activities

In addition to particulate matter released from blasting a range of other pollutants including perchlorates and various water-soluble nitrogen-compounds can be released during the use of explosives (DTSC 2005). As described in Chapter 2, *Project Description*, blasting would only be utilized during the excavation of the BHBA. Excavation of BHBA would require drilling and blasting in benches to break up the rock for efficient excavation. Blasting procedures would be developed by a qualified blaster to control noise, air-overpressure, ground vibration, flyrock, and dust. Water would be used before, during, and after the blasting to minimize dust emissions, but not to the point of creating runoff. The risk from perchlorates and other water-soluble nitrogen-compounds is primarily in relation to groundwater. Perchlorate salts are highly soluble in water and sorbs poorly to mineral surfaces and organic material; therefore, it is typically very mobile in surface water and groundwater. It is persistent in the environment and at high enough concentrations can affect thyroid gland functions. The release of substantial amounts of perchlorate to the environment where it can dissolve into surrounding surface or groundwater would be significant impact. Compliance with the General Construction Permit, which requires controls for pollutants from blasting would reduce this impact, but it could still be significant.

With the implementation of **Mitigation Measure GW-2** (Perchlorate Best Management Practices) (refer to Section 3.12), the impact from blasting activities during Seismic Retrofit component construction will not impair beneficial uses of surface waters; violate any water quality standards or waste discharge requirements, or otherwise substantially degrade surface water quality; or conflict or obstruct implementation of a water quality control plan. The impact would be less than significant with mitigation.

Summary

Impacts associated with Seismic Retrofit construction include in-reservoir impacts to water quality parameters from drawdown and dewatering, and a resulting ~~a~~ reduced storage volume, the release of substantial sediments and resultant turbidity from the erosion of previously inundated sediments at the bottom of the reservoir during and immediately following large storm events; related sediment deposition in Coyote Creek from storm events; alteration of temperature in Coyote Creek and temperature, turbidity, and DO in Anderson Reservoir from reduced storage in the reservoir; sedimentation in decant water from localized dewatering; erosion from construction equipment and construction activities; potential release of petroleum based products and hazardous materials associated with construction vehicles and equipment; the use of a greater volume of imported water for groundwater recharge in Coyote Creek; and release of pollutants from blasting. With the implementation of the SWPPP for out-of-reservoir construction, applicable Valley Water BMPs, applicable VHP conditions and AMMs, **Mitigation Measure WQ-1** for in-reservoir construction, and **Mitigation Measure GW-2**, the construction of Seismic Retrofit components will have a **less-than-significant impact** on the impairment of beneficial uses of surface waters; violation of any water quality standards or waste discharge requirements, or degradation of surface water quality; or conflict or obstruct implementation of a water quality control plan, with two exceptions.

First, ~~within~~ within the reservoir pool, temperature, DO, and turbidity water quality impacts are ~~significant, and an~~ a **significant and unavoidable** consequence of reservoir dewatering. ~~.~~ Second, the temporary exceedance of the turbidity water quality objective in Coyote Creek during certain-sized storm events due to erosion of exposed sediments while the reservoir is dewatered is a **significant and unavoidable impact**. However, the impact on beneficial uses of Coyote Creek from releases of sediment associated with reservoir drawdown and dewatering impairment would be less than significant given the temporary and periodic nature of the turbidity impact, and the ability of Conservation Measures to minimize this impact over the short- and long-term. Regarding the fisheries-related beneficial uses, Section 3.4, *Biological Resources - Fisheries Resources*, demonstrates why temporary increases in turbidity during construction would not cause significant adverse effects on special-status fish populations and habitat. Despite the short-term adverse effects of sediment mobilization and release from Anderson Reservoir during Seismic Retrofit construction, the transport of this sediment downstream to Coyote Creek and San Francisco Bay would be beneficial for downstream ecosystems and habitats and related beneficial uses because the system has historically been deprived of sediment.

Mitigation Measure WQ-1 would reduce sediment impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. ~~No~~ However, no feasible mitigation exists, beyond **Mitigation Measure WQ-1**, to reduce the impact from sediment release from the reservoir during construction such that the turbidity water quality objective is not violated (even if relatively briefly and episodically) given the large area of the reservoir bottom which would be exposed by the dewatering and amount of accumulated sediment (approximately 2.9 million cy) and threat to public health and safety posed by detaining water behind the dam during construction. For example, it may be feasible to hydroseed portions of the reservoir bottom, but it would not stabilize enough sediment to reduce the sediment mobilization in a meaningful way and stabilization would not function effectively when inundated by reservoir inflow. Similarly, measures to settle sediments within the reservoir, rather than allowing them to move downstream (turbidity curtains or operating the reservoir at a higher level) would not be feasible during construction because they required detention of reservoir inflows, which ~~of the potential to~~ increases risks of the interim dam being overtopped and violates the FERC Order regarding Interim Risk Reduction Measures. Therefore, the impact from sediment release during construction of the Seismic Retrofit component is considered **significant and unavoidable**. Please note that a dredging alternative is considered in this EIR as a potential way to reduce violations of the turbidity water quality objective. Please refer to Chapter 5, *Alternatives*, *Conservation Measures Construction Impacts Analysis*.

Conservation Measure Construction

Ogier Ponds Conservation Measure

While the Ogier Ponds CM would provide substantial benefits to Coyote Creek temperature once complete, the construction of the conservation measure would have short-term impacts to temperature and turbidity during dewatering and diversion activities. Construction activities would involve heavy equipment use in and around the active channel, diesel generators that would be used to pump groundwater from the work area, large quantities of excavation and placement of fill, and storage and staging of equipment, fill dirt, and materials at a staging area and stockpiling area, where pollutants could potentially be mobilized to the Ogier Ponds or Coyote Creek offsite via stormwater runoff.

The heavy equipment needed for the Ogier Ponds CM construction would utilize the same types of hazardous materials that are discussed above with respect to the Seismic Retrofit components of the Project. As such, without preventative measures/protocols in place, these materials could leak from equipment or otherwise be released to the environment and receiving waters, such as by accidental releases due to improper storage. Moreover, work within the channel could disturb sediments and temporarily increase turbidity, as well as directly impact aquatic species and/or create a pathway for hazardous materials to be released to waters. Maintaining a dry work area may be necessary constructing elements of the Ogier Ponds CM. The effluent from dewatering efforts would be treated via an ATS. The ATS would have the ability to remove sediment, reduce turbidity, and balance pH from these waters prior to release into Coyote Creek. Therefore, impacts to water quality from elevated suspended sediment levels and other impairments in dewatering effluent from construction work areas would be less than significant.

As described above with respect to the Seismic Retrofit construction process, many potential impacts to water quality from construction of the Ogier Ponds CM would be avoided or reduced via compliance with the implementation of BMPs and control measures required by the Construction General Permit and implementation of the SWPPP, as well as through implementation of applicable Valley Water BMPs, VHP Conditions, and AMMs. The SWPPP would include good housekeeping measures, including requirements with respect to hazardous materials management, as well as erosion and sediment control BMPs. Implementation of the Valley Water BMPs described above for the Seismic Retrofit construction, such as ~~HM-7,~~ HM-8, HM-9, HM-10, WQ-1, WQ-4, WQ-5, WQ-9, WQ-11, WQ-15, WQ-16, GEN-1, GEN-20, GEN-21, GEN-26, GEN-30, GEN-31, GEN-32, and VEG-1, will also help to minimize potential impacts to water quality from the Ogier Ponds CM construction. Additionally, Valley Water BMP WQ-2 will ensure field personnel use the appropriate equipment for minimizing disturbances to the stream bottom and prevent heavy equipment from operating in a live stream, which will reduce impacts during construction. Similarly, BMPs GEN-35 and WQ-3 will ensure pumps and generators are maintained and operated in a manner that minimizes impacts to water quality. Furthermore, as described above for Seismic Retrofit construction, VHP Conditions and AMMs would be implemented, including AMM-7, AMM-8, AMM-11, AMM-66, AMM-67, AMM-68, AMM-84, and AMM-97, which would reduce the potential for water quality impacts.

Overall, given implementation of the measures described above, construction of the Ogier Ponds CM would not substantially impair beneficial uses, violate water quality objectives, or otherwise substantially degrade water quality, such as to conflict with the San Francisco Bay Basin Plan. The impacts would be less than significant.

Maintenance of the North Channel Reach ~~Extension~~

~~The construction~~ Maintenance of the North Channel Reach ~~Extension~~ could similarly lead to temporary impacts to water quality in the immediate area of Coyote Creek abutting the ~~related to dewatering activities, excavation to expand the channel, and placement of rip-rep that could result in erosion of exposed and disturbed soils during construction~~ work area, though these impacts are anticipated to be minor given the limited extent of Project activities (e.g., minor maintenance). ~~However, construction~~ Project activities in ~~for~~ the North Channel Reach ~~Extension~~ would have ~~more~~ limited potential to impact water quality downstream of the work area because the work area ~~entire North Channel~~ would be dry prior to the start of ~~construction~~ Project activities. However, these activities may require minor and localized dewatering. Implementation of the SWPPP, along with Valley Water BMPs GEN-26, GEN-31, GEN-32, WQ-11, and HM-8, as well as AMM-7, AMM-8, and AMM-11 will minimize pollution from vehicle fluids or other oily, greasy, or sediment-laden materials from entering the North Channel and washing downstream during high flows ~~when the channel is activated~~. These measures would include maintaining clean conditions at work sites, keeping spill kits available onsite to clean up any accidental spills, training personnel to properly use spill kits, fueling and cleaning vehicles and equipment off-site, keeping vehicles maintained and clean, and inspecting vehicles and equipment daily for leaks prior to initiation of work.

~~Maintaining a dry work area may be necessary constructing the North Channel Extension. The effluent from dewatering efforts would be treated via an ATS. The ATS would have the ability to remove sediment, reduce turbidity, and balance pH from these waters prior to release into Coyote Creek. Therefore, impacts to water quality from elevated suspended sediment levels and other impairments in dewatering effluent from construction work areas would be less than significant.~~

Given implementation of these measures, impacts related to violation of water quality standards, impairment of beneficial uses, or degradation of water quality in a manner inconsistent with the San Francisco Bay Basin Plan would be less than significant.

Maintenance of Spawning Gravel and Rearing Habitat Improvements in the Live Oak Restoration Reach

As described in Section 3.4, *Biological Resources – Fisheries Resources*, continued maintenance of spawning gravel and habitat improvements in the Live Oak Restoration Reach (which will have been implemented as part of FOCP) would have potential to degrade water quality downstream of the work area if fine sediment were to enter the stream at the time of gravel placement. However, gravel would not be placed directly in the channel, but would be placed adjacent to the channel or on benches above the channel. When flows are high enough to mobilize the gravels in the augmentation piles, there would already be elevated background levels of suspended sediment; therefore, additional sediment from the gravel piles would not add substantially to the total sediment that is already suspended during high flows. Another mechanism by which water quality impacts could occur is via staging and stockpiling areas located immediately downstream of the dam, which could introduce sediment to the channel during precipitation events. Pollution could also be introduced from vehicles and equipment in staging and stockpiling areas.

As discussed above for the Seismic Retrofit component and other CMs, implementation of the SWPPP and applicable Valley Water BMPs and VHP Conditions and AMMs would avoid or minimize potential adverse effects. Specifically, BMPs GEN-1, WQ-4, GEN-26, GEN-31, GEN-32, WQ-11, and HM-8, and AMM-66, AMM-67, AMM-68, AMM-84, AMM-97, AMM-7, AMM-8, and AMM-11 will avoid or minimize impacts. Given implementation of these measures, water quality impacts from construction of this CM would be less than significant.

Sediment Augmentation Program

Like the Maintenance of Spawning Gravel and Rearing Habitat Improvements in the Live Oak Restoration Reach (discussed above), the broader Sediment Augmentation Program would not result in discharge of fine sediment to the stream channel due to placement of gravel adjacent to the channel. Impacts to water quality could potentially occur due to ground disturbance associated with staging and stockpiling of materials, as well as hazardous materials releases from construction equipment. However, implementation of applicable Valley Water BMPs and VHP Conditions and AMMs will avoid or minimize impacts. Specifically, implementation of BMPs GEN-16, WQ-1, GEN-26, GEN-31, GEN-32, WQ-11, and HM-8, and AMM-7, AMM-8, and AMM-11 will avoid or reduce potential impacts. Therefore, water quality impacts would be less than significant.

Phase 2 Coyote Percolation Dam CM

The Phase 2 Coyote Perc Dam CM work could potentially have short-term negative impacts on water quality downstream of the Coyote Percolation Pond during construction via similar mechanisms to those discussed above for the Seismic Retrofit component and other Conservation Measures (e.g., erosion and sedimentation, staging and stockpiling of dirt and materials, dewatering of the work area, releases of hazardous materials from construction equipment) and localized dewatering. Implementation of the SWPPP, as well as Valley Water BMPs and VHP Conditions and AMMs, will avoid or reduce potential impacts on water quality during the Phase 2 Coyote Percolation Dam CM construction. Specifically, implementation of BMPs GEN-20, WQ-16, GEN-26, GEN-31, GEN-32, WQ-11, HM-8, WQ-15, and AMM-66, AMM-84, AMM-97, AMM-7, AMM-8, and AMM-11 will avoid or minimize potential impacts. Given implementation of these measures, impacts related to water quality would be less than significant.

Maintaining a dry work area may be necessary constructing elements of this Conservation Measure. The effluent from dewatering efforts would be treated via an ATS. The ATS would have the ability to remove sediment, reduce turbidity, and balance pH from these waters prior to release into Coyote Creek. Therefore, impacts to water quality from elevated suspended sediment levels and other impairments in dewatering effluent from construction work areas would be less than significant.

Construction Monitoring

Construction monitoring for water quality, fisheries, fish rescue and relocation; juvenile rearing, migration and growth, aquatic species rescue and relocation, suspended sediment, sediment deposition and habitat assessment, groundwater, invasive species, wetland and riparian habitat dryback, *Phytophthora* pathogen, western pond turtle, and milkweed would have little impact on water quality, while helping protect and improve water quality to the extent possible. These monitoring activities would involve small numbers of people visiting monitoring locations throughout the Project Area, which would not involve substantial ground disturbance or use of construction equipment and hazardous materials. Water quality impacts from construction monitoring would therefore be less than significant.

Seismic Retrofit Post-Construction Operations and Maintenance

Operations

Implementation of FAHCE Rule Curves

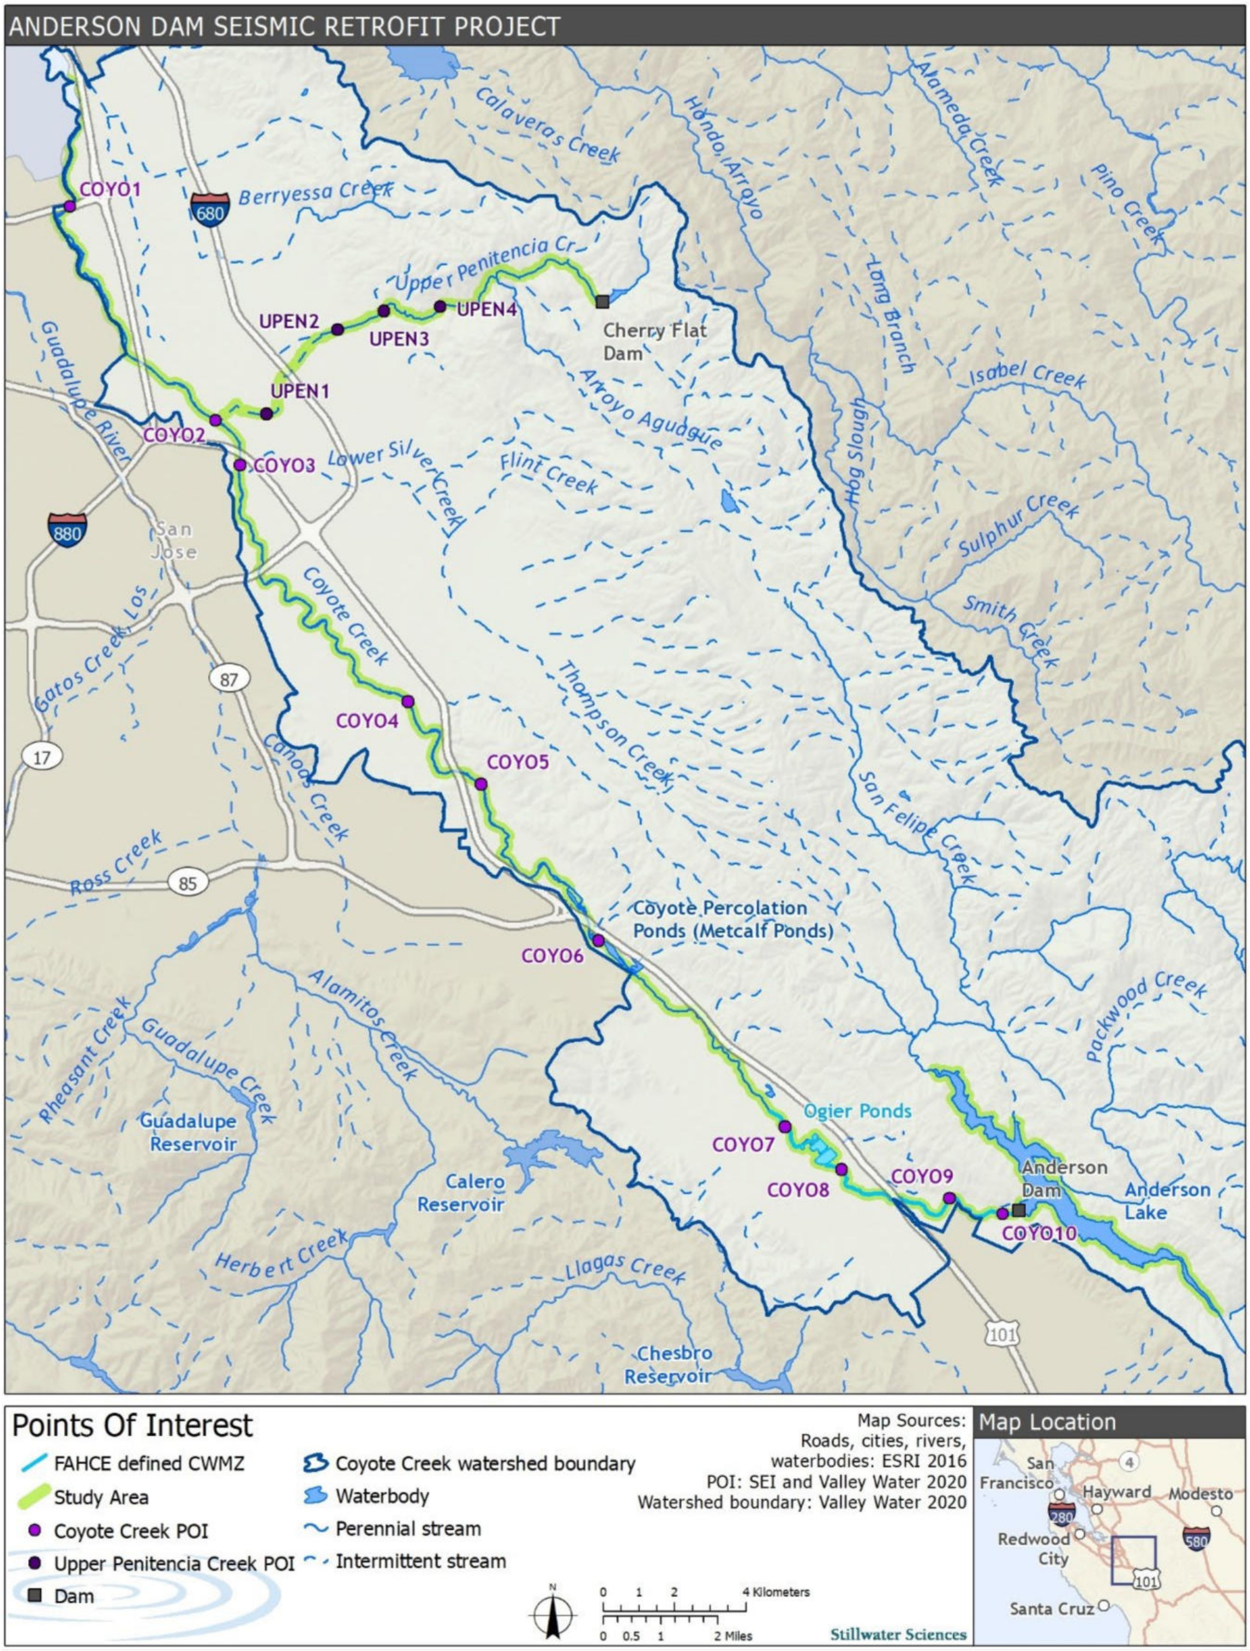
During the post-construction period, releases from Anderson Reservoir would be governed by the FAHCE *Settlement Agreement* rule curves and pulse flows that achieve specific criteria or purposes (e.g., benefits for steelhead and sensitive species fisheries habitat and listed and sensitive fish life stages, sufficient water supply, incidental flood control management). As described in Section 3.11, *Hydrology*, the primary difference under FAHCE compared to the Pre-FERC Order Conditions Baseline would be to introduce “pulse” flows during the winter/spring. Under FAHCE, the pulse flows would be 50 cfs for 5 days, occurring up to two times from February 1 – April 30 if storage thresholds are met. Storage-based winter base rule curves would provide releases of 5, 10, 15, 23, and a highest winter base rule curve which would provide for a minimum release of 26 cfs and up to the amount required for recharge and downstream LSAA flow requirements.

Temperature

For temperature management, annually, Valley Water would calculate the available cold-water pool in Anderson Reservoir and determine a reservoir flow release at a rate to maintain a daily average water temperature not to exceed 18 °C throughout as much of the CWMZ as available cold-water storage will allow during the summer rearing period. In addition, Valley Water would monitor temperatures at the ten FAHCE points of interest (POIs) below the dam as well as the outlet works at the Anderson Dam outlet structures. Releases would be monitored and recorded at just below Anderson Dam, and at streamflow station 5082 (Coyote Creek at Madrone) located approximately 1.2 miles downstream of Anderson Dam (**Figure 3.14-2**). Post-Construction Operations releases may be made from Anderson Reservoir or the CDL, or some combination of both, provided the total required release is made at the required temperature.

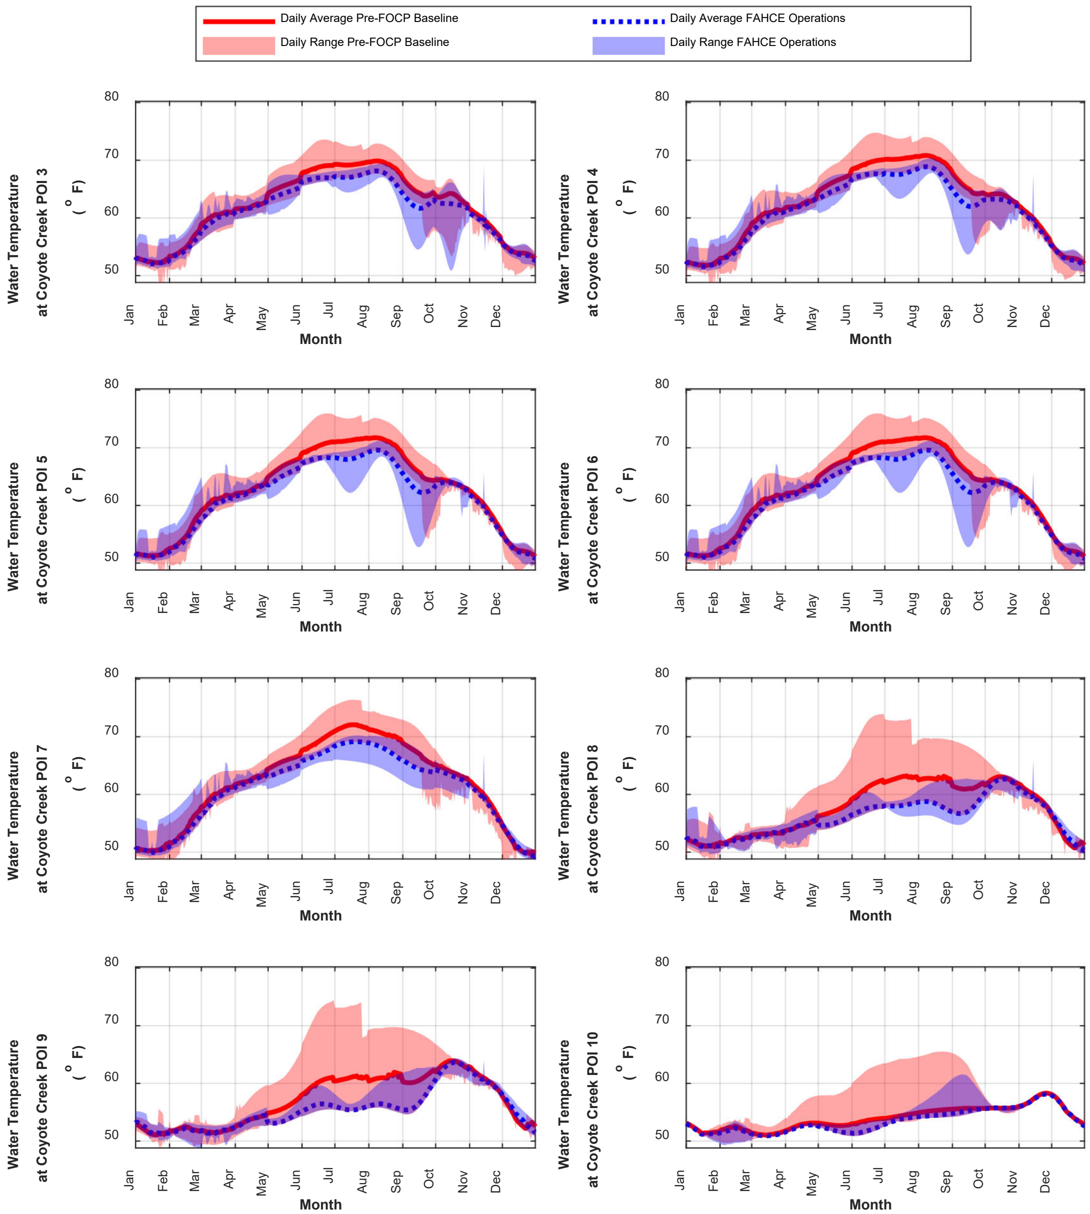
Detailed analysis and modeling of temperature effects as a result of FAHCE implementation during the post-construction period is included in Appendix F, *Biological Resources-Fisheries Technical Report.* As described therein, Valley Water's WEAP model was utilized to model conditions assuming FAHCE operations, as well as for the Pre-FERC Order Conditions Baseline and future conditions baseline. The WEAP model uses hydrology from 20 years in the historical record (1990-2020) to simulate temperature and other factors at the FAHCE POIs along Coyote Creek downstream of Anderson Dam. Refer to Appendix F for detailed discussion of the WEAP model and POIs; however, for reference, the FAHCE POIs are shown on **Figure 3.14-5**. **Figure 3.14-6** shows the WEAP modeling results for the Project (assuming FAHCE implementation), as compared to the Pre-FERC Order Conditions Baseline. **Figure 3.14-7** then shows results for the Project compared to the future conditions baseline (~~Stockholm Environment Institute and~~ Valley Water 2019 ~~2020~~).

1 **Figure 3.14-5. Points of Interest in Coyote Creek and Upper Penitencia Creek**



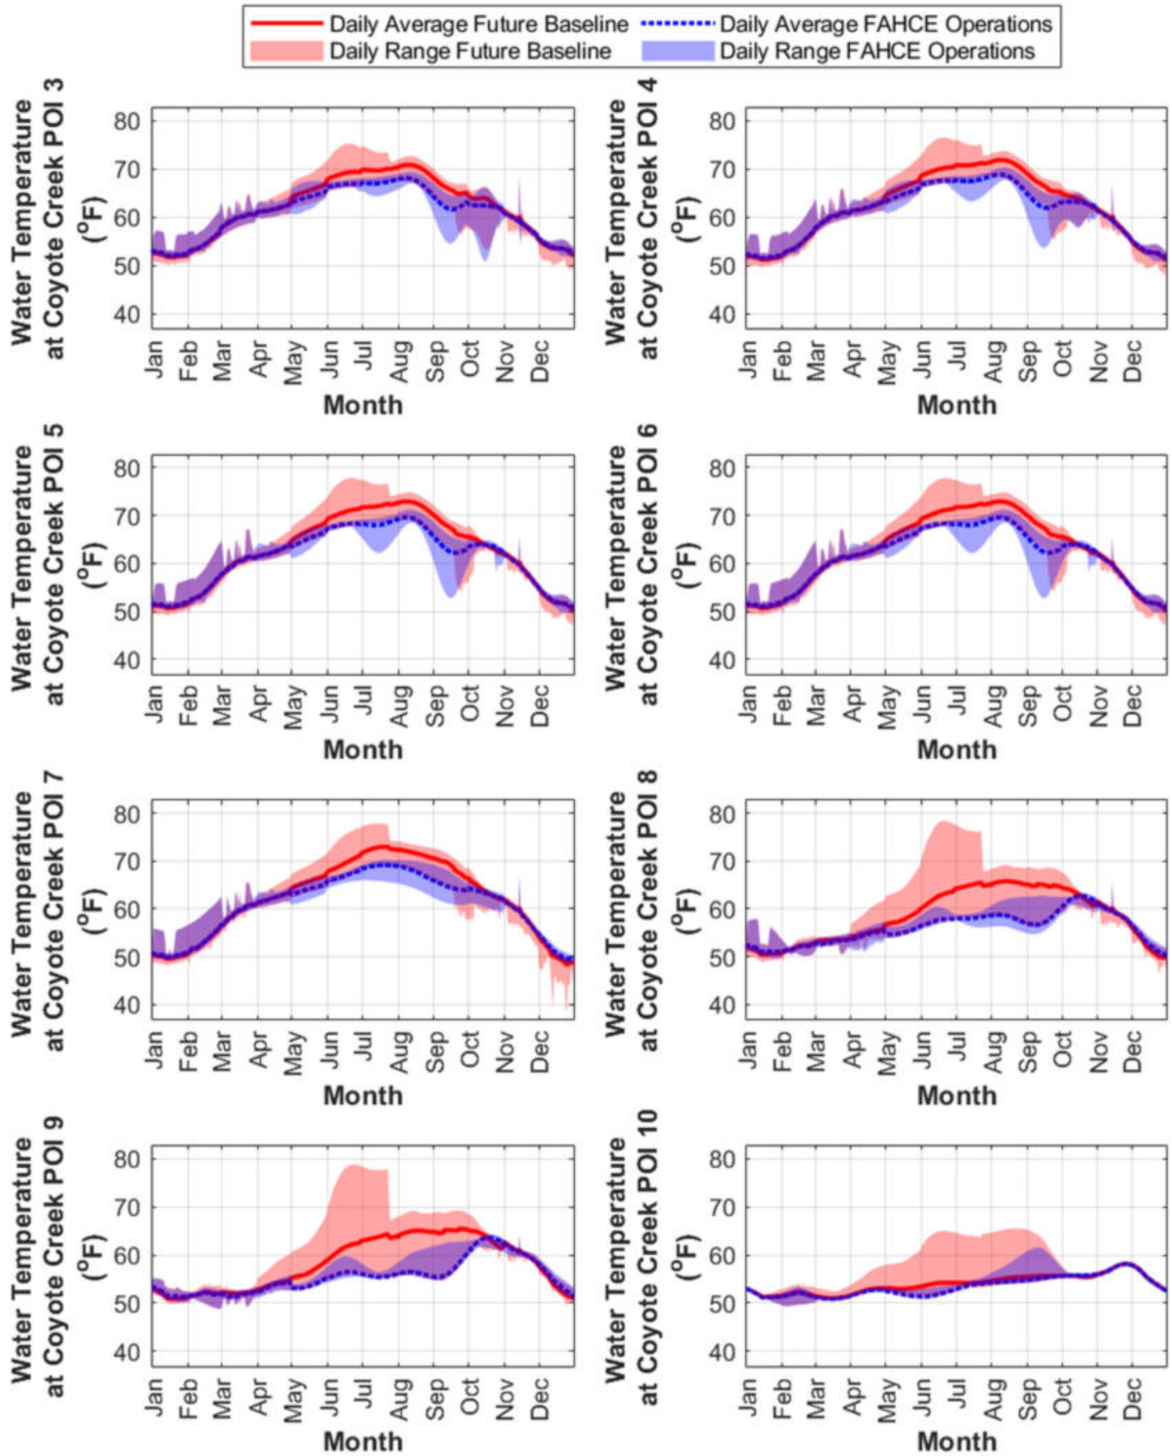
2

Figure 3.14-6. Modeled Daily Average Water Temperature at Coyote Creek Points of Interest – Project vs. Pre-FERC Order Conditions Baseline



Note: Colored bands show the range of the daily average water temperature during the 20-year modeling period (1991-2020) under each scenario. No modeled water temperature results are available for the POIs not shown.

Figure 3.14-7. Modeled Daily Average Water Temperature at Coyote Creek Points of Interest; Project vs. Future Conditions Baseline



Note: Colored bands show the range of the daily average water temperature during the 20-year modeling period (1991-2020) under each scenario. No modeled water temperature results are available for the POIs not shown.

As shown in **Figure 3.14-6** and **Figure 3.14-7**, water temperatures in Coyote Creek under FAHCE operations would be generally lower in every month at every point of interest compared to both the Pre-FERC Order Conditions Baseline and the future conditions baseline. In particular, from roughly April to October, daily average temperature and the daily range in temperature would be substantially lower under FAHCE relative to the two baselines. Most importantly, at POIs COYO 8, 9, and 10, (which are the only POIs within the CWMZ), the temperature would remain under roughly 65 °F (even accounting for the upper end of the range) throughout the year under the FAHCE scenario. By contrast, under both the Pre-FERC Order Conditions Baseline and the future conditions baseline scenarios, the range of daily average water temperature during the 20-year modeling period (1990-2010) would extend well above 65 °F at POIs COYO 8 and 9. At points below the CWMZ, further downstream along Coyote Creek (e.g., POIs 3-7), water temperatures would exceed 65°F during the summer season in all the scenarios modeled, although temperatures would still generally be lower under FAHCE. There are instances when modeled temperature would be higher under the FAHCE but are always less than the 71.6 °F (22 °C) criterion ~~threshold~~.

Given that the WEAP modeling shows water temperatures under FAHCE would remain below 71.6 °F in the CWMZ from May 1 to October 31, and thus in compliance with the Settlement Agreement, the impacts with respect to water temperature during the post-construction period would be less than significant. As shown in **Figure 3.14-6** and **Figure 3.14-7**, the water temperatures at POIs COYO 10, 9, and 8 would be substantially lower under the FAHCE operations scenario than under both the Pre-FERC Order Conditions Baseline and future conditions baseline scenarios.

Generally, the colder water in the CWMZ as a result of Project operations would be beneficial for several beneficial uses (especially those related to fish and aquatic resources) designated for nontidal Coyote Creek in the San Francisco Bay Basin Plan. Relative to the Pre-FERC Order Conditions Baseline and future conditions baseline, the FAHCE operations would an improvement for the COMM, COLD, MIGR, RARE, SPWN, and WILD beneficial uses. Other beneficial uses, such as GWR, REC-1, and REC-2, would not be affected when it comes to temperature changes.

The further down Coyote Creek from Anderson Dam the more the temperature effects associated with releases from the reservoir moderate. This is generally reflected in the WEAP modeling results shown in **Figure 3.14-6** and **Figure 3.14-7** (see the difference between FAHCE operations scenario and Pre-FERC Order Conditions/future conditions baseline scenarios); although, modeling results are not available for POIs COYO 1 and 2, which are the furthest POIs downstream. The WARM beneficial use would not be substantially adversely affected by temperature changes in the lower reaches of Coyote Creek. Warm water favors predators of sensitive and listed species which are the focus of post-construction habitat improvements associated with the Project.

Modeling results are not available for any points that would be within the tidally-influenced portion of Coyote Creek or San Francisco Bay. Nevertheless, the slightly colder conditions that could result from implementation of FAHCE operations would likely be a benefit to the majority of beneficial uses designated for Coyote Slough and South San Francisco Bay, including COMM, SHELL, EST, MIGR, RARE, SPWN, and WILD. Other beneficial uses in these waterbodies would not be adversely affected by small decreases in temperature.

After the completion of the Seismic Retrofit construction Anderson Reservoir would be allowed to start storing water up to its full capacity with no seismic restrictions. Operations would be similar to the Pre-FERC Order Baseline with water stored in the winter and spring and released in the summer and fall for groundwater recharge and habitat benefit. Releases would be based on the FAHCE rule curves are discussed in the section above. The reservoir would again support a cold-water pool at the bottom of the reservoir as it stratifies in the summer and fall as in Pre-FERC Conditions. As in-reservoir temperatures would be similar to the Pre-FERC Order Baseline, the impact is less than significant.

Based on the above analysis, overall, the impacts of Seismic Retrofit post-construction operations with respect to water temperature would be less than significant and largely beneficial.

Dissolved Oxygen

In the post-construction period, with implementation of the FAHCE rule curves, DO levels in Coyote Creek downstream of Anderson Dam would likely be similar or better (i.e., higher) relative to the Pre-FERC Order Conditions Baseline. As described above, the primary difference between FAHCE operations and the Pre-FERC Order reservoir operations would be to introduce pulse flows during the winter and spring, although summer base flows could change modestly as well. WEAP modeling included in Appendix F, *Biological Resources Fisheries-Technical Report,* shows that daily average flow in the upstream portion of the FCWMZ (POI COYO 10) would be elevated for much of the year (in particular, May to October) under the FAHCE operations scenario relative to both the Pre-FERC Order Conditions Baseline and future conditions baseline scenarios (refer to **Figure 2** in Appendix F). By contrast, and somewhat counterintuitively, daily average flow in the downstream portion of the FCWMZ (POI COYO 9) would be slightly reduced during the same period under the FAHCE operations scenario relative to Pre-FERC Order Conditions Baseline and future conditions baseline scenarios.

Regardless, changes in Coyote Creek flows as a result of FAHCE rule curves would not be dramatic enough to result in substantial changes in water surface-to-air mixing and oxygenation within the water column.

Additionally, the improvements to the Coyote Creek channel made as part of the Project Conservation Measures would also likely improve mixing and oxygenation within the creek. For example, ~~the North Channel Extension,~~ Maintenance of Spawning Gravel and Rearing Habitat Improvements in the Live Oak Restoration Reach, Sediment Augmentation Program, and Phase 2 Coyote Percolation Dam CM would each generally increase channel roughness (e.g., due to the presence of coarse gravel/cobble and other channel features [logs, snags]) which would likely increase turbulence and interaction with the air (thus increasing DO) (USEPA 2023b). The Ogier Ponds CM would disconnect the existing Ogier Ponds from Coyote Creek, which would likely have the effect of increasing water velocity and turbulence in this area, such as to increase DO. Under the Pre-FERC Order Conditions Baseline, the Ogier Ponds were a location where Coyote Creek flows would slow substantially, allowing for low DO conditions to develop (USEPA 2023b).

Finally, the lower water temperatures in Coyote Creek that would be achieved with FAHCE operations (see discussion above, and **Figure 3.14-6** and **Figure 3.14-7**) would potentially result in increased DO, since high temperatures reduce the solubility of oxygen in water (i.e., warm water holds less DO than cold water) (USEPA 2023b). For all these reasons, impacts related to

DO during the post-construction period from Seismic Retrofit component operations would be less than significant.

Following Seismic Retrofit construction, given that the surface area of Anderson Reservoir would be restored to Pre-FERC Order levels due to the increased storage capacity, there would be more opportunity for mixing with the air and oxygenation of water within the reservoir, potentially leading to higher DO levels near the surface. However, there may also be increased opportunity for stratification and for low DO levels to occur at lower depths in the reservoir. This is similar to the Pre-FERC Order Baseline where DO in the reservoir would stratify during the summer and fall. Post construction operation would include the ability to release from different outlets that would allow greater flexibility in controlling the DO of releases. As in-reservoir DO levels would be similar to the Pre-FERC Order Baseline, the impact is less than significant.

Sediment and Turbidity

The temporary and periodic erosion and sedimentation impacts during Seismic Retrofit construction would not be an issue during the post-construction period. After the reservoir is allowed to refill to full capacity, there would no longer be exposed, formerly inundated areas of sediment that has collected within the reservoir that would be especially susceptible to erosion. Thus, precipitation events that occur during the post-construction period would not result in substantial erosion within the lakebed, nor impacts to downstream waterbodies. Suspended sediment concentration and turbidity within the reservoir and dam releases, associated with precipitation events (e.g., upstream erosion and inflow of sediment), would likely be similar in the post-construction period to the Pre-FERC Order Conditions Baseline and the Future Baseline.

As noted above, implementation of the FAHCE rule curves would result in higher flows during certain times of the year and based on certain conditions, relative to the Pre-FERC Order Conditions Baseline and future baseline. Additionally, the new outlet works to be installed as part of the Seismic Retrofit component would have a substantially greater capacity (total combined [LLOW and HLOW] capacity of 6,720 cfs) compared to the outlet works during the Pre-FERC Order period (maximum capacity of 500 cfs). Thus, Valley Water could potentially release substantially more water during post-construction operations relative to the Pre-FERC Order Conditions Baseline.

Section 3.11, *Hydrology*, analyzes the frequency of high flows under the Project (FAHCE) as compared to the Pre-FERC Order Conditions Baseline and summarizes information from the *Potential Flood Impacts for ADSRP Memorandum* (Valley Water 2023d ~~2023a~~) (see Appendix K). This issue is also discussed in Section 3.18, *Recreation*. As shown in **Table 3.11-8** in Section 3.11, flood flows (i.e., releases from Anderson Dam during precipitation events) would generally be lower under the Project (2032 FAHCE scenario) compared to the Pre-FERC Order Conditions Baseline (2017 DSOD scenario). However, **Table 3.11-9** shows that moderately high flows (e.g., greater than or equal to 500 cfs and greater than or equal to 1,000 cfs) would occur more frequently under post-construction conditions compared to the Pre-FERC Order Conditions Baseline. Specifically, the modeling shows that over the study period considered (1973-2022), there would be 309.7 days with flows over 500 and 1,000 cfs under the post-Project FAHCE scenario, compared to 162.9 days and 25.8 days with flows over 500 cfs and 1,000 cfs, respectively, under the Pre-FERC Order (Valley Water 2022a). This is likely due to higher flows being enabled under routine operations with completion of the Seismic Retrofit component (greater capacity outlet works); whereas, under the Pre-FERC Order Conditions Baseline, flows over 500 cfs could only be realized through an uncontrolled spill from the reservoir.

As discussed in Section 3.11, *Hydrology*, Valley Water implemented flood management measures as part of FOCP to accommodate the higher flows that were enabled with construction of ADTP (with a capacity of 2,500 cfs), including constructing floodwalls, levees, and berms at select locations along Coyote Creek, as well as elevation or property acquisition of 10 residential properties (Valley Water 2020c ~~2020d~~). Additionally, prior to Seismic Retrofit component construction, Valley Water would implement additional flood management measures along Coyote Creek to accommodate the even higher flows that will be made possible with construction of the LLOW and HLOW, thereby limiting potential flooding impacts. Thus, the more frequent, moderately high flows that would result from implementation of the Project would not result in substantial flooding along Coyote Creek such as to impact adjacent properties and structures.

There would be potential, however, for the higher flows (e.g., greater than or equal to 500 cfs and greater than or equal to 1,000 cfs) to result in increased suspended sediment concentration and turbidity in Coyote Creek, since the larger volume of water would generally have greater erosive power and thus could increase erosion along the streambed and banks. As noted above, elevated suspended sediment concentration and turbidity are generally detrimental for a number of beneficial uses, including COMM, COLD, MIGR, RARE, SPWN, WARM, WILD, REC-1, REC-2, EST, and SHELL. Given the infrequency of such moderately higher flows (300 days over the course of the 49-year study period [or an average of roughly 6 days per year], based on the flood modeling), these impacts would not be significant. Relative to the Pre-FERC Order Conditions Baseline, the increase in flows of 500 cfs or greater under FAHCE (or future conditions baseline) would be equivalent to an average of roughly 2.8 days per year; for flows of 1,000 cfs or greater, the increase would equate to an average of roughly 5.59 days per year. These higher flows would also likely be occurring during a time of the year (winter season, during storms) when elevated suspended sediment concentration and turbidity would be natural and expected. For flows of 2,000 cfs or higher, as can be seen in **Table 3.11-9** in Section 3.11, *Hydrology*, these flows would become less common under the Project (2032 FAHCE) relative to the Pre-FERC Order Conditions Baseline (2017 DSOD). Presumably, this would be due to the larger outlet works following Seismic Retrofit construction being utilized to avoid uncontrolled spills from the reservoir.

Overall, any changes in suspended sediment concentration and turbidity in nontidal Coyote Creek, as well as further downstream in Coyote Slough and South San Francisco Bay, associated with more frequent, moderately high flows under FAHCE, would likely be modest and would not represent a substantial change from the Pre-FERC Order Baseline Conditions. Additionally, continued implementation of the Sediment Augmentation Program during the post-construction period would act to reduce potential adverse effects, as the replacement of fine sediment with more coarse gravel would reduce susceptibility to erosion during higher flows. Improvements associated with other CMs, such as the Ogier Ponds CM and Phase 2 Coyote Percolation Dam CM, (e.g., reconstructed channel segments with improved features [coarse gravel, rocks, logs]), would also likely improve the health and resilience of the stream channel in these areas, potentially reducing suspended sediment concentration and turbidity effects during higher flows. Relatedly, the more frequent higher flows under FAHCE would not result in substantially increased sediment deposition such as to affect fish habitat and/or beneficial uses.

Based on the above analysis, sedimentation and turbidity impacts from Seismic Retrofit post-construction operations would be less than significant.

Fish Habitat and Fish Passage

As described in Section 3.4, *Biological Resources – Fisheries Resources*, implementation of the FAHCE rule curves is predicted to increase overall incubation and spawning habitat, fry and juvenile rearing habitat, adult upstream passage conditions, and juvenile downstream migration conditions in Coyote Creek downstream of Anderson Dam for steelhead, Chinook salmon, and Pacific lamprey. The analysis is nuanced, and different effects are predicted for different life stages of various listed and sensitive fish, and some results vary by location; refer to Section 3.4 and Appendix F, *Biological Resources-Fisheries Technical Report* for detailed analysis and discussion.

In short, WEAP modeling generally shows that implementation of FAHCE rule curves would increase steelhead and other special status fish habitat relative to the Pre-FERC Order Baseline and Future Conditions Baseline, both by increasing the wetted area of the channel in certain locations and at key times of the year (e.g., during the spawning and incubation period) and expanding the suitable habitat conditions within the creek beyond the FCWMZ through cold-water releases. Additionally, although not reflected in the WEAP modeling, the Live Oak Restoration Project would have expanded habitat immediately downstream of the dam as part of FOCP, and continued maintenance of the Live Oak habitat as a component of the Project will provide continued habitat benefits for fisheries within that reach of Coyote Creek. Ogier Ponds CM, Phase 2 Coyote Percolation Dam CM, and broader Sediment Augmentation Program would also substantially increase fisheries habitat for all the different steelhead and sensitive fish life stages. Additionally, the Ogier Ponds CM would improve adult upstream passage opportunities by disconnecting Coyote Creek from the ponds, while the Phase 2 Coyote Percolation Dam CM would generally improve upstream and downstream passage conditions at the Coyote Percolation Dam area.

These changes as a result of FAHCE post-construction operations and the CMs would be beneficial to fish and aquatic species in general, but especially for the special-status, anadromous fish species in Coyote Creek. With respect to the San Francisco Bay Basin Plan, these effects would be positive for beneficial uses in nontidal Coyote Creek, such as COMM, COLD, MIGR, RARE, SPWN, WARM, and WILD. As such, the impacts would be less than significant and largely beneficial.

Salinity

Changes in freshwater releases from Anderson Reservoir could potentially impact salinity levels where Coyote Creek enters the South San Francisco Bay compared to the Pre-FERC Order Baseline and future baseline. This could directly affect beneficial uses in Coyote Slough and South San Francisco Bay by changing salinity levels. Additionally, if freshwater releases/flows in Coyote Creek were to be substantially reduced as a result of FAHCE rule curve implementation, this could increase encroachment of saltwater upstream and landward. This could potentially result in impacts on the freshwater Coyote Creek surface system (e.g., beneficial uses designated for nontidal Coyote Creek), as well as impacts on the groundwater basin if additional saltwater intrusion were to occur. Valley Water conducted an analysis of salinity impacts due to changes in releases associated with the FAHCE project. This qualitative volumetric analysis used

WEAP model outputs, the Bay Area Aquatic Resources Inventory geospatial dataset, and a USGS Report on salinity in the South San Francisco Bay (see Appendix K). For all creeks studied (Guadalupe, Stevens, and Coyote), changes in releases due to FAHCE were relatively small compared to typical flows following storm events. For Coyote Creek, the largest increase in releases associated with FAHCE would be about 14 cfs during March and April, while storm flows commonly exceed 500 or 1,000 cfs. The greatest decrease in flows would occur in November, with a reduction of 3.4 cfs (or 8.2 percent). The results of the flow analyses are shown in **Table 3.14-6** and **Table 3.14-7**.

Table 3.14-6. FAHCE Changes to Coyote Creek Freshwater Flows to San Francisco Bay

	Monthly Average Change in Flow, Coyote Creek	
	cfs	%
Jan	1.7	0.9%
Feb	1.2	0.5%
Mar	14.2	10.5%
Apr	14.3	21.7%
May	-0.9	-2.2%
Jun	-0.9	-2.9%
Jul	-0.8	-3.4%
Aug	-0.7	-3.3%
Sep	-0.6	-3.1%
Oct	-0.5	-2.1%
Nov	-3.4	-8.2%
Dec	1.9	2.2%
Overall Avg.	2.1	2.9%

Table 3.14-7. Average Change in Coyote Creek Freshwater Flow Due to FAHCE by Water Year Type

	% Change in Flow
Above Normal	5.9%
Below Normal	3.7%
Critical Dry	0.6%
Dry	2.9%
Wet	2.2%
Overall Avg.	2.9%

Source: Valley Water 2022b

The greatest increase in flows due to FAHCE rule curve implementation for Coyote Creek of 14.3 cfs (see **Table 3.14-6)** would translate to approximately 17,632 cubic meters (m^3) per day (Valley Water 2022b), whereas the greatest decrease in flows of 3.4 cfs would translate to approximately 4,192 m^3 per day. By contrast, the total volume of the South Bay Estuary at mean sea level is roughly 86 million m^3 (Valley Water 2022b). Thus, the potential increment of change due to the Project would not be of a sufficient magnitude to meaningfully affect the salinity dynamics in the South Bay Estuary and the Coyote Creek system. More importantly, a USGS study on Bay salinity indicates that salinity changes are driven by large storm events, and less so by reservoir releases (Valley Water 2022b). Given the minor role that reservoir releases have on salinity in the south San Francisco Bay, the impacts of FAHCE rule curves with respect to salinity would be less than significant.

Summary of FAHCE Rule Curve Implementation Impacts

In summary, compared to the Pre-FERC Order Conditions Baseline and future conditions baseline, implementation of FAHCE rule curves would, over the long term, have positive impacts on beneficial uses and water quality in Anderson Reservoir and Coyote Creek. WEAP modeling shows that implementation of FAHCE rule curves would result in water temperatures remaining below fish health-based thresholds within the CWMZ, and adverse effects due to FAHCE would not occur for DO, suspended sediment concentrations and turbidity, and salinity. Longer-term benefits include reinvigorating a more dynamic channel, with geomorphic processes that help create new instream habitats. The pulse flows, and other periodic high flows enabled through FAHCE and the increased outlet capacity provided by the Project, while potentially leading to temporary spikes in turbidity and suspended sediment (which are not significant), would provide more frequent "channel-forming flows". The increase in these dynamic geomorphic processes is beneficial to instream habitat and water quality. Overall, the impacts from FAHCE rule curves implementation would be less than significant and largely beneficial. FAHCE rule curves would not impair beneficial uses of surface waters; violate any water quality standards or waste discharge requirements, or otherwise substantially degrade surface water quality; or conflict or obstruct implementation of a water quality control plan.

Within-Reservoir Effects

With respect to the impacts on water quality within the reservoir itself, the filling of the reservoir following Seismic Retrofit component construction would allow for the full restoration of beneficial uses associated with the reservoir including habitat related uses: COLD, SPWN, WARM, and WILD; water supply benefits: Municipal and Domestic Supply and GWR; and once the reservoir is again opened to the public COMM, Non-contact Water Recreation (REC-2), and Water Contact Recreation (REC-1). The operation of the reservoir at its full capacity would be a beneficial impact against both the existing conditions baseline, when the reservoir is restricted to deadpool, and the Pre-FERC Order Baseline, when the reservoir had a ~~seismic~~ restriction limiting storage to about half of the capacity.

Higher Flows During Normal Operating Conditions and Emergency Drawdown

The Seismic Retrofit components of the Project would greatly increase the capacity of the dam's outlet works and could thus provide the ability to release substantially greater volumes of water, resulting in higher flows downstream in Coyote Creek. As opposed to the dam's outlet works prior to the FOCP, which had a maximum capacity of 500 cfs, the Seismic Retrofit would establish new outlet works with a total combined capacity of 6,840 cfs. This would include the LLOW, which would have a maximum capacity of 1,540 cfs, but would operate up to 1,400 cfs under most operations The HLOW, which would have a capacity of 5,300 cfs, and would be used during emergencies that require a DSOD-mandated drawdown of the reservoir (i.e., to respond to an earthquake emergency). The new spillway constructed as part of the Seismic Retrofit would be able to safely convey the PMF, which is estimated to be approximately 98,000 cfs, but would be utilized less frequently due to the new larger LLOW. The new dam release facilities constructed as part of the Seismic Retrofit would enable higher flows during operation, which could cause erosion downstream if substantially higher than existing flows.

While the FAHCE rule curves would govern releases most of the time during Project operation, the reservoir may need to be lowered quickly during emergency situations, such as responding to a DSOD mandate to draw down the reservoir after an earthquake. This would potentially result in very high flows for short periods of time. The seismic retrofit would greatly increase the capacity of the dam's outlet works, thereby making a quick drawdown of the reservoir's water level possible in an impending emergency situation. This would comply with DSOD requirements as described in Chapter 2, *Project Description,* to provide a new outlet works at Anderson Reservoir to be capable of lowering the reservoir's maximum storage depth by 10 percent within 7 days and draining its full content within 90 days (DSOD 2018 ~~2017~~). Between the LLOW and HLOW, the reconstructed Anderson Dam would be able to release up to 6,840 cfs. Relative to the dam's maximum discharge capacity via its outlet works of 500 cfs under the Pre-FERC Order Conditions Baseline, this would represent a substantial increase in the potential peak controlled releases/flows from the dam. Under the Pre-FERC Order Conditions Baseline very high flows would pass over the spillway when the reservoir was filled and the volume of water coming into the reservoir was greater than the capacity of the outlet to release water (500 cfs). Under post-construction operations high flows may still pass over the spillway when the reservoir is filled; however, this would be less likely given the ability to release greater volumes of water prior to a large storm (Valley Water 2023d ~~2023a~~).

Similar to uncontrolled releases observed in the Pre-FERC Order Condition (i.e., 2017 spill event resulted in flows of 7,400 cfs at the Madrone Gage), controlled releases of high flows can increase potential for erosion downstream, as greater volumes of water traveling at greater velocities would increase the erosive power of the flows. Given the infrequency of emergency drawdown scenarios, these effects would also be infrequent and would occur in the context of necessary dam operations for the protection of life and property. In this respect, the effects would be less of a concern, although single, extreme events can cause a large amount of erosion and siltation and sedimentation that can be damaging to the ecosystem. Refer to *Hydrology* Section 3.11 for a discussion of potential effects related to flooding caused by the higher releases made possible by the seismic retrofit elements of the Project.

Many of the Project features described above would serve to minimize potential adverse effects associated with peak flows in the event of an emergency. ~~For example, the reconstructed North Channel would enable Valley Water to split high flows between the North and South Channels of Coyote Creek, thereby minimizing the concentration of flows and the erosive power.~~ The ongoing sediment augmentation activities, as part of the Sediment Augmentation Program, would also help to replenish sediment that may have been washed out during a high flow event. As noted above, the existing and Pre-FERC Order Baseline Conditions include very high flows during and after large winter storms that inundate the floodplain and carry large amounts of sediment downstream. As the volume of peak flows would be reduced as would the number of uncontrolled releases when measured against the Pre-FERC Order Baseline impacts from higher flows and emergency drawdown would be less than significant.

Use of Imported Water

During post-construction operations the reservoir would be allowed to fill to its full capacity. This would allow for more water captured in the reservoir to be released to Coyote Creek and a greater volume of cold water to support downstream fisheries. The amount of imported water needed to support groundwater recharge and supplement flows would be reduced. Imported water could still be used to supplement supplies from Anderson Reservoir, but it would not be chilled prior to release. Imported water is typically warmer than water released from the reservoir, but not warm enough to exceed the 22 °C criterion ~~threshold~~. However, imported water would not be needed to provide cold water as cold water would be supplied by the cold-water pool in the reservoir.

The Cross Valley Pipeline Extension could also still be used, but only in situations where releases from the reservoir do not extend past the CWMZ. This could happen in dry years with limited storage in the reservoir. Cold water releases (about 10 cfs) from the reservoir would be reserved for the CWMZ. A 10 cfs release only keeps the creek wetted through the CWMZ. Releases from the Cross Valley Pipeline Extension would then support groundwater recharge below the CWMZ.

Overall, the use of imported water would be reduced against both the Pre-FERC Order Baseline ~~(when storage was at deadpool)~~ and the existing conditions baseline (when capacity was limited to approximately 50 percent). The use of imported water would not impair water quality standards or otherwise substantially adversely affect water quality in Coyote Creek. The water quality impact from use of imported water would be less than significant.

Discharges of Pollutants from Impervious Surfaces

As described in Section 3.11, *Hydrology*, the Seismic Retrofit component would result in additional impervious surface area in the area of Anderson Dam due to widening of several roadways and other modifications. In total, this would result in approximately 2.14 acres of additional impervious surface area relative to the Pre-FERC Order Conditions Baseline. In general, impervious surfaces increase the amount of water runoff following storms, as no portion of the precipitation falling on these areas is able to infiltrate into the soil and groundwater. Rather, the water flows directly off the surface and at a higher velocity compared to “natural” ground conditions. This can lead to increased erosion and sedimentation, as the higher velocity runoff has greater erosive power, and can also potentially lead to discharges of other types of pollutants (e.g., fuel, oil, grease, etc.) that are associated with vehicle use of the impervious surface areas.

The permanent roadway modifications installed as part of the Project would be designed to drain runoff into a stormwater system that would discharge runoff to Coyote Creek in a controlled manner or flow directly to the surrounding pervious lands. Given these factors, the additional impervious surface that would be created via the Seismic Retrofit components would not substantially discharge polluted water to Coyote Creek. The Project would also comply with applicable provisions of the Municipal Regional Stormwater NPDES permit. Impacts of pollutant discharges from impervious surfaces would therefore be less than significant.

Dam Maintenance

Post-construction Anderson Dam facilities maintenance may include vegetation management, burrowing rodent control, access road and boat ramp work, erosion control/bank stabilization/drainage, embankment repair (cracking and slumping), and trash and debris removal. Additionally, maintenance could be performed on various types of dam appurtenances and equipment, such as inlets/outlets, valve systems and hydraulic systems, sediment removal around intake structures and hydraulic lines; concrete structure repairs, replacement and cleaning (including weep holes); seepage systems (weirs and piping), and other appurtenances. Maintenance could also include inspections and exploratory field investigations (e.g., drilling), as well as reservoir dewatering to provide access and refurbish dam appurtenances located in wetted areas. Additionally, repair and replacement of various types of pipelines, pump stations, blow offs, turnouts and vaults associated with Anderson Dam may be required during the post-construction period.

These maintenance activities would be covered under the DMP and PMP Water quality impacts associated with dam facility maintenance will be minimized through implementation of BMPs HM-1 and HM-4 through HM-8, and DMP Mitigation Measures Water Quality-1 and Wildlife-4 as discussed under Hazardous Materials Releases during Seismic Retrofit construction. Considering the extensive BMPs for these programs, the maintenance activities would have short-term, less-than-significant impacts on water quality.

Seismic Retrofit Operations and Maintenance Summary

Operations of the Seismic Retrofit components would have positive impacts on beneficial uses and water quality in Anderson Reservoir and Coyote Creek through refilling of the reservoir and use of the FAHCE rule curves. Maintenance activities impacts would be less than significant. Overall, the impacts from operation and maintenance would not impair beneficial uses of surface waters; violate any water quality standards or waste discharge requirements, or otherwise substantially degrade surface water quality; or conflict or obstruct implementation of a water quality control plan, and impacts would therefore be less than significant.

Conservation Measures Post-Construction Operations and Maintenance

Operations

The Conservation Measures would have beneficial effects on water quality over the long-term, during the post-construction period.

The placement of spawning gravel and rearing habitat improvements in the Live Oak Restoration Reach would create improved spawning habitat during all post-construction operational conditions within this upper reach of Coyote Creek. The improvement in habitat would have a beneficial impact on rare and endangered species and fish, spawning and related beneficial uses, as it would replace coarse gravel lost due to dam operations; refer to Section 3.4, *Biological Resources – Fisheries Resources*, for detailed discussion of fish habitat effects.

The Ogier Ponds CM would benefit water temperatures in Coyote Creek in the long-term by avoiding the ponds and reducing surface area exposed to solar radiation which increases the temperature of flows in the Pre-FERC Order and existing conditions baselines. The created channel (approximately 6,500 feet in length) would restore the historic (1970's) channel alignment. At the end of construction, the channel would be devoid of mature vegetation; however, as riparian vegetation is established and grows to maturity temperature benefits would increase. The Ogier Ponds CM would increase water velocity and turbulence in this area, such as to increase DO. Under the Pre-FERC Order Conditions Baseline, the Ogier Ponds were a location where Coyote Creek flows would slow substantially allowing for low DO conditions to develop (USEPA 2023b). Ogier Ponds CM would also improve the health and resilience of the stream channel reducing suspended sediment concentration and turbidity effects during higher flows.

Monthly inspections would be conducted at Ogier Ponds to monitor water quality changes. To maintain or improve DO in the ponds and wetland during normal conditions in the absence of creek flow-through, solar powered floating aerators would be installed to maintain or improve DO as compared to existing conditions. Other water quality best management practices may be deployed if necessary, as indicated by pond water quality monitoring results to maintain or improve upon existing water quality conditions in the ponds. ~~The North Channel Extension would split high flows slowing the water down in a manner that minimizes the potential for erosion and entrapment of steelhead and other sensitive fish. This splitting of flows and slowing of water velocity would occur in the wintertime when warming is unlikely; thus, impacts on water temperature are unlikely The North Channel Extension would also generally increase channel roughness (e.g., due to the presence of coarse gravel/cobble and other channel features [logs, snags]) which would increase turbulence and interaction with the air (thus increasing DO) (USEPA 2023b).~~

The Sediment Augmentation Program places gravels in areas along Coyote Creek to improve habitat conditions and by extension would improve the beneficial uses of the creek. Increased channel roughness (e.g., due to the presence of coarse gravel/cobble and other channel features [logs, snags]) would increase turbulence and interaction with the air (thus increasing DO) (USEPA 2023b), and the replacement of fine sediment with more coarse gravel and would reduce susceptibility to erosion during higher flows.

The Phase 2 Coyote Percolation Dam CM would be operated consistent with existing requirements for water supply and fish passage. Operation of the facility would not alter water quality parameters from the existing conditions baseline. As a result, no significant changes to water quality as a result of the operation of the facility are likely. The roughened channel would generally increase channel roughness which would increase turbulence and interaction with the air (thus increasing DO) (USEPA 2023b) and improve the health and resilience of the stream channel reducing suspended sediment concentration and turbidity effects during higher flows. Within 13 months of completion of the Phase 2 Coyote Percolation Dam design (completion of design anticipated ~~in~~ prior to Year 1 ~~-4~~), Valley Water will prepare a Phase 2 Coyote Percolation Dam Operations Plan in coordination with the regulatory agencies. The objectives of the Operations Plan will be to continue to provide sufficient groundwater recharge, while improving conditions for smolt migration.

Sediment augmentation activities would improve geomorphic processes that create and maintain steelhead habitat (sediments and spawning gravels) and reduce channel incision that is typical in Lower Coyote Creek downstream of the dam. Valley Water would collect the data and conduct analysis from the sediment deposition monitoring, sediment transport modeling, and long-term spawning habitat assessment monitoring. Valley Water would share this data and information and work in coordination with the regulatory agencies composing the AMT to agree, based upon such data and analysis, upon appropriate sediment volume, composition, and frequency of sediment augmentation required to benefit over the long-term spawning gravel habitat and geomorphic conditions within the CWMZ without increasing flood risk or damage to infrastructure. Valley Water would conduct annual monitoring to determine the degree suitable steelhead spawning and rearing habitat remains within the CWMZ. At least every 5 years, Valley Water ~~will~~ would replenish spawning gravels within the Live Oak Restoration Reach and/or the Ogier Ponds CM restoration reach by placing up to the 500 cy of sediment (composition to be determined) within the reach using the methods similar to the construction activities described for the Sediment Augmentation Program.

The improvements to the Coyote Creek channel made as part of the Conservation Measures would likely improve mixing and oxygenation within the creek.

Overall, operation of the Conservation Measures would have beneficial impacts on water quality parameters including temperature, DO, and turbidity and beneficial uses in Coyote Creek.

Maintenance

Post-construction maintenance activities for the North Channel Reach ~~Extension~~, the Live Oak Restoration Reach, Ogier Ponds ~~ponds~~, and Coyote Percolation Pond, would result in the same types of impacts as described previously for construction activities. However, the magnitude of those impacts would be much lower for operations and maintenance, as repairs and maintenance would be necessary infrequently and in more limited, localized areas than the initial construction. Furthermore, these activities would be necessary to allow these facilities to continue to operate effectively, benefiting water quality and protecting related beneficial uses.

The maintenance of spawning gravel and rearing habitat improvements in the Live Oak Restoration Reach would have a beneficial impact on rare and endangered species and fish spawning beneficial uses, as it would replace coarse gravel lost due to dam operations; refer to Section 3.4, *Biological Resources – Fisheries Resources*, for detailed discussion of fish habitat effects. Maintenance would include placing 5 to 500 cy of spawning gravels or sediments within Coyote Creek adjacent to the channel within the CWMZ as dictated by on-going monitoring of the creek. In addition, culverts and low-flow crossings between the Anderson Dam and Coyote Percolation Ponds would be maintained as needed.

Ogier Ponds CM maintenance would include vegetation management and replanting or other efforts to establish native vegetation. Berms, spillways, fish screens, in-channel bio-engineered habitat enhancements, rock slope protection, and stormwater outfalls would be inspected and repaired, as necessary. Additional maintenance activities would include trash removal, inspection and graffiti abatement at floodwalls, access road inspections, and road maintenance.

North Channel Reach maintenance would include maintaining the constructed wetland bench, maintaining design flow capacity through the North Channel, and replacing restoration plantings, as needed. ~~North Channel Extension maintenance would include debris and/or vegetation removal from the channel or may require the dewatering and grading of channel bottom and banks to ensure the improvements maintain their proper capacity and slope to convey flows from the reservoir.~~

Phase 2 Coyote Percolation Dam CM maintenance would include periodic removal of sediment deposited in the restored channel, vegetation management, replacing roughness elements and/or repair of in-channel bio-engineered habitat enhancements, and enhancing rock slope protection as needed.

Maintenance activities for all these Conservation Measure facilities have potential to result in minor erosion and siltation on- or offsite with the use of equipment and vegetation removal. The use of hazardous materials in equipment and herbicides in vegetation maintenance could result in water quality impacts if these materials were spilled. All Conservation Measures will be subject to appropriate BMPs to avoid and minimize water quality impacts. BMPs will include HM-1 through HM-6 which establish appropriate use and handling of herbicides; ~~HM-7~~ HM-8 through HM-10 which ensure hazardous materials are only used in appropriate locations and are used properly; and WQ-1 through WQ-9 which minimize erosion through proper maintenance techniques. Considering the extensive BMPs for these activities, the maintenance of the Conservation Measure components will have short-term less-than-significant impacts on water quality.

Conservation Measure Operations and Maintenance Summary

Operations of the Conservation Measure components would have positive impacts on beneficial uses and water quality in Coyote Creek through improved flow conditions through Ogier Ponds and the Coyote Percolation Pond, and habitat enhancement that support many of the assigned beneficial uses. Maintenance activities impacts would be less than significant. Overall, the impacts from operation and maintenance would not impair beneficial uses of surface waters; violate any water quality standards or waste discharge requirements, or otherwise substantially degrade surface water quality; or conflict or obstruct implementation of a water quality control plan.

Post-Construction Project and FAHCE Adaptive Management

Water quality impacts of monitoring activities during AMP implementation would be less than significant, and similar to those of construction monitoring. Adaptive management measures may refine Anderson Dam post-construction FAHCE flow releases and implemented habitat restoration Conservation Measures after they meet their project-specific success criteria when they are not functioning over the long-term as intended or are not meeting measurable objectives. Refinements would likely have impacts similar to those discussed for post-construction operation of Anderson dam and Conservation Measure construction. As noted above these are considered here at a programmatic level, and future CEQA evaluation may be undertaken in the as necessary when specific projects are proposed, and project-specific details are available.

Significance Conclusion Summary

Adverse water quality impacts of the Project result from construction of the Seismic Retrofit components. Construction activities with the potential to affect water quality ~~include~~ are a consequence of dewatering of the reservoir which would ~~reduce the quality of habitat~~ potentially increase water temperature and turbidity and reduce DO within the reservoir pool. ~~and~~ Dewatering would also expose a high volume of sediments on the bottom of the reservoir that would be subject to erosion, especially in larger storm events, that would temporarily cause high levels of sedimentation and turbidity in Coyote Creek ~~for the days~~ during and for a short time following storms. **Mitigation Measure WQ-1** requires implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of

BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements.

The excavation of material, placement of fill to construct seismic retrofit improvements, stockpiling of materials, and construction equipment can create turbidity in Coyote Creek through erosion during construction and maintenance activities at the dam or Conservation Measures sites. For conventional out-of-reservoir construction activities, Valley Water would implement a SWPPP~~, comply~~ in compliance with the Construction General Permit ~~BMPs~~. Valley Water would also implement applicable VHP AMMs, VHP conditions, and Valley Water BMPs ~~;and~~ for in-reservoir and out-of-reservoir construction activities. In addition, Valley Water would implement a Water Quality Sampling Plan, a Sediment Monitoring Plan, and a Sediment Deposition Monitoring Plan, as well as ~~suspended sediment and sediment deposition monitoring~~, rearing juvenile steelhead monitoring, an active treatment system within constructed elements of the Seismic Retrofit downstream of the Stage 1 Diversion System and Stage 2 Diversion System, and use a chiller for the discharge of imported water if needed to maintain cold water conditions in the FCWMZ. These measures would ~~to~~ minimize adverse water quality impacts during construction activities. General construction water quality impacts would be **less than significant**. While not required to reduce general water quality impacts to less than significant, Valley Water would implement **Mitigation Measure WQ-1** which would further reduce general water quality impacts by requiring implementation of a WQMPP for in-reservoir construction, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements.

Perchlorate impacts from blasting would be significant, but less than significant with implementation of **Mitigation Measure GW-2** (Perchlorate Best Management Practices).

After mitigation, impacts of Project construction would be less than significant, with two exceptions caused by drawdown and dewatering of the reservoir associated with Seismic Retrofit construction. First, within the reservoir pool, water quality impacts related to temperature, DO and turbidity are ~~significant, and an~~ a **significant and unavoidable** consequence of reservoir dewatering. Second, the temporary exceedance of the turbidity water quality objective in Coyote Creek during certain-sized storm events due to erosion of exposed sediments while the reservoir is dewatered is a **significant and unavoidable** impact. However, the impact on beneficial uses ~~impairment~~ in Coyote Creek from releases of sediment associated with in-reservoir construction dewatering would be **less than significant** given the temporary and periodic nature of the turbidity impact, and the ability of Conservation Measures to minimize this impact over the short- and long-term. Regarding the fisheries-related beneficial uses, Section 3.4, *Biological Resources – Fisheries Resources*, demonstrates why temporary increases in turbidity during construction would not cause significant adverse effects on special-status fish populations and habitat. Despite the short-term adverse effects of sediment mobilization and release from Anderson Reservoir during Seismic Retrofit construction, the transport of this sediment downstream to Coyote Creek and San Francisco Bay would be beneficial for downstream ecosystems and habitats and related beneficial uses because the system has historically been deprived of sediment. Therefore, impacts on beneficial uses would be **less than significant**. ~~No~~ However, no feasible mitigation exists to reduce the impact such that the turbidity water quality objective is not violated and impacts would be **significant and unavoidable**.

Conservation Measure construction would not result ~~in~~ in significant water quality impacts, given implementation of a SWWPP complying with Construction General Permit BMPs, VHP AMMs, and Valley Water BMPs.

The FAHCE rule curves were developed to improve fisheries habitat quality in Coyote Creek including a primary biological feature of that habitat, namely water quality parameters, and particularly temperature. Conservation Measures, including the North Channel Extension, Ogier Ponds CM, Sediment Augmentation Program, and Phase 2 Coyote Percolation Dam would also be operated in manner that improves habitat conditions and related ~~, including~~ water quality parameters and beneficial uses.

In summary, the Project ~~conventional construction activities~~ would result in short-term, construction-related impacts to the beneficial uses of Anderson Reservoir and Coyote Creek, sedimentation and turbidity, and could introduce petroleum products and hazardous material through use of heavy equipment; however, these impacts are generally short-term and/or minimized through the implementation of the SWPPP, Mitigation Measure WQ-1 and the WQMPP, Valley Water BMPs, VHP Conditions and AMMs, and the construction monitoring that is part of the Project. Over the long-term, the Project would have beneficial impacts on water quality parameters including temperature, DO, and turbidity and enhance Coyote Creek habitat in support of fisheries related beneficial uses. Therefore, water quality impacts from in-reservoir and out-of-reservoir construction activities would be **less than significant**.

Adverse water quality impacts resulting from construction related drawdown and dewatering of the reservoir are, however, considered **significant and unavoidable** due to significant and unavoidable in-reservoir water quality impacts and the temporary exceedance of the Coyote Creek turbidity water quality objective during certain-sized storm events while the reservoir is dewatered.

Mitigation Measures

GW-2 Perchlorate Best Management Practices

WQ-1 Develop and Implement an In-Reservoir Construction Area Water Quality Monitoring and Protection Plan

Prior to construction, Valley Water will prepare and submit to the State Water Resources Control Board for approval a site- and discharge-specific Water Quality Monitoring and Protection Plan (WQMPP) for stormwater discharges associated with in-reservoir construction-related activities. The WQMPP will specify water quality control measures to minimize release of construction-related pollutants and associated water quality impacts to Coyote Creek downstream of Anderson Dam in accordance with the Clean Water Act and Porter Cologne Water Quality Control Act, taking into account fundamental differences in ADSRP in-reservoir construction areas and activities as compared to typical construction sites and activities.

The WQMPP will be implemented through Year 8 of construction when the reservoir is refilled and restrictions on impoundment within the reservoir are lifted. The WQMPP will include, at a minimum, the following elements:

- A detailed description of site conditions and the proposed in-reservoir construction activities and areas of disturbance.

- Detailed descriptions, design drawings, and specific locations of water quality control measures (Best Management Practices [BMPs]) that can feasibly be implemented to control pollutants in stormwater discharges associated with in-reservoir construction activities given unique characteristics of those construction activities and areas. Control measures may include, but not be limited to the following BMPs:
    - Limiting impacts from construction related staging and stockpiles.
    - Maintaining clean conditions at the work site.
    - Implementing spill prevention and response controls, including secondary containment.
    - Limiting locations for vehicle cleaning, fueling and maintenance to areas where unintentional spills do not threaten a discharge to waters;
- A technical demonstration that the BMPs satisfy Clean Water Act requirements for fundamentally different construction activities (including 33 USC sections 1342(p)(3) and 40 CFR sections 125.30-125.32)
- Ongoing evaluation and consideration during ADSRP construction of monitoring data collected and reported pursuant to the water quality monitoring program described in Final EIR section 2.7.1, including temperature, DO, pH and turbidity data collected pursuant to the Water Quality Sampling Plan, turbidity and TSS data collected pursuant to the Sediment Monitoring Plan, and sediment data collected pursuant to the Sediment Deposition Monitoring Plan. This mitigation measure may also rely on other data collected pursuant to existing FOCP and/or other water quality monitoring plans when appropriate to avoid duplicative data collection.

The WQMPP will be kept up to date to reflect any changes in site conditions and project activities, and to address controllable water quality factors in response to monitoring data.

3.14.5 Cumulative Impacts

The geographic study area for the cumulative impact analysis for Water Quality is areas around Anderson Reservoir and the Coyote Creek Watershed downstream of the reservoir to San Fransico Bay.

This section describes the Project's contribution to cumulative water quality impacts, as summarized in **Table 3.14-8**.

Table 3.14-8. Summary of Project Impact Contribution to Cumulative Water Quality Impacts

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact WQ-1: Impair beneficial uses of surface waters OR violate any applicable surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality OR conflict or obstruct implementation of a water quality control plan	Yes	Yes	CC	MM WQ-1 MM GW-2	Yes

Key: CC = cumulatively considerable

***Cumulative Impact WQ-1: Impair beneficial uses of surface waters OR violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality OR conflict or obstruct implementation of a water quality control plan* (Cumulatively Considerable)**

~~Project construction activities would involve drawdown of the reservoir for the seven years of construction.~~ Localized dewatering of nuisance groundwater would occur in areas associated with construction of improvements. The excavation of soils within or near the reservoir and creek, placement of fill within or near the reservoir or creek to construct dam improvements and Conservation Measures, vehicle travel on unpaved access and haul roads, exposed unvegetated work sites and staging areas, uncovered stockpiles, and mining activities could result in erosion of surface soils. Resultant erosion may cause turbidity and sedimentation, and impact beneficial uses tied to water availability and water quality. Construction and maintenance activities would also involve the use of hazardous materials and herbicides, which could accidentally be released into the environment, resulting in adverse effects on water quality. ~~General~~ However, general construction impacts would be **less than significant** with implementation of a SWPPP for out-of-reservoir construction, and implementation of applicable Valley Water BMPs and VHP conditions and AMMs during in-reservoir and out-of-reservoir construction.

Project construction activities would involve drawdown of the reservoir during construction. Dewatering during Seismic Retrofit construction would exacerbate adverse effects of water quality within the reservoir. The further lowering of water levels within the reservoir would increase water temperature~~,~~ and turbidity and reduce DO in the reservoir ~~(especially following storms)~~, and potentially concentrate other pollutants that would be present within the water column. This impact would be **significant and unavoidable**.

Reservoir dewatering would result in temporary and episodic, but substantial, discharges of sediment as storm runoff travels over previously inundated sediments at the bottom of the reservoir exposed during reservoir drawdown. Because of the threat presented to public health and safety, ~~and~~ there is only limited water storage allowed behind the dam due to FERC's Order to implement Interim Risk Reduction Measures, so there is no detention capacity to settle out sediments ~~from~~ upstream prior to release to Coyote Creek~~. ; and could increase water temperatures in Coyote Creek downstream.~~ Sediment discharged from the reservoir during storms would deposit in Ogier Ponds, Coyote Percolation Pond, Coyote Creek downstream of Coyote Percolation Pond, and San Francisco Bay. The temporary exceedance of the turbidity water quality objective during certain-sized storm events while the reservoir is dewatered is a **significant and unavoidable** impact. However, the impact on beneficial use impairment would be **less than significant** given the temporary and periodic nature of the turbidity impact~~, and the ability of Conservation Measures to minimize this impact over the short- and long-term~~. Despite the short-term adverse effects of sediment mobilization and release from Anderson Reservoir during Seismic Retrofit component construction, the transport of this sediment downstream to Coyote Creek and San Francisco Bay would be beneficial for downstream ecosystems and habitats and related beneficial uses because the system has historically been deprived of sediment.

The Project would create approximately two acres of new impervious surface which could result in a greater volume of polluted runoff. However, the Project would also generate substantial beneficial impacts to water quality and beneficial uses. The new reservoir outlet would allow for greater flexibility in releases that would allow greater use of the reservoir's cold water pool and reduce the potential for uncontrolled reservoir spills. The Live Oak Restoration Project, the Ogier Ponds CM, Sediment Augment Program, ~~North Channel Extension,~~ and Phase 2 Coyote Percolation CM would all provide water quality benefits and habitat enhancements that support beneficial uses.

The Project could impact surface and groundwater quality using explosives that contain perchlorate and other nitrogen-based chemicals which could degrade water quality at the Project level. ~~Perchlorate impacts from blasting would be significant, but less than significant with implementation of **Mitigation Measure GW-2** (Perchlorate Best Management Practices).~~

Cumulative projects, plans, and programs could result in incrementally adverse impacts if their construction, restoration, or operation could impair beneficial uses of surface waters; or violate any water quality standards or waste discharge requirements; or otherwise substantially degrade surface water quality; or conflict or obstruct implementation of a water quality control plan in Anderson Reservoir or Coyote Creek.

Cumulative Effects of Project with the FOCP

The FOCP lowered the storage behind Anderson Reservoir to deadpool. The reservoir levels would be further lowered during construction of the ADSRP. This exposes exposed previously inundated sediment that had accumulated behind the dam to erosion as flows from upstream run through the footprint of the reservoir. At the same time, the reduction of stored water reduces the reservoir's ability to settle out sediment being carried down from upstream sources. This greatly increases the volume of sediments released downstream to Coyote Creek during storm events. Construction of new access and haul roads, as well as removal of Coyote Road, during site mobilization involved substantial ground disturbance and operation of heavy equipment. This could result in erosion and subsequent transport/runoff of eroded materials to Anderson Reservoir and Coyote Creek.

The Project could impact surface and groundwater quality using explosives that contain perchlorate and other nitrogen-based chemicals which could degrade water quality at the Project level. The FOCP does not require ~~could also potentially~~ use explosives ~~in constructing the outlet tunnel~~ that may contain perchlorate or other nitrogen-based chemicals.

The cumulative risk to exceedance of the water quality objectives ~~degradation~~ is significant and the Project's contribution is cumulatively considerable. Both projects involve an extended period of reservoir dewatering that could increase erosion of sediments deposited in the reservoir when they are exposed by drawdown, particularly in connection with ADSRP construction where the reservoir must be drawn down to a lower elevation than deadpool. ~~Both projects involve construction activities that could increase erosion and involve the use of hazardous material during construction and maintenance that could impact Coyote Creek and the~~ The Project extends the period that Anderson ~~Andreson~~ Reservoir storage is lowered which greatly increases the potential for erosion of sediments on the bottom of the reservoir, and for temporary and episodic exceedances of the Coyote Creek turbidity water quality objective. Drawdown of the reservoir would also increase water temperature and turbidity and reduce DO within the reservoir. The Project's construction phase impacts when added to the FOCP's impacts on water quality are cumulatively significant, and the Project's contribution is **cumulatively considerabl**e. However, the long-term effects of sediment releases from Anderson Reservoir during Seismic Retrofit component construction would have beneficial effects on the San Francisco Bay estuary where sediment is needed by marshes to keep up with sea level rise.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Other probable future projects that could impact water quality in Coyote Creek include the SMP, VHP, DMP, Coyote Creek Flood Protection Project, Santa Clara County Parks Planning Projects and Natural Resource Management, as well as development projects in the Coyote Creek Watershed. These other projects involve construction and maintenance activities that could result in erosion and subsequent transport and runoff of eroded materials, the increase of impervious surfaces that can degrade water quality, and the use hazardous material in construction equipment.

All construction projects over one acre in size must comply with the Construction General Permit and implementation of a SWPPP which requires erosion control measures and BMPs to avoid and reduce the risk of erosion of materials to adjacent water bodies. The Project would implement a SWPPP in compliance with the Construction General Permit for out-of-reservoir construction activities. In addition, this Project and other Valley Water projects~~,~~ implement as appropriate the Valley Water erosion control BMPs to further reduce this risk such as: BMP AQ-1 (Use Dust Control Measures), BMP WQ-4 (Limit Impacts From Staging and Stockpiling Materials), BMP WQ-1 (Conduct Work from Top of Bank), BMP WQ-2 (Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms), BMP WQ-5 (Stabilize Construction Entrances and Exits), BMP WQ-9 (Use Seeding for Erosion Control, Weed Suppression, and Site Improvement), BMP WQ-10 (Prevent Scour Downstream of Sediment Removal), BMP WQ-11 (Maintain Clean Conditions at Work Sites), and BMP WQ-16 (Prevent Stormwater Pollution).

The implementation of the SWPPP BMPs for construction activities outside the reservoir along with applicable Valley Water BMPs and VHP conditions and AMMs would also reduce the potential for accidental releases of petroleum based products and hazardous materials during construction and maintenance, as well as limit the potential for impacts in the event of such releases. The SWPPP would include good housekeeping measures that would likely include secondary containment for any hazardous materials that are stored at the construction site. Additionally, Valley Water BMP HM-8 ~~BMPs HM-7 and HM-8~~ reduces the risk of vehicle-related pollutants from impacting water quality by ensuring vehicles and equipment ~~are cleaned in appropriate locations and that they~~ are properly fueled and maintained, reducing the risk of fuel or other leaks entering waterways. BMP WQ-6 limits the impact of concrete near waterways. Implementation of BMPs HM-9 and HM-10 also would protect water resources by ensuring proper management of hazardous materials and the implementation of spill prevention measures.

Banned and restricted-use pesticides that contribute to the downstream water quality impairments would not be used. For any legal herbicides that may be needed during construction and maintenance, BMPs HM-1 (Comply with All Pesticide Application Restrictions and Policies), HM-2 (Minimize Use of Pesticides), HM-4 (Comply with All Pesticide Usage Requirements), HM-5 (Comply with Restrictions on Herbicide Use in Upland Areas), and HM-6 (Comply with Restrictions on Herbicide Use in Aquatic Areas) would help protect water quality by ensuring that applicable pesticide application restrictions, usage requirements, and policies are followed (in both upland and aquatic areas) and by evaluating the use of alternative pest control methods and pesticides.

The cumulative effect of general construction and maintenance activities for the Project together with other projects with the implementation of SWPPPs for construction activities outside the reservoir and applicable BMPs for in-reservoir and out-of-reservoir construction is not cumulatively significant, and the Project's contribution is **not cumulatively considerable**.

The Project's sediment impacts due to erosion from the exposure of sediments on the bottom of Anderson Reservoir extends the period that these sediments are vulnerable to erosion during storms. The impact related to exceedance of the Coyote Creek turbidity objective is cumulatively significant when added to turbidity impacts of other probable future projects. Based on the severity of the Project's drawdown related sediment impacts, and the Project's contribution to adverse sediment effects is **cumulatively considerable**. The long-term effects of sediment releases from Anderson Reservoir during Seismic Retrofit component construction would have beneficial effects on the San Francisco Bay estuary where sediment is needed by marshes to keep up with sea level rise.

After construction, the proposed Project would not contribute excessive sediments or other pollutants to Anderson Reservoir or Coyote Creek. Existing water quality conditions in the Project area would not change as a result of proposed Project operations. Project operation would not affect implementation of TMDLs established in the future. The proposed Project would result in a more secure dam and would provide operational flexibility to protect against flooding damage, and associated water quality impacts from flooding, in the future. Impacts from Project operations of the seismic retrofit and Conservation Measures when added with the impacts of other probable future projects' impacts are not cumulatively significant, and the Project's impacts are **not cumulatively considerable**.

Significance Conclusion Summary

The Project, FOCP, and most other probable projects are largely construction projects over one acre in size and must comply with the Construction General Permit and implementation of a SWPPP for out-of-reservoir construction activities. The Project, and other Valley Water projects, also implement applicable Valley Water ~~erosion control~~ BMPs and VHP conditions and AMMs. The cumulative effect of general construction and maintenance activities from the Project's activities with the FOCP and other probable projects with the implementation of a SWPPP for construction activities outside of the reservoir and applicable Valley Water BMPs and VHP conditions and AMMs for all construction activities is not cumulatively significant, and the Project's impacts are **not cumulatively considerable**. While not required to reduce water quality impacts from general construction activities to less than significant, **Mitigation Measure WQ-1** would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control water quality pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements.

The Project ~~and FOCP~~ could ~~both~~ pollute water resources through the introduction of perchlorates or other nitrogen-based chemicals by blasting activities. The FOCP does not require use explosives that may contain perchlorate or other nitrogen-based chemicals. ~~The cumulative impact with FOCP would be significant, and the Project's contribution would be cumulatively considerable.~~ Implementation of **Mitigation Measure GW-2** (Perchlorate Best Management Practices) would ensure that risks to water quality are minimized, and the Project's contribution is **not cumulatively considerable**.

The ~~Project's~~ Project in combination with FOCP extends the period of reservoir dewatering, and dewaters the reservoir to a lower elevation than FOCP, creating cumulatively considerable water quality impact related to in-reservoir temperature, turbidity and DO, and erosion ~~from the exposure~~ of sediments exposed on the bottom of Anderson Reservoir after certain storm events ~~extends the period that these sediments are vulnerable to erosion during storms~~. The mobilization of this sediment following certain storm events is likely to result in an ~~impact related to~~ exceedance of the Coyote Creek turbidity objective during the combined duration of FOCP and ADSRP and therefore is cumulatively significant with the FOCP and other projects, and the Project's temporary impacts are **cumulatively considerable** even with implementation of **Mitigation Measure WQ-1** requiring implementation of a WQMPP for construction activities within the reservoir. Despite the short-term adverse effects of sediment mobilization and release from Anderson Reservoir during Seismic Retrofit component construction, the transport of this sediment downstream to Coyote Creek and San Francisco Bay would be beneficial for downstream ecosystems and habitats and related beneficial uses because the system has historically been deprived of sediment. The long-term effects of sediment releases from Anderson Reservoir during Seismic Retrofit component construction would have beneficial effects on the San Francisco Bay estuary where sediment is needed by marshes to keep up with sea level rise. Therefore, impacts on beneficial uses would **not be cumulatively considerable**.

No additional feasible mitigation beyond **Mitigation Measure WQ-1** is available to address ~~short-term turbidity and sedimentation~~ the increases in turbidity that are a significant, and an unavoidable consequence of reservoir dewatering. The Project's construction phase temporary exceedances of the turbidity water quality objective in Coyote Creek during certain-sized storm events due to erosion of exposed sediments while the reservoir remains. No feasible mitigation exists to reduce the impact such that the turbidity water quality objective is not violated (even if relatively briefly and episodically) when the reservoir is dewatered, given the massive area of the reservoir bottom which would be exposed by the dewatering and amount of accumulated sediment (approximately 2.9 million cy) and the limitation on BMPs that can be implemented in-reservoir. For example, it may be feasible to hydroseed portions of the reservoir bottom, but it would not stabilize enough sediment to reduce the sediment mobilization in a meaningful way and stabilization would not function effectively when inundated by reservoir inflow. Similarly, measures to settle sediments within the reservoir, rather than allowing them to move downstream (turbidity curtains or operating the reservoir at a higher level) would not be feasible during construction because they require detention of reservoir inflows, which ~~of the potential to~~ increases risks of the interim dam being overtopped. The Project's impacts when added to the impacts of the FOCP and other probable future projects on exceedance of the turbidity water quality objective is cumulatively significant, and the Project's impact is **cumulatively considerable**.

3.15 Land Use

This section evaluates the Project's impacts on the study area that has been defined for land use and planning. The *CEQA Guidelines* significance criteria for land use and planning address impacts related to consistency with land use plans, policies, or regulations adopted for the of purpose of avoiding or mitigating an environmental effect. Land use policies pertain to the type, location, and physical form of new development. For this analysis, policies "adopted for the purpose of avoiding or mitigating an environmental effect" are those that, if implemented and adhered to, would avoid or mitigate physical impacts on the environment. Other policies that relate to avoiding or mitigating an environmental effect are considered in other environmental resource evaluations in Chapter 3, *Regulatory and Environmental Setting and Impact Analysis*.

The study area that was defined to assess impacts related to land use and planning focuses on the portions of the county, San José, and Morgan Hill that comprise the Project Area, including the construction limits of the Seismic Retrofit and Conservation Measures components.

3.15.1 Environmental Setting

3.15.1.1 Regional Setting

Morgan Hill is largely comprised of single-family residential neighborhoods interspersed with multi-family residential uses and commercial areas. Land uses surrounding Morgan Hill consist of rural residential development, agricultural lands, and open space. Specifically, these land uses include nurseries, orchards, and vineyards. Lands to the east and west of Morgan Hill predominantly include undeveloped hillsides, open space areas and reservoirs, including Anderson Reservoir, Anderson Lake County Park, and Coyote Reservoir to the east, and Uvas Reservoir and Chesbro Reservoir to the west (City of Morgan Hill 2017 ~~2016~~).

San José is characterized by an urban environment adjacent to large open spaces. Historically, development patterns in San José focused on preserving its surrounding hillsides as open space, parklands, or natural habitat, providing San José's residents with a visual reminder of the nearby natural environment, and developing parklands and trails along the city's riparian corridors (City of San José 2023 ~~2011~~).

Unincorporated Santa Clara County is characterized by regional parks, trails, agriculture, agriculture ranchlands, hillside, and large open spaces. The southern portion of Anderson Reservoir is located in unincorporated areas of the county. Land uses in the unincorporated county within the Project Area include hillside, agriculture ranchlands, rural residential, and open space.

The Project Area includes lands in the immediate vicinity of Anderson Reservoir owned by Valley Water and the County, as well as portions of the Cochrane Road and Coyote Road rights-of-way. Existing land uses within and adjacent to the Project Area include vast areas of parkland. Anderson Lake County Park surrounds Anderson Reservoir and has many features, including the Anderson Reservoir boat ramp, multiple picnic areas, Anderson Lake County Park Visitor's Center, Serpentine Trail, Lakeview Trail, and Rancho Laguna Seca Trail (refer to **Figure 3.18-2** in Section 3.18 *Recreation*). Other land uses around the reservoir include grazing lands and single-family residences (both rural and suburban). The Santa Clara County Justice Training Center and the William F. James Boys Ranch are also located just downstream of the dam.

Approximately 1 mile downstream of Anderson Dam, Anderson Lake County Park adjoins the Coyote Creek Parkway. The Coyote Creek Parkway contains multi-use trails and a variety of recreational amenities, including picnic and rest areas, Ogier Ponds, a model airplane field, and the Coyote Percolation Pond. Coyote Creek Parkway includes the Coyote Creek Trail that runs adjacent to Coyote Creek and extends from the San Francisco Bay to the northern end of Morgan Hill. This area is also comprised of orchard lands.

3.15.1.2 Land Uses Designations and Zoning

General Plan land use designations within the Project Area include the following: Existing Regional Parks/Recreation, Open Space/ Hillsides/ Ranchland, Agricultural, Single-Family Residential, and Utility. A general description of the primary land use designations is included below. **Figure 3.15-1** shows the land use designations for the Project Area.

Table 3.15-1 provides lists the parcels within the Project Area, including jurisdiction, zoning, land use designations, and the Project's uses for the affected properties. **Figure 3.15-2** shows the zoning district for the Project Area. Zoning districts are generally consistent with the land use designations as described above.

Existing Regional Parks/Recreation

Much of the land within the Project Area is designated as existing regional parks (park lands of the county and cities) and is used for recreational purposes. The Seismic Retrofit component is located within Anderson Lake County Park which offers opportunities for hiking, bicycling, horseback riding, picnicking, fishing, and power and non-power boating. The Conservation Measures components located downstream of the dam along Coyote Creek are located within Coyote Creek Parkway, which also provides a wide range of recreational uses, including hiking, bicycling, horseback riding, picnicking, and fishing. See Section 3.18, *Recreation*, for a detailed discussion of recreational facilities within the Project Area. Parcels with this land use designation are within San José and the county.

Open Space/Hillsides/Ranchland

A majority of the Project Area around Anderson Reservoir and in the vicinity of Ogier Ponds and Metcalf Ponds is surrounded by open space, designated as hillsides and ranchlands. These areas are generally hilly, remote, and are unsuitable or not planned for urban development due to the topography and/or limited public access. Parcels with this land use designation are within San José and Morgan Hill.

Agricultural

Adjacent, privately-owned properties on Cochrane Road downstream of the dam are designated for agricultural activity. Some contain single-family residential structures, which are consistent with agricultural land uses. In addition, Ogier Ponds is surrounded by agricultural lands, which are protected and preserved within the county. Refer to Section 3.2, *Agricultural Resources* for a discussion on farmland and agricultural uses. Parcels with this land use designation are within San José, Morgan Hill, and the county.

Single-Family Residential

Several single-family residences are located to the west of the downstream dam embankment along Cochrane Road in Morgan Hill. Additional parcels within the northern half of the Project Area within San José are designated as single-family residential uses. Generally, the northern portion of the Project Area is more urbanized and consists of residential neighborhoods in proximity to Metcalf Pond. Parcels with this land use designation are within Morgan Hill.

Utility

Within the Project Area, both Anderson Dam and Coyote Percolation Dam serve multiple purposes, but the primary use is utility. Water resource facilities within the Seismic Retrofit component footprint include the dam and outlet works, reservoir, and spillway. These facilities are owned and operated by Valley Water. Further downstream, Valley Water owns and operates the Coyote Percolation Dam at Metcalf Ponds. Parcels with this land use designation are within San José.

1 **Table 3.15-1 Properties Affected by Project Components**

APN	Jurisdiction	Zoning Designation	Land Use General Plan Designation[1]	Project's Use of Property
Seismic Retrofit Component				
627-14-026	City of San José	Agriculture (A)	Open Hillside	Materials handling in reservoir

Anderson Dam Seismic Retrofit Project
Environmental Impact Report

3.15.2 Regulatory Setting

This section summarizes State, regional, and local laws, regulations, policies, and plans pertinent to the evaluation of the Project's impacts on land use and planning. No specific federal laws, regulations, or policies related to land use are applicable to the Project.

3.15.2.1 State Laws, Regulations and Policies

California Government Code

The California Government Code Title 5, Division 2, Part 1, Chapter 1, Article 5 establishes certain exemptions for water and electric energy facilities from local zoning ordinances. Section 53091(e), states:

> Zoning ordinances of a county or city shall not apply to the location or construction of facilities for the production, generation, storage, treatment, or transmission of water, or for the production or generation of electrical energy, facilities that are subject to Section 12808.5 of the Public Utilities Code, or electrical substations in an electrical transmission system that receives electricity at less than 100,000 volts. Zoning ordinances of a county or city shall apply to the location or construction of facilities for the storage or transmission of electrical energy by a local agency, if the zoning ordinances make provision for those facilities.

3.15.2.2 Regional and Local Laws, Regulations, and Policies

Santa Clara County General Plan

The following land use and planning policies from the Santa Clara County General Plan (County 1994) are relevant to the Project.

Resource Conservation

The Resource Conservation Element of the Santa Clara County General Plan addresses the County's overall strategy for the preservation and conservation of natural resources. For each type of resource, there is a set of strategies tailored to indicate the general approach taken to manage each resource. However, each of these strategies share some aspects in common. These serve in an introductory way as an "overall strategy" for resource conservation on the local and regional levels which incorporates the major principles of stewardship for the county.

> **Policy C-RC 7:** Countywide land use and growth management planning should be coordinated with overall water supply planning by the SCVWD [Santa Clara Valley Water District] in order to maximize dependability of long-term water supply resources.
>
> **Policy C-RC 16:** Seismic safety considerations for new and existing reservoirs should be addressed in order to ensure water supply and public safety in the event of earthquake.
>
> **Policy C-RC 19:** The strategies for maintaining and improving water quality on a countywide basis, in addition to ongoing point source regulation, should include:
>
> a. effective non-point source pollution control;

b. restoration of wetlands, riparian areas, and other habitats which serve to improve Bay water quality; and,

c. comprehensive Watershed Management Plans and "best management practices" (BMPs).

Policy C-RC 58: The general approach to scenic resource preservation on a countywide basis should include the following strategies:

- conserving scenic natural resources through long range, inter-jurisdictional growth management and open space planning;
- minimizing development impacts on highly significant scenic resources; and, maintaining and enhancing scenic urban settings, such as parks and open space, civic places, and major public commons areas.

Policy R-RC 35: Flood control modifications to be made in streams that have substantial existing natural areas should employ flood control designs which enhance riparian resources and avoid to the maximum extent possible significant alteration of the stream, its hydrology, and its environs.

Safety and Noise

The Safety and Noise Element of the Santa Clara County General Plan addresses a range of countywide public health and safety issues. This element includes policies that minimize the risk of human or environmental injury and property damage through the appropriate siting of development.

Policy R-HS 48: To enhance the effectiveness of each agency's efforts to protect local surface and groundwater quality, the County should encourage cooperation between the regional and local water agencies, sharing of information, and appropriate ongoing water quality monitoring efforts.

South County Joint Area Plan

The South County Joint Area Plan is an integrated policy framework within which the County, City of Morgan Hill, and City of Gilroy adopt and review more specific General Plan amendments, ordinance revisions, administrative procedures, project review, and contractual agreements between the jurisdictions. It is intended to achieve cooperation among the three jurisdictions, and consistency between their adopted policies.

Policy SC 15.8: Natural streamside and riparian areas should be left in their natural state, in order to preserve their value as percolation and recharge areas, natural habitat, scenic resources, recreation corridors and for bank stabilization. If flood control projects needed to protect presently existing development make this infeasible, disruption should be minimized, maintaining slow flow and stable banks through design and other appropriate mitigation measures.

Santa Clara County Countywide Trails Master Plan Update

The Santa Clara County Countywide Trails Master Plan Update (Santa Clara County Parks and Recreation Department [SCCPRD] 1995) and its accompanied Supplemental EIR were adopted by the Santa Clara County Board of Supervisors in 1995 and serve as a guide for trail system development to improve trail connectivity throughout the region. The purpose of the Countywide Trails Mater Plan Update is to build a trail system that meets the needs of residents, respects private property rights in planning and designing trails, provides responsible trail management and teaches trail users to respect adjacent land uses, accepts responsibility for any liability arising from the public's use of County trails, and implements trails involving private property only when the landowner is a willing participant in the process (SCCPRD 1995).

The plan proposes approximately 535 miles of off-street trail routes and over 120 miles of on-street bicycle-only routes as part of a countywide trail system. Trails within the plan fall into three different categories: (1) Regional Trails that are of national, state, or regional significance; (2) Sub-Regional Trails that provide continuity between cities and link two or more Regional Trails; and (3) Connector Trails that provide urban access to Regional or Sub-Regional Trails or that connect county parks. An updated trail status map (SCCPRD 2015) shows existing and proposed trail routes throughout the county, including several proposed segments of the Bay Area Ridge Trail, (which is considered a Regional Trail) around Anderson Lake and the proposed and existing Coyote Creek Trail segments that follow Coyote Creek and intersect with several Project components (which is considered a Sub-Regional Trail). No other trails of regional or sub-regional significance are indicated in the trails master plan update and map (SCCPRD 2015). The following policy is relevant to the Project.

> **Policy PR-TS 6.3:** Public improvement projects, such as road widenings, bridge construction, and flood control projects that may impact existing or proposed trails should be designed to facilitate provision of shared use.

City of Morgan Hill General Plan

The City of Morgan Hill General Plan (City of Morgan Hill 2017 ~~2016~~) represents the community's collective vision for Morgan Hill through 2035. The City of Morgan Hill General Plan contains the following goals and policies relevant to the Project.

Natural Resources and Environment

The Natural Resources and Environment Element of the City of Morgan Hill General Plan addresses preserving open space, agricultural uses, hillsides, riparian areas, wildlife habitat and other natural features. Policies seek to establish a greenbelt around the city, preserve El Toro Mountain, conserve resources, and protect the city's cultural heritage to help Morgan Hill retain its rural atmosphere as it continues to grow.

> **Policy NRE-5.3:** Natural State of Streamside and Riparian Areas. Retain natural streamside and riparian areas in their natural state in order to preserve their value as percolation and recharge areas, natural habitat, scenic resources, and recreation corridors, and to stabilize banks. (South County Joint Area Plan 15.08)

> **Policy NRE-5.4:** Development Impacts in Riparian Areas. Consider development impacts upon wildlife in riparian areas and mitigate those environmental impacts.

> **Policy NRE-5.6:** Stream Channel Protection. Protect existing stream channels and riparian vegetation by requiring buffering or landscaped setbacks and storm runoff interception as specified in **Table NRE-1** and consistent with the Santa Clara Valley Habitat Plan.

Table NRE-1. Required Stream Setback Distances

Slope	Category 1 Streams (Water Present Year-Round During Normal Rain Years)		Category 2 Streams (Water Present During the Wet Season Only During Normal Rain Years)
	Inside Urban Service Area	Outside Urban Service Area	Inside/Outside Urban Service Area
0-30%	100 feet	150 feet	35 feet
>30%	150 feet	200 feet	

Source: City of Morgan Hill 2017 ~~2016~~

Policy NRE-9.1: Interjurisdictional Coordination. Maintain close coordination with the following agencies and organizations which share jurisdiction and interest relative to South County's water supply and water quality: Regional Water Quality Control Boards, Santa Clara Valley Water District (Valley Water), Santa Clara County, City of Gilroy Planning Department, and San Martin Planning Committee. (South County Joint Area Plan 10.02)

Safety, Services, and Infrastructure

The Safety, Services, and Infrastructure Element of the City of Morgan Hill General Plan addresses protecting people from detrimental impacts associated with development, including noise impacts, by requiring the proper siting of new development, avoiding hazardous areas and materials and/or provide adequate mitigation.

Policy SSI-2.4: Code Requirements for Critical Structures. Design and construct critical structures above and beyond the applicable engineering and building standards, where such measures are deemed necessary from available geologic and engineering data. Critical structures are those structures:

- needed after a disaster (e.g., emergency communications, fire stations, hospitals, bridges and overpasses);
- whose continued functioning is critical (e.g., major power lines and stations, water lines, and other public utilities); or
- whose failure might be catastrophic (e.g., large dams).

Policy SSI-2.5: Design of Critical Structures. Design and construct critical structures to resist minor earthquakes without damage, resist moderate earthquakes without structural damage, and resist major earthquakes of the intensity or severity of the strongest experienced in California without collapse.

Policy SSI-6.6: Flood Management Design. Encourage flood management designs that respect the natural topography and vegetation of waterways while retaining dynamic flow and functional integrity.

Policy SSI-14.7: Water District Programs. Encourage the Santa Clara Valley Water District to continue developing programs to assure effective management of water resources, such as well monitoring, percolation of imported water, reclamation, and conservation. (South County Joint Area Plan 7.07)

Envision San José General Plan

The Envision San José 2040 General Plan (City of San José 2023 ~~2011~~) adopted in 2011 and last amended on May 12, 2023 ~~November 3, 2022~~, plans for future growth, development, and the provision of municipal services for the City of San José. Land use policies in the General Plan emphasize growing jobs and housing in areas served by transit and other City services to minimize the environmental and fiscal impacts of new growth. The Envision San José 2040 General Plan contains the following goals and policies relevant to the Project.

Environmental Considerations

The City of San José's Sphere of Influence includes many areas subject to varying degrees of naturally occurring hazards. Historically, as land becomes scarce, there is increased pressure to develop vacant land with a higher hazard potential. Development in hazardous areas, however, can result in significant costs to the community, including major property damage as well as loss of life. For new development, the emphasis of the Envision San José 2040 General Plan policies is to regulate construction and minimize identifiable risks.

Goal EC-3: Minimize the risk of injury, loss of life, property damage, and community disruption from seismic shaking, fault rupture, ground failure (liquefaction and lateral spreading), earthquake-induced landslides, and other earthquake-induced ground deformation.

> **Policy EC-3.5:** Locate, design and construct vital public utilities, communication infrastructure, and transportation facilities in a manner that maximizes risk reduction and functionality during and after an earthquake.

Goal EC-5: Protect the community from flooding and inundation and preserve the natural attributes of local floodplains and floodways.

> **Policy EC-5.10:** Encourage the preservation and restoration of urban creeks and rivers to maintain existing floodplain storage. When in-channel work is proposed, engineering techniques which include the use of plant materials (bio-engineering) are encouraged.

Environmental Resources

The goals and policies in the Environmental Resources Element protect the City of San José's terrestrial and aquatic assets, as well as the flora and fauna these natural resources support. They also provide for the protection of San José's archaeological and extractive resources.

Goal ER-9: Protect water resources because they are vital to the ecological and economic health of the region and its residents.

> **Policy ER-9.4:** Work with Valley Water to preserve water quality by establishing appropriate public access and recreational uses on land adjacent to rivers, creeks, wetlands, and other significant water courses.

Santa Clara Valley Habitat Plan

The vast majority of Project activities are considered covered activities under the VHP. Valley Water will obtain VHP coverage of eligible activities and comply with all applicable VHP conditions. See Section 3.4, *Biological Resources – Fisheries Resources* for a description.

Santa Clara County Zoning Ordinance

The Santa Clara County Zoning Ordinance establishes the location and boundaries of various zoning districts and sets forth regulations for the development of land within each zoning district. The Project Area within the unincorporated county has the following zoning designations: Hillside (HS), Exclusive Agriculture (A), Agricultural Ranchlands (AR), Rural Residential (RR), and A1 (General Use).

The Project is exempt from local zoning regulations under Government Code Section 53091(e), which states that local government building and zoning ordinances do not apply to the construction of facilities for water storage or transmission. In addition, zoning ordinance **Table 2.20-2**, Non-Residential Uses in Rural Base Districts, Note #16 recognizes that utility structures and facilities may be exempt from local zoning regulations if they are established by a government agency (County 2020).

City of Morgan Hill Zoning Ordinance

The City of Morgan Hill Zoning Code, Title 18 of the Morgan Hill Municipal Code, regulates land uses within Morgan Hill. The Zoning Code identifies allowable uses and sets standards such as minimum lot size, maximum building height, and minimum front yard depth. The Project Area within Morgan Hill has the following zoning designations: Open Space, Scenic Road Combining District/Coyote Valley Climate Resilience Combining Zone (A-20s-sr-cv), Roadside Services, and Single-family Residential (R-1-1).

City of San José Zoning Ordinance

The City of San José Zoning Code, Title 20 of the San José Municipal Code, is a set of regulations that guide and regulate future growth and development in the city and promote compliance with the goals and policies of Envision San José 2040 General Plan. The Project Area within San José has the following zoning designations: Agriculture, Single-family Residential, Scenic Road Combining District/Coyote Valley Climate Resilience Combining Zone (A-20s-sr-cv), Planned Development, and Rural District (HS).

3.15.3 Methodology and Approach to Impact Analysis

This impact analysis considers whether construction and operations of the Project would conflict with a land use plan, policy, or regulation, resulting in significant environmental impacts. The analysis evaluates impacts on these resources that would occur as a result of the following activities:

- Seismic Retrofit components construction
- Conservation Measures components construction
- Post-construction Anderson Dam facilities operations and maintenance
- Post-construction Conservation Measures components operations and maintenance
- Post-construction FAHCE adaptive management

The analysis focuses on reasonably foreseeable effects of the Project on existing land use conditions based on a review of City and County General Plan land use and zoning designations and desktop evaluations performed using a geographic information systems analysis of existing land uses within and surrounding the Project Area. The analysis considers temporary impacts, or short-term impacts, that may occur during the 7-year construction period, as well as permanent impacts, or impacts considered to be long term and/or that would result from ongoing facility operations and maintenance.

The direct impacts of the Project are described and evaluated according to significance criteria derived from Appendix G of the *CEQA Guidelines*, discussed in "Thresholds of Significance" below.

The assessment of impacts for the purposes of this section has been divided into construction-related impacts and operation-related impacts by Project component, as identified and described in **Table 2-1** of Chapter 2, *Project Description*. Additional information on impact assessment approach by Project ~~project~~ component is provided below.

3.15.3.1 Seismic Retrofit Construction

As described in Section 3.0, *Introduction*, the baseline for evaluating Seismic Retrofit components construction effects is the existing conditions at the time of EIR preparation modified by FOCP implementation (referred to as the existing conditions baseline).

3.15.3.2 Conservation Measures Construction

As described in Section 3.0, *Introduction*, the baseline for evaluating conservation measure construction effects is the existing conditions at the time of EIR preparation modified by FOCP implementation (existing conditions baseline). Conservation Measures components requiring construction activities that are evaluated in the impact analysis include:

- Ogier Ponds CM
- Maintenance of the North Channel Reach ~~Extension~~
- Maintenance Activities at the Live Oak Restoration Reach
- Sediment Augmentation Program
- Phase 2 Coyote Percolation Dam CM

3.15.3.3 Construction Monitoring

Construction monitoring activities are not considered in the impact analysis, as monitoring would involve data and information collection and assessment and would not result in direct or indirect impacts related to land use and planning. Thus, construction monitoring is not discussed further in this section.

3.15.3.4 Post-Construction Anderson Dam Facilities Operations and Maintenance

This analysis considers the land use impacts that could result from operational changes proposed for nonemergency flow releases following completion of the Anderson Dam facility upgrades and improvements, as described in Chapter 2, *Project Description*.

As described in Section 3.0, *Introduction*, the baseline for evaluating post-construction operation effects to land use and planning is the existing conditions at the time of EIR preparation modified by FOCP implementation (existing conditions baseline).

Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain the newly retrofitted Anderson Dam and Reservoir per Valley Water's existing DMP. Maintenance of the Anderson Dam facilities was previously evaluated in the Final DPM EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012), which concluded that the DMP would not result in activities that would impact land use. Impacts related to land use associated with post-construction maintenance activities would not differ substantially from those impacts identified in the DMP EIR. Furthermore, previously identified DMP impacts would not be exacerbated with implementation of the Project. For these reasons, post-construction dam facility maintenance activities are not discussed further in this section.

3.15.3.5 Post-Construction Conservation Measures Operations and Maintenance

The Conservation Measures component focuses on improving fish habitat (e.g., sediment augmentation, separation of Coyote Creek from Ogier Ponds, fish passage enhancement). Operations and maintenance of those components, including Maintenance Activities at the Live Oak Restoration Reach, would not result in activities that have the potential to substantially affect land uses. Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain Coyote Percolation Dam per Valley Water's existing DMP. Maintenance of Coyote Percolation Dam facilities were previously evaluated in the Final DMP EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). Although temporary disturbances to recreational users may occur during operations and maintenance (e.g., operation of maintenance equipment near a trail that could generate noise temporarily affecting recreationalists), all work would be temporary and would not conflict with existing land use plans, policies, or regulations.

Also, the activity of data collection and assessment would not result in any conflict with existing land use designations associated with the Conservation Measures components sites. Furthermore, post-construction Conservation Measures components operations would not result in a land use change nor would it result in a conflict with existing land use designations.

Therefore, operations and maintenance of Conservation Measures components would not result in an impact regarding land uses, and impacts associated with the operation and maintenance of Conservation Measures components are not discussed further in this section.

3.15.3.6 Post-Construction Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of Project ~~project~~ flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). Impacts of these monitoring activities are not evaluated in the impact analysis because the activities are unlikely to result in a land use change or conflict with existing land use designations.

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from original Conservation Measure construction. Impacts of these adaptive actions are not evaluated in the impact analysis because the activities are unlikely to result in a land use change or conflict with existing land use designations. These impacts are considered here at a programmatic level because the detailed characteristics, timing, and/or locations of the proposed adaptive measures are not known at the time of EIR preparation. Project-specific CEQA review would be undertaken in the future, as necessary, when specific projects are proposed and project-specific details are available.)

3.15.3.7 Applicable Best Management Practices and VHP Conditions

As noted in Chapter 2, *Project Description*, Valley Water would incorporate a range of BMPs, including conditions and avoidance and minimization measures from the VHP, to avoid and minimize adverse effects on the environment that could result from the Project. All relevant BMPs and AMMs for the Project are included in Appendix A, *Best Management Practices and Santa Clara Valley Habitat Plan Conditions, Avoidance and Minimization Measures, and Mitigation Measures* ~~*Incorporated in the Proposed Project*~~. ~~BMPs have been customized for the Project, as necessary, to help achieve the intended goal is achieved.~~ BMPs relevant to the land use analysis include the following:

GEN-36: Public Outreach – Would specify measures to notify the public of Proposed Project measures and allow for public to adjust recreational use to other area facilities.

GEN-37: Implement Public Safety Measures – Would specify public safety measures to notify and warn the recreating public of Project measures and mitigate public safety at recreational facilities and trails.

GEN-39: Planning for Pedestrians, Traffic Flow, and Safety Measures – Would schedule bicycle and pedestrian facility closures outside the peak morning and afternoon periods to minimize the impact of Project measures on recreational access and use.

AQ-1: Use Dust Control Measures – Would require dust and air quality management measures, including implementation of the BAAQMD's [Bay Area Air Quality Management District's] BMPs for dust suppression, relevant when considering impacts on recreationists that may be present in the vicinity of the Project.

AQ-2: Avoid Stockpiling Odorous Materials – Would avoid stockpiling odorous materials (for example, reservoir sediment containing high levels of hydrogen sulfide) within 1,000 feet of residential areas or other odor sensitive land uses, including recreational areas.

TR-1: Incorporate Public Safety Measures – Would requires installation of signs, safety fencing, and access to detours (if feasible) that provide adequate warning to the public of the construction work area.

There are no relevant VHP conditions that would apply to land use.

3.15.3.8 Thresholds of Significance

For the purposes of this analysis, the Project would result in a significant land use impact if it would:

LU-1: Physically divide an established community (criterion a); or

LU-2: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect (criterion b).

Issues Dismissed from Further Review

CEQA Guidelines Appendix G suggests that projects may have a significant effect on land use if they would physically divide an established community (criterion a). This criterion was dismissed from further analysis because the Project would be confined to the existing footprint of the Anderson Dam and Reservoir, as well as portions of Coyote Creek downstream of the dam, including at Ogier Ponds and the Coyote Percolation Pond. The established communities that surround the Project Area would not be divided by activities or construction of Project features. Project construction activities would primarily occur on property owned by either Valley Water or the County and, thus, would not divide established communities. For these reasons, the Project would not result in physical division of an established community and this criterion is not discussed further.

Additionally, construction of the Project would not conflict with any policies or preclude implementation of actions associated with the VHP, and therefore potential VHP conflicts are not analyzed in this section. For additional discussion of the VHP, refer to Section 3.5, *Biological Resources - Wildlife and Terrestrial Resources.*

3.15.4 Impact Analysis

***Impact LU-1: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect* (Less than Significant)**

The criterion for determining significant environmental impacts is whether the Project would conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. This criterion recognizes that an inconsistency with an individual plan, policy, or regulation does not necessarily equate to a significant environmental impact.

As described above in the *Regulatory Setting*, Valley Water is not subject to the local government building and zoning ordinances of a City or County for projects involving the construction of facilities for water production, generation, storage, treatment, or transmission pursuant to Government Code Section 53091(e). In addition, utility structures and facilities may be exempt from local zoning regulations if they are established by a government agency per the County Zoning Ordinance. Nevertheless, potential conflicts with land use plans, policies, or regulations are discussed here.

Seismic Retrofit Construction

Land Use Compatibility Discussion

As discussed above and shown in **Table 3.15-1** and on **Figure 3.15-1**, existing land uses within the Seismic Retrofit area consist of open space, hillside areas, ranchlands, single-family residential, utility, and recreational. Project activities would consist of site mobilization and preparation, including clearing and preparing staging and stockpile areas, reservoir dewatering and cofferdam construction, construction of the temporary water diversion system, dam excavation and fill (including excavation of embankment materials from borrow areas and disposal of excess materials at disposal areas), construction of the new outlet works and spillway, construction other ancillary facilities, the decommission of the hydroelectric facility, and site restoration. Completion of Seismic Retrofit component would not require a land use designation change or amendment and the proposed activities are not prohibited under these listed land use designations. Thus, it would not result in a substantial land use conflict with an any land use plan, policy, or regulation intended to avoid or minimize environmental effects.

The Seismic Retrofit component area includes seven parcels that are designated as single-family residential. The construction of the Seismic Retrofit component would not require the demolition of any existing structures and would not construct any nonresidential structures. Implementation of the Seismic Retrofit component would not require a general plan amendment, nor would it result in activities on these seven parcels that would conflict with allowable land uses onsite. Thus, it would not result in a substantial land use conflict related to any land use plan, policy, or regulation intended to avoid or minimize environmental effects.

The majority of the parcels within the Seismic Retrofit component area are designated as recreational. The baseline for evaluating Seismic Retrofit components construction effects on recreational land uses is the existing conditions at the time of EIR preparation modified by FOCP implementation. This includes the closure of some Anderson Lake County Park recreational amenities. These areas would be closed for all or portions of ~~remain closed through the duration of the~~ Seismic Retrofit construction for approximately 7 years, or for a total of 10 years for both projects combined. Thus, the baseline conditions used for the analysis has precluded the use of portions of the Anderson Lake County Park for recreation and open space as they are closed for implementation of the FOCP. With regards to the Seismic Retrofit components of the Project, construction would require temporary recreational closures of additional trails in the Rosendin Park Area, picnic areas, including the Live Oak Picnic Area, and parking spaces at Anderson Lake County Park, while these areas are being used for various aspects of construction, modified from their existing design to accommodate structures related to the Seismic Retrofit components, and/or otherwise closed to protect public safety.

Temporary closures of recreational facilities during Seismic Retrofit components construction would be incompatible with the recreation and open space land use designations for these areas. However, during construction, temporary impacts on the use and quality of recreational land use would be reduced through the implementation of BMPs. Implementation of BMP AQ-1 (Use Dust Control Measures) and BMP AQ-2 (Avoid Stockpiling Odorous Materials) will minimize dust and odors from construction; implementation of BMP TR-1 (Incorporate Public Safety Measures) will provide the public with construction warning signs, safety fencing, and access to detours during construction; and implementation of BMPs GEN-36 (Public Outreach), GEN-37 (Implement Public Safety Measures), and GEN-39 (Planning for Pedestrians, Traffic Flow, and Safety Measures) will require the advance notification to the public of recreational closures. These BMPs will minimize the level of disruption and impairment of recreational activities from construction activities. Over the long-term, once completed the Seismic Retrofit component would be consistent with applicable recreation land use designations.

Policies Compatibility Discussion

Construction of the Seismic Retrofit components would be consistent with land use policies listed above that have been adopted for the purpose of avoiding or mitigating an environmental effect.

The Resource Conservation Element of the Santa Clara County General Plan emphasizes local agency coordination with Valley Water to maximize dependability of water supply resources (Policy C-RC 7) and consideration of seismic safety in new and existing reservoirs (Policy C-RC 16). The purpose and objectives of the Project are consistent with these policies. The completion of the Seismic Retrofit component would increase future water supply dependability within a seismically active area.

The Safety and Noise Element of the Santa Clara County General Plan emphasizes local agency coordination with Valley Water to protect local surface and groundwater quality (Policy R-HS 48). The purpose and objectives of the Project are consistent with this policy. The completion of the Seismic Retrofit component would increase future water supply dependability within a seismically active area.

The Santa Clara County Countywide Trails Master Plan Update states that public improvement projects that may affect existing or proposed trails should be designed to facilitate shared use. The construction of the Seismic Retrofit components has the potential to conflict with public use of countywide trails (Grey Pine, Rancho Laguna Seca, Lakeview ~~Lake View~~, and Serpentine Trails). Implementation of BMPs GEN-36 (Public Outreach), GEN-37 (Implement Public Safety Measures), and GEN-39 (Planning for Pedestrians, Traffic Flow, and Safety Measures) will require the advance notification to the public of recreational closures. These BMPs would minimize the level of disruption and impairment of recreational activities from construction activities. Over the long term, the Seismic Retrofit components would be consistent with applicable county trails policies. The Project would improve and replace existing trails (Grey Pine, Rancho Laguna Seca, Lakeview ~~Lake View~~, and Serpentine Trails), improve the Live Oak Picnic area with additional park infrastructure (picnic facilities, bathrooms~~, bridges for public access across Coyote Creek~~), additional and improved parking at the Boat Launch Parking area, and improved bathrooms at the Boat Launch Parking area.

The Natural Resources and Environment Element of the City of Morgan Hill General Plan encourages interjurisdictional coordination regarding water supply considerations (Policy NRE-

9.1). The Safety, Services, and Infrastructure Element prioritizes engineering and design for critical structures, including those “whose failure might be catastrophic (e.g., large dams)” (Policy SSI-2.4), particularly with regard to seismic standards (Policy SSI-2.5). Valley Water is specifically encouraged to “continue developing programs to assure effective management of water resources” (Policy SSI-14.7). The Seismic Retrofit components of the Project is consistent with these policies. The completion of the Seismic Retrofit components would increase future water supply dependability within a seismically active area.

The Environmental Considerations Element of the Envision San José 2040 General Plan emphasizes design and construction of vital public utilities to maximize risk reduction and functionality during and after an earthquake (Policy EC-3.5). The Environmental Resources Element indicates that Valley Water should “preserve water quality by establishing appropriate public access and recreational uses” adjacent to water bodies (Policy ER-9.4). Through the extensive design and planning process, construction of the Seismic Retrofit components of the Project is consistent with these policies. The completion of the Seismic Retrofit components would increase future water supply dependability within a seismically active area.

In summary, construction of the Seismic Retrofit components would result in short-term incompatibility with certain County policies related to recreation and open space access. However, local jurisdictions have additional policies that prioritize the types of improvements and activities that comprise the Seismic Retrofit, such as seismic safety improvements to critical structures. Over the long-term, once completed the Seismic Retrofit component would be consistent with applicable policies. Overall, the Seismic Retrofit components would not conflict with the jurisdictions’ land use policies intended to avoid or minimize environmental effects.

Summary ~~Determination~~

Following Seismic Retrofit construction, both land-based and water-based recreational opportunities would be restored to prior conditions before Anderson Reservoir was seismically restricted (pre-FOCP) or replaced, allowing for these areas to revert back to historic land uses and continue to align with local land use plans, policies, and regulations. Because impacts to land use from construction would be temporary and land within the Seismic Retrofit area would be returned to uses consistent with land use plans, policies, and regulations after construction, construction of Seismic Retrofit components would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Conservation Measure Construction

As shown in **Table 3.15-1** above, existing land uses affected by the implementation of the Conservation Measures consist of recreational/existing parks, agriculture, open space/hillside areas/ranchlands, residential and utility (refer to **Figure 3.15-1b** and **Figure 3.15-1c**).

Ogier Ponds CM

Land uses included within the Ogier Ponds CM site, including ~~and~~ staging and stockpiling areas, consist of agricultural, recreational, and hillside. The majority of land uses impacted by the Ogier Ponds CM consist of recreational land uses. Similar to construction-related impacts resulting from Seismic Retrofit components, construction of Conservation Measures, which are located within Anderson Lake County Park and Coyote Creek Parkway, would result in temporary closures of recreational facilities, which would be incompatible with recreational land use designations due to lack of access and use of recreational lands. Specifically, construction work within Ogier Ponds and the Coyote Creek Parkway related to the Ogier Ponds CM would require temporary closure while the area is modified from the existing conditions baseline. Closures would be temporary and would result in temporary impacts to recreational land uses. Refer to the recreation land use discussion below.

The Ogier Ponds CM would also occur on land designated for agricultural land uses. The continued use of the site for recreational activities as described in Chapter 2, *Project Description*, along with the separation of Coyote Creek and the Ogier Ponds would not preclude the site from future agricultural use. The realignment of the creek onsite would not require a change in land use designation, nor would it result in a prohibited use of the site under the agricultural land use designation. Temporary use of the Barnhart Avenue Stockpiling Area would not preclude the area from agricultural use following construction. Thus, it would not result in a substantial land use conflict related to any land use plan, policy, or regulation intended to avoid or minimize environmental effects.

The Ogier Ponds CM staging area consists of a hillside land use designation. The staging area was previously disturbed during past mining activities and would be used for office and equipment trailers, equipment and materials storage, equipment maintenance facilities, fuel pumps and fuel storage tanks, construction vehicle parking, and laydown. The temporary use of this site for staging would not result a permanent change in land use and the hillside land use designation does not prohibit the use of the area for temporary construction staging. Thus, it would not result in a substantial land use conflict related to any land use plan, policy, or regulation intended to avoid or minimize environmental effect.

Phase 2 Coyote Percolation Dam CM

Land uses included within the Phase 2 Coyote Percolation Dam CM site consist of open space, recreational, and ranchlands. Similar to the Ogier Ponds CM, the majority of land uses that would be impacted by the implementation of Phase 2 Coyote Percolation Dam CM would be recreational land uses. Construction of the Conservation Measure component would result in temporary closures of existing recreational facilities, which would be incompatible with recreational land use designations due to lack of access and use of recreational lands. The Phase 2 Coyote Percolation Dam Fish CMs would require temporary closure of a portion of Coyote Creek Parkway and adjacent trails immediately upstream and downstream of the Coyote Percolation Dam. Closures would result in temporary impacts to recreational land uses. Refer to the recreation land use discussion below. Construction of the Phase 2 Coyote Percolation Dam CM would occur on land with a consist of an open space and ranchlands land use designation. Project activities would consist of the construction of a roughened channel which would improve fish passage. Construction of the fish enhancement features would not prevent future use of the site for ranchland or open space purposes. Completion of this Conservation Measure would not require a land use designation change or amendment and the proposed activities are not prohibited under either land use designation. Thus, it would not result in a substantial land use conflict related to any land use plan, policy, or regulation intended to avoid or minimize environmental effects.

Maintenance of the North Channel Reach ~~Extension~~

Land uses included within the North Channel Reach ~~Extension~~ site consist of open space, recreational, and open hillside. ~~During construction of the North Channel Extension, temporary work within select reaches of Coyote Creek that may temporarily reduce recreational access and use of the Coyote Creek Parkway. Closures would be temporary and would result in temporary impacts to recreational land uses.~~ Maintenance of the North Channel Reach ~~Extension~~ would occur on land that ~~with a~~ consists of an open space and open hillside land use designation. Project activities would consist of the maintenance of the North Channel Extension (e.g., maintaining channel conveyance, replacing plantings, etc.), completed as part of FOCP ~~restoration of the existing channel and revegetation with native vegetation. Regrading of the North Channel would not prevent future use of the site for open hillsides or open space purposes~~. Completion of this Conservation Measure would not require a land use designation change or amendment and the proposed activities are not prohibited under either land use designation. Thus, it would not result in a substantial land use conflict related to any land use plan, policy, or regulation intended to avoid or minimize environmental effects.

Maintenance Activities at the Live Oak Restoration Reach and Sediment Augmentation Program

Land uses included within the Maintenance Activities at the Live Oak Restoration Reach and Sediment Augmentation Program areas consist of recreational and hillside. Maintenance Activities at the Live Oak Restoration Reach and the Sediment Augmentation Program would occur on lands with hillside land use designations. Maintenance Activities would include monitoring of the Live Oak Restoration Reach and the replacement of in-channel materials, as needed, to maintain restoration features to provide habitat for steelhead throughout the south channel of Coyote Creek (e.g. large woody debris, wetland benches).The Sediment Augmentation Program would involve the initial stockpiling and placement of at least 500 cy of sediment in the Live Oak Restoration Reach, and then replenishing this sediment at least every 5 years in an amount up to 500 cy in various locations in Coyote Creek during adaptive management. ~~consist of removing and stockpiling approximately 55,000 cy of suitable sediment throughout the duration of Project construction and would be washed and sorted prior to placing it in Coyote Creek.~~ This would result in a temporary visual change to the program site but would not result in a permanent physical change. The stockpiling of materials is not a prohibited use under the hillside land use designation. Thus, the temporary use of land designated hillside for stockpiling would not result a permanent change in land use. Therefore, it would not result in a substantial land use conflict on hillside land related to any land use plan, policy, or regulation intended to avoid or minimize environmental effects.

During implementation of the Sediment Augmentation Program, temporary work within select reaches of Coyote Creek that may temporarily reduce recreational access and use of the Coyote Creek Parkway. Closures would be temporary and would result in temporary impacts to recreational land uses. Refer to the recreation land use discussion below.

Recreational Land Use Discussion

Similar to construction-related impacts resulting from Seismic Retrofit components, construction of Conservation Measures, which are located within Anderson Lake County Park and Coyote Creek Parkway, would result in temporary closures of existing recreational facilities, which would be incompatible with existing recreational land use designations, as identified in **Table 3.15-1** above. Specifically, construction work within Ogier Ponds ~~and the Coyote Creek Parkway~~ related to the Ogier Ponds CM would require temporary closure, while the area is modified from the existing conditions baseline and the Phase 2 Coyote Percolation Dam CM would require temporary closure of a portion of Coyote Creek Parkway and adjacent trails immediately upstream and downstream of the Coyote Percolation Dam. Furthermore, conservation measures related to the maintenance of habitat enhancements within the north channel and in-creek work related to spawning gravel and rearing habitat improvements would also require temporary work within select reaches of Coyote Creek that may temporarily reduce recreational access and use of the Coyote Creek Parkway.

Temporary closures of recreational facilities during construction of the Conservation Measure components would be incompatible with the recreation land use designations for these areas. However, adherence to the requirements of BMPs would reduce the effects. As discussed above, implementation of BMP AQ-1 (Use Dust Control Measures) and BMP AQ-2 (Avoid Stockpiling Odorous Materials) will minimize dust and odors from construction; implementation of BMP TR-1 (Incorporate Public Safety Measures) will provide the public with construction warning signs, safety fencing, and access to detours during construction; and implementation of BMPs GEN-36 (Public Outreach), GEN-37 (Implement Public Safety Measures), and GEN-39 (Planning for Pedestrians, Traffic Flow, and Safety Measures) will require the advance notification to the public of recreational closures. These BMPs will reduce the level of disruption and impairment of recreational activities from construction activities. Over the long term, once completed the Conservation Measure components would be consistent with applicable recreation land use designations.

Land Use Policies Discussion

In addition, construction of the Conservation Measure components would be consistent with various land use policies adopted for the purpose of avoiding or mitigating an environmental effect.

The Resource Conservation Element of the Santa Clara County General Plan states that strategies for maintaining and improving water quality should include restoration of wetlands, riparian areas, and other habitats (Policy C-RC 19); cites long-range, inter-jurisdictional growth management and open space planning as a general approach to conserving natural resources (Policy C-RC 58); and encourages enhancement of riparian resources and protection of streams, their hydrology, and their environment when implementing flood control modifications (Policy R-RC 35). Construction of Conservation Measures along Coyote Creek and at Ogier Ponds would help restore steelhead habitat. Completion of these Conservation Measures would enhance existing degraded habitat, which would be consistent with Policy C-RC 19, Policy C-RC 58, and Policy R-RC 35.

The South County Joint Area Plan states that "[i]f flood control projects needed to protect presently existing development make [leaving natural streamside and riparian areas sin their natural state] infeasible, disruption should be minimized, maintaining slow flow and stable banks through design and other appropriate mitigation measures" (Policy SC 15.8). Construction of conservation measures along Coyote Creek and at the Ogier Ponds would be consistent with this policy. ~~In particular, the North Channel Extension would support continuous flows through each channel, to the greatest extent practicable, and would not increase the existing potential~~

~~for fish strandings as the historic North Channel would be graded to remove existing holes and pools that may strand fish when waters recede. Additionally, the restored North Channel would be designed to facilitate drainage and would be designed and graded to allow flows to continue to the greatest extent feasible during low flow times. These design measures would be consistent with Policy SC 15.8.~~ The Santa Clara County Countywide Trails Master Plan Update states that public improvement projects that may affect existing or proposed trails should be designed to allow shared use (Policy PR-TS 6.3). Construction activities along Coyote Creek and at the Ogier Ponds would be planned and designed to allow continued shared use of trails following construction. Recreation in Coyote Creek Parkway is planned and managed in keeping with policies contained in the Coyote Parkway Integrated Natural Resources Management Plan (INRMP). The INRMP calls for expansion of recreational infrastructure throughout the parkway, including the Ogier Ponds area. Construction of the Ogier Ponds CM would not prevent the continued use of the site for recreational purposes or be inconsistent with the INRMP. Thus, completion of the Ogier Ponds CM would not conflict with recreational goals and plans for the Ogier Ponds area.

The Natural Resources and Environment Element of the City of Morgan Hill General Plan emphasizes retention of natural streamside and riparian areas and identify stream setbacks for Category 1 and Category 2 streams (Policies NRE-5.3, 5.4, and 5.6). Conservation Measures constructed along Coyote Creek and at Ogier Ponds would be consistent with these policies. The Safety, Services, and Infrastructure Element encourages designs that retain the natural topography and vegetation while maintaining the designed flow and functional integrity (Policy SSI-6.6). The Environmental Considerations Element of the Envision San José 2040 General Plan identifies a goal to “protect the community from flooding and inundation and preserve the natural attributes of local floodplains and floodways” (Goal EC-5 and Policy EC-5.10). The City of San José Zoning Ordinance recognizes the dual goals to “prevent unwarranted deterioration of the environment and promote a balanced ecology” (Purpose #7). Because the conservation measures would be constructed specifically for this purpose, construction would be consistent with balancing safety and ecological benefits.

Summary ~~Determination~~

While construction associated with Conservation Measure components would temporarily preclude the use of portions of these areas for recreation, impacts would be short term in each location, and after construction, these areas would be restored, restoring consistency with land use plans, policies, and regulations. Because the Conservation Measure components would be constructed specifically to implement the types of ecological restoration, protection, and enhancement activities envisioned by local jurisdictions’ policies construction of Conservation Measure components would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Post-Construction Anderson Dam Facilities Operations

Following construction of the Seismic Retrofit component, Anderson Dam would be retrofitted and upgraded to meet FERC and DSOD public safety requirements. The improved reliability of the dam structure would reduce the risk of catastrophic failure that would in the absence of the Project adversely affect downstream land uses in the region. Additionally, all recreational facilities temporarily closed as a result of construction would be restored and reopened, allowing for these areas to revert back to historic land uses and to align with local land use plans, policies, and regulations. Furthermore, no permanent modifications to recreational facilities would reduce the availability or quality of recreational uses, although there would be minor increases in inundation of downstream Coyote Creek recreational facilities due to modified reservoir operations (see Section 3.18, *Recreation*, Impact REC-1c.)

The Seismic Retrofit area includes parcels that are designated as open space/hillside areas/ranchlands, and utility. Operation of Anderson Dam post-construction would not impact the use of the parcels designated as open space/hillside areas/ranchlands, and utility. Operation and Maintenance of Anderson Dam would not require a land use designation change or amendment and the proposed activities are not prohibited under these listed land use designations. Thus, it would not result in a substantial land use conflict related to any land use plan, policy, or regulation intended to avoid or minimize environmental effect. The Seismic Retrofit area includes seven parcels that are designated as single-family residential. Operation and Maintenance of Anderson Dam post-construction would not impact the use of the parcels designated as single-family residential. The Seismic Retrofit component would not require a general plan amendment, nor would it result in activities on these seven parcels that would conflict with allowable land uses onsite. Thus, it would not result in a substantial land use conflict related to any land use plan, policy, or regulation intended to avoid or minimize environmental effect.

As described above for construction of the Seismic Retrofit component, many of the County General Plan's Resource Conservation policies are designed to provide adequate, high-quality water supplies for the community, including the ability to meet long-term projected demands, seismic safety, and groundwater management. In addition, several of the goals and policies identified in the Envision San José 2040 General Plan discuss protection of water supply, water quality, and groundwater recharge. As discussed in Chapter 2, *Project Description*, the purpose of the Project is to seismically retrofit, maintain, and operate Anderson Dam and Reservoir to meet safety requirements, thereby allowing Valley Water to maximize water supply and groundwater recharge capacity and benefits. Implementation of a seismically retrofitted Anderson Dam would be consistent with these policies, minimizing the risk of reservoir spill and downstream flooding, and providing in-stream environmental flows consistent with regulatory requirements. Thus, post-construction operations would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Project and FAHCE Adaptive Management Program

As described above, the implementation of adaptive actions as part of the FAHCE AMP may include refinements to the timing, frequency, and duration of Anderson Dam flow releases, as well as refinements to Conservation Measures. These actions would occur when flow measures are not functioning as intended or not meeting FAHCE measurable objectives. Adaptive actions occurring within the Coyote Creek floodplain may result in temporary disruptions to adjacent recreational land uses (e.g., construction equipment operating near a trail that could generate noise temporarily affecting recreationalists). However, all work would be temporary and would not limit the use of an area. Thus, adaptive management actions would not conflict with any land use plan, policy, or regulation related intended to avoid or minimize environmental effect and would in many instances allow for enhanced implementation of land use plans, policies, and regulations that have been adopted for recreational opportunities, natural resource conservation, and environmental stewardship. Thus, adaptive management-related impacts would be less than significant.

Significance Conclusion Summary

Implementation of the Project would occur in areas designated as recreational, residential, agricultural, open space/hillside/ranchlands, and utility. As discussed above, the implementation of the Project on land designated as residential, agricultural, open space/hillside/ranchlands, and utility would not preclude the land from future use of the site for those land uses. The activities proposed as part of the Project would not occur on land whose land use designation prohibits such activities, as identified in **Table 3.15-1**. Thus, the Project would not result in a substantial conflict with these existing land use designations.

The majority of the land that would be affected by the Project is designated as recreational. In particular, portions of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond would be temporarily closed during construction of the Seismic Retrofit improvements and Conservation Measure components, affecting recreational land uses in the area. While construction activities would disrupt existing recreational land uses, these effects would be temporary in nature.

As discussed above, implementation of BMP AQ-1, BMP AQ-2 BMP TR-1, BMPs GEN-36, GEN-37, and GEN-39 would minimize the level of disruption and impairment of onsite land uses during the Project construction period. Because impacts to land use from construction would be temporary, land within the Project Area would be returned to uses consistent with land use plans, policies, and regulations post-construction. Furthermore, operation of the Project would minimize the risk of reservoir spill and downstream flooding and provide in-stream environmental flows consistent with land use policies and regulations. The Project would seismically upgrade a critical facility consistent with local goals and policies, and construction and operation would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

3.15.5 Cumulative Impacts

The geographic study area for the cumulative impact analysis for land use and planning is the portions of Santa Clara County, San José, and Morgan Hill that comprise the Project Area.

This section describes the Project’s contribution to cumulative land use and planning impacts, as summarized in **Table 3.15-2**.

Table 3.15-2 Summary of Project Impact Contribution to Cumulative Land Use and Planning Impacts

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact LU-1: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect	No	No	NCC	None	No

Key: NCC = not cumulatively considerable

Cumulative Impact LU-1: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect **(Not Cumulatively Considerable)**

Because impacts on conflicts with land use from Project construction would be temporary and land within the Project area would be returned to uses consistent with land use plans, policies, and regulations after construction, the Project would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

Cumulative effects of Project with the FOCP

Activities associated with the FOCP would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. This is because FOCP activities would be temporary and land within the Project area would be returned to uses consistent with land use plans, policies, and regulations after construction. The cumulative impact on the environment resulting from a conflict with applicable land use plans, policies, or regulations from the FOCP and the Project would not be cumulatively significant, and the Project's contribution would **not be cumulatively considerable**.

Cumulative effects of Project with Probable Future Projects, Programs, and Plans

Projects listed in Section 3.0.5, as well as other future development projects that may be proposed in the next 10 years, would be reviewed for their consistency with regional and local plans and policies adopted for the purpose of avoiding or mitigating an environmental effect. Those projects would be reviewed for compliance with the Santa Clara County General Plan, South County Joint Area Plan, Santa Clara County Countywide Trails Master Plan Update, Santa Clara Valley Habitat Plan, City of Morgan Hill General Plan, or Envision San José 2040, as applicable, and any inconsistencies would be assessed prior to project approval. Therefore, the cumulative impact on the environment resulting from a conflict with applicable land use plans, policies or regulations from the Project and probable future projects, programs and plans would not be cumulatively significant, and the Project's contribution would be **not cumulatively considerable.**

Significance Conclusion Summary

The cumulative impact on the environment resulting from a conflict with applicable land use plans, policies or regulations from the Project and probable future projects, programs and plans would **not be cumulatively significant**, and the Project's contribution would be **not cumulatively considerable**.

Mitigation Measures

No mitigation is required.

3.16 Noise and Vibration

This section provides information about applicable regulations related to noise and vibration, the noise setting, and evaluates noise and vibration Project impacts. The information in this section is based in part on the Anderson Dam Seismic Retrofit Project Noise and Vibration Technical Memorandum ~~Impact Assessment Report~~, which is included in Appendix M[1].

The study area for noise and vibration focuses on the portions of the county, San José, and Morgan Hill that are in or near the Project Area, including the construction limits of the Seismic Retrofit and Conservation Measures components and the surrounding sensitive receptors.

3.16.1 Environmental Setting

3.16.1.1 Noise and Vibration Principles

Sound

Sound is the transmission of energy in the form of fluctuating pressure waves from a vibrating source through an elastic medium, such as air, that is detectable by the human ear. The pressure fluctuates above and below atmospheric pressure. The amplitude of the pressure fluctuation is typically described in terms of decibels (dB), while the rate of fluctuation per unit time (frequency) is described in hertz (Hz).

The decibel is a logarithmic ratio of a given sound pressure to a reference sound pressure. A logarithmic ratio is used for decibels since human hearing is roughly logarithmic, rather than linear. The reference sound pressure is roughly equal to the threshold of human hearing. Sound pressure levels below the human threshold of hearing are less than 0 dB, while levels above the human threshold of hearing are greater than 0 dB. Differences in sound level are also described in decibels. A 3-dB difference is considered “just noticeable”, a 5-dB difference is considered “clearly noticeable”, while a 10-dB difference is perceived as a doubling (or halving) in loudness. **Table 3.16-1** provides a list of common noise sources, their sound level, and their subjective loudness.

Because the decibel is logarithmic, a doubling of sound energy from a noise source produces a 3-dB increase in sound level from that source, not a doubling of the loudness of the sound (which requires a 10-dB increase). For example, if traffic along a road is causing a 60 dB sound level at some nearby location, doubling the amount traffic on this same road would cause the sound level at this same location to increase to 63 dB.

The range of frequencies a healthy human ear can hear is approximately 20 Hz to 20,000 Hz. The human ear is not equally sensitive to all frequencies across the audible frequency spectrum. The human ear is most sensitive to mid frequencies (the frequency range associated with speech) and is less sensitive at low frequencies and very high frequencies. To account for this, frequency weighting networks have been developed to approximate the human ear’s frequency response at different sound pressure levels. The A-weighting network is used to approximate the frequency response of the human ear at normal sound levels. Measurements using the A-

1 Appendix M has been revised in support of the Final EIR.

weighting network are described in terms of A-weighted decibels, often abbreviated colloquially as dBA. **Table 3.16-1** shows some representative noise sources and their corresponding noise levels in dBA.

Table 3.16-1. Typical A-Weighted Noise Levels

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
Onset of physical discomfort	120+	
	110	Rock Band (near amplification system)
Jet Flyover at 1,000 feet		
	100	
Gas Lawn Mower at three feet		
	90	
Diesel Truck at 50 feet, at 50 mph		Food Blender at 3 feet
	80	Garbage Disposal at 3 feet
Noisy Urban Area, Daytime		
	70	Vacuum Cleaner at 10 feet
Commercial Area		Normal speech at 3 feet
Heavy Traffic at 300 feet	60	
		Large Business Office
Quiet Urban Daytime	50	Dishwasher Next Room
Quiet Urban Nighttime	40	Theater, Large Conference Room (background)
Quiet Suburban Nighttime		
	30	Library
Quiet Rural Nighttime		Bedroom at Night, Concert Hall (background)
	20	
		Broadcast/Recording Studio
	10	
Lowest Threshold of Human Hearing	0	Lowest Threshold of Human Hearing

Sound Level Metrics

To better characterize changes in sound levels over time, several sound level metrics have been developed. The following is a summary of some of the more common metrics.

- Sound environments often vary in level over time. The equivalent-continuous sound level, Leq, is the steady-state sound level over a given time period that has the same total sound energy as the time-varying sound level measured over that same time period. Leq is the time-averaged sound energy of a measurement.
- The Day-Night Level, abbreviated as either DNL or L_{dn}, is an equivalent-continuous sound pressure level for a 24-hour period that includes a 10-dB penalty from 10:00 p.m. to 7:00 a.m. to reflect people's increased sensitivity to noise at night.

Noise Effects on People

Noise is sound that is considered undesirable or unpleasant. The effects of noise on people depends on a variety of factors, including the type of noise source, the context of the noise, and the sensitivity of the person.

How noticeable a noise source is depends on the following factors:

- The sound level. Louder noise tends to be more annoying. In addition, noise sources that change in sound level over time are more noticeable than those that do not vary over time.
- The duration. Noise that is fairly steady over time tends to be less noticeable, while short, impulsive noises are more noticeable.
- The frequency spectrum. Broadband noise—noise that contains sound energy at many frequencies—is not as noticeable as noise that contains discrete tones. For example, the tone from a backup beeper is more noticeable than noise from a fan, even if they are producing the same overall sound level.
- Masking effects. Noise from one source can be masked—made less noticeable—by noise from one or more louder sources.

The extent to which noise affects people can vary from subjective (causing annoyance) to physical (causing hearing loss). Where noise is loud enough to cause hearing loss, regulations such as those developed by OSHA have been adopted to mitigate hearing loss. In most environments, noise is not sufficiently loud to cause hearing loss but may still cause annoyance or impact people's productivity and general well-being. Note that the degree of annoyance caused by a given noise varies from person to person.

Environmental Noise and Propagation

Environmental noise refers to noise that propagates outdoors. The way in which sound propagates outdoors and the descriptors used to differentiate types of sound and noise sources are summarized below.

The attenuation of sound over distance outdoors depends on the type of source and environmental factors. In the free field (i.e., no obstructions for the sound), sound from a source that can be considered a point spreads hemispherically, resulting in a sound attenuation rate of

6 dB per doubling of distance. Point sources include, for example, fans and individual vehicles such as trucks. Sound from a line source spreads in the shape of a half cylinder, with a sound attenuation rate of 3 dB per doubling of distance. The most common type of line source is a highway. While highways have many point sources (vehicles), the constant stream of traffic results in the collection of point sources acting as a line source.

Vibration

Vibration is the transmission of energy in the form of waves through the ground, man-made structures, or other solid objects. As with sound, the frequencies of vibration are described in Hz. The amplitude of vibration is typically described either as peak particle velocity (PPV) in units of inches per second (in/sec) or in decibels of vibration velocity, abbreviated as VdB.

Vibration is perceived tactilely whether through feet or hands or through the whole body while sitting or lying down. Like noise, vibration can be a source of annoyance and can cause sleep disturbance.

Most perceptible indoor vibration is caused by sources within buildings, such as equipment operation, movement of people, or slamming doors. Typical outdoor sources are heavy construction equipment and activities (such as blasting and pile driving), steel-wheeled trains, and heavy trucks on rough roads or offroad. It is unusual for vibration from sources, such as buses and trucks on smooth roads to be perceptible, even in nearby locations.

Table 3.16-2 summarizes common sources of groundborne vibration velocity levels and average response to vibration by a person at rest in quiet surroundings (tolerance to vibration increases considerably during physical activity). The duration of the vibration event affects human response, as does its frequency of occurrence; increases in both result in decreased tolerance. Typical background vibration levels in residential areas are usually 50 VdB or lower, well below the threshold (65 VdB) of perception for most humans.

Table 3.16-2. Typical Vibration Levels and Associated Average Responses

Human or Structural Response	Vibration Velocity Level (VdB)	Typical Sources (50 feet from source)
Threshold for minor cosmetic damage to fragile buildings	100	Blasting, pile driving, vibratory compaction equipment
Difficulty with tasks such as reading a video or computer screen	90	Heavy tracked vehicles (bulldozers, cranes, drill rigs)
Threshold for residential annoyance for infrequent events (e.g., commuter rail)	80	Freight rail, typical Commuter rail, upper range
	70	Rapid transit, upper range
Threshold for residential annoyance for frequent events (e.g., rapid transit)	60	Commuter rail, typical

Human or Structural Response	Vibration Velocity Level (VdB)	Typical Sources (50 feet from source)
Approximate threshold for human perception of vibration and limit for vibration sensitive equipment	50	Bus or truck over bump or on rough roads, typical rapid transit, typical bus or truck on public road

Source: Federal Transit Administration 2018

Energy Transmission of Blasting

During blasting activity, the majority of the energy of detonations is consumed by rock breakage and movement. However, a small amount of energy is transmitted past the blasting area through vibration and air overpressure. The total energy released by the detonation of an explosive is typically provided in terms of Trinitrotoluene equivalent (TNTe). Various types of explosives have varying effectiveness factors compared to TNT. Limits for safe air overpressure and vibration from blasting are given in terms of TNTe per delay.

Vibration

Blasting results in groundborne vibration propagating from the blasting area. Blasting creates vibration waves in the ground of varying amplitude, frequency, and speed. Like other forms of groundborne vibration, the frequencies are described in Hz. The amplitudes are typically described in terms of PPV in/sec. The two most significant factors influencing the amplitude of vibration are the weight of charge and distance from the charge, though factors including timing between charges, geology, and charge confinement also play a role.

Vibration from blasting of sufficient amplitude can cause structures to respond, resulting in rattling within buildings, and excessive vibration from blasting has the potential to cause damage to structures. However, proper planning and monitoring of vibration can mitigate risk to nearby buildings.

Air Overpressure

Blasting creates vibrations in the air referred to as air overpressure. Air overpressure is the change in air pressure from normal atmospheric pressure generated by a blast. Air overpressure propagates as a pressure wave in the form of compression (positive pressure) followed by rarefaction (negative pressure). Like sound waves, air overpressure can be described in terms of pascals (Pa) or the sound equivalent in dB.

Much of the acoustic energy from air overpressure is below the range of human hearing (less than 20 Hz). The portion of an air overpressure below the range of human hearing is perceived as a sudden gust of wind, sometimes referred to as an “airblast” or “air concussion.” While most of the airblast energy is below the range of human hearing, it can cause structures to respond, resulting in rattling within buildings.

Factors that influence air overpressure include charge-weight per delay, depth of burial, volume of displaced rock, delay time intervals, type of explosive, atmospheric conditions, and topography.

3.16.1.2 Valley Water and Anderson Dam

Noise Sensitive Receptors

Noise exposure goals for various types of land uses reflect the varying noise sensitivities associated with those uses. Noise sensitive receptors are defined as places where noise could interfere with regular activities such as sleeping, talking, and recreation, which include hospitals, residences, convalescent homes, schools, libraries, churches, and other religious institutions.

Existing land uses within and adjacent to the Project Area include Coyote Creek, parkland and hiking trails, the Anderson Reservoir boat ramp, the Anderson Lake County Park Visitor's Center, the Santa Clara County Justice Training Center, the William F. James Boys Ranch, an orchard, and private residences. As such, noise sensitive receptor locations in the Project Area include residential communities, a high school, and public parkland, where sensitive receptors may reside or otherwise conduct regular activities. Sensitive receptors in the Project Area are described below by Project component.

Anderson Dam Seismic Retrofit Components

Nearby sensitive receptors include single-family residences, the William F. James Boys Ranch, and recreational users and staff members at Anderson Lake County Park, Rosendin Park, and nearby recreational trails. Residences and recreational trails along the southwestern bank of the reservoir (i.e., near Stockpile ~~Areas D and~~ Area K) and in the south area of the dam are within Morgan Hill, with residences closest to the dam within unincorporated Santa Clara County.[2.] The William F. James Boys Ranch is located within San José. There are no noise-sensitive receptors located northwest of the dam, within the vicinity of several stockpile areas (Stockpile Areas H, I, J, and L).

Recreational uses at the southeastern bank of the reservoir are located within the county, and recreational uses at the northwestern bank and the northern dam area are within San José. Recreational uses that border the Project Area include the Anderson Lake County Park to the southwest (which includes hiking trails and boating activities within the Seismic Retrofit component Project Area), the Live Oak Picnic Area also to the southwest, and the Rosendin Park Area to the southeast. These recreational areas would be temporarily closed during construction. Specifically, the Rosendin Park Area would be fully closed during the initial blasting phase of construction which is expected to take place over 3 to 4 months during Year 4, 5, or 6 of construction. Following the initial blasting phase, some trails in the park would be reopened with the exceptions of Lakeview, Gray Pine, and Rosendin Trails, which would all remain closed for the duration of blasting in Years 4, 5, and/or 6. There would be no planned closures of Rosendin Park Area before Year 4 or after Year 6 of Project construction. Rancho Laguna Seca Trail and the Cochrane Trail would remain partially closed and would be dead-end trails with a turnaround at the construction site following the blasting phase of Project construction.

[2] Note: Receptors R-31 and R-32 have been added to the noise analysis to more accurately estimate noise and vibration impacts on residences within unincorporated Santa Clara County.

The predominant noise sources to the southwest of the dam are natural sounds and traffic noise from Cochrane Road. At Anderson Lake County Park and Rosendin Park to the southeast, the predominant noise source is natural sounds.

Conservation Measures

Ogier Ponds Conservation Measure

The closest sensitive receptor to the Ogier Ponds CM area is the Parkway Lakes RV Park located southwest of Ogier Ponds along the east side of Monterey Highway, adjacent to the Project Area. Sensitive receptors also include users of the trails near Ogier Ponds, such as the Coyote Creek Trail. The predominant source of noise in the vicinity of Ogier Ponds is traffic noise from US 101, Ogier Avenue, and Barnhart Avenue, and sounds typical of nature, such as birds chirping and wind gusts.

Maintenance of the North Channel Reach ~~Extension~~ and Maintenance Activities at the Live Oak Restoration Reach

Maintenance of the North Channel Reach ~~Extension~~ and Maintenance Activities at the Live Oak Restoration Reach CMs would occur downstream of Anderson Dam along Coyote Creek. Nearby sensitive receptors include residential communities adjacent to Coyote Creek to the south of Cochrane Road and Malaguerra Avenue. Sensitive receptors also include users of the trails that are adjacent to Coyote Creek, such as the Coyote Creek Trail. The predominant source of noise in the vicinity of Coyote Creek is traffic noise from US 101, Monterey Highway, and Cochrane Road. Additional sources of noise include natural sources, such as birds chirping and wind gusts.

Sediment Augmentation Program

The Sediment Augmentation CM spans the length of Coyote Creek downstream of Anderson Dam to Ogier Ponds. Nearby sensitive receptors include those near the Maintenance of the North Channel Reach ~~Extension~~ and Maintenance Activities at the Live Oak Restoration Reach CMs, discussed above, and residential communities southwest of Coyote Creek bound by US 101 to the northeast and Monterey Highway to the southwest. The predominant source of noise in the vicinity of Coyote Creek is traffic noise from US 101 and other major roadways such as Cochrane Road and Monterey Highway.

Phase 2 Coyote Percolation Dam Conservation Measure

The closest receptors near the Phase 2 Coyote Percolation Dam CM include residential communities adjacent to Coyote Percolation Pond to the south and west, recreational users at Metcalf Park adjacent to the south, and recreational users along Coyote Creek Trail, which has a trailhead at Metcalf Park. Residential communities are also located north of US 101, approximately 0.1 miles from the Project Area. The predominant source of noise in the vicinity of the Phase 2 Coyote Percolation Dam Conservation Measure is traffic noise from US 101 and other major roadways, such as Monterey Highway and Metcalf Road.

Ambient Noise Levels

To characterize ambient noise levels in the Project Area, Ramboll conducted ambient noise level measurements from June 13 through June 17, 2022. Eight (8) 24-hour sound level measurements were conducted in the vicinity of Anderson Dam, one 24-hour sound level measurement was conducted in the vicinity of Ogier Ponds, and two 24-hour sound level measurements were conducted in the vicinity of the Phase 2 Coyote Percolation Dam CM area.

The measurement locations were chosen based on the locations of future construction activities and the locations of noise-sensitive receptors. The measurements were conducted using Larson Davis LxT sound level meters, which meet ANSI S1.4 requirements for a Type 1 sound level meter and were made in general conformance to ANSI S12.9-1992/Part 2. Weather conditions were clear throughout the measurements.

The results of the measurements taken in the vicinity of Anderson Dam are summarized in **Table 3.16-3**. The location of the noise measurements in the vicinity of Anderson Dam are shown in **Figure 3.16-1**. The primary sources of noise in the vicinity of Anderson Dam included traffic noise from local roads, with insects, birds, and wind also contributing to the noise environment. Based on observations on site, the intersection of Cochrane Road and Malaguerra Avenue saw more traffic than other road sections near the Project Area. As a result, the ambient noise levels measured at Sound Level Measurement (SLM)-2 were higher than the other monitoring locations. Monitoring locations SLM-5 through SLM-6 were shielded from local traffic noise and had the lowest ambient noise levels.

Table 3.16-3. Anderson Dam Noise Level Measurement Results

Tag	Location	Measurement Period	Nearest Noise-Sensitive Receptor(s)	Nearest Area(s) of Construction Activity	L_{dn} (dBA)
SLM-1	~60 feet east of Malaguerra Avenue and Sycamore Avenue intersection	7:00 a.m. 06/15/2022 - 8:00 a.m. 06/16/2022	Residences along Malaguerra Avenue	Staging Area 1, Stockpile Area E, Sediment Augmentation Program	50
SLM-2	~60 feet northeast of Cochrane Road-Malaguerra Ave intersection	9:00 a.m. 06/16/2022 - 10:00 a.m. 06/17/2022	Residences along Cochrane Road and Malaguerra Avenue, juvenile correctional facility	Staging Area 1, Stockpile Area E	61
SLM-3	Northeast corner of Live Oak Picnic Area near Coyote Creek	9:00 a.m. 06/16/2022 - 10:00 a.m. 06/17/2022	Residences along Cochrane Road, juvenile correctional facility	Staging Area 1, Stockpile Area E, North Channel Reach ~~Extension~~	50
SLM-4	~80 feet northwest of Cochrane Road-Via Sebastian intersection	7:00 a.m. 06/15/2022 - 8:00 a.m. 06/16/2022	Residences along Cochrane Road	Staging Area 4, Staging Area 1	54

Tag	Location	Measurement Period	Nearest Noise-Sensitive Receptor(s)	Nearest Area(s) of Construction Activity	L_{dn} (dBA)
SLM-5	Southeast corner of Rosendin Park	10:00am 06/15/2022 - 10:00 a.m. 06/16/2022	Residences along Holiday Drive	Basalt Hill Borrow Area, Stockpile Area D	45

Key: SLM = sound level meter

The results of the measurement taken in the vicinity of Ogier Ponds are summarized in **Table 3.16-4**. The location of the noise measurement in the vicinity of Ogier Ponds is shown in **Figure 3.16-2.** The primary source of noise in the vicinity of Ogier Ponds was traffic along US 101, with noise from Monterey Highway, insects, birds, and farm animals also contributed to the noise environment.

Table 3.16-4. Ogier Ponds Noise Level Measurement Results

Tag	Location	Measurement Period	Nearest Noise-Sensitive Receptor(s)	Nearest Area(s) of Construction Activity	L_{dn} (dBA)
SLM-9	Near Ogier Avenue, ~170 feet beyond Barnhart Avenue	9:00 p.m. 06/13/2022 - 9:00 p.m. 06/14/2022	Parkway Lakes RV Park	Ogier Ponds	57

The results of the measurements taken in the vicinity of the Phase 2 Coyote Percolation Dam are summarized in **Table 3.16-5**. The locations of the noise measurements in the vicinity of the Phase 2 Coyote Percolation Dam are shown in **Figure 3.16-3.** The dominant source of noise at the percolation dam is traffic noise from US 101. Local traffic along Forsum Road and activity at Metcalf Park also contribute to the noise environment.

3.16.2 Regulatory Setting

3.16.2.1 Federal Laws, Regulations, and Policies

U.S. Environmental Protection Agency Noise Control Guidelines

In 1972, the Noise Control Act (42 USC Section 4901 et seq.) was passed by Congress to regulate noise environments in support of public health and welfare. It also established the USEPA Office of Noise Abatement and Control to coordinate federal noise control activities. The USEPA established guidelines for noise levels that would be considered safe for community exposure without the risk of adverse health or welfare effects. The USEPA found that to prevent hearing loss over the lifetime of a receptor, the yearly average equivalent continuous sound level (L_{eq}) should not exceed 70 dBA. The USEPA also found that the day-night average sound level (L_{dn} or DNL) should not exceed 55 dBA in outdoor activity areas, or 45 dBA indoors, to prevent interference and annoyance. In 1982, the USEPA phased out the office's funding as part of a shift in federal noise control policy to transfer the primary responsibility of regulating noise to state and local governments. While the Office of Noise Abatement and Control no longer exists, the Noise Control Act has been used as a resource in developing state and local standards for environmental noise.

Federal regulations also establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under Title 40 of the CFR, Part 205, Subpart B. The federal truck pass by noise standard is 80 dBA at 50 feet from the vehicle pathway centerline, under specified test procedures. These noise limits are implemented through regulatory controls that are required of truck manufacturers.

Federal Transit Administration Noise and Vibration Assessment Criteria

The FTA provides criteria for assessing construction noise impacts based on the potential for adverse community reaction in its *Transit and Noise Vibration Impact Assessment Manual* (FTA 2018). For a general assessment, the criterion is 80 dBA $L_{eq(8\text{-}hr)}$ during the day at residential receptors.

The FTA has adopted vibration criteria for assessment of vibration from construction activities, for damage to structures (FTA 2018). The criteria are summarized in **Table 3.16-6**. For potential human annoyance, the FTA recommends a limit of 72 VdB at residential receptors from frequent events (i.e., 70 or more per day). <u>Indoor ground borne vibration impact criteria are included in **Table 3.16-7**</u>.

Table 3.16-6. Construction Vibration Damage Criteria

Building Category/Structural Category	Peak Particle Velocity, in/sec
I. Reinforced concrete, steel or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment. 2018.

Table 3.16-7. Indoor Ground-Borne Vibration Impact Criteria for General Vibration Assessment

Land Use Category	Ground-Borne Vibration Impact Levels (VdB re 1 µin/sec rms)		
	Frequent Events[1]	Occasional Events[2]	Infrequent Events[3]
Category 1: Buildings where vibration would interfere with interior operations	65 VdB[4]	65 VdB[4]	65 VdB[4]
Category 2: Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB
Category 3: Institutional land uses with primarily daytime use	75 VdB	78 VdB	83 VdB

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment. 2018.

Notes:
[1] More than 70 events per day
[2] 30-70 events per day
[3] Fewer than 30 events per day
[4] From FTA, 2018: "This criterion limit is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes. For equipment that is more sensitive, a Detailed Vibration Analysis must be performed."

3.16.2.2 State Laws, Regulations, and Policies

California Department of Transportation Vibration Guidelines

The Caltrans *Transportation and Construction Vibration Guidance Manual* contains guidance on air overpressure and ground vibration from blasting (Caltrans 2020). The relevant section on criteria for air overpressure and ground vibration does not provide any requirements for Caltrans projects but does include a discussion of their effects on people and structures, and a summary of limits provided by the U.S. Bureau of Mines (USBM) and the Office of Surface Mining and Reclamation Enforcement.

The manual outlines the USBM conclusions of USBM RI 8507 "Structure Response and Damage Produced by Ground Vibration from Surface Mine Blasting", including the following:

- The potential for damage to residential structures is greater with low-frequency blast vibration (below 40 Hz) than with high frequency blast vibration (40 Hz and above).
- The type of residential construction is a factor in the vibration amplitude required to cause damage.
- For low-frequency blast vibration, a limit of 0.75 in/sec for modern drywall construction and 0.50 in/sec for older plaster-on-lath construction was proposed. For frequencies above 40 Hz, a limit of 2.0 in/sec for all types of construction was proposed.

~~Regarding air overpressure,~~ According to the manual, since most modern seismographs with air overpressure recording capability have a frequency response from 2-250 Hz ~~Hertz (Hz), and a~~ the limit of 133 dB is appropriate (Caltrans 2020).

3.16.2.3 Regional and Local Laws, Regulations, and Policies

Santa Clara County Municipal Code Noise Ordinance

The Santa Clara County Noise Ordinance (2017) is included in Chapter VIII, Control of Noise and Vibration, in the County Code of Ordinances. The intent of the ordinance is to control unnecessary, excessive, and annoying noise and vibration, and to prohibit the noise and vibration generated from or by all sources. The ordinance includes exterior and interior noise limits, prohibits specified noise-generating activities, establishes motor vehicle noise limits, and outlines special provisions, including exemptions for construction activities and demolition activities. The County also intends to maintain quiet in those areas that exhibit low noise levels and to implement programs aimed at reducing noise in those areas where noise levels are above acceptable values.

Section B11-154(b)(6) of the Santa Clara County Code prohibits the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between weekdays and Saturday hours of 7:00 p.m. and 7:00 a.m., or at any time on Sundays or holidays, that would generate a noise disturbance across a residential or commercial real property line. Where technically and economically feasible, construction activities must be conducted in a manner such that the maximum noise levels at affected properties will not exceed the following levels:

- Maximum noise level for stationary construction equipment noise affecting single-family residences is 60 dBA on weekdays and Saturdays from 7:00 a.m. to 7:00 p.m., and 50 dBA at all other times.
- Maximum noise level for stationary construction equipment noise affecting multi-family residences is 65 dBA on weekdays and Saturdays from 7:00 a.m. to 7:00 p.m., and 55 dBA at all other times.
- Maximum noise level for stationary construction equipment noise affecting commercial areas is 70 dBA on weekdays and Saturdays from 7:00 a.m. to 7:00 p.m., and 65 dBA at all other times.

Regarding groundborne vibration, Section B11-154(b)(7) of the Santa Clara County Code prohibits operating or permitting the operation of any device that creates a vibrating or quivering effect that endangers or injures the safety or health of human beings or animals, annoys or disturbs a person of normal sensitivities, or endangers or injures personal or real properties.

Santa Clara County General Plan Safety and Noise Element

The Santa Clara County General Plan Safety and Noise Element (2015) contains the following policies relevant to noise and vibration (see Section 3.3.2, *County of Santa Clara General Plan*, and Table 6 of Appendix M for a summary of goals and policies):

Policy C-HS 24: Environments for all residents of Santa Clara County free from noises that jeopardize their health and well-being should be provided through measures which promote noise and land use compatibility.

Policy C-HS 25: Noise impacts from public and private projects should be mitigated.

Policy C-HS(i) 23: Project design review should assess noise impacts on surrounding land uses. (Implementors: County and cities)

Policy C-HS(i) 24: Where necessary, construct sound walls or other noise mitigations. (Implementors: County, cities, and public agencies.)

Policy C-HS(i) 25: Prohibit construction in areas which exceed applicable interior and exterior standards, unless suitable mitigation measures can be implemented. (Implementors: County and cities)

Policy C-HS(i) 26: Require project-specific noise studies to assess actual and protected dB noise contours for proposed land uses likely to generate significant noise. (Implementors: County and cities)

City of San José Municipal Code

Section 20.100.450 of the San José Municipal Code (2023a) contains the City's restrictions on hours for construction, including the following:

> Unless otherwise expressly allowed in a Development Permit or other planning approval, no applicant or agent of an applicant shall suffer or allow any construction activity on a site located within 500 feet of a residential unit before 7:00 am or after 7:00 pm, Monday through Friday, or at any time on weekends.

Section 20.75.400 states that there shall be no activity on any site that causes vibration that is perceptible without instruments at the receiving property line of the site. See Section 3.3.3, *City of San Jose Municipal Code*, of Appendix M for more information.

Envision San José 2040 General Plan (2023b)

Policy EC-1.2: Minimize the noise impacts of new development on land uses sensitive to increased noise levels (Categories 1, 2, 3 and 6) by limiting noise generation and by requiring use of noise attenuation measures such as acoustical enclosures and sound barriers, where feasible. The City considers significant noise impacts to occur if a project would:

- Cause the DNL at noise sensitive receptors to increase by five dBA DNL or more where the noise levels would remain "Normally Acceptable" [below 60 dBA DNL for residential land uses]; or
- Cause the DNL at noise sensitive receptors to increase by three dBA DNL or more where noise levels would equal or exceed the "Normally Acceptable" level [60 dBA DNL or greater].

Policy EC-1.3: Mitigate noise generation of new nonresidential land uses to 55 dBA DNL at the property line when located adjacent to existing or planned noise sensitive residential and public/quasi-public land uses.

Policy EC-1.9: Regulate the effects of operational noise from existing and new industrial and commercial development on adjacent uses through noise standards in the City's Municipal Code.

Policy EC-1.7: Require construction operations within San José to use best available noise suppression devices and techniques and limit construction hours near residential uses per the City's Municipal Code. The City considers significant construction noise impacts to occur if a project located within 500 feet of residential uses or 200 feet of commercial or office uses would:

- Involve substantial noise generating activities (such as building demolition, grading, excavation, pile driving, use of impact equipment, or building framing) continuing for more than 12 months.

For such large or complex projects, a construction noise logistics plan that specifies hours of construction, noise and vibration minimization measures, posting or notification of construction schedules, and designation of a noise disturbance coordinator are required prior to the start of construction, and implemented during construction to reduce noise impacts on neighboring residents and other uses.

Policy EC-2.3: Require new development to minimize continuous vibration impacts to adjacent uses during demolition and construction. For sensitive historic structures, including ruins and ancient monuments or buildings that are documented to be structurally weakened, a continuous vibration limit of 0.08 in/sec PPV (peak particle velocity) will be used to minimize the potential for cosmetic damage to a building. A continuous vibration limit of 0.20 in/sec PPV will be used to minimize the potential for cosmetic damage at buildings of normal conventional construction. Equipment or activities typical of generating continuous vibration include but are not limited to: excavation equipment; static compaction equipment; vibratory pile drivers; pile-extraction equipment; and vibratory compaction equipment. Avoid use of impact pile drivers within 125 feet of any buildings, and within 300 feet of historical buildings, or buildings in poor condition. On a project-specific basis, this distance of 300 feet may be reduced where warranted by a technical study by a qualified professional that verifies that there will be virtually no risk of cosmetic damage to sensitive buildings from the new development during demolition and construction. Transient vibration impacts may exceed a vibration limit of 0.08 in/sec PPV only when and where warranted by a technical study by a qualified professional that verifies that there will be virtually no risk of cosmetic damage to sensitive buildings from the new development during demolition and construction. See Section 3.3.4, *City of Morgan Hill Code of Ordinances,* of Appendix M for more information.

City of Morgan Hill Noise Ordinance

Chapter 8.28 of the Morgan Hill Code of Ordinances contains the City's noise ordinance. The noise ordinance provides regulations related to construction noise. Section 8.28.040 states that construction activities are prohibited other than between the hours of 7:00 a.m. and 8:00 p.m., Monday through Friday, and, between the hours of 9:00 a.m. and 6:00 p.m. on Saturday, unless public works projects, the chief building official, or the city council, allow hours to be worked outside of these time periods. Construction activities may not occur on Sundays or federal holidays. Section 18.76.090.B exempts temporary construction, demolition, and vehicles that enter and leave a site (e.g., construction equipment, trucks) from the noise standards in the noise ordinance (e.g., 60 dBA for public/quasi-public uses).

Section 18.76.130 prohibits vibration that is perceptible without instruments at the lot line, but, exempts temporary construction, demolition, and vehicles that enter and leave a lot (e.g., construction equipment, trucks). See Section 3.3.5*, City of Morgan Hill Code of Ordinances,* and Table 8 of Appendix M for more information.

City of Morgan Hill General Plan Safety, Services, and Infrastructure Element

The City of Morgan Hill General Plan (2017 ~~2016~~) Safety, Services, and Infrastructure Element contains the following goals and policies relevant to noise:

> **Policy SSI-8.2: Impact Evaluation.** The impact of a proposed development project on existing land uses should be evaluated in terms of the potential for adverse community response based on significant increase in existing noise levels, regardless of compatibility guidelines.

> **Policy SSI-8.5: Traffic Noise Level Standards.** Consider noise level increases resulting from traffic associated with new projects significant if: a) the noise level increase is 5 dBA L_{dn} or greater, with a future noise level of less than 60 dBA L_{dn}, or b) the noise level increase is 3 dBA L_{dn} or greater, with a future noise level of 60 dBA L_{dn} or greater.

> **Policy SSI-8.6: Stationary Noise Level Standards.** Consider noise levels produced by stationary noise sources associated with new projects significant if they substantially exceed existing ambient noise levels. See Section 3.3.6, *City of Morgan Hill General Plan*, of Appendix M for more information.

3.16.3 Methodology and Approach to Impact Analysis

This impact analysis considers whether implementation of the Project would result in significant impacts related to noise and vibration. This section includes an evaluation of the noise and vibration impacts generated by construction and operation of the Project. The analysis evaluates noise and vibration impacts that would occur as a result of the following activities:

- Seismic Retrofit Construction
- Conservation Measure Construction
- Construction Monitoring
- Post-Construction Anderson Dam Facilities Operations and Maintenance
- Post-Construction Conservation Measures Operations and Maintenance
- Post-Construction Project and FAHCE Adaptive Management

3.16.3.1 Seismic Retrofit Construction

As described in Section 3.0, *Introduction*, the baseline for evaluating Seismic Retrofit construction effects is the existing conditions at the time of EIR preparation modified by FOCP implementation (referred to as the existing conditions baseline).

Existing baseline operations for the Project reflect a seismically restricted capacity (e.g., maintenance of the reservoir at deadpool and 3 percent capacity), and flow releases and maintenance activities projected to occur following completion of the FOCP, presently under construction. Similarly, the construction baseline assumes completion of facility upgrades and physical changes associated with the FOCP.

Noise

Onsite Noise

During construction, onsite noise sources would consist of construction equipment within the Project Area. The Anderson Dam Seismic Retrofit Project (Project) Noise and Vibration Technical Memorandum ~~Impact Assessment (Ramboll 2023)~~ (Appendix M), which supports the noise and vibration assessment in this section, utilized the Computer Aided Noise Abatement (CadnaA) software to estimate noise levels due to construction at the nearest sensitive receptors to the Project Area (Datakustik 2024 ~~2022~~). The CadnaA environmental noise prediction software enables noise modeling of complex facilities using sound propagation factors as adopted by the International Organization for Standardization (i.e., ISO 9613, ISO 17534). CadnaA considers distance, topography, intervening structures, atmospheric attenuation, ground effects, and vegetation when estimating sound levels from specific sources at distant receptor locations. The model was used in lieu of simple calculations due to the area's varied topography, and the effect that the topography may have on construction noise propagation at nearby noise-sensitive receptors. In addition to topography, the model allows for consideration of other factors that may influence the propagation of sound such as ground surface type (i.e., acoustically hard or soft surfaces), intervening structures and acoustic reflection from structures, meteorology, and dense vegetation. The model predicts sound levels at identified noise-sensitive residential uses.

Noise levels due to construction of the Project were estimated based upon available reference noise level data for construction equipment published by the Federal Highway Administration (FHWA), the FTA, and manufacturers. Where sound data was not available, sound levels were estimated based on horsepower ratings. The reference construction equipment sound levels are shown in **Table 3.16-8 ~~Table 3.16-7.~~**

Table 3.16-8 ~~3.16-7~~ Reference Construction Equipment Noise Levels

Key: L_{ASmax} = A-weighted, slow response, maximum, sound level.

Noise levels generated from construction activities would vary depending on the type of equipment in use, how many pieces of equipment are operating at any one time, the proximity of equipment to a noise receptor location (i.e., mobile equipment can be moved around a construction site), and the duration of equipment use. In addition, some equipment or activities, such as pile driving and jackhammering, generate "impulsive" noise levels (i.e., impact noise).

For the purposes of modeling noise from construction equipment and activities, representative noise sources (i.e., construction equipment) were placed at representative geographic locations within each construction area. Equipment and activity locations were estimated based on the construction phasing plan and the *Project Description* (see Section 2.5.1).

Construction activities would occur intermittently at the Project Area over the 7-year construction period of the Seismic Retrofit component. Construction activities could expose sensitive receptors to temporary or extended durational increases in noise and vibration. Construction would result in temporary increases in truck traffic noise along routes for hauling of material from borrow and stockpile areas, as well as along offsite roadways.

Each phase of construction was evaluated separately to identify the potential for noise impacts from each phase with consideration of the factors identified above, specific to each geographic area. Overlapping construction activities were evaluated when activities would overlap during the same time in the same vicinity. **Table 3.16-9** ~~**Table 3.16-8**~~ provides a brief summary of the Seismic Retrofit component construction phases, equipment and activities identified in each phase, duration of each phase, and the noise-sensitive receptor areas potentially affected by each construction phase. A more detailed summary of this information can be found in Appendix M.

Table 3.16-9 ~~3.16-8~~. Noise Assessment by Seismic Retrofit Construction Phase

Construction Phase	Activities	Duration (months)	Noise-Sensitive Receptor Areas Potentially Affected
Year 1	Construction of haul roads and preparation stockpile areas; dredging at dam toe; begin tunneling for the LLOW	9	Residences near Staging Areas 1-6 ~~4~~ and Stockpile Area E, juvenile detention center, Holiday Lake Estates residences near Stockpile Area K, residences along truck routes
Year 2 (Stage 1a)	Construction of cofferdam, bypass pump system; excavation of upstream and downstream portals; tunnel excavation	12	Residences near Staging Areas 1, 4, Stockpile Area E, and excavation area; juvenile detention center; Holiday Lake Estates residences near Stockpile Area K; residences along truck routes
Year 3 (Stage 1b)	Excavation, demolish spillway, excavation and foundation preparation; HLOW tunnel excavation and lining; gate shaft excavation and lining	12	Residences near Staging Areas 1-4 and excavation area, juvenile detention center, Holiday Lake Estates residences near Stockpile Area K, residences along truck routes
Year 4	Hauling filler and drain material to site; excavation, fill, and foundation preparation; construction of spillway structure; installation of water treatment system	12	Residences near Staging Areas 1-4 and excavation area, juvenile detention center, Holiday Lake Estates residences near Stockpile Area K, residences along truck routes
Year 5 (Stage 3a)	Hauling filler and drain material to site; excavation; fill; excavation, blasting, and hauling of material; construction of spillway structure; sloping intake structure; excavate downstream portal trench; water treatment system	12	Residences near Staging Areas 1, 4; juvenile detention center; residences along Barnard Rd; western end of Holiday Lake estates; residences along truck routes

Construction Phase	Activities	Duration (months)	Noise-Sensitive Receptor Areas Potentially Affected
Year 6 (Stage 3b)	Hauling filler and drain material to site; excavation; construct bypass pump system; conveying bypass flows; fill; excavation, blasting, and hauling of material; excavate sloping intake structure; construct pipe supports and lining	12	Residences near Staging Areas 1, 4, and Stockpile Area E, juvenile detention center, residences along Barnard Rd residences near Stockpile Area K, western end of Holiday Lake estates, residences along truck routes
Year 7	Construction of concrete lined channel; restoring parking areas; construction of permanent access roads	10	Residences near Staging Areas 1-4 and excavation area, residences along truck routes

Key: HLOW = high-level outlet works

Construction activities would be conducted during a 10-hour shift per day, between 6:00 a.m. and 4:00 p.m., Monday through Saturday, with limited Sunday work. Sunday work would include up to 12 Sundays in Years 1 through 3, up to 40 Sundays in Year 4, and up to 12 Sundays in Years 5 through 7. Nighttime construction work could occur during excavation and fill of the dam, tunneling for outlet works, paving activities on Cochrane Road, construction of the spillway and conversion of the existing Stage 1 Diversion System into Stage 2 Diversion System, and support production. The nighttime work could occur during all seven years of construction. Specific Project components that would require modified construction hours include:

- Excavation of the existing dam and construction of the replacement dam and spillway, and conversion of existing Stage 1 Diversion System into Stage 2 Diversion System—two 10-hour shifts, with a 0.5-hour lunch break (one shift between 6:00 a.m. and 4:30 p.m., and the second shift from 6:00 p.m. to 4:30 a.m., Monday through Saturday and certain Sundays).
- Blasting at BHBA—restricted hours of 8:00 a.m. to 5:00 p.m.
- Cochrane Road—communication lines and repaving construction may occur outside the work window of 6:00 am and 4:00 pm, including weekends on a limited basis up to 24-hours a day, 6 days per week ~~24-hours per day, including weekends, on a limited basis for several consecutive days as needed to avoid traffic and transportation conflicts~~.
- Delivery of materials (e.g., equipment, aggregate base, and drainage and filter material) —7:00 a.m. to 8:00 p.m., Monday to Friday.
- Tunneling (e.g., use of a road header) required for the outlet works (e.g., construction of the HLOW and LLOW at the dam)—24 hours per day ~~(two 12-hour shifts)~~, 6 days per week.
- Support production (e.g., concrete placement ~~and formwork for the spillway walls, outlet works, and other concrete structures~~)—24 hours per day ~~(two 12-hour shifts)~~, 6 days per week.

Offsite Noise

During construction, offsite noise sources consist of daily truck deliveries of rocks, aggregate, and soil to the Project Area, shuttle bus trips for workers between Staging Area 5 and Staging Area 4, and worker vehicle trips to and from staging areas. Noise sensitive receptors consist of residences near the road segments being used. Delivery of materials to the Project Area is assumed to be limited to the hours of 7:00 a.m. to 8:00 p.m., Monday to Friday.

An approximately 0.8-miles section of Cochrane Road between Malaguerra Avenue and Coyote Road would be fully or partially closed to through traffic during construction. Vehicles would be routed through a detour along Peet Road, Half Road, Elm Road, and East Main Road.

Predicted Seismic Retrofit Component-related vehicle counts were compared to 2015 traffic data for Morgan Hill (City of Morgan Hill 2015). Changes in traffic along US 101 from Seismic Retrofit Component-related traffic were assumed to be negligible. The estimated sound levels for Years 1, 3, and 6 were chosen as Year 1 represents typical daytime truck activity, Year 3 represents greatest nighttime worker activity (worker vehicle and shuttle bus trips), and Year 6 represents greatest daytime and nighttime truck activity.

The estimated noise levels include the following assumptions:

2015 Traffic Data

- 90 percent of traffic occurs during the day (7:00 a.m. to 10:00 p.m.)
- 10 percent of traffic occurs at night (10:00 p.m. to 7:00 a.m.)
- 2015 traffic did not include any trucks, buses, or motorcycles

Project Traffic

- 100 percent of delivery truck traffic occurs during the day (7:00 a.m. to 8:00 p.m.).
- The daily maximum estimates were used for analysis

These assumptions are generally conservative since the areas between US 101 and the Project Area have seen significant development since 2015, which means that ambient traffic noise levels were lower in 2015, in general, providing a more conservative baseline for assessing Project impacts.

Vibration

Construction vibration levels that could occur due to Seismic Retrofit Component construction are based on reference vibration levels published by the FTA. Groundborne vibration attenuation rates were applied to reference vibration levels from construction equipment to predict the levels of construction vibration at the nearest vibration-sensitive receptors. Construction vibration to receptors more than 500 feet from the edge of the construction sites were not considered. Groundborne vibration and groundborne noise dissipate rapidly over distance and would be minimal at distances greater than 500 feet (FTA 2018). Vibration levels for typical construction equipment are shown in **Table 3.16-10 ~~3.16-9~~**.

Table 3.16-10 ~~3.16-9~~. Example Vibration Source Levels for Construction Equipment

Equipment		PPV_{ref} at 25 feet (in/sec)	Approximate Lv* at 25 feet
Pile Driver (impact)	Upper range	1.518	112
	Typical	0.644	104
Pile Driver (sonic)	Upper range	0.734	105
	Typical	0.17	93
Clam shovel drop (slurry wall)		0.202	94
Hydromill (slurry wall)	In soil	0.008	66
	In rock	0.017	75
Vibratory Roller		0.210	94
Hoe Ram		0.089	87
Large Bulldozer		0.089	87
Caisson Drilling		0.089	87
Loaded Trucks		0.076	86
Jackhammer		0.035	79
Small Bulldozer		0.003	58

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment, September 2018.
** RMS velocity in decibels, VdB re 1 micro-in/sec.*

Blasting

Air overpressure and vibration from blasting at the residential receptor nearest to the BHBA was evaluated using methods found in the International Society of Explosives Engineers (ISEE) *Blasters' Handbook*, 18th Edition (ISEE 2011). The significance thresholds for blasting identified in *Specific Thresholds of Significance* were used as limits to calculate the maximum allowable charge per delay.

3.16.3.2 Conservation Measures Construction

As described in Section 3.0, *Introduction*, the baseline for evaluating Conservation Measure construction effects is the existing conditions at the time of EIR preparation modified by FOCP implementation (i.e., existing conditions baseline). Conservation Measures involving construction activities with a potential to substantially ~~adversely~~ affect noise and vibration that were modeled and are evaluated in the impact analysis include:

- Ogier Ponds CM
- ~~North Channel Extension~~
- ~~Maintenance Activities at the Live Oak Restoration Reach~~

- Sediment Augmentation Program[3]
- Phase 2 Coyote Percolation Dam CM

The noise and vibration impacts from the construction of the Conservation Measure components were analyzed using the same methodologies as the Seismic Retrofit construction. Conservation Measures construction activities would generally be conducted during a 12-hour ~~10-hour~~ shift per day, between ~~6:00 a.m.~~ 7:00 a.m. and ~~6:00 p.m.~~ 5:00 p.m., Monday through Friday. Equipment maintenance would occur on Saturdays, and no work would occur on Sundays. Select construction activities such as the operation of pumps and electric generators to control groundwater seepage may operate at any time on any day of the week.

Maintenance of the North Channel Reach and Live Oak Restoration Reach would be downstream of the existing Anderson Dam outlet structure and would primarily involve minor and intermittent maintenance activities including vegetation management, replacement plantings, and gravel placement. The work would coincide with Seismic Retrofit construction and would be significantly smaller in scale. As a result, the noise and vibration analysis for Seismic Retrofit construction would also apply to the North Channel Reach and Live Oak Restoration Reach. Therefore, no additional noise or vibration analysis has been conducted specific to the North Channel Reach or Live Oak Restoration Reach.

3.16.3.3 Construction Monitoring

Construction Monitoring activities are not included in the impact analysis, as monitoring would involve data and information collection and assessment and would not result in any substantial amount of noise. Thus, construction monitoring is not discussed further in this section.

3.16.3.4 Post-Construction Anderson Dam Facilities Operations and Maintenance

Operation of the Anderson Dam following construction of the Project would involve implementation of the FAHCE rule curves and pulse flows, which would not result in generation of additional noise or vibration sources compared to the existing conditions baseline. Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain the newly retrofitted Anderson Dam and Reservoir per Valley Water's existing DMP. Maintenance of Anderson Dam facilities was previously evaluated in the Final DMP EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). Operational stationary noise sources such as an emergency backup generator proposed at the Diversion Control Structure and air release valves at the LLOW Control Structure and gate shaft are compared to the noise environment under baseline conditions.

[3] Noise and vibration impacts were only quantified for the initial placement of gravel, assumed to occur in Year 8. While noise and vibration impacts associated with future gravel augmentation are assumed to be minor, their scale, timing, and duration are speculative and were not quantified.

3.16.3.5 Post-Construction Conservation Measures Operations and Maintenance

Similar to the operation of the Anderson Dam, post-construction operations and maintenance of the conservation measures including Ogier Pond CM and Phase 2 Coyote Percolation Dam CM operations and maintenance, North Channel Reach ~~Extension~~ and Live Oak Restoration Reach maintenance, and the Sediment Augmentation Program maintenance would involve minimal activities requiring noise and vibration generation. Conservation measure maintenance activities would be limited to minor access road repairs, vegetation and sediment management, placement of small amounts (less than 500 cy) of gravel, trash removal, and inspections, all of which would generate minimal noise and vibration. Similar to the post-construction Anderson Dam Facilities maintenance activities, the Phase 2 Coyote Percolation Dam CM facilities would be maintained per Valley Water's existing DMP. Maintenance of Coyote Percolation Dam facilities were previously evaluated in the Final DMP EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). No new long-term operational sources generating noise or vibration would be added by the conservation measures. Therefore, operations and maintenance of conservation measures would not result in significant impacts to noise or vibration, and these impacts are not discussed further in this section.

3.16.3.6 Post-Construction Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of Project ~~project~~ flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). Impacts of these monitoring activities are not evaluated in the impact analysis because they would result in only minor noise and vibration generating activities.

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from original Conservation Measure construction. Impacts of these adaptive actions are not evaluated in the impact analysis because they would result in only minor noise and vibration generating activities.

3.16.3.7 Applicable Best Management Practices and VHP Conditions

No BMPs or VHP conditions are applicable to noise and vibration.

3.16.3.8 Thresholds of Significance

Significance Criteria

For the purposes of this EIR and pursuant to Appendix G of the *CEQA Guidelines*, the Project would result in a significant impact related to noise or vibration if it would lead to:

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, or generate a substantial incremental increase in noise levels

b) Generation of excessive ground-borne vibration or ground-borne noise levels

c) for a project located within the vicinity of a private airstrip or an airport land use plan or where such a plan has not been adopted within two miles of a public airport or public use airport, exposure of people residing or working in the project area to excessive noise levels

The Project is not located within an airport land use plan and there are no public airports or public use airports within 2 miles of the Project. Additionally, there are no private airstrips within the Project vicinity. The nearest public or public use airport is the San Martin Airport, approximately five miles south of the Project Area. There would be no impact related to criterion c, which is not considered further in the EIR analysis.

Specific Thresholds of Significance

This EIR applies the following noise and vibration thresholds. Some of these thresholds are based on standards in local government noise ordinances since they represent noise levels acceptable to the local community, consistent with *CEQA Guidelines* Appendix G (Question XIII[a]). However, Valley Water is exempt from compliance with the local noise ordinances under either Government Code Secs. 53091(d) or (e) (which state that county or city building and zoning ordinances do not apply to the construction of facilities for water storage or transmission), or for non-building and zoning ordinances, under *Hall v. Taft* (1956) 47 Cal. 2d 177,189 (which holds that water districts are exempt from municipal police power regulation).

Noise

<u>Construction</u>

Development facilitated by the Project could have a significant impact to noise-sensitive receptors in San José and Morgan Hill if temporary construction noise exposed noise-sensitive receivers to significantly adverse noise levels. As neither the City of San José nor the City of Morgan Hill have quantified construction noise limits, for purposes of analyzing impacts from the Project at noise-sensitive receptors located in San José and Morgan Hill, Valley Water has determined that the FTA construction noise criteria are appropriate. The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction in its *Transit and Noise Vibration Impact Assessment Manual*. For residential uses in San José and Morgan Hill, the daytime noise threshold is 80 dBA $L_{eq(8hr)}$ for an 8-hour period. To assess potential nighttime construction noise impacts, recommendations from the USEPA's *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Safety Margin of Safety* is used. Based on available sleep criteria data, an interior nighttime level of 35 dBA is considered acceptable (USEPA 1974). Assuming a 15-dBA reduction with a windows-open condition, an exterior noise level of 50 dBA L_{eq} would be required to maintain an acceptable interior noise environment of 35 dBA. For residential uses in San José and Morgan Hill, the nighttime construction noise threshold is 50 dBA L_{eq}.

For noise-sensitive receptors located in unincorporated Santa Clara County, construction noise impacts would be significant if maximum noise levels from stationary construction equipment noise exceed 60 dBA on weekdays and Saturdays from 7:00 a.m. to 7:00 p.m., and 50 dBA at all other times at single-family residences or if maximum noise levels from stationary construction equipment noise exceed 65 dBA on weekdays and Saturdays from 7:00 a.m. to 7:00 p.m., and 55 dBA at all other times at multi-family residences.

In addition, this EIR uses a threshold of 10 dBA DNL increase above ambient noise levels to assess temporary construction noise impacts at residential receptors.

Finally, per Caltrans recommendations, air overpressure from blasting resulting in noise would be significant if it exceeds 133 dB at a sensitive receptor building (Caltrans 2020).

Operation

Operational stationary source noise is addressed qualitatively since most equipment under the Project would replace equipment existing under baseline conditions. Noise generated by intermittent release of water at the gate shaft during emergency conditions would be located away from nearby sensitive receptors and is addressed qualitatively.

Roadway Vehicle Noise

Construction and Operation

Construction and operational roadway vehicle noise impacts were analyzed using the Envision San José 2040 General Plan (2011) noise standards and the City of Morgan Hill 2035 General Plan (2017 ~~2016~~) noise standards. Roadway vehicle noise impacts would be significant where such noise causes an increase of 5 dBA DNL where ambient noise levels are below 60 dBA DNL or causes an increase of 3 dBA DNL where ambient noise levels are 60 dBA DNL or greater. It should be noted that while the applicability of these traffic noise thresholds may be intended for assessing permanent traffic noise increase impacts, this EIR conservatively applies these thresholds to Project construction traffic noise as well. In lieu of quantified roadway vehicle noise thresholds in the county, the same noise thresholds are applied to sensitive receptors in unincorporated Santa Clara County.

Vibration

Construction and Operation

Criteria from the FTA are used to evaluate potential construction vibration impacts related to potential building damage and indoor human annoyance impacts from construction.

Construction vibration impacts of the project would be significant if vibration levels exceed the FTA criteria for building damage (see **Table 3.16-6** ~~**3.16-32**~~). Construction vibration impacts of the project would be significant if vibration levels exceed the FTA criterion for indoor human annoyance of 72 VdB at sensitive receptors (FTA 2018, see **Table 3.16-7**).

In addition, potential damage to structures from blasting would be significant if vibration levels exceed 0.1884 in/sec PPV at 1 Hz, 0.5 in/sec PPV at 3 Hz to 40 Hz, and 2.0 in/sec PPV at 40 Hz and above (Caltrans 2020).

3.16.4 Impact Analysis

Impact NOI-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, or generation of substantial incremental increase in noise levels **(Significant and Unavoidable)**

Construction

Seismic Retrofit Construction

Onsite Construction Noise

To assess onsite construction noise levels, the activity or activities with the highest total sound levels (sound levels of all equipment for that activity) for each year were selected to represent the maximum noise impact for each year of construction. For similar activities across multiple years (e.g., dam excavation and fill activities from Year 2 through Year 6), the year with the loudest activity was selected. For example, Year 4 and Year 5 are not explicitly called out in the construction noise level tables (**Table 3.16-11** ~~**3.16-10**~~ through **Table 3.16-15** ~~**3.16-14**~~), as noise levels in those years are substantially similar to the noise levels in Year 6 given the similar construction activities. The following construction phases were assessed for Seismic Retrofit construction:

- Year 1, Construction of Haul Roads and Preparation of Stockpile Areas, Begin Tunneling of LLOW
- Year 2, Excavation of Downstream Portal
- Year 3, Excavation and Foundation Preparation of Spillway, Construction of Tie-Back Wall at Cochrane Road
- Year 6, Dam Excavation and Fill
- Year 7, Restoration of Parking Areas and Construction of Permanent Access Roads

Seismic Retrofit construction noise levels are summarized in **Table 3.16-11** ~~**3.16-10**~~ through **Table 3.16-15** ~~**3.16-14**~~ at the closest noise sensitive receptors. Refer to **Figure 3.16-4** for the locations of sensitive receptors near the Seismic Retrofit construction. Two receptors (R-33 and R-34) have been added to represent receptors at Rosendin Park for informational purposes. Because R-33 and R-34 do not represent residences or commercial receptors, significance thresholds have not been assigned.

As shown in **Table 3.16-11** ~~**3.16-10**~~ through **Table 3.16-15** ~~**3.16-14**~~, onsite construction noise levels (DNL) would exceed the 10 dBA increase above ambient threshold at Receptors R-2, R-4, R-5, and R-31 during Year 1; at Receptors R-2, R-4 through R-8, R-31, and R-32 during Year 2; at Receptors R-2 through R-9, R-31, and R-32 during Year 3; at Receptors R-2 through R-8, Receptors R-10 through R-12, R-31, and R-32 during Year 6; and Receptors R-2, R-4 through R-9 ~~R-8~~, R-31, and R-32 during Year 7.[4] Average construction noise levels (L_{eq}) would not exceed the FTA's construction noise daytime threshold of 80 dBA L_{eq}. Receptors R-8, R-9, R-31, and R-32 are located in unincorporated Santa Clara County and would be subject to Santa Clara County's weekday and Saturday daytime construction noise threshold of 60 dBA at residences. Onsite construction noise levels would exceed the Santa Clara County daytime construction noise threshold at Receptors R-8, R-31, and R-32 in Year 1, at Receptor R-8, R-31, and R-32 in Year 2, at Receptors R-8, R-9, R-31, and R-32 in Year 3, at Receptor R-8, R-31, and R-32 in Year 6, and at Receptor R-8, R-31, and R-32 in Year 7. Nighttime construction noise levels would exceed the residential nighttime construction noise threshold of 50 dBA L_{eq} at Receptors R-1 through R-9, R-31, and R-32 in Years 2, 3, and 7; and at each residential receptor in Year 6. Sunday work would exceed the Santa Clara County Sunday residential threshold of 50 dBA at Receptors R-8, R-9, R-31, and R-32 during Years 2, 3, 6, and 7. Therefore, onsite construction noise impacts from construction of the Seismic Retrofit components would be significant at nearby residences.

Recreational users at Anderson Lake County Park, the Rosendin Park Area, and the Live Oak Picnic Area would not be impacted during the times that these areas would be closed to users; however, recreators may be affected when the Rosendin Park Area is open outside of the initial blasting phase during Years 4, 5, or 6 of construction ~~as those areas would be closed to users during construction~~. Users of Rosendin Park would only be near the construction site for a relatively short time since there is no common outdoor use area, and hikers, for example, would not remain stationary. In addition, the County's construction noise limits apply only to residential and commercial properties. Because Rosendin Park is neither and users of the park would not be exposed to excessive construction noise for a substantial period, noise impacts on residential users would be a less-than-significant impact. ~~Therefore, onsite construction noise impacts from construction of the Seismic Retrofit components would be significant~~.

[4] While the modeled Overall with Project DNL values did not change, Receptors R-5, R-6, R-7, and R-9 were erroneously not included in this paragraph in the Partially Recirculated Draft EIR, and is updated here.

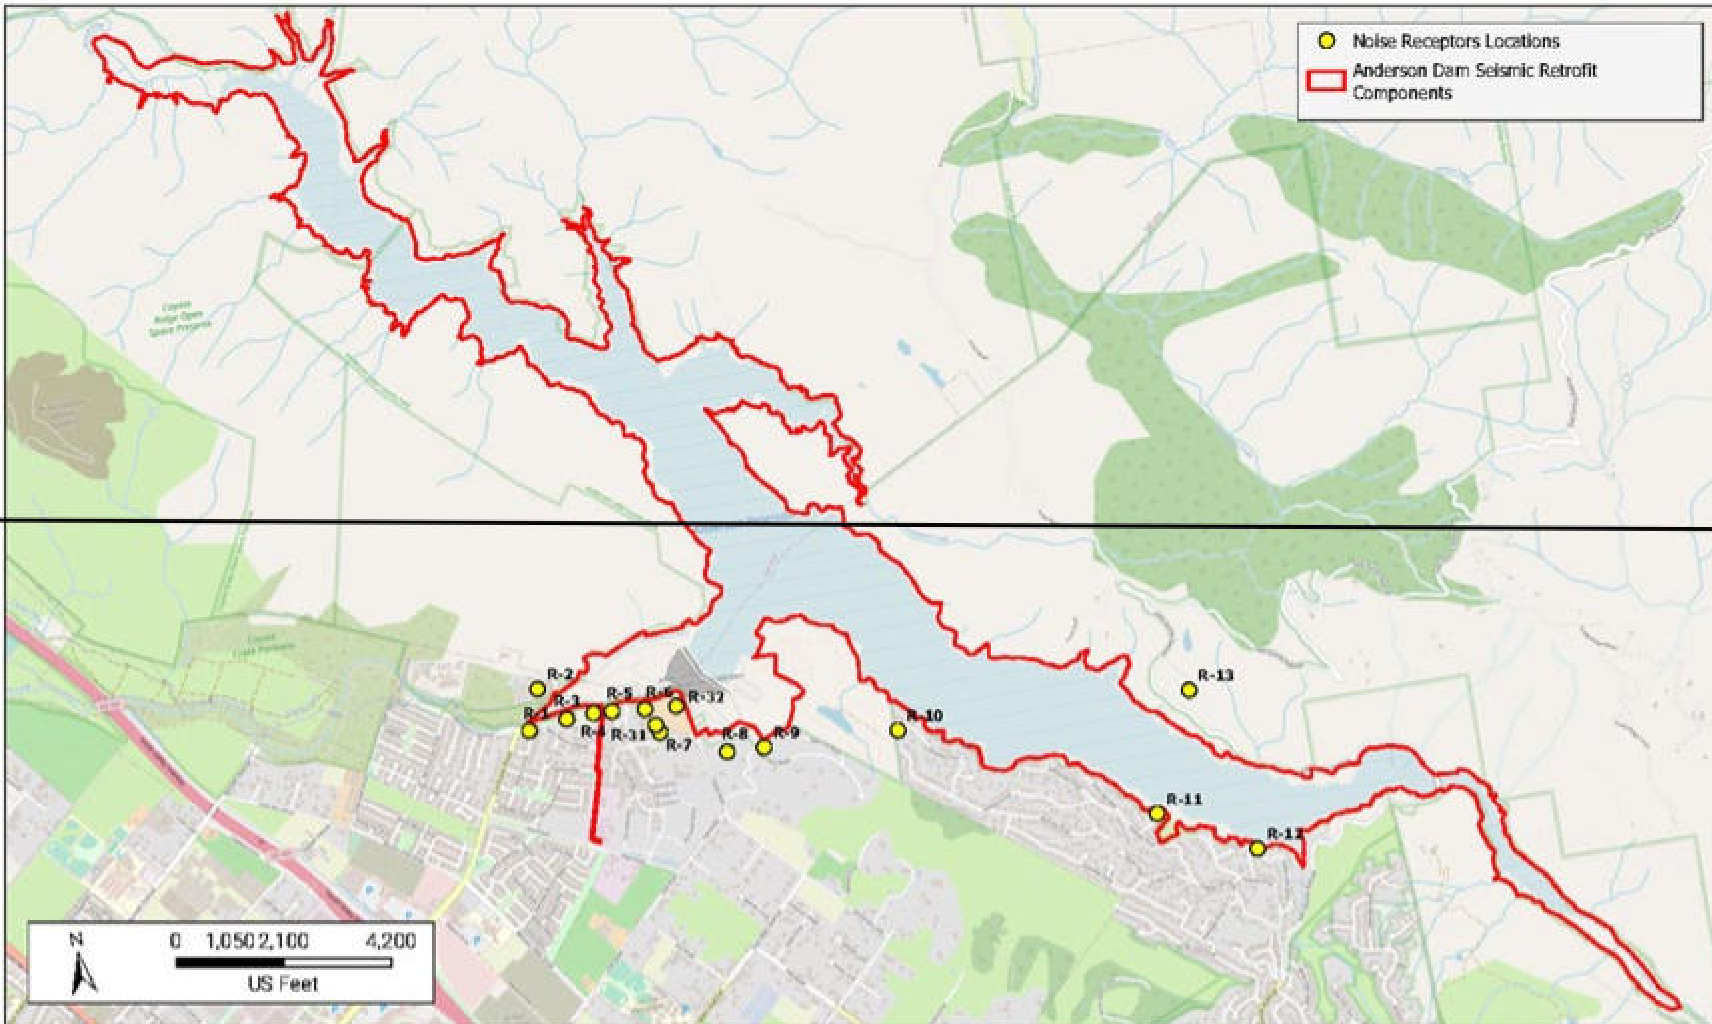
1



BLACK & VEATCH

Figure 3.16-4. Seismic Retrofit Construction Equipment Noise Receptor Locations – Anderson Dam Area

Anderson Dam Seismic Retrofit Project EIR (3400-06)
August 2024

<u>Offsite Construction Noise</u>

Offsite construction noise sources would consist of daily truck deliveries of rocks, aggregate, and soil to the Project Area, shuttle bus trips for workers between Staging Area 5 and Staging Area 4, and worker vehicle trips to and from staging areas. An approximately 0.8-miles section of Cochrane Road between Malaguerra Avenue and Coyote Road would be fully or partially closed to through traffic during construction. Vehicles would be routed through a detour along Peet Road, Half Road, Elm Road, and East Main Road. Noise-sensitive receptors consist of residences near these roadway segments. Delivery of materials to the Project Area is limited to the hours of 7:00 a.m. to 8:00 p.m.

The estimated offsite construction noise levels for Years 1, 3, and 6 are provided in **Table 3.16-16** **~~3.16-15~~** through **Table <u>3.16-18</u>** **~~3.16-17~~** These years were chosen as Year 1 represents typical daytime truck activity, Year 3 represents greatest nighttime worker activity (worker vehicle and shuttle bus trips), and Year 6 represents greatest daytime and nighttime truck activity. <u>A detailed description of the various truck routes for each phase of construction can be found in Chapter 2, *Project Description*.</u>

As shown in **Table <u>3.16-16</u>** **~~3.16-15~~**through **Table <u>3.16-18</u>** **~~3.16-17~~,** offsite construction noise levels would exceed the 5 dBA increase above ambient threshold along Route 1b and Route 3. Therefore, offsite construction noise levels would be significant.

<u>Overall Construction Noise</u>

Implementation of **Mitigation Measures NOI-1 and NOI-2** would reduce construction noise impacts. **Mitigation Measure NOI-1**, described below, will require Valley Water to implement a Construction Management Plan, which would require prior notice of construction activities to nearby sensitive receptors, proper maintenance of all construction equipment, equipping all construction equipment with mufflers and air intake silencers, locating staging and delivery areas as far from sensitive receptors as is feasible, enclosing stationary noise sources in temporary sheds, restricting the use of bells, whistles, alarms, and horns, and posting signs at construction area entrances to reinforce the prohibition of unnecessary idling. **Mitigation Measure NOI-2**, described below, is specific to Seismic Retrofit construction and would require the installation of a temporary noise barrier, limiting of construction activity at Staging Area 1 ~~and Stockpile Area E~~ within 300 feet of <u>nearby residences</u> ~~Receptor R-2 and residences across Cochrane Road~~, reducing the noise levels generated by track drill rigs to 86 dBA at 50 feet, posting a sign 10 days prior to the start of nighttime construction that details Project construction and provides a noise complaint phone number, and conducting construction noise monitoring during periods of nighttime construction work. **Mitigation Measure NOI-2** will also reduce offsite construction noise levels by reducing speeds along haul routes and routing truck traffic and worker vehicles along Route 1a instead of Route 1b.

Implementation of **Mitigation Measures NOI-1 and NOI-2** will reduce Seismic Retrofit construction noise levels by up to approximately 15 dBA (Bies, Hansen, and Howard 2018, Harris 1991). Therefore, **Mitigation Measures NOI-1 and NOI-2** will reduce nighttime construction noise to approximately 64 dBA L_{eq} or less. Seismic Retrofit construction noise could still exceed the nighttime construction noise threshold of 50 dBA L_{eq} even with implementation of **Mitigation Measures NOI-1 and NOI-2.** Therefore, Seismic Retrofit construction noise impacts will be significant and unavoidable.

Table 3.16-16 ~~3.16-15~~. Offsite Seismic Retrofit Construction Road Noise at 50 feet, Year 1

Route	Road Segment	Existing Traffic Noise Level (dBA DNL)	Overall with Project[1] Noise Level (dBA DNL)	Threshold of Significance (dBA DNL)[4]	Exceed Threshold?

Conservation Measures Construction

Ogier Ponds CM

Onsite Construction Noise

To assess onsite construction noise levels, several phases were selected based on total sound levels, number of pieces of equipment, and proximity to noise-sensitive receptors in order to represent phases of greatest activity. The following phases were assessed:

- Construction of the Haul Roads and Preparation of Stockpile Areas (Year 6 ~~1~~)
- Dewater Pond 1 (Year 6 ~~1~~)
- Pond 1 Fill Borrow Hill Excavation (Year 6 ~~1~~)
- Pond 1 Fill Import from Basalt Hill Excavation (Year 6 ~~1~~)
- Spillway (Year 8 ~~2~~)

Recreational users along Coyote Creek Trail would be exposed to Ogier Ponds CM construction noise. The Coyote Creek Trail is within the Ogier Ponds CM Project Area and trail users would be exposed to noise associated with most construction activities during the 3-year construction period~~, including material hauling across the trail~~. Users of the trail would only be near the construction site for a relatively short time since there are no common outdoor use areas, and they are not expected to remain stationary for extended periods of time. The impact to trail users would be less than significant.

Ogier Ponds CM onsite construction noise levels are summarized in **Table 3.16-19** ~~**3.16-18**~~ through **Table 3.16-23** ~~**3.16-22**~~ and sensitive receptors are included in **Figure 3.16-5**. As shown in **Table 3.16-19** ~~**3.16-18**~~ through **Table 3.16-23** ~~**3.16-22**~~, onsite construction noise levels (DNL) would not exceed the 10 dBA increase above ambient threshold ~~at Receptors R-18 through R-20 during the spillway construction phase. Construction noise levels during all other modeled construction phases would not exceed the 10 dBA increase above ambient threshold~~. Average construction noise levels (L_{eq}) at receptors not located in unincorporated Santa Clara County would not exceed the FTA's construction noise daytime threshold of 80 dBA L_{eq}. Nighttime construction would not occur during Ogier Ponds CM construction and, thus, the nighttime construction noise threshold of 50 dBA L_{eq} would not be exceeded. Receptors R-8, R-9, and R-20 are located in unincorporated Santa Clara County and would be subject to Santa Clara County's weekday and Saturday daytime construction noise threshold of 60 dBA. Onsite construction noise levels would exceed the applicable Santa Clara County construction noise threshold at Receptor R-8 ~~R-9~~ during the pond 1 fill borrow hill ~~import from Basalt Hill~~ excavation construction phase and at Receptor R-20 during the construction of haul roads and preparation of stockpile areas, dewatering of pond 1, pond 1 fill import from Basalt Hill excavation, and spillway construction phases. Therefore, onsite construction noise impacts from construction of the Ogier Ponds CM would be significant.

August 2023

Offsite Construction Noise

Offsite construction noise sources would consist of daily truck deliveries of rocks, aggregate, and soil to the Ogier Ponds CM Project Area from the BHBA, in addition to worker vehicles traveling to and from the Ogier Ponds CM Project Area.

The estimated offsite construction noise levels for Pond 1 Fill – Borrow Hill Excavation in Year 6, Pond 1 Fill Import – Basalt Hill Excavation in Year 6, and Import of materials from Holiday Lakes Estates Bench Excavation in Year 7 are provided in **Table 3.16-24 ~~3.16-23~~** through **Table 3.16-26 ~~3.16-25.~~** The other phases of Ogier Ponds CM construction would result in fewer than one truck delivery per hour on average, which would not result in an increase in offsite construction noise levels.

As shown in **Table 3.16-24 ~~3.16-23~~** through **Table 3.16-26 ~~3.16-25~~**, offsite construction noise levels would not exceed the 5 dBA increase above ambient threshold ~~along Cochrane Road between Staging Area 1 to Peet Road during Pond 1 Fill in Year 6~~. Therefore, offsite construction noise levels would be less than significant.

Overall Construction Noise

Implementation of **Mitigation Measures NOI-1 and NOI-3** would reduce construction noise impacts. **Mitigation Measure NOI-1,** described below, will require Valley Water to implement a Construction Management Plan, which would require prior notice of construction activities to nearby sensitive receptors, proper maintenance of all construction equipment, equipping all construction equipment with mufflers and air intake silencers, locating staging and delivery areas as far from sensitive receptors as is feasible, enclosing stationary noise sources in temporary sheds, restricting the use of bells, whistles, alarms, and horns, and posting signs at construction area entrances to reinforce the prohibition of unnecessary idling. **Mitigation Measure NOI-3**, described below, is specific to Ogier Ponds CM construction and will require the installation of a temporary noise barrier ~~and the reduction of truck and vehicle speeds along Cochrane Road~~.

Implementation of **Mitigation Measures NOI-1 and NOI-3** will reduce Ogier Ponds CM onsite construction noise levels by 15 dBA, which would result in construction noise levels below the applicable thresholds of significance. ~~However, offsite construction noise levels would still exceed the 5 dBA increase above ambient threshold~~. Therefore, Ogier Ponds CM construction noise impacts would be less than significant with mitigation ~~and unavoidable~~.

~~North Channel Extension~~

~~Work on the North Channel Extension would be downstream of the existing Anderson Dam outlet structure. Construction equipment used for the North Channel Extension would include a bulldozer, motor grader, excavator, loader, dump truck, water truck, pumps, and supporting vehicles. The work would coincide with Year 1 and Year 7 of the Seismic Retrofit construction and would be significantly smaller in scale. As a result, the noise analysis for the Seismic Retrofit construction would also apply to the North Channel Extension. Therefore, no additional noise analysis has been conducted specific to the North Channel Extension~~.

Sediment Augmentation Program

Onsite Construction Noise

Recreational users along Coyote Creek Trail would be exposed to Sediment Augmentation Program construction noise. The Coyote Creek Trail is within the Sediment Augmentation Program Project Area and trail users would be exposed to noise associated with construction activities. Users of the trail would only be near the construction site for a relatively short time since there are no common outdoor use areas, and they are not expected to remain stationary for extended periods of time. The impact to trail users would be less than significant.

Sediment Augmentation Program construction noise levels are summarized in **Table 3.16-27 ~~3.16-26~~** and sensitive receptors are included in **Figure 3.16-6.** As shown in **Table 3.16-27 ~~3.16-26 through Table 3.16-28~~** , average construction noise levels (L_{eq}) would not exceed the FTA's construction noise daytime threshold of 80 dBA L_{eq}. Nighttime construction would not occur during Sediment Augmentation Program construction and, thus, the nighttime construction noise threshold of 50 dBA L_{eq} would not be exceeded. However, onsite construction noise levels (DNL) would exceed the 10 dBA increase above ambient threshold at Receptor R-2 ~~during construction of haul roads and preparation of stockpile areas~~. Therefore, onsite construction noise impacts from construction of the Sediment Augmentation Program would be significant.

Offsite Construction Noise

Haul trips and worker trips related to construction of the Sediment Augmentation Program would be minimal. Therefore, offsite construction noise impacts related to the Sediment Augmentation Program would be less than significant.

Overall Construction Noise

Implementation of **Mitigation Measure NOI-1** would reduce on-site construction noise impacts. **Mitigation Measure NOI-1**, described below, will require Valley Water to implement construction noise BMPs, which would require prior notice of construction activities to nearby sensitive receptors, proper maintenance of all construction equipment, equipping all construction equipment with mufflers and air intake silencers, locating staging and delivery areas as far from sensitive receptors as is feasible, enclosing stationary noise sources in temporary sheds, restricting the use of bells, whistles, alarms, and horns, and posting signs at construction area entrances to reinforce the prohibition of unnecessary idling.

Implementation of **Mitigation Measure NOI-1** will reduce Sediment Augmentation Program construction noise; however, construction noise levels would still exceed applicable thresholds of significance. Therefore, Sediment Augmentation Program construction noise impacts would be significant and unavoidable.

BLACK & VEATCH

Phase 2 Coyote Percolation Dam CM Construction

Onsite Construction Noise

Recreational users along Coyote Creek Trail would be exposed to Phase 2 Coyote Percolation CM construction noise. The Coyote Creek Trail is within the Phase 2 Coyote Percolation CM Project Area and trail users would be exposed to noise associated with most construction activities. Users of the trail would only be near the construction site for a relatively short time since there are no common outdoor use areas, and they are not expected to remain stationary for extended periods of time. The impact to trail users would be less than significant.

Phase 2 Coyote Percolation Dam CM construction noise levels are summarized in **Table 3.16-28** ~~**3.16-29**~~ and **Table 3.16-29** ~~**3.16-30**~~**,** and sensitive receptors are included in **Figure 3.16-7**. As shown in **Table 3.16-28** ~~**3.16-29**~~ and **Table 3.16-29** ~~**3.16-30**~~, onsite construction noise levels (DNL) would not exceed the 10 dBA increase above ambient threshold. Average construction noise levels (L_{eq}) would not exceed the FTA's construction noise daytime threshold of 80 dBA. Nighttime construction would not occur during Phase 2 Coyote Percolation Dam CM construction and, thus, the FTA nighttime construction noise threshold of 50 dBA L_{eq} would not be exceeded. Additionally, recreational users at Metcalf Park and along Coyote Creek trail would be exposed to Phase 2 Coyote Percolation Dam CM construction noise. Construction noise levels would expose recreational users at Metcalf Park to significant noise levels if construction noise levels exceed the FTA's construction noise daytime threshold of 80 dBA L_{eq}. Construction noise levels at receptors R-21 and R-22 are most representative of Phase 2 Coyote Percolation Dam CM construction noise levels for recreational users at Metcalf Park. As shown in **Table 3.16-28** ~~**3.16-29**~~ and **Table 3.16-29** ~~**3.16-30**~~, construction noise levels at receptors R-21 and R-22 would be below 80 dBA L_{eq}. Therefore, onsite construction noise impacts from construction of the Phase 2 Coyote Percolation Dam CM would be less than significant.

Offsite Construction Noise

Haul trips and worker trips related to construction of the Phase 2 Coyote Percolation Dam CM would be minimal. Therefore, offsite construction noise impacts related to Phase 2 Coyote Percolation Dam CM would be less than significant.

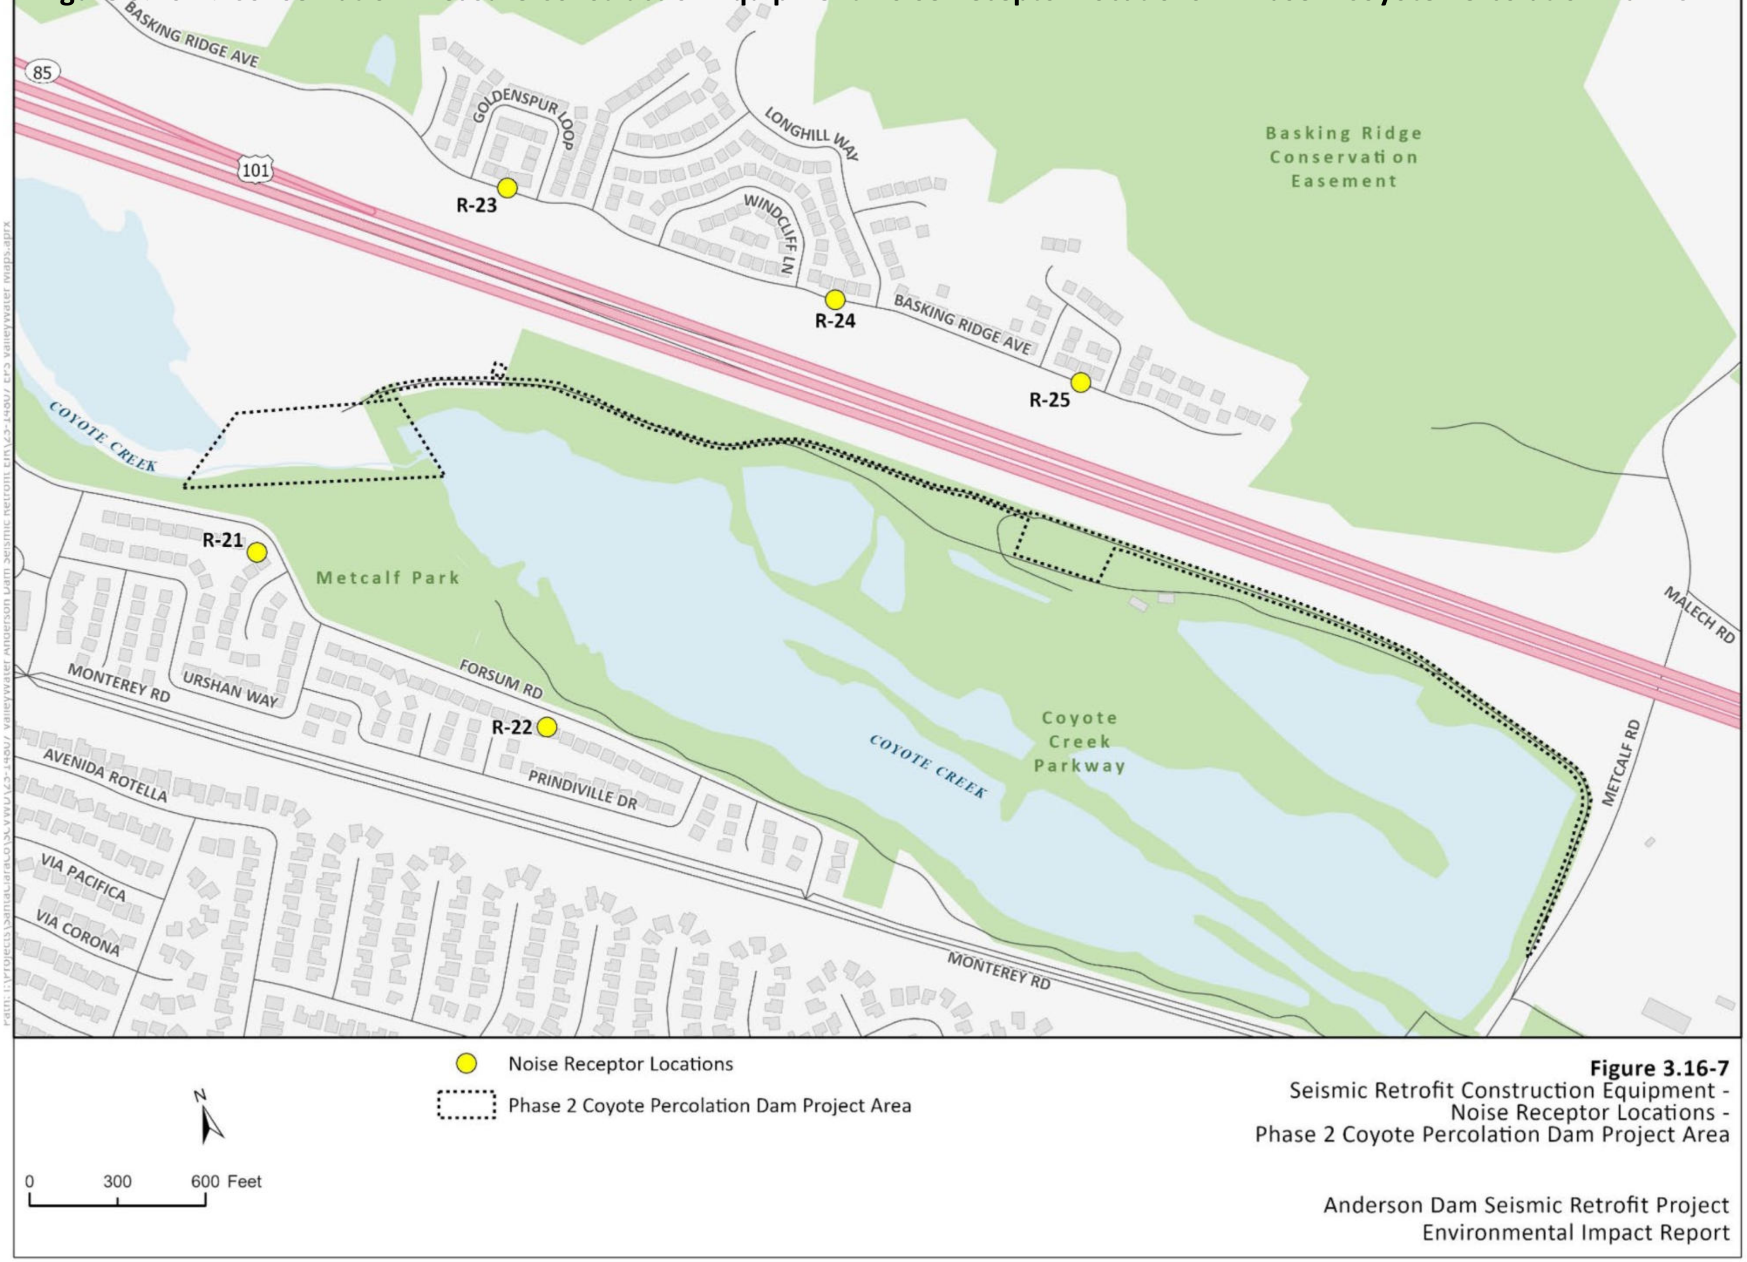
Figure 3.16-7. Conservation Measure Construction Equipment Noise Receptor Locations – Phase 2 Coyote Percolation Dam CM



Operations and Maintenance

As discussed in Section 3.3.3, *Methodology and Approach to Impact Analysis*, post-construction operations and maintenance of the Anderson Dam Facilities and Conservation Measures, as well as the Project and FAHCE AMP, would result in negligible sources of noise. A diesel generator is proposed at the new outlet works which would replace an existing diesel generator in the same general area north of Via Sebastian. Noise from the proposed generator would generate similar noise levels to the existing generator due to occasional testing and in the case of power loss. In addition, air release valves are proposed at the LLOW, which would intermittently generate noise. However, noise from the air release valves is anticipated to be similar to noise levels generated by the existing AMF facility air release valves, which would be replaced with the Project. The existing facility and proposed facility are located in the same general area north of Cochrane Road. Finally, the gate shaft located at northern end of the top of the dam would potentially produce noise from the infrequent release of water during water level events. However, at a distance of approximately 1,000 feet from the nearest residences south of Cochrane Road, noise levels would not be significant. Therefore, operational noise impacts would be less than significant.

Significance Conclusion Summary

Construction of the Seismic Retrofit Component, Ogier Ponds CM, and the Sediment Augmentation Program would exceed applicable construction noise thresholds of significance, while Project operational noise impacts would be less than significant. Specifically, onsite Seismic Retrofit construction noise levels would exceed the 10 dBA increase above ambient threshold at Receptors R-2, R-4, R-5, and R-31 during Year 1; at Receptors R-2, R-4 through R-8, R-31, and R-32 during Year 2; at Receptors R-2 through R-9, R-31, and R-32 during Year 3; at Receptors R-2 through R-8, R-10 through R-12, R-31, and R-32 during Year 6; and at Receptors R-2, R-4 through R-9, ~~R-8~~, R-31, and R-32 during Year 7.[5] On-site construction noise levels would exceed the applicable Santa Clara County daytime residential construction noise threshold at Receptors R-8 R-9, R-31, and R-32 in Year 1, at Receptors R-8, R-31, and R-32 in Year 2, at Receptors R-8, R-9, R-31, and R-32 in Year 3, at Receptors R-8, R-31, and R-32 in Year 6, and at Receptors R-8, R-31, and R-32 in Year 7. Seismic Retrofit nighttime construction noise levels would exceed the nighttime residential construction noise threshold of 50 dBA L_{eq} at Receptors R-1 through R-9, R-31, and R-32 in Years 2, 3, and 7; and at each residential receptor in Year 6. Sunday work would exceed the Santa Clara County Sunday residential threshold of 50 dBA at Receptors R-8, R-9, R-31, and R-32 during Years 2, 3, 6, and 7. Offsite Seismic Retrofit construction noise levels would exceed the 5 dBA increase above ambient threshold along Route 1b and Route 3.

Onsite Ogier Ponds CM construction noise levels would not exceed the 10 dBA increase above ambient threshold ~~at Receptors R-18 through R-20 during the spillway construction phase~~. Onsite Ogier Ponds CM construction noise levels would exceed the applicable Santa Clara County construction noise threshold at Receptor R-8 ~~R-9~~ during the Pond 1 fill borrow hill ~~import from Basalt Hill~~ excavation construction phase and at Receptor R-20 during the construction of haul roads and preparation of the staging and stockpile areas, dewatering of Pond 1, Pond 1 fill

[5] While the modeled Overall with Project DNL values did not change, Receptors R-5, R-6, R-7, and R-9 were erroneously not included in this paragraph in the Partially Recirculated Draft EIR, and is updated here.

import from Basalt Hill excavation, and spillway construction phases. Offsite Ogier Ponds CM construction noise would not exceed the 5 dBA increase above ambient threshold~~ along Cochrane Road between Staging Area 1 to Peet Road during Year 6, Pond 1 Fill~~. Onsite Sediment Augmentation Program construction noise would exceed the 10 dBA increase above ambient threshold at Receptor R-2 during activity near Cochrane Road and Malaguerra Avenue ~~haul roads and preparation of stockpile areas construction phase~~. Onsite ~~North Channel Extension and~~ Phase 2 Coyote Percolation Dam construction noise would not exceed applicable construction noise thresholds. Offsite construction noise associated with the ~~North Channel Extension and~~ Phase 2 Coyote Percolation Dam would also not exceed applicable noise thresholds. Implementation of **Mitigation Measure NOI-1**, described below, will require Valley Water to implement a Construction Management Plan, which would require prior notice of construction activities to nearby sensitive receptors, proper maintenance of all construction equipment, equipping all construction equipment with mufflers and air intake silencers, locating staging and delivery areas as far from sensitive receptors as is feasible, enclosing stationary noise sources in temporary sheds, restricting the use of bells, whistles, alarms, and horns, and posting signs at construction area entrances to reinforce the prohibition of unnecessary idling.

Implementation of **Mitigation Measure NOI-2**, described below, is specific to Seismic Retrofit construction and will require the installation of a temporary noise barrier, limiting of construction activity at Staging Area 1 ~~and Stockpile Area E~~ within 300 feet of nearby ~~Receptor R-2 and~~ residences ~~across Cochrane Road~~, reducing the noise levels generated by track drill rigs to 86 dBA at 50 feet, posting a sign 10 days prior to the start of nighttime construction that provides a noise complaint phone number, and construction noise monitoring during nighttime periods of construction. **Mitigation Measure NOI-2** will also reduce offsite construction noise levels by reducing speeds along haul routes and routing truck traffic and worker vehicles along Route 1a instead of Route 1b. Mitigated Seismic Retrofit nighttime construction noise levels would still exceed the nighttime construction noise threshold of 50 dBA $L_{eq.}$

Implementation of **Mitigation Measure NOI-3**, described below, is specific to Ogier Ponds CM construction and will require the installation of a temporary noise barrier. ~~and the reduction of truck and vehicle speeds along Cochrane Road~~. Mitigated Ogier Ponds CM construction noise would be less than significant with mitigation. ~~offsite construction noise would still exceed the 5 dBA increase above ambient threshold~~. Mitigated Sediment Augmentation Program onsite construction noise would also still exceed applicable thresholds of significance. Therefore, Project construction would result in generation of a substantial temporary increase in ambient noise levels in the Project vicinity in excess of locally-adopted standards and the standards of other agencies, or would result in generation of substantial incremental increases in noise levels. Impacts would be **significant and unavoidable**.

Mitigation Measures

NOI-1 Implement Construction Noise Reduction Measures

Prior to the start of construction, Valley Water shall prepare a Construction Management Plan. Valley Water will include the following construction noise reduction measures in the Construction Management Plan:

- At least 30 days prior to the start of construction activities, all offsite businesses and residents within 500 feet of the Project Area will be notified of the planned construction activities. The notification will include a brief description of the Project, the activities that would occur, the hours when construction would occur, and the construction period's overall duration. The notification will include the telephone numbers of Valley Water's and the contractor's authorized representatives that are assigned to respond in the event of a noise complaint.

- At least 30 days prior to the start of construction activities, a sign will be posted at each construction site entrance, or other conspicuous location, that includes a 24-hour telephone number for Project ~~project~~ information, and a procedure in which a construction manager will respond to and investigate noise complaints and take corrective action, if necessary, in a timely manner. The sign will have a minimum dimension of 48 inches wide by 24 inches high with a 1-inch minimum font height and will also include contact information for Valley Water staff. The sign will be placed 5 feet above ground level.
- If a construction noise complaint(s) is registered and if Valley Water or its contractor are not available to make noise measurements, Valley Water will retain a noise consultant to conduct noise measurements at the properties that registered the complaint. The noise measurements will be conducted for a minimum of 1 hour. Valley Water will prepare a letter report summarizing the measurements, calculation data used in determining impacts, and potential measures to reduce noise levels to the maximum extent feasible.
- Prior to the start of and for the duration of construction, the contractor will properly maintain and tune all construction equipment in accordance with the manufacturer's recommendations to minimize noise emissions.
- Prior to use of any construction equipment, the contractor will fit all equipment with properly operating mufflers, air intake silencers, and engine shrouds no less effective than as originally equipped by the manufacturer.
- Material hauling and deliveries will be coordinated by the construction contractor to reduce the potential of trucks waiting to unload for protracted periods of time.
- To the extent feasible, hydraulic equipment will be used instead of pneumatic impact tools, and electric powered equipment will be used instead of diesel-powered equipment.
- Stationary noise sources (e.g., generators) will be located as far from sensitive receptors as practicable, and they will be muffled and enclosed within temporary sheds, or insulation barriers.
- The use of bells, whistles, alarms, and horns will be restricted to safety warning purposes only.
- Signs will be posted at the job site entrance(s), within the onsite construction zones, and along queueing lanes (if any) to reinforce the prohibition of unnecessary engine idling. All other equipment will be turned off if not in use for more than two ~~five~~ minutes. The construction manager will be responsible for enforcing this.

NOI-2 Implement Seismic Retrofit Construction Noise Reduction Measures

Valley Water and/or its contractor will implement the following noise mitigation measures as part of the Seismic Retrofit construction component:

- For Staging Area 1 ~~and Stockpile Area E~~, as much as is feasible, limit activity of construction equipment within 300 feet of nearby ~~Receptor R-2 and~~ residences ~~across Cochrane Road~~.

- Install temporary noise barriers between Staging Area 1~~/Stockpile Area E~~ and noise-sensitive receptors, as feasible. The barriers will be at least 12 ~~18~~ feet high and have no cracks or gaps, except where access is required (e.g., options for noise barriers include field-constructed wood or masonry walls, manufactured noise curtains [e.g., Kinetics KBC], and semi-truck trailers) and provide a minimum noise reduction of 15 dBA.
- For track drill rigs, when they are not in a tunnel or shaft, install manufacturer-provided or third-party noise reduction systems, or install a sound barrier between the track drill rigs and noise-sensitive receptors to reduce noise levels to 86 dBA at 50 feet.
- Limit activity at Stockpile Areas K North and South to daytime (7:00 a.m. to 5:00 p.m.) hours as feasible.
- To reduce offsite construction noise, the following measures will be implemented:
  - Route truck traffic and worker vehicles along Route 1a and avoid Route 1b to the extent feasible.
  - Temporarily reduce worker vehicle and truck speeds ~~the posted speed limits~~ along East Main Avenue between Hill Road and Cochrane Road and on Cochrane Road between East Main Avenue and Half Road by 5 mph below the speed limit.
  - Reduce worker vehicle and truck speeds along the section of Cochrane Road closed to through traffic from the currently posted speed limit 45 mph to 35 mph.
- Prior to the start of construction, Valley Water will retain a qualified acoustical consultant to conduct construction noise monitoring during the nighttime work of Project construction at select locations in the surrounding community. The number and location of monitoring positions will be determined by Valley Water in consultation with the acoustical consultant. All sound level meters used during monitoring will satisfy the American National Standards Institute (ANSI) standard of Type 2 instrumentation or higher. All measurements shall be at least 5 feet above the ground and away from reflective surfaces. The noise monitoring data and results will be submitted in a memorandum to Valley Water on a weekly basis along with comparison to the 50 dBA $_{Leq}$ nighttime construction noise limit. If exceedances of the construction noise limit are found, the construction contractor will modify construction techniques and equipment to reduce the construction noise below the 50 dBA $_{Leq}$ limit, to the degree feasible.

NOI-3 Implement Ogier Ponds CM Construction Noise Reduction Measures

Valley Water and/or its contractor will implement the following noise mitigation measures as part of the Ogier Ponds CM construction component:

- Install temporary noise barriers between regions of significant activity and noise-sensitive receptors. The barriers will be at least 12-feet high and have no cracks or gaps, except where access is required (e.g., options for noise barriers include field-constructed wood or masonry walls, manufactured noise curtains [e.g., Kinetics KBC]), and semi-truck trailers) and provide a minimum noise reduction of 15 dBA.
- ~~To reduce offsite construction noise, the following measures will be implemented:~~
  - ~~Reduce truck speeds along the section of Cochrane Road closed to through traffic from the currently posted speed limit of 45 mph to 35 mph.~~

- ~~Require trucks to reduce their speed along Cochrane Road between Malaguerra Road and US 101 to 5 mph below the posted speed limit.~~

Impact NOI-2: Generate excessive groundborne vibration or groundborne noise levels (Less than Significant with Mitigation)

Construction

Seismic Retrofit Construction

Vibration from Seismic Retrofit construction is considered for sensitive receptors within 500 feet of construction activity areas. The following activity areas are more than 500 feet from any sensitive receptors, and therefore are not considered:

- BHBA
- Coffer dam
- Dredging
- Packwood Gravel Borrow Area
- Reservoir Disposal Area
- Spillway
- Boat ramp parking area
- Dam toe parking area
- Staging Area 3
- Stockpile Area B
- Stockpile Area C
- ~~Stockpile Area D~~
- Stockpile Area H
- Stockpile Area L
- Stockpile Area M

Seismic Retrofit construction vibration levels at sensitive receptors within 500 feet of the construction activity areas are summarized in **Table 3.16-30 ~~3.16-31~~** sensitive receptors are included in **Figure 3.16-8 ~~3.16-7~~**. Seismic Retrofit construction vibration levels would be significant if they exceed the 0.20 in/sec PPV threshold for structural damage and the indoor impact threshold of 72 VdB at sensitive receptors. As shown in **Table 3.16-30 ~~3.16-31~~** Seismic Retrofit construction vibration would not exceed the 0.20 in/sec PPV threshold for structural damage at any of the nearby sensitive receptors. Seismic Retrofit construction vibration would exceed the 72 VdB indoor impact threshold at Receptors R-2 and R-32. Therefore, Seismic Retrofit construction vibration would be significant.

Implementation of **Mitigation Measure NOI-4**, described below, will require the use of oscillatory or static rollers in lieu of a vibratory roller within 150 feet of residential structures. Implementation of **Mitigation Measure NOI-4** will reduce vibration levels below the 72 VdB indoor impact threshold. Therefore, Seismic Retrofit construction vibration impacts would be less than significant with mitigation incorporated.

Table 3.16-30 ~~3.16-31~~. Seismic Retrofit Construction Vibration

Receptor	Activity Area	Distance	Maximum Vibration			Significance Thresholds		Exceed Structural Damage Threshold?	Exceed Indoor Impact Threshold?
			Amplitude (PPV, in/sec)	Level (VdB)	Source	Structural Damage (PPV, in/sec)	Indoor Impact (VdB)		
R-6	Excavation	480	0.002	56	Padfoot roller	0.20	72	No	No
	Staging Area 4	340	0.004	60	Road-header	0.20	72	No	No

Figure 3.16-8. Seismic Retrofit Construction Equipment Noise Receptor Locations – Anderson Dam Area

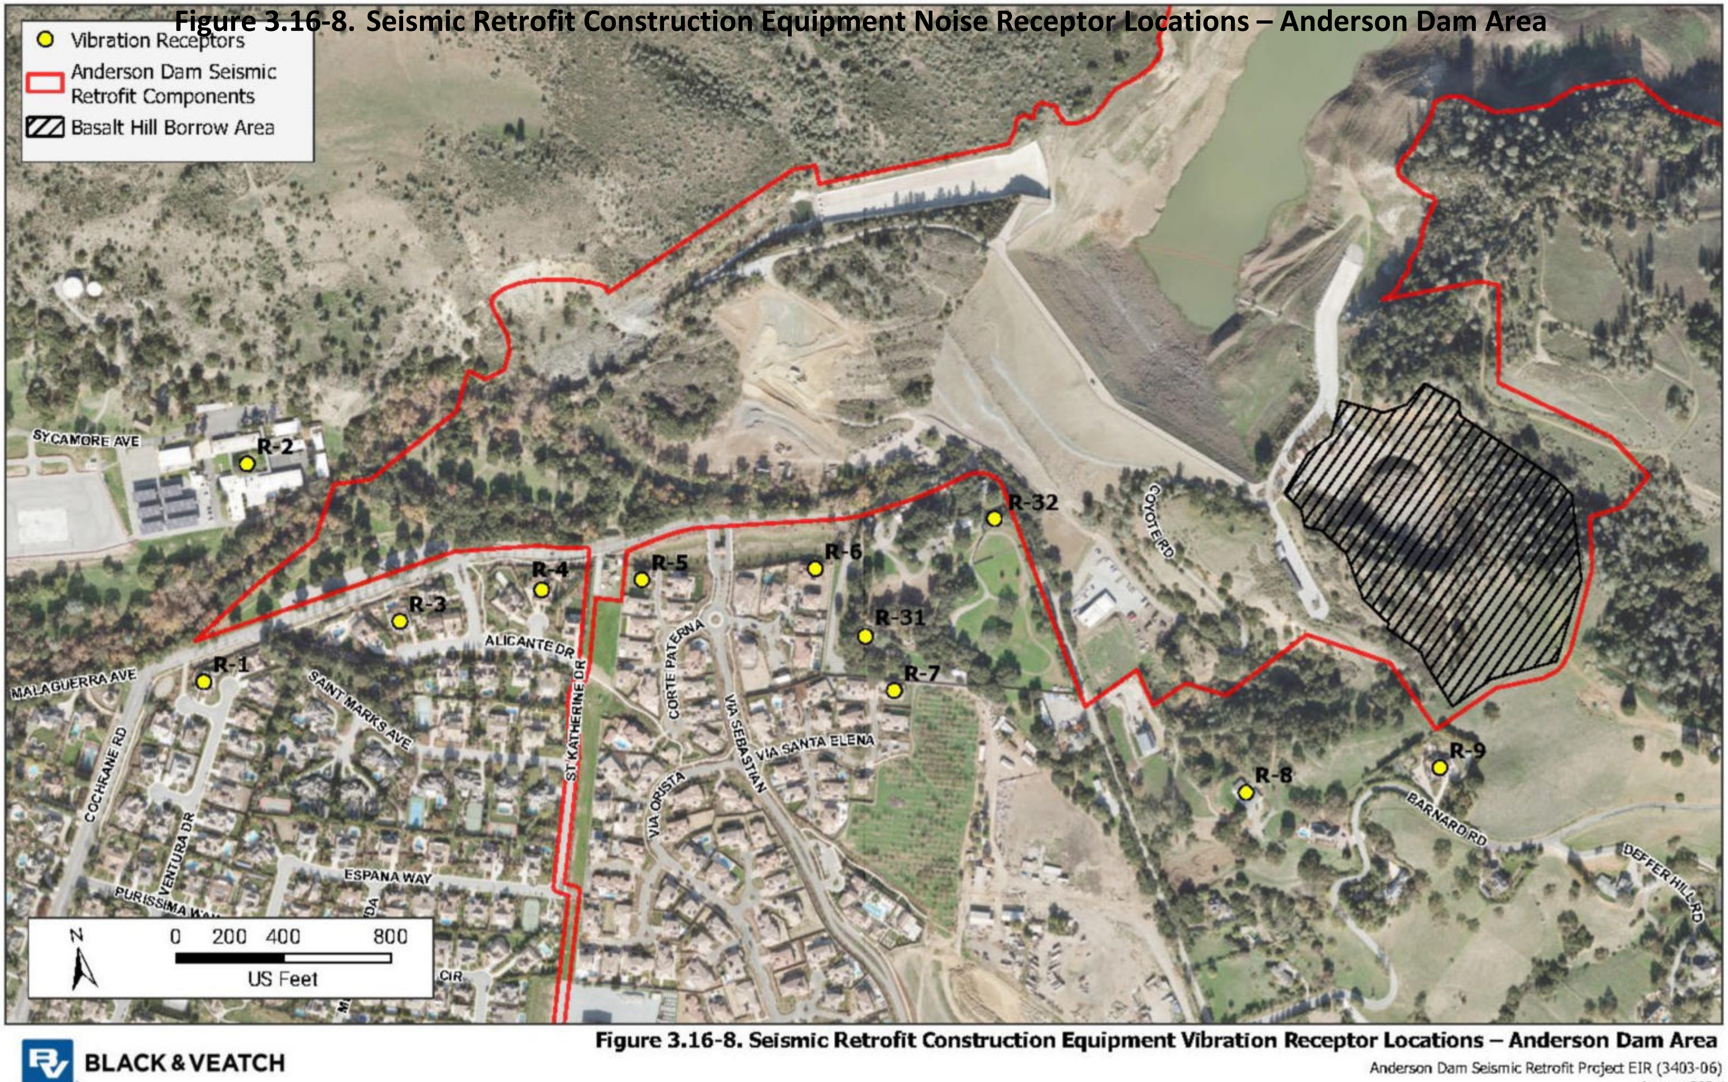

Figure 3.16-8. Seismic Retrofit Construction Equipment Vibration Receptor Locations – Anderson Dam Area
Anderson Dam Seismic Retrofit Project EIR (3403-06)
August 2024

Blasting Air Overpressure and Vibration

Construction of the Seismic Retrofit Component would require blasting at the BHBA. The approximate extent of blasting activities and proximity to the nearest sensitive receptors is shown in **Figure 3.16-8** ~~3.16-7~~. The minimum slant distance between the edge of the blasting area and the nearest sensitive receptor is approximately 240 feet.

Vibration from blasting activities would be significant if levels exceed the vibration threshold of 0.1884 in/sec PPV at 1 Hz, 0.5 in/sec PPV at 3 to 40 Hz, or 2.0 in/sec PPV at 40 Hz and above. Additionally, vibration from blasting activities would be significant if the air overpressure threshold of 133 dBL is exceeded. If uncontrolled, blasting vibration and air overpressure could exceed the established thresholds.

Implementation of **Mitigation Measure NOI-5**, described below, will require vibration and air overpressure monitoring be conducted while initial blasting activities occur. Monitoring results would be used to adjust blast loading limits to properly reflect site-specific conditions to prevent vibration impacts from blasting from exceeding the building damage thresholds and the air overpressure threshold of 133 dBL. Implementation of **Mitigation Measure NOI-5** will also include a Blasting Plan, which restricts blasting to between the hours of 8:00 a.m. and 5:00 p.m. and includes details for nearby sensitive receptors to file complaints. Implementation of **Mitigation Measure NOI-5** will require that blast loading limits do not exceed the significance thresholds mentioned above. Therefore, vibration impacts from blasting activities would be less than significant with mitigation incorporated.

Conservation Measures Construction

Ogier Ponds CM

Ogier Ponds CM construction vibration levels would be significant if they exceed the 0.20 in/sec PPV threshold for structural damage and the indoor impact threshold of 72 VdB at sensitive receptors. The nearest vibration-sensitive receptor is located more than 80 ~~60~~ feet from the Ogier Ponds CM construction area. At this distance, the structural damage thresholds would not be exceeded. Potential indoor vibration impacts would be less than significant at distances beyond 80 feet. There are no sensitive receptors within 80 feet of the Ogier Ponds CM construction area. Therefore, Ogier Ponds CM construction vibration would be less than significant.

~~North Channel Extension~~

~~Work on the North Channel Extension would be downstream of the existing Anderson Dam outlet structure. Construction equipment used for the North Channel Extension would include a bulldozer, motor grader, excavator, loader, dump truck, water truck, pumps, and supporting vehicles. The work would coincide with Year 1 and Year 7 of the Seismic Retrofit construction and would be significantly smaller in scale. As a result, the vibration analysis for Seismic Retrofit construction would also apply to the North Channel Extension . Therefore, no additional vibration analysis has been conducted specific to the North Channel Extension.~~

Sedimentation Augmentation Program

Sediment Augmentation Program construction vibration levels would be significant if they exceed the 0.20 in/sec PPV threshold for structural damage and the indoor impact threshold of 72 VdB at sensitive receptors. As shown in **Table 3.16-31 ~~3.16-32~~**, Sediment Augmentation Program construction vibration would not exceed the 0.20 in/sec PPV threshold for structural damage at sensitive receptor locations. Sediment Augmentation Program construction vibration would exceed the 72 VdB indoor impact threshold at Receptor R-2. Therefore, Sediment Augmentation Program construction vibration would be significant.

Implementation of **Mitigation Measure NOI-4**, described below, will require the use of oscillatory rollers in lieu of a vibratory roller within 150 feet of residential structures, including Receptor R-2. Implementation of **Mitigation Measure NOI-4** will reduce vibration levels below 72 VdB indoor impact threshold. Therefore, Sediment Augmentation Program construction vibration impacts would be less than significant with mitigation incorporated.

Phase 2 Coyote Percolation Dam CM

Phase 2 Coyote Percolation Dam CM construction vibration levels would be significant if they exceed the 0.20 in/sec PPV threshold for structural damage and the indoor impact threshold of 72 VdB at sensitive receptors. As shown in **Table 3.16-32 ~~3.16-33~~** Phase 2 Coyote Percolation Dam CM construction vibration would not exceed the 0.20 in/sec PPV threshold for structural damage or the 72 VdB indoor impact threshold. Therefore, Phase 2 Coyote Percolation Dam CM construction vibration would be less than significant.

Table 3.16-31 ~~3.16-32~~ Sediment Augmentation Program Construction Equipment Vibration

Note: The receptors at Donna Ct Residence and Burnett Ave Residence were removed given the modeled Sediment Augmentation Program activities occurring in Year 8 at the Live Oak Restoration Reach would occur over 2,500 and 3,500 feet from these receptors, respectively; therefore, there would be no impact.

Source: Ramboll. 2024 ~~2023~~. Anderson Dam Seismic Retrofit Project Noise & Vibration Technical Memorandum ~~Impact Assessment~~ (Appendix M)

Operations and Maintenance

As discussed in Section 3.3.3, *Methodology and Approach to Impact Analysis*, post-construction operations and maintenance of the Anderson Dam Facilities and Conservation Measures, as well as Project and FAHCE Adaptive Management, would result in negligible sources of groundborne vibration and groundborne noise. Therefore, operational vibration impacts would be less than significant, and no mitigation is required.

Significance Conclusion Summary

Construction of the Seismic Retrofit components and the Sediment Augmentation Program would exceed construction vibration thresholds of significance. Specifically, Seismic Retrofit construction vibration would exceed the 72 VdB indoor impact threshold at Receptor R-2 and R-32. Blasting activities during Seismic Retrofit construction that occur at a distance greater than 240 feet from the nearest sensitive receptors could exceed applicable blasting thresholds. Sediment Augmentation Program construction vibration would exceed the 72 VdB indoor impact threshold at Receptor R-2.

Implementation of **Mitigation Measure NOI-4**, described below, will require the use of oscillatory or static rollers in lieu of a vibratory roller within 150 feet of residential structures. Implementation of **Mitigation Measure NOI-5**, described below, will require vibration and air overpressure monitoring be conducted while initial blasting activities occur. Monitoring results would be used to adjust blast loading limits to properly reflect site-specific conditions to prevent vibration impacts from blasting from exceeding the building damage thresholds or air overpressure threshold of 133 dBL. Mitigated Seismic Retrofit and Sediment Augmentation Program construction vibration levels would not exceed the 0.20 in/sec PPV threshold for structural damage and the indoor impact threshold of 72 VdB. Therefore, Project construction would not generate excessive groundborne vibration or groundborne noise levels and impacts would be **less than significant with mitigation** incorporated.

Mitigation Measures

NOI-4 Seismic Retrofit and Sediment Augmentation Program Construction Vibration Reduction

Valley Water and/or its contractor will implement the following vibration mitigation measures for the Seismic Retrofit and Sediment Augmentation Program construction:

I. Use of oscillatory or static rollers (which maintains constant contact with the ground) in lieu of vibratory rollers (which lifts off and pounds the ground) for compaction near residential structures (within 150 feet)

NOI-5 Implement Blasting Plan

Valley Water and/or its contractor will implement a Blasting Plan that requires vibration and air overpressure monitoring be conducted by a qualified engineer or acoustical consultant while initial blasting activities occur. Monitoring results will be used to adjust blast loading limits to properly reflect site-specific conditions to prevent vibration impacts from blasting from exceeding the building damage threshold of 0.1884 in/sec PPV if blasting frequency is below 1 Hz, 0.5 in/sec PPV if blasting frequency is 3 Hz to 40 Hz, 2.0 in/sec PPV ay 40 Hz and above, or the air overpressure threshold of 133 dBL. ~~Initially, the maximum loading will not exceed 7.5 lb.~~

~~TNTe per delay (~3.4 kg).~~ The allowable explosive loading in lb. of TNTe per delay will be converted to explosive material used on the Project ~~project~~ and provided to the construction contractor. The allowable maximum loading may be adjusted up based on the frequency (Hz) of blasting and the results of blasting vibration and air overpressure monitoring at the recommendation of the monitoring engineer or qualified acoustical consultant conducting the blasting monitoring. The Blasting Plan will restrict blasting activities to between the hours of 8:00 a.m. and 5:00 p.m. The Blasting Plan will also include details regarding outreach to nearby sensitive receptors to notify them in advance of days in which blasting will occur and contact information on who to reach out to regarding complaints from the blasting.

3.16.5 Cumulative Impacts

The cumulative impact study area for noise and vibration focuses on the portions of the county, San José, and Morgan Hill that are in or near the Project Area, including the construction limits of the Seismic Retrofit and Conservation Measures components and the surrounding sensitive receptors. Predominant noise sources in the study area include traffic noise from nearby roadways and natural sounds, such as birds chirping and wind gusts.

The approach to the cumulative impacts analysis and list of foreseeable future projects, programs, and plans considered in the cumulative impact analysis is included in Section 3.0.5, *Approach to Cumulative Impacts*.

This section describes the Project's contribution to cumulative noise and vibration impacts, as summarized in **Table 3.16-33 ~~3.16-34~~** Cumulative impact thresholds for noise and vibration are the same as the impact thresholds presented in Section 3.16.3.8, *Thresholds of Significance*.

Table 3.16-33 ~~3.16-34~~. Summary of Project Impact Contribution to Cumulative Noise and Vibration Impacts

Impact	Significant Cumulative Impact with FOCP?	Significant Cumulative Impact with other Projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact NOI-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies	No	Yes	CC	MM NOI-1 MM NOI-2 MM NOI-3	Yes

Impact	Significant Cumulative Impact with FOCP?	Significant Cumulative Impact with other Projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact NOI-2: Generate excessive groundborne vibration or groundborne noise levels	No	No	NCC	MM NOI-4 MM NOI-5	No

Key: CC = cumulatively considerable; NCC = not cumulatively considerable; MM = Mitigation Measure

Cumulative Impact NOI-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies (Cumulatively Considerable)

Cumulative projects, plans, and programs could result in incrementally adverse impacts if their construction or operation activities overlap within the same timeframe as the construction activities for the Project.

Cumulative Effects of Project with the FOCP

The FOCP would be completed before construction activities for the Project begin; therefore, these two projects would not result in cumulative impacts related to noise. There would be no cumulative effect.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Most of the other reasonably foreseeable future projects identified in Section 3.0.5, *Approach to Cumulative Impacts,* would occur within the county. Construction or operation of future projects, programs, and plans could overlap with the 8-year ~~15-year~~ construction schedule during which the Seismic Retrofit Components and Conservation Measures construction would occur. As indicated under Impact NOI-1, construction of the Project would exceed applicable construction noise thresholds of significance. Project construction, combined with any construction occurring at the same time from probable future projects, plans, and programs, could generate a substantial temporary increase in noise levels resulting in a significant cumulative impact. Although Project mitigation measures would be implemented to reduce the Project's incremental noise impacts, they would remain, cumulatively considerable.

Significance Conclusion Summary

Valley Water would reduce the Project’s contribution to cumulative impacts related to construction noise through implementation of **Mitigation Measures NOI-1 through NOI-3**. Implementation of **Mitigation Measure NOI-1** will require Valley Water to implement a Construction Management Plan, which would require prior notice of construction activities to nearby sensitive receptors, proper maintenance of all construction equipment, equipping all construction equipment with mufflers and air intake silencers, locating staging and delivery areas as far from sensitive receptors as is feasible, enclosing stationary noise sources in temporary sheds, restricting the use of bells, whistles, alarms, and horns, and posting signs at construction area entrances to reinforce the prohibition of unnecessary idling. Implementation of **Mitigation Measure NOI-2** is specific to Seismic Retrofit construction and will require the installation of a temporary noise barrier, limiting of construction activity at Staging Area 1 ~~and Stockpile Area E~~ within 300 feet of nearby residences ~~of the William F. James Boys Ranch and residences across Cochrane Road~~, reducing the noise levels generated by track drill rigs to 86 dBA at 50 feet, posting a sign 10 days prior to the start of nighttime construction that provides a noise complaint phone number, and construction noise monitoring during nighttime periods of construction. **Mitigation Measure NOI-2** will also reduce offsite construction noise levels by reducing speeds along haul routes and routing truck traffic and worker vehicles along Route 1a instead of Route 1b. Implementation of **Mitigation Measure NOI-3** is specific to Ogier Ponds CM construction and will require the installation of a temporary noise barrier ~~and the reduction of truck and vehicle speeds along Cochrane Road~~. With implementation of **Mitigation Measures NOI-1 through NOI-3,** Project construction noise levels will still exceed the applicable construction noise thresholds at some receptors. Therefore, the Project's contribution to the significant cumulative impact related to a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project would be **cumulatively considerable**.

Mitigation Measures

NOI-1 Implement Construction Noise ~~BMPs~~ Reduction Measures

NOI-2 Implement Seismic Retrofit Construction Noise Reduction Measures

NOI-3 Implement Ogier Ponds CM Construction Noise Reduction Measures

Cumulative Impact NOI-2: Generate excessive groundborne vibration or groundborne noise levels **(Not Cumulatively Considerable)**

Cumulative projects, plans, and programs could result in incrementally adverse impacts if their construction or operation activities overlap within the same timeframe as the construction activities for the Project.

Cumulative Effects of Project with the FOCP

The FOCP would be completed before construction activities for the Project begin; therefore, these two projects would not result in cumulative impacts related to groundborne vibration or noise. There would be no cumulative effect.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Most of the other reasonably foreseeable future projects identified in Section 3.0.5, *Approach to Cumulative Impacts*, would occur within the County. Construction or operation of future projects, programs, and plans could overlap with the 8-year ~~15-year~~ construction schedule during which the Seismic Retrofit Component and Conservation Measures construction would occur. As indicated under Impact NOI-2, Project construction vibration level impacts would be less than significant with mitigation incorporated. Project construction, in combination with construction or operation occurring at the same time from probable future projects, plans, and programs, is unlikely to result in a significant cumulative impact related to groundborne vibration. This is because for construction groundborne vibration impacts to cumulate, construction activities need to occur within relatively close distances of each other (e.g., within approximately 25 feet for a vibratory roller for potential architectural damage). None of the cumulative projects would be within 25 feet of a given sensitive receptor at the same time. Therefore, the cumulative impact resulting from the Project in combination with other probable future projects would not be significant, and the Project's contribution would not be cumulatively considerable.

Significance Conclusion Summary

Valley Water would reduce the Project's contribution to cumulative construction vibration impacts through implementation of **Mitigation Measures NOI-4 and NOI-5**. Implementation of **Mitigation Measure NOI-4** will require the use of oscillatory or static rollers in lieu of a vibratory roller within 150 feet of residential structures during Seismic Retrofit and Sediment Augmentation Program construction. Implementation of **Mitigation Measure NOI-5** will require vibration and air overpressure monitoring be conducted while initial blasting activities occur. Monitoring results would be used to adjust blast loading limits to properly reflect site-specific conditions to prevent vibration impacts from blasting from exceeding the building damage threshold of 0.1884 in/sec PPV if blasting frequency is below 1 Hz, 0.5 in/sec PPV if blasting frequency is 3 Hz to 40 Hz, 2.0 in/sec PPV ay 40 Hz and above, or the air overpressure threshold of 133 dBL. ~~Tentatively, the maximum loading will not exceed 7.5 lb. TNTe per delay (~3.4 kg).~~ Implementation of **Mitigation Measure NOI-5** will also include a Blasting Plan, which restricts blasting between the hours of 8:00 a.m. and 5:00 p.m. and includes details for nearby sensitive receptors to file complaints. With implementation of **Mitigation Measures NOI-4 and NOI-5**, Project construction vibration levels will not exceed the 0.20 in/sec PPV threshold for structural damage and the indoor impact threshold of 72 VdB, or the blasting vibration and air overpressure significance thresholds, and as a result, impacts related to excessive groundborne vibration would **be not cumulatively considerable**.

3.17 Public Services

This section evaluates the Project's impacts related to public services, which includes police and fire protection services. The *CEQA Guidelines* significance criteria for public services address impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times, or other performance objectives for fire protection, police protection, and parks. Impacts related to parks and recreation are discussed in Section 3.18, *Recreation*. The baseline used for the analysis of potential impacts to public services consists of existing conditions at time of the EIR preparation as modified by FOCP implementation.

The study area used to assess impacts related to public services is the service areas of the police and fire protection resources that serve the Project Area in the communities of the county, San José, and Morgan Hill.

The Project would not affect the enrollment for existing school facilities or contribute to any change in population or other land use modification that would affect the local school district. Furthermore, the Project would not conflict with the continued operation of the William F. James Boys Ranch juvenile detention facility, in a manner that would require new or expanded public service facilities. Impacts related to the Project resulting in the provision of new or physically altered schools or the William F. James Boys Ranch or any other non-police and non-fire public services or facilities that would cause significant environmental impacts are not addressed in this section.

3.17.1 Environmental Setting

3.17.1.1 Police Protection

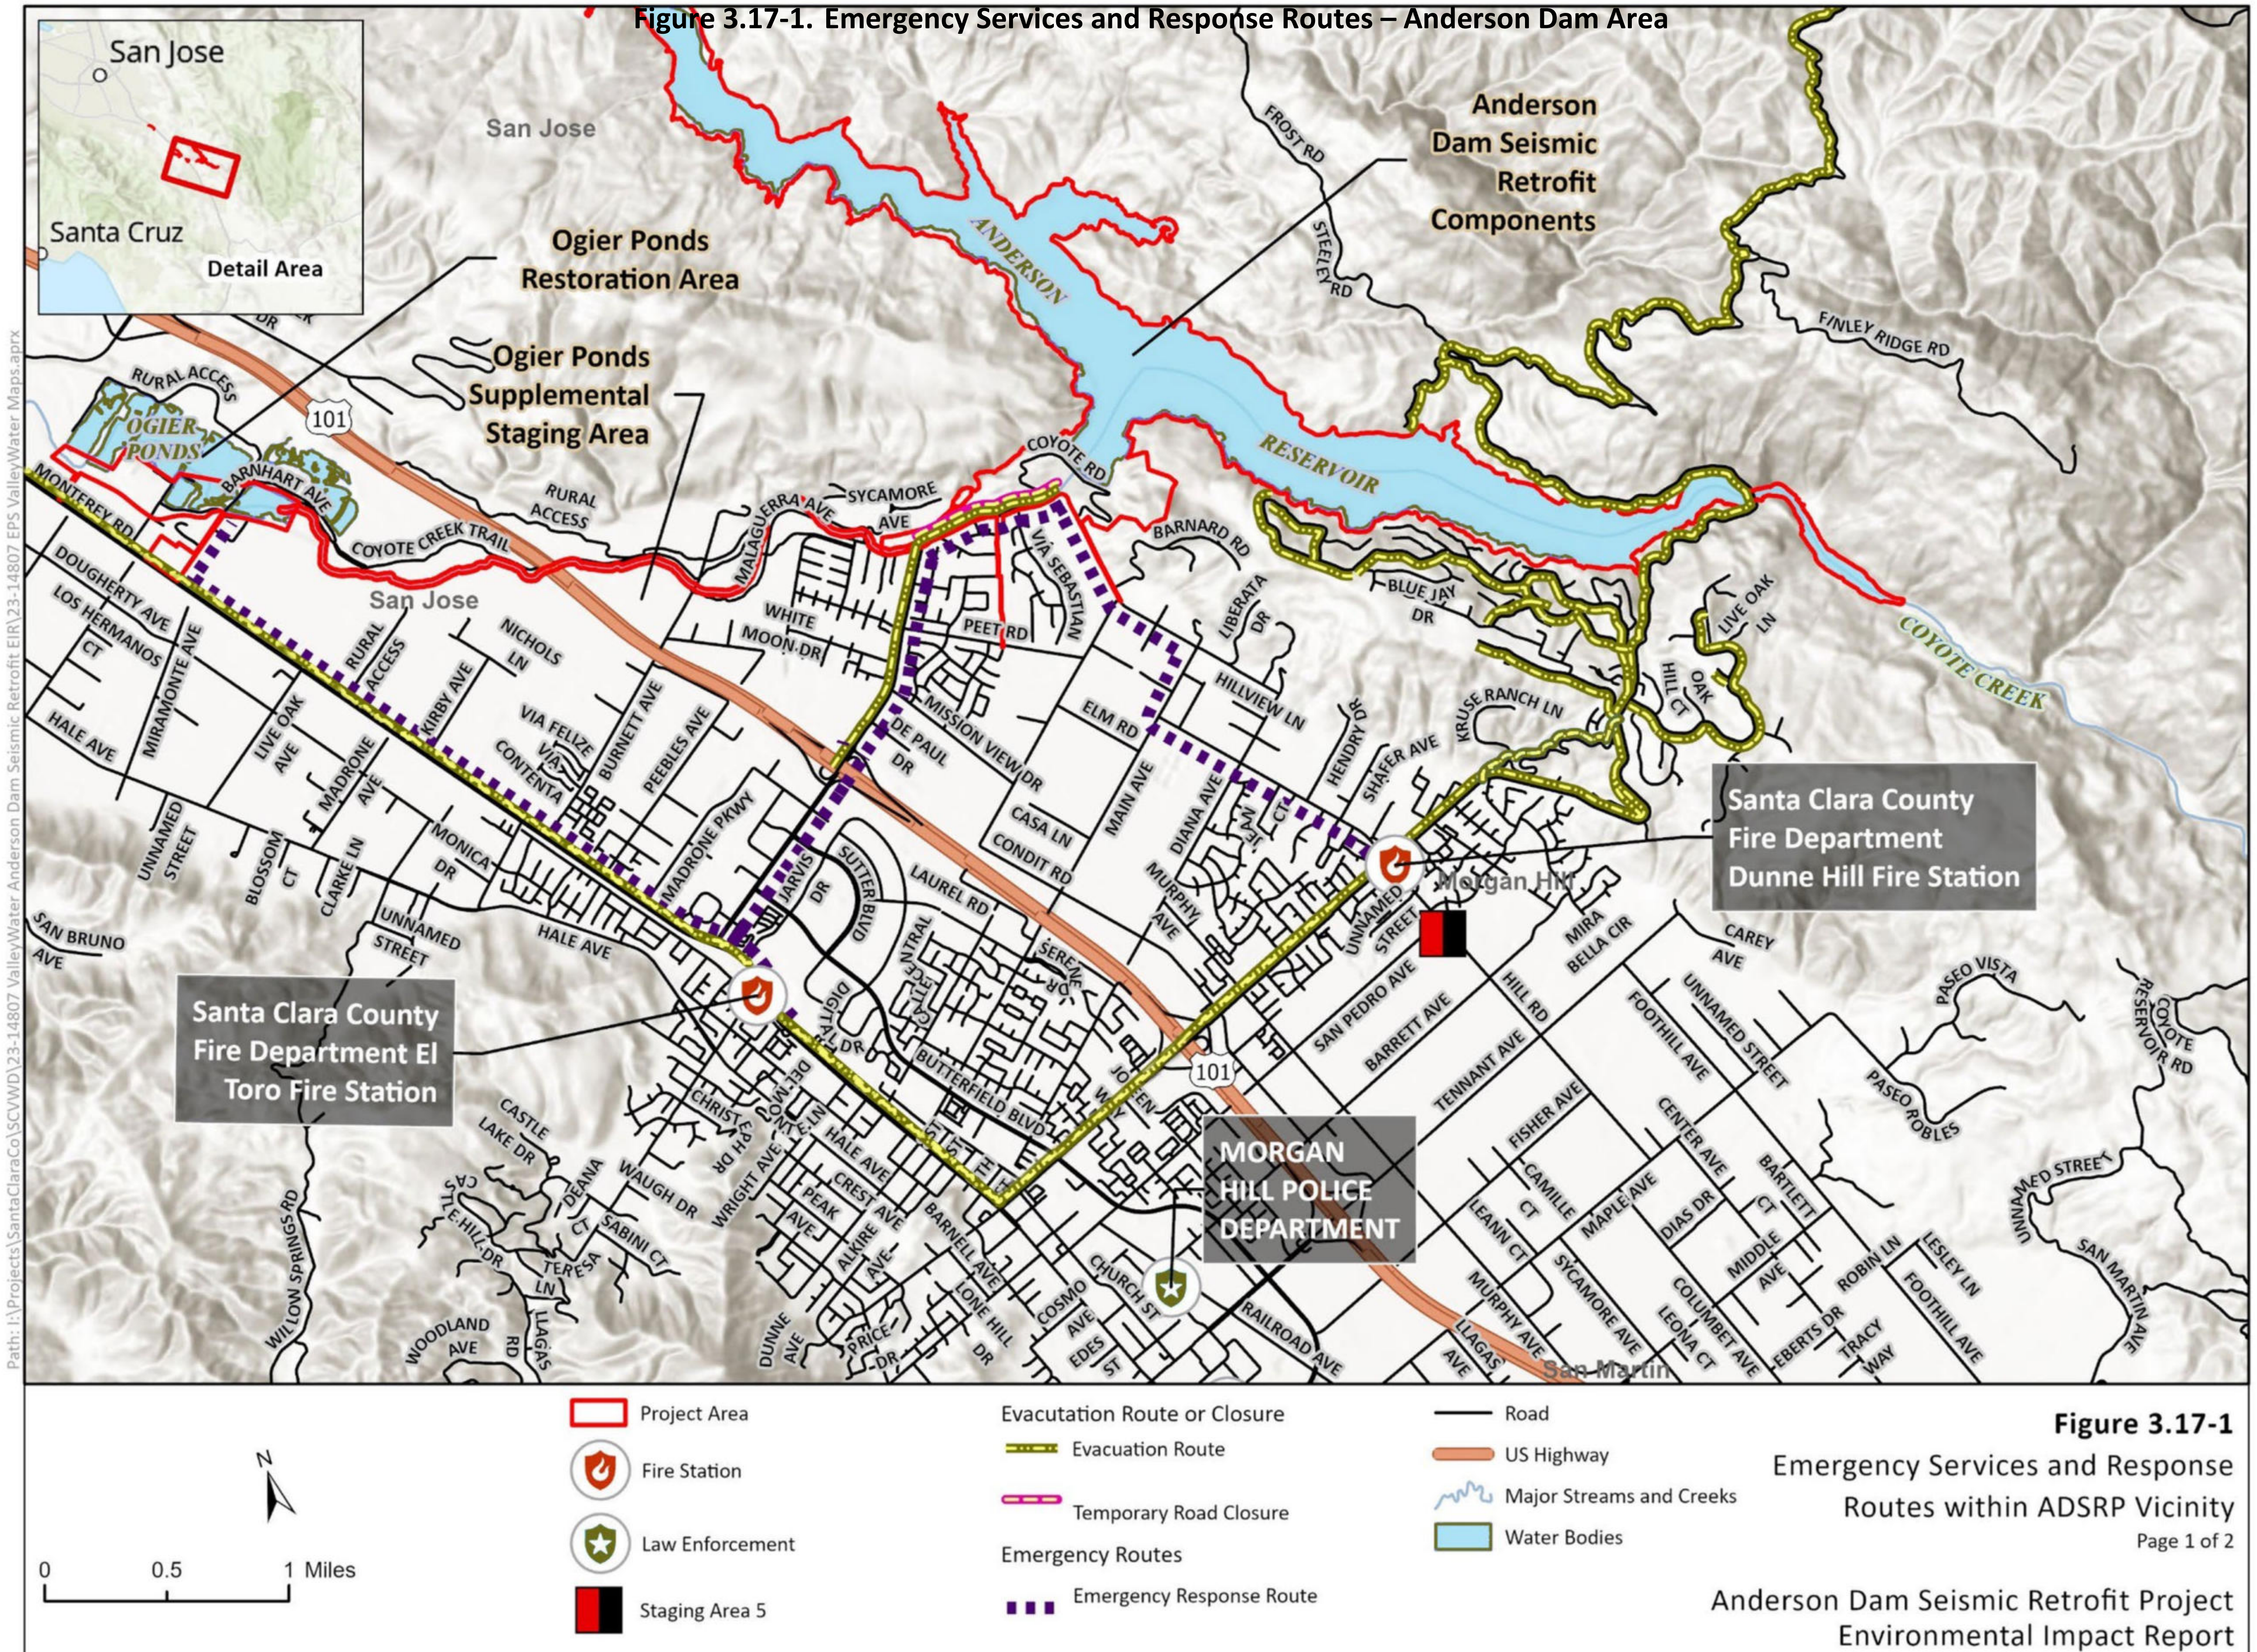
Law enforcement and public safety services in the study area are provided by a combination of departments from the County, City of San José, and City of Morgan Hill.

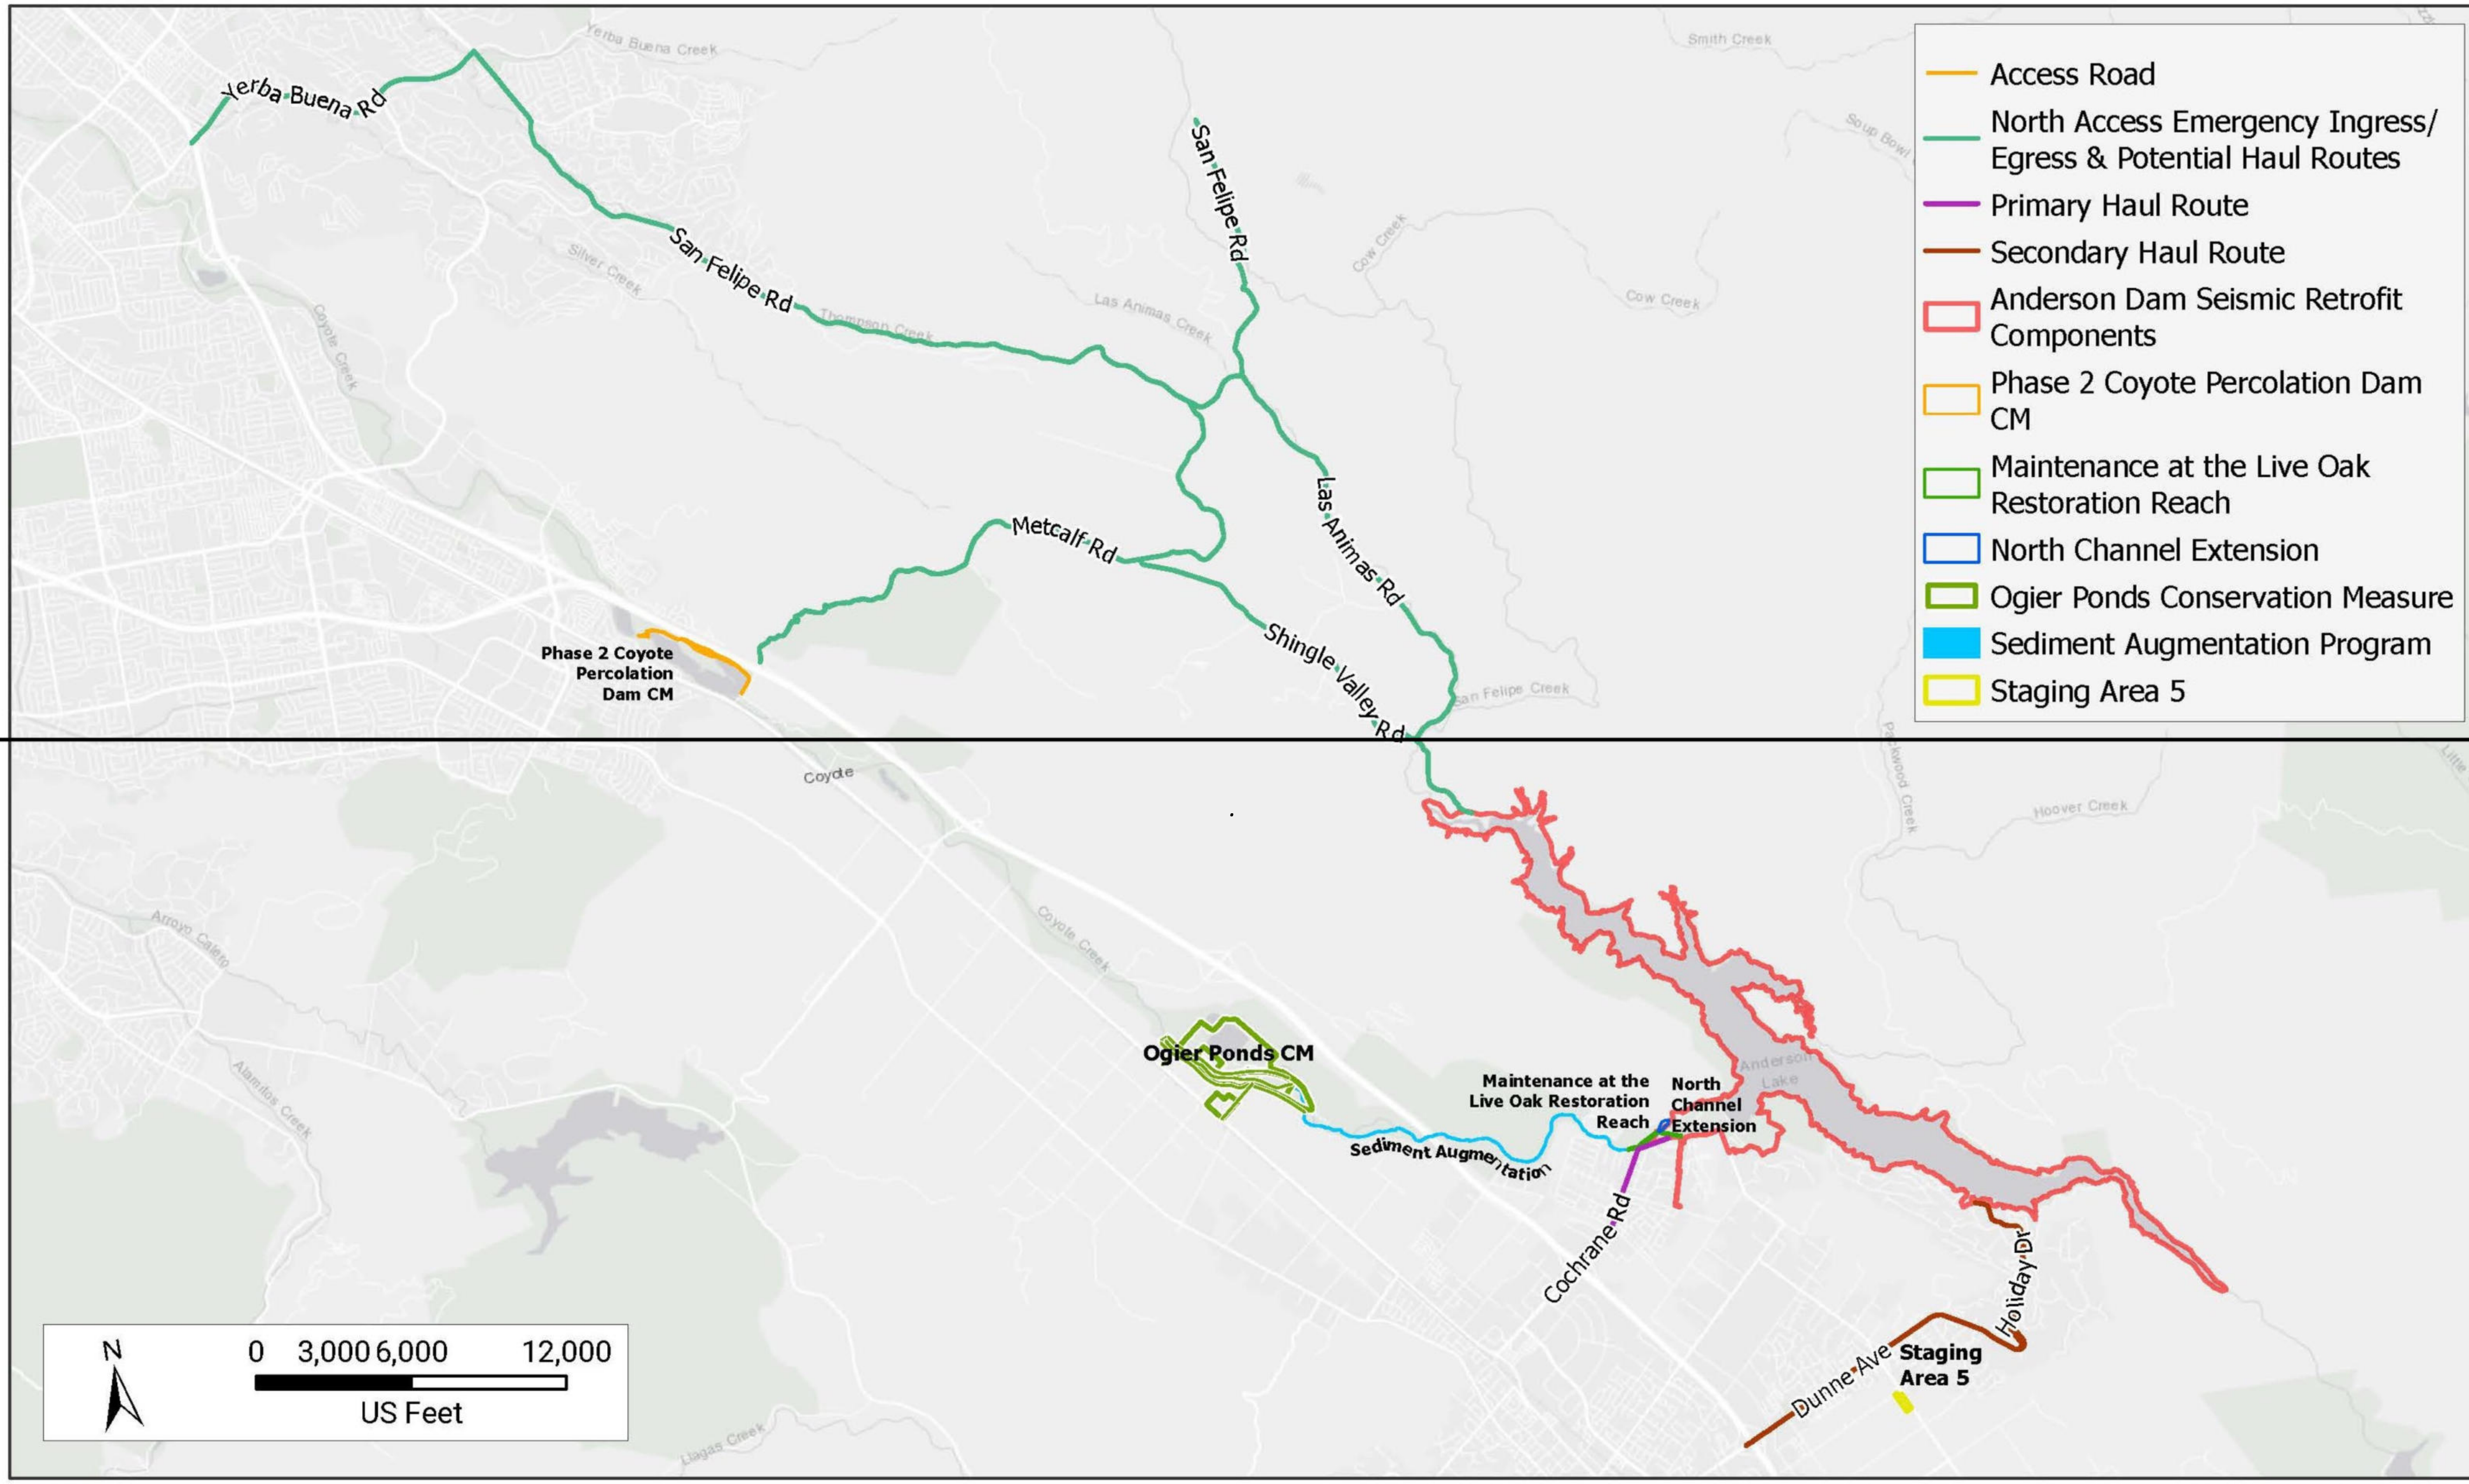
The Santa Clara County Sheriff's Office employs 2,025 personnel, of whom 1,453 are sworn law enforcement officers (Santa Clara County Sheriff's Office 2021). The Sheriff's Office is divided into four bureaus: Administrative Services, Enforcement, Custody, and Support Services.

The San José Police Department is authorized to employ approximately 1,400 employees and is divided into four bureaus: Investigations, Field Operations, Administration, and Technical Services (San José Police Department 2021). The Project is located within the San José Police Department's Southern Division. From 2020 to 2021, the San José Police Department citywide average response time for Priority 1 calls was 7.12 minutes and 22.8 minutes for Priority 2 calls (City of San José 2021). Priority 1 calls are those that represent a present or imminent danger to life or there is major damage to/loss of property while Priority 2 calls are those with injury or property damage or potential for either to occur or the suspect is still present in the area (City of San José 2021).

The Morgan Hill Police Department is separated into three divisions: Field Operations, Special Operations, and Support Services (Morgan Hill Police Department 2021). In 2021, the average response time for the Morgan Hill Police Department was 4.2 minutes (Tada, personal communication, 2022). The Morgan Hill police station is closest to the Project site, and is located at 16200 Vineyard Boulevard, Morgan Hill. This police station is approximately 3.3 miles southwest of the Project site (**Figure 3.17-1**). The Santa Clara County Sheriff's Office South County Substation is located at 80 Highland Avenue in San Martin. The Santa Clara County Sheriff's Office is approximately 6 miles south of the Project site ~~(**Figure 3.17-1**).~~

1 Figure 3.17-1. Emergency Services and Response Routes – Anderson Dam Area





BLACK & VEATCH

Figure 3.17-1 Emergency Services and Response Routes – Anderson Dam Area

Anderson Dam Seismic Retrofit Project EIR (3403-06)

August 2023

3.17.1.2 Fire Protection

The Project is located within both the SRA and Local Responsibility Area (LRA) (CAL FIRE 2007 ~~2008~~) (**Figure 3.22-1** in Section 3.22, *Wildfire*). The State of California is financially responsible for the prevention and suppression of wildfires in SRAs, while local jurisdictions are responsible in LRAs. LRAs in the Project Area include those under the jurisdiction of the City of San José and the City of Morgan Hill. The Project is also within the boundaries of the South Santa Clara Fire Protection District (SSCFPD) (SWCA 2016a). Under a cooperative agreement, CAL FIRE provides fire and emergency services to both SSCFPD and the City of Morgan Hill (Center for Public Safety Management 2017). The CAL FIRE Santa Clara Unit also serves the SRA portion of the Project Area. CAL FIRE is California's fire department and resource management agency with nearly 8,000 permanent and seasonal employees.

There are three fire stations close to the Project site (**Figure 3.17-1)**. These three fire stations are described below:

- The Morgan Hill Fire Department Dunne Hill Fire Station is located 1.9 miles southeast of the Project Area at 2100 East Dunne Avenue, Morgan Hill. The response time for 90 percent of calls for the Morgan Hill Fire Department for the period from 2016 to 2018 was 6.4 minutes or less (Citygate Associates 2019).
- The Morgan Hill Fire Department El Toro Fire Station ~~CAL FIRE Station 11~~ is located approximately 2.4 ~~3.9~~ miles southwest of the Project Area at 18300 Old Monterey Road ~~15670 Monterey Street~~ in Morgan Hill. The Morgan Hill Fire Department has an average response time of 7.0 minutes within its coverage area ~~CAL FIRE has an average response time of 7 minutes for fires in the Morgan Hill coverage area and 10.7 minutes in the South Santa Clara County Fire District coverage area~~ (Center for Public Safety Management 2017).
- Station 27 is the closest San José Fire Department station, which is located at 6027 San Ignacio Road in San José, approximately 9 miles northwest of the Project Area. From 2020 to 2021, the responded to 73 percent of Priority 1 incidents within 8 minutes (City of San José 2021). Additionally, mutual aid fire resources are available from other County fire agencies, including fire officers, fire engines, air tankers, helicopter, and hand crews (SWCA 2016b). The closest fire stations to the Project Area are shown on **Figure 3.17-1**.

Access and evacuation routes for wildfires typically overlap, with fire crews traveling towards an advancing fire as residents and visitors travel away from the fire. ~~Primary emergency~~ Emergency evacuation routes identified along the east side of the reservoir in the Holiday Lake Estates and Jackson Oaks communities include East Dunne Avenue, Holiday Drive, and Monterey Road. Local roadways within Holiday Lake Estates and Jackson Oaks that connect to East Dunne Avenue, and therefore which would provide emergency evacuation access as well, are Quail Lane/Copper Hill Drive, Jackson Oaks Drive,~~ and~~ Oak Leaf Drive, and Thomas Grade. ~~is designated as a secondary emergency travel route.~~ All-evacuation routes are directed west of US 101. ~~(Morgan Hill Community Emergency Response Team [CERT] 2016).~~ Cochrane Road is the main road for the area west of Anderson Dam and provides access to US 101. Therefore, it could be used by emergency vehicles and may be used as an evacuation route by residents in the event of an emergency. Evacuation routes are shown on **Figure 3.17-1**. Additionally, the Project includes construction of temporary access/haul roads that would not serve as evacuation routes to the public, but would allow emergency access to the Project site. Specifically, Las Animas Road and Shingle Valley Road would provide emergency access to the Project site via the constructed Shingle Valley Haul Road.

~~Starting October 1, 2020, the FOCP construction and operation resulted in the closure Woodchopper's Flat Picnic Area in Anderson Lake County Park. The Woodchopper's Flat Picnic Area is designated as a temporary refuge area during a wildfire (Morgan Hill CERT 2016). The Woodchopper's Flat would remain closed throughout the duration of construction but would be restored and reopened following construction of the Project.~~ [1]

3.17.2 Regulatory Setting

This section summarizes laws, regulations, and policies pertinent to the evaluation of the Project's impacts on public services. No specific federal regulations related to public services are applicable to the Project.

3.17.2.1 State Laws, Regulations, and Policies

California Master Mutual Aid Agreement

The California Master Mutual Aid Agreement is a framework agreement between the State of California and local governments that provides for aid and assistance through the interchange of services and facilities. This aid agreement includes, but is not limited to, the following: fire, police, medical and health, communication, and transportation services, as well as facilities to cope with issues related to rescue, relief, evacuation, rehabilitation, and reconstruction.

California Fire Code

The California Fire Code (Title 24 CCR, Part 9) establishes minimum requirements to safeguard public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings, including state essential services facilities. Chapter 33 of the CCR contains requirements for fire safety during construction and demolition as follows:

> **3304.1 Smoking.** Smoking shall be prohibited except in approved areas. Signs shall be posted in accordance with Section 310. In approved areas where smoking is permitted, approved ashtrays shall be provided in accordance with Section 310.
>
> **3304.2 Combustible debris, rubbish and waste.** Combustible debris, rubbish and waste material shall comply with the requirements of Sections 3304.2.1 through 3304.2.4.
>
> **3304.2.1 Combustible waste material accumulation.** Combustible debris, rubbish and waste material shall not be accumulated within buildings.
>
> **3304.2.2 Combustible waste material removal.** Combustible debris, rubbish and waste material shall be removed from buildings at the end of each shift of work.

[1] Woodchopper's Flat was identified as a temporary refuge area by the City of Morgan Hill's Community Emergency Response Team in 2016. However, per communications with the City of Morgan Hill on April 22, 2024, the Community Emergency Response Team map that identifies Woodchopper's Flat as a refuge area is outdated (Jennifer Ponce pers. comm.). Accordingly, Woodchopper's Flat is no longer considered a temporary refuge area and is no longer considered in this analysis.

3304.2.3 Rubbish containers. Where rubbish containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m^3 [cubic meter]) are used for temporary storage of combustible debris, rubbish and waste material, they shall have tight-fitting or self-closing lids. Such rubbish containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kilowatt per square meter (kW/m^2) when tested in accordance with American Society for Testing and Materials E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

3304.2.4 Spontaneous ignition. Materials susceptible to spontaneous ignition, such as oily rags, shall be stored in a listed disposal container.

3304.6 Cutting and welding. Operations involving the use of cutting and welding shall be done in accordance with Chapter 35.

3304.7 Electrical. Temporary wiring for electrical power and lighting installations used in connection with the construction, alteration or demolition of buildings, structures, equipment or similar activities shall comply with the California Electrical Code.

3308.1 Program superintendent. The owner shall designate a person to be the fire prevention program superintendent who shall be responsible for the fire prevention program and ensure that it is carried out through completion of the Project. The fire prevention program superintendent shall have the authority to enforce the provisions of this chapter and other provisions as necessary to secure the intent of this chapter. Where guard service is provided, the superintendent shall be responsible for the guard service.

3308.2 Prefire plans. The fire prevention program superintendent shall develop and maintain an approved prefire plan in cooperation with the fire chief. The fire chief and the fire code official shall be notified of changes affecting the utilization of information contained in such prefire plans.

3310.1 Required access. Approved vehicle access for firefighting shall be provided to all construction or demolition sites. Vehicle access shall be provided to within 100 feet of temporary or permanent fire department connections. Vehicle access shall be provided by either temporary or permanent roads, capable of support vehicle loading under all weather conditions. Vehicle access shall be maintained until permanent fire apparatus access roads are available.

3316.1 Conditions of use. Internal combustion–powered construction equipment shall be used in accordance with all of the following conditions:

1. Equipment shall be located so that exhausts do not discharge against combustible material.
2. Exhausts shall be piped to the outside of the building.
3. Equipment shall not be refueled while in operation.
4. Fuel for equipment shall be stored in an approved area outside of the building.

3.17.2.2 Regional and Local Laws, Regulations, and Policies

Laws, regulations, and policies governing the Project Area are implemented and enforced at the local or regional level. Local Laws, regulations, and policies that are applicable to the Project are described below.

Santa Clara County General Plan

- Policy C-PR 2: Sufficient land should be acquired and held in the public domain to satisfy the recreation needs of current and future residents and to implement the trailside concept along our scenic roads.
- Policy C-PR 14: Parks and recreation system planning, acquisition, development, and operation should be coordinated among cities, the County, State and Federal governments, school districts and special districts, and should take advantage of opportunities for linkages between adjacent publicly owned parks and open space lands.
- Policy C-GD 34: Planning must ensure that adequate services and amenities are available to urban areas proposed for compact development and/or mixed use centers, including but not limited to adequate: a. urban open space, commons, and recreational spaces; b. public safety and security; c. urban services and infrastructure, including dependent care and school facilities; and d. transportation system capacity, both streets and transit services.
- Policy C-GD 55: Coordination between school districts and cities should be improved to the extent necessary to resolve common problems stemming from urban growth and development.
- C-HS 22 Ensure that critical emergency services and equipment normally provided by outside agencies will be available in each jurisdiction to the extent possible (i.e., public health, mental health, coroner, fire suppression, etc.)
- R-HS 7 Areas of significant natural hazards, especially high or extreme fire hazard, shall be designated in the County's General Plan as Resource Conservation Areas, with generally low development densities in order to minimize public exposure to risks associated with natural hazards and limit unplanned public costs to maintain and repair public infrastructure
- R-HS 26 For communities in areas of high or extreme fire hazard that have developed under development densities greater than generally allowed under current General Plan policies, water systems with hydrants should be provided wherever feasible.
- R-HS 27 The County should encourage the use of fire-retardant building materials and landscaping not already required by County development and building codes when new development and rebuilding are proposed in areas of high or extreme fire hazard.
- R-HS 28 Development projects shall be reviewed by the County Fire Marshall's Office for safety code compliance and should also be referred if necessary to the appropriate fire protection authority or district for further review and recommendations

Envision San José 2040 General Plan

The Envision San José 2040 General Plan (General Plan)[2] contains the following relevant policies related to public services:

> **Policy ES-1.9:** Provide all pertinent information on 2040 General Plan amendments, rezonings and other development proposals to all affected school districts in a timely manner.
>
> **Policy ES-2.2:** Construct and maintain architecturally attractive, durable, resource-efficient, and environmentally healthful library facilities to minimize operating costs, foster learning, and express in built form the significant civic functions and spaces that libraries provide for the San José community. Library design should anticipate and build in flexibility to accommodate evolving community needs and evolving methods for providing the community with access to information sources. Provide at least 0.59 square feet of space per capita in library facilities.
>
> **Policy ES-2.3:** Prioritize Neighborhood Business Districts, Urban Villages, and other commercial areas as preferred locations for branch libraries to encourage social activity and economic development in San José's neighborhoods.
>
> **Policy ES-2.8:** Measure Library service delivery to identify the degree to which library activities are meeting the needs of San José's community.
>
> **Policy ES-2.9:** Foster a high-performing, collaborative library system responsive to changing customer and community needs.
>
> **Policy ES-3.1:** Provide rapid and timely Level of Service response time to all emergencies:
>
> 1. For police protection, achieve a response time of six minutes or less for 60 percent of all Priority 1 calls, and eleven minutes or less for 60 percent of all Priority 2 calls.
> 2. For fire protection, achieve a total response time (reflex) of eight minutes and a total travel time of four minutes for 80 percent of emergency incidents.
> 3. Enhance service delivery through the adoption and effective use of innovative, emerging techniques, technologies and operating models.
> 4. Measure service delivery to identify the degree to which services are meeting the needs of San José's community.
> 5. Ensure that development of police and fire service facilities and delivery of services keeps pace with development and growth in the city.
>
> **Policy ES-3.3:** Locate police and fire service facilities so that essential services can most efficiently be provided and level of service goals met. Ensure that the development of police and fire facilities and delivery of services keeps pace with development and growth of the city.

---

[2] City of San José 2023, Envision San José 2040 General Plan, adopted November 1, 2011 (amendedMay 12, 2023 ~~March 16, 2020).~~ Available at https://www.sanjoseca.gov/home/showdocument?id=22359. Accessed June 21, 2023.

Policy ES-3.4: Construct and maintain architecturally attractive, durable, resource-efficient, environmentally sustainable and healthful police and fire facilities to minimize operating costs, foster community engagement, and express the significant civic functions that these facilities provide for the San José community in their built form. Maintain City programs that encourage civic leadership in green building standards for all municipal facilities.

Policy ES-3.5: Co-locate public safety facilities with other public or private uses to promote efficient use of space and provision of police and fire protection services within dense, urban portions of the city.

Policy ES-3.6: Work with local, State, and Federal public safety agencies to promote regional cooperation in the delivery of services. Maintain mutual aid agreements with surrounding jurisdictions for emergency response.

Policy ES-3.11: Ensure that adequate water supplies are available for fire-suppression throughout the City. Require development to construct and include all fire suppression infrastructure and equipment needed for their projects.

Activate San José Strategic Plan

Activate San José (ActivateSJ) is the 20-year strategic plan established by Parks, Recreation and Neighborhood Services to maintain, improve, and expand facilities, programs, and services in San José (City of San José 2019). Goals of the plan include:

- Focus efforts on improving the condition of parks and trails.
- Develop and effectively manage a 100-mile paved off-street trail network.
- Seek sustainable funding mechanisms for the parks and recreation system.
- Ensure that all San José residents can walk to a neighborhood park in 10 minutes.
- Continue to pursue the General Plan goal of 3.5 acres of parkland per 1,000 people.

San José Municipal Code

The following chapters of the San José Municipal Code contain relevant provisions pertaining to fire protection and emergency services:

- **Chapter 17.12 (City of San José Fire Code)** adopts the 2019 California Fire Code, with local amendments related to fire flow; sprinkler and fire alarm systems and standards; lithium batteries; 3D printing additive manufacturing; mobile fueling; plant production extraction processing systems; and highly toxic, toxic, and moderately toxic gases; and maintenance of existing fire protection and regulatory authority.
- **Chapter 17.68 (Hazardous Materials Storage Permit)** describes the requirements for storage of hazardous materials, including flammable and combustible liquids classified by the NFPA. These requirements include acquiring a storage permit, developing and submitting a Hazardous Materials Management Plan, and complying with requirements for storage, transportation, monitoring and inspection, and secondary containment. The Hazardous Materials Management Plan must include an emergency response plan that describes emergency equipment availability, testing, and maintenance.

- **Chapter 17.82 (Fire Safety during Construction)** is intended to minimize the potential for the occurrence and spread of fires, and to facilitate firefighting efforts, during construction of wood frame buildings. Chapter 17.82 requires that a construction fire protection plan be prepared before issuance of a building permit for any building involving wood frame construction. The plan must be approved by the fire chief and must specify how off-hours security will be addressed, and how construction sequencing—including the installation of mitigating fire protection barriers—will be used to minimize the potential for the occurrence and spread of fire.

Morgan Hill General Plan

Goal SSI-3 Minimal threat to persons, property, and the environment from fire hazards.

Policy SSI-3.2 Wildfire Risks. Avoid actions which increase fire risk, such as increasing public access roads in fire hazard areas, because of the great environmental damage and economic loss associated with a large wildfire. (South County Joint Area Plan 15.04)

Policy SSI-3.3 Public Facilities Location. Locate, when feasible, new essential public facilities outside of high fire risk areas, including, but not limited to, hospitals and health care facilities, emergency shelters, emergency command centers, and emergency communications facilities, or identify construction methods or other methods to minimize damage if these facilities are located in a state responsibility area or very high fire hazard severity zone.

Policy SSI-3.4 Adequate Infrastructure. Design adequate infrastructure if a new development is located in a state responsibility area (SRA) or in a very high fire hazard severity zone (VHFHSZ) or high fire hazard severity zone (HFHSZ) as indicated on the City of Morgan Hill Wildland Urban Interface map (adopted March 18, 2009), including safe access for emergency response vehicles, visible street signs, and water supplies for structural fire suppression.

Policy SSI-3.5 Fire Risks. Work cooperatively with CAL FIRE and other public agencies with responsibility for fire protection to reduce fire risks in Morgan Hill.

Policy SSI-3.6 Fire Hazard Severity Zones. Continue to support special High Fire Hazard Severity Zone requirements.

Policy SSI-3.7 Inspection Program. Maintain a long range inspection program for fire prevention with highest priority established by the level of occupancy (high density uses – hotels apartments, offices, theaters and churches) and the nature of occupancy (schools, hospitals, jails and nursing homes). Update all information regarding hazardous areas to reflect current knowledge. (South County Joint Area Plan 15.11)

Goal SSI-11 Efficient police, fire, and emergency medical response and services, and access to local medical facilities.

Policy SSI-11.1 Staffing. Provide police and fire staffing and facilities as necessary to provide adequate public safety protection.

Policy SSI-11.2 Prevention through Design. Promote police and fire security considerations in all structures by ensuring that crime and fire prevention concepts are considered in development and design.

Policy SSI-11.3 Medical Services. Encourage provision of a full range of medical services in the city, including an acute care hospital.

Goal SSI-12 Reduce risk to life and property associated with emergencies and natural and manmade disasters.

Policy SSI-12.1 Emergency Response Public Awareness. Promote public awareness of potential disaster scenarios for Morgan Hill and encourage individual preparedness.

Policy SSI-12.2 Emergency Response Education. Provide education and support to neighborhood- or block level efforts to prepare for disasters.

Policy SSI-12.3 Disaster Preparedness. Maintain an adequate level of disaster response preparedness through careful review of proposed developments and through staff training in and exercise of the local hazard mitigation plan.

Policy SSI-12.4 Maintenance of Emergency Access Routes. Require that emergency access routes be kept free of traffic impediments.

Policy SSI-12.5 Emergency Response Plan. Maintain comprehensive Emergency Response Plans.

Policy SSI-12.6 Accessibility. Continue restricting development in areas of poor accessibility. Discourage development in areas where access is provided by a single road that could be damaged by faulting or landslides, or where access could be cut off by wildfires, trapping residents or workers. (South County Joint Area Plan 15.07)

Goal HC-3 Usable, complete, well-maintained, safe, and high-quality activities and amenities, including active and passive parks and recreational facilities, community gardens, and trails that are accessible to all ages, functional abilities, and socio-economic groups.

Policy HC-3.20 Safety. Incorporate fire and police services into the design review process for new parks, recreation facilities, and trails.

3.17.3 Methodology and Approach to Impact Analysis

This section describes the methodology and approach to impact analysis for public services. The impact analysis focuses on reasonably foreseeable effects of the Project based on a review of local planning documents and maps. Based on the review of these local planning documents and maps, the analysis determines whether the Project would result in significant impacts related to public services. The analysis considers temporary impacts, or short-term impacts that may occur during the 7-year construction period, as well as permanent impacts, or impacts considered to be long-term and/or that would result from ongoing facility operations and maintenance. The baseline used for the analysis of potential impacts to public services is the existing conditions baseline, which consists of conditions at time of the EIR preparation as modified by FOCP implementation.

The direct and indirect effects of the Project are described and evaluated according to significance criteria from Appendix G of the *CEQA Guidelines*. The impact assessment in this section has been described by Project component in two parts, one for the construction-related impacts and another for the operations and maintenances-related impacts for both the Seismic

Retrofit components and the Conservation Measure components. The Project components are described in **Table 2-1** of Chapter 2, *Project Description*. Additional information on impact assessment approach by Project component is provided below.

3.17.3.1 Seismic Retrofit Construction

The location and nature of Seismic Retrofit construction activities are considered in the context of existing public services, wherein they provide service to areas within or immediately adjacent to the study area. The impact analysis considers the potential for construction of the Seismic Retrofit component to result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times, or other performance objectives for fire protection and police protection services. The potential for Seismic Retrofit components construction activities to require new or physically altered public services facilities is evaluated.

As described in Section 3.0, *Introduction*, the baseline for evaluating Seismic Retrofit components construction effects is the existing conditions following completion of the FOCP upgrades to the existing dam and reservoir facilities.

3.17.3.2 Conservation Measures Construction

The potential for conservation measure construction activities to require new or physically altered public services facilities is evaluated. As described in Section 3.0, *Introduction,* the baseline used for evaluating impacts to public services is the existing conditions baseline, which consists of existing conditions at the time of the EIR preparation as modified by FOCP implementation. Construction activity impacts are re-evaluated for the following Conservation Measures:

- Ogier Ponds CM
- Maintenance of the North Channel Reach ~~Extension~~
- Maintenance Activities at Live Oak Restoration Reach
- Sediment Augmentation Program
- Phase 2 Coyote Percolation Dam CM

3.17.3.3 Construction Monitoring

Construction monitoring activities are not considered in the public services impact analysis, as the construction monitoring plans and activities would involve data and information collection and assessment within the existing Valley Water facilities and would not result in direct or indirect adverse impacts to public services. Thus, construction monitoring is not discussed further in this section.

3.17.3.4 Post-Construction Anderson Dam Facilities Operations and Maintenance

The analysis considers the impacts related to public services that would result from operational changes proposed for nonemergency flow releases following completion of the Seismic Retrofit components construction, as described in Chapter 2, *Project Description*. As described in Section 3.0, *Introduction*, the baseline used for the analysis of potential impacts to utilities consists of existing conditions at time of the EIR preparation as modified by FOCP implementation.

Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain the newly retrofitted Anderson Dam per Valley Water's existing DMP. Maintenance of the Anderson Dam facilities was evaluated previously in the Final DMP Program EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). The DMP found no impacts on public services would result. Impacts on public services related to post-construction maintenance activities would not differ from those impacts identified in the DMP EIR. Furthermore, previously identified DMP impacts would not be exacerbated with implementation of the Project. Therefore, no new impacts would occur as a result of post-construction dam maintenance activities. For these reasons, post-construction dam maintenance activities are not discussed further in this section.

3.17.3.5 Post-Construction Conservation Measures Operations and Maintenance

The Conservation Measures components focus on improving fish habitat (e.g., gravel augmentation, separation of Coyote Creek from Ogier Ponds, and fish passage enhancement). Conservation measures would operate passively, without mechanical or human intervention, in conjunction with Anderson Dam Reservoir flow releases. Conservation measures would be reviewed to ensure that they are satisfying success criteria.

The operations and maintenance of the Conservation Measure components would not result in a need for new or expanded public service facilities. BMPs, discussed in Section 3.17.3.7., will be implemented as part of the Project that would minimize potential impacts related to public services during operation and maintenance activities. Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain the newly retrofitted Anderson Dam and Reservoir per Valley Water's existing DMP. Maintenance of Anderson Dam facilities was previously evaluated in the Final DMP EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). Therefore, operations and maintenance of Conservation Measures would not result in an impact related to public services. Thus, these topics are not discussed further in this section.

3.17.3.6 Post-Construction Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of ~~project~~ Project flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). Impacts of these monitoring activities are not evaluated in the impact analysis because these activities would not require police or fire protection services, or otherwise generate the need for expanded services such that it would affect the environment.

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from original Conservation Measure construction. These impacts are considered here at a programmatic level, because the detailed characteristics, timing, and/or locations of the proposed adaptive measures are not known at the time of EIR preparation. Project-specific CEQA review would be undertaken in the future, as necessary, when specific projects are proposed and project-specific details are available.

3.17.3.7 Applicable Best Management Practices and VHP Conditions

As noted in Chapter 2, *Project Description*, Valley Water would incorporate a range of BMPs, including measures from the VHP, to avoid and minimize adverse effects on the environment that could result from the Project. All relevant BMPs for the Project are included in Appendix A, *Best Management Practices and Santa Clara Valley Habitat ~~Conservation~~ Plan Conditions, Avoidance and Minimization Measures, and Mitigation Measures ~~Incorporated in the Project.~~* There are no relevant VHP conditions that would apply to public services. BMPs relevant to public services include the following:

HM-8: Ensure Proper Vehicle and Equipment Fueling and Maintenance – Would reduce the potential for accidental upset of hazardous materials.

HM-9: Ensure Proper Hazardous Materials Management – Would reduce the potential for accidental upset of hazardous materials.

HM-12: Incorporate Fire Prevention Measures – Would reduce the potential for fire ignition.

TR-1: Use Suitable Public Safety Measures – Would reduce the potential for safety impacts on traffic.

3.17.3.8 Thresholds of Significance

For the purposes of this analysis, the Project would result in a significant impact on public services if it would:

PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times, or other performance objectives for fire protection (criterion a.i)

PS-2: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times, or other performance objectives for police protection (criterion a.ii).

3.17.3.9 Issues Dismissed from Further Review

CEQA Guidelines Appendix G suggests that projects may have a significant impact on public services if the project would result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, to maintain acceptable service ratios, response times, or other performance objectives for schools (criterion a.iii), parks (criterion a.iv), and other public facilities (criterion a.v). Because the Project would not affect enrollment for existing school facilities or contribute to any change in population or other land use modification that would affect the local school district, there would be no impact associated with the need to expand any school facilities and this threshold is dismissed from further environmental evaluation (criterion a.iii). Although the County-operated William F. James Boys Ranch juvenile detention facility is located immediately adjacent to the Project Area within 2,000 feet of the spillway, the Project would not conflict with the continued operation of this County-operated facility in a manner that would require new or expanded public service facilities; there would be no impact to this or any other non-police and non-fire public services or facilities, and this threshold is dismissed from further environmental evaluation (criterion a.v).

The Project's potential impacts to parks are discussed in Section 3.18, *Recreation*, under Impact REC-2 (criterion b).

3.17.4 Impact Analysis

***Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection* (Less than Significant with Mitigation)**

Seismic Retrofit Construction

As discussed in Section 3.22, *Wildfire*, CAL FIRE has historically used Anderson Reservoir as a source of water for firefighting via helicopter. Even at its post-FOCP implementation condition at deadpool, the reservoir water depth far exceeds CAL FIRE's minimum depth requirements and clearance criteria for helicopter water retrieval operations and Anderson Reservoir is an available firefighting resource (Valley Water 2020). Following complete dewatering of the reservoir for construction (as proposed to occur during Year 2 and to remain dewatered until the proposed refilling during Year 6), CAL FIRE would be temporarily unable to access Anderson

Reservoir water for emergency fire protection services; however, multiple nearby water sources in the vicinity, including Coyote, Chesbro, and Uvas Reservoirs, that are available for firefighting uses would provide sufficient water for fire protection services during the construction of the Seismic Retrofit components. During a November 2, 2020, meeting between Valley Water and CAL FIRE, CAL FIRE did not express any concerns over lack of access to water for firefighting during the time when Anderson Reservoir is drawn down to deadpool or when drained completely during construction (Valley Water 2020). Therefore, temporary reduction in water supply provided by Anderson Reservoir for emergency services would not result in significant alterations to fire service ratios or response times due to increased distance to water supply sources, which would be maintained during Seismic Retrofit construction. Thus, there would be no need for the construction of new or the physical alteration of fire protection facilities as a result of the proposed dewatering during construction.

As discussed in Section 3.22, *Wildfire*, construction of the Seismic Retrofit components would include use of equipment that could generate sparks or extreme heat during the dry summer months when fire danger is the highest. The increased potential for accidental ignition of a wildfire as a result of Seismic Retrofit components construction could lead to the need for additional fire protection services and equipment. Implementation of BMP HM-12 (Incorporate Fire Prevention Measures) would minimize impacts by requiring on-site fire suppression equipment, spark arrestors on all equipment with internal combustion engines, and prohibiting smoking except in designated staging areas. Implementation of BMP HM-12 would minimize the risk of accidental ignition such that the Seismic Retrofit construction is unlikely to exacerbate wildfire risk and would not require additional firefighting facilities. Furthermore, construction would be required to comply with the requirements of the California Fire Code, which would require the removal of combustible materials, proper containment of oily, combustible materials, the development and implementation of pre-fire plans, compliance with the California Electrical Code for the provision of temporary electrical facilities, and provision of fire access within 100 feet of construction activities. Therefore, the increased risks of wildfires associated with the Seismic Retrofit construction would not result in the need for construction of new or the physical alteration of fire protection facilities.

As discussed in Section 3.10, *Hazards and Hazardous Materials*, construction of Seismic Retrofit components would involve use of hazardous materials, such as fuels. Hazardous materials (e.g., fuel, oil, or lubricant) may need to be stored temporarily at staging areas. Fueling and maintenance of vehicles and equipment would introduce the potential for upset or accident conditions, which could require fire protection services. Implementation of BMP HM-8 (Ensure Proper Vehicle and Equipment Fueling and Maintenance) and HM-9 (Ensure Proper Hazardous Materials Management) will minimize the potential of accidental upset of hazardous materials and, therefore, the potential need for increased fire protection services by ensuring proper vehicle and equipment fueling and maintenance methods are followed and implementing proper handling and storage of hazardous materials. Additional information regarding the impacts associated with the Seismic Retrofit construction on hazardous materials are discussed in Section 3.10, *Hazards and Hazardous Materials*. Therefore, hazardous material used during construction would not result in the need for the construction of new or the physical alteration of fire protection facilities.

As discussed in both Section 3.19, *Transportation* and the Section 3.10, *Hazards and Hazardous Materials*, the Seismic Retrofit construction would generate a temporary increase in vehicle traffic in the immediate vicinity of the construction area from workers, equipment deliveries, and trucks during its 7-year construction period. Increased vehicle traffic would have an impact on emergency service vehicle response times, including fire protection services. Additionally, a portion of Cochrane Road would be temporarily closed to through traffic on four separate occasions during construction (see Section 2.5.2.3 for additional details). However, the road could be used by fire protection vehicles in the event of an emergency.

As discussed in Section 3.19, *Transportation*, access for emergency vehicles would be accommodated through construction zones and road or lane closures, as necessary Furthermore, traffic impacts on emergency response would be minimized through implementation of BMP TR-1 (Incorporate Public Safety Measures) which requires implementation of construction warning signs, safety fencing, and detours. However, a significant impact related to emergency response time, that might require construction of new temporary emergency access roads that might cause significant impacts, would still remain. Implementation of **Mitigation Measure PS-1** will further reduce impacts on emergency response by requiring the preparation and implementation of a TMP and coordination with local and State agencies, including fire protection services and first responders. In addition, as discussed in Section 3.22, *Wildfire*, **Mitigation Measure WF-1** would minimize the impact of road closures on emergency access ~~of an identified temporary refuge area (Woodchopper's Flat Picnic Area)~~ by requiring coordination with local and state emergency response and fire agencies and preparation of Response and Evacuation Strategy (RES) to maintain adequate emergency response and evacuation routes throughout construction of the Project in locations where Project construction substantially interferes with emergency access and evacuation ~~identify an alternative temporary refuge area or provide emergency access~~ during construction of the seismic retrofit components in the event of a wildfire. Therefore, there would be no need to construct new temporary emergency access roads. With implementation of these mitigation measures, the construction of Seismic Retrofit components would not have a significant impact on response times that would require new or physically altered firefighting facilities.

Although Seismic Retrofit construction could result in an increase in calls for fire protection services, implementation of **Mitigation Measure PS-1**, which will require preparation of a TMP and coordination with agencies to minimize impacts on emergency response times, and **Mitigation Measure WF-1**, which will require coordination with local and State emergency response agencies and ~~to~~ preparation of a RES ~~identify an alternative temporary refuge area~~, will help ensure that the Seismic Retrofit construction will not require new or physically altered fire facilities to maintain acceptable performance standards. As such, construction of Seismic Retrofit components would not result in significant impacts associated with an increased need for new or physically altered fire protection facilities. Therefore, impacts would be less than significant with mitigation.

Conservation Measure Construction

Construction activities associated with Conservation Measure components, including the Ogier Ponds CM, the Phase 2 Coyote Percolation Dam CM, Maintenance of the North Channel Reach ~~Extension~~, Sediment Augmentation Program, and Maintenance Activities at the Live Oak Restoration Reach, would be similar to those described above for the Seismic Retrofit components but on a smaller scale. Construction of the Conservation Measures components would pose a risk of accidental ignition of a wildfire, use and storage of hazardous materials and associated risk of upset, and temporary increases and disruptions in vehicle traffic in and around construction work areas due to operation and temporary storage of large construction equipment, construction worker trips to and from the sites, and transportation of construction material which may lead to increased needs for fire protection services and equipment and impede emergency response times.

However, as described above, implementation of BMPs HM-8, HM-9, and TR-1 will minimize impacts associated with hazardous materials and traffic disruptions by ensuring proper vehicle and equipment fueling and maintenance methods are followed, implementing proper handling and storage of hazardous materials, and implementing construction warning signs, safety fencing, and detours. However, there would still be a significant impact related to impeding emergency response time from traffic disruptions, which might require construction of new temporary emergency access roads, which could cause significant impacts. With implementation of **Mitigation Measure PS-1**, which requires preparation of a TMP and coordination with fire protection services and first responders would reduce these risks, and **Mitigation Measure WF-1**, which requires coordination with local and State emergency response agencies ~~to~~ and preparation of a RES ~~identify an alternative temporary refuge area,~~ construction of the Conservation Measures components would not result in significant impacts associated with an increased need for new or physically altered fire protection facilities. Impacts would be less than significant with mitigation.

Post-Construction Anderson Dam Facilities Operations

Following construction of the Seismic Retrofit components, Anderson Reservoir capacity would be restored to its unrestricted capacity, which is over 88,8800-AF ~~capacity~~, which would then be able to support firefighting services in the region. Post-construction releases from Anderson Reservoir into Coyote Creek would conform to FAHCE operating rule curves, as described in Chapter 2, *Project Description*. Operational changes to reservoir flow releases would not require equipment that could result in an accidental ignition of a wildfire or result in disruptions to vehicle traffic on roadways that could impede emergency response time. In addition, operation of post-construction dam facilities would not require road closures that would impede emergency response times in such a way as to require the construction of new fire protection facilities. Thus, post-construction Anderson Dam facilities operations would not result in significant impacts associated with an increased need for new or physically altered fire protection facilities. Impacts would be less than significant.

Post-Construction Project and FAHCE Adaptive Management

The implementation of adaptive actions as part of the Project and FAHCE AMP may include refinements to the timing, frequency, and duration of Anderson Dam flow releases or physical changes in the Coyote Creek watershed such as exotic species removal, replacement riparian planting, or additional sediment augmentation. These actions would occur when conservation measures are not functioning as intended or not meeting measurable objectives. Adaptive actions would occur at Anderson Reservoir and within the Coyote Creek floodplain and may involve the use of construction equipment that could result in an accidental ignition of wildfire and use hazardous materials that may be accidentally spilled, both of which could require potential need for increased fire protection services. However, implementation of BMP HM-8, HM-9, and HM-12 will require that proper vehicle and equipment fueling and maintenance methods are followed, that proper handling and storage of hazardous materials measures are implemented, and that fire prevention methods are implementing including, maintaining onsite fire suppression equipment and park arrestors on all equipment with internal combustion engines, and prohibiting smoking except in designated staging areas. Therefore, post-construction Project and FAHCE adaptive management measures would not result in significant impacts associated with an increased need for new or physically altered fire protection facilities. Impacts would be less than significant.

Significance Conclusion Summary

Water in Anderson Reservoir would be temporarily unavailable to CAL FIRE during construction after Dam Construction Year 2; however, during consultation, CAL FIRE had not expressed any concerns over lack of access to water and there are other, nearby sources of water available to support aerial firefighting methods. Additional temporary impacts on fire protection services would include accidental ignition of a wildfire, use of hazardous materials that may require additional fire protection services, and temporary increases and disruptions to vehicle traffic in the vicinity of the Project Area, which could impede emergency response timing.

Implementation of BMPs HM-12, HM-8, and HM-9 will minimize the risk of accidental ignition though: maintaining onsite fire suppression equipment and park arrestors on all equipment with internal combustion engines, and prohibiting smoking except in designated staging areas; ensuring proper vehicle and equipment fueling and maintenance methods are followed; and, ensuring that proper handling and storage of hazardous materials measures are implemented. BMP TR-1 will also require the implementation of construction warning signs, safety fencing, and detours which would minimize potential impacts on emergency response times.

However, a significant impact related to emergency response time, that might require construction of new temporary emergency access roads that might cause significant impacts, would still remain. Implementation of **Mitigation Measure PS-1**, which requires preparation of a TMP and coordination with fire protection services and first responders, and **Mitigation Measure WF-1**, which requires coordination with emergency response agencies and preparation of a RES, will reduce potential impacts associated with impeding emergency response times to a less-than-significant level. Because the Project would not generate substantial demand for additional fire protection and the Project would not significantly affect average response times or other performance metrics, the Project as mitigated would not require the provision of new or physically altered fire protection facilities. Therefore, this impact would be **less than significant with mitigation.**

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

Before construction of Project components, Valley Water and its contractors will prepare and implement a TMP to minimize traffic delays and safety hazards that may result from lane restrictions or closures in the work zone. TMP strategies will manage ~~improve~~ the mobility as well as safety for the traveling public and construction workers and will be consistent with applicable provisions of the Caltrans Transportation Management Plan Guidelines (2015). Overall TMP strategies ~~shall~~ will include:

- Public Information – Valley Water will keep the local and state agencies, as well as the public informed at the beginning of the Project, and periodically as construction proceeds with work zone information using the Project website, communication with selected stakeholders, and public outreach meetings.

- Motorist Information – Motorists will be provided with information regarding the work zone using Changeable Message Signs and Portable Changeable Message Signs. These signs notify the users of lane and road closures, work activities, traffic queues, delay, or travel time information.
- Incident Management – Incidents occurring in or near work zones will be addressed by employing construction tow services, and dedicated law enforcement and other first responders as necessary.
- Construction will be coordinated with the CHP, CAL FIRE, and other state and local agencies such as the Morgan Hill Fire Department, the San José Fire Department, and SSCFPD that provide public and/or emergency services for the study area. These agencies would be made aware of any traffic management issues and would share that information with first responders.
- Construction worker evacuation routes – Efficient construction worker evacuation routes will be designated, including use of the of north and south haul roads.

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~Emergency Action Plan~~

Refer to Section 3.22, *Wildfire*.

***Impact PS-2: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection* (Less than Significant with Mitigation)**

Seismic Retrofit Construction

Law enforcement and public safety services in the vicinity of the Seismic Retrofit construction area are provided by a combination of departments from the County, City of San José, and City of Morgan Hill. As described in the fire protection service analysis above, temporary construction of Seismic Retrofit components would result in the potential for accidental wildland fire ignition, which would be minimized with the inclusion of BMP HM-12. Furthermore, construction would be required to comply with the requirements of the California Fire Code, which would further reduce the potential for accidental ignition. Implementation of BMP HM-12 and California Fire Code requirements will reduce the risk of accidental ignition such that the Project would not impact police service ratios or require the expansion or construction of additional police services related to fires.

The construction site would contain equipment and materials for construction of the Seismic Retrofit components. Valley Water's contractor would provide security to minimize the potential for theft from the construction site. Therefore, this aspect of construction would not require additional police services.

Seismic Retrofit components would generate a temporary increase in vehicle traffic in the immediate vicinity of the Project area from workers, equipment deliveries, and trucks. Additionally, a portion of Cochrane Road would be temporarily closed to through-traffic on four separate occasions during construction (see Section 2.5.2.3 for additional details). This represents a significant impact related to the possible construction of new or expanded police facilities associated with the potential need for temporary emergency access roads that could cause significant impacts. Traffic impacts on emergency response will be reduced through implementation of BMP TR-1 which requires implementation of construction warning signs, safety fencing, and detours, but the potential need for temporary emergency access road will still exist. Implementation of **Mitigation Measure PS-1**, which requires preparation of a TMP and coordination with local agencies, and **Mitigation Measure WF-1**, which requires coordination with local and state emergency response agencies <u>and preparation of a RES</u>, will reduce impacts on emergency police services to less-than-significant levels because there would be no need to construct new temporary emergency access roads. Although construction traffic levels and the temporary closure of Cochrane Road would increase emergency service response times, construction would not otherwise disrupt emergency police service response to the point that would require the construction or expansion of police facilities. With the inclusion of BMP TR-1 and the implementation of **Mitigation Measure PS-1**, the Santa Clara County Sheriff's Office did not foresee a significant effect on response times from the Project (Davis, personal communication, 2022).

As discussed above for Impact PS-1, construction of the Seismic Retrofit components would involve use and storage of hazardous materials, such as fuels. Fueling and maintenance of vehicles and equipment within the Seismic Retrofit construction area would introduce the potential for upset or accident conditions, which could require police or emergency response services in the event of a spill. Implementation of BMP HM-8 and HM-9 will minimize the potential for accidental upset of hazardous materials and thus minimize the need for an increase of police services by ensuring proper vehicle and equipment fueling and maintenance methods are followed and implementing proper handling and storage of hazardous materials.

BMPs HM-8, HM-9, HM-12, and TR-1 will minimize Seismic Retrofit competent impacts on police services. With implementation of and **Mitigation Measures PS-1** and **WF-1**, Seismic Retrofit construction will not generate substantial demand for police protection and will not significantly impact response times or other performance metrics such that the Seismic Retrofit construction would require the provision of new or physically altered governmental police protection facilities, the construction of which could cause significant environmental impacts. Therefore, this impact would be less than significant with mitigation.

Conservation Measure Construction

Construction activities associated with Conservation Measure components, including the Ogier Ponds CM, the Phase 2 Coyote Percolation Dam CM, <u>Maintenance of the</u> North Channel <u>Reach</u> ~~Extension~~, Sediment Augmentation Program, and Maintenance Activities at the Live Oak Restoration Reach, have the potential to result in similar impacts to police facilities as those described above for construction of the Seismic Retrofit. Potential impacts include accidental ignition of a wildfire, use and storage of hazardous materials and associated risk of upset, and temporary increases and disruptions in vehicle traffic in and around construction work areas due to operation and temporary storage of large construction equipment, construction worker trips to and from the sites, and transportation of construction material. These impacts may lead to an increased need for police protection and emergency responders or increase response times.

As described above, implementation of BMPs HM-8, HM-9, and TR-1 will minimize impacts associated with hazardous materials and traffic disruptions by requiring proper vehicle and equipment fueling and maintenance methods to be followed, implementing proper handling and storage of hazardous materials, and implementing construction warning signs, safety fencing, and detours. However, a significant impact related to impeding emergency response time from traffic disruptions would still remain due to the potential need for temporary emergency access roads.

Implementation of **Mitigation Measure PS-1**, which requires preparation of a TMP and coordination with fire protection services and first responders would reduce these risks, and **Mitigation Measure WF-1**, which requires coordination with local and state emergency response agencies <u>and preparation of a RES</u>, will mitigate this impact to less-than-significant levels. With these mitigation measures, construction of the Conservation Measures components would not result in significant impacts that would result in substantially increased need for new or physically altered police protection facilities. Impacts would be less than significant with mitigation.

Post-Construction Anderson Dam Facilities Operations

Post-construction releases from Anderson Reservoir into Coyote Creek would conform to FAHCE operating rule curves. Operational changes to reservoir flow releases would not require equipment that could result in an accidental ignition of a wildfire or result in disruptions to vehicle traffic on roadways that could led to an increased need for police protection services or impede emergency response time. Thus, post-construction Anderson Dam facilities operations would not result in new significant impacts associated with an increased demand for additional police protection that would result in a need for new or physically altered police protection facilities. Impacts would be less than significant.

Post-Construction Project and FAHCE Adaptive Management

The implementation of adaptive actions as part of the Project and FAHCE AMP may include refinements to the timing, frequency, and duration of Anderson Dam flow releases or physical changes in the Coyote Creek watershed such as exotic species removal, replacement riparian planting, or additional sediment augmentation. These actions would occur when conservation measures are not functioning as intended or not meeting measurable objectives. Adaptive actions would occur within Anderson Reservoir and the Coyote Creek floodplain and may involve the use of construction equipment that could result in an accidental ignition of wildfire and use hazardous materials that may be accidentally spilled, both of which could require potential need for increased police protection services. However, implementation of BMP HM-8, HM-9, and HM-12 will require that proper vehicle and equipment fueling and maintenance methods are followed, that proper handling and storage of hazardous materials measures are implemented, and fire prevention methods are implemented, including maintaining on-site fire suppression equipment and park arrestors on all equipment with internal combustion engines, and prohibiting smoking except in designated staging areas. Therefore, post-construction Project and FAHCE adaptive management measures would not result in significant impacts associated with an increased need for new or physically altered police protection facilities. Impacts would be less than significant.

Significance Conclusion Summary

Impacts on police protection services include accidental ignition of a wildfire, temporary increases and disruptions to vehicle traffic in the vicinity of the Project that impedes emergency response timing, and increased potential for accidental upset of hazardous materials. Implementation of BMPs HM-12, HM-8, and HM-9 will minimize the risk of accidental ignition by maintaining onsite fire suppression equipment and park arrestors on all equipment with internal combustion engines, and prohibiting smoking except in designated staging areas; ensuring proper vehicle and equipment fueling and maintenance methods are followed; and ensuring that proper handling and storage of hazardous materials measures are implemented, respectively. Additionally, BMP TR-1 would require the implementation of construction warning signs, safety fencing, and detours which would minimize potential impacts on emergency response times. Traffic impacts on emergency response will be reduced through implementation of BMP TR-1, but the potential need for temporary emergency access road will still exist, a significant impact. Implementation of **Mitigation Measure PS-1**, which requires preparation of a TMP and coordination with police protection services and first responders, and **Mitigation Measure WF-1**, which requires coordination with emergency response agencies and preparation of a RES, will reduce potential impacts associated with impeding emergency response times to a less-than-significant level. Because the Project would not significantly affect average response times or other performance metrics nor generate substantial demand for additional police protection, the Project as mitigated would not require provision of new or physically altered police protection facilities, the construction of which could cause significant environmental impacts. Therefore, this impact would be **less than significant with mitigation**.

Mitigation Measures

PS-1 *Prepare and Implement Traffic Management Plan. Refer to Impact PS-1 above.*

WF-1 *Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~Emergency Action Plan~~ Refer to Section 3.22, Wildfire.*

3.17.5 Cumulative Impacts

The geographic study area for the cumulative impact analysis for public services is the service areas of the police and fire protection resources that serve the Project Area in the communities of the county, San José, and Morgan Hill.

This section describes the Project’s contribution to cumulative public services impacts, as summarized in **Table 3.17-1**.

Table 3.17-1. Summary of Project Impact Contribution to Cumulative Public Service Impacts

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection	No	No	NCC	PS-1 WF-1	No
Cumulative Impact PS-2: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or	No	No	NCC	PS-1 WF-1	No

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
other performance objectives for police protection					

Key: NCC = not cumulatively considerable

***Cumulative Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection* (Not Cumulatively Considerable)**

Additional temporary impacts on fire protection services would include accidental ignition of a wildfire, use of hazardous materials that may require additional fire protection services, and temporary increases and disruptions to vehicle traffic in the Project vicinity, which could impede emergency response timing. Implementation of BMPs HM-12, HM-8, and HM-9 will minimize the risk of accidental ignition though: maintaining on-site fire suppression equipment and park arrestors on all equipment with internal combustion engines and prohibiting smoking except in designated staging areas; ensuring proper vehicle and equipment fueling and maintenance methods are followed; and, ensuring that proper handling and storage of hazardous materials measures are implemented. BMP TR-1 will also require the implementation of construction warning signs, safety fencing, and detours which would minimize potential impacts on emergency response times.

However, even with BMP TR-1, a significant impact related to emergency response time from construction traffic, that might require construction of new temporary emergency access roads that might cause significant impacts, would still remain. Implementation of **Mitigation Measure PS-1,** which requires preparation of a TMP and coordination with fire protection services and first responders, and **Mitigation Measure WF-1**, which requires coordination with emergency response agencies and preparation of a RES, will reduce potential impacts associated with impeding emergency response times to a less-than-significant level.

Cumulative Effects of Project with the FOCP

~~As described in Section 3.17, "Public Services," the FOCP required closure of Woodchopper's Flat Picnic Area which a is designated as a temporary refuge area during a wildfire. The Woodchopper's Flat would remain closed throughout construction but would be restored and reopened following construction of the Project. The other elements of the~~ FOCP-related activities are at discrete and separate locations from Project activities and would not contribute to a cumulatively significant impact on fire protection services.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Buildout of the Santa Clara Housing Element, which would occur concurrently with Project construction, was determined to have a less-than-significant impact on fire protection services

(Santa Clara County 2023). Buildout of Envision San José 2040, also to occur concurrently with Project construction, was determined to have a less-than-significant impact on fire protection services with implementation of proposed general plan policies (San Jose 2023 ~~2011~~). Similarly, buildout of the Morgan Hill General Plan 2035 was determined to have a less-than-significant impact on fire protection services with implementation of proposed general plan policies (Morgan Hill 2016).

Additionally, development projects within the county, San José and Morgan Hill would be constructed at the same time as Project (over the course of 7 years). Those lead agencies would be required to complete CEQA compliance prior to project approval to avoid, reduce, or minimize potential impacts on the environment, including fire protection services. Also, these projects would not generate substantial traffic in the same area as the Project. Therefore, the cumulative impact on fire protection services resulting from the Project in combination with other probable future projects, programs, and plans would not be significant.

Significance Conclusion Summary

The construction of the Seismic Retrofit component would have a significant impact to fire response time, but this is at the project level. **Mitigation Measures PS-1 and WF-1** would reduce this impact to less-than-significant levels. The Project would not combine with the FOCP or other future projects in a manner that would cause a cumulatively significant impact to fire protection. The Project impact on construction or expansion of fire facilities would be **not cumulatively considerable.**

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~Emergency Action Plan~~

***Cumulative Impact PS-2: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection* (Not Cumulatively Considerable)**

Impacts on police protection services include accidental ignition of a wildfire, temporary increases and disruptions to vehicle traffic in the Project vicinity would that impede emergency response timing and increase potential for accidental upset of hazardous materials. Implementation of BMPs HM-12, HM-8, and HM-9 would minimize the risk of accidental ignition by maintaining on-site fire suppression equipment and park arrestors on all equipment with internal combustion engines and prohibiting smoking except in designated staging areas; ensuring proper vehicle and equipment fueling and maintenance methods are followed; and ensuring that proper handling and storage of hazardous materials measures are implemented, respectively. Additionally, BMP TR-1 would require the implementation of construction warning signs, safety fencing, and detours which would minimize potential impacts on emergency response times.

However, even with BMP TR-1, the potential need for temporary emergency access road will still exist, a significant impact. Implementation of **Mitigation Measure PS-1**, which requires preparation of a TMP and coordination with police protection services and first responders, and **Mitigation Measure WF-1**, which requires coordination with emergency response agencies and preparation of a RES, will reduce potential impacts associated with impeding emergency response times to a less-than-significant level.

Cumulative Effects of Project with the FOCP

The FOCP would be completed before Project-related construction activities begin, and elements of the FOCP are at discrete and separate locations from Project activities that would not create a cumulative effect on police protection services.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Buildout of the Santa Clara Housing Element, which would occur concurrently with Project construction, was determined to have a less-than-significant impact on police protection services (Santa Clara County 2023). Buildout of Envision San José 2040, also to occur concurrently with Project construction, was determined to have a less-than-significant impact on police protection services with implementation of proposed general plan policies (San Jose 2023 ~~2011~~). Similarly, buildout of the Morgan Hill General Plan 2035 was determined to have a less-than-significant impact on police protection services with implementation of proposed general plan policies (Morgan Hill 2016).

Additionally, development projects within the county, San José and Morgan Hill would be constructed at the same time as Project (over the course of 7 years). Those lead agencies would be required to complete CEQA compliance prior to project approval to avoid, reduce, or minimize potential impacts on the environment, including police protection services. Also, these projects would not generate substantial traffic in the same area as the Project. Therefore, the cumulative impact on police protection services resulting from the Project in combination with other probable future projects, programs, and plans would not be significant.

Significance Conclusion Summary

The construction of the Seismic Retrofit component would have a significant impact to police response time, but this is at the project level. **Mitigation Measures PS-1 and WF-1** would reduce this impact to less-than-significant levels. The Project would not combine with the FOCP or other future projects in a manner that would cause a cumulatively significant impact to police protection. The Project's impact on construction or expansion of police facilities would be **not cumulatively considerable.**

Mitigation Measures

3.18 Recreation

This section evaluates the Project impacts on recreational resources, facilities, and opportunities within the three study areas, defined below. These include both land-based and water-based recreational resources and the areas that support them. Recreational opportunities that have been considered include hiking, camping, picnicking, fishing (i.e., angling), wildlife viewing, bicycling, horseback riding, day use amenities, trail use, and powered and nonpowered boating.

The study areas include:

(1) recreational areas that could be directly affected by construction activities related to the seismic retrofit and conservation measure components (i.e., closures or disruptions to recreational areas from construction-related activities and ground disturbance);

(2) recreational areas that could be affected by increased usage that would occur as a result of closures or disruptions happening within or adjacent to the Project area; and,

(3) Anderson Reservoir, Coyote Creek, and other natural resources (e.g., connecting water features [e.g., streams and creeks], wetlands, and trees) within park and recreational areas that may be affected by operational changes related to implementation of the Project.

For the purpose of this evaluation, the study areas are based on the assumption that boating and angling recreationalists would travel up to 25 miles from the Project area within Santa Clara County (County) to reach an alternate facility, and other users (picnickers/hikers who generally originate within walking distance of Anderson Reservoir) would travel up to 5 miles from the Project area to reach an alternative recreational facility or opportunity for picnicking and potentially further to regional parks in the County for hiking, nature viewing, and other activities.

3.18.1 Environmental Setting

The environmental setting describes the existing conditions of recreational resources in the study areas. The environmental setting is based on three different baseline conditions that form the basis for comparing Project impacts for recreational resources against the baseline. The existing conditions baseline reflects reasonable assumptions of the recreational setting following the implementation of the FOCP, based on available information at the time of EIR preparation (2022). The existing conditions baseline would be used for evaluating the Seismic Retrofit and Conservation Measure construction impacts. For evaluating post-construction operations impacts, the Pre-FERC Order Baseline and a future conditions baseline are used; see below discussion for evaluating impacts of Anderson Reservoir operations.

Information about the environmental setting for recreation was primarily gathered from websites and documents of the SCCPRD, California State Parks, City of Morgan Hill Department of Parks and Recreation, City of San José Department of Parks, ~~and~~ Recreation, and Neighborhood Services, Midpeninsula Regional Open Space District, and Santa Clara Open Space Authority.

Table 3.18-1 lists recreational facilities within the study areas and Project vicinity, summarizes the facilities and amenities offered at each location, and uses that each area supports. The table lists facilities based on their distance from the Project Area. **Figure 3.18-1** depicts the locations of recreational facilities within the study areas. The first two parks in **Table 3.18-1**, Anderson Lake County Park and Coyote Creek Parkway, essentially encompass the Project Area. The remaining parks listed in **Table 3.18-1** may be impacted by the displacement of recreators that would typically use Anderson Lake County Park and/or Coyote Creek Parkway.

Table 3.18-1. Recreational Facilities in the Study Areas

Map Number	Name	Owner	Regional Park	Area (acres)	Amenities	Recreational uses	Hours of Operation	Operational Notes	Distance from Project Area	Boating	Angling	Land Based
1	Anderson Lake County Park (including the Rosendin Park Area)	County Parks	✓	4,287	Reservoir, paved and unpaved multi-use trails, picnic areas, boat launch, equestrian staging area	Horseback riding, hiking, fishing, non-power boating, power boating, angling, historic site, interpretive program, picnicking, nature trails, reservable group picnics, kayak, trails	Open year round; 8:00 a.m. to sunset	Currently closed to boating due to ~~dam~~ construction activities at Anderson Dam (FOCP), along with select recreational areas closed	0.0	✓	✓	✓
2	Coyote Creek Parkway	County Parks	✓	866	Paved and unpaved multi-use trails, connects to Anderson Lake County Park and Hellyer County Park	Biking, horseback riding, hiking, fishing, historic site, wildlife viewing, picnicking, unpaved and paved trails	Open year round; 8:00 a.m. to sunset		0.0		✓	✓
3	Metcalf Park	City of San José		6	Picnic areas (non-reservable), sand volleyball court, basketball courts, playground, BBQ area, street parking, restrooms	Picnicking, sports activities, volleyball, basketball, children's activities	Open year round; sunrise to 1 hour after sunset		0.0			✓
4	Basking Ridge Park	City of San José		8	Playground, picnic area, BBQ area, open grass area, paved trails, creek, street parking	Children's activities, picnicking, nature viewing, walking	Open year round; sunrise to 1 hour after sunset		0.5			✓
5	Serra Park	City of Morgan Hill		3	Tennis courts, open grass areas, picnic area	Tennis, nature viewing, picnicking, walking	Open year round; 6:00 a.m. to 10:00 p.m.		0.5			✓
6	Los Paseos Park	City of San José		12	Picnic areas, exercise court, tennis courts (lighted), turf area for informal sports, playground, community center, restroom, parking, open grass area	Reservable group picnics, sport activities, tennis, children's activities, walking, nature viewing	Open year round; sunrise to 1 hour after sunset		0.6			✓
7	Lantana/Wisteria Community Park	City of Morgan Hill		1	Playground, picnic area, open grass areas, street parking	Children's activities, picnicking, nature viewing, walking	Open year round; 6:00 a.m. to 10:00 p.m.		0.6			✓
8	Mission Ranch Park	City of Morgan Hill		2	Playgrounds, open grass areas, street parking, picnic areas	Children's activities, nature viewing, walking, picnicking	Open year round; 6:00 a.m. to 10:00 p.m.		0.6			✓
9	Coyote Lake-Harvey Bear Ranch County Park	County Parks	✓	6,730	Reservoir, stream, campsites, boat launch, paved and unpaved multi-use trails, picnic areas, amphitheater (outdoor), restroom, restroom with shower, parking	Biking, mountain biking, horseback riding, walking, hiking, fishing, family campsites, dogs (on-leash), RV camping, non-power boating, power boating, outdoor amphitheater, interpretive program, picnicking, nature trails, youth group overnight campsites, group overnight campsites, vista point	Open year round; 8:00 a.m. to sunset	Vehicle entry fees collected year-round; Coyote Lake periodically closes to boating due to low water levels	0.7	✓	✓	✓
10	Bautista Park	City of Morgan Hill		0.3	Playground, picnic area, open grass area, street parking	Playground, picnicking, walking	Open year round; 6:00 a.m. to 10:00 p.m.		0.7			✓
11	Avenida Espana Park	City of San José		1	Playgrounds, open grass areas, street parking	Children's activities, nature viewing, walking	Open year round; sunrise to 1 hour after sunset		0.9			✓

Map Number	Name	Owner	Regional Park	Area (acres)	Amenities	Recreational uses	Hours of Operation	Operational Notes	Distance from Project Area	Boating	Angling	Land Based
12	Santa Teresa County Park	County Parks	✓	1,484	Golf club, equestrian staging area, picnic areas, archery range, unpaved multi-use trails, cultural venues, trailhead with parking, restroom, historic site	Biking, horseback riding, hiking, walking, archery, historic site, interpretive program, picnicking, golf course, reservable group picnics, dogs on leash, horseshoe pit, volleyball, mountain biking, nature viewing, wildlife viewing	Open year round; 8:00 a.m. to sunset	Vehicle entry fees are collected year-round	1.1			✓
13	Jackson Park	City of Morgan Hill		1	Playground, open grass area	Children's activities, nature viewing, walking	Open year round; 6:00 a.m. to 10:00 p.m.		1.2			✓
14	Henry W. Coe SP	California State Parks	✓	87,188	Unpaved multi-use trails, camp sites, picnic areas, ponds, lakes, creeks, rugged terrain	Hiking, mountain biking, backpacking, horseback riding, car camping, picnicking, photography, fishing, rugged terrain, wildlife viewing	Open year round; 24 hours	Temporary closures; see map	1.2		✓	✓

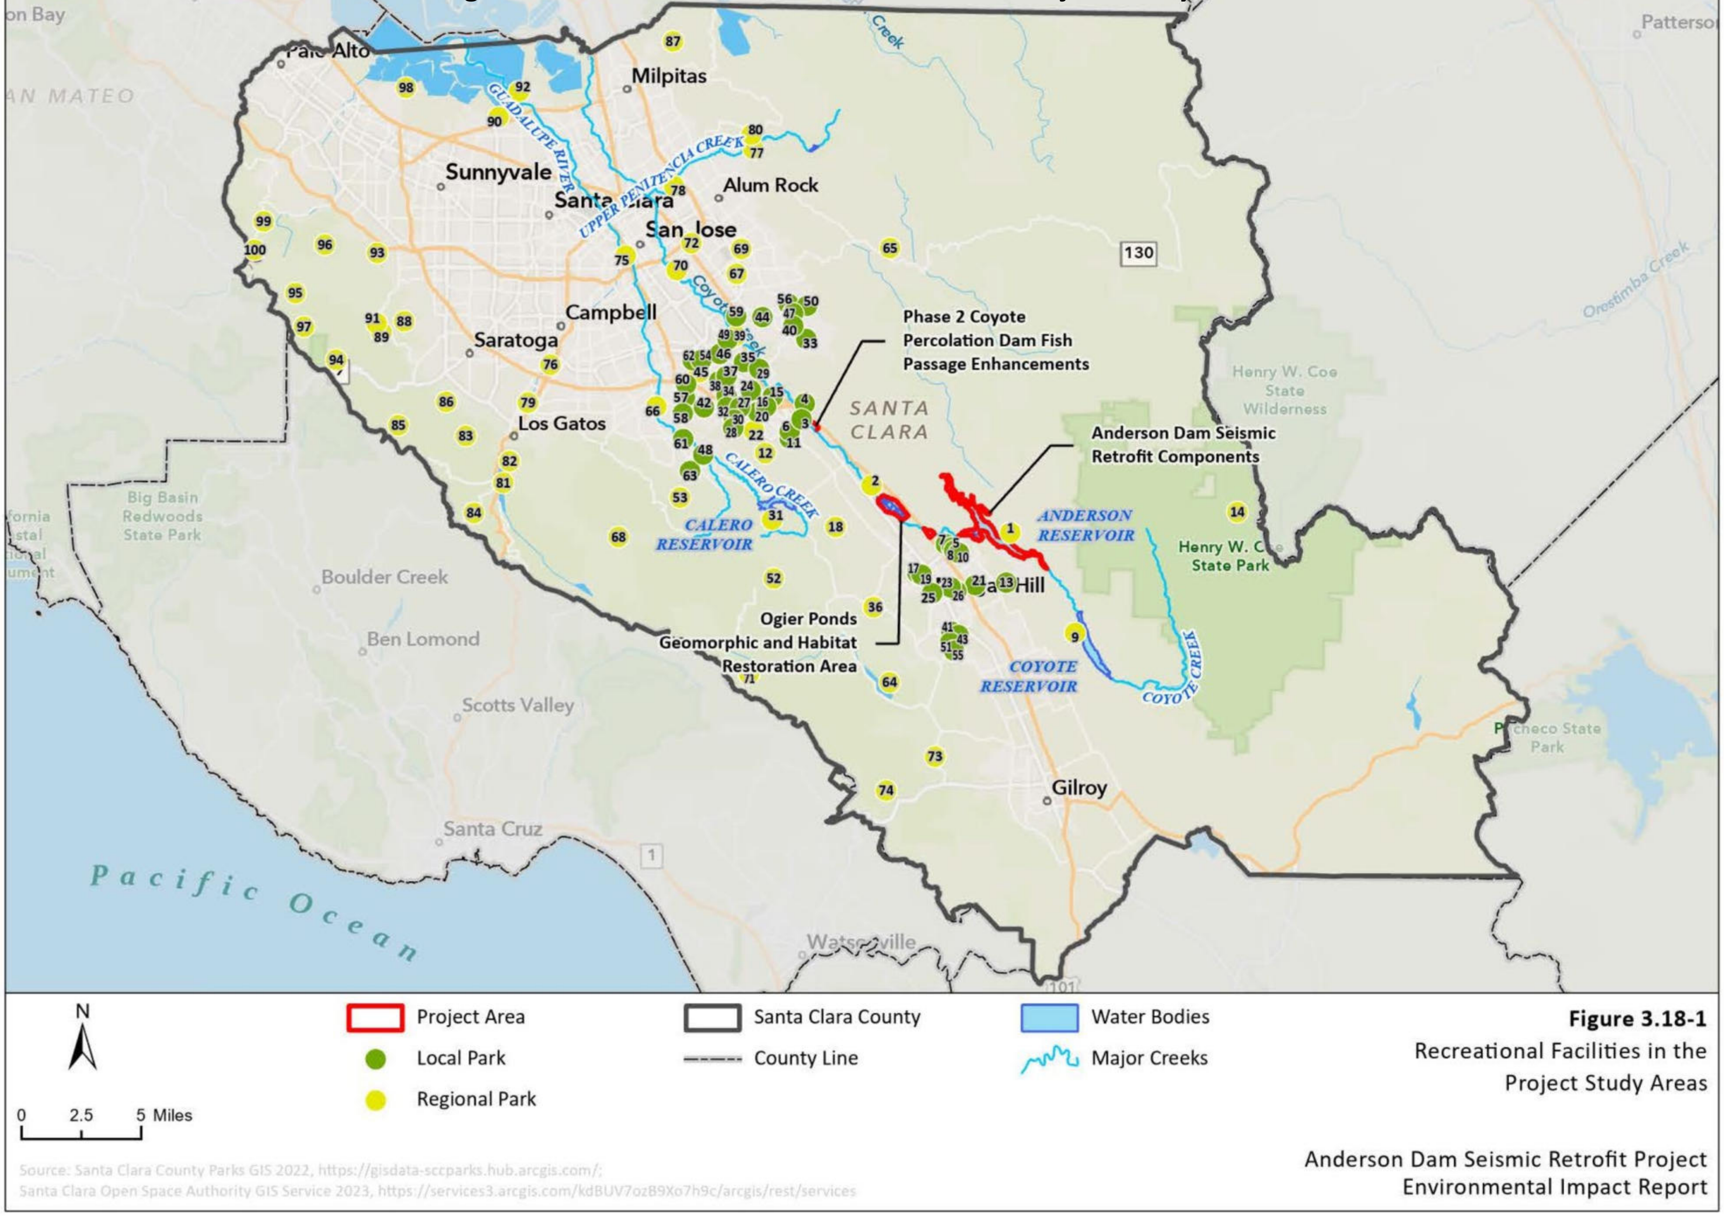
Figure 3.18-1. Recreational Facilities in the Project Study Areas



This page intentionally left blank

3.18.1.1 Santa Clara County Parks and Recreation Department

Pre-FERC Order Conditions Baseline

The SCCPRD owns and/or maintains 28 parks encompassing approximately 52,000 acres, including Anderson Lake County Park, where the Anderson Reservoir and Dam are located. Half the County's 28 parks incorporate or abut Valley Water property. Under an existing agreement between the SCCPRD and Valley Water, the SCCPRD has the authority to make available for public recreation ten reservoirs and five ponds owned and operated by Valley Water. The SCCPRD's regional parks are typically more than 200 acres (i.e., much larger than local neighborhood or community parks). In addition to Anderson Lake County Park, other County parks near the Project include the Coyote Creek Parkway, Calero County Park, Coyote Lake–Harvey Bear Ranch, and Hellyer County Park. Activities available at the County parks include, but are not limited to, biking, hiking, horseback riding, interpretive (educational) programs, picnicking, fishing, power and non-power boating, water-related recreation (other than swimming), camping, and wildlife viewing (SCCPRD 2021a).

Appendix N, *Recreation ~~Technical~~ Appendix*, provides supporting data collected by the SCCPRD about recreational facility usage for the County park facilities. As summarized in Appendix N, the average annual attendance at the County's parks between 1999 and 2014 was 2,569,072 visitors. In 1999, which had the highest attendance reported over the 15-year period, the total number of visitors to all of the County's parks was 3,524,168. The lowest attendance reported was in 2006 (1,791,991). Data for general day-use attendance at the individual County parks are available for 2011 to 2015. The annual total number of day-use visitors for all 23 of the County's parks in 2015 was about 3,066,763. Countywide, in both 2014 and 2015, almost half (about 50 percent) of the visitors stated that they were hiking or running. Biking was the second most popular activity (about 22.5 percent). Picnicking totaled approximately 17 percent.

In 2015, Anderson Lake County Park received 46,167 day-use visitors, including hikers, anglers, picnickers, and bicyclists. This visitation ranks it 15 of 23 for most annual general day-use attendance; in 2014, it was ranked 17 of 23. In addition, in 2015, Anderson Lake County Park had 17,665 boating visitors. This visitation ranks it 3 of 7 for boating uses.

In 2015, Coyote Creek Parkway South[1] received 148,866 visitors, which ranks it 16 of 23 for most annual general day-use attendance; in 2014, it was ranked 11 of 23.

Anderson Lake County Park

Anderson Lake County Park is a 4,275-acre park that features Anderson Reservoir and includes recreational amenities including local and regional trails, Rosendin Park Area, Jackson Ranch Historic Park, Burnett Park Area, multiple picnic areas (e.g., Live Oak Picnic Area, former Toyon Picnic Area, and Woodchoppers Flat Picnic Area), Anderson Reservoir boat launch and parking area, Anderson Lake County Park Visitor's Center and Park Office, and the Anderson Lake County Park Maintenance facility. The Toyon picnic area was closed under the FOCP. The park provides a connection to the Coyote Creek Parkway multiple use trails and recreation areas within the

[1] Coyote Creek Parkway South is a 9.2-mile level paved trail (with a separate unpaved path for horses) that goes from Metcalf Park in San José to Anderson Lake Visitor Center. ~~This portion of Coyote Creek Parkway is, therefore, in the study area.~~ Coyote Creek Parkway North is a 12.4-mile nearly level paved trail from Williams Street to Metcalf Park in San José.

Coyote Creek Parkway, including the Coyote Creek Trail, additional picnic areas and rest areas, Ogier Ponds, and a remote-control model airplane field. Anderson Lake County Park has been historically open year-round and charges vehicle entry fees (SCCPRD 2021b). Anderson Lake County Park is operated by SCCPRD, but it is located on property owned by the County and Valley Water and spans portions of Morgan Hill and San José and unincorporated Santa Clara County.

Figure 3.18-2a–Figure 3.18-2d illustrates existing recreational resources in the Project area, specifically at Anderson Lake County Park and Coyote Creek Parkway, including parklands, water features, trails, and picnic areas.

Prior to the FOCP and water storage capacity restrictions within Anderson Reservoir, the reservoir provided a 7-mile long, 953-surface-acre lake that allowed for power and non-power boating and fishing (SCCPRD 2021b). Parking for vehicles and boat trailers was available in a fee-required boat parking lot at the top of the dam. Water-related activities allowed at the reservoir included boating, jet skiing, waterskiing, wakeboarding, tubing, paddle boarding, and kayaking. Swimming has not been an allowable use in the reservoir at any time, due to restrictions by the Santa Clara County Public Health Department. When water levels have been historically low, no watercraft of any type, including float tubes, have been allowed to launch into the waterway.[2] Access to boating facilities has varied in the past due to water levels. For example, in 2013, Anderson Reservoir was open to power and non-power boats (SCCPRD 2013). In contrast, in 2018, Anderson and Coyote Reservoirs were closed for power and non-power boating due to low water levels. For the 2019 off-season (beginning August 19, 2019), Anderson and Coyote Reservoirs were closed to all boating, including power boats, kayaks, and float tubes due to low water levels.

The paved road along the dam crest has historically provided additional parking and scenic views. Recreators have been able to access the shoreline of the lake for walking, fishing, and relaxing from informal trails on both sides of the dam crest. A number of unmarked trails are available on the north side of the lake. The Woodchoppers Flat Picnic Area is located on the south end of the lake and is accessible by boat or by vehicle from East Dunne Avenue (SCCPRD 2017). The Jackson Ranch Historic site is also located on the south end of the lake and can be accessed from East Dunne Avenue, although it is closed to the public.

Historically, fishing has occurred year-round at Anderson Reservoir. Even when the water levels are low and the boat launch is closed, anglers are often observed fishing from the shore. The reservoir contains a wide variety of game fish species, including largemouth bass, carp, bluegill, crappie, sunfish, and catfish. The County recommends catch-and-release fishing because mercury and PCBs have accumulated in the reservoir at levels that pose potential risks to human health (~~SCCPRD~~ Santa Clara County 2013, OEHHA CalEPA 2017 ~~2004~~). For more information related to existing and typical fish species, refer to Section 3.4, *Biological Resources – Fisheries Resources*.

[2] Because historically Anderson Reservoir is either open or closed to on-water recreation depending upon water levels, this variable condition is considered to be the baseline for the purposes of the environmental analysis.

As shown in **Figure 3.18-2a** and **Figure 3.18-2b**, the Burnett Entrance (trailhead and parking area), is accessible from Burnett Avenue or via the Nature Trail that originates at the Anderson Lake Visitor Center on Malaguerra Avenue. The Live Oak Entrance, off Cochrane Road, is a part of Anderson Lake County Park that includes open space under a tree canopy, dozens of picnic tables, and the Serpentine Trail, which is a narrow dirt trail that was popular with hikers prior to the FOCP closure of this trail. The Live Oak Picnic Area includes large barbecue pits, restrooms, water fountains, and seating for up to 100 people. Reservations and additional fees are required for use of the group site (SCCPRD 2021). Additionally, more than two dozen picnic tables are available, many of which have small barbecues.

Figure 3.18-2a. Recreational Facilities in the Project Area

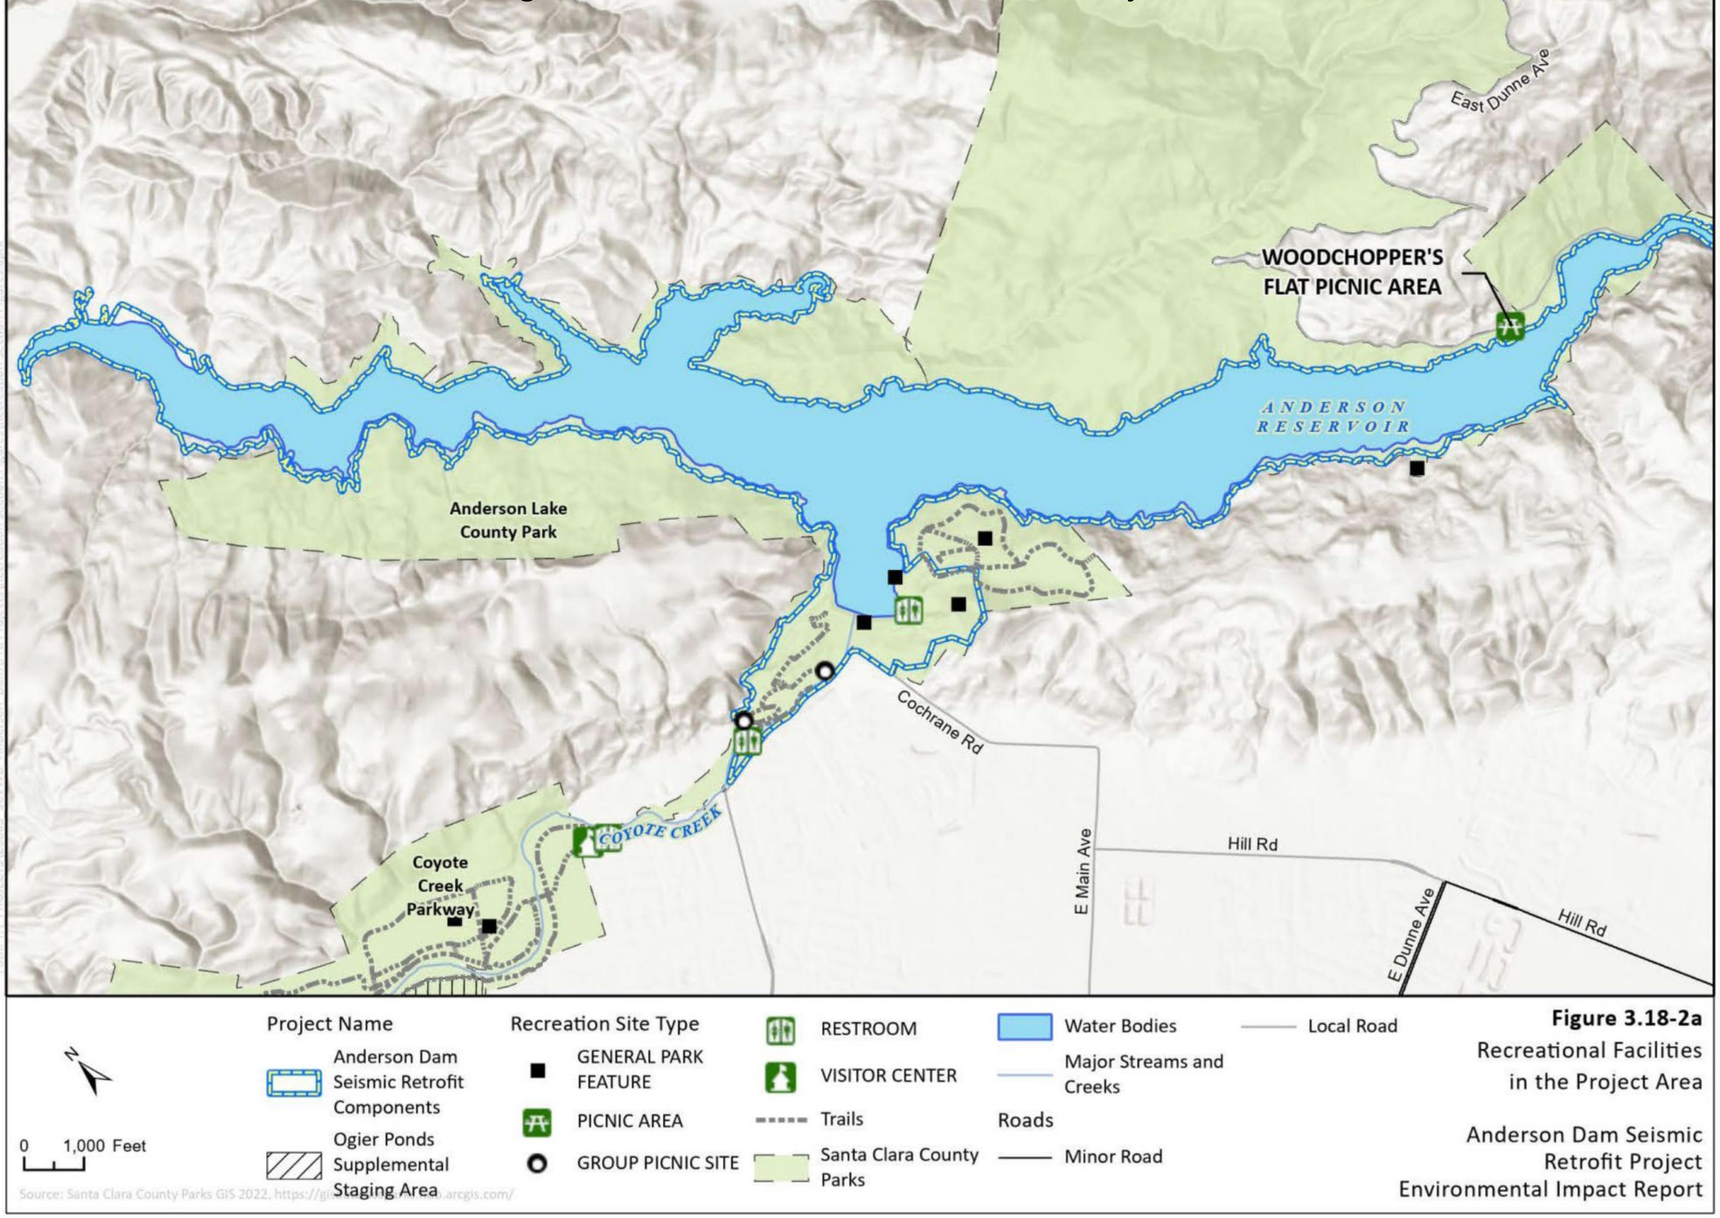


Figure 3.18-2b. Recreational Facilities in the Project Area

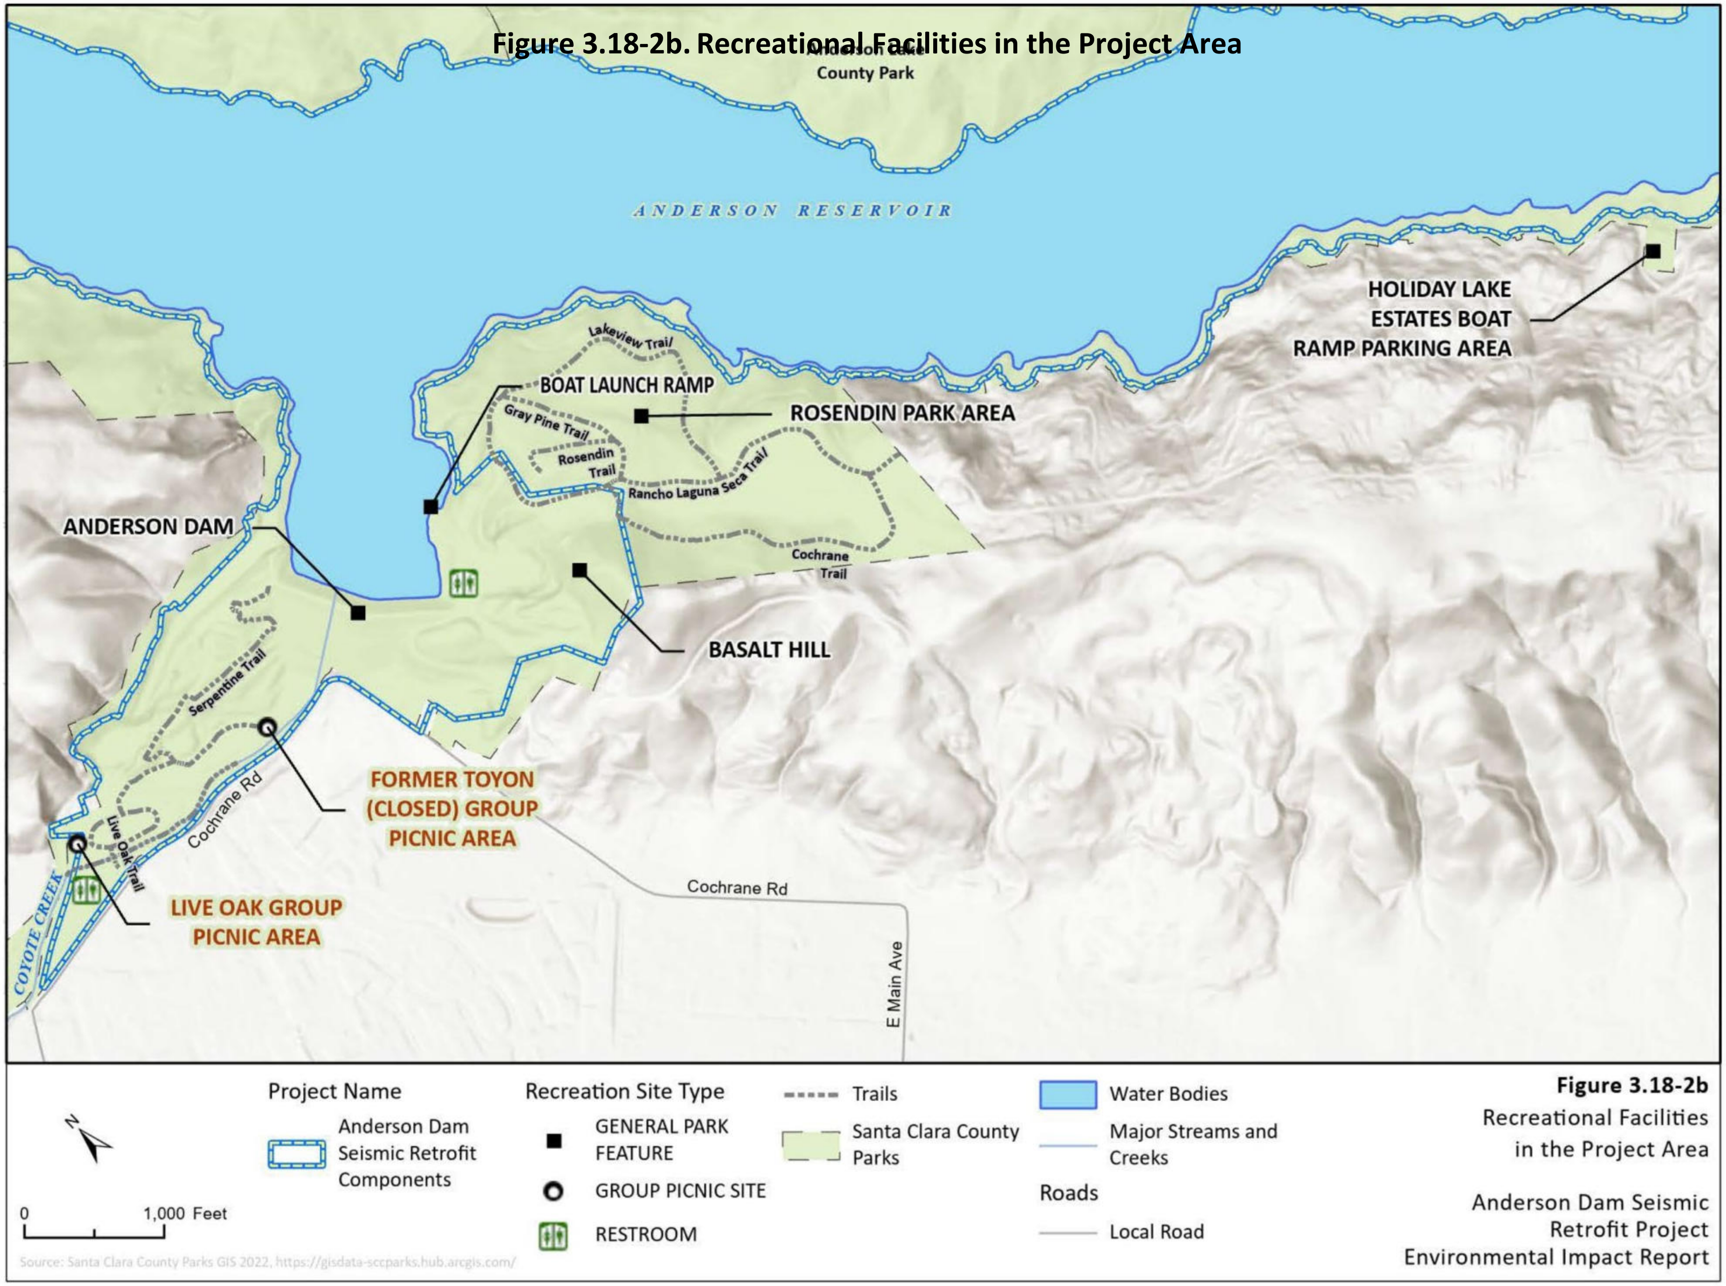

Figure 3.18-2c. Recreational Facilities in the Project Area

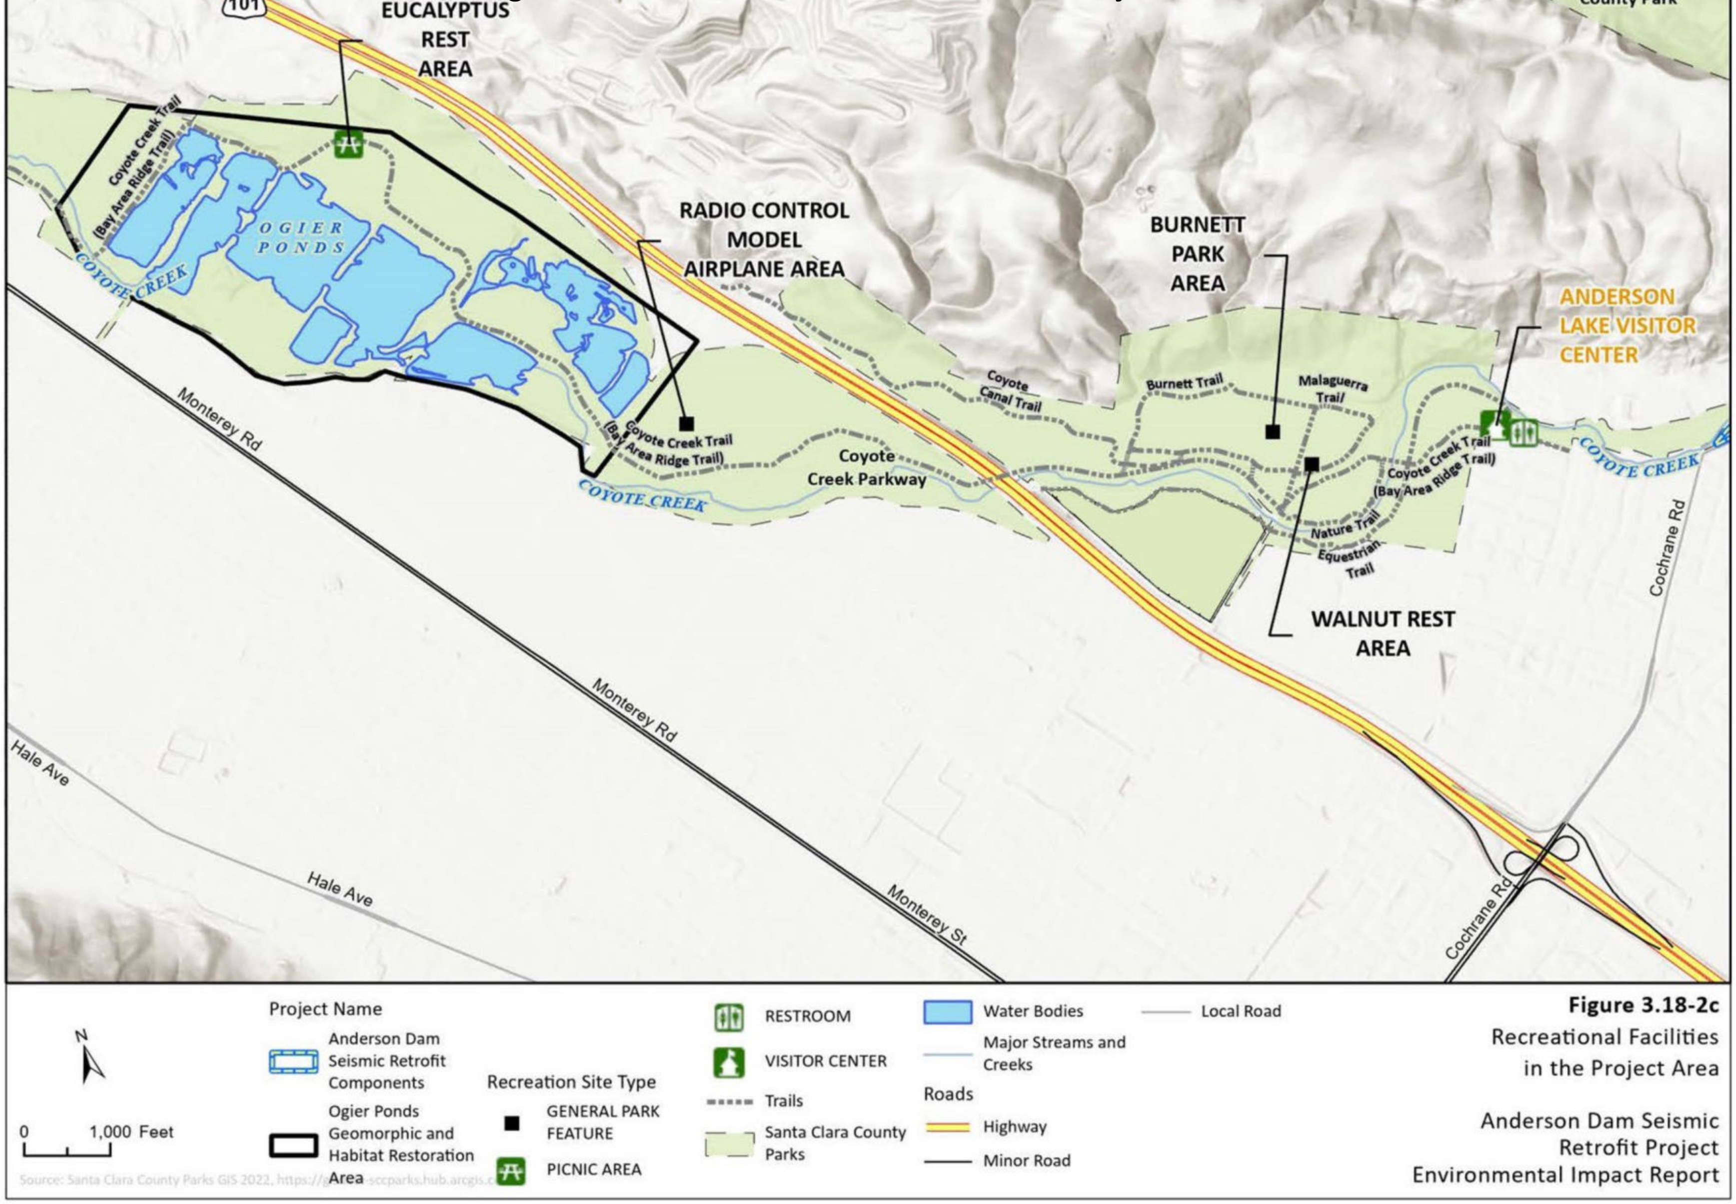

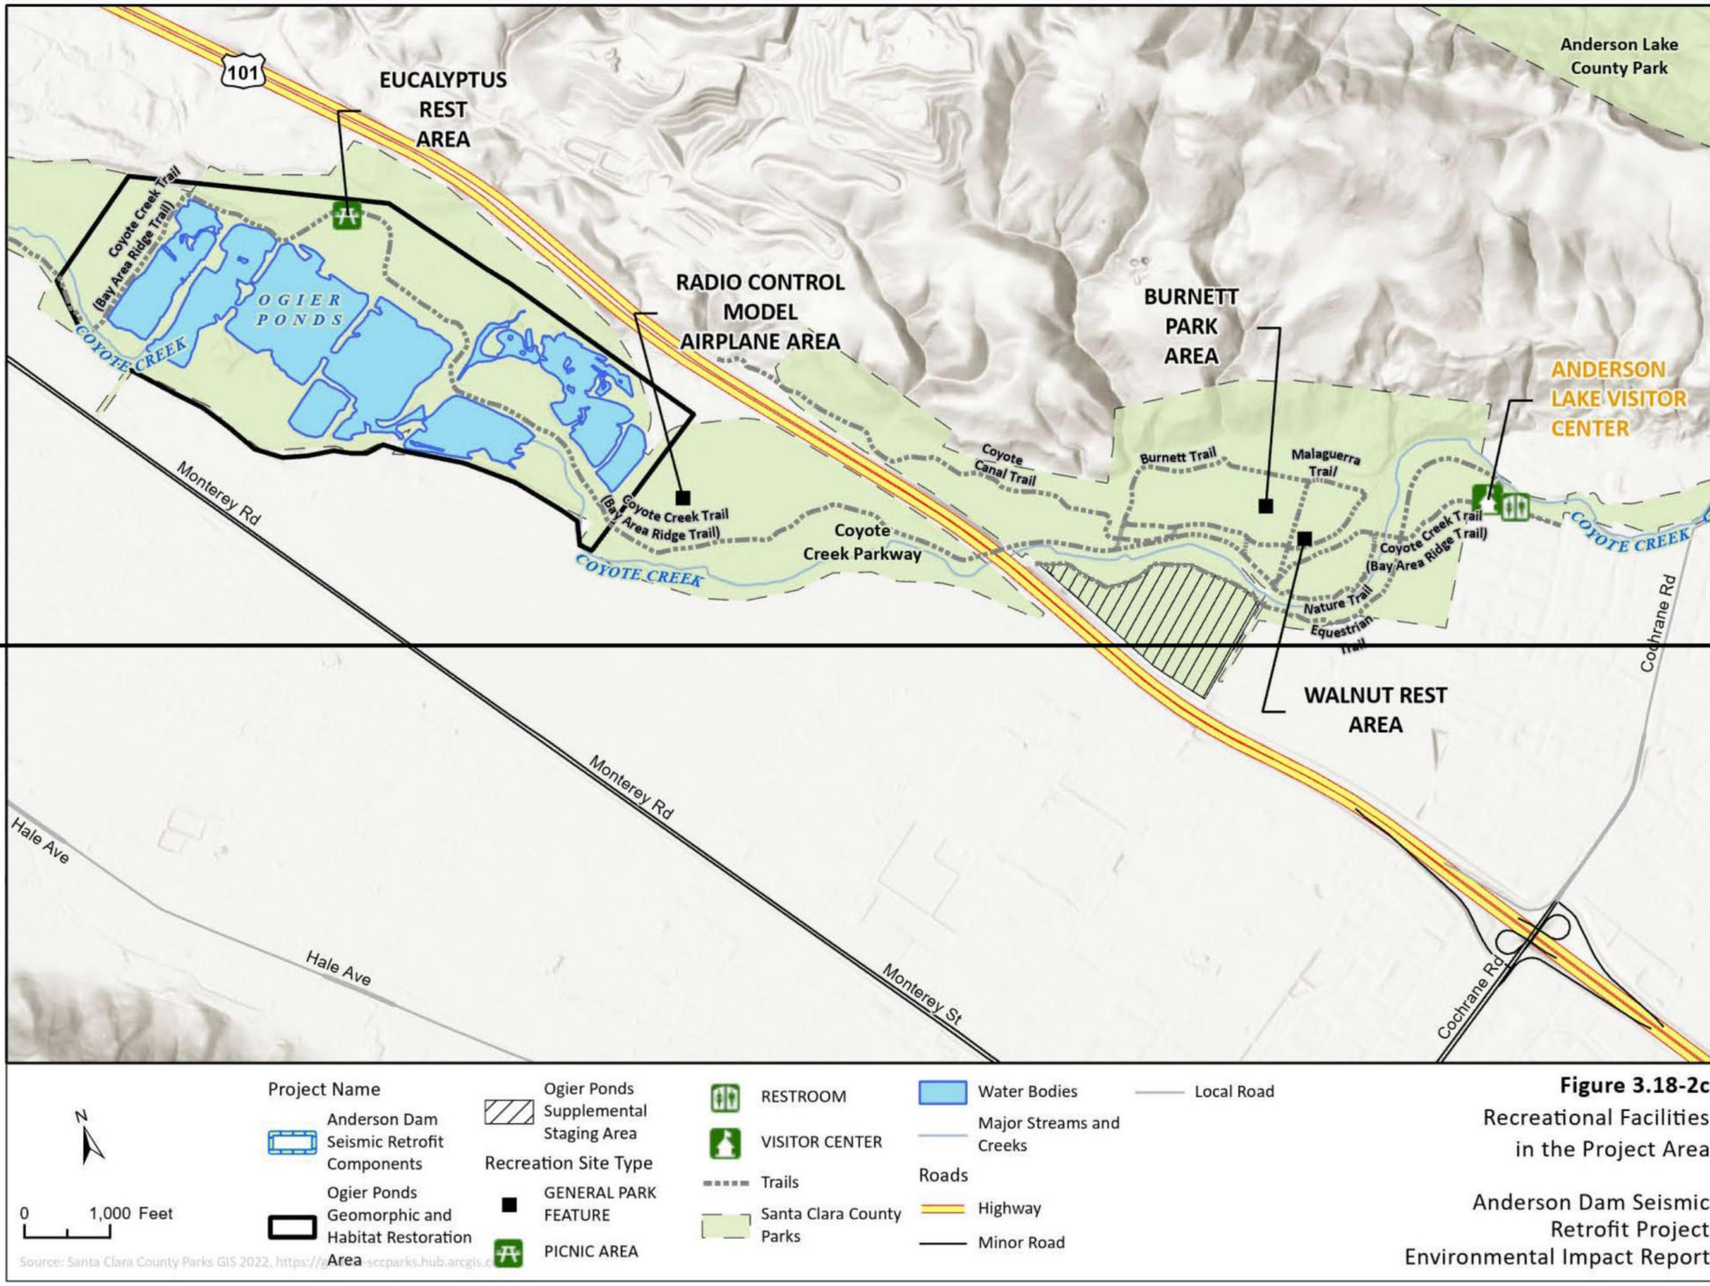

Figure 3.18-2c
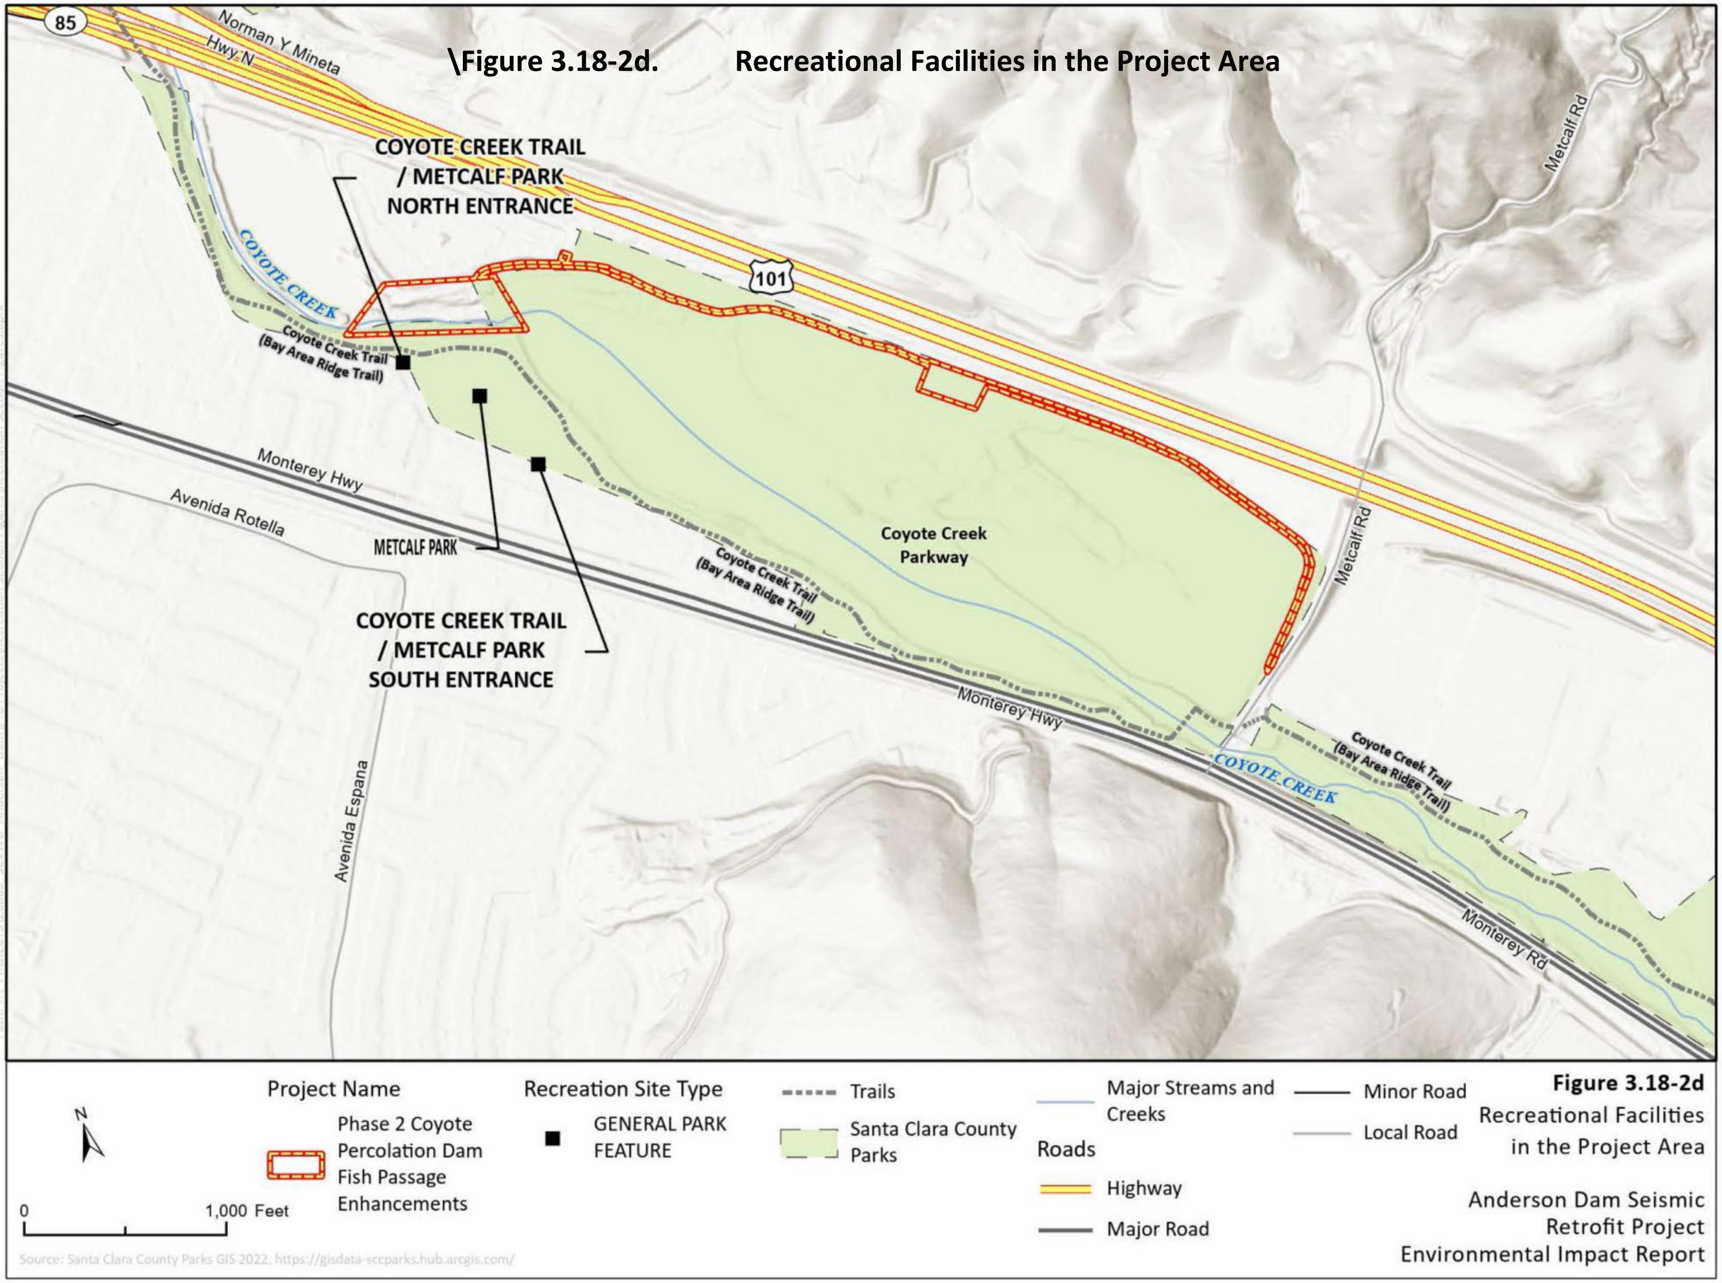
Recreational Facilities in the Project Area

Anderson Dam Seismic Retrofit Project Environmental Impact Report

\Figure 3.18-2d. Recreational Facilities in the Project Area



Historically, there have been two parking lots along Cochrane Road. Both lots provide easy access to the park. West of the Live Oak Group Picnic Area, the Coyote Creek Parkway begins, connecting Anderson Lake County Park with Hellyer County Park, discussed in more detail below (**Figure 3.18-2b–Figure 3.18-2d**). The Anderson Lake County Park Visitor's Center is located at the western end of Malaguerra Avenue and provides parking and access to the Coyote Creek Parkway.

Directly south of the boat launch parking area, there are undesignated trails leading up to Basalt Hill that provide hiking and scenic viewing opportunities for recreators (**Figure 3.18-2b**). Slightly farther to the east, the Rosendin Park Area is situated in the hills between the lake and the Holiday Lake Estates community. Several popular rocky dirt trails, including the Lakeview ~~Lake View~~ Trail, Grey Pine Trail, and Rancho Laguna Seca Trail are used by hikers, mountain bikers, and dog walkers. The trails cross through different habitats and provide views of the lake and nearby mountains. Parking is available in the County Park parking lot near the boat launch area for a fee. No public street parking is allowed within Holiday Lake Estates.

Coyote Creek Parkway

Coyote Creek Parkway is a 15-mile multi-use parkway in southern Santa Clara County, serving bicyclists, rollerbladers, hikers, equestrians, anglers, picnickers, wildlife viewers, dogs on leash and their owners, members of the Academy of Model Aeronautics and Santa Clara County Model Aircraft Skypark, and model airfield users (SCCPRD 2023a). In addition, fishing is also allowed in Coyote Creek during fishing season (i.e., April through November) (SCCPRD 2017).

Coyote Creek Parkway contains a number of paved and unpaved multi-use trails which connect Anderson Lake County Park with Hellyer County Park (refer to **Figure 3.18-2a–Figure 3.18-2d**). The scenic parkway begins west of the Live Oak Picnic Area downstream of Anderson Dam and runs parallel to Coyote Creek for 15 miles, extending to Hellyer County Park north of US 101. This recreational area consists of a relatively flat and tree-lined trail along Coyote Creek. The trail alignment is lined by oak, cottonwood, and sycamore trees. The parkway provides a number of recreational opportunities, including biking, horseback riding, hiking, and picnicking (SCCPRD 2017). During the fishing season, multi-use trails in this region may be used by anglers to access reaches of Coyote Creek. The Coyote Creek Trail (which is also a segment of the Bay Area Ridge Trail) extends from the southern terminus at Malaguerra Avenue along Coyote Creek within the parkway to the northern terminus in Hellyer County Park at Tully Road. In addition, an 8-mile-long equestrian trail runs roughly parallel to the Coyote Creek Trail, a paved pathway available for pedestrians, bicyclists and hikers. An equestrian staging area and horse trailer parking are located at Burnett Avenue. A 1-mile-long, self-guided nature trail is provided for visitors who would like to learn about the wildlife and riparian habitat within the parkway. Rest areas and emergency call boxes are located throughout the parkway, but no potable water is available along the trail. The parkway also includes Ogier Ponds (although access is restricted) and Metcalf Ponds, described in more detail below.

As described above, the Coyote Creek Trail is a portion of the Bay Area Ridge Trail within the Project area. The Bay Area Ridge Trail is a regional trail network that provides approximately 400 miles of trail around the Bay Area (Bay Area Ridge Trail Council 2022). A portion of the Bay Area Ridge Trail is proposed to traverse along the western and eastern side of Anderson Reservoir (Bay Area Ridge Trail Council 2017). The western portion of the Bay Area Ridge Trail is proposed to cross over the top of the dam and then connect to the existing Bay Area Ridge Trail downstream of the dam. The eastern portion of the trail is proposed to travel around the entire eastern side of the Anderson Reservoir and connect to the Coyote-Bear County Park. The Bay Area Ridge Trail, as discussed below under "Trails and Other Land-Based Uses," is a regional trail that connects the Project area to the rest of the larger Bay Area.

Ogier Ponds

Ogier Ponds is located 5 miles downstream and northwest of Anderson Dam. This recreational area is situated in the middle of the Coyote Creek active floodplain and consists of approximately 600 acres of land and water which are owned and managed by SCCPRD. The site includes multiple public use trails and a radio-controlled model airplane field. The northeast limit of the ponded area is bordered by the Perry's Hill area, which SCCPRD plans to develop into a public recreation area in the future (SCCPRD 2006). Ogier Ponds connects with the paved Coyote Creek Trail, providing recreational opportunities for hiking and biking, and is a popular site for birding, sightseeing, and fishing within the ponds. Informal levee trails are also located between the ponds. No recreational facilities (e.g., picnic tables or bathrooms) are located at the ponds themselves, and boating and watercraft (e.g., kayaks and canoes) within the ponds are currently prohibited.

Coyote Percolation Pond (Metcalf Pond and Parkway Lakes)

Coyote Percolation Pond, also known as Metcalf Pond and Parkway Lakes, is accessible from the Coyote Creek Trail and provides recreational opportunities for birding, hiking, and fishing. No recreational facilities (e.g., picnic tables or bathrooms) are located at the pond, and boating and watercraft (e.g., kayaks, canoes, and paddleboards) are prohibited within the pond itself.

Existing Conditions Baseline

The existing conditions baseline in all parks is substantially the same as the Pre-FERC Order Conditions Baseline, except that, starting October 1, 2020, construction and operation of the FOCP necessitated the closure of Anderson Reservoir to all recreational water-related activities, including boating and fishing along the entire reservoir shoreline, and the closure of the following recreational areas within Anderson Lake County Park:

- Toyon Group Picnic and Parking Areas, Serpentine Trail, Dam Crest informational trails, and Woodchoppers Flat Picnic Area
- Boat and vehicle parking areas, and the boat launch ramp
- Coyote Road from the toe of the dam to the boat and vehicle parking areas
- Lakeview ~~Lake View~~ Trail from the boat launch ramp parking area trailhead to the westernmost junction with the Rancho Laguna Seca Trail (SCCPRD 2021b)

Of these areas, the Toyon Group Picnic and Parking Area will remain permanently closed.[3] All other recreational areas would remain temporarily closed through the duration of the Project and would be restored and reopened following construction completion.

[3] The Toyon Group Picnic Area was permanently removed as part of the FERC-Ordered Compliance Project (FOCP).

Table 3.18-2 shows visitation in Anderson Lake County Park and Coyote Creek Parkway in 2015 by recreational use type compared to visitation in all County parks. (See Appendix N for details and other years). More recently, the County reported 5,482,718 annual visitors (SCCPRD 2023b).

Table 3.18-2. Anderson Lake County Park and Coyote Creek Parkway Visitation 1999-2015 by Activity Type

Activity Type	All County Parks	Anderson Lake County Park	Percentage	Coyote Creek Parkway	Percentage
Land-Based	2,950,693	41,321	1.4%	197,294	6.7%
Angling	116,070	4,846	4.2%	1,608	1.4%
Boating	123,682	17,665	14.3%	not available	n/a
Total	3,190,445	63,832	2.0%	198,902	6.2%

Source: Appendix N ~~SCCPRD 2015c.~~

Notes:

[a] Among boating types, only kayaking is permitted in Coyote Creek. Visitation data for kayaking at Coyote Creek are not available.

3.18.1.2 Other Recreational Facilities

Multiple other recreational facilities outside of the Project Area are located within the study area (i.e., within 5 miles of the Project area for local parks that offer land-used based activities, and regional parks and parks with lakes or reservoirs in the county that offer boating and angling opportunities). These other recreational facilities are managed by several local jurisdictions and agencies, as described below and listed in **Table 3.18-1**. These agencies offer recreational opportunities similar to those found in Anderson Lake County Park and Coyote Creek Parkway.

- California State Parks owns and operates Henry W. Coe State Park, located slightly east of the Project Area. Recreational opportunities include hiking, camping, nature viewing, angling, and horse riding (DPR 2023b).
- The City of Morgan Hill Parks and Recreation Department operates 29 parks that provide opportunities for picnicking, swimming, tennis, and other outdoor activities (City of Morgan Hill 2009), and three park areas affiliated with Morgan Hill's Downtown Park Program (Nob Hill Trail Park, Railroad Park, and Third Street Creek Park).
- The City of San José Department of Parks and Recreation oversees nine regional parks, 207 neighborhood parks, 290 park playgrounds, 48 community centers, and 61 ~~operates more than 200 parks, including 60~~ miles of scenic trails (City of San José 2021h). The City of San José parks provide opportunities for on- and off-leash dog walking, fishing, golfing, hiking, horse-riding, biking, swimming, and many other activities.
- The Midpeninsula Regional Open Space District (MROSD) oversees more than 65,000 acres of greenbelt in 26 open space preserves in the San Francisco Bay Area. Twelve are in the land-based recreational use study area. The largest of these preserves, Sierra Azul, is near the Project area (MROSD 2022 ~~2021b~~). Recreational opportunities at Sierra Azul include hiking, bicycling, horse riding, and nature viewing (MROSD 2021b~~c~~).
- Santa Clara Valley Open Space Authority (SCVOSA) preserves more than 26,000 acres of natural areas in the county, except those within the boundaries of MROSD and Gilroy.

Some of these lands are open to the public and offer recreational opportunities, including hiking, bicycling, horse riding, picnicking, and nature viewing (SCVOSA 2021c).

Boating

Other parks in the boating and angling study area offer boating (power boats, non-power boats, and kayaks) at the following locations: Alviso Marina, Anderson Lake, Calero Reservoir, Coyote Lake-Harvey Bear Ranch, Lexington Reservoir, Stevens Creek Reservoir, and Vasona Lake County Parks under SCCPRD management (Appendix N ~~SCCPRD 2015c~~).

Typically, boating has been a popular seasonal activity in the region. Peak boating season generally runs from early spring through early fall. The season varies from year to year depending on water levels and other conditions. For example, in 2013, the peak season ran from mid-April through mid-October. During those months, Alviso Marina, Coyote Reservoir, and Calero Reservoir were open to power and non-power boats, and Stevens Creek and Lexington Reservoirs were open to non-power boats (SCCPRD 2013). Similarly, for the 2017 to 2018 off-season (beginning October 15, 2017), Stevens Creek and Lexington Reservoirs were temporarily closed to boating, while Calero Reservoir and Alviso Marina remained open for boating and watercraft activities during this period (SCCPRD 2016~~c~~, 2017a).

Table 3.18-1 lists recreational areas within the study areas, indicating areas historically known to offer water-related recreational facilities and a current (2021) status of operation.

As summarized in Appendix N, according to data for annual boating attendance from 2015, the total number of people who visited the SCCRD's facilities for boating was 123,682, approximately 4 percent of the total County park attendance for that year (Appendix N ~~SCCPRD 2015c~~). Of those attending for boating, Alviso Marina received 41 percent of the boaters in County parks, Lexington Reservoir received 26 percent, and Coyote Lake received 11 percent. Visitation statistics by use type are not available for the City of San José Parks.

Angling

Several parks and recreation agencies, including SCCPRD, DPR, and the City of San José, manage recreational facilities in the boating and angling study area that offer angling opportunities other than Anderson Lake County Park and Coyote Creek Parkway. A fishing license is required for angling at these recreational areas, which are described in more detail below. In general, anglers are advised to catch and release rather than catch for consumption because of the risk of consuming methylmercury in fish caught in reservoirs.

Santa Clara County Parks and Recreation Department

SCCPRD manages 15 parks within the study area that allow angling: Anderson Lake, Calero Reservoir, Chesbro Reservoir, Coyote Creek Parkway, Coyote Lake Harvey Bear Ranch, Almaden-Quicksilver, Uvas Reservoir, Joseph D. Grant, Hellyer, Los Gatos Creek, Vasona Lake, Lexington Reservoir, Ed R. Levin, Sanborn, and Stevens Creek County Parks (SCCPRD 2023c). Except for Coyote Lake Harvey Bear Ranch County Park, Calero County Park, and Lexington Reservoir, where boating is allowed, fishing is from the banks.

As summarized in Appendix N, according to data for annual angling attendance from 2015, the total number of people who visited the County's parks for angling was 126,583, approximately 4 percent of the total County Park attendance for that year (Appendix N ~~SCCPRD 2015c~~). Of those attending for angling, Uvas Reservoir had the highest percentage of anglers, at 20 percent of the total angling users. Chesbro Reservoir and Los Gatos Creek had 15 percent each of the total angling users.

California Department of Parks and Recreation

Henry W. Coe State Park offers fishing from the banks of multiple ponds and small lakes. While spring is generally the best season for fishing (Pine Ridge Association 2021), fishing is allowed year-round. None of the ponds and lakes are accessible by car, and the closest ponds located near visitor centers are at least 4.5 miles away. Visitation statistics for anglers are not available for Henry W. Coe State Park.

City of San José

City of San José Parks, Recreation, and Neighborhood Services Department manages two parks in the study area that allow fishing from the banks: Almaden Lake Regional Park and Lake Cummingham Park (City of San José Parks, Recreation, and Neighborhood Services n.d.~~.a; The Outdoorsman 2023a, 2023b~~). Boating at these two parks are not allowed. Visitation statistics by use type are not available for City of San José Parks.

Trails and Other Land-Based Uses

Santa Clara County offers a wide variety of trail opportunities including hiking, biking, and horseback riding. Approximately 300 miles of hiking trails and more than 160 miles of bike trails, including off road biking opportunities from paved trails to single track mountain bike trails, are located within the county (SCCPRD 2016). Within the county, approximately 200 miles of hiking trails may also be used for equestrian use. According to the Countywide Trails Prioritization and Gaps Analysis, as of 2015, approximately 316 miles of County trails were complete, and another 471 miles of future trails had been identified (SCCPRD 2015a).

Trail restrictions or closures occur most commonly during winter because of conditions that lead to trail erosion, the creation of unofficial trails, or unexpected wildlife habitat impacts; other closures are based on impacts to threatened or endangered species, new trail construction, or trail maintenance (SCCPRD 2019). SCCPRD implements the following types of trail closures (SCCPRD 2019):

- Temporary closures: During the wet season, certain trails may be closed temporarily to running/hiking, equestrian, and mountain bike use, as well as during periods of flooding or other hazard; trails are evaluated daily for reopening.
- Seasonal closures: Trails may be closed to all user types, and generally for a longer duration, a set period of time, or for reoccurring time periods. These closures may result based on geographic location, topographical features, and soil types; these closures are based on safe trail access balanced with resource protection.
- Construction closures: Newly constructed trails may be closed for the first winter after construction until June 1 to allow the trail to settle, compact, and accumulate vegetation. These construction closures would provide a better and more stable trail system in the long term, and to meet County obligations to protect water quality and wildlife habitat (SCCPRD 2019).

In addition to the County trails, regional and municipal trails also exist throughout the county. Regional trails provide longer-distance trail opportunities that often extend beyond the boundaries of the county. The local or municipal trails that are owned and operated by the applicable municipalities generally provide connectivity between local parks and connect to other area trails, are often located in urban areas, and typically consist of paved trail systems. Trails in the study area include trails managed by CSJ, DPR, MROSD, SCVOSA, SCCPRD, and City of Morgan Hill.

As described above, the Bay Area Ridge Trail is a regional trail network that provides approximately 400 miles of trail and an additional 150 miles of planned trails around the Bay Area (**Figure 3.18-1**). Within the Project Area, the Coyote Creek Trail is a portion of the Bay Area Ridge Trail. Other segments of the Bay Area Ridge Trail are also located within the county and provide access to other County parks, providing a connecting corridor from the Project Area. A portion of the Bay Area Ridge Trail is proposed to connect Anderson Lake County Park to the Coyote-Bear County Park (Bay Area Ridge Trail 2017).

Other land-based uses in parks in the study area are picnicking, nature viewing, sports, and playground usage.

3.18.2 Regulatory Setting

This section summarizes State, regional, and local laws, regulations, policies, and plans pertinent to the evaluation of the Project impacts on parkland and recreational resources. No specific federal laws, regulations, or policies related to recreation are applicable to the Project.

3.18.2.1 State Laws, Regulations, and Policies

California Public Code 5400: Public Park Preservation Act of 1971

The Public Park Preservation Act of 1971 prohibits public entities from acquiring any property that is in use as a park at the time of acquisition from using such property for nonpark purposes, unless the acquiring entity provides compensation to the operating entity to replace the park and its facilities.

3.18.2.2 Regional and Local Laws, Regulations, and Policies

Santa Clara County General Plan

The Santa Clara County General Plan (County 1994) Parks and Recreation Countywide Issues and Policies section outlines three types of areas and facilities that can contribute both to meeting future recreation demands and to maintaining the county’s natural resources and beauty, including Regional Parks and Public Open Space Lands, Trails, and Scenic Highways.

The Parks and Recreation chapter provides strategies, policies, and implementation frameworks for parks and public open space lands, trails and pathways, and scenic highways. Key strategies and policies are listed below.

Regional Parks and Open Space Lands

- Strategy #1: Develop Parks and Open Space Lands
- Strategy #2: Improve Accessibility
- Strategy #3: Balance Recreation and Environmental Objectives
- Strategy #4 Facilitate Interjurisdictional Coordination
- Strategy #5: Encourage Private Sector and Non-Profit Involvement

Trails and Pathways

- Strategy #1: Plan for Trails
- Strategy #2: Provide Recreation, Transportation, and Other Public Trail Needs in Balance with Environmental and Land Owner Concerns
  - C-PR 24 As provided for in the Resource Conservation Chapter, trails shall be located to recognize the resources and hazards of the areas they traverse, and to be protective of sensitive habitat areas such as wetlands and riparian corridors and other areas where sensitive species may be adversely affected.
  - C-PR(i) 15 Prior to developing any new trail route for public use, prepare design and management plans that ensure provision of services necessary to provide for the safety and support of trail users and affected landowners, and respond to the unique safety and use concerns associated with highway safety, traffic operations, public transit, and businesses such as quality water source development, intensive agriculture, grazing, mining, railroads, and defense research and testing industries.
- Strategy #3: Implement the Planned Trails Network
- Strategy #4: Adequately Operate and Maintain Trails
  - C-PR 30 Trails shall be temporarily closed when conditions become unsafe or environmental resources are severely impacted. Such conditions could include soil erosion, flooding, fire hazard, environmental damage, or failure to follow the specific trail management plan.
  - C-PR(i) 19.6 Design trail access points to ensure that off-road motorized vehicles do not use trails except for maintenance and emergency purposes or wheelchair access.
- Strategy #5: Establish Priorities
- Strategy #6: Facilitate Inter-Jurisdictional Coordination
  - C-PR 33.5 Public improvement projects, such as road widenings, bridge construction, and flood control projects, that may impact existing or proposed trails should be designed to facilitate provision of shared use.

Santa Clara County Parks and Recreation Department 2018 Strategic Plan

Santa Clara County has an extensive history of countywide park planning and development managed by SCCPRD. Supported by a voter approved Park Charter Fund, the Parks and Recreation Department manages 28 parks comprising over 52,000 acres. Valley Water works in partnership with the SCCPRD to provide recreational opportunities at many of Valley Water's reservoirs and along over 70 miles of creek-side trails.

The 2018 Strategic Plan (SCCPRD 2018) outlines the process used to define the Parks and Recreation Department's vision statement and vision elements, and defines priorities, goals, strategies, actions, and practices for implementing the vision.

Countywide Trails Prioritization and Gaps Analysis

Santa Clara County Parks and Recreation Department (SCCPRD 2015a) completed an analysis of off-street trails, identifying priorities of "gap" trails. The Coyote Creek Trail was identified as having challenges related to funding, property acquisition, flood protection, riparian zone permitting, and infeasible segments.

Coyote Creek Parkway Integrated Resource Management Plan and Master Plan

The Coyote Creek Parkway Integrated Resource Management Plan and Master Plan is designed to balance the long-term resource management of the Coyote Creek Parkway (Parkway) corridor with recreational uses that directly reflect the mission and vision of the SCCPRD. This plan depicts, over a 20-year period, how the Parkway can be managed to provide a quality outdoor recreation experience while also enhancing the habitat for special status species, providing and improving ecological functions of Coyote Creek, including flood protection, and maintaining a riparian forest along Coyote Creek (SCCPRD 2006). Key goals and objectives are listed below.

Goal PR-1. Consistent with resource programs, retain existing recreational use areas and facilities where feasible.

Objective PR-1.1 Retain and enhance, where appropriate, existing recreation opportunities provided by lessees and permittees.

Goal PR-2 Enhance the multi-use trail system of the Parkway while providing manageable access points.

Objective PR-2.4 Provide connections to Regional, Sub-regional, and Connector trails as identified on the Countywide Trails Master Plan

Objective PR-2.8 Where feasible, relocate the Coyote Creek Trail outside the Coyote Creek floodplain.

Goal PR-3. Provide water-based outdoor recreation opportunities.

Objective PR-3.2 Maintain the existing Coyote Creek fishing program and tailor it in the future to reflect changes in the fishery.

Santa Clara County Countywide Trails Master Plan-Update

The Santa Clara County Countywide Trails Master Plan Update (SCCPRD 1995) and its Supplemental EIR were adopted by the Santa Clara County Board of Supervisors in 1995 and serve as guides for trail system development to improve trail connectivity throughout the region. An updated trail status map (SCCPRD 2015b) shows existing and proposed trail routes throughout the county, including several proposed segments of the Bay Area Ridge Trail around Anderson Lake and the proposed and existing Coyote Creek Trail segments that follow Coyote Creek and intersect with several Project components. In the EIR scoping comments, the County noted impacts to the Bay Area Ridge Trail as a concern; however, the Bay Area Ridge Trail has not been completed, except for a single disjointed segment within the Project area that would be closed during construction.

Coyote Lake – Harvey Bear Ranch County Park Natural Resource Management Plan

The Natural Resource Management Plan (NRMP) for Coyote Lake – Harvey Bear Ranch County Park, along with its associated Final Master Plan EIR, was developed in order to provide SCCPRD with natural resource management programs for the park (SCCPRD 2004). The NRMP considers the park's existing biological conditions, identifies recreational opportunities, and serves to guide the development of Coyote Lake-Harvey Bear Park. The NRMP explains the guiding principles for resource management and outlines specific resource management practices. The NRMP zone of influence does not overlap with the Project Area, except for biological monitoring activities that occur between Anderson Lake and Coyote Lake. As such, Valley Water shares all data sets and monitoring reports with SCCPRD, which could be used to supplement SCCPRD's monitoring commitments set forth in the NRMP.

Jointly Adopted Agreements Between Santa Clara County Board of Supervisors and Valley Water Board of Directors

On August 14, 2018, the Santa Clara County Board of Supervisors and Valley Water Board of Directors adopted a 5-year term joint resolution that approved a set of Shared Principles which provides a framework for the land use relationship between both agencies. The joint resolution also included a renewable 5-year term Memorandum of Agreement regarding the implementation of the Shared Principles; a Master License Agreement, which provides a means for establishing land access agreements; and a 20-year term Master Partnership Agreement.

The Master Partnership Agreement (Valley Water 2018) between Valley Water and the County provides a renewed commitment to partnership in the operation of Valley Water properties for public recreational use (Valley Water 2018). Sections of the agreement relevant to the Project include the following:

- Valley Water responsibility for repairing and/or replacing County improvements damaged or removed by Valley Water as part of Valley Water projects
- Requirement that Valley Water provide the County with an annual notice of the scheduled operational levels for each reservoir on Valley Water property for the remainder of the calendar year
- Requirement that Valley Water engage the County early in conceptual and subsequent planning and design for projects

City of Morgan Hill Bikeways, Trails, Parks, and Recreation Master Plan

The City of Morgan Hill Bikeways, Trails, Parks, and Recreation Master Plan (City of Morgan Hill 2017) was developed to guide the improvements and future development for planning, design, operation, and maintenance of the City's Parks and Recreation system over the next 20 years. The Parks and Recreation Commission developed the Master Plan to provide a comprehensive system of high-quality parks, trails, recreation facilities, and programs that meet existing and future needs of the community, enhance partnerships, contribute to the city's scenic quality, identity, and livability, and are sustained over time. The Bikeways, Trails, Parks, and Recreation Master Plan identifies community recreation facility needs, including pedestrian and bicycle trails, as well as creeks and waterways that are preferred sites for unpaved and paved pedestrian and bicycle trails.

Santa Clara Valley Water District Act and Related Policies

Valley Water operates as a state of California Special District with jurisdiction throughout Santa Clara County. The Santa Clara Valley Water District Act (District Act) defines the powers and purposes of Valley Water. According to the District Act, Valley Water's purpose includes comprehensive water management, including protecting beneficial uses. Regarding Valley Water's purpose to provide or maintain recreation, the District Act states that Valley Water's purpose includes "preserv[ing] open space in Santa Clara County and support[ing] the county park system."

Valley Water's Board Governance Policies are the official adopted policies of Valley Water's Board of Directors. Also known as Valley Water's Ends Policies, these policies help Valley Water accomplish its mission of providing "a healthy, safe, and enhanced quality of living in Santa Clara County through watershed stewardship and comprehensive management of water resources in a practical, cost-effective, and environmentally sensitive manner for current and future generations." The Ends Policies support ends-oriented management, in which management is directed by the desired outcome or condition. The following Ends Policies related to recreation, as revised by the Board of Directors in June 2021 are relevant to the Project's recreation impacts.

Policy No. E-2 Water Supply Services

2.3. Protect and maintain existing water infrastructure (i.e., Anderson Dam which creates an opportunity for water based recreation)

Policy No. E-4 Water Resources Stewardship

4.5. Engage the community to promote watershed stewardship by providing meaningful engagement in Valley Water programs for all people regardless of race, color, gender identity, disability status, national origin, tribe, culture, income, immigration status, or English language proficiency.

4.5.1. Provide appropriate and equal public access to Valley Water's streamside and watershed lands.

4.5.2. Engage and educate the community in stream and watershed protection.

4.5.3. Build partnerships to protect and enhance watersheds and aquatic ecosystems.

3.18.3 Methodology and Approach to Impact Analysis

This impact analysis describes whether construction and operation of the Project would result in significant adverse effects on recreational resources and the ability to access natural resources (such as angling) in the Project area and in the recreational resource study areas. The impact analysis focuses on two issues: (1) whether temporary and permanent closures of recreational facilities in the Project area would result in substantially increased use at alternate recreational facilities by displaced recreators such that substantial physical deterioration of the facility would occur or be accelerated and (2) whether Project-related restoration and modification of recreational facilities in the Project area would result in impacts on the environment.

For impacts on other recreational facilities related to Project closures, the location and nature of Project construction and operation and maintenance activities are considered in the context of existing recreational facilities or opportunities that could be affected by Project activities. Each Project component has been analyzed to determine whether Project construction or operation activities would result in substantial physical deterioration of existing recreational facilities both in the Project Area and in the Project vicinity within the study areas. The analysis of impacts on alternate recreational facilities that could experience deterioration as a result of the use by displaced recreators considers temporary impacts that may occur during the ~~7-~~ 8-year construction period, as well as permanent impacts, or impacts considered to be long-term and/or that would result from ongoing operations and maintenance activities.

In addition, this impact analysis considers impacts on the physical environment that would result from construction activities related to restoration or modification of recreational facilities as a result of Project implementation. The study area for this impact is the Project area.

The direct impacts of the Project are described and evaluated according to significance criteria from Appendix G of the *CEQA Guidelines*, discussed in “Thresholds of Significance” below.

This analysis is based on the following evaluations.

- Desktop evaluations performed using a GIS analysis of existing recreational resources managed by SCCPRD, the cities of Morgan Hill, San José, and Gilroy, MROSD, Santa Clara Valley Open Space Authority, and California State Parks
- Review of recreation amenities at parks in the study areas
- Review of recreation data, including SCCPRD visitation statistics
- Coordination with SCCPRD, including site visits and the application of agreements such as the Master Partnership Agreement

The potential temporary or permanent loss of recreational opportunities at any particular location is not itself an environmental impact under CEQA.

As stated immediately above, impacts on other existing recreational facilities in the study areas are related to temporary and permanent closures of facilities in Anderson Lake County Park and Coyote Creek Parkway. Anderson County Park would remain open during construction except for those areas that were closed under the FOCP. The areas that would remain closed include the continued permanent closure of the Toyon Group Picnic Area and Coyote Road across the dam crest, and the continued temporary closure during ongoing construction of Woodchopper’s Flat Picnic Area, Serpentine Trail, Dam Crest Informational Trails, Anderson Reservoir Boat Launch Ramp and associated parking areas, and portions of the Lakeview ~~Lake View~~ Trail, and Rancho Laguna Seca Trail. The Project would require the additional temporary closure of the Live Oak Picnic Area throughout the duration of Project construction and Rosendin Park Area, including all trails (i.e., Rancho Laguna Seca, Lakeview ~~Lake View~~, and Grey Pine Trails) during the initial blasting phase of construction. The partial closures of Rancho Laguna Seca and Cochrane trails would extend throughout the entire construction period. All other facilities within the Anderson Lake County Park, including the Jackson Ranch Historic Site, Burnett Park Area, Anderson Lake County Park Visitor’s Center and Park Office, Anderson Lake County Park

Maintenance facility, and other internal and regional trails would remain open to the public. The Live Oak Picnic Area would be used as a staging area throughout Project implementation. All park features would remain or be replaced onsite and in-kind following construction activities associated with the Project. Permanent modifications to the Live Oak Picnic Area would be limited to the required tree removal for Project implementation.

Valley Water confirmed at the September 5, 2013, public agency scoping meeting that the Live Oak Bridge would not be used for transportation of construction equipment or vehicles. A new temporary bridge crossing would be constructed to support construction equipment crossings over Coyote Creek throughout Project implementation.

All public use of vehicles on Coyote Road along the dam crest would be permanently closed as a result of Project implementation; however, pedestrian access would remain open post-construction. Parking along the dam crest would also be removed, and these parking spaces would be relocated to the expanded boat launch parking area. Other permanent design modifications would include realigning the Serpentine Trail, restoring trails and pedestrian access along the dam crest, which connects to the trails upslope of the boat launch parking area (known as the Rosendin area), and permanently modifying off-trail hiking trails in the BHBA. Upon completion of Project construction, recreational facilities and parking areas that were temporarily closed would be restored to pre-FOCP conditions, to the greatest extent feasible, with on-site and/or in-kind replacement of facilities.

Since the time of the NOP, SCCRD and Valley Water have coordinated closely and developed a Master Partnership Agreement to further establish a cooperative understanding between Valley Water and SCCRD about permanent changes and reconfigurations to County parklands and recreational facilities.

Impacts on fisheries habitat and the recovery of game fish populations are analyzed in Section 3.14, *Water Quality*, Section 3.15, *Water Supply*, and Section 3.4, *Biological Resources – Aquatic and Fisheries Resources*. Impacts to site access, egress and ingress, and traffic circulation during construction and post-construction are discussed in Section 3.19, *Transportation*.

Table 3.18-3 summarizes the changes to recreational facilities that could be affected by Project-related temporary and permanent closures. **Figure 3.18-3a–Figure 3.18-3d** indicates closures in the Project area.

1 **Table 3.18-3. Closures and Changes to Recreational Facilities in the Project Area**

Recreational Facility	Temporary Changes	Dates of Existing Conditions (FOCP) Closure	~~Dates of Project-Related~~ Construction Years Related to Temporary Closure	Duration of Project-Related Temporary Closures (years)	Permanent Changes
Anderson Reservoir	Closed during FOCP; closure would be extended under the Project.	October 2020 – 2024	Years 1-7 ~~2024 – 2032~~	8	After seismic retrofit construction, the reservoir will be capable of holding more water more frequently compared to the existing conditions baseline, allowing greater boating opportunities.[a]
Undeveloped land within Live Oak Picnic Area	Partial closure during all of FOCP. This facility would be entirely closed in December 2023 under FOCP and remain closed throughout seismic retrofit construction.	North Channel backwater and staging area near Coyote Discharge line partially closed from 2021 –2024 South Channel, portions of the North Channel, and portions of Live Oak Picnic area closed during December 2023 – 2024	Years 1-7 ~~2024 – 2032~~	8	This recreational facility would be restored after seismic retrofit construction.
Holiday Lake Estates Boat Ramp Parking Area	Boat ramp will be closed throughout FOCP and seismic retrofit construction.	October 2020 – 2024 (through seismic retrofit construction)	Years 1-7 ~~2024 – 2032~~	8	This recreational facility would be restored after seismic retrofit construction.

Recreational Facility	Temporary Changes	Dates of Existing Conditions (FOCP) Closure	~~Dates of Project-Related~~ Construction Years Related to Temporary Closure	Duration of Project-Related Temporary Closures (years)	Permanent Changes
Woodchopper's Flat Picnic Area	Closed throughout FOCP construction and would continue to be closed throughout seismic retrofit construction because the area is susceptible to erosion due to low reservoir levels and is unstable for park users.	October 2020 – 2024 (through seismic retrofit construction)	Years 1-7 ~~2024 – 2032~~	8	This recreational facility would be restored when Anderson Reservoir refills.
Dam Crest Trail, ~~Cochrane Trail,~~ and Serpentine Trail	Closed during FOCP and seismic retrofit construction	October 2020 – 2024 (through seismic retrofit construction)	Years 1-7 ~~2024 – 2032~~	8	No permanent loss of function are proposed at these recreational facilities.
Toyon Picnic Area	Not Applicable to the Project (Closed due to implementation of FOCP)	Closed since October 2020	Not applicable	Not applicable	This recreational facility remains closed permanently, except for the Serpentine trail connection from the Live Oak Area to the Dam Crest.[b]
Live Oak Picnic Area (creek portions)	Completely closed in December 2023 for FOCP and closed in entirety throughout seismic retrofit construction	2023-2024	Years 1-7 ~~2024 – 2032~~	8	Permanent changes to this recreational facility include tree replacement, installation of shade structure, and installation of weirs in the North and South Channel.

Recreational Facility	Temporary Changes	Dates of Existing Conditions (FOCP) Closure	~~Dates of Project-Related~~ Construction Years Related to Temporary Closure	Duration of Project-Related Temporary Closures (years)	Permanent Changes
Anderson Lake Boat Ramp Area	Already closed as part of FOCP and would remain closed to boating, hiking, and picnicking throughout the duration of seismic retrofit construction. Boat ramp and parking lot would be replaced and improved.	2020-2024	Years 1-7 ~~2024 – 2032~~	8	No permanent changes are proposed at this recreational facility.
Basalt Hill	Informal trails and area closed through FOCP and would remain closed throughout seismic retrofit construction. Trails system would be restored following seismic retrofit construction. Boat area would be enhanced with additional parking.	2020-2024	Years 1-7 ~~2024 – 2032~~	8	Approximately 0.8 acre of Basalt Hill would be permanently fenced off and closed at this recreational facility.
Rosendin Park Area	Portions of trails that lead to/from Anderson Boat Ramp closed through FOCP, and all trails in Rosendin Park Area would be closed during the initial blasting phase of construction of the seismic retrofit which would last for approximately 3-4 months. Trails closest to Basalt Hill Borrow Area would be closed for the duration of blasting.	2020-2024	Years 4, 5, and/or 6 ~~2024-2032~~	Complete closures would last for approximately 3-4 months; partial closures of Rancho Laguna Seca and Cochrane trails would extend throughout the entire construction period. Lakeview Trail, Gray Pine Trail, Rosendin Trail and portions of Rancho Laguna Seca and Cochrane Trails	No permanent changes are proposed at this recreational facility.

Recreational Facility	Temporary Changes	Dates of Existing Conditions (FOCP) Closure	~~Dates of Project-Related~~ Construction Years Related to Temporary Closure	Duration of Project-Related Temporary Closures (years)	Permanent Changes
				would remain closed for the duration of blasting. ~~12~~	
Coyote Creek Parkway, trail	Partially closed throughout construction of ~~Ogier Ponds~~ Phase 2 Coyote Percolation Dam conservation measure. Detours and traffic control would be needed for Coyote Creek Parkway trail during ~~Ogier Ponds~~ construction.	None	Years 1-2 ~~2030-2032~~	Intermittent closures over 2 years	No permanent changes are proposed at this recreational facility.
Coyote Creek Parkway, Ogier Ponds	No changes to Ogier Ponds. Related changes to Coyote Creek Parkway trail.	None	None	None	No permanent changes are proposed at this recreational facility.
Coyote Creek Parkway-Sediment Augmentation Program	None	None	None	None	No permanent changes are proposed at this recreational facility.
Coyote Percolation Dam	Informal trails and 10-foot buffer around dam along the access road closed during active construction of Phase 2.	None	Intermittent closures in Years 1- 2 ~~2030 – 2031~~	Intermittent closures over 2 ~~1~~ years	No permanent changes are proposed at this recreational facility.

Notes:

[a] The spillway and capacity of the reservoir will remain the same compared to the Pre-FERC Order Conditions Baseline. Accordingly, rates of boating and angling are expected to return to the same or greater compared to Pre-FERC Order Conditions.

[b] Toyon picnic area was closed under the FOCP under the existing conditions baseline. Accordingly, the closure of this facility under seismic retrofit activities would not represent a change from baseline.

Key: FOCP = Federal Energy Regulatory Commission Order Compliance Project

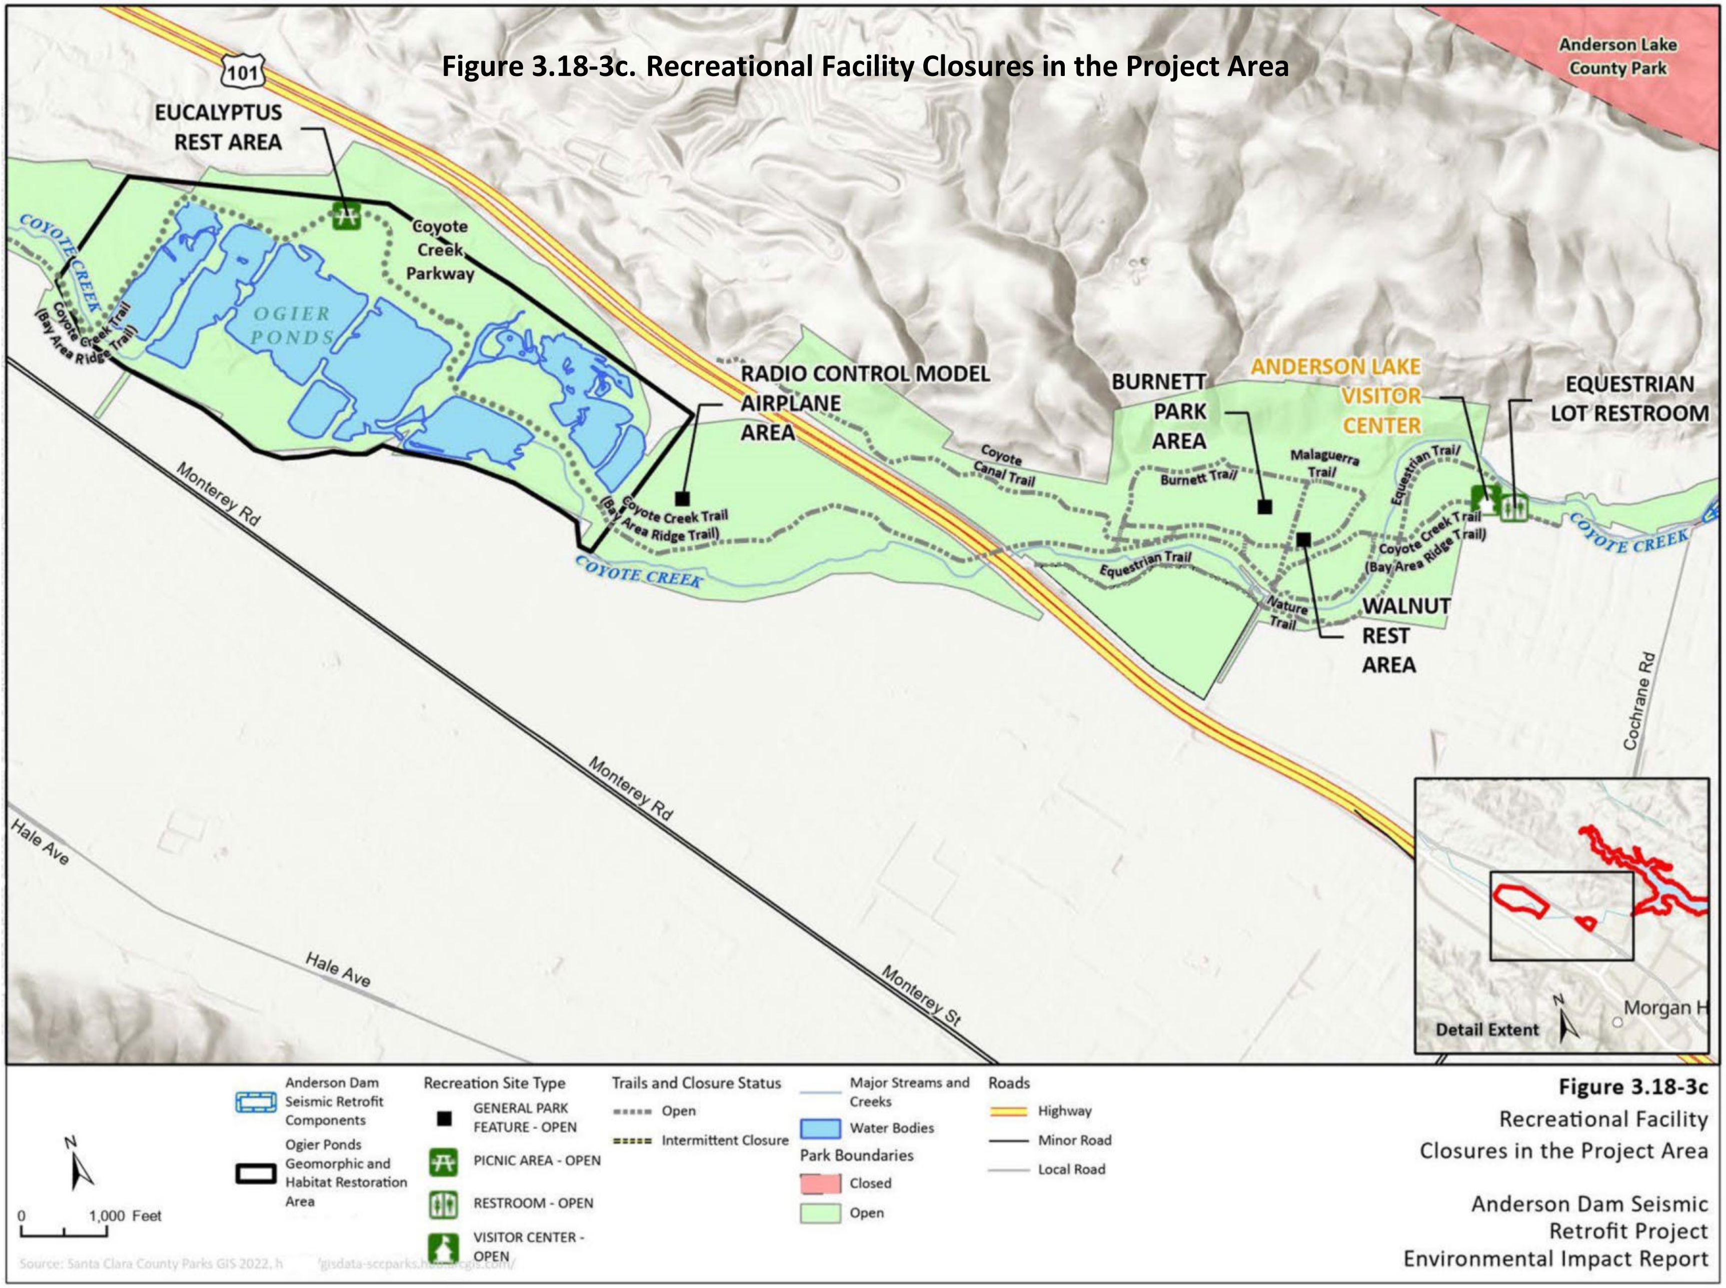

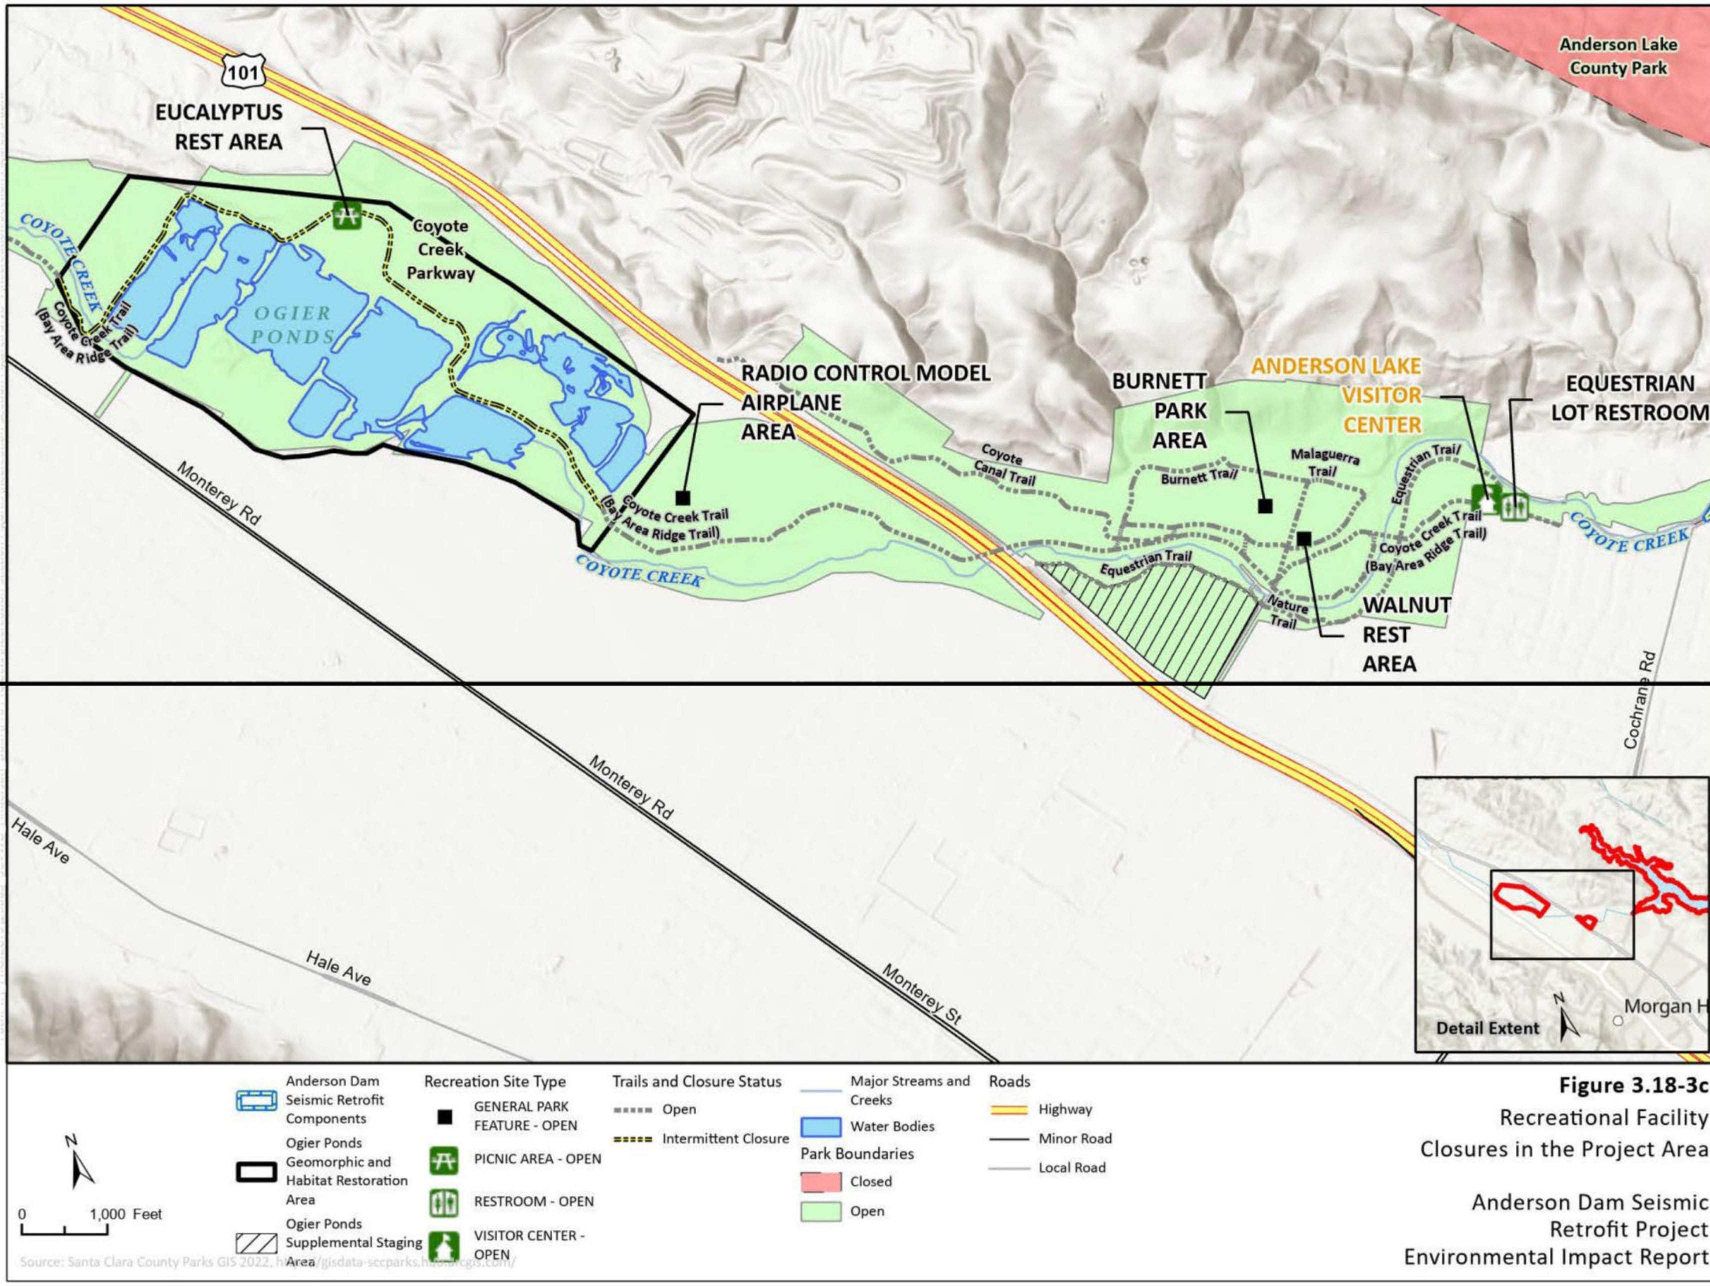

Figure 3.18-3c
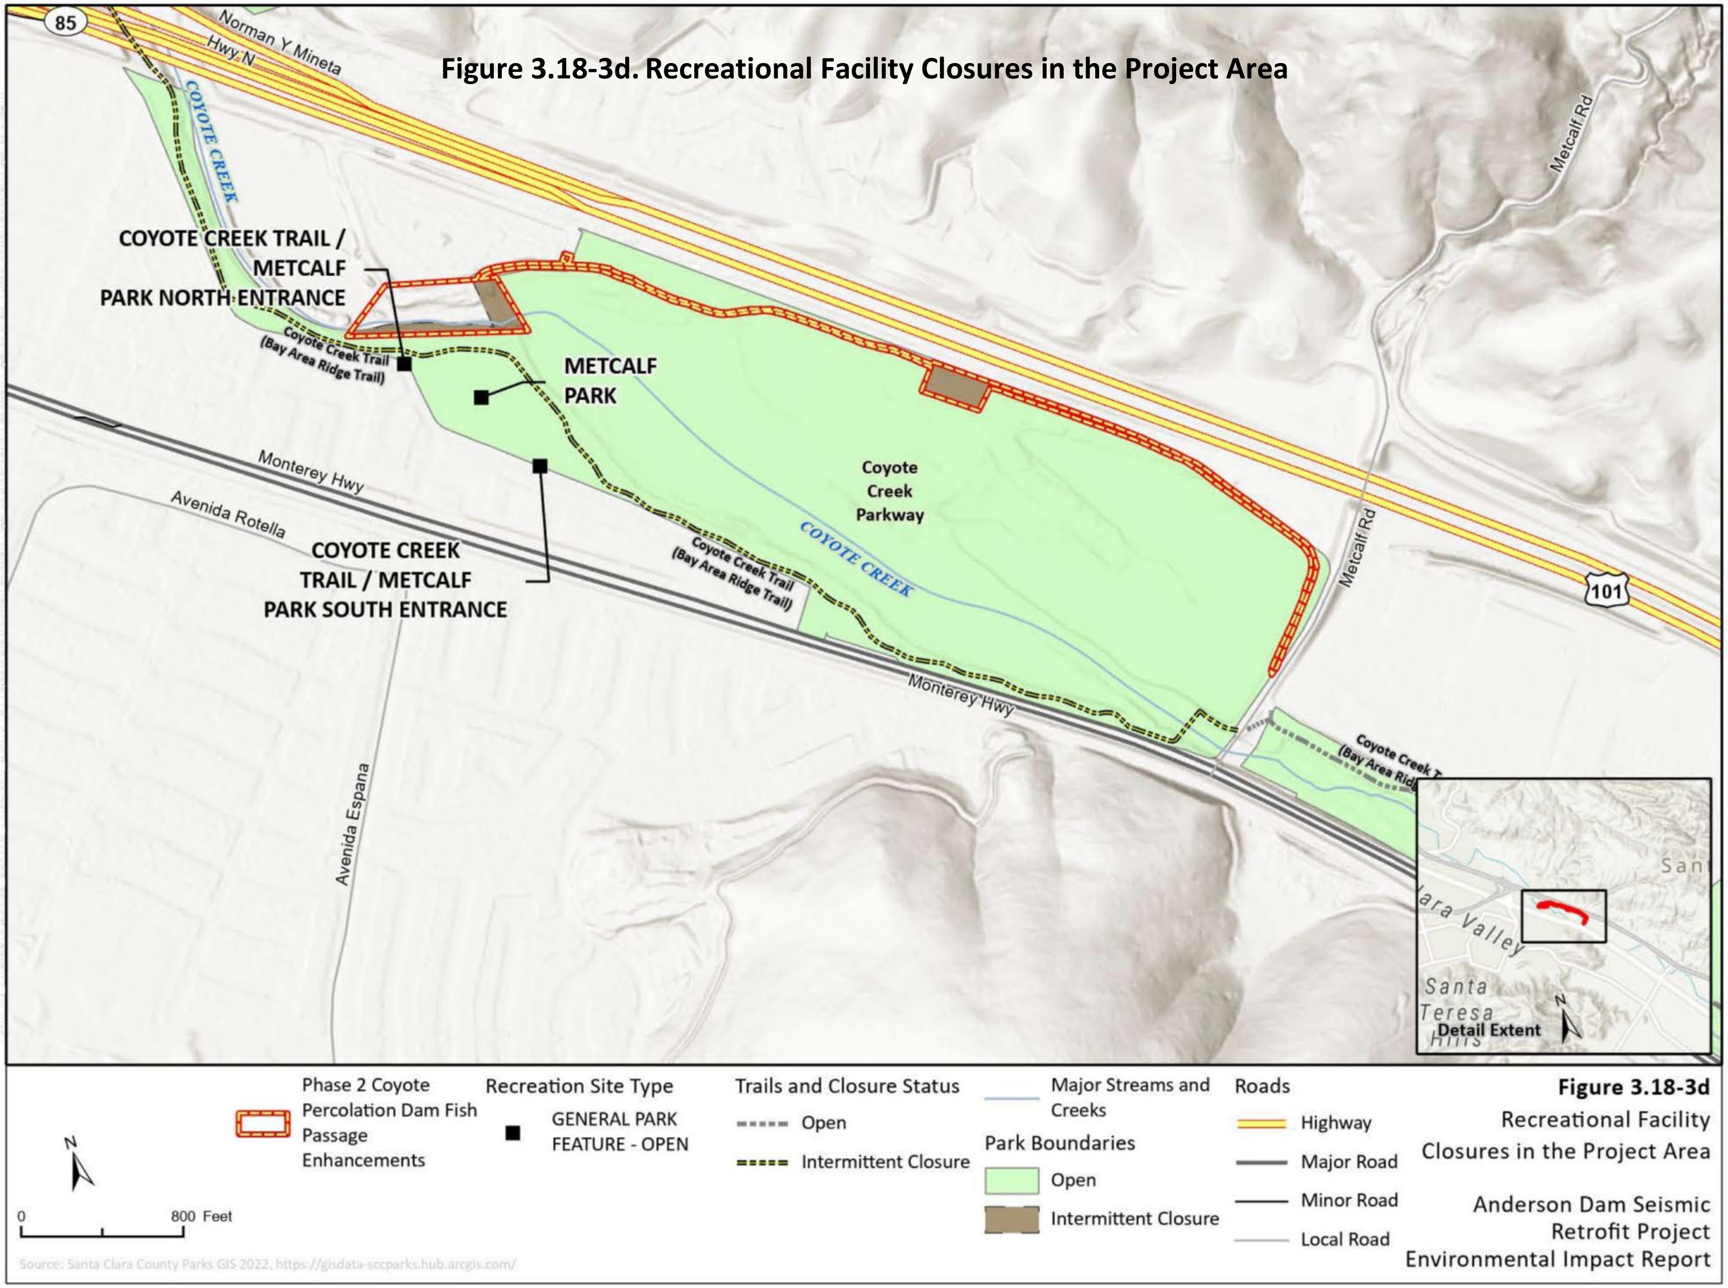
Recreational Facility Closures in the Project Area

Anderson Dam Seismic Retrofit Project Environmental Impact Report

Figure 3.18-3d. Recreational Facility Closures in the Project Area



Impact analysis related to increased use of other boating facilities focuses on changes to recreational boating and fishing in Anderson Reservoir and nearby Ogier Ponds, as well as changes in water levels in Anderson Reservoir that could increase use of other boating facilities. Impact analysis related to increased use of other facilities focuses on whether Project-related changes to land-based recreational uses such as hiking, picnicking, and nature viewing and Project-related changes to angling opportunities would increase the use of other facilities.

As stated in the Introduction to this section, two study areas were defined for evaluating these impacts. For land-based recreational uses, the study area includes all parks within 5 miles from the Project Area plus all regional parks in the county. This study area assumes that some limited uses, such as picnicking, could be displaced to nearby city parks, but that other land-based uses, such as hiking and nature viewing, could be displaced to other more distant parks with similar qualities to those in the Project Area, including a wilderness experience, hiking opportunities, and opportunities for nature viewing. For boating and angling uses, the study area includes all regional reservoir/lake-containing parks in the county that allow boating and/or angling. This study area assumes that parks with water features that are similar to those at Anderson Lake County Park and Coyote Creek Parkway would be visited by displaced boaters and anglers.

To evaluate whether Project construction activities would result in substantial physical deterioration of existing recreational facilities both in the Project Area and in the Project vicinity within the study area, nearby facilities in the study area were evaluated to determine their proximity for serving displaced recreators during Project construction and operation, as well as the suitability of the alternate recreational facilities to fill the needs of displaced recreators. **Figure 3.18-1** and **Table 3.18-1** show recreational facilities that could serve hikers, nature viewers, picnickers, and other land uses in the land-based study area. **Figure 3.18-4** and **Table 3.18-1** show recreational facilities that could serve boaters and anglers in the boating and angling study area.

This impact analysis also considers impacts on the environment that would result from Project-related restoration or modification of recreational facilities. Those facilities listed in **Table 3.18-3** that would be affected by a temporary closure would be restored to their pre-Project and pre-FOCP capacity and conditions, and the pre-construction quality of recreational facilities would be restored. Those facilities in **Table 3.18-3** that would be affected by a permanent modification would be replaced by other facilities that are equal to or better than those that existed prior to issuance of the FERC Order and implementation of the FOCP. Specifically, permanent design modifications at Coyote Road along the dam crest include elimination of the loop road, the removal of 61 parking spaces along the dam crest, and the relocation of the 61 parking spaces to the Boat Launch Parking area, which would be permanently modified to accommodate those relocated parking spaces. In addition, although access along Coyote Road, would be restored, the portion along the dam crest would become a restricted access road for Valley Water and SCCPRD staff and would no longer be accessible to private vehicles but pedestrian use of the road across the dam crest would be maintained.

Figure 3.18-4. Boating and Angling Facilities in Santa Clara County

The assessment of impacts has been divided into construction-related impacts and operation-related impacts by Project component, as identified in **Table 2-1** of Chapter 2, *Project Description*. The following subsections provide information on baselines and other Project-component information relevant to impact analysis.

3.18.3.1 Seismic Retrofit Construction

As described in Section 3.0, *Introduction,* the existing conditions baseline for evaluating seismic retrofit construction effects is the existing conditions following completion of the FOCP upgrades to the existing dam and reservoir facilities (i.e., existing conditions modified by FOCP implementation).

The existing conditions baseline for impact analysis therefore assumes implementation of FOCP, which began in 2020. This baseline establishes which facilities are considered to be open or closed. However, this section also considers park visitation statistics from 2015 with respect to the question of whether decreased visitation of Project recreational facilities would result in sufficient displaced recreators to cause deterioration of alternate recreational facilities. To more accurately and conservatively portray Seismic Retrofit construction impacts, this older dataset was chosen for three reasons, summarized below:

- The 2015 date is a more accurate representation of visitation at Anderson Lake County Park than a more recent date because the reservoir was drawn down starting in 2017 due to a DSOD order, which lowered boating activity, and the reservoir was drawn down further starting in 2020 to deadpool in compliance with the FOCP, which ceased boating activity on the reservoir. Other visitation is also likely to have been less because of the lowering of the reservoir.
- The 2015 date was in the middle of drought conditions that lasted from 2011 to 2017 and predates the most recent drought conditions from 2020 to 2022.
- The 2015 date predates the COVID-19 pandemic, which skewed visitation statistics.

3.18.3.2 Conservation Measure Construction

As described in Section 3.0, *Introduction,* the baseline for evaluating Conservation Measure construction impacts is the existing conditions baseline (i.e., following completion of the FOCP upgrades to the existing dam and reservoir facilities). Similar to the analysis for the Seismic Retrofit construction, this section considers park visitation statistics from 2015 with respect to the question of whether decreased visitation of Project recreational facilities would result in sufficient displaced recreators to cause deterioration of alternate recreational facilities.

3.18.3.3 Construction Monitoring

Construction monitoring activities are not considered in the impact analysis, as monitoring would involve data and information collection and assessment and would not result in direct or indirect adverse impacts to recreational facilities. Thus, construction monitoring is not discussed further in this section.

3.18.3.4 Post-Construction Anderson Dam Facilities Operations and Maintenance

This analysis considers the impacts to other off-site recreational resources that would result from operational changes proposed for nonemergency and emergency flow releases following completion of Anderson Dam facility upgrades and improvements, as described in Chapter 2, *Project Description*. This analysis evaluates whether the Project would result in increased average daily peak flows that could inundate existing recreational facilities and trails along downstream reaches for a sustained period and potentially result in increased use at other existing recreational facilities. The results of instream models (Valley Water 2022a) and regional maps were used to determine the location of existing recreational facilities where recreational facilities could be affected. As such, impacts on other recreational facilities from changes to Anderson Dam operations would be considered temporary, and are addressed under Impact Rec-1a only.

3.18.3.5 Post-Construction Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of Project ~~project~~ flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). Impacts of these monitoring activities are not evaluated in the impact analysis because none of these activities would increase the use of, or redirect the use of, Project Area recreational facilities, or require the construction or expansion of recreational facilities, such that physical deterioration or environmental degradation would occur.

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from original Conservation Measure construction. Impacts of these adaptive actions are not evaluated in the impact analysis because they are expected to be minor and not increase the use of, or redirect the use of, Project Area recreational facilities, or require the construction or expansion of recreational facilities, such that physical deterioration or environmental degradation would occur. The BMPs and mitigation measure applied to the impacts of the Conservation Measures to achieve a less-than-significant level for recreational resources would be at least as adequate to achieve the same level of impact or less for the adaptive actions.

3.18.3.6 Applicable Best Management Practices and VHP Conditions

As noted in Chapter 2, *Project Description*, Valley Water would incorporate BMPs, VHP Conditions, and AMMs to avoid and minimize adverse effects on the environment that could result from the Project. All relevant BMPs for the Project are included in Appendix A, *Best Management Practices and Santa Clara Valley Habitat Plan Conditions, Avoidance and Minimization Measures, and Mitigation Measures* ~~*Incorporated in the Project*~~. In reference to recreation resources, applicable BMPs focus on public noticing, safety, reduction in construction-related impacts (e.g., dust, odor, traffic, and noise), and the timing of Project activities. No VHP conditions directly apply to recreational resources. BMPs relevant to recreational resources include the following:

GEN-36: Public Outreach – Would specify measures to notify the public of Project activities and allow for the public to adjust recreational use to other area facilities.

GEN-37: Implement Public Safety Measures – Would specify public safety measures to notify and warn the recreating public of Project measures and mitigate public safety at recreational facilities and trails.

~~**GEN-38:** Minimize Noise Disturbances to Residential Areas – Would specify maintenance practices that minimize disturbances to residential areas and recreational facilities and users.~~

GEN-39: Planning for Pedestrians, Traffic Flow, and Safety Measures – Would schedule bicycle and pedestrian facility closures outside the peak morning and afternoon periods to minimize the effect of Project measures on recreational access and use.

AQ-1: Use Dust Control Measures – Would ensure dust and air quality management measures, including implementation of BAAQMD's BMPs for dust suppression, relevant when considering impacts on recreators that may be present in the Project area.

AQ-2: Avoid Stockpiling Odorous Materials – Would avoid stockpiling odorous materials (for example, reservoir sediment containing high levels of hydrogen sulfide) within 1,000 feet of residential areas or other odor sensitive land uses, including recreational areas.

TR-1: Incorporate Public Safety Measures – Would requires installation of signs, safety fencing, and access to detours (if feasible) that provide adequate warning to the public of the construction work area.

3.18.8 Thresholds of Significance

For the purposes of this analysis, the Project would result in a significant impact on recreational resources if it would:

REC-1: Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (criterion a).

To determine whether the Project would result in a significant impact falling under criterion (a), the environmental analysis below is divided into the following two subcategories:

REC-1a: Temporary increased use of neighboring recreational facilities; and,

REC-1b: Permanent loss of recreational facilities.

In addition, the Project would result in a significant impact on recreational resources if it would:

REC-2: Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment (criterion b).

3.18.3.7 Issues Dismissed from Further Review

CEQA Guidelines Appendix G suggests that projects may have a significant effect on recreational facilities if the Project would cause a substantial physical deterioration or would require construction or expansion of recreational facilities. However, the potential temporary or permanent loss of recreational opportunities at any particular location itself is not a physical environmental impact under CEQA. Rather, consistent with the *CEQA Guidelines*, for purposes of this EIR, impacts to be evaluated are whether such losses would cause increased use of alternative recreation facilities that may cause their deterioration, or whether the project requires expansion of recreation facilities which may have a physical environmental impact. Please note that the loss of recreational opportunities during Project construction would be temporary and would be reversed through Project restoration of recreational facilities.

Impacts from the Seismic Retrofit Construction component and Conservation Measure Construction component are discussed under Impact Rec-1a since they would be temporary impacts of the Project, and are not discussed under Impact Rec-1b since they would not cause permanent impacts on recreational facilities.

Maintenance of conservation measures within Coyote Creek would be conducted in accordance with existing Valley Water maintenance programs (e.g., DMP, SMP, BMPs, and AMMs) as listed in **Table 2-1**, in the Project Description. These measures would be implemented to minimize potential impacts to recreational facilities and opportunities during operations and maintenance activities. The conservation measures focus on improving fish habitat (e.g., gravel augmentation, separation of Coyote Creek from Ogier Ponds, fish passage enhancement). Operations and maintenance would not result in activities that have the potential to substantially affect recreational facilities or opportunities. Temporary disturbances to recreational users may occur during operations and maintenance (e.g., construction equipment operating near a trail that could generate noise temporarily affecting recreationalists). However, all work would be temporary and conducted in close coordination with SCCRD. These activities are not expected to limit recreational use and would therefore not contribute to the displacement of recreators to other recreational facilities, accelerating physical deterioration.

The Ogier Ponds CM would require permanent modifications to ponds (e.g., open waters), but no recreational facilities would be permanently affected (e.g., all informal levee trails would be restored post-construction). In addition, activities at the Ogier Ponds site would not affect the Coyote Creek Parkway to the east of the construction site, and access would be maintained throughout construction. Conservation Measures would operate passively, without mechanical or human intervention, in conjunction with Anderson Dam Reservoir flow releases. While data collection and assessment might indicate that certain Conservation Measures are not satisfying success criteria specified for those measures, such as habitat vegetation cover, presence of particular sized gravel and woody debris, or similar criteria, the actions that would be undertaken to attain prescribed success criteria would be similar to the methods described for implementation of the Conservation Measures.

As described in Chapter 2, *Project Description*, Valley Water would maintain the newly retrofitted Anderson Dam and Reservoir per Valley Water's existing DMP. Anderson Dam was previously evaluated in the Final DMP Program EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). The DMP includes measures to reduce impacts to recreational facilities, including impacts of maintenance-related reservoir dewatering activities. DMP Mitigation Measure General-3 requires the preparation of reservoir-specific dewatering plans that consider the reduction of impacts on water-based recreational activities. Impacts on recreational facilities and opportunities related to post-construction maintenance activities would not differ substantially from those impacts identified in the DMP EIR. Furthermore, previously identified DMP impacts would not be exacerbated with implementation of the Project. Therefore, no new impacts would occur as a result of post-construction dam maintenance activities. For these reasons, post-construction dam facility maintenance activities are not discussed further in this section.

3.18.4 Impact Analysis

***Impact REC-1a: Temporary increased use of neighboring recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated* (Less than Significant with Mitigation)**

Seismic Retrofit Construction

Anderson Lake County Park has existing recreational amenities, including boating and angling, that are not currently available due to the closures required for the FOCP (SCCPRD 2021b) (refer to **Table 3.18-3** and **Figure 3.18-3**). These restrictions would remain in place through the duration of Seismic Retrofit construction, for approximately seven years. Construction for the Seismic Retrofit components would result in temporary closures of additional facilities, including the Live Oak Group Picnic Area, the Rosendin Park Area (to be fully closed during the initial blasting phase of construction with some trails being opened before and after the initial blasting phase), the Grey Pine Trail, and portions of the Rancho Laguna Seca Trail (which would remain partially closed throughout the duration of blasting), and Lakeview ~~Lake View~~ Trail. In addition, the Seismic Retrofit components would require the continued closure of the Boat Ramp and Boat Ramp Parking Area, and Serpentine Trail, including individual picnic tables, public restrooms, and parking for the duration of construction. Because the Serpentine Trail is not connected through existing trail linkages, the temporary closure due to the Project would not affect the greater Bay Area Ridge Trail connectivity.

In addition to direct effects (i.e., trail and facility closures), noise, dust, odors, and vibration from Seismic Retrofit construction activities could discourage recreational use in locations where nearby recreational facilities remain open (e.g., Bay Area Ridge Trail/Coyote Creek Trail, etc.). Implementation of BMP AQ-1 (Use Dust Control Measures) and BMP AQ-2 (Avoid Stockpiling Odorous Materials) would minimize dust and odors from construction activities. ~~Implementation of BMP GEN-38 (Minimize Noise Disturbances to Residential Areas) would limit work to occur only during normal working hours, equip construction equipment and vehicles with adequate mufflers, and restrict vehicle idling time to minimize noise generated by construction activities.~~ Implementation of BMP-TR-1 (Incorporate Public Safety Measures) would provide the public with construction warning signs, safety fencing, and access to detours (if feasible) during construction. Implementation of BMP GEN-36 (Public Outreach [which includes County coordination]), BMP GEN-37 (Implement Public Safety Measures), and BMP GEN-39 (Planning for Pedestrians, Traffic Flow, and Safety Measures) would also reduce impacts and contribute to public safety, and ensure the advance notification of recreators so that they may choose alternate recreational facilities during the construction period for the Seismic Retrofit component.

In the Pre-FERC Order condition, the Coyote Creek Trail and portions of Hellyer Park are periodically inundated by Coyote Creek because several low flow crossings, including the crossing the leads to Velodrome at Hellyer Park, when flows exceed 25 cfs (when measured at the Edenvale Stream Gage). Based on the hydrologic record between 1988 and 2020, the Edenvale Gage exceeds 25 cfs about 13% of the time (Valley Water, 2022 ~~2023~~, therefore the Pre-FERC Order condition included trail closures during winter storms. However, while the Seismic Retrofit construction is underway, releases to Coyote Creek have the potential to inundate additional parkland downstream of Anderson Dam because water will not be stored behind the dam while it is under construction. Flows from a 5 year-event (estimated to have a 20% chance of occurring annually) are expected to have larger peak flows compared to the Pre-FERC Order condition and would occur for a longer period of time. Peak flows would inundate portions of the Coyote Creek Trail and portions of Hellyer Park (see **Table 3.11-8**, **Table 3.11-9**, and Section 3.11, *Hydrology* for additional analysis). Generally, flows below 5,000 cfs would be more likely to occur, but flows greater than 6,000 cfs would be less likely to occur during the Seismic Retrofit construction. Due to the larger sized diversions during construction, the durations of flows exceeding 300 cfs would be slightly decreased during the Seismic Retrofit construction, as shown in **Table 3.11-9**.

There are 100 other recreational facilities in the study area (i.e., all parks within 5 miles of the Project area as well as regional parks in Santa Clara County), many of which include a variety of infrastructure and accommodate a wide range of recreational activities (see **Table 3.18-1** and **Figure 3.18-1**). Temporary impacts on recreational facilities resulting from the Seismic Retrofit components would be distributed across a large number of nearby recreational facilities, and it cannot be predicted which facility would be used by recreators seeking an alternate facility.

Coyote Creek does not accommodate recreational watercraft. Therefore, reduced downstream flow during construction operations would not displace recreators with kayaks to alternate boating facilities.

Anderson Reservoir has historically fluctuated yearly as to whether the reservoir would support boating, depending on water levels and natural environmental conditions. Therefore, it is not anticipated that parks featuring other reservoirs in the area that would absorb boaters displaced from the Seismic Retrofit components would have substantial physical deterioration of recreational facilities in the region or the acceleration of the physical deterioration of those facilities.

Based on 2015 data from the SCCPRD (see Appendix N), the number of individuals angling at Anderson Reservoir represented a small proportion (4.17 percent) of the total number of individuals angling at all County facilities. **Table 3.18-1** and **Figure 3.18-4** show that several neighboring areas provide opportunities for fishing from boats and/or shorelines. Specifically, the following parks within the region support fishing activities: Almaden Quicksilver County Park, Calero County Park, Chesbro Reservoir, Coyote Creek Parkway, Coyote Lake-Harvey Bear

Ranch County Park, Hellyer County Park, Henry W. Coe State Park, Joseph D. Grant County Park, Los Gatos Creek County Park, Mount Madonna County Park, Uvas Reservoir, and Vasona Lake County Park. While the Project would expand the duration for temporary closure of the reservoir by approximately seven years, these conditions would be similar to the existing conditions baseline, under which the reservoir is closed to anglers until the dam is retrofitted to meet FERC and DSOD safety requirements.

Data suggest that historically (i.e., prior to both FOCP and the Seismic Retrofit), Anderson Lake County Park has not been heavily visited for angling as compared to other recreational facilities in the area that offer angling opportunities. Because nearby facilities are currently accommodating anglers who have been unable to use Anderson Reservoir in recent years, it is likely that these same reservoirs would continue to accommodate anglers that would be temporarily displaced as a result construction of the Seismic Retrofit, despite the long period of facility closures (up to seven years). In addition, the proportion of SCCRD recreators visiting parks for angling activities is small compared to the overall anglers at SCCRD.

The downstream quality of seasonal angling conditions in Coyote Creek have been diminished during FOCP due to drawdown of the reservoir and FERC Order requirements to maintain the reservoir at or below deadpool. Angling conditions would continue to be diminished in Coyote Creek through the period of Seismic Retrofit construction and implementation of the Drawdown and Operations Plan, similar to the existing conditions baseline, as a result of reduced flow releases during Seismic Retrofit construction coupled with expansive drought conditions (refer to Section 3.14, “Water Quality”; Section 3.15, “Water Supply”; and Section 3.4, “Biological Resources – Aquatic and Fisheries Resources”).

As mentioned above, implementation of BMPs during construction of seismic improvements would ensure the advance notification of recreators so that they may choose alternate angling facilities during the construction period. Given the relatively small number of displaced anglers and the large number of alternative angling locations, the increased usage of other parks featuring fishing opportunities in the area that would accommodate anglers temporarily displaced from Seismic Retrofit construction would not result in substantial physical deterioration of recreational facilities in the region or the acceleration of the physical deterioration of those facilities. However, the modified releases to Coyote Creek could lead to larger releases and wider park closures during the wet season, which could result in physical deterioration of other recreational facilities or the acceleration of the physical deterioration of those facilities. Therefore, this impact would be significant.

Conservation Measure Construction

Construction of Conservation Measures in Coyote Creek Parkway and Metcalf Park could result in increases in the use of alternate recreational facilities and trails. As discussed in Chapter 2, *Project Description*, some conservation measures require temporary work crews to construct or maintain physical resources, which could result in the temporary disruption of, access to, and use of existing recreational facilities and trails. These changes, while temporary, could cause displaced users to seek alternative recreational facilities and trails in the three study areas. Certain activities, including Maintenance of the North Channel Reach ~~Extension~~ and maintenance of the Live Oak Restoration reach, will occur concurrent to the temporary park closures associate Seismic Retrofit construction (see above discussion related to the temporary park closures with Anderson Lake Park).

Specifically, construction work within Ogier Ponds and the Coyote Creek Parkway related to the Ogier Ponds CM would require temporary closures for recreators while the area is modified from the existing conditions baseline. Likewise, the Phase 2 Coyote Percolation Dam CM would require temporary closure of undeveloped parkland within Metcalf Park.

Appendix N, *Recreation ~~Technical~~ Appendix*, presents historical recreational usage information collected by SCCPRD. As shown in Appendix N, in 2015, Coyote Creek Parkway was attended by an estimated total of 197,294 people for land-based uses. As discussed above (see Section 3.18.2.1), the annual total number of day-use visitors other than anglers for all 28 of the County's parks in 2015 was about 2,950,693. Therefore, in 2015, the total number of individuals using Coyote Creek Parkway was small compared to the total number of individuals using all County facilities for land-based uses. Most of the users were hikers/runners, bicyclists, and equestrians using Coyote Creek Trail. Considering the number of alternative recreational facilities that offer land-based uses such as hiking/running, bicycling, and equestrian activities (see Table 3.18-1**)**, and the limited closures at Coyote Creek Parkway for construction activities, it is likely that regional and City parks would be able to accommodate any land-based recreators that might be temporarily displaced as a result of the construction of the conservation measures.

While construction of the Phase 2 Coyote Percolation Dam CM ~~some conservation measures~~ may disrupt recreational opportunities intermittently within Coyote Creek Parkway during the up to 2 year construction period, these effects would be temporary in any given location and ~~.~~ ~~During the construction period of the Ogier Ponds CM and the Phase 2 Coyote Perc Dam CM over three years and one year, respectively,~~ recreators would be accommodated at similar recreational facilities located in the study area (see **Table 3.18-1**). However, a relatively small number of recreators would be displaced. Further, the large number of recreational facilities in the study area collectively provide a variety of infrastructure and amenities to accommodate the temporary loss of recreational activities within the study area. Increased usage of other recreational facilities from temporary closures and disruptions would be distributed across these other recreational facilities. Accordingly, displaced recreators would not substantially increase recreational use of any specific facilities to a degree that would result in the substantial physical deterioration of any recreational facilities or the acceleration of the physical deterioration of those facilities.

~~It is possible that~~ While some recreational resources in Coyote Creek Parkway would remain open during Conservation Measures construction, ~~but~~ recreators might be discouraged from using them because of construction activities, restricted access, and reduced parking availability. However, adherence to the requirements of BMPs would reduce the effects. As discussed above, implementation of BMP-AQ-1 (Use Dust Control Measures) and BMP-AQ-2 (Avoid Stockpiling Odorous Materials) would minimize dust and odors from construction. ~~Implementation of BMP GEN-38 (Minimize Noise Disturbances to Residential Areas) would limit work to occur during normal working hours, equip construction equipment and vehicles with adequate mufflers, and restrict vehicle idling time to minimize noise generated by construction activities.~~ Implementation of BMP-TR-1 (Incorporate Public Safety Measures) would provide the public with construction warning signs, safety fencing, and access to detours (if feasible) during construction. Implementation of BMPs GEN-36 (Public Outreach), GEN-37 (Implement Public Safety Measures), and GEN-39 (Planning for Pedestrians, Traffic Flow, and Safety Measures) would reduce impacts and contribute to public safety, and ensure the advanced notification of recreators so that they may choose alternate recreational facilities during the Project construction period. Although some recreators would likely seek recreation at other facilities instead, impacts to existing neighborhood and regional parks or other recreational facilities in the study area related to physical deterioration that could be caused by increased use during construction of conservation measure components would be less than significant.

Presently, the use of boats and/or watercraft in Ogier Ponds, Coyote Percolation Pond, and Coyote Creek is prohibited. Construction of the conservation measures would not contribute to the displacement of boating facilities, and while less flow may be available in Coyote Creek during construction phase operations pursuant to the Drawdown and Operations Plan, the reduced flows would not affect use of boating of watercraft in Coyote Creek. Therefore, there would be no impact on alternate recreational facilities offering boating associated with conservation measure construction.

Construction of conservation measures that require work within and adjacent to Coyote Creek, Ogier Ponds, and Coyote Percolation Pond where fishing is permissible would result in temporary closures as a result of construction activities. This would result in an increased demand on the use of alternate facilities for angling by displaced recreators. Conservation measures that would involve construction work within areas in the vicinity of angling activities would include Ogier Ponds, the Coyote Percolation Pond, and sediment augmentation within individual reaches of Coyote Creek. Construction of the Ogier Ponds CM and the Phase 2 Coyote Percolation Dam CM would extend over a total of up to 5 ~~four~~ years beginning in construction years 1 and 6 ~~and 4~~, respectively. Closures would not be simultaneous but instead would be staged. Anglers would be accommodated during these intermittent closure period at other recreational facilities within the study area (see **Table 3.18-1**). However, the temporary closures could displace anglers who previously fished in Coyote Creek.

As shown in Appendix N, in 2015 Coyote Creek had light use for fishing compared to other facilities that offer fishing in the area (1,608 anglers compared to 116,070 throughout SCCRD). Therefore, while construction of the conservation measures may affect areas that anglers would utilize such as Ogier Ponds and Coyote Percolation Ponds, these impacts would be temporary and would affect a small population of fishing visitors in Santa Clara County. Any temporary impacts from increased usage of recreational facilities would be distributed across multiple recreational facilities (see **Table 3.18-1**). Further, these temporary impacts would occur over an approximately five ~~four~~-year collective conservation measure construction period in the locations indicated. However, the closures would not occur all at the same time but instead would be staged. Because the number of displaced anglers would be small, closures would be short term and staggered, and multiple facilities exist where anglers could be accommodated, the use of any individual alternate recreational facility by displaced recreators (see **Table 3.18-1**) would not increase use to a degree that would result in substantial physical deterioration of recreational facilities or the acceleration of the physical deterioration of those facilities.

Habitat restoration and fish improvements in Coyote Creek would consist of the Ogier Ponds CM, ~~Anderson Dam Outlet~~ Maintenance of the North Channel Reach ~~Extension~~, Maintenance Activities at the Live Oak Restoration Reach, Sediment Augmentation Program, and Phase 2 Coyote Percolation Dam CM. Although habitat improvements within Coyote Creek may change, the opportunity for anglers to fish along Coyote Creek would not change. Therefore, changes in anglers along Coyote Creek are not expected to substantially change.

Implementation of BMPs GEN-36 (Public Outreach), GEN-37 (Implement Public Safety Measures), and GEN-39 (Planning for Pedestrians, Traffic Flow, and Safety Measures) would ensure the advance notification of recreators so that they may choose alternate recreational facilities during the Conservation Measure construction period. Based on the above analysis, impacts to other existing recreational facilities by displaced anglers in response to conservation measure implementation would be less than significant.

Post-Construction Anderson Dam Facilities Operations

Following construction of the Seismic Retrofit, Anderson Reservoir capacity would be unrestricted for the first time since 2008, well before the FERC Order. Normal operations at the range of water levels in the reservoir associated with unrestricted capacity is described by the WEAP modeled future conditions baseline. Post-Project releases from the unrestricted Anderson Reservoir into Coyote Creek would conform to FAHCE Settlement Agreement operating rule curves. The improved reliability of the dam structure would allow for storage of water to a higher elevation compared to pre-FERC order conditions within the reservoir, improving reservoir depths when hydrologic conditions allow greater storage, as well as reduced risk of a catastrophic failure that could adversely affect recreational facilities and amenities in the region.

Under the pre-FERC order baseline, some downstream recreational facilities in Coyote Creek Parkway, such as portions of the Coyote Creek Trail, the Live Oak Picnic Area, and portions of Hellyer Park, are at risk of temporary inundation from storm events. As stated above, in the Pre-FERC Order conditions it is estimated that the low-flow crossings along Coyote Creek Trail are closed 13 percent of the time. As described in Section 3.11, "Hydrology," during post-construction Anderson Dam facilities operations, there would continue to be a risk of temporary inundation of these facilities during storm events, but those facilities would be inundated less frequently. In fact, as stated in Impact HYD-1(iv), the maximum modeled storm event that could briefly inundate these facilities for a few days would occur very rarely (approximately 0.04 percent of the time over the 49-year study period).

Based on the above analysis, impacts to existing recreational facilities by inundation from post-construction Anderson Dam facilities operations would be less than significant.

Significance Conclusion Summary

Portions of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond would be temporarily closed during construction of the Project improvements, affecting a small percentage of visitors recreational facilities in the study area. While construction activities would disrupt recreational opportunities, these effects would be temporary in nature. Currently, some of these areas are already closed as a result of the FOCP. Displaced recreators from new and expanded closures resulting from the Project would be accommodated by and distributed among the large number of nearby recreational facilities described in **Table 3.18-1**. In addition, drawdown of the reservoir during construction could affect the recreational experience for hikers, picnickers, and other land-based recreators, potentially causing them to seek recreational opportunities at other facilities.

However, because the recreators would be distributed among the nearby recreational facilities and because the proportion of total users of SCCPRD that would be displaced is small, this temporary change in park visitation is unlikely to result in adverse impacts to those other recreational facilities beyond ordinary wear and tear. However, due to the modified flows expected in Coyote Creek during Seismic Retrofit construction, larger portions of the Coyote

Creek Trail and Hellyer Park may be inundated, causing recreators to concentrate within the portions of the facility that remain open. The concentrated use of the open areas, in combination with high water conditions, could result in impacts to SCCDPR facilities**. Mitigation Measure REC-1** would require Valley Water to provide funding for and implementation of future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities improvements ~~reimburse the SCCDR for maintenance activities that are triggered by flow events during Seismic Retrofit construction that are greater than 500 cfs (the existing outlet's maximum capacity),~~ which would reduce Seismic Retrofit component construction impacts to less than significant levels, therefore this impact would be **less than significant with mitigation**.

While construction of Conservation Measures similarly would disrupt recreational opportunities, these impacts would generally be short-term in any given location and temporary in nature. Although the temporary closures would span multiple months and years, construction would affect a small proportion of all visitors to SCCPRD, and these displaced recreators would be distributed across a large number of alternative facilities.

Some recreational resources in the Coyote Creek Parkway and Anderson Lake County Park would remain open, but recreators may be discouraged from using them because of construction activities, restricted access, and reduced parking availability. As discussed above, implementation of BMPs would reduce impacts and contribute to enhancing public safety, and would ensure the advanced notification of recreators so that they may choose alternate recreational facilities during the Project construction period.

Anderson Reservoir has been closed to recreational boating and angling, necessitated by the FOCP, and would not be reopened until the Seismic Retrofit improvements are complete and the reservoir has met FERC and DSOD safety requirements. Seismic Retrofit construction would extend the existing closure of Anderson Reservoir through Project construction by an additional 7 years, for a total of 11 ~~10~~ years. Displaced boaters would continue utilizing other reservoirs and water bodies during Project construction. Historically displaced recreators have traveled to other reservoirs and water bodies as a result of Anderson Reservoir closures due to natural environmental causes, and therefore the deterioration of other reservoirs by additional boating use would not substantially change from existing conditions. There is also no boating allowed downstream of Anderson Dam on Coyote Creek, so there would be no displacement of boaters downstream of the dam.

Anderson Reservoir has been closed for fishing throughout the construction of FOCP and would not be reopened for fishing until the seismic retrofit improvements are constructed meet FERC and DSOD safety requirements and the recreational area facilities are restored. Reduced flows in Coyote Creek resulting from construction phase implementation of the Drawdown and Operations Plan would also reduce flows and angling opportunities within Coyote Creek. In 2015, Anderson Lake County Park accommodated approximately 4,846 anglers, a small proportion of SCCRD anglers. Coyote Creek Parkway accommodated an additional 1,608 anglers, also a small proportion of SCCRD anglers. During this same year, there were 16 other parks that accommodated anglers, seven of which had greater attendance numbers than Anderson Lake and Coyote Parkway areas. Because of their history of accommodating substantially larger numbers than Anderson Lake and Coyote Parkway, other fishing areas in the region would likely accommodate the demand for fishing throughout the period of construction, despite the length of closures without substantial deterioration of those other recreational facilities.

Mitigation Measures

REC-1. ~~Maintenance Reimbursement for~~ Funding and Implementation of Park Facility Improvements within the Coyote Creek Corridor ~~Closures During High Flow Events.~~

Consistent with a December 2024 agreement between Valley Water and Santa Clara County, Valley Water will contribute funding to support SCCDPR's future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities. Improvements would include repairs, relocation, and/or realignment of trails, bank stabilization, and installation of bridges and culvert crossings. The County will be responsible for the planning, design, and construction of these improvements, which will not be implemented until CEQA review, if required, is completed. ~~Coordinate with the SCCDPR to develop an agreement for Valley Water to reimburse cost associated with additional maintenance activities that would be necessary to address high water conditions at park facilities during construction of the Seismic Retrofit component when flows exceed 500 cfs (measured at Madrone Gage) Activities that will be covered are trail repairs in areas that are inundated, bathroom repairs (if they are inundated), trail and parking lot sweeping, efforts to place additional signage along the trail, efforts to provide website updates, and debris removal.~~

Impact REC-1b: Permanent loss of recreational facilities resulting in substantial physical deterioration, or the acceleration of physical deterioration, of neighboring facilities (Less than Significant)

Post-Construction Anderson Dam Facilities Operations

Following Project construction, Anderson Reservoir capacity would be unrestricted for the first time since 2008, well before the FERC Order. Without ~~seismic~~ restrictions, Anderson Reservoir would be available for boating and angling uses again and, thus, not create a permanent loss of recreational facilities resulting in substantial physical deterioration, or the acceleration of physical deterioration, of neighboring facilities.

Maximum flows released from the new outlets during post-construction operations (the future conditions baseline) would be larger than what was releases from the outlets in the Pre-FERC Order conditions (1,400 cfs vs. 500 cfs). However, large spill events are expected to be of a lower magnitude than under the pre-FERC Order conditions baseline (Valley Water 2023 ~~2022a~~). Therefore, while there is likely to be temporary inundation of recreational facilities downstream, these recreational facilities are already prone to temporary inundation under the existing conditions baseline, and they would be inundated less frequently after Project implementation. Further, the duration of high flow release (those that exceed 500 cfs) would be shorter after completion of the Project ~~project~~. Implementation of the Project would provide improved flood protection, such that operational flexibility afforded by facility improvements would attract recreators who had been displaced to other recreational facilities and would thereby reduce impacts to adjacent recreational areas or trails.

There would be no permanent loss of recreational facilities from operations of Anderson Dam and Reservoir that could cause impacts on neighboring recreational facilities. As stated above, the number of anglers on Coyote Creek is small compared to the total number of anglers in SCCPRD and displacement of these anglers would not result in substantial deterioration of alternative angling facilities. The impact would be less than significant.

Normal operations at the range of water levels in the reservoir associated with unrestricted capacity is described by the WEAP modeled future conditions baseline. Post-Project releases from the unrestricted Anderson Reservoir into Coyote Creek would conform to FAHCE Settlement Agreement operating rule curves. The improved reliability of the dam structure would allow for storage of water to a higher elevation compared to pre-FERC order conditions within the reservoir, improving reservoir depths when hydrologic conditions allow greater storage, as well as reduced risk of a catastrophic failure that could in the absence of the Project adversely affect recreational facilities and amenities in the region. The increased depth of the reservoir over the pre-FERC order conditions baseline would likely attract land-based recreators such as hikers, picnickers, and nature enthusiasts back to Anderson Lake County Park after having been displaced to other facilities in the area during Project construction.

In addition, under the pre-FERC order baseline, some downstream recreational facilities, including portions of the Coyote Creek Trail and Hellyer Park, are at risk of temporary inundation from storm events. Modeling indicates that maximum flows released from the spillway and outlet during post-construction operations (the future conditions baseline) would be lower than maximum flows under the pre-FERC Order conditions baseline (Valley Water 2023 ~~2022a~~). Therefore, while there is likely to be temporary inundation of recreational facilities downstream, these recreational facilities are already prone to temporary inundation under existing conditions, and they would be inundated less frequently after Project implementation. In addition, these facilities would experience fewer closures under higher flows than under the existing conditions baseline (note: for water-based recreational facilities [e.g., boating and angling] see Impacts REC-1b). See also Impact HYD-1(iv) in Section 3.11, *Hydrology*. Thus, operational changes at Anderson Dam are unlikely to result in substantial temporary or permanent changes to downstream land-based recreational facilities or activities, including Coyote Percolation Pond and Ogier Ponds, causing recreators to use alternative facilities due to increased temporary inundation of some facilities. Therefore, impacts on neighboring and regional parks or other land-based recreational facilities in the study area related to physical deterioration that might be caused by increased use from post-construction operations of Anderson Dam facilities would be less than significant.

Based on the future operations of Anderson Reservoir, the reservoir would not be closed to boating more frequently under the future conditions baseline than under the pre-FERC Order conditions baseline; the frequency of reservoir closure to boating opportunities would be largely determined by drought conditions, and not changes in planned operations. The number of boaters displaced (temporarily, or otherwise) would not increase under future operation of the reservoir, and there would be no increased use of alternative facilities such that substantial physical deterioration of any one facility would occur or be accelerated. Accordingly, no reduction in boating opportunities is expected, and impacts on other reservoir-based recreational facilities would be less than significant.

Following Project construction, Anderson Reservoir capacity would be unrestricted for the first time since 2008, well before the FERC Order. For the reasons noted under Impact REC-1a, the operational changes at Anderson Dam would not adversely affect recreational angling within Anderson Reservoir, compared to the Pre FERC-Order Baseline. To the contrary, the restored capacity in Anderson Reservoir may improve fishing conditions for recreational anglers, likely reattracting anglers who sought out alternate angling opportunities during closure of Anderson Lake County Park to fishing.

Post-construction releases from Anderson Reservoir into Coyote Creek would conform to FAHCE Settlement Agreement operating rule curves,[4] which could affect in-stream angling downstream of Anderson Reservoir within Coyote Creek. To evaluate the effects on recreational anglers, Valley Water's WEAP model compares average daily peak instream flows between projected operations and the corresponding pre-FERC Order conditions baseline and future conditions baseline for instream flows.

Post-construction releases would have a colder temperature regime for a mile downstream of Anderson Dam than under the existing conditions baseline (Valley Water 2022b). This temperature regime would support a different fish population than the current game fish population, namely cold-water anadromous fish species. Although fish populations may vary from existing conditions, any angling population displaced from downstream Coyote Creek would be able to fish at Anderson Reservoir as well as at other fishing facilities in the study area, which are already accommodating displaced anglers, and anglers in Coyote Creek account for approximately 1 percent of the County total. Therefore, displacement of these recreators would not result in increased usage of alternate facilities such that their condition would deteriorate more quickly than without the Project.

Over the long-term, the restored capacity in Anderson Reservoir would improve fishing conditions for recreational anglers in the reservoir. As a result, Project impacts on nearby recreational facilities as a result of changes to angling opportunities would be **less than significant.**

Significance Conclusion Summary

The Project would permanently remove several unmarked trails from the BHBA, access by private vehicles along a portion of Coyote Road, parking along the dam crest, and trees at Live Oak Picnic Area. The Ogier Ponds CM would result in permanent modifications to the ponds, including the loss of Ponds 1 and 5 and partial filling of Ponds 2 and 4 ~~5~~, which would result in a permanent loss of open waters for fishing. However, the new low flow creek channel and adjoining floodplain would be restored and contain in-channel features (e.g., overhanging banks, large woody debris jams, stream barbs) to enhance the aquatic habitat. Land-based recreational opportunities other than angling on Coyote Creek may be expanded so that there is no permanent loss of recreational facilities or opportunities other than angling.

Overall, there would not be a substantial permanent reduction in the availability or quality of recreational uses in the Project area that could cause significant impacts on neighboring recreational facilities. The newly retrofitted dam would restore or improve upon pre-FERC Order recreational opportunities within Anderson Reservoir and Coyote Creek, allowing for boating in the reservoir, fishing, and water activities to resume. Therefore, no permanent displacement of recreators to adjacent recreational areas or trails is anticipated, other than anglers on Coyote Creek. This impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

4 The operational rule curve is the maximum elevation to which Valley Water can fill a reservoir during various times during the year.

Impact REC-2: Construction or Expansion of Recreational Facilities Which Might Have an Adverse Physical Effect on the Environment (Less than Significant)

The Project includes no components that would construct or expand recreational facilities that would result in a significant adverse impact on the environment. The Project would result in several permanent modifications to recreational facilities. As described in Section 2.4.5.12, the Live Oak Picnic Area would include an improved walking loop~~, a bridge over the North Channel and connection to the Serpentine Trail,~~ an interpretive trail along Coyote Creek, relocation of the group picnic area closer to restroom and parking areas, and tree replacement planting. Additionally, the existing boat ramp at Anderson Dam would be improved by constructing a second entrance off of Cochrane Road, constructing a dedicated inspection area, and an electric vehicle charging area would be replaced and improved. Public access would be provided along the west ~~left~~ bank of Ogier Ponds. These facility improvements would be minor and would not have a significant adverse physical effect on the environment; minor construction impacts of these recreational facilities are included in the Seismic Retrofit construction impacts discussed throughout this ~~D~~EIR.

Significance Summary Conclusion

The Project would not construct or expand recreational facilities which would cause a significant adverse physical effect on the environment. Therefore, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

3.18.5 Cumulative Impacts

The geographic study area for the cumulative impact analysis for recreation encompasses parks, creeks, lakes, trails, and other recreational facilities in Santa Clara County, as outlined in **Table 3.18-1**. This study area has extensive recreational facilities managed by multiple public agencies. This section describes the Project's contribution to cumulative recreation impacts, as summarized in **Table 3.18-4**.

Cumulative impact thresholds for recreation are the same as the impact thresholds presented in Section 3.18.8, *Thresholds of Significance*.

Table 3.18-4. Summary of Project Impact Contribution to Cumulative Recreation Impacts

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact REC-1a: Temporary increased use of neighboring recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated	Yes	Yes	CC	REC-1	No
Cumulative Impact REC-1b: Permanent loss of recreational facilities resulting in substantial physical deterioration, or the acceleration of physical deterioration, of neighboring facilities	No	No	NCC	None	No
Cumulative Impact REC-2: Construction or expansion of recreational facilities which might have an adverse physical effect on the environment	No	No	NCC	None	No

Key: CC = cumulatively considerable; NCC = not cumulatively considerable

Cumulative Impact REC-1a: Temporary increased use of neighboring recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated (Not Cumulatively Considerable)

Temporary closures of recreational facilities are not expected to cause significant impacts, because displaced recreators would be distributed among the nearby recreational facilities and because the proportion of total users of SCCPRD that would be displaced is small, this temporary change in park visitation is unlikely to result in adverse impacts to those other recreational facilities beyond ordinary wear and tear. However, due to the modified flows expected in Coyote Creek during Seismic Retrofit construction, larger portions of the Coyote Creek Trail and Hellyer Park may be inundated, causing recreators to concentrate within the portions of the facility that remain open. The concentrated use of the open areas, in combination with high water conditions, could result in impacts to SCCDPR facilities**. Mitigation Measure REC-1** would require Valley Water to provide funding for and implementation of the future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities ~~reimburse the SCCDR for maintenance activities that are triggered by flow events during Seismic Retrofit construction that are greater than 500 cfs (the existing outlet's maximum capacity)~~, which would reduce Seismic Retrofit component construction impacts to less than significant levels, therefore this impact would be less than significant with mitigation.

Cumulative Effects of Project with the FOCP

As described in Section 2, “Project Description,” as part of the FOCP, the Anderson Dam Boat Ramp and Parking Areas, Toyon Park, Basalt Hill, parking and access to Holiday Lake Estates, and trails that lead to the dam and are located on the dam have been closed since October 2020. Various facilities at Perry’s Hill will offset impacts from closing the Toyon Group Picnic Area. The FOCP would be completed before Project-related construction activities begin. Modified flows during FOCP construction may have affected Coyote Creek Trail and Hellyer Park similarly to the Project’s construction impacts. This would be a cumulatively significant impact on affected facilities, for which the Project’s contribution would be cumulatively considerable. Other elements of the FOCP are at discrete and separate locations from Project activities that would not create a cumulative significant effect on recreation resources.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Santa Clara County Parks would enhance trail connectivity and acquire land for public recreational use, but has no plans to close any facilities in the foreseeable future (Santa Clara County 2018). Additionally, the County does not plan to close Calero County Park to boating. The only proposed project at that location is the Calero Trails Master Plan (Santa Clara County 2023). The County has no plans to close existing facilities simultaneously with Project construction that would cause a cumulative impact to other recreational facilities such that substantial physical deterioration would occur (Santa Clara County 2023).

Similarly, the California State Parks Department has no plans to close or upgrade Henry W. Coe State Park, which typically stays open year-round (California State Parks 2023). The Santa Clara Valley Open Space Authority has no plans to close recreational facilities and is working to enhance Coyote Valley as one of its conservation focuses (SCVOSA 2014). The Midpeninsula Regional Open Space District likewise has no plans to close recreational facilities and is working to enhance trails in El Sereno and Bear Creek Redwoods (MPROSD 2014). The City of San José has no plans to close recreational facilities for more than a few months in the foreseeable future (City of San José 2023). The City of Morgan Hill has priority projects in its Bikeway, Trails, Parks and Recreation Master Plan (2017) that include constructing new community parks and recreational open spaces. The timing of that land acquisition and construction is unknown (within the next 10-20 years) and may overlap with Project construction and implementation. However, Project construction would not contribute to a cumulative impact such that a substantial deterioration of recreation facilities would occur. The cumulative impact on recreational facilities resulting from the Project in combination with other probable future projects would not be cumulatively significant.

Overall, the multiple agencies that manage public recreational facilities in the study area have no foreseeable projects that would result in a cumulative impact on recreational resources, causing substantial deterioration of other recreational facilities as a result of diverting recreators from the affected park to other facilities. This is because the large number resources of recreational resources present in the geographic scope would accommodate existing recreators to pursue a wide range of recreational interests, and none of those resources are planned to be closed for any length of time that would overlap with Project construction. The cumulative impact on recreational facilities resulting from the Project in combination with other probable future projects would not be cumulatively significant.

However, it is possible that other probable future projects in the Coyote Creek watershed could add flows to Coyote Creek that would add to Seismic Retrofit Construction flow-related impacts on Coyote Creek Trail and Hellyer Park. This would be a cumulatively significant impact on affected facilities, and the Project's contribution would be cumulatively considerable.

Significance Conclusion Summary

Valley Water would reduce the Project's incremental contribution to cumulative impacts on recreation through implementation of BMPs, including BMP-AQ-1 (Use Dust Control Measures) and BMP-AQ-2 (Avoid Stockpiling Odorous Materials), ~~BMP GEN-38 (Minimize Noise Disturbances to Residential Areas),~~ BMP-TR-1 (Incorporate Public Safety Measures), BMP GEN-36 (Public Outreach [which includes County coordination]), BMP GEN-37 (Implement Public Safety Measures), and BMP GEN-39 (Planning for Pedestrians, Traffic Flow, and Safety Measures).

Coyote Creek Trail and portions of Hellyer Park would be periodically inundated by Coyote Creek at several low flow crossings more frequently during construction the seismic retrofit. Longer park closures during the wet season could result in physical deterioration of other recreational facilities or the acceleration of the physical deterioration of those facilities. Cumulative impacts on affected facilities when added to other project impacts would be significant, and the Project's contribution would be cumulatively considerable pre-mitigation. **Mitigation Measure REC-1** requires ~~compensating SCCPRD~~ Valley Water to provide funding for and implementation of the future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities ~~anticipated extra maintenance costs should high flows occur,~~ which would prevent displaced recreators from substantially increasing deterioration of other facilities. Implementation of this mitigation measure would reduce the Project's contribution to cumulative impacts on recreation **not cumulatively considerable**.

Mitigation Measures

REC-1 ~~*Maintenance Reimbursement for*~~ *Funding and Implementation of Park Facility Improvements within the Coyote Creek Corridor* ~~*Closures During High Flow Event*~~

Cumulative Impact REC-1b: Permanent loss of recreational facilities resulting in substantial physical deterioration, or the acceleration of physical deterioration, of neighboring facilities **(Not Cumulatively Considerable)**

Cumulative Effects of Project with the FOCP

The FOCP would not permanently close recreational facilities such that a substantial physical deterioration of neighboring facilities would occur. Therefore, the cumulative impact on recreational facilities resulting from the Project in combination with the FOCP would not be significant.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

As mentioned under Cumulative Impact REC-1a, no agency that manages recreational facilities in the study area has plans to close their facilities for any length of time in the foreseeable future. As described in Section 3.18, Impact REC-1b, Project implementation would not result in a permanent loss of recreational facilities. Therefore, the cumulative impact on recreational facilities resulting from the Project in combination with other probable future projects, programs, and plans would not be significant.

Significance Conclusion Summary

The Project would not have a significant cumulative impact on permanent loss of recreational facilities such that there would be a substantial physical deterioration of neighboring facilities. The Project would not combine with the FOCP or other future projects in a manner that would cause a cumulative impact. The Project impact on permanent loss of recreational facilities would be **not cumulatively considerable.**

Mitigation Measures

No mitigation is required.

Cumulative Impact REC-2: Construction or expansion of recreational facilities which might have an adverse physical effect on the environment **(Not Cumulatively Considerable)**

Cumulative effects of Project with the FOCP

The FOCP includes no construction or expansion of recreational facilities that may have a significant adverse physical effect on the environment. Therefore, the cumulative impact from recreational facility construction or expansion resulting from the Project in combination with the FOCP would not be significant.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Of the multiple agencies listed above, only Santa Clara Parks and the City of Morgan Hill have plans to construct new recreational facilities in their master plans. Both agencies would be required to undergo CEQA compliance for those facilities prior to construction to avoid, reduce, or minimize potential impacts on the environment. Because the Project does not include any construction or expansion of recreational facilities that might have a significant adverse physical effect on the environment, it would not contribute to a significant cumulative impact. Therefore, the cumulative impact from recreational facility construction or expansion resulting from the Project in combination with other probable future projects, programs, and plans would not be significant.

Significance Conclusion Summary

The Project would not have a significant impact on construction or expansion of recreational facilities such that there would be a substantial physical effect on the environment. The Project would not combine with the FOCP or other future projects in a manner that would cause a significant cumulative impact. The Project impact from recreational facility construction or expansion would be **not cumulatively considerable**.

Mitigation Measures

No mitigation is required.

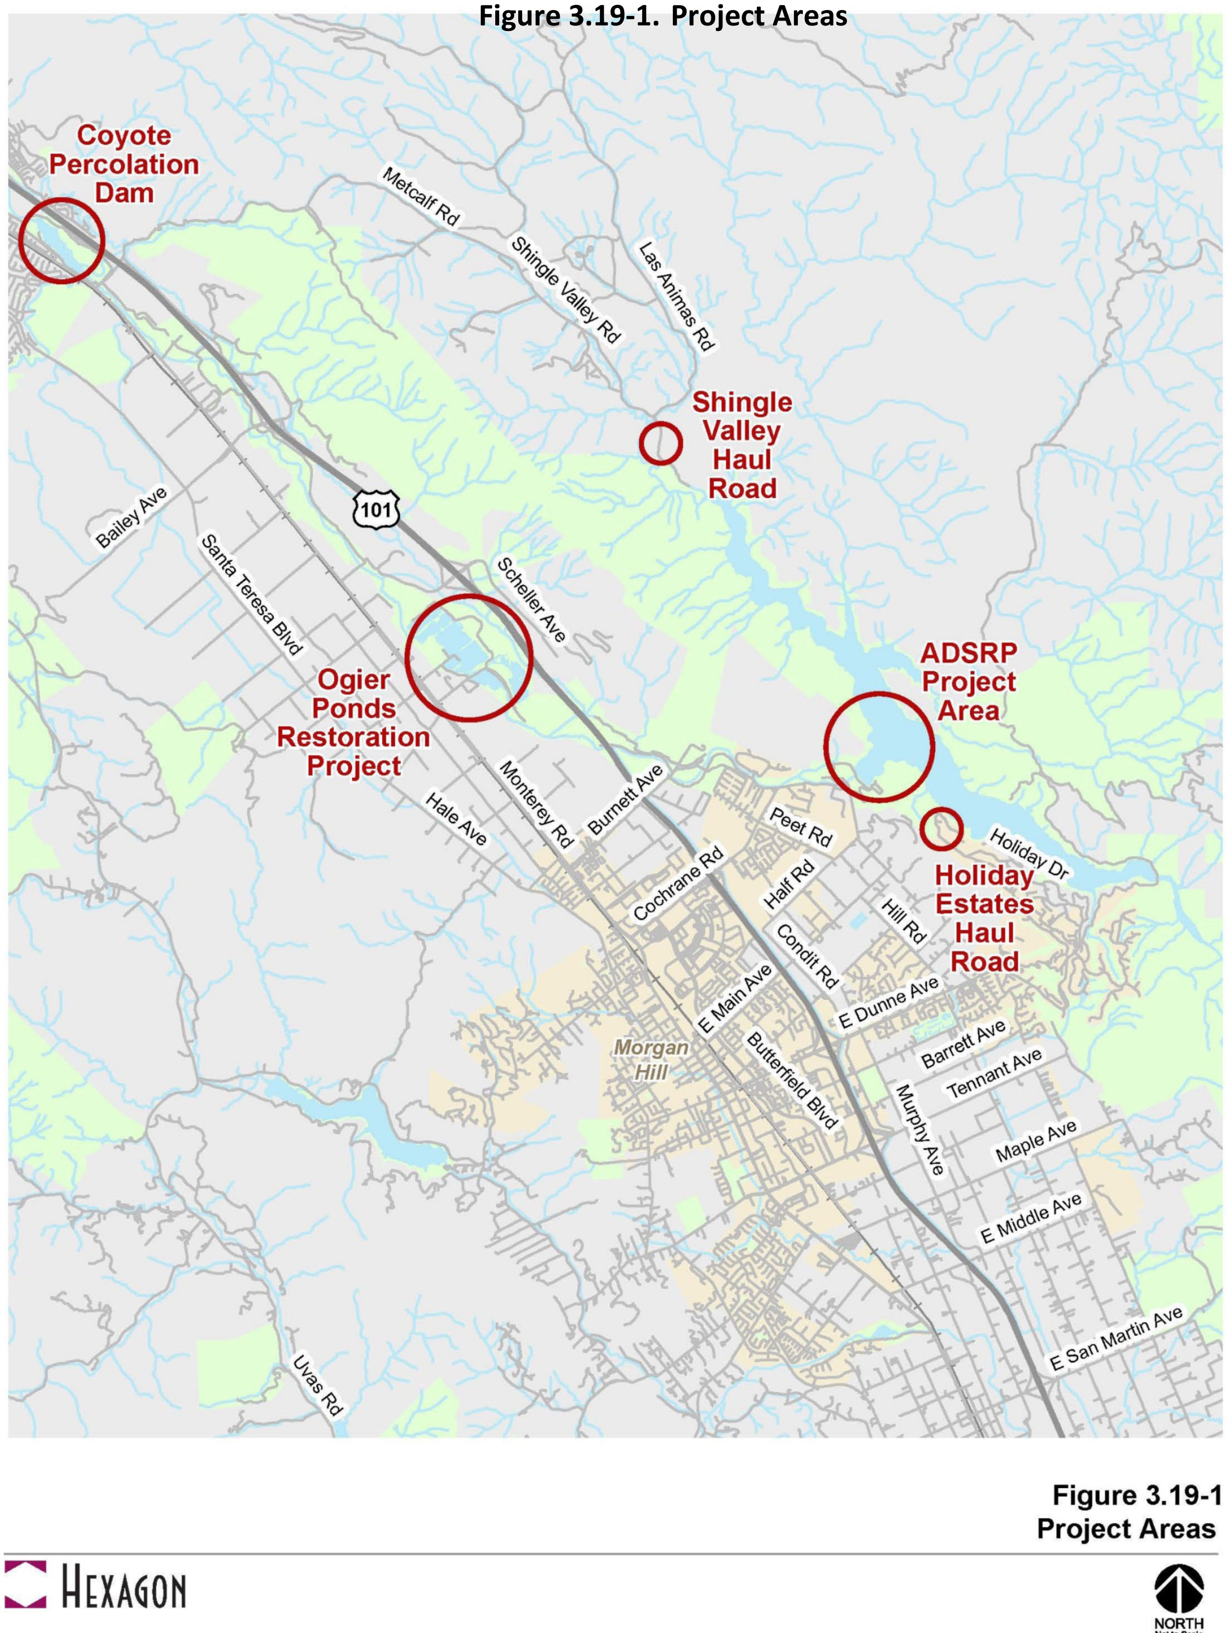
3.19 Transportation

This section describes the existing transportation facilities and circulation systems in the study area and their relevant regulatory framework. Also, this section evaluates impacts of the Project related to potential for conflict with *CEQA Guidelines* Section 15064.3(b) related to VMT; conflict with existing programs, plans, ordinances, or policies addressing roadway, pedestrian, bicycle, and transit facilities; and increase in hazards due to geometric design features; or inadequate emergency access. The information in this section is informed by the ADSRP Transportation Technical Memorandum ~~Study~~ prepared in March 2023 (included in Appendix O of this ~~Draft~~ Final EIR).

The study area for transportation focuses on the facilities and circulation systems in the county, San José, and Morgan Hill that exist within and connect to the Project Area, including designated truck haul roads and Cochrane Road.

Most of the Project components discussed in this section are shown on **Figure 3.19-1**, and the study area is shown on **Figure 3.19-2**.

1 **Figure 3.19-1. Project Areas**



1 **Figure 3.19-2. Project Site and Study Area**

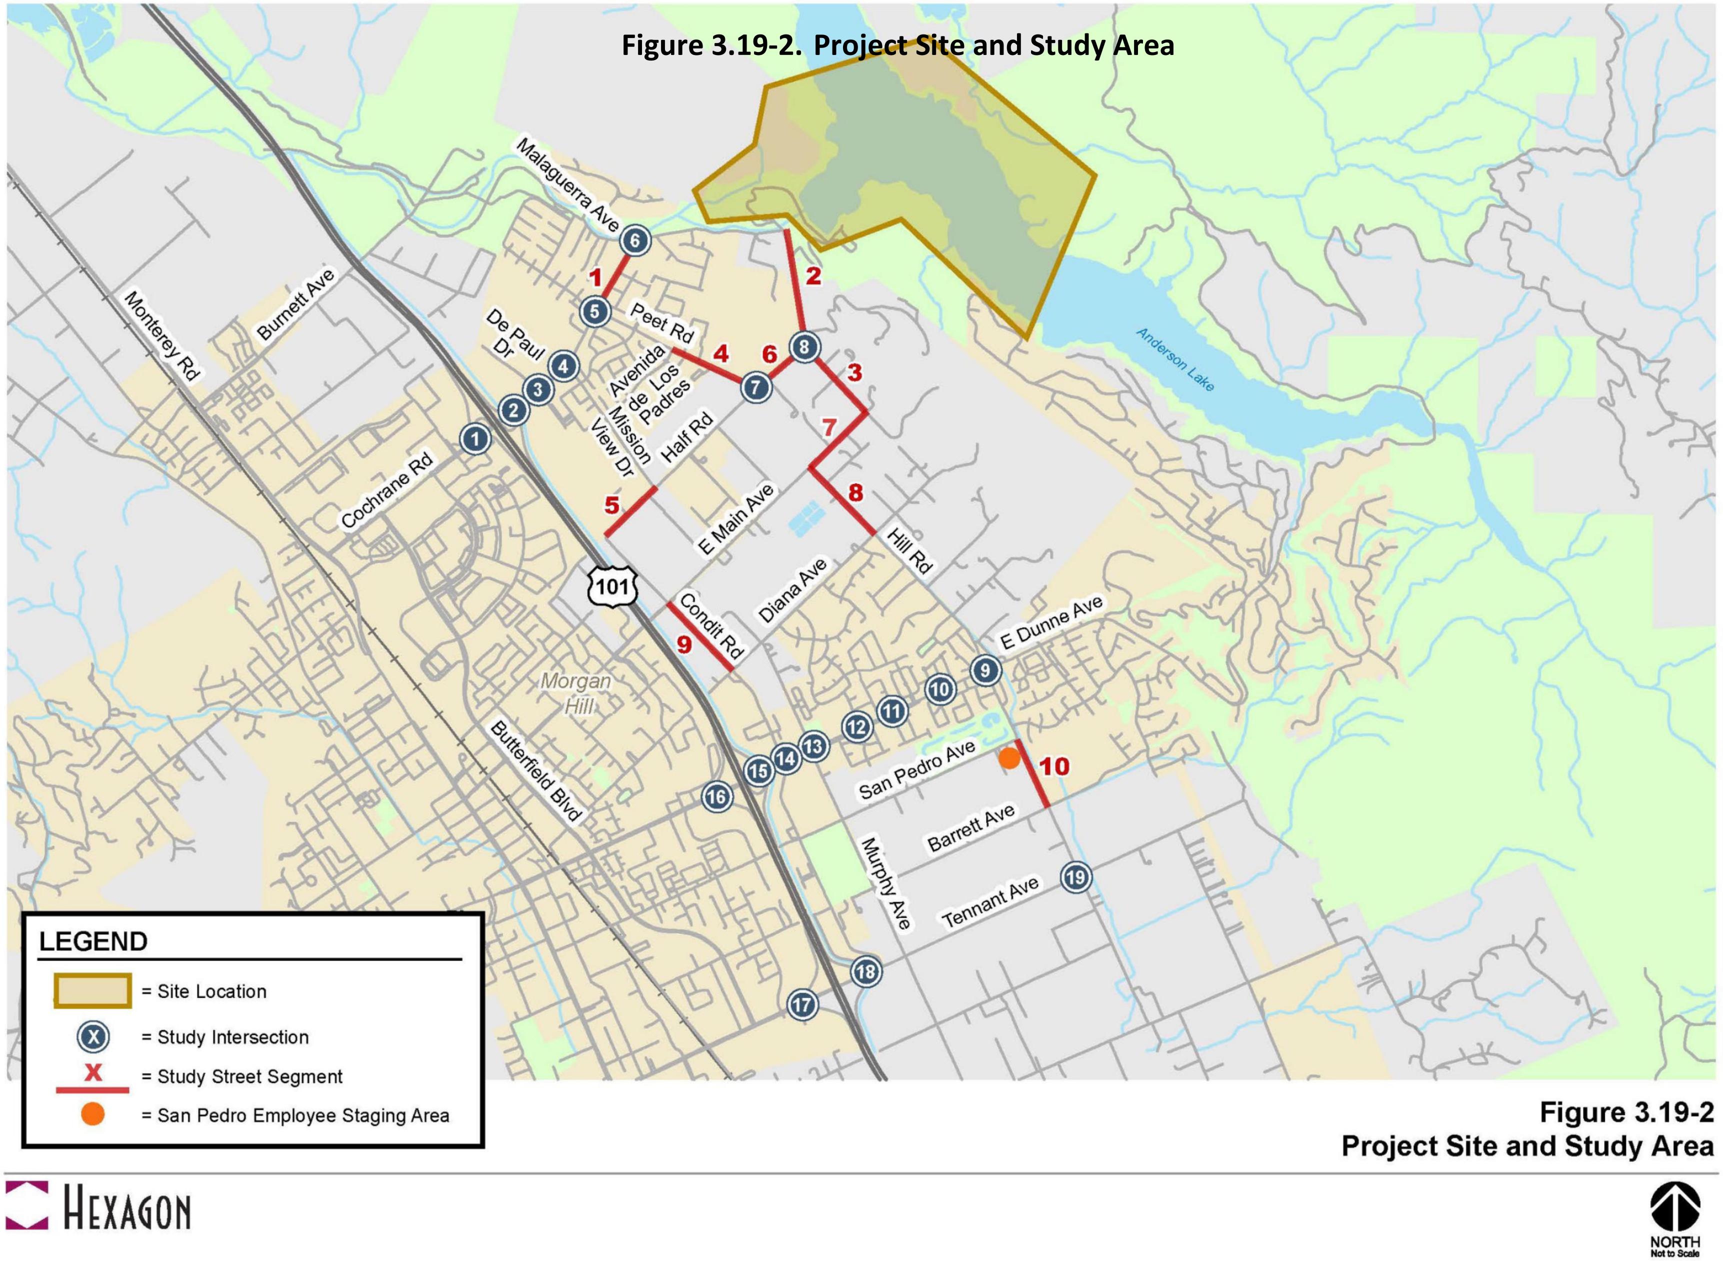


Figure 3.19-2
Project Site and Study Area

3.19.1 Environmental Setting

3.19.1.1 Regional and Local Transportation System

Roadway Network

Regional access to the study area is provided via US 101. Cochrane Road is the primary local roadway providing access to the study area (**Figure 3.19-2**).

- ***US 101*** is a north-south freeway extending northward to San Francisco and southward through Gilroy. US 101 is an eight-lane freeway (three mixed-flow lanes and one high-occupancy vehicle [HOV] lane in each direction) north of Cochrane Road. South of Cochrane Road, US 101 narrows to a six-lane freeway with no HOV lanes. Access to and from the study area and the San Pedro Avenue staging area is provided via its interchanges at Cochrane Road, Dunne Avenue, and Tennant Avenue.
- ***Cochrane Road*** is predominantly an east-west arterial that extends from Main Avenue in the east to Monterey Road. Cochrane Road is generally a four-lane divided roadway west of Mission View Drive and a two-lane undivided roadway east of Mission View Drive. Cochrane Road includes bike lanes on both sides of the street and has a posted speed of 40 mph in the Project vicinity. Cochrane Road provides direct access to the study area.

Pedestrian and Bicycle Facilities

Pedestrian Facilities

Pedestrian facilities in the study area consist primarily of trails, sidewalks, pedestrian push buttons, marked crosswalks, and signal heads at signalized intersections. There are pedestrian trails throughout the study area, specifically in Anderson Lake County Park and Coyote Creek Parkway, such as the Dam Crest Trail, Cochrane Trail, Serpentine Trail, Basalt Hill, Rosendin ~~Rosedin~~ Park Area, and Coyote Creek Parkway trails as detailed in Section 3.18, *Recreation*. In addition, there are existing sidewalks along the south side of Cochrane Road and along portions of the north side of Cochrane Road.

Bicycle Facilities

As defined by the VTA, bicycle facilities include Class I bikeways (off-street bike paths, which are shared with pedestrians and exclude general motor vehicle traffic), Class II bikeways (striped bike lanes on street), and rated streets. Rated streets are streets frequently used by bicyclists, sharing the roadway with motor vehicles, and includes city-designated Class III bike routes. Rated streets include extreme caution (heavy traffic volumes with high traffic speeds), alert (moderate traffic volumes and speeds), and moderate (low traffic volumes and moderate to low traffic speeds). Class III bikeways only have signs to help guide bicyclists on recommended routes to certain locations.

In the study area vicinity, bike lanes currently extend along Cochrane Road from Monterey Road to Via Sebastian before terminating. Bike lanes on Cochrane Road do not resume until Half Road and continue along the length of the street. An unpaved bike path, the Madrone Channel Trail, runs along the east side of US 101, between Tennant Avenue and Cochrane Road.

The remaining bicycle facilities in the area are located beyond the immediate study area vicinity. Bike lanes are currently provided along the following roadways:

- Main Avenue, between Live Oak High School and Peak Avenue
- Dunne Avenue, west of Gallop Drive
- Hill Road, between Dunne Avenue and Diana Avenue
- Murphy Avenue, between Dunne Avenue and Kelly Park Circle
- Butterfield Boulevard, along its entire length
- Sutter Boulevard, between Cochrane Road and Butterfield Boulevard
- Central Avenue, between Butterfield Boulevard and its termination point west of US 101
- Monterey Road, nearly its entire length within Morgan Hill limits, with the exception of the segment through downtown between Dunne Avenue and Main Avenue
- Tennant Avenue, between Condit Road and Olympic Drive
- Depot Street, along its entire length
- Peak Avenue, between Dunne Avenue and Wright Avenue
- Hale Avenue, between Main Avenue and north of Morgan Hill

Other bicycle facilities in Morgan Hill include the following:

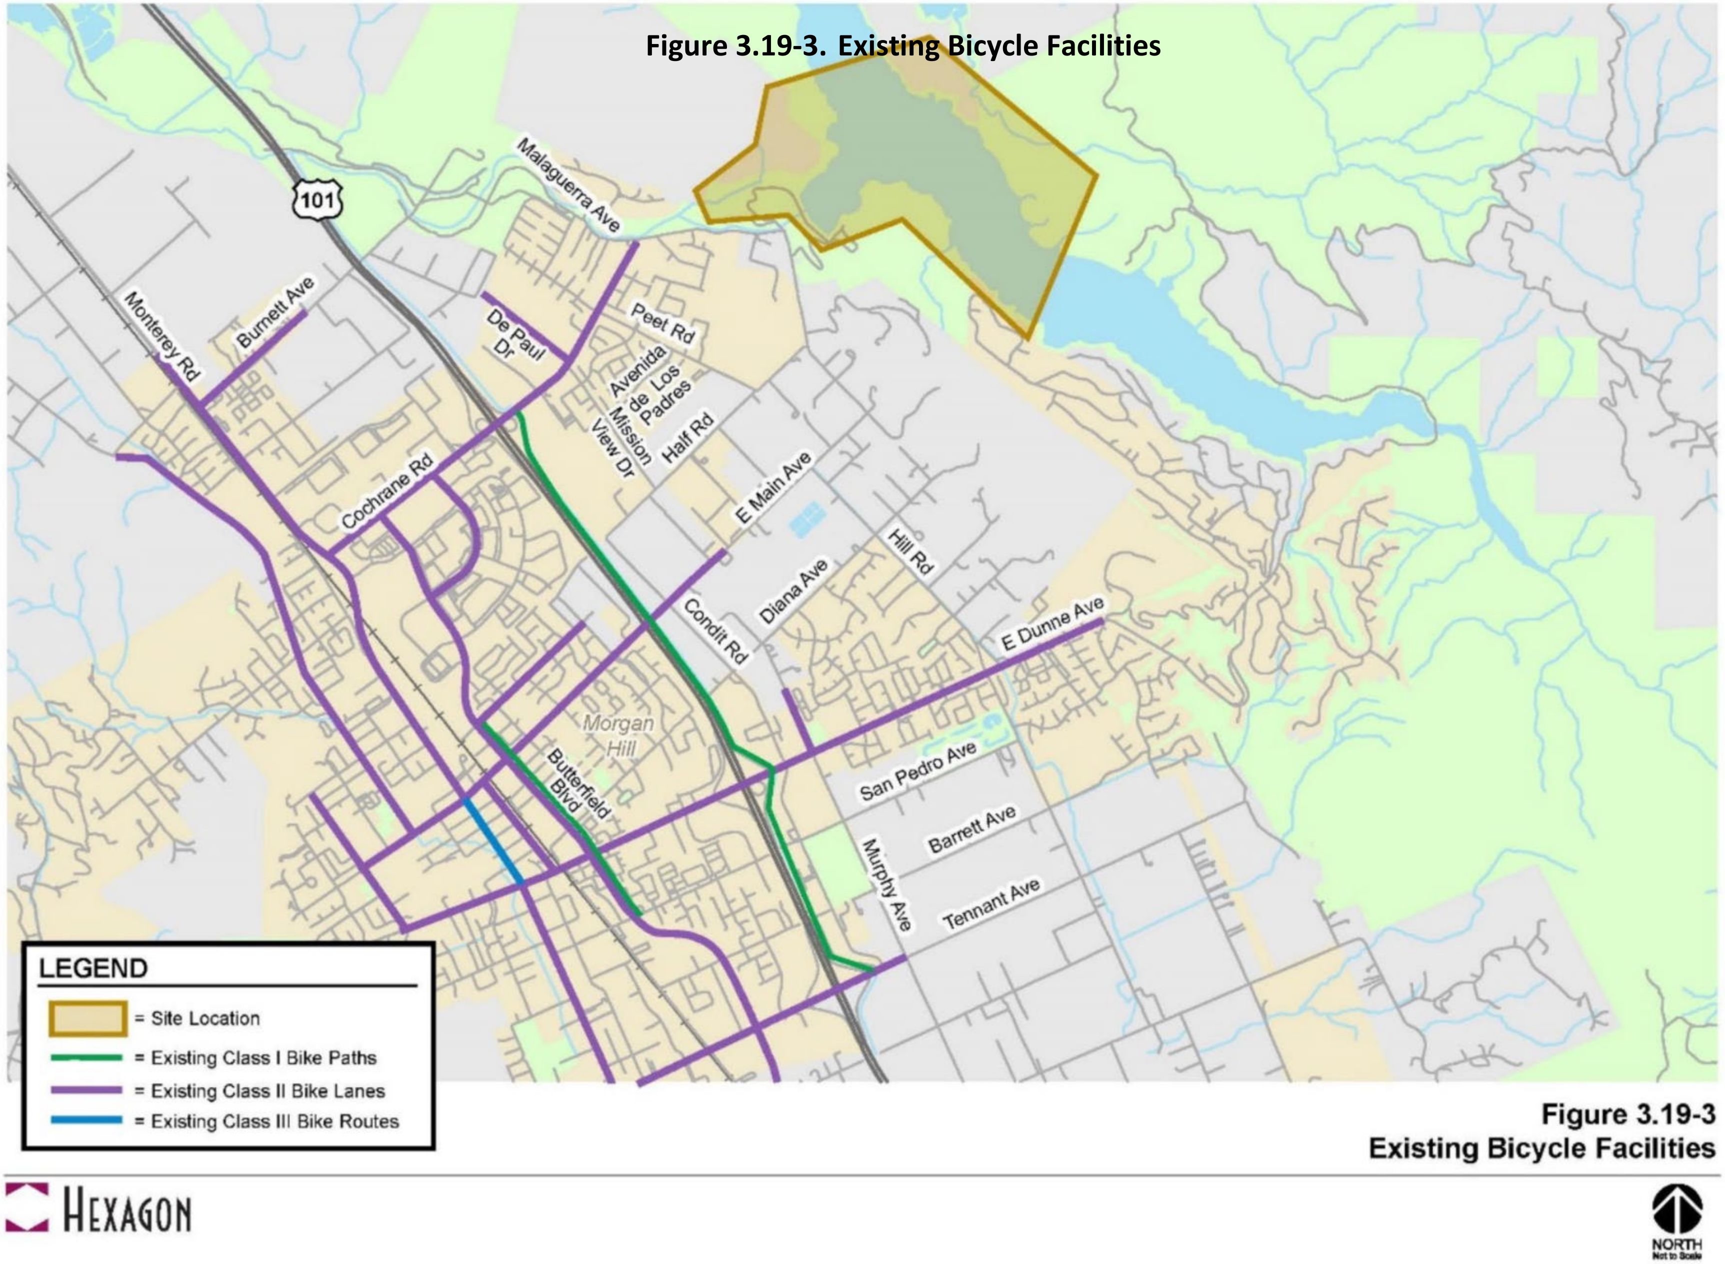
- Bike route on Monterey Road, between Dunne Avenue and Main Avenue
- Paved bike path on the east side of Butterfield Boulevard, between San Pedro Avenue and Central Avenue
- Paved bike path along the west bank of Little Llagas Creek, extending from Watsonville Road north to Spring Avenue

The existing bicycle facilities in Morgan Hill are shown on **Figure 3.19-3**.

In addition, a portion of the study area is situated within San José (Phase 2 Coyote Percolation Dam ~~Pond~~ CM). The Phase 2 Coyote Percolation Dam ~~Pond~~ CM area is bound by Monterey Road to the southwest, US 101 to the northeast, and Metcalf Road to the southeast. Bicycle facilities located within the vicinity of the Phase 2 Coyote Percolation Dam ~~Pond~~ CM area include Class 2 bike lanes extending from Bernal Road to Metcalf Road. In addition, Coyote Creek Parkway is an off-street bikepath.

~~The existing bicycle facilities in the study area are shown on **Figure 3.19-3**.~~

1 **Figure 3.19-3. Existing Bicycle Facilities**



Transit Facilities and Service

Existing transit service to and within the study area is provided by VTA and Caltrain. The transit facilities and services are described below and shown on **Figure 3.19-4**.

VTA Bus

The study area is served directly by one local bus (Local Bus Route 87). In addition, Express Route 168 operates along Cochrane Road west of US 101.

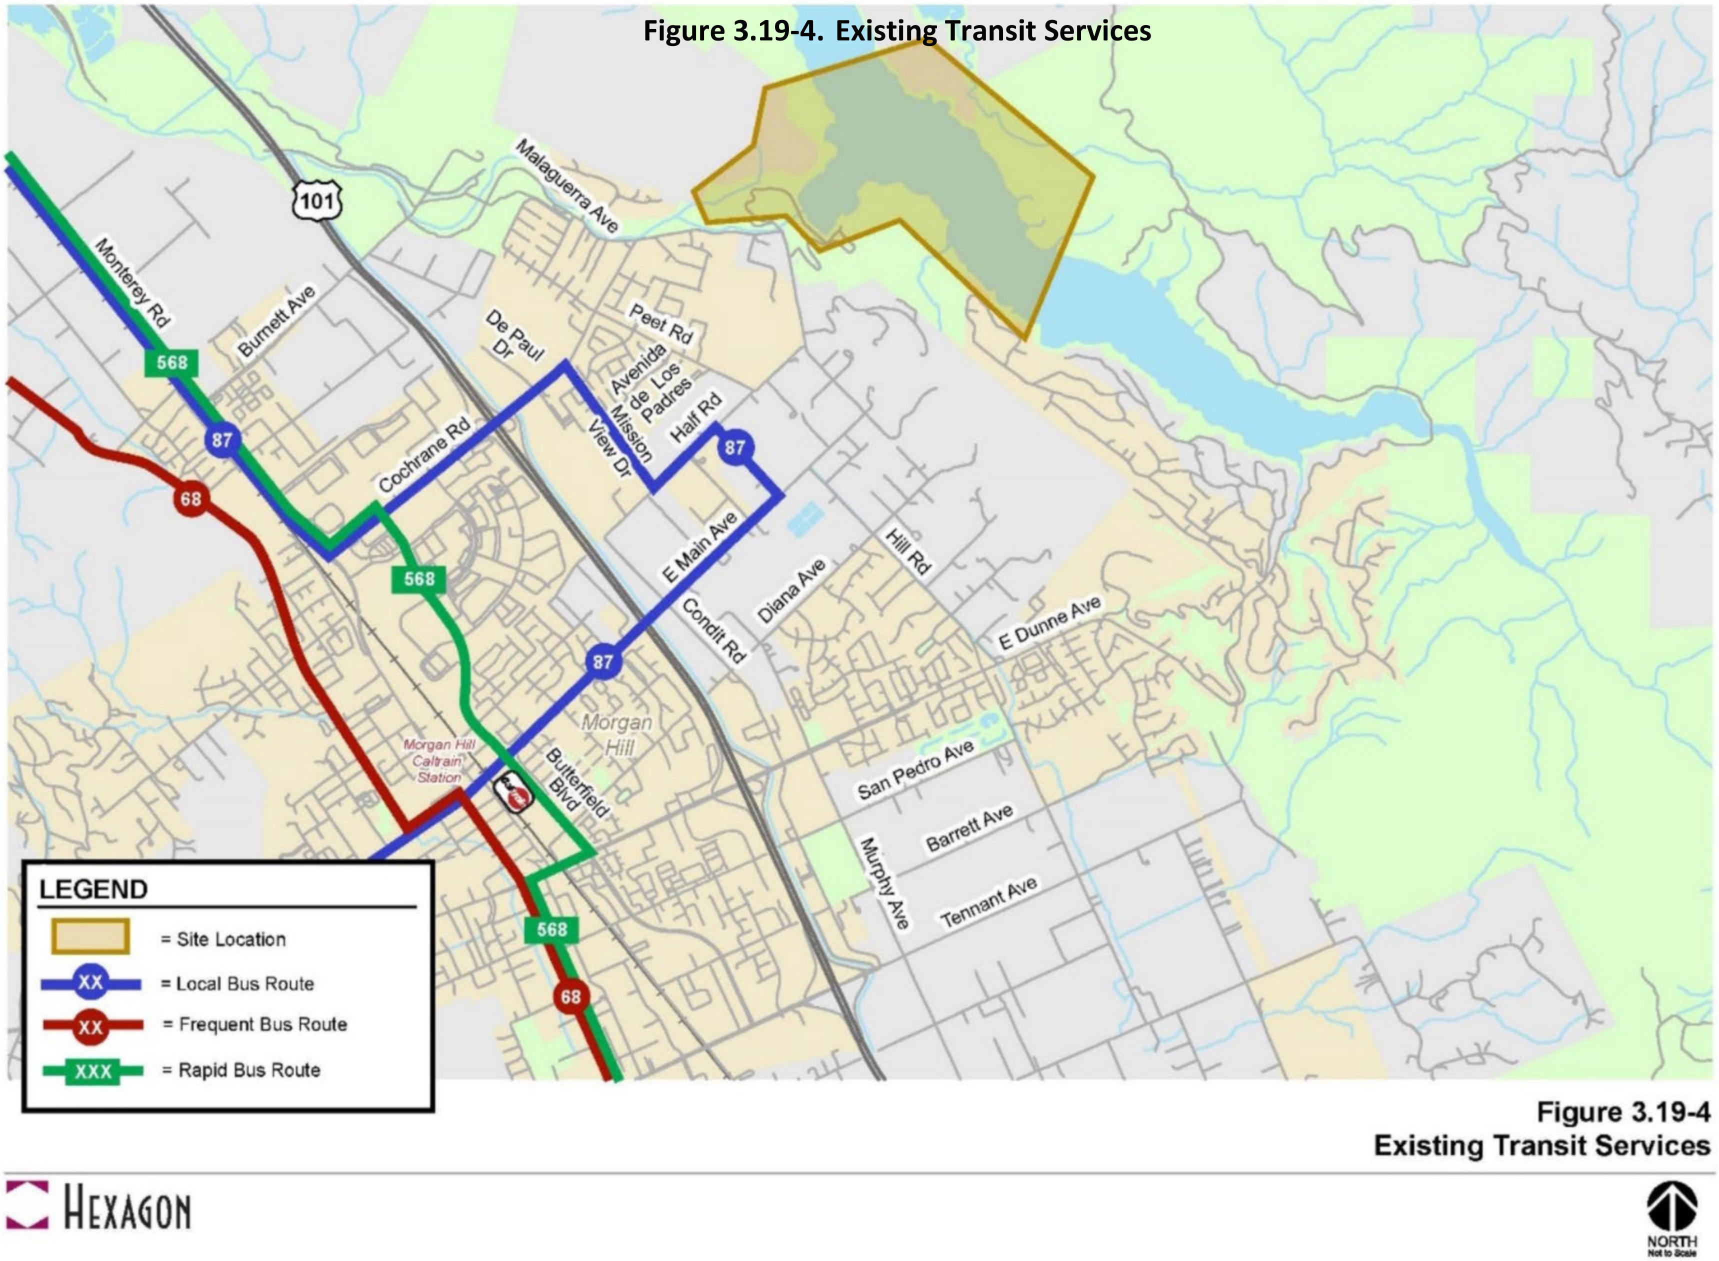
Local Bus Route 87 is a local route that operates on Cochrane Road, Mission View Drive, and Half Road in the study area. It runs from Burnett Avenue to the Civic Center (Main and Dewitt) in Morgan Hill with approximately 60-minute headways in the a.m. and p.m. commute periods. Route 87 operates between 6:45 a.m. and 6:00 p.m. The nearest Route 87 bus stops to the Project Area are located near the De Paul Drive/Cochrane Road, Mission View/Cochrane Road, and Elm Street/Half Road intersections.

Rapid Route 568 is a rapid route that operates on Butterfield Boulevard and Cochrane Road on its route between the Gilroy Transit Center and the San José Diridon Transit Center. Route 568 operates between 5:15 a.m. and 8:15 p.m. northbound with approximately 30- to 45-minute headways during the a.m. commute period and southbound with approximately 45-minute headways during the p.m. commute period. The nearest Route 568 bus stop to the Project Area is located near the intersection of Cochrane Circle/Cochrane Road.

Caltrain

Commuter rail service between San Francisco and Gilroy is provided by Caltrain. The Morgan Hill Caltrain Station is located along Depot Street, with main access and parking off Butterfield Boulevard, approximately 3.5 miles from the Project Area. At the Morgan Hill Station, Caltrain provides three northbound trains during the a.m. commute period and three southbound trains during the p.m. commute period.

Figure 3.19-4. Existing Transit Services



3.19.1.2 Valley Water and Anderson Dam

Roadway Network

Local roadways ~~that~~ serve as access roads (as listed in Section 2.5.2.3, *Access Roads*) to and within the Project Area as well as access roads to planned staging areas consist of Cochrane Road as well as the following roadways (**Figure 3.19-2**).

- ***Main Avenue*** is designated as an arterial per the Morgan Hill 2035 General Plan and is a two-lane, east-west roadway that extends from Cochrane Road in the east to John Telfer Drive in the west. Main Avenue includes on-street parking and bike lanes along some portions of the roadway. Main Avenue has a posted speed of 40 mph in the study area and provides access to the Project Area via Cochrane Road and provides access to the San Pedro Avenue staging area via Hill Road.
- ***Hill Road*** is designated as an arterial in the study area and is a two-lane, north-south undivided road that extends from Main Avenue in the north to Maple Avenue in the south. Hill Road has a posted speed of 40 mph with bike lanes between Dunne Avenue and Diana Avenue. Sidewalks are only provided adjacent to the existing residential developments along Hill Road near Dunne Avenue. Hill Road provides direct access to the San Pedro Avenue staging area.
- ***Dunne Avenue*** is designated as an arterial per the Morgan Hill 2035 General Plan and traverses Morgan Hill extending from the east to the west with a posted speed limit of 35 to 40 mph. Bike lanes are provided along both sides of Dunne Avenue between Peak Avenue and Gallop Drive (east of US 101). Dunne Avenue provides access to the San Pedro Avenue staging area via Hill Road.
- ***Tennant Avenue*** is designated as an arterial west of Hill Road and as a collector east of Hill Road per the Morgan Hill 2035 General Plan and is a two-lane, east-west roadway with a posted speed limit of 45 mph. There are no bike lanes or sidewalks provided on either side of the street in the Project Area. Tennant Avenue provides access to the San Pedro Avenue staging area via Hill Road.
- ***Coyote Road*** is a one-way local street that provides access to Anderson Dam from Cochrane Road. Coyote Road does not have any sidewalks nor does the street contain on-street parking or bike lanes. The street commences and terminates at two locations along Coyote Road. In addition, Coyote Road does not have a posted speed limit.
- ***Metcalf Road*** is designated as a two-lane city connector street in the Envision San José 2040 General Plan. There are no sidewalks or bike lanes along Metcalf Road. In addition, Metcalf Road has a posted speed limit of 30 mph.
- ***San Felipe Road*** is a two-lane designated city connector street north of The Villages Parkway and as a local connector street south of The Villages Parkway in the Envision San José 2040 General Plan. The street contains no sidewalks or bike lanes. In addition, the street has a posted speed limit of 35 mph.
- ***Las Animas Road*** is designated as a local collector street in the Envision San José 2040 General Plan. The street is a single lane and contains no sidewalks or bike lanes. Las Animas Road does not have a posted speed limit.

- ***Monterey Road*** is designated as an arterial in the City of Morgan Hill 2035 General Plan. Portions of Monterey Road are improved with sidewalks and bike lanes. In addition, Monterey Road has a posted speed limit of 45 mph.
- ***Ogier Road*** is a local street with no sidewalks, bike lanes, or posted speed limit signs.
- ***Barnhart Avenue*** is a local street with no sidewalks, bike lanes, or posted speed limit.
- ***Coyote Creek Golf Course Drive*** is a local street with no sidewalks or bike lanes. This street has a posted speed limit of 25 mph.
- ***Holiday Lake Drive*** is a private local street with no sidewalks or bike lanes. The street has a posted speed limit of 20 mph.

Pedestrian and Bicycle Facilities

In the Project Area, no bike lanes exist. However, the majority of the roads are bordered by pedestrian sidewalks. There are pedestrian trails throughout the study area, specifically in Anderson Lake County Park and Coyote Creek Parkway, such as the Dam Crest Trail, Cochrane Trail, Serpentine Trail, Basalt Hill, Rosendin Park Area, and Coyote Creek Parkway trails as detailed in Section 3.18, *Recreation.* Coyote Creek Trail is within the Ogier Ponds CM Project Area. The nearest bicycle facilities are the Class II bike lanes located on Cochrane Road, located approximately 0.4 miles to the west of the Project Area.

Transit Facilities and Service

In the Project Area, no transit exists. The nearest bus stop is located at Elm Street and Half Road, approximately 1 mile to the southwest of the Project Area, and the nearest rail stop is located at the Morgan Hill Station, approximately 3.5 miles to the southwest of the Project Area.

3.19.2 Regulatory Setting

3.19.2.1 Federal Laws, Regulations, and Policies

Fixing America's Surface Transportation Act

The FHWA is the agency of the USDOT responsible for the federally funded roadway system, including the interstate highway network and portions of the primary state highway network. FHWA funding is provided through the Fixing America's Surface Transportation Act. Federal funds can be used to fund eligible local transportation improvements such as projects to improve the efficiency of existing roadways, traffic signal coordination, bikeways, pedestrian facilities, and transit system upgrades.

3.19.2.2 State Laws, Regulations, and Policies

Senate Bill 743

Previously under CEQA, transportation impacts were evaluated by examining whether the project is likely to cause automobile delay at intersections and congestion on nearby individual highway segments, and whether this delay will exceed a certain amount (i.e., LOS analysis). SB 743, which was signed into law in 2013, updated section 15064.3 of the *CEQA Guidelines* to change how lead agencies evaluate transportation impacts. Starting on July 1, 2020, agencies analyzing the transportation impacts of new projects must now use VMT as a transportation impact metric instead of LOS. VMT measures how much actual automobile travel (additional miles driven) a proposed project would create on California roads.

To assist with implementation of the VMT metric, the Office of Planning and Research (OPR) prepared a Technical Advisory on Evaluating Transportation Impacts in CEQA (OPR 2018). OPR's Technical Advisory recommends that for land use projects a per capita or per employee VMT that is 15 percent below that of existing development may be a reasonable threshold. In making this recommendation, OPR recognized that land use development projects (i.e., those involving residential, office, and retail proposals) tend to have the greatest influence on VMT. For other types of projects, lead agencies should consider the purposes in PRC section 21099(b)(1) (i.e., promote reduction of GHG emissions, the development of multimodal transportation networks, and a diversity of land uses) in applying a threshold of significance. Qualitative analyses are acceptable when methods do not exist for undertaking a quantitative analysis.

California Department of Transportation Requirements

Caltrans is the primary State agency responsible for transportation issues. One of Caltrans' duties is the construction and maintenance of the state highway system. Caltrans has established standards for roadway traffic flow and has developed procedures to determine if State-controlled facilities require improvements. Any improvements or modifications to the highway system, including ramps and access points, within the study area would need to be approved by Caltrans. Caltrans facilities within the study area consist of US 101.

For projects that may physically affect facilities under its administration, Caltrans requires encroachment permits before any construction work may be undertaken. This includes a traffic control plan that adheres to the standards set forth in the California Manual of Uniform Traffic Control Devices (MUTCD). As part of these requirements, there are provisions for coordination with local emergency services, training for flagmen for emergency vehicles traveling through the work zone, temporary lane separators that have sloping sides to facilitate crossover by emergency vehicles, and vehicle storage and staging areas for emergency vehicles. MUTCD requirements also provide for construction work during off-peak hours and flaggers. For projects that would not physically affect facilities but may influence traffic flow and LOS at such facilities, Caltrans may recommend measures to improve traffic operations.

In its 2020 memorandum on CEQA significance determinations, Caltrans stated that VMT is the most appropriate measure of transportation impacts under CEQA (Caltrans 2020). While the VMT metric is appropriate for CEQA analyses, Caltrans does continue to use the LOS metric for operating state highway facilities to evaluate their operations and as one of its measures of effectiveness.

Assembly Bill 43

AB 43, also known as Traffic Safety, allows local government agencies to reduce vehicle speeds to accommodate vulnerable users such as pedestrians, bicyclists, seniors, and wheelchair users to improve traffic safety. AB 43 takes effect in July 2024.

3.19.2.3 Regional and Local Laws, Regulations, and Policies

Plan Bay Area 2050

Plan Bay Area 2050 is a 30-year plan that provides 35 strategies to address housing, the economy, transportation and the environment across the Bay Area's nine counties—Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano and Sonoma. The plan was prepared by the Bay Area's two regional planning agencies, the Metropolitan Transportation Commission and the Association of Bay Area Governments (MTC/ABAG). The final Plan was adopted by both agencies in October 2021. Because the Plan does not set specific requirements for individual projects, this EIR does not address consistency with Plan Bay Area 2050 strategies (MTC/ABAG 2021).

Santa Clara Valley Transportation Authority Valley Transportation Plan 2040

The Valley Transportation Plan 2040 (VTP 2040) provides a long-range vision for the transportation system in the county. VTP 2040 identifies programs, projects, and policies that the VTA's Board of Directors will pursue over the lifetime of the plan. The Plan connects projects and programs with anticipated funds and provides a framework for the development and maintenance of County transportation over the 25-year life of the Plan. The Plan considers all travel modes and addresses the links between transportation, land use, air quality, energy use, and community livability (VTA 2014).

The following planning initiative would be applicable to the Project:

- **Complete Streets Corridor Program.** VTA will explore developing a complete streets program. This program will seek to create new opportunities to maximize the investments of VTA and local agencies. This will include ways to combine program elements and funding for bicycles, pedestrian, streetscape, safety and transit improvements in corridors.

Santa Clara County General Plan

The Santa Clara County General Plan (County 1994) provides strategies, policies, and implementation measures to improve the adequacy of the overall transportation system by ensuring that it is balanced, well-integrated, and sufficient to meet current and future mobility needs. Those that are relevant to the Project are listed below.

Strategy #1: Develop Urban Land Use Patterns that Support Travel Alternatives

C-TR 1: Santa Clara County should develop and maintain an adequate, balanced, and integrated transportation system that is affordable and convenient to use and that is capable of meeting projected future demand.

C-TR 8: Urban design concepts and site development standards which facilitate use of transit and other travel alternatives should be adopted and implemented by local jurisdictions, to provide adequate:

a. accessibility to transit and transit facilities;

b. pedestrian and bicycle pathways and facilities, both on and between individual sites; and building design, orientation, on-site services and amenities which support the use of travel alternatives.

Santa Clara Countywide Trails Map (2023)

The County Countywide Trails Master Plan Update serves as a guide for trail system development to improve tail connectivity throughout the region. In 2023, County Parks published its draft update to the 2015 Countywide Trails Map. This map contains information on trails planning and development projects for the county. It includes several proposed segments of the Bay Area Ridge Trail around Anderson Lake, and the proposed and existing Coyote Creek Parkway trail segments that follow Coyote Creek and intersect with several Project components.

Roadway segments located within the study area that were identified in the Countywide Trails Map are identified below:

- R1 - Juan Bautista de Anza National Historic Trail
- R5 - Bay Area Ridge Trail
- S5 - Coyote Creek/Llagas Creek Trail

The segments that have been completed since the adoption of the 1995 Countywide Trails Master Plan include R1 – Juan Bautista de Anza National Historic Trail, portions of R5- Bay Ridge Trail (the segment that wraps around the Anderson Dam Lake has not been completed since the adoption of the 1995 Plan), and S5 – Coyote Creek/Llagas Creek Trail (Santa Clara County Parks 2023).

City of Morgan Hill 2035 General Plan

The following goals/policies are contained in the Morgan Hill 2035 General Plan Transportation Element (City of Morgan Hill 2017 ~~2016~~) and are applicable to evaluating impacts to the transportation system caused by the Project.

Goal TR-1: A balanced, safe, and efficient circulation system for all segments of the community, meeting local needs and accommodating projected regional and sub-regional traffic while protecting neighborhoods.

Policy TR-1.1: *System Efficiency.* Plan, construct, and maintain a coordinated and efficient system of local streets and highways throughout the community, meeting local needs and accommodating projected regional and sub-regional traffic, while protecting neighborhoods from cut-through traffic.

Policy TR-1.3: *Transportation Safety.* Implement strategies to ensure the safe and appropriate operation of all components of the transportation system for all users, such as programs to lower crash rates and reduce the number of transportation-related injuries in the city through education, enforcement, engineering strategies, physical improvements, and operational systems. Prioritize strategies that improve safety for students, pedestrians, and bicyclists.

Goal TR-3: A coordinated, continuous network of streets and roads.

Policy TR-3.2: *Safe and Complete Improvements.* Avoid creating incomplete public improvements that create public safety hazards.

Vision Zero Morgan Hill

The Morgan Hill City Council adopted Vision Zero policies on January 17, 2018 (City of Morgan Hill 2018). The following goals and actions are applicable to evaluating potential impacts to pedestrians and cyclists.

Engineering: The City ensures that both new development and capital projects are constructed to standards that promote safety for all transportation modes.

Engineering Action 3. High-visibility ladder, zebra, and continental crosswalk markings are preferable.

Engineering Action 12. Create temporary accommodations for bicyclists and pedestrians along construction sites when sidewalks and other travel ways have been closed.

City of Morgan Hill Bikeways, Trails, Parks and Recreation Master Plan

The City adopted its Bikeways, Trails, Parks and Recreation Master Plan in July 2017. The Master Plan is a strategic and practical guide for improving and expanding the City of Morgan Hill's recreation system over 20 years (City of Morgan Hill 2017b). The Master Plan document contains several relevant goals and policies that would be applicable to the Project.

Bikeways and Trails: Key Findings. There is a gap between the heavily used Coyote Creek Trail and local bikeways. Residents are interested in accessing regional parks and trails via safe bikeways and community stakeholders would like regional trail users to travel safely into the City.

B3. Improve safety for all roadway users by providing bikeways and trails with comfortable separation from motor vehicles and a focus on safety.

B3-1. Continue to support the City's adopted Vision Zero Framework to reduce traffic injuries and fatalities. Once adopted, implement strategies to improve safety.

B9. Evaluate the potential to expand pathways along creeks and drainage ways.

B9-1. Support General Plan Policy HC-3.14 by working in partnership with the Santa Clara Valley Water District to establish easements and joint use agreements and to develop trails and linear parks along creeks and drainage channels.

Relevant Sites:

- Llagas Creek west of Silveira to Santa Teresa
- Madrone Channel trail
- The trails at Silveira to incorporate desired community uses
- The loop trail and usable open space at San Pedro Percolation Ponds as a loop trail and usable open space

- The northern extension of the Little Llagas Creek Trail from Spring Avenue to W Main Avenue, per General Plan Policy TR-8.8
- The Madrone Channel Trail northern extension to the Coyote Creek Trail and southern extension to Middle Avenue
- The Tennant Creek Trail from E Dunne Avenue to Middle Avenue

Recommended Enhancements:

B-B. Construct buffered bike lanes and upgrade the existing shoulder/ discontinuous bike lanes to continuous buffered lanes including multimodal intersection improvements at major arterial intersections.

Relevant Sites:

- B-B1. Cochrane Road and Malaguerra Avenue from Monterey Road to Coyote Creek Trailhead
- B-B7. Peet Road/Hill Road from Eagle View Drive to Tennant Avenue
- B-B8. Dunne Avenue from Dewitt Avenue to Jackson Oaks Drive

B-D. Improve intersections to create separation between car traffic and people bicycling and walking/rolling. Multimodal intersection improvements can include both time- and space-separation that continues a protected or buffered bike lane's separation from vehicles through intersections.

Relevant Sites:

- D4. Cochrane Road and US 101 (North and South ramps, Madrone Parkway and Depaul Drive)

Envision San José 2040 General Plan

The Circulation Element of the Envision San José 2040 General Plan includes a set of balanced, long-range, multimodal transportation goals and policies that provide for a transportation network that is safe, efficient, and sustainable (minimizes environmental, financial, and neighborhood impacts). In combination with land use goals and policies that focus growth into areas served by transit, these transportation goals and policies are intended to improve multimodal accessibility to employment, housing, shopping, entertainment, schools and parks and create a city where people are less reliant on driving to meet their daily needs (City of San José 2011). The General Plan transportation goals, policies and actions aim to:

- Establish circulation policies that increase bicycle, pedestrian, and transit travel, while reducing motor vehicle trips, to increase the City's share of travel by alternative transportation modes.
- Promote San José as a walking- and bicycling-first city by providing and prioritizing funding for projects that enhance and improve bicycle and pedestrian facilities. According to the Government Code Section 65302 and the California Complete Streets Act of 2008, the Circulation Element must plan for a balanced, multimodal transportation network that meets the needs of all users of streets, roads, and highways for safe and convenient travel in a manner that is suitable to the rural, suburban, or

urban context of the general plan. The statute defines all "users of streets, roads, and highways" as "bicyclists, children, persons with disabilities, motorists, movers of commercial goods, pedestrians, users of public transportation, and seniors."

The Envision San José 2040 General Plan included the following transportation goals and policies applicable to the Project:

Goal TR-1: Balanced Transportation System. Complete and maintain a multimodal transportation system that gives priority to the mobility needs of bicyclists, pedestrians, and public transit users while also providing for the safe and efficient movement of automobiles, buses, and trucks.

Policy TR-1.1: Accommodate and encourage use of non-automobile transportation modes to achieve San José's mobility goals and reduce vehicle trip generation and VMT.

Policy TR-1.2: Consider impacts on overall mobility and all travel modes when evaluating transportation impacts of new developments or infrastructure projects.

Policy TR-1.5: Design, construct, operate, and maintain public streets to enable safe, comfortable, and attractive access and travel for motorists and for pedestrians, bicyclists, and transit users of all ages, abilities, and preferences.

Policy TR-1.7: Require that private streets be designed, constructed and maintained to provide safe, comfortable, and attractive access and travel for motorists and for pedestrians, bicyclists, and transit users of all ages, abilities, and preferences.

Policy TR-1.8: Actively coordinate with regional transportation, land use planning, and transit agencies to develop a transportation network with complementary land uses that encourage travel by bicycling, walking and transit, and ensure that regional greenhouse gas emission standards are met.

Goal TR-2: Walking and Bicycling. Improve walking and bicycling facilities to be more convenient, comfortable, and safe, so that they become primary transportation modes in San José.

Policy TR-2.8: Require new development where feasible to provide on-site facilities such as bicycle storage and showers, provide connections to existing and planned facilities, dedicate land to expand existing facilities or provide new facilities such as sidewalks and/or bicycle lanes/paths, or share in the cost of improvements.

Goal TR-5: Vehicular Circulation. Maintain the City's street network to promote the safe and efficient movement of automobile and truck traffic while also providing for the safe and efficient movement of bicyclists, pedestrian, and transit vehicles.

Policy TR-5.4: Maintain and enhance the interconnected network of streets and short blocks that support all modes of travel, provide direct access, calm neighborhood traffic, reduce vehicle speeds, and enhance safety.

Policy TR-5.5: Require that new development, which includes new public or private streets, connect these streets with the existing public street network and prohibit the gating of private streets with the intention of restricting public access. Furthermore, where possible, require that the street network within a given project consists of integrated short blocks to facilitate bicycle and pedestrian travel and access.

Goal TR-9: Reduction of VMT. Reduce VMT per service population by 20% (2030 goal) and by 45% (2040 goal), from the 2017 levels.

Policy TR-9.1: Enhance, expand and maintain facilities for walking and bicycling to provide neighborhoods with safe and direct access to transit and key destinations, particularly to provide neighborhoods with safe and direct access to transit and key destinations, a complete alternative transportation network that facilitates non-automobile trips, and enjoyable outdoor open space.

~~Police~~ <u>Policy</u> TR-9.3: Enhance the overall travel experience of transit riders, pedestrians, bicyclists, and shared micro-mobility users to encourage mode shift.

Trail Network

Goal TN-1: National Model for Trail Development and Use. Develop the nation’s largest urban network of trails. Become a national model for trail development and use. Remain a national leader in terms of the scale and quality of trails.

Goal TN-2: Trails as Transportation. Develop a safe and accessible Trail Network to serve as a primary means of active transportation and recreation within an integrated multi-modal transportation system.

Policy TN-2.1: Support off-street travel by interconnecting individual trail systems to each other and to regional trail systems.

Policy TN-2.6: Integrate and connect trail and pathway networks with a larger network of countywide and regional trails such as the Bay Area Ridge, San Francisco Bay, and Juan Bautista De Anza Trails to allow for a broad base of opportunities and linkage with the greater Bay Area.

Policy TN-2.8: Coordinate and connect the trail system with the on-street bikeway system, and consider policies from the Circulation and the Parks, Trails, Open Space, and Recreation Amenities/Programs sections of this Plan to create a complete BikeWeb to serve the needs of San José’s diverse community.

Action TN-2.10: Work with the Santa Clara Valley Water District and the utilities, including PG& E, to explore opportunities to develop trails, joint-use facilities, and/or other recreational amenities along their rights-of-way.

Move San José

Move San José establishes a decision-making process that joins citywide policies, neighborhood improvements, and reinvention of San José city streets. The goal is a San José that is easier and more convenient to get around without a car while being safer to travel in. (City of San José 2022).

Move San José contains the following strategies and steps that are applicable to the Project.

District 2 Strategy Recommendations:

Fill Gaps in Trails and Sidewalks. The City should create an inventory of sidewalks and trails in District 2 to identify where there are gaps and then address them. These improvements should be added to make places more walkable, bikeable, and accessible for wheelchair and white cane users. This can help improve jobs accessibility by walk and bike. *This improves the Less Driving, Access for All, Enjoyable Transportation, Transportation Safety, Clean the Air, Connected Neighborhoods, and Move the Economy scores for District 2.*

Improve Existing Transit Service. Improving existing transit service makes it easier to get around on public transit by increasing frequencies of service, adding things like bus lanes, and signal priority, and having transit run more hours of the day. This helps connect District 2 to other parts of San José without a car. *This improves the Less Driving, Access for All, Enjoyable Transportation, Transportation Safety, Clean the Air, Connected Neighborhoods, and Move the Economy scores for District 2.*

San José Better Bike Plan 2025

San José's Department of Transportation aims to construct an extensive on-street bike network and supportive programs and policies (City of San José 2020). The following programs from the San José Better Bike Plan 2025 are applicable to the Project.

Program: Collaborate across agencies and modal planning to advance mutually beneficial VMT reduction initiatives and advocate for complete and multimodal street allocation.

Program: Increase coordination between agencies involved in the planning, design, operation, and maintenance of streets and multi-use paths to advocate for San José's priorities and values for the transportation system. Agencies include VTA, Caltrans, and departments within the City of San José, such as DOT and Parks, Recreation and Neighborhood Services, among others.

San José Complete Streets Design Guidelines and Standards

The City of San José Complete Streets Design Standards and Guidelines have been developed as a comprehensive set of street design standards and guidelines to guide how the City of San José builds and retrofits streets. In addition to designing complete streets through the use of these standards and guidelines, in 2014 the City of San José joined a coalition of other city transportation departments in the United States as a National Association of City Transportation Officials (NACTO) member city. NACTO is a national leader in promoting safe, multimodal street design to build cities as places for people, with safe, sustainable, accessible and equitable transportation choices that support a strong economy and vibrant quality of life (City of San José 2018).

Standards

Sidewalk and Walkway Design

12. Sidewalks shall be people-oriented and comprised of the following zones: Frontage Zone, Through Zone, Furnishing Zone, and Curb Zone.

13. The path of travel between sidewalks and building entries, as well as paths to and from on-street parking for people with disabilities, shall be kept clear.

Bikeways Design

17. Cycle tracks, bike lanes, and shared use paths shall have bike signal detection and/or actuation.

18. Cycle tracks shall include intersection approaches.

Principles

Walkways and Sidewalks

7. Pedestrian networks should be integrated within the larger transportation network.

8. Sidewalks should connect to other modes of travel and provide connectivity, ease of travel, and a comfortable environment to wait for transit.

9. Sidewalk width should allow for "green" design features.

Buffered Bike Lanes

36. Buffered bike lanes should be used whenever there is sufficient roadway width, where right-of-way allows, and/or where comfortable bike facilities are important.

3.19.3 Methodology and Approach to Impact Analysis

The methodology and approach to the impact analysis is partially informed by the methodology and approach to analysis contained in the Project Transportation Technical Memorandum ~~Study~~ prepared for the Project (included in Appendix O). The CEQA impact analysis includes an evaluation of the Project's impact on VMT, pursuant to *CEQA Guidelines* section 15064.3(b); potential to conflict with existing programs, plans, ordinances, or policies addressing roadway, pedestrian, bicycle, and transit facilities; increase in hazards due to geometric design features; and impacts to emergency access. The analysis evaluates impacts related to transportation that could occur as a result of the following activities:

- Seismic Retrofit Construction
- Conservation Measures Construction
- Construction Monitoring
- Post-construction Anderson Dam Facilities Operations and Maintenance
- Post-construction Conservation Measures Operations and Maintenance
- Post-construction FAHCE Adaptive Management

As described in Section 3.0, *Introduction*, the baseline for evaluating Project impacts is the existing conditions following completion of the FOCP implementation (i.e., existing conditions baseline).

VMT Evaluation Methodology

CEQA Guidelines section 15064.3(a) states that VMT refers to the amount and distance of automobile (cars and light trucks) travel attributable to a project. VMT measures the full distance of personal motorized vehicle trips with one end within the project area. Typically, projects that are farther from other, complementary land uses (such as a business park far from housing) and in areas without transit or active transportation infrastructure (bike lanes, sidewalks, etc.) generate more driving than development near complementary land uses with more transportation options. The objective of the SB 743 legislation and switch to VMT instead of LOS is to reduce VMT related to commuting to and from work and through use of local retail services by encouraging alternative modes of travel such as walking, bicycling, transit, or carpooling.

Since SB 743 eliminated the use of LOS for CEQA impact analysis purposes, that method is not utilized in this analysis. The analysis in this EIR examines roadway transportation impacts under current CEQA criteria. Additionally, *CEQA Guidelines* section 15064.3(3) states that "a qualitative analysis of construction traffic may be appropriate." As such, VMT analysis is not intended to evaluate temporary construction-related traffic nor how goods and products are shipped and moved in the marketplace. Even though one particular project may generate a large number of construction trips, the amount of construction-generated VMT for an individual project is incidental and temporary when compared to the total long-term VMT in a jurisdiction generated by residential, commercial, and office uses.

The City of Morgan Hill and County have not yet adopted analysis procedures, standards, or guidelines consistent with SB 743 that differ from OPR guidelines or provide guidance for infrastructure projects. The City of San José has adopted VMT guidelines but indicates that the significance criteria for VMT for "Public/Quasi-Public" projects should be in accordance with the most appropriate type as determined by the Public Works Director (City of San José 2023). Valley Water has also not determined criteria for analysis consistent with SB 743. In the absence of an adopted policy with impact thresholds relevant for the Project, the assessment of the Project's effects related to VMT relies on guidelines published by OPR in its *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR 2018), in addition to San José's guidelines.

As stated in the OPR Technical Advisory, an operational VMT impact threshold of 15 percent below the existing regional VMT per worker for office uses is recommended. OPR does not provide recommended impact thresholds for industrial uses, while San José recommends existing conditions as the industrial threshold. Office space and jobs are more commonly available in urban areas in close proximity to supporting residential uses, unlike industrial land uses which are typically more isolated from residential areas. While office employees may have the option to choose a convenient job location in close proximity to their place of residence, industrial employees may have limited options, resulting in longer trips and consequently greater VMT.

For this reason, jurisdictions that have adopted their own VMT guidelines and impact thresholds, have tended to define impact thresholds for industrial land uses that are less stringent than the recommended 15 percent below existing VMT per worker for office uses (Appendix O). In most jurisdictions, such as San José, the existing VMT per industrial job is used as the impact threshold (City of San José 2023). Therefore, whether the Project's operational VMT substantially differs from the existing project area VMT ~~per industrial worker~~ is used as the impact threshold for the employees ~~of~~ during operation and maintenance of the Project. Specifically, Project operation would a have a less than significant VMT impact if it generates no substantial change or a decrease in long-term VMT compared to existing VMT.

~~The~~ For information purposes only, the evaluation of the Project's effects on VMT during construction was completed by Hexagon using the Santa Clara Countywide Vehicle Miles

Traveled Evaluation Tool (VMT Evaluation Tool) (Appendix O). The VMT Evaluation Tool identifies the existing average VMT per capita and VMT per worker for areas throughout the county based on the APN of a project site. Based on the Project location, type of development, Project description, and proposed trip reduction measures, the evaluation tool calculates the Project VMT during construction. The VMT Evaluation Tool indicates that the regional average VMT per industrial worker is currently 15.33. The VMT per worker (25.47) in the Project Area is currently greater than the regional average.

The VMT Evaluation Tool is limited to the evaluation of the general land use categories of residential, office, and industrial. None of these land uses are applicable to Project (Seismic Retrofit and CMs); additionally, trips generated by the Project would primarily occur during construction and long-term trips from operation and maintenance would be minimal. Construction VMT estimates are presented under Impact TR-2 for informational purposes, but these results are not used to determine impact significance, pursuant to *CEQA Guidelines* section 15064.3(3). Because long-term trips from operations and maintenance would be minimal and the land uses in the VMT Evaluation Tool are not applicable to Project operation, the VMT Evaluation Tool would not provide an accurate estimate of change in VMT; therefore, the operations analysis is discussed qualitatively.

Other Transportation Analysis

Other transportation issues associated with the Project include:

- review of the Project's effects on pedestrian, bicycle, and transit facilities
- consistency with other applicable plans and programs
- conflicts with geometric hazards
- impediments to emergency access

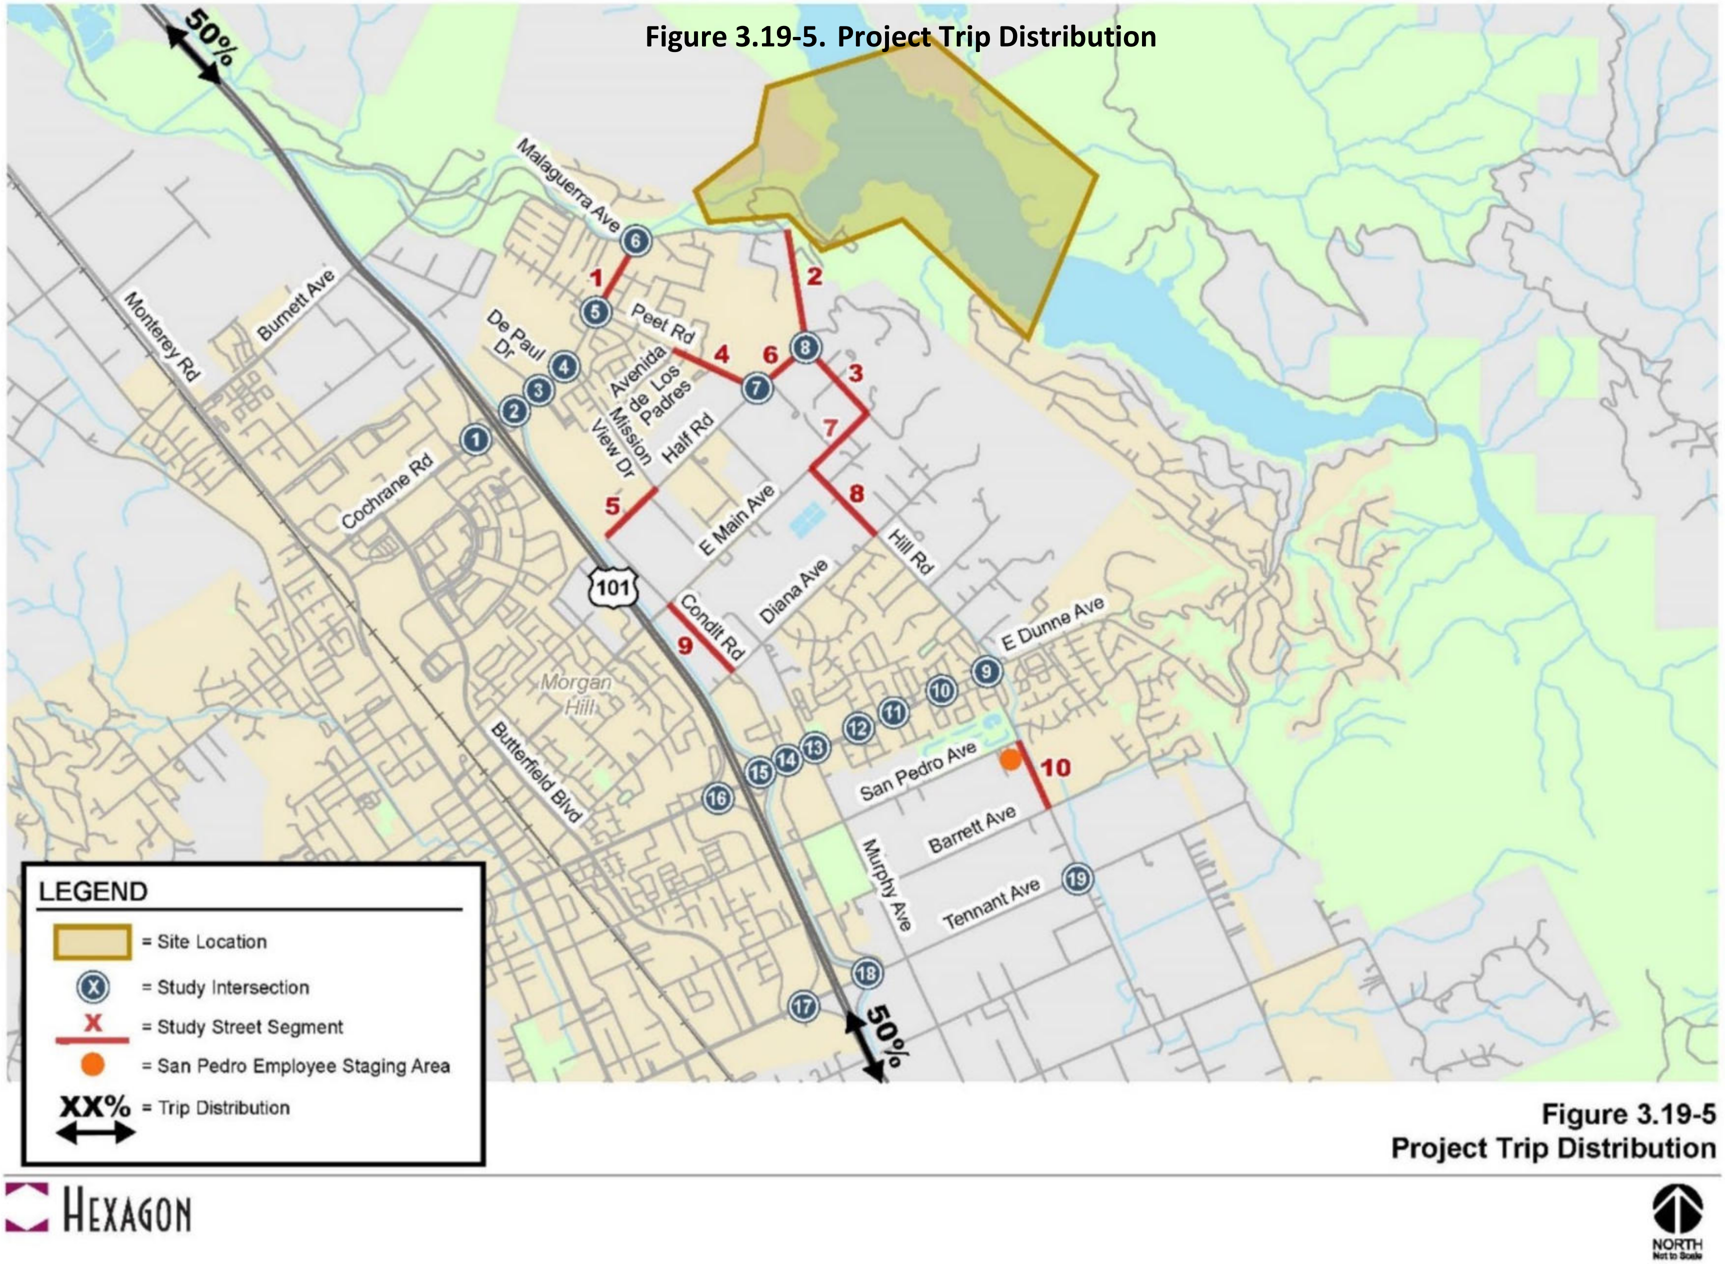
The Project Transportation Technical Memorandum ~~Study~~ (Appendix O) provides supplemental LOS analysis that can be utilized to identify potential improvements of the transportation system that may be implemented to minimize adverse effects of Project construction traffic on the circulation system, hazards, and emergency access. However, the identified roadway operations (i.e., congestion) impacts are not considered CEQA Project impacts per *CEQA Guidelines*, which determines a significant transportation impact based on VMT.

The Project would temporarily generate heavy-duty truck and automobile trips associated with workers and activities during its construction along roadways that provide access to the study area. Generally, the number of workers on site would vary during the Project's 7-year construction period based on the phase of construction. ~~At~~ Preliminary rough estimates prepared for the Draft EIR indicate that at most, construction would generate an approximate maximum of 235 daily workers, 30 daily employee shuttle trips, and a maximum of 125 support truck trips per day, which would utilize roadways in the study area. (See Appendix O for details on Project trip estimates.) ~~This approximation represents a conservative scenario of Project-generated construction traffic and is much greater than would occur during the majority of the 7-year construction period.~~ The distribution of employee and truck traffic was assumed to be distributed equally to US 101 north and south of the study area. The shuttle traffic would only travel between the Project Area at Anderson Dam and the San Pedro Avenue staging area (Staging Area 5). **Figure 3.19-5** shows the trip distribution patterns for employees and trucks.

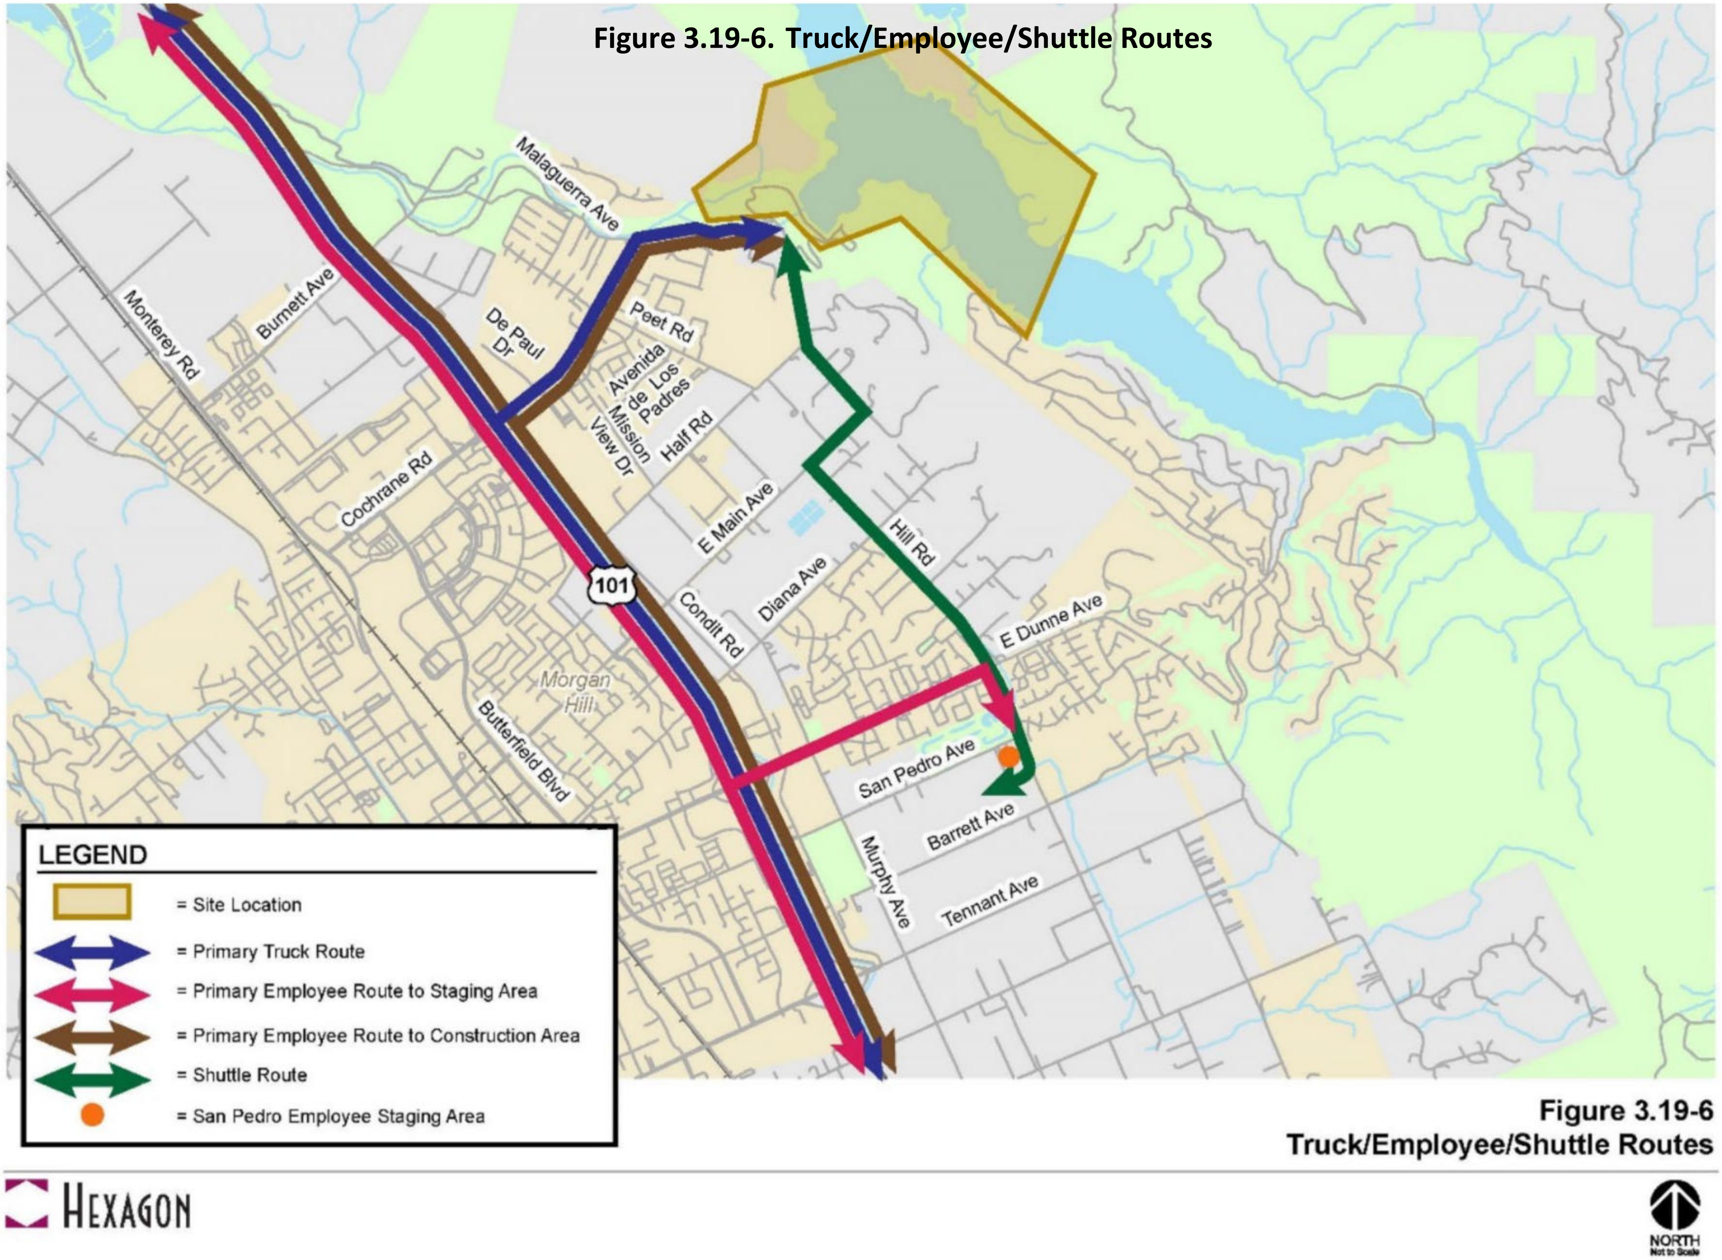
Figure 3.19-6 shows the primary truck, employee, and shuttle routes. For purposes of the analysis, traffic is assumed to traverse all study area roadways in an undetermined quantity.

Impacts of construction activities on the temporary access roads via Shingle Valley Road (north haul road) and via Holiday Drive (south haul road) and the temporary partial closure of Cochrane Road are qualitatively discussed. The temporary and permanent roadway modifications described in Chapter 2, *Project Description*, are also discussed.

Figure 3.19-5. Project Trip Distribution



1 **Figure 3.19-6. Truck/Employee/Shuttle Routes**



3.19.3.1 Seismic Retrofit Construction

As discussed above, analysis for the Seismic Retrofit component of the Project would primarily be qualitative. While Appendix O contains quantified roadway vehicle trip information, pursuant to *CEQA Guidelines* construction roadway vehicle trips is analyzed qualitatively. The impacts of construction VMT related to conflicts with the policies that govern the circulation system, geometric design hazards, and emergency access are discussed qualitatively utilizing information about road closures and quantity of construction vehicle trips on study area roadways.

3.19.3.2 Conservation Measures Construction

A qualitative evaluation of the effects on roadway vehicle trips due to the construction activities associated with the Ogier Ponds CM, Phase 2 Coyote Percolation Dam CM, Sediment Augmentation Program, Maintenance of the North Channel Reach ~~Extension~~, and Maintenance Activities at the Live Oak Restoration Reach is provided.

Similar to the Seismic Retrofit components, construction of the Conservation Measures are analyzed qualitatively. Each of the Conservation Measure component sites are separate from the Seismic Retrofit components site and on a separate construction schedule. Therefore, the effects of the Conservation Measure components are evaluated individually at a qualitative level.

Conservation measures include:

- Ogier Ponds CM
- Maintenance of the North Channel Reach ~~Extension~~
- Maintenance Activities at the Live Oak Restoration Reach
- Sediment Augmentation Program
- Phase 2 Coyote Percolation Dam CM

Maintenance Activities at the Live Oak Restoration Reach involve monitoring during construction and would otherwise include similar construction activities as for the Sediment Augmentation Program for replenishment of spawning gravels. Therefore, Maintenance Activities at the Live Oak Restoration Reach are not discussed further in this section.

3.19.3.3 Construction Monitoring

Construction monitoring activities are not considered in the impact analysis, as monitoring would involve data and information collection and assessment and would result in only a negligible and temporary generation of VMT or other transportation impacts. Thus, construction monitoring is not discussed further in this section.

3.19.3.4 Post-Construction Anderson Dam Facilities Operation and Maintenance

Operation of Anderson Dam following construction of the Seismic Retrofit component would involve implementation of the FAHCE rule curves and pulse flows, which would not change VMT or result in transportation impacts compared to the existing conditions baseline. VMT associated with operation of the Project would be a function of the frequency of inspection and maintenance. As described in **Table 2-19** in Section 2.7, *Post-Construction Anderson Dam Facilities Operations and Maintenance*, maintenance activities would be related to the dam embankment, spillway, inlet/outlet works, pipelines, roadway modifications, recreational facility modifications, and decommissioning of the hydroelectric facility. Such maintenance activities, especially related to vegetation management and routine maintenance, may occur at regular monthly intervals; while other activities, such as roadway modifications or inspections may occur only every 10 years or so.

Assuming these operations and maintenance roadway vehicle trips are made from the Valley Water office at 5750 Almaden Expressway in San José, the total round trip for an inspector or maintenance worker would be approximately 36 miles and would occur only periodically. Compared to the existing and future trips and distances traveled by daily long-distance commuters and truck drivers in the region, these periodic operational trips would contribute a de minimis increment and would be very similar to the baseline condition.

As large infrastructure does not require substantial or regular employee roadway vehicle trips for operations and maintenance, reservoir operation and maintenance would have little long-term effect on air quality and GHG benefits related to long-term reductions in VMT. Therefore, Post-Construction Anderson Dam Facilities Operations and Maintenance VMT impacts would generate a negligible effect on VMT during operations.

Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain the newly retrofitted Anderson Dam and Reservoir per Valley Water's existing DMP. Maintenance of Anderson Dam facilities was previously evaluated in the Final DMP EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). No new substantial long-term operational VMT generation or transportation impacts would be added by dam maintenance. Therefore, post-construction dam facility maintenance activities are not discussed further in this section.

3.19.3.5 Post-Construction Conservation Measures Operations and Maintenance

Similar to the operation of the Anderson Dam, post-construction operations and maintenance of the Conservation Measures components would involve minimal activities generating VMT or other transportation impacts. Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain Coyote Percolation Dam per Valley Water's existing DMP. Maintenance of Coyote Percolation Dam facilities were previously evaluated in the Final DMP EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). No new long-term transportation impacts would be added by the Conservation Measures post-construction. Therefore, operations and maintenance of the Conservation Measures components would not result in significant impacts related to transportation, and these impacts are not discussed further in this section.

3.19.3.6 Post-Construction Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of Project ~~project~~ flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). These monitoring activities are not evaluated in the impact analysis, because they would result in minimal transportation impacts.

The Project AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those of the original Conservation Measure construction. These adaptive actions are not evaluated in the impact analysis, because they are anticipated to result in minimal r transportation impacts.

3.19.3.7 Applicable Best Management Practices and VHP Conditions

The following Valley Water BMP would serve to minimize impacts on transportation from the Project (refer to Chapter 2, *Project Description*, for the full text of the BMPs):

> **TR-1: Incorporate Public Safety Measures.** Fences, barriers, lights, flagging, guards, and signs will be installed as determined appropriate by the public agency having jurisdiction, to give adequate warning to the public of the construction and of any dangerous condition to be encountered as a result thereof.

No VHP conditions are applicable to transportation.

3.19.3.8 Thresholds of Significance

Significance Criteria

For the purposes of this EIR and pursuant to Appendix G of the *CEQA Guidelines*, the Project would result in a significant impact related to transportation if it would:

- conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities
- conflict or be inconsistent with *CEQA Guidelines* section 15064.3, subdivision (b)

- substantially increase hazards due to a geometric design feature or incompatible uses
- result in inadequate emergency access

Specific Thresholds of Significance

This EIR applies the following transportation thresholds:

Vehicle Miles Traveled

Construction and Operation

The Project was assessed for VMT to determine consistency with SB 743 requirements and *CEQA Guidelines* section 15064.3(b). To determine impacts for the Project, the analysis is based on OPR guidance and utilizing the Santa Clara Countywide VMT Evaluation Tool. *CEQA Guidelines* section 15064.3(3) states that "a qualitative analysis of construction traffic may be appropriate."

The following threshold of significance is used to evaluate potential construction and operational VMT impacts with implementation of the Project:

- Construction: a project that generates temporary construction VMT would be less than significant.
- Operation: a project that generates no substantial change[1] or a decrease in long-term VMT would be less than significant.

Circulation System

Construction and Operation

Generally, a project causes a significant impact to roadway, transit, bicycle, and pedestrian facilities if an element of it conflicts with existing or planned roadways, transit, bicycle, and/or pedestrian facilities. The evaluation shall consider if:

- A project or related mitigation conflicts with roadway, transit, bicycle, and pedestrian programs, plans, ordinances, or policies adopted by City of San José, City of Morgan Hill, or County of Santa Clara for their respective facilities.

Design Feature Hazards

Construction and Operation

The impact would be significant if a project, during construction or operation, resulted in transportation facilities that do not conform to applicable City of San José, City of Morgan Hill, or County of Santa Clara design standards for roadways, bicycle facilities, and pedestrian facilities or introduce a geometric design hazard (i.e., conflicts between large construction equipment and narrow turning radii or personal vehicles).

[1] Substantial change is defined as an incremental change from existing conditions (e.g., from 1-2 percent).

Emergency Access

Construction and Operation

While Valley Water does not have significance thresholds related to emergency access, the City of San José, City of Morgan Hill, and County of Santa Clara Municipal Codes have adopted the California Fire Code and amended the code to address local conditions. Therefore, this EIR evaluates Project construction and operation effects related to emergency access using the significance threshold provided by the California Fire Code as follows:

- Provide a fire apparatus access road that meets the California Fire Code requirements of a minimum width of 20 feet with turning radii of 25-feet inside and 45-feet outside

In addition, the following factors determine whether a project has sufficient access for emergency vehicles, including:

- Location of closest fire stations
- Number of access points (both public and emergency access only)
- Width, height, and turning radius of access points and roadways
- Road closure/congestion conflicts

3.19.4 Impact Analysis

***Impact TR-1: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities* (Less than Significant with Mitigation)**

Construction

Seismic Retrofit Construction

Roadway Facilities

Seismic Retrofit construction would involve a partial closure of Cochrane Road (shown in **Figure 3.19-7**), usage of north and south haul roads, usage of temporary access/haul roads, and permanent roadway modifications (as detailed in Section 2.5, *Seismic Retrofit Construction*), most of which involve roadways governed by plans and policies addressing roadway facilities.

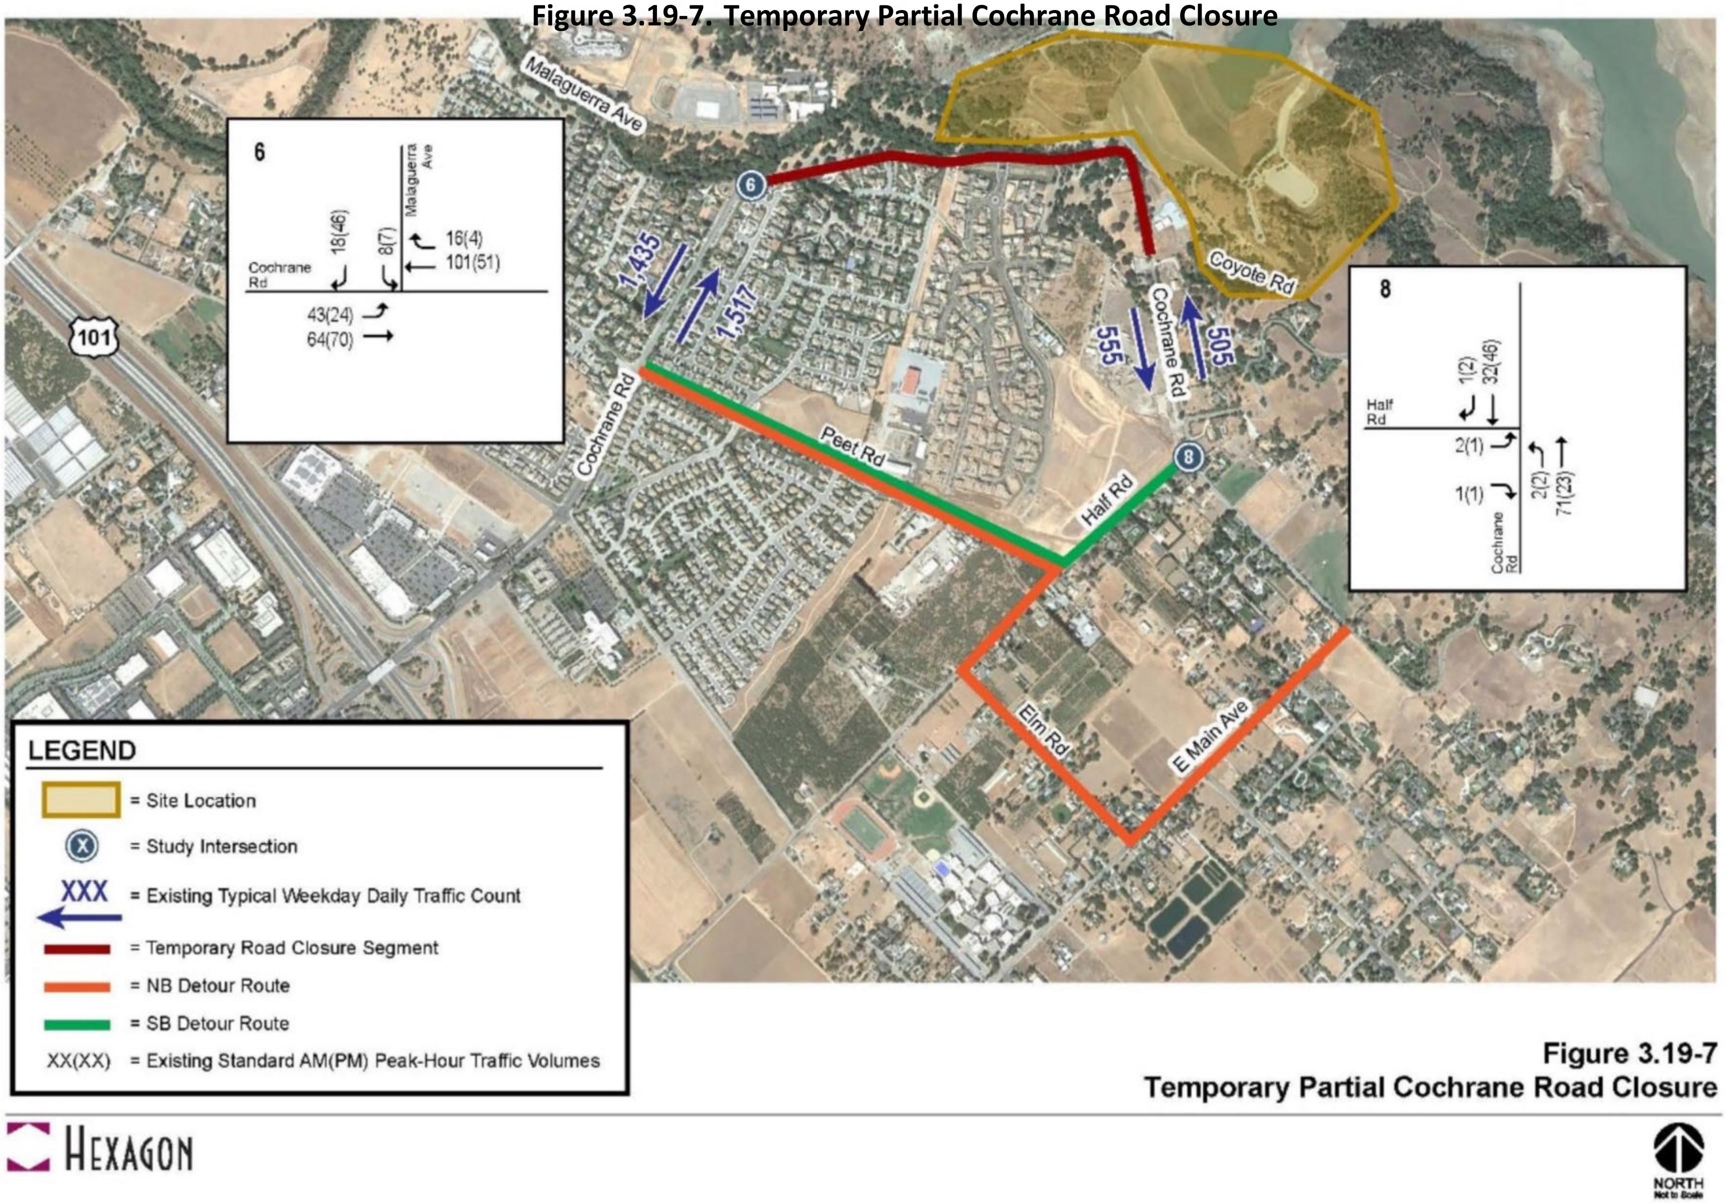
The City of Morgan Hill 2035 General Plan includes goals and policies related to a balanced, safe, and efficient circulation system (Goal TR-1; Policies TR-1.1, TR-1.3, TR-3.2). Specifically, Policy TR-1.1 calls for protection of neighborhoods from cut-through traffic. Construction of the Project would involve partial closure of Cochrane Road (0.8-miles section of Cochrane Road extending between Coyote Road and Malaguerra Avenue) through varying stages of construction, which may detour additional traffic onto neighborhood streets. However, the surrounding roadways and proposed detour routes are anticipated to have sufficient capacity to handle detoured vehicles and closure would occur only over a total of 32 weeks during the 7-year construction period. Additionally, temporary access and haul roads would divert construction traffic from neighborhood roadways. Therefore, the Project would be consistent with Policy TR-1.1.

Regarding transportation safety and safe and complete improvements called for in Morgan Hill 2035 General Plan Policies TR-1.3 and TR-3.2, the temporary partial road closure of Cochrane Road would primarily be within the Project Area and would either be removed upon completion of construction or abandoned in-place. Permanent roadway modifications, including road widening, repaving, and new roadways would be completed following construction and would improve access to the study area, including for maintenance activities. Moreover, implementation of BMP TR-1 would improve safety by requiring fences, barriers, lights, flagging, guards, and signs to be installed as determined appropriate by the public agency having jurisdiction, providing adequate warning to the public of the construction and of any dangerous condition to be encountered as a result thereof. While already less than significant, impacts would be further reduced by implementation of **Mitigation Measure PS-1**, which requires a traffic management plan that will improve roadway safety. Therefore, the Project would be consistent with Policies TR-1.3 and TR-3.2.

The Envision San José 2040 General Plan includes several policies regarding roadway safety (such as Policies TR-1.7, TR-5.4, and TR-5.5); however, roadways impacted by construction of the Project do not extend into the City of San José. Therefore, there would be no roadway facilities conflicts with policies in the Envision San José 2040 General Plan.

Overall, conflicts with policies and plans governing roadway facilities would be minimal due to the limited frequency of the Cochrane Road closure, the ability of the surrounding roadways to accommodate detoured traffic, the use of roadways privately owned by Valley Water, and roadway improvements after construction. While already less than significant, potential conflicts with policies and plans governing roadway facilities would be reduced pursuant to Valley Water BMP TR-1 that will improve roadway safety and reduce conflicts with the discussed plans and policies. Therefore, the Project would have a less-than-significant impact related to conflicts with a program, plan, ordinance, or policy addressing roadway facilities. **Mitigation Measure PS-1** would further reduce this impact.

Figure 3.19-7. Temporary Partial Cochrane Road Closure



Pedestrian, Bicycle, and Transit Facilities

Based on the relatively remote location of the Project Area, the Project would not be likely to generate pedestrian, bicycle, and transit trips. Pedestrian trips for the Project would likely be on-site trips only. In addition, construction traffic would not require re-routing or temporary closure of existing pedestrian, bicycle, and transit facilities. As shown on **Figure 3.19-3** and **Figure 3.19-4**, the temporary partial road closure of Cochrane Road would not affect existing pedestrian and bicycle facilities and transit services. However, as described in Section 3.18, *Recreation*, closures or modified flows during construction may impact recreational trails and facilities, such as the Dam Crest Trail, Cochrane Trail, Serpentine Trail, Basalt Hill, Rosendin Park Area, and Coyote Creek Parkway. The required trail closures may cause conflicts with plans and policies addressing pedestrian and bicycle facilities and trails, such as the Santa Clara Countywide Trails Master Plan; City of Morgan Hill Bikeways, Trails, Parks and Recreation Master Plan; Envision San José 2040 General Plan (Goals TN-1 and TN-2 and Policies TN-2.1, TN-2.6, TN-2.7, TN-2.8, and TN-2.10); and Move San José.

However, as concluded in Section 3.18, *Recreation*, the impacts of trail closures would generally be less than significant due to the numerous nearby recreational alternatives and the temporary nature of the closures. Likewise, conflicts with the aforementioned plans and policies would be temporary and not prevent long-term implementation.

However, due to the modified flows expected in Coyote Creek, larger portions of the Coyote Creek Trail and Hellyer Park may be inundated during construction, causing pedestrians and bicyclists to concentrate within the portions of the facility that remain open. The concentrated use of the open areas, in combination with high water conditions, could result in impacts to these recreational facilities, which are used by pedestrians and bicyclists. This would be a significant impact on pedestrian and bicycle facilities. **Mitigation Measure REC-1** would require Valley Water to provide funding for and implementation of future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities improvements ~~reimburse the SCCDPR for maintenance activities during construction that are triggered by flow events that are greater than 500 cfs (the existing outlet's maximum capacity),~~ thereby reducing impacts on pedestrian and bicycle facilities and preventing substantial conflicts with trails plans and policies. Seismic Retrofit component construction impacts would therefore be less than significant with mitigation.

Conservation Measures Construction

Roadway Facilities

Construction methods and affected roadways for the Conservation Measures, including Ogier Ponds, Maintenance of the North Channel Reach ~~Extension~~, Sediment Augmentation Program, and Phase 2 Coyote Percolation Dam are described in Section 2.6, *Conservation Measures Construction*. Construction of these Conservation Measures would include vehicular access on roadways including Monterey Road, Barnhart Avenue, Ogier Avenue, US 101, Coyote Creek Golf Drive, Metcalf Road, and Cochrane Road.

The discussion of applicable policies included in the analysis of Seismic Retrofit construction would similarly apply to construction of the Conservation Measures, as roadway impacts would be temporary. Implementation of these measures would have the same effect of reducing conflicts with roadway facilities' policies during construction, as discussed above. In addition, the less-than-significant impact would be further reduced by implementation of BMP TR-1 and **Mitigation Measure PS-1**. Therefore, the Project would have a less-than-significant impact related to conflicts with a program, plan, ordinance, or policy addressing roadway facilities.

Pedestrian, Bicycle, and Transit

As with the Seismic Dam Retrofit, due to the nature and location of temporary construction activities associated with the Conservation Measures, the Project would not generate pedestrian, bicycle, and transit trips. Construction traffic would not result in the closure or detour of existing bicycle routes, transit routes, or sidewalks along public roadways. Although pedestrian trips related to the construction of Conservation Measures would be limited to onsite pedestrian trips only, construction activities for the ~~Ogier Ponds~~ Phase 2 Coyote Percolation Dam CM would temporarily impact the Coyote Creek Trail during the 2-year ~~3-year~~ construction period. These temporary impacts are due to construction activities and material hauling across the Trail, resulting in temporary trail closures and detours. The Project would include improvements to pedestrian facilities. The Live Oak Picnic Area would include an improved walking loop and an interpretive trail along Coyote Creek. The discussion of applicable policies included for the Seismic Retrofit construction would similarly apply to construction of the Conservation Measures, as trail impacts would be temporary and numerous alternatives exist to avoid conflicts with plans and policies. Therefore, the Project would have a less-than-significant impact related to conflicts with a program, plan, ordinance, or policy addressing transit, bicycle, and pedestrian facilities.

Operations and Maintenance

As discussed in Section 3.19.3, *Methodology and Approach to Impact Analysis*, post-construction operations and maintenance of the Anderson Dam Facilities and Conservation Measures would be largely consistent with the County, City of Morgan Hill, and City of San José plans and policies governing the transportation circulation system in terms of roadway, pedestrian, bicycle, and transit facilities. Therefore, Project operational impacts related to conflicts with programs, plans, and policies addressing the circulation system would be less than significant, and no mitigation is required.

Significance Conclusion Summary

Project construction and operation would largely be consistent with plans and policies governing the circulation system. Therefore, overall Project impacts related to conflicts with programs, plans and policies addressing the circulation system would be less than significant, with one exception. Due to the modified flows expected in Coyote Creek during Seismic Retrofit construction, larger portions of the Coyote Creek Trail and Hellyer Park may be inundated, causing pedestrians and bicyclists to concentrate within the portions of the facility that remain open. The concentrated use of the open areas, in combination with high water conditions, could result in impacts to these recreational facilities, which are used by pedestrians and bicyclists. This would be a significant impact on pedestrian and bicycle facilities. **Mitigation Measure REC-1** would require Valley Water to provide funding for and implementation of the future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities ~~reimburse the SCCDPR for maintenance~~

~~activities during Seismic Retrofit construction that are triggered by flow events that are greater than 500 cfs (the existing outlet's maximum capacity),~~ thereby reducing impacts on pedestrian and bicycle facilities and preventing substantial conflicts with trails plans and policies. Seismic Retrofit component construction impacts would therefore be **less than significant with mitigation**.

In addition, implementation of BMP TR-1 and **Mitigation Measure PS-1** will further reduce impacts with regard to conflicts with policies governing roadway facility safety by ensuring safe handling of traffic detours, and trail closures would not conflict with plans and policies due to the temporary nature of closures and availability of alternatives.

Mitigation Measures

REC-1. Funding and Implementation of ~~Maintenance Reimbursement for~~ Park Facility Improvements within the Coyote Creek Corridor ~~Closures During High Flow Events~~

PS-1. Prepare and Implement ~~Construction~~ Traffic Management Plan

Impact TR-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b) **(Less than Significant)**

Construction

Seismic Retrofit Construction

As previously described, *CEQA Guidelines* section 15064.3(3) states that "a qualitative analysis of construction traffic may be appropriate." VMT analysis is not focused on evaluating temporary construction-related trips; SB 743 is focused on reducing long-term VMT to help achieve the State's GHG reduction targets. Even though one particular project may generate a large number of construction trips, the number of construction-generated VMT for an individual project is incidental and temporary when compared to the total operational VMT in a jurisdiction generated by residential, commercial, and office uses.

Construction VMT estimates are presented for informational purposes only. The construction worker VMT estimate generated by the Project is 24.69 VMT per worker. While this is less than the current Project Area, VMT per worker of 25.47, it is not necessarily relevant to determine the Project's significance, since a qualitative analysis is appropriate for construction VMT (see Appendix O).

Construction employees and vendors are anticipated to travel to the Project Area from throughout the Bay Area and Central Valley utilizing personal vehicles or carpooling when possible. As a result, opportunities to substantially lessen VMT during the construction period are limited, as the supplier markets are distant from the construction area and the choice of construction contractors by Valley Water would depend on a number of factors, including availability when the work is scheduled. Additionally, with housing costs increasingly unaffordable in the South Bay Area, it would not be reasonable to assume that Valley Water could contract only with a local workforce and vendors.

Construction trips would comprise only a small portion of regional trips and can be anticipated to be similar to those of existing travelers. Furthermore, VMT generated would not persist when Seismic Retrofit construction is complete. In other words, post-construction, VMT from the

Seismic Retrofit construction would cease to exist. Caltrans in its guidance for implementing SB 743 indicates that "vehicle trips used for construction purposes would be temporary, and any generated VMT would generally be minor and limited to construction equipment and personnel and would not result in long-term trip generation" (Caltrans 2020). Because a primary goal of VMT reduction is to reduce air quality and lessen GHG emissions, further information on how construction VMT contributes to these emissions is presented in Section 3.3, *Air Quality*, and 3.10, *Greenhouse Gas Emissions*.

As such, VMT associated with the Seismic Retrofit construction would be temporary and not contribute to a substantial change in long-term VMT. Therefore, the Seismic Retrofit construction would be consistent with *CEQA Guidelines* section 15064.3(b), resulting in a less-than-significant impact.

Conservation Measures Construction

Similar to the discussion above, VMT generated by construction of the Ogier Ponds, Phase 2 Coyote Creek Percolation Dam, Sediment Augmentation Program, and <u>Maintenance of the</u> North Channel <u>Reach</u> ~~Extension~~ would be temporary and not contribute to a long-term change in VMT. As such, VMT associated with the Conservation Measures construction would be temporary and not contribute to a substantial change in long-term VMT. Therefore, Conservation Measures construction would be consistent with *CEQA Guidelines* section 15064.3(b), resulting in a less-than-significant impact.

Operations and Maintenance

As discussed in Section 3.19.3, *Methodology and Approach to Impact Analysis*, post-construction operations and maintenance of the Anderson Dam Facilities and Conservation Measures would result in negligible VMT generation and, thus, not contribute to a substantial change in long-term VMT. Therefore, the Project would be consistent with *CEQA Guidelines* section 15064.3(b), resulting in a less-than-significant operational impact related to VMT. No mitigation is required.

Significance Conclusion Summary

The Project's construction-related VMT would be temporary, and operation-related VMT would be negligible and would not contribute to a substantial change in long-term VMT. And as a large infrastructure project, the Project would have little long-term effect VMT-generated air quality and greenhouse gas emissions (as discussed under Section 3.19.3, *Methodology*). Because the increase in VMT during construction would be temporary, and there would be a negligible effect on VMT during operation, the Project would not conflict with or be inconsistent with *CEQA Guidelines* section 15064.3(b). Therefore, overall Project impacts related to VMT would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact TR-3: Substantially increase hazards due to a geometric design feature or incompatible use (Less than Significant)

Construction

Seismic Retrofit Construction

Staging/Stockpiling Areas and Temporary Access Roads/Bridges

Construction equipment would be staged in six staging areas, as described in **Table 2-4**, *Overview of Stating Areas*, in Section 2.5.2, *Seismic Retrofit Site Mobilization and Preparation*. To ensure that these staging areas would be equipped to safely move and store construction equipment, prior to use they would be cleared of vegetative groundcover and debris, graded to be flat, and a gravel or separation fabric would be placed over the ground surface. Likewise, the stockpile areas described in **Table 2-5,** *Stockpile Areas*, would be cleared of vegetation and graded to accommodate construction materials and equipment. Such modifications would ensure that hazards due to geometric design would be reduced in the equipment staging and stockpile areas by creating a flat and clear surface.

Primary access to the Project Area would be via US 101 and Cochrane Road. From Cochrane Road there would be four Project Area access points: (1) the western end of the Live Oak Picnic Area (Staging Area 1); (2) the current entrance to Toyon Park at the toe of the dam; and (3) the entrance to Anderson Lake County Park (intersection of Coyote Road and Cochrane Road), and (4) North Access Point, which would be from US 101 to Stockpile L. These are existing entrances, and, therefore, no new geometric design features would be introduced with the exception of Staging Area 1. Access to Staging Area 1 would be from Cochrane Road and the Live Oak Picnic Area and include a temporary bridge across the south channel, which is discussed below.

As described in Section 2, *Project Description*, access roads and temporary bridges for construction would be constructed within the Project Area to allow for the movement of heavy construction equipment between active work areas, staging areas, stockpile areas, borrow sites, and disposal sites. One-way access roads would be up to 30-feet wide with turnouts, and two-way access roads would be up to 60-feet wide with turnouts. Once Seismic Retrofit construction is complete, temporary access roads located along the slope of the dam would be removed, and temporary access roads located within the reservoir area would be abandoned in-place. Temporary access roads on the downstream and upstream slope of the dam would be removed and the temporary access roads in the reservoir area connecting to the stockpile areas and PGBP would be abandoned in-place. A pile supported temporary bridge, approximately 150-foot long and 40-foot wide, would be constructed across the North Channel to provide access from the access road along the Anderson Dam Trail into Staging Area 1E. In addition, a pile-supported bridge, approximately 100-feet long and 40-feet wide, would be constructed across the South Channel to provide access from Staging Area 1W to Staging Area 1E. The widths of the temporary roads, along with the provided turnouts, would ensure that construction equipment and employees could safely move through the Project Area and reduce hazards.

Overall, movement of construction equipment and vehicles within staging/stockpiling areas and temporary access roads/bridges would not substantially increase geometric design hazards due to preemptive vegetation clearing and grading, as well as installation of adequately wide roads and turnouts. Therefore, Seismic Retrofit construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Roadway Closure and Modifications

Cochrane Road Closure

Approximately 0.8 miles of Cochrane Road would be fully or partially closed to public through-traffic for varying durations of the construction period. To ensure that roadway hazards would not be substantially increased, during times of roadway closure, secure access gates located at either end of the road closure would limit access to only construction-related vehicles and equipment, and local residents. Barricades and/or signage would be placed at the northern terminus of St. Marks Avenue and San Rafael Street to block vehicular traffic from entering the closed area. At the southern terminus, a barricade and/or signage would be placed at Barnard Road to restrict vehicular traffic from proceeding north into the closed portion of the roadway. All vehicles, with the exception of those noted above, would be routed through a clearly marked detour using adjacent streets (Peet Road, Half Road, Elm Road, and East Main Road) to avoid the closed road. The detour would be demarcated using a combination of signage, fencing, barriers, lights, flagging, and/or guards. Following construction, this section of Cochrane Road would be repaved. The barricade/signage to block vehicular traffic and clear demarcation of a detour, combined with repavement, would ensure that hazards are not substantially increased during construction of the Project. Therefore, Cochrane Road Closure construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Coyote Road up to the Boat Ramp Parking Area

As part of the Seismic Retrofit construction, Coyote Road from the intersection with Cochrane Road up to the Boat Ramp Parking Area would be permanently modified to provide access from the dam crest to the marina. The intersection between Coyote Road and Cochrane Road would be widened and relocated approximately 200-feet south to provide a safer park entrance. Portions of Coyote Road, from the old entrance kiosk to the dam crest (approximately 1,850 lineal feet), would be widened from an approximately 13-foot-wide,[2] one-way road, to a 30-foot-wide, two-way road that would include a sidewalk.

These modifications would improve roadway conditions and would not increase hazards due to a geometric design feature. Therefore, Coyote Road up to the Boat Ramp Parking Area construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Coyote Road across the Dam Crest

Once Seismic Retrofit construction is complete, Coyote Road would be replaced with a two-lane roadway, similar to the existing road alignment. This permanent roadway modification would allow for Valley Water maintenance activities, restrict public vehicle access across the dam due to safety concerns, and provide pedestrian access to the Serpentine Trail via the roadway. The new permanent, paved two-lane Coyote Road to be constructed along the dam crest would be

[2] Some segments of the existing road extend up to 24-feet wide.

approximately 1,150-feet long and 24-feet wide. Along the segment that extends from the left (south) end of the dam to the gravity wall at the right (north) end of the dam, the road would be equipped with guard rails on either side. The new roadway would no longer be a one-way loop that crosses the dam crest. The new roadway would extend on the dam crest with a western terminus near the spillway; the portion of the roadway along the south side of the spillway would no longer be open to public vehicles. A security gate would be located at the left side (south end) to prevent public vehicular access to the dam crest.

These modifications would improve roadway conditions for maintenance activities and restrict public access across the dam crest. No geometric design features that would increase hazards would occur. Therefore, Coyote Road across the Dam Crest construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Coyote Road along the Spillway

Coyote Road, along the spillway, would be permanently modified to provide an access road for maintenance activities only. This roadway would be permanently modified to limit all public vehicular access and would end in a dead-end near the spillway. This 1,100-foot-long segment of Coyote Road, located along the south side of the spillway, would be a one-lane, 14-foot-wide paved roadway. This road segment would start at the dam crest and end at a 60-foot-diameter, paved turnaround, located approximately 200-feet downstream of the end of the concrete lined spillway chute. The west end of the turnaround would connect to an unimproved access road along the south bank of the unlined spillway chute.

These modifications would improve roadway conditions for maintenance activities and restrict public vehicular access. No geometric design features that would increase hazards would occur. Therefore, Coyote Road along the Spillway construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Access from Cochrane Road to Anderson Dam Toe

Permanent roadway modification would be proposed from Cochrane Road to the toe of Anderson Dam. This permanent roadway modification would be constructed to allow maintenance access to the LLOW outlet structure and HLOW outlet structure from the lower-level parking lot. Access from Cochrane Road to the Anderson Dam toe would be relocated approximately 220-feet west, to improve sight distance. The access would include a paved, two-lane, 30-foot-wide driveway used to access the low-level outlet structure parking area. A 325-foot-long, one-lane, 20-foot-wide, paved access from the west end of the parking area would be used to access the high-level outlet structure access pad. In addition, the shoulder width would be widened by up to 5 feet along a 740-foot-long segment of the westbound lane of Cochrane Road, from the start of the curve (northbound) to about 300-feet west of the new driveway into the Anderson Dam toe.

These modifications would improve roadway conditions for maintenance activities and access and widen a portion of the westbound lane of Cochrane Road. No geometric design features that would increase hazards would occur. Therefore, Access from Cochrane Roade to Anderson Dam Toe construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Access from Cochrane Road to Left Bank of North Channel

Cochrane Road, from the left bank of the North Channel, would be permanently modified to construct a maintenance road. The maintenance road would be used to access the North and South Channel weirs, Coyote Creek, the outlet channels, and the North Channel habitat enhancement features (constructed as part of FOCP). A 950-foot-long, 14-foot-wide, paved driveway, located on the north (westbound) side of Cochrane Road would be used for maintenance access to the left bank of the North Channel. This driveway would include a crossing (bridge) of the South Channel.

These modifications would improve roadway conditions for maintenance activities. No geometric design features that would increase hazards would occur. Therefore, Access from Cochrane Road to Left Bank of North Channel construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Repaving of Cochrane Road (US 101 to Anderson Dam)

Cochrane Road would be repaved from US 101 to the Anderson Dam entrance at Coyote Road. The repaving of Cochrane Road from US 101 to Anderson Dam would occur once installation of the communication lines is completed in Year 7. Repaving of Cochrane Road would restore the road conditions and repair damage sustained during construction. Roadway paving work would begin at the southbound exit of US 101 and continue to the dam site for a total distance of approximately 2 miles (including the 0.8-miles segment between Malaguerra Avenue and Coyote Road). The paving equipment would be transported by flatbed trailers and would be staged at designated staging areas on the dam site when not in use.

To reduce potential incompatible uses associated with construction equipment and roadway traffic, the Project would implement BMP TR-1, which would require fences, barriers, lights, flagging, guards, and signs be installed as determined appropriate by the public agency having jurisdiction (City of Morgan Hill), to give adequate warning to the public of the construction and of any dangerous condition to be encountered as a result thereof. Additionally, construction within Caltrans right-of-way near the US 101 off ramp would be required to adhere to conditions of Caltrans encroachment permits, including a traffic control plan that adheres to the standards set forth in the California MUTCD, which would ensure safe movement of vehicles through the construction area and limit incompatible uses related to construction equipment and vehicular roadway trips. Therefore, Repaving of Cochrane Road (US 101 to Anderson Dam) construction-related impacts associated with geometric design feature or incompatible use hazards would be less than significant.

Conservation Measures Construction

Ogier Ponds

Vehicular access to the Ogier Ponds would be provided from Monterey Road via its intersection with Barnhart Avenue and Ogier Avenue. These are existing public roads. Access would also be provided from US 101 and Coyote Creek Drive via a gated restricted access point. A network of rural roads surfaced with crushed rock would be installed at the staging and construction areas to allow internal vehicle and equipment movement through the Ogier Ponds area. Material hauling from the BHBA would be from Cochrane Road to Monterey Road, and from Monterey Road to Barnhart Avenue. Material stockpiling would occur at the Barnhart Avenue Stockpiling Area at the northeast corner of Barnhart Avenue and Monterey Road. These roadways would provide access to the construction staging and stockpiling areas from the paved public roads.

Construction associated with Ogier Ponds would not require a change to existing vehicular access from public roads and therefore would not result in hazards due to geometric design features. However, construction equipment has the potential to result in incompatible uses with vehicular traffic along Monterey Road, Barnhart Avenue, and Cochrane Road. Therefore, this Conservation Measure would be subject to BMP TR-1 which would require fences, barriers, lights, flagging, guards, and signs will be installed as determined appropriate by the public agency having jurisdiction (City of Morgan Hill), to give adequate warning to the public of the construction and of any dangerous condition to be encountered as a result thereof. Therefore, Ogier Ponds construction-related impacts associated with incompatible uses due to construction equipment and vehicular roadway trips would be less than significant.

Phase 2 Coyote Creek Percolation Dam

Vehicular access to the Coyote Creek Percolation Dam would be provided from Monterey Road via its intersection with Metcalf Road and internal roads at the Coyote Creek Percolation Dam site that are closed to the public. The staging area would be located at a 0.8-acre parking lot accessed from Metcalf Road.

Construction associated with Phase 2 Coyote Creek Percolation Dam would not require any changes to existing public roads or vehicular access points and therefore would not result in hazards due to geometric design features. However, construction equipment has the potential to result in incompatible uses with vehicular traffic along Monterey Road and Metcalf Road. Therefore, this Conservation Measure would be subject to BMP TR-1, which would require fences, barriers, lights, flagging, guards, and signs will be installed as determined appropriate by the public agency having jurisdiction (City of San Jose ~~Morgan Hill~~), to give adequate warning to the public of the construction and of any dangerous condition to be encountered as a result thereof. Therefore, Phase 2 Coyote Creek Percolation Dam construction-related impacts associated with incompatible uses due to construction equipment and vehicular roadway trips would be less than significant.

Sediment Augmentation Program

~~Vehicular access to the Sediment Augmentation Program staging area would be provided via Holiday Lake Drive and through in-reservoir haul roads. Sediment materials would then be transported to the Live Oak Restoration Reach or Ogier Ponds using in-reservoir access roads or public roads (Cochrane Road, Monterey Road, Barnhart Avenue).~~

Construction associated with the Sediment Augmentation Program would not require any changes to existing public roads or vehicular access points and therefore would not result in hazards due to geometric design features. However, construction equipment has the potential to result in incompatible uses with vehicular traffic along Cochrane Road, Monterey Road, and Barnhart Avenue. Therefore, this Conservation Measure would be subject to BMP TR-1, which would require fences, barriers, lights, flagging, guards, and signs will be installed as determined appropriate by the public agency having jurisdiction (City of Morgan Hill), to give adequate warning to the public of the construction and of any dangerous condition to be encountered as a result thereof. Therefore, Sediment Augmentation Program construction-related impacts associated with incompatible uses due to construction equipment and vehicular roadway trips would be less than significant.

Maintenance of the North Channel Reach ~~Extension~~

Maintenance of the North Channel Reach would generally be limited to minor and intermittent maintenance activities (e.g., vegetation management, replacement plantings, and maintenance of the wetland bench). Access to the North Channel Reach ~~Extension~~ would be via Cochrane Road. ~~and Staging Area 1 (Live Oak Picnic Area) and include a temporary bridge across the south channel. This internal access road may require removal of some group picnic facilities.Although the creation of this internal access road would be required for the North Channel Extension, it~~ Maintenance of the North Channel Reach would not extend into the public roadway. Therefore, construction associated with the North Channel Reach ~~Extension~~ would not require any changes to existing public roads or vehicular access points and therefore would not result in hazards due to geometric design features. However, construction equipment has the potential to result in incompatible uses with vehicular traffic along Cochrane Road. Therefore, this Conservation Measure would be subject to BMP TR-1, which would require fences, barriers, lights, flagging, guards, and signs will be installed as determined appropriate by the public agency having jurisdiction (City of Morgan Hill), to give adequate warning to the public of the construction and of any dangerous condition to be encountered as a result thereof. Therefore, North Channel Reach ~~Extension~~ construction-related impacts associated with incompatible uses due to construction equipment and vehicular roadway trips would be less than significant.

Operations and Maintenance

As discussed in Section 3.19.3, *Methodology and Approach to Impact Analysis*, post-construction operations and maintenance of the Anderson Dam Facilities and Conservation Measures would not involve changes to roadway geometric design, incline steepness, or use compatibility. In addition, Project operations and maintenance would conform to applicable County, City of Morgan Hill, and City of San José design standards for roadway, bicycle, and pedestrian facilities. Therefore, there would be no Project operational impact related to geometric design feature or incompatible use roadway hazards, and no mitigation is required.

Significance Conclusion Summary

The Project would not include any new roadway or access improvements during construction or operation that would substantially increase hazards due to a geometric design feature or incompatible use. Therefore, overall Project impacts regarding increased hazards due to a geometric design feature or incompatible use would be **less than significant.**

Mitigation Measures

No mitigation is required.

Impact TR-4: Inadequate emergency access (Less than Significant with Mitigation)

Construction

Seismic Retrofit Construction

Construction worker vehicles would increase roadway vehicle volumes on adjacent public roadways, which could impede emergency access. In addition, construction equipment and deliveries also could impede emergency access. Furthermore, a portion of Cochrane Road would be temporarily closed to through traffic for varying durations over the 7-year construction period.

The north and south haul roads would provide emergency access for the construction contractor during construction from Years 2 through 7. The north haul road (Shingle Valley Road) would provide access from US 101 to Metcalf Road to Shingle Valley Road (Private) to Stockpile Area L. ~~(associated with the Phase 2 Coyote Creek Percolation Dam).~~ The south haul road (Holiday Estates) would provide access from US 101 to Dunne Avenue to Holiday Drive to Staging Area 6 (Holiday Lake Estates Boat Ramp Parking Lot ~~Boat Marina~~). During the initial construction period of the north and south haul roads (Year 1), emergency access may be impeded. Cochrane Road would remain accessible to emergency vehicles during the full and partial closures to the public. Temporary access roads would be private roadways and would not impact an emergency access route as compared to existing conditions; still, one-way access roads would be up to 30-feet wide with turnouts, and two-way access roads would be up to 60-feet wide with turnouts and would accommodate emergency vehicle access, in compliance with California Fire Code requirements for fire apparatus access roads. Permanent roadway modifications on Coyote Road and Cochrane Road would improve roadway conditions, construction access, public access, and public safety. These modifications would also improve emergency access. Repaving of Cochrane Road would be phased by closing one side of Cochrane Road at a time to avoid closures and would not impact emergency access.

Emergency access to the Project Area for emergency services included in Section 3.17, *Public Services*, would be maintained as required under BMP TR-1. In addition, as discussed in Section 3.10, *Hazards and Hazardous Materials*, and Section 3.17, *Public Services*, although roadway vehicle impacts would be reduced through implementation of BMP TR-1, a significant impact to emergency access due to delayed response times would remain. Implementation of **Mitigation Measure PS-1** will further reduce impacts on emergency response and emergency access by requiring the preparation and implementation of a ~~Construction~~ Traffic Management Plan and coordination with local and State agencies, including fire protection services and first responders. In addition, as discussed in Section 3.22, *Wildfire*, **Mitigation Measure WF-1** will ~~minimize the impact of closure of an identified temporary refuge area (Woodchopper's Flat Picnic Area) by requiring~~ require coordination with local and State emergency response and fire agencies and preparation of a Response and Evacuation Strategy (RES) such to maintain adequate emergency response and evacuation routes throughout construction of the Project in locations where Project construction substantially interferes with emergency access and evacuation ~~identify an alternative temporary refuge area or provide emergency access~~ during construction of the Seismic Retrofit components in the event of a wildfire.

With implementation of the identified mitigation measures, Seismic Retrofit construction impacts related to emergency access adequacy would be less than significant with mitigation.

Conservation Measures Construction

Construction of Ogier Ponds, Phase 2 Coyote Creek Percolation Dam, the Sediment Augmentation Program, and Maintenance of the North Channel ~~Extension~~ Reach Conservation Measures would not require any changes to public roads or vehicular access points. Similar to the discussion above, emergency access may be impeded by construction activity, specifically along roadways discussed in Section 2.6, *Conservation Measures Construction*, including but not limited to Monterey Road, Barnhart Avenue, Ogier Road and Cochrane Road. During construction activities, emergency access will be provided in accordance with BMP TR-1 and **Mitigation Measures PS-1** and **WF-1**. Therefore, Conservation Measures construction impacts related to emergency access adequacy would be less than significant with mitigation.

Operations and Maintenance

As discussed in Section 3.19.3, *Methodology and Approach to Impact Analysis*, post-construction operations and maintenance of the Anderson Dam Facilities and Conservation Measures would not involve changes related to roadway closures, ingress/egress closures or reduction, or fire apparatus access roads not meeting the California Fire Code requirements. Therefore, there would be no Project operational impact related to emergency access adequacy, and no mitigation is required.

Significance Conclusion Summary

While there would be no operational impacts related to inadequate emergency access, the Project would generate additional construction roadway vehicle trips and include road closures that have the potential to impede emergency access. However, the inclusion of temporary roadways and the haul roads would provide additional ingress/egress for emergency vehicles. Although roadway vehicle impacts would be reduced through implementation of BMP TR-1, a significant impact to emergency access due to delayed response times would remain. **Mitigation Measures PS-1** and **WF-1** will provide for continued emergency access during construction, so that emergency access impacts would be less than significant. Therefore, overall Project impacts related to emergency access adequacy during construction would be **less than significant with mitigation**.

Mitigation Measures

PS-1 Prepare and Implement ~~Construction~~ Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy ~~Emergency Action Plan~~

3.19.5 Cumulative Impacts

The cumulative impact geographic study area for transportation includes the local and regional roadways, transit, pedestrian, and bicycle facilities in Morgan Hill, San José, and unincorporated Santa Clara County.

The approach to the cumulative impacts analysis and list of foreseeable future projects, programs, and plans considered in the cumulative impact analysis is included in Section 3.0.5, *Approach to Cumulative Impacts*.

This section describes the Project's contribution to cumulative transportation impacts, as summarized in **Table 3.19-1**. Cumulative impact thresholds for transportation are the same as the impact thresholds presented in Section 3.19.3.8, *Thresholds of Significance*.

Table 3.19-1. Summary of Project Impact Contribution to Cumulative Transportation Impacts

Impact	Significant Cumulative Impact with FOCP?	Significant Cumulative Impact with other Projects?	Incremental Project Contribution	Applicable Project Mitigations	Cumulatively Considerable after Mitigation?
Cumulative Impact TR-1: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities	No	Yes	CC	MM Rec-1 MM PS-1	No
Cumulative Impact TR-2: Conflict with or be inconsistent with *CEQA Guidelines* section 15064.3, subdivision (b)	No	No	NCC	N/A	No
Cumulative Impact TR-3: Substantially increase hazards due to a geometric design feature or incompatible use	No	No	NCC	N/A	No
Cumulative Impact TR-4: Inadequate emergency access	No	Yes	CC	MM PS-1 MM WF-1	No

Key: CC = cumulatively considerable; MM = Mitigation Measure; N/A = not applicable; NCC = not cumulatively considerable

Cumulative Impact TR-1: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities (Not Cumulatively Considerable)

Cumulative Effects of Project with the FOCP

The FOCP would be completed before construction activities for the Project begin; therefore, these two projects would not result in cumulative impacts related to program, plan, ordinance or policy addressing the circulation system. There would be no cumulative effect.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Most of the other reasonably foreseeable future projects identified in Section 3.0.5, *Approach to Cumulative Impacts*, would occur within the transportation study area. Construction or operation of future projects, programs, and plans could overlap with the 15-year construction schedule during which the Seismic Retrofit construction and Conservation Measures construction would occur. Construction of the Project would generally not conflict with plans or policies addressing the circulation system with implementation of BMP TR-1, which would be reduced by **Mitigation Measure PS-1.** However, modified flows expected in Coyote Creek during Seismic Retrofit construction would result in impacts to recreational facilities that are used by pedestrians and bicyclists. This would be a significant impact on pedestrian facilities. **Mitigation Measure REC-1** would reduce impacts on pedestrian facilities and prevent substantial conflicts with trails plans and policies. Seismic Retrofit component construction impacts would therefore be less than significant with mitigation.

In combination with construction or operation occurring at the same time from probable future projects, plans, and programs, Project construction would generally not further conflict with circulation system plans or policies discussed under Impact TR-1. However, probable future projects could contribute to additional impacts on pedestrian facilities affected by modified Coyote Creek ~~Cerek~~ flows during construction. Therefore, the cumulative impact on pedestrian and bicycle facilities resulting from the Project in combination with other probable future projects would be significant, the Project's contribution would be cumulatively considerable pre-mitigation, but not cumulatively considerable post-mitigation after implementation of **Mitigation Measure REC-1**.

Significance Conclusion Summary

Valley Water would generally reduce the Project's incremental contribution to cumulative impacts on plans and policies addressing the circulation system through implementation of BMP TR-1, and the incremental impact would be further reduced by **Mitigation Measure PS-1**. However, the cumulative impact on pedestrian facilities resulting from Seismic Retrofit construction in combination with other probable future projects would be significant, the Project's contribution would be cumulatively considerable pre-mitigation, but not cumulatively considerable post-mitigation after implementation of **Mitigation Measure REC-1**. With implementation of this mitigation measure Project construction would not conflict with applicable circulation system plans or policies, and the Project's contribution to cumulative impacts is **not cumulatively considerable**.

Mitigation Measures

REC-1 ~~Maintenance Reimbursement for~~ Funding and Implementation of Park Facility Improvements within the Coyote Creek Corridor ~~Closures During High Flow Events.~~

PS-1 Prepare and Implement ~~Construction~~ Traffic Management Plan

***Cumulative Impact TR-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)* (Not Cumulatively Considerable)**

Cumulative effects of Project with the FOCP

The FOCP would be completed before construction activities for the Project begin; therefore, these two projects would not result in cumulative impacts related to VMT. There would be no cumulative effect.

Cumulative effects of Project with Probable Future Projects, Programs, and Plans

Most of the other reasonably foreseeable future projects identified in Section 3.0.5, *Approach to Cumulative Impacts*, would occur within the transportation study area. Construction or operation of future projects, programs, and plans could overlap with the 15-year construction schedule that Seismic Retrofit components and Conservation Measures construction would occur. Cumulative development would generate VMT, which contributes to overall regional and local VMT. Projects that fall below applicable local and regional VMT thresholds are considered to have a less-than-significant impact. Given the land use pattern and scope of cumulative projects in the geographic study area, it is likely that VMT from other projects may increase substantially during the construction period. However, the VMT associated with the Project construction would be temporary and not contribute to a substantial change in long-term VMT, and the Project would therefore be not conflict with and be consistent with *CEQA Guidelines* section 15064.3(b), resulting in a less-than-significant impact. Therefore, the Project would not contribute to a significant cumulative impact on VMT that would conflict or be inconsistent with *CEQA Guidelines* section 15064.3(b), and the Project's contribution would not be cumulatively considerable.

Because a primary goal of VMT reduction is to reduce air quality and lessen GHG emissions, further information on how construction VMT impacts of the Project contributes to cumulative air quality and GHG emissions is presented in Section 3.3, *Air Quality*, and 3.10, *Greenhouse Gas Emissions*.

Significance Conclusion Summary

Construction of the Project would not cause VMT impacts that would conflict or be inconsistent with *CEQA Guidelines* section 15064.3(b). The Project's contribution to cumulative impacts on VMT is **not cumulatively considerable.**

Mitigation Measures

No mitigation would be required.

Cumulative Impact TR-3: Substantially increase hazards due to a geometric design feature or incompatible use (Not Cumulatively Considerable)

Cumulative effects of Project with the FOCP

The FOCP would be completed before construction activities for the Project begin; therefore, these two projects would not result in cumulative impacts related to an increase in hazards. There would be no cumulative effect.

Cumulative effects of Project with Probable Future Projects, Programs, and Plans

Most of the other reasonably foreseeable future projects identified in Section 3.0.5, *Approach to Cumulative Impacts*, would occur within the transportation study area. Construction or operation of future projects, programs, and plans could overlap with the 15-year construction schedule that Seismic Retrofit components and Conservation Measures construction would occur. Construction of the Project would not substantially increase hazards due to a geometric design feature or incompatible use. In combination with construction or operation occurring at the same time from probable future projects, plans, and programs, Project construction would not create significant cumulative impacts. The Project's contribution would not be cumulatively considerable.

Significance Conclusion Summary

Construction of the Seismic Retrofit components and Conservation Measures would not substantially increase hazards. The Project's contribution to cumulative impacts is **not cumulatively considerable.**

Mitigation Measures

No mitigation would be required.

Cumulative Impact TR-4: Inadequate emergency access (Not Cumulatively Considerable)

Cumulative Effects of Project with the FOCP

The FOCP would be completed before construction activities for the Project begin; therefore, these two projects would not result in cumulative impacts related to emergency access. There would be no cumulative effect.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Most of the other reasonably foreseeable future projects identified in Section 3.0.5, *Approach to Cumulative Impacts*, would occur within the transportation study area. Construction or operation of future projects, programs, and plans could overlap with the 15-year construction schedule that Seismic Retrofit components and Conservation Measures construction would occur. Construction of the Project could create significant emergency access impacts even with implementation of BMP TR-1, but **Mitigation Measures PS-1 and WF-1** would reduce the Project's impacts to less than significant levels. In combination with construction or operation occurring at the same time from probable future projects, plans, and programs in the Project vicinity, emergency access cumulative impacts would be significant, and the Project's contribution to these impacts would be cumulatively considerable pre-mitigation, but not cumulatively considerable post-mitigation.

Significance Conclusion Summary

Valley Water would reduce the Project's incremental contribution to cumulative impacts on inadequate emergency access through implementation of **Mitigation Measures PS-1** and **WF-1**. With implementation, construction of the Project would not create inadequate emergency access. The Project's contribution to cumulative emergency access impacts is **not cumulatively considerable**.

Mitigation Measures

PS-1 Prepare and Implement ~~Construction~~ Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy ~~Emergency Action Plan~~

3.20 Tribal Cultural Resources

This section describes the impacts of the Project on tribal cultural resources. Tribal cultural resources are sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe. CEQA requires that agencies considering projects that are subject to discretionary action consider the impacts on tribal cultural resources that may occur from project implementation (see Section 21084.2 and Appendix G of the *CEQA Guidelines*).

This section describes existing tribal cultural resources conditions within the Seismic Retrofit component and the Conservation Measures component areas based on the existing conditions at the time of Draft EIR preparation modified by the FOCP implementation. Project construction analyses are based on this baseline. However, the analyses for Project operations are based on the Pre-FERC Order Conditions Baseline. Significant adverse impacts that could result from Project implementation are described, and mitigation measures to reduce these impacts to less-than-significant levels are identified, as appropriate.

This section relies on the information and findings presented in a series of cultural resources technical reports (see Section 3.20.1 for additional details). These reports detail the methods and results of the cultural resources studies for the Project and associated environmental, ethnographic, and historic background of the Project study area, emphasizing aspects of human occupation. These reports contain information regarding indigenous archaeological resources that may also qualify as tribal cultural resources. Due to the confidential nature of archaeological site locations, as regulated by applicable state regulations (California Government Code Section 6250 et seq. and Section 6254 et seq. [implementing regulations of the California Public Records Act of 2016]), these reports are provided in ~~a~~ confidential Appendix H ~~appendix~~. This confidential appendix is available to qualified individuals upon request to Valley Water.

Study Area for Tribal Cultural Resources

The tribal cultural resources study area for the Project is designed to include all elements of Project construction and operations, and to encompass all tribal cultural resources that could be impacted by the Project. The study area is comparable to that for cultural resources shown in **Figure 3.6-1**. For the purposes of this impact analysis, the study area has been broken down into two regions based upon Project impacts: the Seismic Retrofit study area and the Conservation Measures study area. The Conservation Measures study area has been further split according to each Conservation Measure: Ogier Ponds Geomorphic and Habitat Enhancement (Ogier Ponds CM), Phase 2 Coyote Percolation Dam Fish Passage Enhancements (Phase 2 Coyote Percolation Dam CM), and the Maintenance of the North Channel Reach ~~Extension~~.

The Maintenance Activities at Live Oak Restoration Reach and Sediment Augmentation Program, and subsequent adaptive management actions, are not included in the tribal cultural resources study area, nor in the analysis for tribal cultural resources, as the actions would be contained within portions of Coyote Creek that would be covered under other Project elements. The quarries for sediment, haul roads, and staging areas that would be used to implement the Maintenance Activities at the Live Oak Restoration Reach and Sediment Augmentation Program would also be used for both the construction of the Seismic Retrofit component and the

Conservation Measures. Therefore, the use of those quarries and haul roads will be analyzed under the relevant Project components.

The study area for the Seismic Retrofit component covers approximately 1,530 acres, including the reservoir pool, the Anderson Dam, and those portions of the Project Area below the dam, as shown in **Figure 3.6-1** and described in Section 3.6.1. The study areas acreages associated with individual Conservation Measures include approximately 398 ~~432~~ acres for the Ogier Ponds CM (including the staging area), 2 acres for Maintenance of the North Channel Reach ~~Extension~~, and approximately 8 acres for the Phase 2 Coyote Percolation Dam CM.

3.20.1 Environmental Setting

This section describes the methods and results of the cultural resources records search and literature review, pedestrian survey, and Native American consultation used to gather data about the tribal cultural resources identified within the Project Area. These data are fundamental to the analyses undertaken to evaluate the Project's potential to impact tribal cultural resources. Information provided in this section is derived or taken directly from the following technical reports prepared ~~by Far Western Anthropological Research Group (Far Western)~~ in support of the Project (note, all of these are provided in the confidential Appendix H):

- Rincon Consultants, Inc. 2024. Cultural Resources Study for the Live Oak Restoration Reach Project. Report on file with the Santa Clara Valley Water District, San José, California.

The Project Area is in the ancestral territory of the Ohlone/Costanoan peoples. The Ohlone occupied a large geographic area, which extended along the Pacific Coast from south of Monterey Bay north to the tip of the San Francisco Peninsula, and inland to include the eastern shore of the San Francisco Bay and into the Coast Ranges. The Project Area is located at the boundary of two language groups, the San Francisco Bay Costanoan and Awaswas, and is in the ancestral territory of the Auxentac and Matalan Ohlone. Additional information on the Ohlone is provided in Section 3.6.2.1. Modern-day Ohlone/Costanoans are represented by a number of Tribes within the larger Ohlone/Costanoan ancestral territory. Valley Water reached out to and consulted with Tribes in the study area, as discussed below.

3.20.1.1 Native American Consultation

Valley Water sent an email request to the California NAHC on March 22, 2018, to review its files for the presence of recorded sacred sites within the Project study area. The NAHC responded on April 10, 2018, stating that their search indicated that there were no Native American sacred sites identified in the immediate Project vicinity. They also provided a list of six Native American contacts with a traditional and cultural affiliation to the study area who may have knowledge of, or concerns about, cultural resources that could be affected by the Project.

The Project NOP (of an EIR) was filed in August 2013, two years before AB 52 was applicable to new projects. As a result, Valley Water did not send Project notification letters to, or enter into formal consultation with, California Native American Tribes pursuant to AB 52 (PRC Section 21080.3.1). However, Valley Water engaged the Tribes identified by the NAHC in informal consultation in accordance with the procedures included in with the same intent as AB 52. Valley Water sent letters via U.S. Postal Service to each Native American contact on the NAHC list on April 20, 2018, requesting their input on the Project. Valley Water also followed up by email on April 23, 2018. Subsequent phone calls were made by Far Western in May 2018. The contacted Tribes were:

- Amah Mutsun Tribal Band
- Amah Mutsun Tribal Band of Mission San Juan Bautista
- Indian Canyon Mutsun Band of Costanoan
- Muwekma Ohlone Indian Tribe of the SF Bay Area
- North Valley Yokuts Tribe
- Ohlone Indian Tribe

The Amah Mutsun Tribal Band of Mission San Juan Bautista, Muwekma Ohlone Indian Tribe of the San Francisco Bay Area, and North Valley Yokuts Tribe requested to be kept informed of the Project and stated that a Native American monitor should be present for subsurface investigations. The Indian Canyon Mutsun Band of Costanoan similarly recommended that any earth-moving activities have both a Native American and archaeological monitor present and requested to be kept informed. Valley Water has continually kept these Tribes up to date by providing copies of all documents pertaining to Native American archaeological resources and including Tribal representatives during archaeological excavations (Buonasera et. al. 2022, Scher and Younie 2020). Furthermore, as described in **Mitigation Measure CR-2** in Section 3.6, Tribal monitors will be retained for any subsequent archaeological excavations and for Project ground-disturbing activities in sensitive areas.

Andrew Galvan of the Ohlone Indian Tribe noted that the Project is located in an important area with known burials nearby, and that he was acting as the Most Likely Descendant for a separate project south of Cochrane Road. Valley Water and Mr. Galvan held an in-field meeting on June

20, 2018, and Mr. Galvan recommended minimizing ground disturbance to prevent future Project delays, including avoiding digging up existing pavement in the area downstream of the dam. He also requested a pedestrian survey of Coyote Creek to look for remains that may have been exposed after scouring high flows that occurred in February 2017. Mr. Galvan's recommendations were followed during cultural resource studies completed in 2019 (Scher and Younie 2020).

Chairperson Lopez of the Amah Mutsun Tribal Band requested Tribal involvement, which led to an in-field meeting on July 5, 2018, between Valley Water and Chairperson Lopez. Valley Water continued discussions with Chairperson Lopez and entered into an agreement with the Amah Mutsun Tribal Band in May 2019 for monitoring services during Far Western's subsurface testing that was described in Section 3.6.2.2. Tribal monitors were also present during the NRHP/CRHR evaluation studies conducted at archaeological sites in Anderson Reservoir in 2020 (Scher et al. 2022).

In preparation for studies of the Conservation Measure components, a second request was made to the NAHC on September 6, 2022, for a search of the sacred lands files and for an updated list of Tribal contacts who are affiliated with the area of the Conservation Measure components. The response from the NAHC on October 11, 2022, indicated that no sacred sites had previously been recorded in the areas of the proposed Conservation Measure components. The NAHC list of Tribes associated with the area included those listed above (though some of the contact names had changed) in addition to the following two others:

- Tamien Nation
- Wuksache Indian Tribe/Eshom Valley Band

On behalf of Valley Water, Far Western sent letters to each of the individuals on the updated NAHC contact list on November 8, 2022. The letters provided a detailed explanation of each of the Conservation Measures components and invited the Tribes to provide comments or express concerns about potential impacts to tribal resources. No responses have been received from the contacted Tribes as of the time of the EIR publication.

<u>Rincon contacted the NAHC on May 29, 2024 and July 24, 2024, to request a Sacred Lands File (SLF) search for the staging areas. On July 9 and August 7, 2024, the NAHC responded stating the results of the SLF search were negative.</u>

3.20.1.2 Identified Tribal Cultural Resources

PRC Section 21074(a)(1) defines tribal cultural resources as sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe that meet certain criteria. As noted below in Section 3.20.3.2, the criteria for recognition as a tribal cultural resource include formal listing in the CRHR or a local historical register. A lead agency may also apply the CRHR eligibility criteria, supported by substantial evidence, and use its discretion to determine that a resource is a tribal cultural resource.

Previous work undertaken by Valley Water in the region, including the Pacheco Reservoir Expansion Project, has found that the Ohlone are unified in their desire to preserve those elements of the traditional Ohlone lifeway still visible on the landscape, such as archaeological deposits from villages and camps, spiritual and ceremonial locales, and particularly, burial sites (Milliken et al. 2009, Reddy 2021).

Other kinds of resources of cultural significance to the Ohlone include sites that contain cupules (circular indentations) or linear grooves carved into rock outcrops (Hector 2009), which are associated with a spiritual or ceremonial purpose for California indigenous populations. Pictographs, which are painted images on rock, have a similar association. Dance houses and sweat lodges, where spiritual or ceremonial activities took place, are also important representations of that aspect of Ohlone culture. These kinds of sites with sacred elements are considered to be tribal cultural resources eligible for listing in the NRHP/CRHR for the purposes of this EIR; however, none of these resource types have been identified in the Project area, and therefore impacts to these resources are not evaluated in the EIR.

Anderson Lake occupies portions of the watersheds of Coyote and Animas creeks. Watersheds can sometimes be viewed as tribal cultural landscapes that contain a variety of resource types that reflect aspects of Native American lifeways, such as villages and camps, and spiritual and ceremonial locales. Alternately, a watershed may reflect a landscape that is the focus of a particular resource procurement activities, such as containing oak groves maintained by tribal groups or fisheries. However, landscapes must maintain integrity, which is defined by 14 CCR Section 24 4852(c) as having the ability to convey the authenticity of its physical identity evidenced by the survival of characteristics that existed during the resource's period of significance. Because the filling of Anderson Lake has diminished the integrity of this portion of the watershed by eliminating vegetation and covering cultural sites with water, it can no longer invoke the original qualities that might contribute to the identification of a tribal cultural landscape. Nevertheless, a Tribe may have different criteria for identifying a landscape as significant; however, consulting Tribes did not identify the area of Anderson Lake, or any other areas within the Project Area, as a tribal cultural landscape and, therefore, this resource type in not further evaluated in the EIR.

The results of the NWIC record searches[1] (see Section 3.6.2.2) and discussions with contacted Tribes identified the potential presence of human burials within the Project study areas. Because consulting Tribes have voiced concern about sites with human remains, such resources may be eligible for inclusion in the NRHP and CRHR for the purposes of this EIR and, therefore, meet the criteria for tribal cultural resources pursuant to PRC Section 21074(a)(1)(A). Sites with midden deposits (soils rich in organics from human occupation), which generally reflect habitation of long or repetitive periods of time, often, but not always, have a greater potential for human remains. Because of the potential to contain human burials, sites with midden deposits are considered tribal cultural resources for the purposes of this EIR.

Individual Tribes that were contacted did not identify any specific tribal cultural resources within the study areas, other than the previously mentioned potential for human remains. However, based on the cultural resources studies that have been conducted over the years for the Project, there are numerous archaeological sites within the Seismic Retrofit and Conservation Measures components areas that meet the criteria of tribal cultural resources for the purposes of this EIR. There are also additional sites that have the potential to meet those criteria, but those sites have not yet been thoroughly studied (i.e., evaluated for NRHP/CRHR-eligibility) and may reveal

[1] The NWIC record search identified site P-43-000364/CA-SCL-00358, a site that contained human burials, as being within the Seismic Retrofit Project Area downstream of Anderson Dam. As reported in Section 3.6, *Cultural Resources*, the site was not relocated in the Project Area during the pedestrian survey, nor during subsurface archaeological exploratory trenching. Because no pre-contact materials were identified in the Seismic Retrofit Project Area, the boundary of P-43-000364 was redrawn to restrict the site to the south of Cochrane Road and outside of the Project limits. Because the site was determined to be outside of the Project Area, it has been eliminated from further discussion in the EIR.

the presence of midden or human remains. Furthermore, even if these sites do not contain midden deposits or human remains, they may reveal other qualities that would qualify them as tribal cultural resources. Valley Water has, therefore, used its discretion to determine that previously unevaluated Native American pre-contact archaeological sites are considered tribal cultural resources for the purposes of this EIR. All recorded archaeological sites within the Project Area are listed in **Tables 3.6-3** and **3.6-4** in Section 3.6. The 11 resources that meet the criteria for tribal cultural resources, as defined for this EIR are presented in **Table 3.20-1** and discussed below.

Table 3.20-1. Archaeological Sites Treated as Tribal Cultural Resources in the Project Area

Resource Identifier	Description	NRHP/CRHR Eligibility*	Location	Comments/Potential Impacts
Seismic Retrofit Component Study Area				
P-43-001090	Multi-component; lithic scatter, water trough	Not Eval	Reservoir inundation area, in construction zone	In construction zone, within stockpile area . Reservoir fluctuation during Project operations.
P-43-001094	Multi-component Ground and flaked stone scatter, midden, sparse historic-era refuse	E**	Reservoir inundation, outside of construction zone	Not in construction zone. Reservoir fluctuation during Project operations.
P-43-004083	Pre-contact midden, lithic scatter, human remains	E	Reservoir inundation, outside of construction zone	Not in construction zone. Reservoir fluctuation during Project operations.
P-43-004085	Multi-component Midden/lithic scatter/human remains/ranching	E	Reservoir inundation, in construction zone	In construction zone, adjacent to stockpile area. Reservoir fluctuation during Project operations.
AD-2022-03	Multi-component; Historic-era and Pre-contact artifacts; may be the Pomeroy Adobe	Not Eval	Reservoir inundation, in construction zone	In construction zone, within stockpile area. Reservoir fluctuation during Project operations. May be the Pomeroy Adobe.
AD-2022-04	Pre-contact quarry	Not Eval	Reservoir inundation, outside of	Not in construction zone. Reservoir fluctuation during Project operations.

Resource Identifier	Description	NRHP/CRHR Eligibility*	Location	Comments/Potential Impacts
			construction zone	
AD-2022-05	Pre-contact; ground stone and flaked lithics	Not Eval	Reservoir inundation, in construction zone	In construction zone. Reservoir fluctuation during Project operations.
AD-2022-06	Pre-contact quarry	Not Eval	Reservoir inundation, in construction zone	In construction zone, slight overlap of stockpile area. Reservoir fluctuation during Project operations.
Conservation Measures Component Study Area				
P-43-000176	Multi-component	Not eval	Ogier Ponds	Development of floodplain along Coyote Creek
P-43-001001	Pre-contact	Not eval	Ogier Ponds	In Conservation Measure footprint but no impacts identified
P-43-000189	Pre-contact with human remains	E	Coyote Percolation Dam	Under access road

Source: Buonasera et al. 2022, Izzi and Siskin 2023, Scher and Younie 2020

**Sites that have not been evaluated are assumed to be NRHP/CRHR-eligible and are treated as tribal cultural resources in this EIR.*

*** Site P-43-001094 was originally evaluated as not eligible, but the 2022 study (Buonasera et al. 2022) suggests evaluation should be reconsidered due to discovery of midden deposit.*

Seismic Retrofit Study Area

Eight pre-contact archaeological sites (P-43-001090, P-43-001094, P-43-004083, P-43-004085, AD-2022-03, AD-2022-04, AD-2022-05, AD-2022-06) within the Seismic Retrofit component area are considered tribal cultural resources for the purposes of this EIR. All of them are within the reservoir inundation area, and five of them (P-43-001090, P-43-004085, AD-2022-03, AD-2022-05, AD-2022-06) are also in or near construction areas.

Three pre-contact archaeological sites with midden deposits (P-43-001094, P-43-004083, P-43-004085) are located within the reservoir inundation area. Two of the sites (P-43-001094, P-43-004083) are outside of the construction area for the Seismic Retrofit component; the third (P-43-004085) is within the construction area. All three sites are in the Seismic Retrofit operations inundation zone. Each site was evaluated for NRHP/CRHR-eligibility (Scher et al. 2022). Human remains were identified at two of the sites (P-43-004083, P-43-004085) and, thus, the sites were recommended eligible, while the third site (P-43-001094) was recommended not eligible. However, P-43-001094 was later revisited and a midden deposit discovered, which suggests that the site could be considered an eligible resource (Buonasera et al. 2022). As a result, the three sites are all considered tribal cultural resources for the purpose of this EIR.

Three pre-contact archaeological sites (AD-2022-04, AD-2022-05, AD-2022-06) and two multi-component sites (P-43-001090, AD-2022-03) within the reservoir inundation area have not yet been evaluated for NRHP/CRHR-eligibility. None of these sites were observed to contain midden deposits or human remains, but they contain flaked-stone and ground-stone artifacts, or quarry materials. While these sites do not appear to be tribal cultural resources (i.e., they do not contain midden or human remains), they may contain other elements that would be considered significant, and until the sites are evaluated, they are assumed eligible for the NRHP/CRHR and treated as tribal cultural resources for the purpose of this EIR.

Conservation Measures Study Areas

Two previously recorded archaeological sites within the study area for the Ogier Ponds CM have the potential to be tribal cultural resources. One site, P-43-000176, is a multi-component site and contains both pre-contact and historic-era materials; recorded pre-contact artifacts are limited to several shell fragments and one flake of an undetermined material. The second resource, P-43-001001, is a pre-contact site that contains a flake scatter and midden deposit. Neither site has been evaluated for NRHP/CRHR-eligibility (Izzi and Siskin 2023 ~~2022~~). Because the nature of P-43-000176 is largely unknown and P-43-001001 contains a midden deposit, both sites are considered tribal cultural resources for the purpose of this EIR.

Two pre-contact archaeological sites, P-43-000189 and P-43-001814, the former a large occupation site with human remains, had previously been recorded within the Phase 2 Coyote Percolation Dam CM study area. P-43-000189 contained human remains, was previously determined eligible for listing in the NRHP/CRHR and is considered a tribal cultural resource for the purpose of this EIR. The site is primarily beneath US 101. A pedestrian archaeological survey of the Phase 2 Coyote Percolation Dam~~e~~ CM area did not reveal the presence of cultural materials at the recorded site location (Izzi and Siskin 2023 ~~2022~~). Materials recorded at P-43-001814 included a scatter of stone tools and flakes from tool manufacture, but there was no evidence of the site during the cultural pedestrian survey. Although P-43-001814 has not been formally evaluated for NRHP/CRHR, data from the NWIC record search indicated the site was thoroughly destroyed by previous excavation of one of the ponds within the Ogier Ponds CM. Because human remains or midden were not previously recorded at site P-43-001814, and because it has been completely destroyed by various ground-disturbing activities, it is assumed to be not eligible for the NRHP/CRHR and is not considered a tribal cultural resource under this EIR.

No cultural resources were identified within the Maintenance of the North Channel Reach ~~Extension~~ area, either by the records searches or through pedestrian survey; therefore, there are no known tribal cultural resources associated with this Conservation Measure.

3.20.2 Regulatory Setting

3.20.2.1 Federal Laws, Regulations, and Policies

National Historic Preservation Act

Federal law does not address tribal cultural resources, as these resources are defined in the PRC. However, similar resources, called traditional cultural places (TCP), fall under the purview of Section 106 of the NHPA, as described in Section 3.6, *Cultural Resources*. TCPs are locations of cultural value that are historic properties (i.e., eligible for listing in the NRHP). A place of cultural value is eligible as a TCP "because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community" (National Park Service 2022). A TCP must be a tangible property, meaning that it must be a place with a referenced location, and it must have been continually a part of the community's cultural practices and beliefs for the past 50 years or more. Unlike tribal cultural resources, TCPs can be associated with communities other than Native American Tribes, although the resources are often associated with Tribes. By definition, TCPs are historic properties; that is, they meet the eligibility criteria as a historic property for listing in the NRHP. Therefore, as historic properties, TCPs must be treated by federal agencies according to the NHPA implementing regulations found under Title 36 CFR Part 800, as amended in 2001.

3.20.2.2 State Laws, Regulations, and Policies

Assembly Bill 52

AB 52 (Statutes of 2014, Chapter 532) applies to all projects that file an NOP or notice of a Negative Declaration on or after July 1, 2015. The bill requires that a lead agency begin consultation with a California Native American Tribe if that Tribe has requested, in writing, to be kept informed of proposed projects by the lead agency, prior to the determination whether a Negative Declaration or EIR will be prepared. The bill also specifies mitigation measures that may be considered to avoid or minimize impacts to tribal cultural resources.

AB 52 focuses on the identification and protection of "tribal cultural resources." PRC Section 21074 defines "Tribal Cultural Resources" as:

(a)(1) Sites, features, places, cultural landscapes, sacred places and objects with cultural value to a California Native American tribe that are either of the following:

- (A) Included or determined to be eligible for inclusion in the California Register of Historical Resources; or
- (B) Included in a local register of historical resources as defined in subdivision(k) of Section 5020.1.

(a)(2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

Tribal cultural resources are further defined under PRC Section 21074 as follows:

(b) A cultural landscape that meets the criteria of subdivision (a) is a TCR to the extent that the landscape is geographically defined in terms of the size and scope of the landscape; and,

(c) A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a "nonunique archaeological resource" as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Formal AB 52 tribal consultation for this EIR was not required because Valley Water filed the Project NOP in August 2013. However, as documented in this section, Valley Water has consulted with Tribes that may be affected by the Project, consistent with CEQA requirements. The impact analysis considers whether implementation of the Project would result in significant impacts to tribal cultural resources pursuant to the applicable significance criteria in Appendix G of the *CEQA Guidelines*.

California Health and Safety Code Section 7070.5 and Public Resources Code Section 5097.98

These laws, which govern the discovery of human remains, including procedures for Native American human remains, are described in Section 3.6, *Cultural Resources*.

3.20.2.3 Local Laws, Regulations, and Policies

None of the local agencies associated with the Project (County, City of Morgan Hill, City of San José) have laws, regulations, or policies that specifically address tribal cultural resources. However, both the City of Morgan Hill and the City of San José require work stoppage if human burials are encountered during construction and provide protocols for addressing archaeological resources. Local regulations pertaining to archaeological resources and human remains for the County, City of Morgan Hill, and City of San José are listed in Section 3.6.3.3, *Local Regulations* of Chapter 3.6, *Cultural Resources*.

3.20.3 Methodology and Approach to Impact Analysis

The impact analysis considers whether implementation of the Project would result in significant impacts to tribal cultural resources pursuant to the applicable significance criteria in Appendix G of the *CEQA Guidelines* (see Section 3.20.3.2). Specifically, the impact analysis considers the effects of Seismic Retrofit Project construction, as well as the effects of Seismic Retrofit Project post-construction operations and maintenance. The analysis also considers the effects of Conservation Measures incorporated into the Project, including both construction and post-construction operations and maintenance. As described in Section 3.0, the baseline for evaluating Seismic Retrofit and Conservation Measures construction is the existing conditions at the time of the EIR preparation modified by the FOCP implementation. However, for both the Seismic Retrofit and the Conservation Measures components, the baselines for evaluating post-construction operations and maintenance effects include the Pre-FERC Order Conditions Baseline (based on the 2015 WEAP model) which is also described in Section 3.0.

Construction monitoring impacts are not analyzed, as monitoring is focused on water temperature and quality, groundwater, fisheries, and various other biological species, as discussed in Chapter 2, *Project Description*. Such activities would not cause any ground disturbance or result in direct or indirect adverse impacts to tribal cultural resources under baseline conditions.

Similarly, adaptive management strategies under the FAHCE program are not analyzed, because resources subject to adaptive management are within Coyote Creek and such strategies would largely comprise non-ground-disturbing activities or would be in areas analyzed for other Project components. Geoarchaeological studies (Scher and Younie 2020) for the Project indicated that areas along Coyote Creek where these Conservation Measures would be implemented are not sensitive for buried cultural resources, which could potentially qualify as tribal cultural resources; however, should unknown archaeological materials (which may qualify as tribal cultural resources) be uncovered during Conservation Measures components implementation, these would be addressed according to mitigation measures included herein. Should the results of future adaptive management studies lead to infrastructure improvements, these improvements could require additional CEQA assessment and other regulatory approvals, and additional tribal cultural resources studies and coordination with California Native American Tribes would take place at that time, as necessary.

3.20.3.1 Seismic Retrofit Component Construction

This impact analysis considers the potential for construction of the Seismic Retrofit component to have significant adverse impacts to tribal cultural resources. The location and nature of Seismic Retrofit construction activities are considered in the context of known tribal cultural resources and the potential for discovering buried resources that could be tribal cultural resources. The potential for Seismic Retrofit component construction to result in significant impacts to tribal cultural resources is evaluated.

3.20.3.2 Conservation Measures Component Construction

This impact analysis considers the potential for construction of the Conservation Measures component to cause significant adverse impacts to tribal cultural resources. The location and nature of Conservation Measures construction activities are considered in the context of known tribal cultural resources and the potential to discover buried tribal cultural resources. The potential for Conservation Measures construction to result in significant impacts to tribal cultural resources is evaluated. Conservation Measures requiring construction activities that are evaluated in the impact analysis include:

- Ogier Ponds CM
- <u>Maintenance of the</u> North Channel <u>Reach</u> ~~Extension~~
- Phase 2 Coyote Percolation Dam CM

The Maintenance Activities at Live Oak Restoration Reach and Sediment Augmentation Program are not analyzed as these activities would be contained within Coyote Creek and would not include any ground disturbance that could impact tribal cultural resources. Adaptive management actions identified under the FAHCE program are also not addressed as they would not result in any ground-disturbing activities that could impact tribal cultural resources. Should the results of future adaptive management actions lead to infrastructure improvements that require additional CEQA assessment and other regulatory approvals, additional tribal cultural resources analyses would take place, as necessary.

3.20.3.3 Post-Construction Anderson Dam Facilities Operations and Maintenance

This impact analysis considers the potential for post-construction operations of the Seismic Retrofit components to result in significant adverse impacts to tribal cultural resources. The post-construction operations element of the Project would involve the refilling of Anderson Reservoir, and the continued rise and fall of water levels within the reservoir due to natural causes and planned water releases. The resumption of recreational power boating would also have potential impacts on tribal cultural resources due to wave action. The potential for post-construction Anderson Dam Facilities operations to result in significant impacts to tribal cultural resources are evaluated.

Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain the newly retrofitted Anderson Dam and Reservoir per Valley Water's existing DMP. DMP activities were evaluated previously in the DMP Final Program EIR prepared in January 2012 (SCH No. 2011082077; Valley Water 2012). Dam maintenance activities would be restricted to built environment features and would not impact tribal cultural resources. For these reasons, post-construction dam facility maintenance activities are not discussed further in this section.

3.20.3.4 Post-Construction Conservation Measures Operations and Maintenance

The baseline for evaluating post-construction operation and maintenance effects for the Seismic Retrofit component and Conservation Measures component is the Pre-FERC Order Conditions Baseline. Conservation Measures post-construction operations and maintenance impacts are not addressed because they would not impact tribal cultural resources once these facilities are constructed. This is because all areas of post-construction operations and maintenance would occur in areas impacted by construction of the Conservation Measure components, and no ongoing disturbance would be required; therefore, any potential impacts to tribal cultural resources would have occurred at that time.

3.20.3.5 Post-Construction Project and FAHCE Adaptive Management

The Project and FAHCE AMP would guide post-construction adaptive management of Project flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform a selection of adaptive management measures to implement in response to management triggers and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). Impacts of these monitoring activities are/are not evaluated in the impact analysis because they are not the types of activities that would reasonably be anticipated to have the potential to impact tribal cultural resources, as they would not include ground-disturbing activities.

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from original Conservation Measure construction. Impacts of these adaptive actions are not evaluated in the impact analysis because, as noted above, such actions would occur within Coyote Creek and largely comprise non-ground-disturbing activities or be in areas analyzed for other Project components. These areas are not sensitive for buried archaeological resources, which could qualify as tribal cultural resources; however, should unknown archaeological materials be uncovered during Conservation Measures components implementation, these would be addressed according to mitigation measures included herein.

3.20.3.6 Applicable Best Management Practices and VHP Conditions

There is one Valley Water BMP that is applicable to the protection of archaeological resources and human remains, both of which could qualify as tribal cultural resources, and is described below.

BMP CU-1 Accidental Discovery of Archaeological Artifacts or Burial Remains

If historical or unique archaeological artifacts are accidentally discovered during construction, work in affected areas will be restricted or stopped until proper protocols are met. Work at the location of the find will halt immediately within a 30-foot radius. A “no work” zone will ~~shall~~ be established utilizing appropriate flagging to delineate the boundary of this zone. A Consulting Archaeologist will visit the discovery site as soon as practicable for identification and evaluation pursuant to Section 21083.2 of the PRC, and Section 15126.4 of the CCR. If the archaeologist determines that the artifact is not significant, construction may resume. If the archaeologist determines that the artifact is significant, the archaeologist will determine if the artifact can be avoided and, if so, will detail avoidance procedures. If the artifact cannot be avoided, the archaeologist will develop an action plan within 48 hours which will include provisions to minimize impacts and, if required, a Data Recovery Plan for recovery of artifacts in accordance with PRC Section 21083.2 and Section 15126.4 of the *CEQA Guidelines*.

If burial finds are accidentally discovered during construction, work in affected areas will be restricted or stopped until proper protocols are met. Upon discovering any burial site as evidenced by human skeletal remains, the County Coroner will be immediately notified. The field crew supervisor will ~~shall~~ take immediate steps to secure and protect such remains from vandalism during periods when work crews are absent. No further excavation or disturbance within 30 feet of the site or any nearby area reasonably suspected to contain adjacent remains may be made except as authorized by the County Coroner, California NAHC, and/or the County Coordinator of Indian Affairs.

There are no relevant VHP conditions that would apply to tribal cultural resources.

3.20.3.7 Thresholds of Significance

Based on guidance from the *CEQA Guidelines* Appendix G, implementation of the Seismic Retrofit component and Conservation Measures component would have significant impacts on tribal cultural resources they would:

- Cause a substantial adverse change in the significance of a tribal cultural resource listed or eligible for listing in the CRHR or determined by Valley Water to be significant.

3.20.4 Impact Analysis

***Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource listed or eligible for listing in the California Register of Historical Resources or determined by Valley Water to be significant* (Less than significant with mitigation)**

Seismic Retrofit Construction

Eight Native American pre-contact archaeological sites (P-43-001090, P-43-001094, P-43-004083, P-43-004085, AD-2022-03, AD-2022-04, AD-2022-05, AD-2022-06) have been identified within the reservoir pool of the Seismic Retrofit component area and are treated as tribal cultural resources **Table 3.20-1**). Three of these resources (P-43-001094, P-43-004083, P-43-004085) have been evaluated and either determined or recommended eligible for the NRHP/CRHR. Two of these sites (P-43-004083, P-43-004085) contain midden deposits and human remains, while the third (P-43-1094) is a midden deposit without human remains. The additional five sites (P-43-001090, AD-2022-03, AD-2022-04, AD-2022-05, AD-2022-06) in the reservoir footprint have not yet been formally evaluated. For the purpose of this analysis, these five sites are considered eligible for listing in the NRHP and CRHR and are, therefore, tribal cultural resources.

Five of the tribal cultural resources (P-43-001090, P-43-004085, AD-2022-03, AD-2022-05, AD-2022-06) are within the Seismic Retrofit construction area[2] Three of the resources (P-43-001090, AD-2022-03, AD-2022-06) are in areas identified for stockpiling soil during construction and would be directly impacted by the Project. The placement of stockpile areas, which require ground preparation such as grading, on the identified tribal cultural resources, in addition to other related impacts from Seismic Retrofit component construction activities (i.e., access or haul roads), may cause substantial adverse changes to the significance of these resources.

One resource (P-43-004085) is located in the reservoir footprint adjacent to a proposed soil stockpile area that has been designed to avoid the site; thus, the Project will have no impact on this tribal cultural resource. AD-2022-05, while located in the Project construction area, is located outside of any construction-related activities and would not be impacted by the Project.

The construction of the Seismic Retrofit component would result in a large amount of ground disturbance for a duration of 5 years, and over a large area at the dam, just downstream of the dam, and within the reservoir, as discussed in the table of Seismic Retrofit components found in **Table 2-1** and detailed in Section 2.5 of *Project Description*. Ground-disturbing activities would range from the preparation of construction staging/stockpiling/borrow areas and access roads, to dam excavation and reconstruction, road realignments, and installation of infrastructure such as pipelines, electric power lines, and fiber optic telecommunication lines. Archaeological resources that could be tribal cultural resources are not always visible on the ground surface, and human burials, midden deposits, or other items considered sacred to Native American Tribes may be unearthed during the construction of the Seismic Retrofit component. The inadvertent discovery of and damage to such resources may result in a substantial adverse change in the significance of a tribal cultural resource.

[2] The Seismic Retrofit construction area (519 acres) within Anderson Reservoir is smaller than the Seismic Retrofit Project Area (1142 acres).

To reduce this impact, Valley Water will implement BMP CU-1 Accidental Discovery of Archaeological Artifacts or Burial Remains, which will reduce impacts of inadvertent discoveries of archaeological and human remains that may be considered tribal cultural resources during the Seismic Retrofit component construction activities.

Based on the above analysis, impacts to known and undiscovered tribal cultural resources would be significant. Implementation of **Mitigation Measure CR-1** (Pre-construction Cultural Resources Awareness Training) will require that construction workers be made aware of the protocols to follow if human remains, or any other artifacts of Native American pre-contact origin, are discovered during construction. **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment Plan for Historical Resources that Cannot be Avoided) will require the preparation of a Data Recovery and Treatment Plan for known tribal cultural resources that cannot be avoided by construction. The Data Recovery and Treatment Plan would be developed in consultation with Tribes who have consulted with Valley Water on the Project. **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will provide details for monitoring and addressing discoveries of human remains and other Native American materials in a Monitoring and Unanticipated Discoveries Plan that would be prepared in consultation with Project consulting Tribes. Implementation of these mitigation measures will therefore reduce impacts to tribal cultural resources to less than significant with mitigation for the Seismic Retrofit construction component of the Project.

Conservation Measures Construction

Two archaeological sites (P-43-000176, P-43-001001), with pre-contact Native American materials, are recorded as located within the Ogier Ponds CM footprint; however, only one of the sites (P-43-000176) may be impacted by the construction of the floodplain as part of the Ogier Ponds CM along Coyote Creek. The exact location of this site within the Ogier Ponds CM construction area has not yet been confirmed due to a lack of access caused by high-water levels in Coyote Creek at the time of fieldwork. Furthermore, the site has not been evaluated for NRHP/CRHR-eligibility. It is, therefore, assumed that P-43-000176 is eligible and, thus, a tribal cultural resource for the purposes of this EIR. Construction of the floodplain under this Conservation Measure may result in a substantial adverse change in the significance of the resource. P-43-001001, while in the Ogier Ponds CM footprint, is outside any planned construction activities and would not be impacted by the Project.

One pre-contact site, P-43-000189, within the area of the Phase 2 Coyote Percolation Dam CM, is recorded as having contained human remains and has previously been determined eligible for the NRHP/CRHR; it is, therefore, considered a tribal cultural resource for the purpose of this EIR. The site is, however, largely beneath US 101 and only an edge of the site is recorded within the Phase 2 Coyote Percolation Dam CM area. A pedestrian survey did not discover any surface evidence of the recorded site, and an existing access road crosses over the site. No modifications to this road are proposed during project construction, and therefore, there would be no impact to P-43-000189.

Each of the proposed Conservation Measures (Ogier Ponds CM, Phase 2 Coyote Percolation Dam CM, and Maintenance of the North Channel Reach ~~Extension~~) would involve ground-disturbing activities which may uncover buried pre-contact deposits with human remains and/or midden deposits that may be tribal cultural resources. Should this occur, unknown tribal cultural resources could be significantly impacted by Conservation Measure construction.

Implementation of BMP CU-1, Accidental Discovery of Archaeological Artifacts or Burial Remains, would reduce impacts from construction related inadvertent discoveries of archaeological and human remains that could be considered tribal cultural resources.

Based on the above analysis, impacts to known and undiscovered tribal cultural resources would be significant **Mitigation Measure CR-1** (Pre-construction Cultural Resources Awareness Training) will require that construction workers are instructed about the sensitivity of discovering human remains and the protocols to be followed should they be discovered. Under **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment Plan for Historical Resources that Cannot be Avoided) a Data Recovery and Treatment Plan would be developed to address tribal cultural resources that cannot be avoided during construction. Protocols for monitoring and measures for addressing the inadvertent discovery of human remains and other Native American materials would also be specified in a Monitoring and Unanticipated Discoveries Plan prepared through **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan). These mitigation measures will minimize the impacts to tribal cultural resources to less than significant with mitigation for the Conservation Measures component.

Post Construction Anderson Dam Facilities Operations and Maintenance

Post Construction Operations of the reservoir water storage levels may impact the eight known tribal cultural resources (P-43-001090, P-43-001094, P-43-004083, P-43-004085, AD-2022-03, AD-2022-04, AD-2022-05, AD-2022-06) that are archaeological sites within the reservoir.

Overall, post-construction operations of the reservoir would be largely similar to the Pre-FERC Order Conditions Baseline, with the addition of FAHCE rule curves and pulse flows and a higher reservoir elevation due to lifting of Pre-FERC Order ~~seismic~~ restrictions~~.~~ The initial re-filling of the reservoir and future fluctuating water levels may result in erosion to archaeological sites that are considered to be tribal cultural resources. As water levels rise and fall up to maximum reservoir capacity, wave action would cause erosion of the reservoir rim sediments, and artifacts within the soil matrix of archaeological sites may move. The return of recreational power boating to the reservoir would also cause wave action that would similarly impact archaeological sites. Such erosion by fluctuating reservoir levels and wave action from power boating may significantly impact the eight archaeological sites that are tribal cultural resources within Anderson Reservoir. Furthermore, erosion from reservoir operations, including power boating, could uncover currently unknown buried archaeological sites or human remains that would be tribal cultural resources and significantly impact these resources. Implementation of **Mitigation Measure CR-3** requires Valley Water to prepare a Monitoring and Unanticipated Discoveries Plan, which will include regular monitoring of the sites known to contain tribal cultural resources within the fluctuation zone of the reservoir. The Monitoring and Unanticipated Discoveries Plan would also include protocols for treating any discovered human remains and other Native American materials exposed from reservoir fluctuation at both known sites and newly revealed sites. Implementation of these measures would reduce impacts from Project operations to tribal cultural resources to less than significant with mitigation.

Although the area downstream of Anderson Dam has some potential for containing buried archaeological resources, changes to the flow regime in Coyote Creek would not result in substantial increases in erosion and related geomorphic processes (See Section 3.8, *Geology and Soils*) that would result in substantial adverse changes to the significance of archaeological resources. As a result, there would be a less-than-significant impact to tribal cultural resources in the downstream region of the Seismic Retrofit area.

Post-Construction Conservation Measures Operations and Maintenance ~~Construction~~

Two pre-contact archaeological sites (P-43-000176, P-43-001001) (described in Section 3.20.3.2) considered to be tribal cultural resources are present within the Ogier Ponds CM area. Neither resource has previously been evaluated for NRHP/CRHR-eligibility but are considered tribal cultural resources for the purpose of the EIR. P-43-001001 is outside any areas of planned construction and would not be impacted by construction activities for this Conservation Measure. P-43-000176 could be impacted by construction activities for this Conservation Measure, ranging from floodplain development to berm and trail/road development~~,~~ and construction staging. Any of these actions, all of which would require ground disturbance, could cause substantial adverse changes to the significance of these tribal cultural resources.

One pre-contact archaeological site (P-43-000189) considered to be a tribal cultural resource is located within the area of the Phase 2 Coyote Percolation Dam CM. P-43-000189 has been determined eligible for the NRHP/CRHR. No surface evidence of the site was observed during archaeological pedestrian surveys. P-43-000189 is largely recorded outside the Conservation Measure boundary. Furthermore, the portion of the site within the Conservation Measure limits is below an existing access road and will not be further disturbed by construction activities. Because P-43-000189 is buried beneath an access road, there will be a less-than-significant impact to this tribal cultural resource by construction of the Phase 2 Coyote Percolation Dam CM.

Because archaeological resources are not always visible on the ground surface, ground-disturbing construction activities that involve ground disturbance at any of the Conservation Measure sites (Ogier Ponds CM, Phase 2 Coyote Percolation Dam CM, and North Channel Reach ~~Extension~~) could uncover archaeological resources that may qualify as tribal cultural resources. Examples of such construction activities include, but are not limited to, grading for haul roads and staging areas, excavation and grading for infrastructure construction, and clearing and grubbing of vegetation for channel restoration. BMP CU-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will reduce this impact, but the inadvertent discovery of such resources could result in a substantial adverse change in the significance of tribal cultural resources.

Based on the above analysis, impacts to known and undiscovered tribal cultural resources would be significant. Potential impacts to tribal cultural resources within the Conservation Measure construction areas will be less than significant with the implementation of **Mitigation Measures CR-1, CR-2,** and **CR-3**. Implementation of **Mitigation Measure CR-1** (Pre-construction Cultural Resources Awareness Training) will require construction crews to receive awareness training for identifying archaeological materials uncovered during ground disturbance, the significance of tribal cultural resources, and will provide guidance on treating the resources with respect. **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment Plan for Tribal Cultural Resources that Cannot be Avoided) will require that all tribal cultural resources that will be impacted by construction and operations be included in the treatment plan. **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require that work stop in the vicinity of any archaeological materials discovered during Project construction, and that a Monitoring and Unanticipated Discoveries Plan will provide protocols for monitoring and treating archaeological deposits, including any that may qualify as tribal cultural resources, discovered during construction. **Mitigation Measures CR-1**, **CR-2**, and **CR-3** will require that Valley Water continue to work with Native American Tribes who have been consulting on the Project and include, but are not limited to, inviting Tribes to participate in the worker awareness training, review and comment on the Data Recovery and Treatment and Monitoring and Unanticipated Discoveries plans, and participating in data recovery and construction monitoring.

With implementation of these mitigation measures, substantial adverse changes in the significance of a tribal cultural resource would not occur, and significant impacts to tribal cultural resources within the Project Seismic Retrofit and Conservation Measure areas would be reduced to **less-than-significant through mitigation**.

Significance Conclusion Summary

Valley Water has determined that pre-contact Native American archaeological sites with human remains, as well as sites with midden deposits, are tribal cultural resources for purposes of this EIR. Valley Water also recognizes that sites that have not undergone NRHR/CRHR evaluations may contain materials that could be considered tribal cultural resources and are thus considered as such for the purpose of this EIR. As a result, there are 11 tribal cultural resources identified in the Project Area: eight are in the Seismic Retrofit component area and three are within the Conservation Measures component area (**Table 3.20-1**).

In addition, even with implementation of BMP CUL-1, undiscovered pre-contact archaeological resources that could qualify as tribal cultural resources could be significantly impacted by Seismic Retrofit or Conservation Measure construction. Erosion and recreational power boating within Anderson Reservoir related to the operation of the Seismic Retrofit component of the Project could create wave action along the exposed shoreline of the reservoir as the reservoir is refilled after Project completion, during the regular rise and fall of the reservoir due to Project operation and the resumption of recreational boating. These actions may erode pre-contact archaeological resources that could qualify as tribal cultural resources.

Six of the tribal cultural resources are within the Seismic Retrofit component construction area, with three located within identified stockpile areas, and one within the alignment of an access/haul road. These four tribal cultural resources would be directly impacted by Project construction. One tribal cultural resource, which contains human remains, is adjacent to a stockpile area. One additional site is located in the construction area but is not in the footprint of any planned construction activities. All the sites within the reservoir footprint could be eroded by wave action, from reservoir filling and fluctuation or from recreational boating, as the result of Project operations.

For these reasons, the Project may cause substantial adverse changes to the significance of both known and undiscovered tribal cultural resources, and, therefore, these impacts are significant. BMP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will require that work will cease in areas where archaeological materials are discovered during construction until the finds can be analyzed and evaluated for NRHP/CRHR-eligibility, if appropriate, and that any eligible resources will either be avoided or subject to data recovery studies. **Mitigation Measure CR-1** (Pre-construction Cultural Resources Awareness Training) will require construction crews to receive awareness training for identifying archaeological materials uncovered during ground disturbance, the significance of tribal cultural resources, and will provide guidance on treating the resources with respect. **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment

Plan for Tribal Cultural Resources that cannot be Avoided) will require that all tribal cultural resources that will be impacted by construction and operations be included in the treatment plan. Lastly, **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require an archaeological and tribal monitor in areas sensitive for tribal cultural resources during Project construction, the monitoring of sensitive areas during Project operations, and will implement protocols of the Monitoring and Unanticipated Discoveries Plan should archaeological materials be discovered. With implementation of these mitigation measures, substantial adverse changes in the significance of a tribal cultural resource would not occur, and significant impacts to tribal cultural resources within the Project Seismic Retrofit and Conservation Measure areas would be reduced to **less than significant with ~~through~~ mitigation**.

Mitigation Measures

CR-1 Pre-construction Cultural Resources Awareness Training

Valley Water will provide a cultural resources awareness training program to all construction personnel within the various construction areas during earth moving activities throughout the duration of Project construction. The training will be conducted in person, or via a video or PowerPoint presentation to be viewed by all construction personnel involved in ground disturbing activities prior to working on the Project. The training will be developed and conducted in coordination with a qualified archaeologist that meets the U.S. Secretary of Interior standards for professional archaeologists, as well as a representative from culturally affiliated Native American Tribe(s) who have participated in consultations with Valley Water. The program will include relevant information regarding sensitive cultural resources (including human remains and burials), applicable regulations, protocols for avoidance, and consequences of violating state laws and regulations. The worker cultural resources awareness program will also describe appropriate avoidance and minimization measures for resources that have the potential to be located within the Project construction area and will outline what to do and whom to contact if any potential archaeological resources, human remains and burials, or artifacts are encountered. The program will emphasize the requirement of confidentiality and culturally appropriate treatment of any finds of significance to Native Americans, and behaviors consistent with Native American Tribal values.

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

The preferred treatment for impacts to archaeological sites, including those identified as tribal cultural resources, is avoidance, as directed under *CEQA Guidelines* Section 15126.4(b)(3)(b)(1) and PRC 21084.3. Valley Water has designed the Project to avoid archaeological sites, where feasible; however, not all archaeological sites could be avoided by design. As a result, a Data Recovery and Treatment Plan will ~~shall~~ be prepared by a qualified archaeologist that meets the U.S. Secretary of Interior standards for professional archaeologists, to address impacts to those archaeological historical resources that cannot be avoided by Project construction. The Data Recovery and Treatment Plan will be developed consistent with requirements in PRC Section 21083.2, and Section 15126.4(b) of the *CEQA Guidelines*. The Data Recovery and Treatment Plan will include a research design to identify research questions as the focus of data recovery efforts, as well as detail the field and laboratory methods to address the questions. The Data Recovery and Treatment Plan will also include a specific discussion of the methods and level of effort at each site for data recovery excavations, which are an acceptable form of mitigation under Section 15126.4(b)(3)(c) of the *CEQA Guidelines*. Specific plans for Native American sites will be prepared in consultation with Native American Tribes who participated in EIR tribal consultation. Valley Water will require that data recovery and treatment be scheduled such that the actions will be completed in advance of construction involving impacted sites. The Data Recovery and Treatment Plan protocols will also be used for addressing accidental discoveries, as discussed in **Mitigation Measure CR-3**.

The Plan will specify that if human remains are discovered, procedures for notification of the County Coroner and for the disposition of Native American human remains under Health and Safety Code Section 7050.5 and PRC Section 5097.5 will be followed.

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

Valley Water will prepare a Monitoring and Unanticipated Discoveries Plan in consultation with participating Native American Tribes prior to the initiation of Project construction. The Monitoring and Unanticipated Discoveries Plan will provide that a qualified archaeologist will monitor ground disturbance (e.g., grading, trenching, vegetation clearing and grubbing with a backhoe or other mechanical methods, etc.) in all areas sensitive for archaeological sites, such as those adjacent to Coyote Creek or other water sources. Valley Water will coordinate with participating Native American Tribes to retain a tribal monitor to work in tandem with the archaeological monitor. Monitoring will take place at locations within 50 feet of known archaeological historical resources or at locations identified as cultural resource environmentally sensitive areas. Monitoring will also occur in areas identified by the archaeological principal investigator as sensitive for buried archaeological deposits. Protocols for monitoring, such as scheduling, personnel responsibilities, chain of command, and reporting, will be detailed in the Monitoring and Unanticipated Discoveries Plan.

The Monitoring and Unanticipated Discoveries Plan will also address the accidental discovery of archaeological resources and incorporate the guidelines of BMP CU-1 (accidental discovery of archaeological artifacts or burial remains), including issuance of a stop work order and establishment of a no work zone in the immediate vicinity of the find. The area of the discovery will be flagged to delineate the boundary of the sensitive zone. If either an archaeological or tribal monitor are not present at the time of the discovery, a qualified archaeologist, who meets the U.S. Secretary of the Interior’s professional standards, will visit the discovery site as soon as practicable for identification and evaluation pursuant to Section 21083.2 of the PRC and Section 15064.5 of the *CEQA Guidelines*. If the archaeologist determines that the archaeological find is not a “historical” or “unique archaeological” resource and thus not significant, construction may resume. If the archaeologist determines that the archaeological find is significant, the archaeologist will determine if the find can be avoided and, if so, will detail avoidance procedures. If the archaeological find cannot be avoided, the archaeologist will develop an Action Plan within 48 hours which will include provisions to minimize impacts and, if required, a Data Recovery and Treatment Plan that will follow the protocols outlined in the Data Recovery and Treatment Plan described in **Mitigation Measure CR-2**.

The Plan will specify that if human remains are discovered, procedures for notification of the County Coroner and for the disposition of Native American human remains under Health and Safety Code Section 7050.5 and PRC Section 5097.5 will be followed.

Valley Water will also retain a qualified archaeologist to implement yearly monitoring of the locations of those archaeological sites within the reservoir fluctuation zone that are known to contain human remains (P-43-004083 and P-43-004085). Any remains exposed during reservoir fluctuations would be treated consistent with Health and Safety Code Section 7050.5 and PRC Section 5097.5 procedures, and in accordance with the desires of the relevant Tribes. Areas of sensitivity for the presence of unknown cultural sites within the reservoir fluctuation zone will be defined in the Monitoring and Unanticipated Discoveries Plan and will also be monitored yearly. The specifics of the monitoring and treatment protocols will be developed in consultation with participating Tribes and also detailed in the Monitoring and Unanticipated Discoveries Plan.

3.20.5 Cumulative Impacts

The geographic study area for the cumulative impact analysis for tribal cultural resources encompasses the future Project areas in the southern San Francisco Bay Area where activities including ground disturbance or major alterations to visual settings would occur.

This section describes the Project's contribution to cumulative tribal cultural resources impacts, as summarized in **Table 3.20-2**. Cumulative impact thresholds for cultural resources are the same as the impact thresholds presented in Section 3.20.3.6, *Thresholds of Significance*.

Table 3.20-2. Summary of Project Impact Contribution to Cumulative Tribal Cultural Resources Impacts

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource listed or eligible for listing in the California Register of Historical Resources or determined by Valley Water to be significant	Yes	Yes	CC	MM CR-1 MM CR-2 MM CR-3	No

Key: CC = cumulatively considerable; MM = Mitigation Measure

Cumulative Impact TCR-1: Cause a substantial adverse change in the significance of an archaeological resource **(Not Cumulatively Considerable)**

Ground disturbance during construction at the Seismic Retrofit construction area and the Ogier Ponds CM areas could impact elements of tribal cultural resources. Operational activities within Anderson Reservoir could erode Native American archaeological resources that may qualify as tribal cultural resources buried along the shoreline of the reservoir. In addition, construction activities and future use of reservoir could expose undiscovered Native American archaeological resources that may qualify as tribal cultural resources.

Cumulative projects, plans, and programs could result in incrementally adverse impacts if they create impacts in a manner that progressively reduces the significance of the resource.

Cumulative Effects of Project with the FOCP

The reservoir was drawn down as part of the FOCP which could expose Native American archaeological resources that qualify as tribal cultural resources and make them vulnerable to damage. The Project would extend the period that the reservoir is drained and exposed Native American archaeological resources that qualify as tribal cultural resources in the reservoir are vulnerable to loss or damage. Both projects create similar risks to the loss or destruction of undiscovered Native American archaeological resources that could qualify as tribal cultural resources through ground disturbance and construction activities. This impact is cumulatively significant, and the Project's contribution is **cumulatively considerable**.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Other projects that take place along Coyote Creek such as the SMP, Coyote Creek Flood Protection Project, Santa Clara County Parks Planning Projects and Natural Resource Management, as well as development projects in the County where ground-disturbing activities may take place in or near the creek bed, could result in similar impacts to undiscovered Native American archaeological resources that may qualify as tribal cultural resources as the Project. This impact is cumulatively significant and the Project's contribution is **cumulatively considerable**.

Significance Conclusion Summary

The Project may cause significant cumulative effects to the significance of both known and undiscovered Native American archaeological resource that are considered tribal cultural resources. BMP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) would reduce this impact by requiring that work will cease in areas where archaeological materials are discovered during construction until the finds can be analyzed and evaluated for NRHP/CRHR-eligibility, if appropriate, and whether they qualify as tribal cultural resources. This BMP would reduce impacts from construction-related inadvertent discoveries of archaeological and human remains that could be considered tribal cultural resources.

Mitigation Measure CR-1 (Pre-construction Cultural Resources Awareness Training) will require construction crews to receive awareness training for identifying archaeological materials uncovered during ground disturbance, the significance of tribal cultural resources, and will provide guidance on treating the resources with respect. **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment Plan for Tribal Cultural Resources that Cannot be Avoided) will require that all tribal cultural resources that will be impacted by construction and operations be included in the treatment plan. Lastly, **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require that work stop in the vicinity of any archaeological materials discovered during Project construction, and that a Monitoring and Unanticipated Discoveries Plan will provide protocols for monitoring and treating archaeological deposits, including any that may qualify as tribal cultural resources, discovered during construction.

Implementation of these mitigation measures would reduce the Project's incremental contribution to significant cumulative impacts on tribal cultural resources to **not cumulatively considerable**.

Mitigation Measures

CR-1 Pre-construction Cultural Resources Awareness Training

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

3.21 Utilities and Service Systems

This section evaluates the Project's impacts on utilities and service systems in the study area, defined below. The *CEQA Guidelines* significance criteria for utilities and service systems address impacts that would require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects. The *CEQA Guidelines* also provide significance criteria to determine whether the Project would generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, otherwise impair the attainment of solid waste reduction goals; or fail to comply with federal, State, and local management and reduction statutes and regulations related to solid waste.

The study area used to assess impacts on utilities and service systems includes portions of the communities of the county and San José and Morgan Hill that are within the footprint of the Project Area and within the construction limits of the Seismic Retrofit and Conservation Measure components of the Project. The baseline condition related to utilities and service systems are described below. The baseline used for the analysis of impacts to utilities consists of existing conditions at time of the EIR preparation as modified by FOCP implementation.

3.21.1 Environmental Setting

The environmental setting describes the conditions of utilities resources in the study area. This section describes the study area's existing utilities. The environmental setting is based on two different baseline conditions that would form the basis for comparing Project impacts to utilities. The baselines used in this section include the existing conditions baseline and Pre-FERC Order Conditions Baseline. The existing conditions baseline, which reflects reasonable assumptions of the study area's visual setting, would exist following the completion of the FOCP, based on available information at the time of EIR preparation (2022). The existing conditions baseline is used for evaluating the Seismic Retrofit and Conservation Measures construction impacts. For evaluating post-construction operation, the Pre-FERC Order Conditions Baseline is used. The Pre-FERC Order Conditions Baseline reflects general conditions at the time the NOP was filed in 2013. See discussion below for environmental setting and baseline conditions.

The Project components are located on lands owned by Valley Water, the County, and private owners within the Coyote Creek Watershed, which is the largest watershed in the Santa Clara Basin, encompassing an area of over 320 square miles. Anderson Dam impounds Coyote Creek; the portion of the Coyote Creek Watershed above the dam is 195 square miles. Downstream of Anderson Dam, Coyote Creek flows north-northwest through many highly developed urban areas in the county, including portions of Morgan Hill, San José, and Milpitas, before ultimately reaching San Francisco Bay. The upstream reaches of Coyote Creek, and the portion of the watershed above Anderson Reservoir that feeds Anderson Dam, are largely undeveloped.

3.21.1.1 Wastewater Treatment and Stormwater Facilities

Anderson Dam and Reservoir are operated by Valley Water as water storage infrastructure and used by the county as a recreational facility. Existing conditions of the dam and reservoir after implementation of the FOCP, which serves as the baseline, do not involve wastewater or stormwater collection or treatment. Restroom facilities within the Project Area are connected to the South County Regional Wastewater Authority's (SCRWA) Treatment Plant in Gilroy. Project Conservation Measures which pertain to utilities include the Coyote Percolation Pond 11 miles downstream of Anderson Dam and the North Channel Reach ~~Extension~~ approximately 0.27 miles downstream of the existing outlet of Anderson Dam. During the FOCP, weirs were constructed to restore flows within the historic North Channel of Coyote Creek to provide capacity to split dam outlet flows between the North and South Channels.

3.21.1.2 Water Treatment Facilities

Anderson Reservoir operations release water from the reservoir for multiple purposes, including conveying water for treatment to the Santa Teresa Water Treatment Plant (Plant), the largest of Valley Water's three treatment facilities. The Plant serves residential and commercial customers in South San José in the communities of Almaden Valley, Blossom Valley, and Santa Teresa. The Plant delivers up to 100 million gallons of water per day. The Plant receives most of its water from San Luis Reservoir, with smaller portions from the Calero Reservoir and Anderson Reservoir (Valley Water 2020).

3.21.1.3 Solid Waste Disposal

There are currently four active landfills in the county that could receive construction waste from the Project (CalRecycle 2021):

- Guadalupe Sanitary Landfill – active and estimated to have capacity through 2048 (remaining capacity as of 2011 was 11,055,000 cy)
- Kirby Canyon Recycling and Disposal Facility – active and estimated to have capacity through 2059 (remaining capacity as of 2015 was 16,191,600 cy)
- Newby Island Landfill – active and estimated to have capacity through 2041 (remaining capacity as of 2014 was 21,200,000 cy)
- Zanker Material Processing Facility – active and estimated to have capacity through 2025 (remaining capacity as of 2012 was 640,000 cy)

The nearest facility that accepts hazardous waste materials is Chemical Waste Management, located in Kettleman City, which is approximately 150 miles from the Project Area. Chemical Waste Management is active and estimated to have capacity through 2030 (remaining capacity as of 2010 was 17,468,595 cy). Chemical Waste Management has applied for a permit from the DTSC to expand the capacity of the facility, but as of April 2023, no permit has been issued (DTSC 2023).

3.21.1.4 Electrical Service

PG&E provides electricity services to the Project Area. PG&E is a publicly traded utility company that generates, purchases, and transmits energy under contract with the CPUC. PG&E owns and ~~C~~maintains above- and below-ground networks of electric and gas transmission and distribution facilities throughout the Project Area. PG&E's total service territory is 70,000 square miles in area, roughly extending north to south from Eureka to Bakersfield, and east to west from the Sierra Nevada Mountain range to the Pacific Ocean.

PG&E's total service territory electricity distribution system consists of more than 141,200 circuit miles of electric distribution lines and more than 18,600 circuit miles of interconnected transmission lines. PG&E electricity is generated by a combination of sources such as coal-fired power plants, nuclear power plants, and hydroelectric dams, as well as newer sources of energy, such as wind turbines and photovoltaic plants. The electrical grid is a network of high-voltage transmission lines that link power plants with the PG&E system. The distribution system, comprised of lower voltage secondary lines, is at the street and neighborhood level and consists of overhead or underground distribution lines, transformers, and individual service connections to the individual customer.

Since 2011, PG&E has been implementing a Smart Grid Deployment Plan According to PG&E's *Smart Grid Annual Report 2020* (PG&E 2020). Modernizing the power grid integrates new energy devices, monitoring and control, and other situational awareness technologies to enable greater grid safety, resiliency, and energy diversity for PG&E customers in response to increased wildfire risk, cybersecurity concerns, and technological advances.

PG&E provides electrical power to most of the Project facilities (except facilities at the boat ramp parking area) through an existing overhead 12.47 kV power distribution line along Coyote Road that will be constructed by PG&E during the FOCP. The existing distribution line crosses Coyote Creek with medium-voltage power cables to a pole and distribution transformer. Facilities at the boat ramp parking area receive electrical power through overhead lines that connect to an existing overhead 12.47 kV power distribution line along Coyote Road. These overhead lines, however, terminate at pole-mounted transformers and pad-mounted service equipment located at the left end of the existing dam. An emergency diesel generator and associated components, including an automatic transfer switch, were installed during the FOCP near the diversion outlet structure for emergency power supply. The generator, rated at 277/480 Volt for a three-phase, four-wire distribution system, was sized at 500 kVA.

From 1988 to 2018, Valley Water produced hydroelectric power at the Anderson Dam hydroelectric facility (facility) located approximately 1,300 feet downstream of the dam (Valley Water 2018). The facility, although not currently in use, consists of two induction generators that, when combined, produced approximately 800 kW; however, due to limits in the amount of flows that are allowed to be redirected to the facility for hydroelectric generation, the facility did not produce the full potential of the 800 kW capacity. Throughout the lifetime of the facility, approximately 39,700,000 kWh of renewable energy in total were produced. Over time, the increasing cost to operate and maintain the aging infrastructure exceeded the value of the renewable energy that the facility generated. Therefore, Valley Water stopped power generation at the facility in 2018 and will pursue decommissioning as part of the Project.

3.21.1.5 Natural Gas Service

PG&E's natural gas (methane) pipe delivery system includes more than 42,100 miles of distribution pipelines and more than 6,400 miles of transportation pipelines. Gas delivered by PG&E originates in gas fields in California, the US Southwest, US Rocky Mountains, and from Canada. Transportation pipelines send natural gas from fields and storage facilities in large pipes under high pressure. The smaller distribution pipelines deliver gas to individual businesses or residences.

Natural gas lines operated by PG&E are located within the Project Area. PG&E's natural gas service area extends throughout the county, although the City of San José banned natural gas connections for residential uses in 2021. Several PG&E gas transportation pipelines run through Morgan Hill (City of Morgan Hill 2017 ~~2016~~). Two main lines run roughly parallel to US 101, approximately 1-2 miles east of US 101. Two other pipelines branch off from those main lines and run under Diana Avenue and Cochrane Road, respectively, west of US 101. Distribution gas pipelines are located throughout the city.

Within the Project Area, there is a natural gas pipeline which is owned and operated by PG&E. The pipeline is located within Staging Area 1, downstream of Anderson Dam. The PG&E pipeline would be protected in-place for the duration of the Project. Neither Anderson Dam nor the reservoir require natural gas in either the existing or post-Project conditions.

3.21.1.6 Telecommunication Service

Existing telecommunications facilities within the Project Area include a Supervisory Control and Data Acquisition (SCADA) copper-twisted pair telemetry cable line, which extends from Anderson Dam to Peet Road. The existing SCADA telemetry cable would be replaced with 5,000 linear feet of new fiber optic SCADA telemetry cable between Anderson Dam and the Peet Road Junction Valve Vault. These telecommunication cables would be located in areas that would be disturbed as a result of other construction activities associated with the Seismic Retrofit components, or within existing utility corridors. The primary broadband infrastructure in Morgan Hill is owned and operated by Frontier Communications, which took over ownership and operation of Verizon's wireline telephone systems in California and Charter Communications, which purchased Falcon Communications in 1999. A study of telecommunications services conducted in 2016 (City of Morgan Hill 2016 ~~2016b~~) found a lack of consistent upgrades by Verizon to the legacy telephone system currently owned by Frontier Communications and below-industry-average cable infrastructure maintained by Charter Communications. The study also identified a disparity between the level of broadband service available to business and residential customers, with generally faster speeds in residential areas than in commercial/industrial zones. Secondary broadband service providers—Level 3 and TW Telecom—have moved in to fill some of the gaps left by the primary providers by offering more specialized services, including direct fiber optic connections to end users. Major fiber network operators also provide connectivity in Morgan Hill on a wholesale basis.

3.21.2 Regulatory Setting

This section summarizes federal, State, and local laws, regulations, and policies pertinent to the evaluation of the Project's impacts on utilities and service systems.

3.21.2.1 Federal Laws, Regulations, and Policies

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (amended 1986) is a federal act regulating the potential health and environmental problems associated with solid waste hazards and non-hazardous wastes. Specific regulations addressing solid waste issues are contained in Title 40 of the Code of Federal Regulations.

Federal Power Act

The Federal Power Act (16 USC sections 791 to 823s) grants the FERC jurisdiction over the interstate transmission of electricity, natural gas, and oil, including licensing non-federal hydropower projects, throughout the United States. FERC's hydropower responsibilities include issuance of licenses for the construction and operation of new projects, issuance of relicenses for existing projects, and oversight of all ongoing project operations, including dam safety and security inspections, public safety, and environmental monitoring. Part of the commission's responsibility is to strike an appropriate balance among the many competing developmental and non-developmental (including environmental) interests involved in hydropower regulation (FERC 2019 ~~2021~~).

3.21.2.2 State Laws, Regulations, and Policies

California Public Utilities Commission

The California Constitution vests the CPUC with the sole authority to regulate privately owned and investor-owned public utilities, such as PG&E. This exclusive power extends to all aspects of utility regulation, including facility location, design, construction, maintenance, and operation. The CPUC requires regulated utilities to work closely with local governments and give due consideration to local government concerns. The CPUC does not regulate publicly owned utilities such as Valley Water.

California Integrated Waste Management Act

The California Integrated Waste Management Act of 1989 (CIWMA) (PRC Division 30), enacted through AB 939 and modified by subsequent legislation, required all California cities and counties to implement programs to reduce, recycle, and compost at least 50 percent of wastes by 2000 (PRC section 41780). A jurisdiction's diversion rate is the percentage of its total waste that a jurisdiction diverts from disposal through reduction, reuse, and recycling programs. The State, acting through the California Integrated Waste Management Board, determines compliance with this mandate. Per capita disposal rates are used to determine if a jurisdiction's efforts are meeting the intent of the act.

In 2011, the Legislature implemented a new approach to the management of solid waste. California's Commercial Recycling Bill (AB 341) went into effect on July 1, 2012, and set a recycling goal of 75 percent diversion by 2020, and annually thereafter. The bill is intended to: (1) reduce GHG emissions by diverting recyclable materials, and (2) expand the opportunity for increased economic activity and green industry job creation. AB 341 is a statewide policy goal rather than a city or county jurisdictional mandate.

Utility Notification Requirements

Title 8, section 1541 of the CCR requires excavators to determine the approximate locations of subsurface installations such as sewer, telephone, fuel, electricity, and water lines (or any other subsurface installations that may reasonably be encountered during excavation work) prior to opening an excavation. California law (Government Code Section 4216 et seq.) requires owners and operators of underground utilities to become members of and participate in a regional notification center, such as USA North. USA North receives reports of planned excavations from public and private excavators and transmits the information to all participating members that may have underground facilities at the location of an excavation. USA North members mark or stake their facilities, provide information, or give clearance to dig.

California Solid Waste Reuse and Recycling Access Act

The California Solid Waste Reuse and Recycling Access Act of 1991 (PRC sections 42900–42911) requires that all development projects applying for building permits include adequate, accessible areas for collecting and loading recyclable materials.

Nonhazardous Solid Waste Disposal Standards

Title 14, Chapter 3, of the CCR provides minimum standards for solid waste handling and disposal in California pertaining to nonhazardous solid waste management. The California Department of Resources Recycling and Recovery (CalRecycle) administers programs including the regulation of nonhazardous solid waste facilities in the state. These standards may apply to activities related to Project construction.

3.21.2.3 Regional and Local Laws, Regulations, and Policies

While the majority of the Project study area for utilities and service systems is within the county, portions of the Project are within San José and Morgan Hill. The following policies relate specifically to aspects of the Project with regard to utilities and service systems.

Santa Clara County Integrated Waste Management Plan

The Santa Clara County Integrated Waste Management Plan (SCCIWMP; County 1995) identifies the unified goals, policies, and objectives for waste management in the communities within the county. The plan is implemented by the Santa Clara County Recycling and Waste Reduction Division as part of the County’s Consumer Environmental Protection Agency, which supports waste reduction activities that preserve resources, enhance sustainability, and mitigate climate change. The overall objectives of the plan are to divert an increasing percentage of the waste stream from landfill disposal over time in compliance with CIWMA, design and implement recycling programs, and promote composting of yard waste. Each jurisdiction including unincorporated Santa Clara County has developed and adopted individual goals that feed into the countywide plan. CIWMA and the SCCIWMP have been incorporated by reference into the Santa Clara County General Plan, while the Envision San José 2040 General Plan (1994) incorporates by reference the San José Zero Waste Strategic Plan, a zero-waste strategy that exceeds the requirements of CIWMA and the SCCIWMP. The City of Morgan Hill General Plan (2017 ~~2016~~) addresses waste diversion and waste management policies consistent with CIWMA and the SCCWIMP. Specific policies are addressed below.

Santa Clara County General Plan

The following Santa Clara County General Plan (1994) resource conservation policies may be applicable to the Project.

Resource Conservation

- Policy C-RC 5 An adequate, high quality water supply for Santa Clara County should be considered essential to the needs of households, business and industry.

- Policy C-RC 6 A comprehensive strategy for meeting long term projected demand for water should at a minimum include the following: a. Continued conservation and increased reclamation; b. Securing additional sources as supplemental supply; c. System and local storage capacity improvements; and d. Drought contingency planning and groundwater basin management programs.
- Policy C-RC 7 Countywide land use and growth management planning should be coordinated with overall water supply planning by the SCVWD in order to maximize dependability of long-term water supply resources.
- Policy C-RC 8 Environmental impacts of all state and local water supply planning and decision-making should be taken into full consideration.
- Policy C-RC 9 Conservation should continue to be considered an integral component of local water "supply" resources, effectively minimizing the amount of supplemental supplies which must be obtained from other sources.
- Policy C-RC 13 Use of reclaimed wastewater for landscaping and other uses, including groundwater recharge if adequately treated, should be encouraged and developed to the maximum extent possible.
- Policy C-RC 20 Adequate safeguards for water resources and habitats should be developed and enforced to avoid or minimize water pollution of various kinds, including: a. erosion and sedimentation; b. organic matter and wastes; c. pesticides and herbicides; d. effluent from inadequately functioning septic systems; e. effluent from municipal wastewater treatment plants; f. chemicals used in industrial and commercial activities and processes; g. industrial wastewater discharges; h. hazardous wastes; and i. non-point source pollution
- Policy C-RC 25 Wetlands restoration for the purpose of enhancing municipal wastewater treatment processes, improving habitat and passive recreational opportunities should be encouraged and developed where cost-effective and practical.
- Policy C-RC 63: Santa Clara County shall strive to reduce the quantity of solid waste disposed of in landfills and to achieve or surpass the requirements of state law (the law currently specifies 25 percent reduction of landfilled wastes by 1995, and 50 percent by 2000).
- Policy C-RC 64: Countywide solid waste management efforts shall be guided by the hierarchy of strategies outlined below, emphasizing resource recovery in accordance with state law:
    a. Source reduction and reuse by seeking innovative and effective means of reducing solid waste,
    b. Recycling and composting by considering efforts to increase markets for goods produced from recycled/reused materials as an essential feature of all efforts to manage solid waste and conserve landfill capacity,
    c. Transformation by exploring potential applications for waste transformation and energy generation technologies, and
    d. Landfilling as final option by acknowledging the need for long term disposal capacity and striving to maintain 20 to 30 years of ongoing collective disposal capacity.

- Policy C-RC 65: All solid waste management services and facilities shall conform to applicable federal, state, and local regulations and standards.

Health and Safety

- Policy C-HS 42 The long-term viability and safety of underground aquifers and groundwater systems countywide shall be protected to highest degree feasible.
- Policy C-HS 46 Hazardous materials, whether commercial, industrial, agricultural, or residential in character, should not be disposed of in any wastewater or on-site wastewater treatment system.

Transportation

- Policy C-TR 43 Upgrading the telecommunications infrastructure should be supported and encouraged as a means of enabling more telecommuting and the decentralization of work.

San José Zero Waste Strategic Plan

On October 30, 2007, the San José City Council adopted Resolution 74077, which established a goal to reduce the amount of material being sent to landfills by 75 percent by 2013, and a goal of zero waste by 2022. In San José, “zero waste” is defined as landfilling no more than 10 percent of waste or recycling 90 percent. To help reach the waste reduction goals, the City developed a Zero Waste Strategic Plan that identifies policies, programs, and facilities to be implemented in a phased approach in the short- and long-terms. In 2013, approximately 73 percent of the waste generated was diverted from landfill disposal through programs that include residential curbside recycling and yard trimmings collection programs, City facilities recycling, and the Construction and Demolition Diversion Deposit program.

Envision San José 2040 General Plan

The following Envision San José 2040 General Plan (2023 ~~2011~~) resource conservation policies may be applicable to the Project.

Infrastructure

- Policy IN-1.1 Provide and maintain adequate water, wastewater, and stormwater services to areas in and currently receiving these services from the City.
- Policy IN-1.3 Provide sustainable utility services and infrastructure in a cost-efficient manner consistent with Envision General Plan goals and policies related to Fiscal Sustainability.
- Policy IN-1.10 Require undergrounding of all new publicly owned utility lines. Encourage undergrounding of all privately owned utility lines in new developments. Work with electricity and telecommunications providers to underground existing overhead lines
- Policy IN-1.11 Locate and design utilities to avoid or minimize impacts to environmentally sensitive areas and habitats.
- Policy IN-3.1 Achieve minimum level of services: • For sanitary sewers, achieve a minimum level of service “D” or better as described in the Sanitary Sewer Level of

Service Policy and determined based on the guidelines provided in the Sewer Capacity Impact Analysis (SCIA) Guidelines. • For storm drainage, to minimize flooding on public streets and to minimize the potential for property damage from stormwater, implement a 10-year return storm design standard throughout the City, and in compliance with all local, State and Federal regulatory requirements.

- Policy IN-3.10 Incorporate appropriate stormwater treatment measures in development projects to achieve stormwater quality and quantity standards and objectives in compliance with the City's National Pollutant Discharge Elimination System (NPDES) permit.
- Policy IN-4.1 Monitor and regulate growth so that the cumulative wastewater treatment demand of all development can be accommodated by San José's share of the treatment capacity at the San José/Santa Clara Regional Wastewater Facility.
- Policy IN-5.3: Use solid waste reduction techniques, including source reduction, reuse, recycling, source separation, composting, energy recovery and transformation of solid wastes to extend the life span of existing landfills and to reduce the need for future landfill facilities and to achieve the City's Zero Waste goals.
- Policy IN-5.4: Support the expansion of infrastructure to provide increased capacity for Materials Recovery Facilities (MRF)/transfer, composting, and Construction and Demolition materials processing (C&D) at privately operated facilities and on lands under City control to provide increased long-term flexibility and certainty.

Measurable Sustainability

- Goal MS-5: Waste Diversion. Divert 100% of waste from landfills by 2022 and maintain 100% diversion through 2040.
- Policy MS-5.6: Enhance the construction and demolition debris recycling program to increase diversion from the building sector.
- Policy MS-6.5: Reduce the amount of waste disposed in landfills through waste prevention, reuse, and recycling of materials at venues, facilities, and special events
- Policy MS-6.8: Maximize reuse, recycling, and composting citywide
- Policy MS-18.12: Encourage stormwater capture and encourage, when feasible and cost-effective, on-site rainwater catchment for new and existing development.
- Policy MS-18.14: Participate in regional efforts to develop codes and standards for stormwater capture and graywater reuse, whenever feasible and cost-effective, and in areas that do not impact groundwater quality as determined through coordination with local agencies.
- Policy MS-20.3: Protect groundwater as a water supply source through flood protection measures and the use of stormwater infiltration practices that protect groundwater quality. In the event percolation facilities are modified for infrastructure projects, replacement percolation capacity will be provided.

Environmental Resources

- Policy ER-8.1 Manage stormwater runoff in compliance with the City's Post-Construction Urban Runoff (6-29) and Hydromodification Management (8-14) Policies.

- Policy ER-8.2 Coordinate with regional and local agencies and private landowners to plan, finance, construct, and maintain regional stormwater management facilities.
- Policy ER-8.4 Assess the potential for surface water and groundwater contamination and require appropriate preventative measures when new development is proposed in areas where storm runoff will be directed into creeks upstream from groundwater recharge facilities.
- Policy ER-8.5 Ensure that all development projects in San José maximize opportunities to filter, infiltrate, store and reuse or evaporate stormwater runoff onsite.
- Policy ER-8.7 Encourage stormwater reuse for beneficial uses in existing infrastructure and future development through the installation of rain barrels, cisterns, or other water storage and reuse facilities.

Community Development

- Policy CD-1.27 When approving new construction, require the undergrounding of distribution utility lines serving the development. Encourage programs for undergrounding existing overhead distribution lines. Overhead lines providing electrical power to light rail transit vehicles and high tension electrical transmission lines are exempt from this policy.

City of Morgan Hill General Plan

The following City of Morgan Hill 2035 General Plan (2017 ~~2016~~) resource conservation policies may be applicable to the Project.

Natural Resources and the Environment

- Policy NRE-7.2: Water Standards for Public Development. Promote water conservation and efficient water use in all public development projects. All new public buildings shall be designed to exceed State standards for water efficiency.
- Action NRE-7.A: Infrastructure Maintenance. Correct known deficiencies in the City’s sewer, storm drain, and water systems and work toward environmentally sustainable systems. Maintain the City’s infrastructure to ensure that facilities are up to date and incorporate efficiency and conservation mechanisms.

Safety, Services, and Infrastructure

- Policy SSI-6.8: Increased Capacity. Encourage increased stormwater and flood management infrastructure capacity in order to accommodate changes in climate, precipitation, and extreme weather events.
- Policy SSI-13.2: System Assessment. Evaluate the capacity and condition of water, wastewater, and stormwater facilities on a regular basis to assess each system’s ability to withstand increased wet and dry weather events, meet changes in demand, and determine system deficiencies.
- Action SSI-13.A: Utility Improvements. Create a plan a d schedule for converting overhead utilities to underground facilities.
- Action SSI-13.D: Inspections. Regularly inspect infrastructure more vulnerable to storms (e.g., wooden utilities poles) to ensure reliability during storm events.

- Policy SSI-14.1: Efficient Water Management. Manage the supply and use of water more efficiently through appropriate means, such as watershed protection, percolation, conservation, and reclamation. (South County Joint Area Plan 7.00.
- Policy SSI-14.7: Water District Programs. Encourage the Santa Clara Valley Water District to continue developing programs to assure effective management of water resources, such as well monitoring, percolation of imported water, reclamation, and conservation. (South County Joint Area Plan 7.07).
- Policy SSI-15.6: Regional Infrastructure Planning. Coordinate with Gilroy and Santa Clara County on the infrastructure and public services needed for future urban development, including their location and timing. (South County Joint Area Plan 17.08)
- Policy SSI-16.4: Regional System Compatibility. Coordinate with the Santa Clara Valley Water District to ensure compatibility of the local and regional storm drainage systems.
- Policy SSI-17.1: Waste Diversion. Maximize reuse, recycling, and composting citywide to reduce the amount of waste disposed of in landfills.
- Policy SSI-17.3: Public Waste Reduction. Reduce the amount of waste disposed of in landfills through waste prevention, reuse, and recycling at venues, public facilities, and special events.
- Policy SSI-18.1: Access and Availability. Work with service providers to ensure access to and availability of a wide range of state-of-the-art telecommunication systems and services for households, businesses, institutions, and public agencies in Morgan Hill.

3.21.3 Methodology and Approach to Impact Analysis

The impact analysis considers whether implementation of the Project would result in significant adverse impacts related to utilities and service systems. The analysis focuses on reasonably foreseeable effects of the Project on existing utility services based on review of data collected. This analysis considers temporary impacts, or short-term impacts that may occur during the 7-year construction period, as well as permanent impacts, or impacts considered to be long-term and/or that would result from ongoing facility operations and maintenance.

The direct and indirect impacts of the Project are described and evaluated according to significance criteria from Appendix G of the *CEQA Guidelines*, discussed below. The baseline used for the analysis of impacts to utilities consists of existing conditions at time of the EIR preparation as modified by FOCP implementation.

The assessment of impacts for the purposes of this section has been divided into construction-related impacts and operation-related impacts by Project ~~project~~ component, as identified and described in **Table 2-1** of Chapter 2, *Project Description*. **Table 3.21-1** provides a summary of projected construction excavation volumes expected at the BHBA, the PGBP, and the three staging areas. Additional information on impact assessment approach by Project ~~project~~ component is provided below.

Table 3.21-1. Summary of Construction Excavation Volumes

Location/Stage	Cubic Yards Excavated	Cubic Yards Unusable*	Cubic Yards Reusable	Reusable Percent
Basalt Hill Borrow Area	1,677,000 ~~1,170,000~~	470,000 ~~367,000~~	1,207,000 ~~803,000~~	72% ~~68%~~
Packwood Gravel Borrow Pit	205,000	45,000 ~~160,000~~	160,000 ~~45,000~~	78% ~~99%~~
Stage 1a	1,210,000 ~~1,104,000~~	117,500 ~~98,000~~	1,092,800 ~~1,006,000~~	91%
Stage 1b	1,573,700 ~~1,507,000~~	359,800 ~~324,000~~	1,213,900 ~~1,183,000~~	79% ~~76%~~
Stage 2a	899,000 ~~970,000~~	40,000	930,000	96%
Total	5,636,000 ~~4,956,000~~	1,032,300 ~~989,000~~	4,603,700 ~~3,967,000~~	82% ~~80%~~

Source: Valley Water 2023 ~~2021a~~

** Excavated dam foundation, materials excavated from portals, tunnels, structures, and the top materials from borrow areas that cannot be reused (or disposed of within the borrow areas themselves) would be disposed of within a designated Reservoir Disposal Area.*

3.21.3.1 Seismic Retrofit Construction

The impact analysis considers the potential for the construction of the Seismic Retrofit component to result in impacts that would require or result in the relocation or construction of new or expanded stormwater drainage, electric power, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects. The analysis also considers whether the Project would generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, otherwise impair the attainment of solid waste reduction goals, or fail to comply with federal, State, and local management and reduction statutes and regulations related to solid waste. The location and nature of Seismic Retrofit construction activities are considered in the context of existing utilities and service systems that are within or immediately adjacent to the Project Area. The potential for Seismic Retrofit construction activities to result in a significant impact to the environment and public associated with utilities and service systems is evaluated. As described in Section 3.0, *Introduction*, the baseline for evaluating Seismic Retrofit construction effects is existing conditions at time of the EIR preparation as modified by FOCP implementation in 2020. Six Project ~~project~~ staging areas during seismic retrofit construction and construction of the Conservation Measures are proposed for the purposes of temporary offices and worker parking space, materials storage, construction vehicle and equipment parking and laydown areas, reservoir access, and stockpiling. As shown in **Table 2-4**, staging areas have been proposed in existing developed areas (picnic areas, parking lots) where possible, as well as some residential, open space, and undeveloped areas. Potential impacts to utilities consist of the protection of existing restroom facilities and the temporary removal of water fountains at the Live Oak Group Picnic Area during Project construction; and potentially the temporary removal of some lighting, landscaping and irrigation at a paved parking lot at the Anderson Reservoir boat launch parking lot. These construction-related impacts would be temporary and would not require or result in the relocation or construction of new or expanded facilities that could cause significant environmental effects. As a result, the potential impacts of the staging areas on utilities is not discussed further.

3.21.3.2 Conservation Measures Construction

Other components of the Project involve construction of Conservation Measures aimed at habitat restoration and facility improvements downstream of Anderson Dam. Impacts associated with utilities as noted above for the Seismic Retrofit component are analyzed for the Conservation Measure components. As described in Section 3.0, *Introduction*, the baseline for evaluating Conservation Measure construction effects is the existing conditions at time of the EIR preparation as modified by FOCP implementation.

Conservation Measures requiring construction activity that are evaluated in the impact analysis are:

- Ogier Ponds CM
- Maintenance Activities at Live Oak Restoration Reach
- Maintenance of the North Channel Reach ~~Extension~~
- Sediment Augmentation Program
- Phase 2 Coyote Perc Dam CM

3.21.3.3 Construction Monitoring

As described in Section 3.0, *Introduction*, the baseline for evaluating Construction Monitoring effects is the existing conditions at time of the EIR preparation as modified by FOCP implementation. Construction monitoring activities include data collection to monitor habitat environmental conditions (e.g., water quality, fisheries, sediment deposition, groundwater, invasive species); identify any changes to ecological functions and habitat values that have or may result from construction activity; and, where feasible, adjust construction activities to prevent or reduce the effect of those changes on baseline environmental conditions, often in compliance with Project regulatory permits. Construction monitoring activities are not considered in the impact analysis, as monitoring would involve data and information collection and assessment and would not result in direct or indirect adverse impacts related to utilities and service systems.

3.21.3.4 Post-Construction Anderson Dam Facilities Operations and Maintenance

As described in Chapter 2, *Project Description*, Valley Water would maintain the seismically retrofitted Anderson Dam and Reservoir in accordance with the existing DMP, which covers the maintenance of this facility. The Final DMP Program EIR was approved in January 2012 (SCH No. 2007022052; Valley Water 2012), and the impacts to utilities and service systems associated with Anderson Dam and Reservoir were determined to be less than significant. Impacts related to utilities and service systems associated with post-construction dam maintenance activities would be largely the same as existing conditions, and therefore the impacts identified in the analysis do not differ substantially from those impacts identified in the DMP EIR, which would cover these activities. Furthermore, previously identified DMP impacts would not be exacerbated with implementation of the Project. Therefore, no new impacts would occur as a result of post-construction dam maintenance activities.

Therefore, post-construction dam maintenance activities are not discussed further in this section.

3.21.3.5 Post-Construction Conservation Measures Operations and Maintenance

Operations and maintenance of Conservation Measures involves typical inspection site activities, trash and debris removal, vegetation trimming, repair and replacement of equipment or materials and other minor activities associated with successful continued operation of the facilities. Post-construction operations and maintenance of Project ~~project~~ Conservation Measures, including maintenance of the Live Oak Restoration Reach, would not result in the need for construction of new or replacement of utility facilities. Nor would the amount of trash or debris to be removed during routine maintenance activities be in excess of state or local goals or otherwise limit attainment of waste reduction goals.

Therefore, operations and maintenance of Conservation Measures would not result in significant impacts related to utilities and service systems. Thus, these topics are not discussed further in this section.

3.21.3.6 Post-Construction Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of Project ~~project~~ flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). Impacts of these monitoring activities are not evaluated in the impact analysis because they would not require the replacement, relocation, or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities. Also, they would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure.

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from original Conservation Measure construction. These impacts are considered here at a programmatic level, because the detailed characteristics, timing, and/or locations of the proposed adaptive measures are not known at the time of EIR preparation. Project-specific CEQA review would be undertaken in the future, as necessary, when specific projects are proposed and project-specific details are available.

3.21.3.7 Applicable Best Management Practices and VHP Conditions

As noted in Chapter 2, *Project Description,* Valley Water would incorporate a range of BMPs, including measures from the VHP, to avoid and minimize adverse effects on the environment that could result from the Project. All relevant BMPs for the Project are included in Appendix A, *Best Management Practices and Santa Clara Valley Habitat ~~Conservation~~ Plan Conditions, Avoidance and Minimization Measures, and Mitigation Measures* ~~*Incorporated in the Project.* BMPs have been customized for the Project, as necessary, to increase the potential that the intended goals are achieved.~~ There are no relevant VHP conditions that would apply to utilities and service systems. BMPs relevant to utilities and service systems include the following:

> **WQ-16:** Prevent Stormwater Pollution – Would prevent stormwater pollution by installing sedimentation and erosion control measures.

> **WQ-17:** Manage Sanitary and Septic Waste – Would avoid the need for relocation or construction of wastewater treatment facilities through the use of temporary sanitary facilities.

3.21.3.8 Thresholds of Significance

For the purposes of this analysis, the Project would result in a significant impact on utilities and service systems if it would:

> **UTL-1:** Require or result in the replacement, relocation, or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects (criterion a); or

> **UTL-2:** Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, otherwise impair the attainment of solid waste reduction goals; or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste (criteria d and e).

In addition to evaluating the physical effects of the Project to the study area's Utilities and Service Systems, applicable General Plan policies of the study area municipalities were considered when assessing the presence and severity of impacts on these systems, particularly with regard to Impact UTL-2.

3.21.3.9 Issues Dismissed from Further Review

CEQA Guidelines Appendix G suggests that projects may have a significant effect on utilities and service systems if they would require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects (criterion a). The Project would not involve the use, addition, replacement, or removal of natural gas pipelines or service within or immediately adjacent to the Project Area; therefore, no impact related to natural gas would result and this portion of the threshold (criterion a) is dismissed from further environmental evaluation. Project impacts to telecommunications facilities are addressed in Impact UTL-1 below.

CEQA Guidelines Appendix G suggests that projects may have a significant effect on utilities and service systems if they would have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years (criterion b). As discussed in the IS/NOP (Appendix B), the Project is designed to improve the safety, reliability, and flexibility of Valley Water's water supply by improving dam seismic stability. For this reason, the IS dismissed criterion b from further analysis. Impacts related to Valley Water's water supply are discussed in Section 3.13, *Water Supply*. Also, the Project by its very nature involves construction of new or expanded water supply facilities. These water supply facilities are described in Chapter 2, *Project Description*, and evaluated throughout this EIR, so are not separately evaluated in this section. The availability of water supply for construction activities, as well as water supply and supplemental groundwater replenishment supplies during construction while the Anderson Reservoir is drained and/or offline, are addressed in Section 3.13, *Water Supply*. The Project would not require construction of any new water supply treatment facilities. For these reasons, Project impacts on water facilities are not evaluated further in this section.

CEQA Guidelines Appendix G also suggests that projects may have a significant effect on utilities and service systems if they would result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments (criterion c). As described in the IS, during Project construction, portable toilets would be provided at the construction site, and wastewater generated from construction employees would be disposed of at the SCRWA wastewater treatment plant. The Project would comply with all State, RWQCB, and local requirements related to the disposal of sewage, and daily wastewater generated at the construction site would not exceed wastewater treatment requirements. Additionally, the Project would not result in any changes to the restrooms at Anderson Lake County Park, which would be closed throughout the Seismic Retrofit construction and would not result in the generation of additional wastewater requiring treatment and disposal.

The Project would have no impacts associated with wastewater treatment requirements, would not require new or expanded wastewater facilities, and thus, would have no impact on wastewater treatment demand or facilities. Lastly, Valley Water BMP WQ-17 would avoid the need for relocation or construction of wastewater treatment facilities through the use of temporary sanitary facilities. For these reasons, the impact with regard to wastewater service and facilities would be less than significant and this threshold (criterion c) is dismissed from further environmental evaluation.

During the public scoping period, the public expressed concern about the availability of irrigation water to residents along Coyote Road during Project construction. This issue is addressed in Section 3.13, *Water Supply*.

3.21.4 Impact Analysis

***Impact UTL-1: Require or result in the replacement, relocation, or construction of new or expanded stormwater drainage, telecommunication, or electric power facilities, the construction or relocation of which could cause significant environmental effects* (Less than Significant)**

Seismic Retrofit Construction

Construction of the Seismic Retrofit has the potential to impact utilities through the replacement, relocation, or construction of new or expanded stormwater drainage, telecommunication, or electric power facilities. The potential of the Seismic Retrofit to affect each resource type during construction and operation is discussed below.

Stormwater Drainage Facilities

As described in Chapter 2, *Project Description*, stormwater would be routed from upstream of the dam into the water diversion system and released into Coyote Creek; stormwater from downstream areas (at the spillway and outlet works construction areas and BHBA) would be collected and pumped to an ATS and released into Coyote Creek. Construction activities would also be subject to Valley Water BMP WQ-16, and conditions of the Project's SWPPP. In particular, BMP WQ-16 would protect stormwater quality through the use of sedimentation and erosion control measures. For the post-construction operations of the Anderson Dam Facilities, new or expanded stormwater facilities would not be required. Therefore, new or expanded stormwater drainage facilities (other than those included in the Project) would not be required for Seismic Retrofit components construction, and construction impacts on stormwater drainage would be less than significant.

Telecommunication Facilities

The existing SCADA copper-twisted pair telemetry cable would be replaced with 5,000 linear feet of new fiber optic SCADA telemetry cable between Anderson Dam and the Peet Road Junction Valve Vault. As described in Section 2.5.4 of Chapter 2, *Project Description*, the new telemetry cable would be installed using the cut-and-cover construction method with excavations up to 8-feet deep at locations of existing pullboxes and trenching up to 15-feet deep along existing conduit. Trenches would be shored to minimize excavation footprints. As noted above, all construction activities would be subject to Valley Water BMP WQ-16, and conditions of the Project's SWPPP. The proposed SCADA in-place replacement cables would serve the Anderson Dam, hydroelectric facility, and the Coyote Pumping warehouse and would not extend to existing or future offsite development. Aside from the telemetry cable installation, no activities related to telecommunication service would take place. These telecommunication cables would be located in areas that would be disturbed as a result of other construction activities associated with the Seismic Retrofit components, or within existing utility corridors. Therefore, construction impacts related to telecommunication facilities would be less than significant.

Electrical Facilities

Final decommissioning of the Anderson Dam hydroelectric facility would be a part of the Seismic Retrofit to improve cost efficiency of dam operations. Termination of the connection between the existing facility and PG&E infrastructure related to power generation occurred in 2018. As part of the Seismic Retrofit component, mechanical and electrical equipment would be disassembled and removed from the facility. This would occur during the first year of construction; all work would occur within the existing footprint of the facility. Following decommissioning, the hydroelectric facility would require minimal maintenance-related activities, including activities to prevent the dilapidation of the abandoned structure (e.g., routine annual inspections, building maintenance and repair, trash and debris removal, and vegetation management). Decommissioning of the hydroelectric facility would not require Valley Water or PG&E to construct new or expanded electrical facilities, because Valley Water stopped power generation at the facility in 2018 and is pursuing decommissioning as part of the Project due to the increasing cost to operate and maintain the aging infrastructure, which exceeded the value of the renewable energy that the facility generated.

During construction, electrical power would be supplied to all the Seismic Retrofit facilities (except facilities at the boat ramp parking area) by PG&E through an existing overhead 12.47 kV power distribution line along Coyote Road that will be constructed by PG&E during the FOCP. Toward the end of construction, the overhead line, power cables, utility poles, and distribution transformer would be relocated to new, permanent locations that are closer to the LLOW. Power needed for the temporary bypass pumping system in Year 2 and Year 6 may also require use of diesel-powered generators to support required pumping. Relocation of the overhead line, power cables, and distribution transformer would be implemented according to standard construction measures and best practices; accordingly, construction impacts would not be significant.

For those facilities located at the boat ramp parking area, electrical power would also be supplied by PG&E through overhead lines that connect to an existing overhead 12.47 kV power distribution line along Coyote Road. These overhead lines would be disconnected so the pole, transformers, and service equipment could be demolished for dam excavation and construction. Following completion of the dam, PG&E would install a new pole, service lines, and transformers at the left end of the dam. Reconstruction of the pole, service lines, and transformers would be implemented according to standard construction measures and best practices; accordingly, construction impacts would not be significant.

In the event of a major PG&E power outage, an emergency diesel generator and associated components, including an automatic transfer switch, installed during the FOCP near the diversion outlet structure, would be available for emergency power supply. The generator, rated at 277/480 Volt for a three-phase, four-wire distribution system, was sized at 500 kVA and would be able to be continuously operated. During the construction of the Seismic Retrofit components, the generator would be relocated to a location near the LLOW. Based on the above analysis, impacts related to electrical power facilities during Seismic Retrofit components construction would be less than significant.

Conservation Measure Construction

Construction of the Ogier Ponds CM would involve installation of a creek bypass system, partial or complete dewatering of Ponds 1, 2, 4, and 5, and construction of a spillway and outlet culvert. Construction of the Phase 2 Coyote Percolation Dam CM would include construction of a ramp up to the bladder dam foundation and alterations to provide adequate flow depth and velocity across the foundation and deflated bladder dam. ~~Construction~~ Maintenance of the North Channel ~~Extension~~ Reach would involve minor and intermittent maintenance activities (e.g., vegetation management, replacement plantings, and maintenance of the wetland bench~~)~~ ~~extending the channel previously modified during the FOCP to facilitate drainage and reconnection with Coyote Creek; work includes grading and vegetation removal~~. Construction activities included in Sediment Augmentation Program would improve geomorphic processes that create and maintain steelhead habitat (sediments and spawning gravels) and reduce channel incision that is typical in Lower Coyote Creek downstream of the dam. No new stormwater drainage, electrical power, or telecommunication infrastructure would be constructed as part of any of these Conservation Measures components.

Conservation Measures components construction activities would not require additional water supply or telecommunications facilities. Stormwater treatment and conveyance would conform to Valley Water BMP WQ-16 and SWPPP measures, as described above for Seismic Retrofit construction. Construction of the Conservation Measures components would rely upon electricity provided initially by onsite generators powered by diesel and/or propane and would not require the expansion of electrical utilities to the conservation measure sites. Construction activities associated with the Conservation Measures components would not result in an increased demand related to new or expanded storm water drainage, electrical power, or telecommunications facilities nor would the construction activities require the construction of new or relocation of existing utility facilities resulting in significant environmental effects. Therefore, impacts would be less than significant.

Post-Construction Anderson Dam Facilities Operations and Maintenance

Post-construction releases from Anderson Reservoir would be consistent with FAHCE rule curves and pulse flows. The proposed releases would not require new or expanded stormwater, telecommunications, or electrical facilities.

The Seismic Retrofit components, once constructed, would not substantially increase stormwater discharges to existing stormwater drainage systems, and therefore, would not require or result in the relocation or construction of new or expanded offsite stormwater management facilities. This impact would be less than significant.

Following relocation of the overhead line, power cables, and distribution transformer closer to the LLOW, operation and maintenance of electrical equipment would continue unchanged from current conditions. Similarly, after PG&E installs a new pole, service lines, and transformers at the boat ramp parking area, operation and maintenance of those facilities would conditions after implementation of the FOCP (existing conditions baseline). Electrical power for the operation of the dam facilities would be provided by existing electrical facilities.

Operations and maintenance of the existing electrical and telecommunications infrastructure associated with the Seismic Retrofit components would be similar to how those activities are performed under the existing conditions after implementation of the FOCP (existing conditions baseline). Operation and maintenance of the Seismic Retrofit components would not result in a substantial increase in electrical and telecommunications demand. Based on the above analysis, impacts related to the replacement, relocation, or construction of public utilities would be less than significant.

Post-Construction Project and FAHCE Adaptive Management

The implementation of adaptive actions as part of the Project FAHCE AMP may include refinements to the timing, frequency, and duration of Anderson Dam flow releases or physical changes in the Coyote Creek Watershed, such as exotic species removal, replacement riparian planting, or additional sediment augmentation. These actions would occur when conservation measures are not functioning as intended or not meeting measurable objectives. Adaptive actions would occur in Anderson Reservoir or within the Coyote Creek floodplain and may require the limited use of water or electricity. These refinements would likely have impacts similar to those discussed in this section for Conservation Measure construction and post-construction operations. Thus, adaptive management-related impacts associated with the use of utilities would not result in an increased demand related to new or expanded stormwater drainage, electrical power, or telecommunications facilities. Impacts would be less than significant.

Significance Conclusion Summary

As described above, construction of the Seismic Retrofit components would not require construction of new stormwater, telecommunications, or electric facilities. Relocation of some power lines would be required as part of the Seismic Retrofit component, and this process has been incorporated into the design of the Seismic Retrofit components. The utility infrastructure proposed to be relocated to serve the seismically retrofitted facilities would not affect other users. Decommissioning of the hydroelectric facility would not require Valley Water or PG&E to construct replacement electrical facilities. Therefore, impacts related to the replacement, relocation, or construction of public utilities would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact UTL-2: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, otherwise impair the attainment of solid waste reduction goals, or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste **(Less than Significant)**

Seismic Retrofit Construction

As described in Section 3.21.2, *Regulatory Setting*, the SCCIWMP describes implementation methods to divert waste away from landfills and encourage recycling and composting. More specifically, the City of San José's Construction and Demolition Diversion Deposit Program requires projects to achieve a 50 percent recycling rate. The recycling requirement may be met through direct facility recycling, reuse of the materials on site, or donation to reuse and salvage businesses in the Bay Area.

As discussed above, excavated materials not suitable for disposal in the reservoir disposal area would be hauled to an appropriate landfill depending on the material quantity and composition. Solid waste generated by the Project would include construction debris, demolition materials, excavated soils, and refuse. As shown in **Table 3.21-1** above, Seismic Retrofit construction would involve excavation of approximately 5,636,000 cy of material. Most of this material would be reused as fill material or disposed of in reservoir disposal areas. However, Project activities would generate solid waste that would be disposed of at off-site facilities. Solid waste generated by the Project includes but is not limited to approximately 12,500 cy of steel reinforced concrete excavated during spillway replacement; approximately 20,740 cy of concrete and 6,915 cy of asphalt demolished during repaving of Cochrane Road; and additional excavated material from the Basalt Hill Borrow Area and the Packwood Gravel Borrow Pit that cannot be reused. The Newby Island Landfill, Guadalupe Landfill, and Zanker Material Processing Facility are all certified under the City of San José's program to process mixed construction and demolition (C&D) waste. The landfills in San José have an estimated combined remaining capacity of approximately 33 million cy, and all but the Zanker Material Processing Facility have an estimated closure date beyond 2040.

As discussed in Chapter 2, *Project Description*, earthen materials associated with the removal and reconstruction of Anderson Dam would be primarily re-used on-site. The Project design includes excavating the shells of the dam and most of the core down to clay core foundation to receive the new embankment. The excavated shell and core materials would be salvaged from the dam shell excavation and stockpiled for reuse. **Table 3.21-1** provides a summary of earthwork volumes and their respective re-usable rate. In addition, construction would require clearing and grubbing; much of the vegetative material removed during this process would be chipped and re-used onsite.

As shown in **Table 3.21-1**, Seismic Retrofit construction would meet the City of San José's 50 percent recycling rate through the reuse of earthwork onsite. Collectively, Seismic Retrofit components would result in an estimated 1,032,300 ~~1,150,000~~ cy of material that could not be re-used onsite and would be placed in a 30-acre Reservoir Disposal Area within the reservoir on the west side of the downstream portion of the southern reservoir arm. This use of the Reservoir Disposal Area would reduce the quantities of material that would be sent to local landfills. All solid waste generated by the Project that cannot be utilized onsite would be disposed of at one or more of the City-certified mixed C&D waste facilities. These landfills would have the capacity to accept the Project's solid waste spread out over the course of the approximately 7-year-long construction period. If any soil is found to contain hazardous materials, excess soils would be characterized, transported from the Project Area, and disposed of at an appropriate landfill in compliance with federal, state, and local regulations. Refer to Section 3.10, *Hazards and Hazardous Materials*, for information regarding disposal of hazardous materials.

Seismic Retrofit components would not generate solid waste that would exceed federal, State or local standards, or exceed the capacity of local infrastructure, or impair the attainment of any solid waste goals. Seismic Retrofit construction would comply with applicable management and reduction regulations related to solid waste and would achieve an overall 80 percent diversion rate of re-usable materials. Thus, the Seismic Retrofit would comply with AB 939 by achieving a greater than 75 percent diversion rate. As mentioned above, the Project would meet diversion requirements for City of San José's Construction and Demolition Diversion Deposit Program. Therefore, this impact would be less than significant.

Conservation Measure Construction

Both the Ogier Ponds CM and the Phase 2 Coyote Percolation Dam CM would generate solid waste during construction activities. For construction of the Ogier Ponds CM, placement of about 630,000 ~~494,000~~ cy of fill would be necessary. Approximately 135,700 ~~114,000~~ cy would be soil that is reused from the excavation site. Construction of the Phase 2 Coyote Percolation Dam CM would require approximately 10,000 ~~6,400~~ cy of engineered fill material.

In addition, both Conservation Measures components would result in the removal of debris from the sites. Debris removed would consist of the unusable excavation material, vegetation and other organic material, and materials typically associated with construction. Unusable materials consist of top materials from borrow areas that cannot be reused or disposed of within the borrow areas themselves. While some of debris material would be re-used onsite. However, as mentioned above, the landfills in San José have an estimated combined remaining capacity of approximately 33 million cy. Additionally, all the listed landfills except the Zanker Material Processing Facility have an estimated closure date of 2040 or beyond. Any non-recyclable solid waste generated by the construction of these measures would be processed at one or more of these mixed C&D City-certified facilities, which would dispose of the leftover residue.

Because some waste would be re-used and based on the nature of the conservation measure construction process, this component of the Project would not generate solid waste in excess of federal, State, or local standards, or in excess of the capacity of local infrastructure, or impair the attainment of any solid waste goals. Additionally, implementation of Conservation Measures would comply with applicable management and reduction regulations related to solid waste. Therefore, this impact would be less than significant.

Post-Construction Anderson Dam Facilities Operations and Maintenance

Post-construction releases from Anderson Reservoir would be consistent with FAHCE rule curves and pulse flows. The proposed releases would not generate solid waste. Maintenance of Anderson Dam facilities also would not generate substantial amounts of solid waste, and any solid waste impacts would be minimized by the DMP and its BMPs. Anderson Dam Facilities operations and maintenance activities would not generate solid waste that would exceed federal, State or local standards, or exceed the capacity of local infrastructure, or impair the attainment of any solid waste goals.

Post-Construction Project and FAHCE Adaptive Management

The implementation of adaptive actions as part of the Project and FAHCE AMP may include refinements to the timing, frequency, and duration of Anderson Dam flow releases or physical changes in the Coyote Creek Watershed. Adaptive actions may require excavation and/or removal of material. Impacts of adaptive actions are expected to be similar to but less than impacts of constructing the Conservation Measures being adaptively managed. Thus, this component of the Project would not generate solid waste in excess of federal, State, or local standards, or in excess of the capacity of local infrastructure, or impair the attainment of any solid waste goals. Therefore, this impact would be less than significant.

Significance Conclusion Summary

The Project would neither generate solid waste exceeding the capacity of existing local solid waste management facilities, nor conflict with the Santa Clara County Integrated Waste Management Plan, the City of San José's Zero Waste Strategic Plan or local or State policies or regulations. Therefore, the Project would not generate solid waste that exceeds State or local standards or exceeds capacity of local solid waste management infrastructure, or otherwise impair attainment of solid waste reduction goals. The Project would comply with federal, State, and local management and reduction statutes and regulations related to solid waste. Therefore, the Project's impacts related to solid waste would be **less than significant**.

Mitigation Measures

No mitigation is required.

3.21.5 Cumulative Impact - Utilities and Service Systems

The study area for the cumulative impact analysis on utilities and service systems includes portions of the communities of the county and San José and Morgan Hill that are within the footprint of the Project Area and within the construction limits of the Seismic Retrofit and Conservation Measure components of the Project. This section describes the Project's contribution to cumulative recreation impacts, as summarized in **Table 3.21-2**.

Cumulative impact thresholds for recreation are the same as the impact thresholds presented in Section 3.21.3.8, *Thresholds of Significance*.

Table 3.21-2. Summary of Project Impact Contribution to Cumulative Utilities Impacts

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact UTL-1: Require or result in the replacement, relocation, or construction of new or expanded stormwater drainage, telecommunication, or electric power facilities, the construction or relocation of which could cause significant environmental effects	No	No	NCC	None	No
Cumulative Impact UTL-2: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, otherwise	No	No	NCC	None	No

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
impair the attainment of solid waste reduction goals, or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste					

Key: NCC = not cumulatively considerable

Cumulative Impact UTL-1: Require or result in the relocation or construction of new or expanded water, stormwater drainage, or electric power facilities, the construction or relocation of which could cause significant environmental effects (**Not Cumulatively Considerable)**

As discussed in Section 3.21.4, construction, operations, and adaptive management-related impacts associated with the Project would not result in an increased demand related to new or expanded stormwater drainage, electrical power, or telecommunications, the construction or relocation of which could cause significant environmental effects.

Cumulative Effects of Project with the FOCP

As described in Chapter 2, *Project Description*, no changes to existing utilities were implemented as part of the FOCP. Therefore, impacts to utilities between the Project and the FOCP would not be cumulatively significant, and the Project's contribution would not be cumulatively considerable.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Construction of the Seismic Retrofit would include temporary impacts to utilities including the temporary rerouting of stormwater during construction; the protection of existing restroom facilities and the temporary removal of water fountains at the Live Oak Group Picnic Area during Project construction; and potentially the temporary removal of some lighting, landscaping and irrigation at a paved parking lot at the Anderson Reservoir boat launch parking lot; replacement of existing telecommunication lines with fiberoptic cable; relocation and construction of electric power lines and transformers within the Seismic Retrofit Project Area ~~project area~~; and the decommissioning of the Anderson Dam hydroelectric facility, which has been nonoperational since 2018 and which involves leaving the existing infrastructure in place. All construction activities would have a less than significant environmental effect with the implementation of Valley Water best management practices and standard construction measures. New or expanded stormwater drainage, telecommunication, and electric power facilities would not be required for the post-construction operations of the Anderson Dam Facilities and Anderson Lake County Park.

Relevant projects within the study area that could have a potential impact on utilities include the Pacheco Reservoir Expansion Project, the Valley Water Encampment Clean Up Program, Residential, Commercial, Industrial, and Recreation Area Development within Santa Clara County. The Pacheco Reservoir Expansion Project is slated for construction from 2027 through 2034 and is located approximately 53 miles southeast of the Project. Due to the location of this project relative to the Project and the need to comply with federal and state requirements, it is unlikely that cumulatively significant impacts to water, stormwater, or electrical utilities would occur.

Regarding the Valley Water Encampment Clean Up Program and future Residential, Commercial, Industrial, and Recreation Area Development generally in Santa Clara County, the timing of those projects is ongoing and may overlap with Project construction and implementation. While it is possible these projects could require the construction or relocation of utilities which could cause an individual or cumulatively considerable environmental effect, these projects will also be required to undergo an evaluation of any potential environmental impacts and provide avoidance and minimization or mitigation measures for any identified effects in compliance with federal, state, and local requirements. The Project's impacts when added to the impacts of other probable future impacts are not cumulatively significant, and the Project's contribution is not cumulatively considerable.

Significance Conclusion Summary

Project activities would not result in a significant environmental effect due to the relocation or construction of utilities. Additionally, as any impacts would be limited to the Project area in timing and scope and as other projects in the study area will be required to provide avoidance and minimization, or mitigation measures for any potential environmental effects resulting from the relocation or construction of new or expanded utilities, the Project's impacts when added to the impacts of other probable future impacts related to the relocation or construction of new or expanded utilities on local service areas are **not cumulatively significant**, and the Project's contribution is **not cumulatively considerable**.

Mitigation Measures

No mitigation is required.

Cumulative Impact UTL-2: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, otherwise impair the attainment of solid waste reduction goals, or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste (Not Cumulatively Considerable)

As discussed in Section 3.21.4, the Project would re-use approximately 80 percent of all solid waste generated by the Project (in compliance with the City of San Jose's 50 percent recycling rate and AB 341 75 percent diversion requirements), resulting in approximately 1,032,300 ~~989,000~~ cubic yards of unusable solid waste, of which the majority would be placed in a 30-acre Reservoir Disposal Area onsite. Any waste off-hauled would be disposed of in compliance with federal, state and local management and reduction statutes and regulations related to solid waste.

Cumulative Effects of Project with the FOCP

As described in Section 2, *Project Description*, as part of the FOCP, excavated materials from the diversion portal and diversion tunnel material and other FOCP activities were stockpiled onsite in anticipation of future construction work. These quantities were minimal in comparison to the proposed Seismic Retrofit and have been incorporated into **Table 3.21-1**, Summary of Construction Excavation Volumes and compliance with City of San Jose and AB 939 requirements. Accordingly, the effect on solid waste generation of the Project with the FOCP is not cumulatively significant, and the Project's contribution is not cumulatively considerable.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Most of the cumulative projects listed in Section 3.0.5, *Approach to Cumulative Impacts*, regardless of construction date, would dispose of construction debris at available landfills, which would contribute to reductions in available landfill capacity. Similar to the Project, these projects would be subject to 75 percent diversion requirements pursuant to AB 341. Additionally, Santa Clara County's Integrated Waste Management Plan identified the unified goals, policies and objectives for waste management across the county, with an overall objective of complying with CIWMA. Accordingly, individual projects will be required to comply with applicable federal, state and local requirements for solid waste diversion both individually and cumulatively. Therefore, the Project with other probable projects is not cumulatively significant, and the Project's contribution is not cumulatively considerable.

Significance Conclusion Summary

The Project would not generate solid waste in excess of State or local standards or in excess of the capacity of local infrastructure. The Project would not otherwise impair the attainment of solid waste reduction goals, or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste. The Project's impacts when added to the impacts of the FOCP or other probable future projects would **not be cumulatively significant**, and the Project's impacts would **not be cumulatively considerable**.

Mitigation Measures

No mitigation is required.

3.22 Wildfire

This section describes the impacts of the Project related to wildfire. The regulatory setting and environmental setting are provided as a basis for evaluating significant impacts.

The study area used to assess impacts related to wildfire includes the Project Area of the Seismic Retrofit and Conservation Measures components (i.e., the Project Area), inclusive of construction limits, as well as any adjacent lands within a 500-foot buffer that are designated or zoned for fire hazard severity and/or wildland urban interface (WUI). The baseline used for the analysis of wildfire impacts consists of existing conditions at the time of EIR preparation as modified by the FOCP implementation.

3.22.1 Environmental Setting

The environmental setting presents existing wildfire conditions in the Project study area. **Figure 3.22-1** shows the Project Area in relation to CALFIRE's Fire Hazard Severity Zones (FHSZ) and the SRA, and **Figure 3.22-2** shows the Project Area in relation to WUI zones. Wildland urban interface is dense housing adjacent to vegetation that can burn in a wildfire while wildland urban intermix is housing development interspersed in an area dominated by wildland vegetation subject to wildfire (CALFIRE 2019a). The wildfire influence zone is wildfire susceptible vegetation up to 1.5 miles from WUI or wildland urban intermix (CALFIRE 2019a).

Fire Hazard Severity Zones

CALFIRE maps FHSZ based on factors such as fuel, slope, and fire weather. The designated zones are classified as having moderate, high, and very high fire severity. FHSZs do not predict where wildfires may occur, but they do indicate where the effects of a wildfire could be greater and have more impact to values at risk such as residences or watersheds. The goal of FHSZ mapping is to reduce the loss associated with wildfire by incorporating the risk of wildfire into planning, fire prevention, and fire mitigation measures. **Table 3.22-1** summarizes the areas of FHSZs within the Seismic Retrofit component area, which includes HFHSZ. These areas are shown in **Figure 3.22-1**.

A portion of the Project Area is located within a SRA, and it is designated a HFHSZ (CALFIRE 2007a). The Project Area also includes lands located within a LRA that are not considered a HFHSZ (CALFIRE 2008). Finally, the Project Area includes lands located within the WUI, as mapped by the County (County 2009) and shown in **Figure 3.22-2**. WUI areas are locations where urbanized areas adjoin wildland areas that contain fuel, terrain, and other characteristics that make them conducive to wildfire and the spread of wildfire from wildland areas into urbanized and developed areas.

Table 3.22-1. Fire Hazard Severity Zones Within the Project Area

Fire Hazard Severity Zone Classification	Acres Within the Seismic Retrofit Component Area
Moderate	469
High	57
No Fire Hazard Severity Zone	747

CALFIRE 2019b

Fire History

Although wildfires occur on an annual basis throughout the county, they are often contained through early identification, maintaining emergency access routes, and an extensive County-fire suppression response. However, fires can quickly increase in size and cause significant damage if ignitions occur during unfavorable weather (i.e., dry and windy) and/or in areas with poor access. Several fires have occurred in the Project Area vicinity, including but not limited to:

- The 2023 Cochrane Fire, which burned 72 acres north of Morgan Hill adjacent to the Kirby Canyon Landfill and Coyote Ridge Open Space Preserve (CALFIRE 2023a).
- The 2020 Santa Clara Unit Lightning Complex Fire, which was the third largest wildfire in California history, burning 396,624 acres and spanning Stanislaus, Santa Clara, Alameda, Contra Costa, and San Joaquin Counties (CALFIRE 2021). The closest perimeter of the Santa Clara Unit Lightning Complex Fire is located approximately 6 miles northeast of the Project Area.
- The 2020 Park Fire, which burned 343 acres southeast of Anderson Reservoir over three days. The extent of this fire included residential areas along East Dunne Avenue and Finley Ridge Road (CALFIRE 2023b).
- The 2011 McDonald Fire, which burned approximately 60 acres near McDonald Lane in Morgan Hill west of Anderson Reservoir (CALFIRE 2011).
- ~~The perimeter of t~~ The 2007 Lick Fire, which burned 47,183 acres. The perimeter of the 2007 Lick Fire is~~also~~ located approximately 6 miles northeast of the Project Area (CALFIRE 2007b ~~2020~~).

Other fire incidents have occurred recently in the Anderson Reservoir area that required emergency response from CALFIRE, including but not limited to a vehicle fire on Shady Lane Drive east of Anderson Reservoir in 2023. CALFIRE has historically used Anderson Reservoir as a source of water for firefighting, via dipping of water buckets by helicopter.

Fire Threat (CALFIRE)

A risk/hazard assessment of Morgan Hill conducted as part of the Santa Clara County CWPP identified the Project Area as having areas of low, moderate, high, and extreme risk for Fire Threat (County 2016 ~~SWCA 2016b~~), as summarized in **Table 3.22-2** and shown in **Figure 3.22-3**. A Fire Threat is a combination of two factors: 1) historic fire frequency, which is an indicator of the likelihood of a given area burning, and 2) potential fire behavior (hazard), based on fuels, terrain, wind patterns, and other characteristics that lead to a heightened risk of wildfire. These two factors are combined to create four threat classes ranging from moderate to extreme. Fire

Threat represents the relative likelihood of a damaging or difficult to control wildfire occurring in a given area. A portion of the Project Area is located within high and very high fire threat areas, indicating that fires that start within certain portions of the Project Area have the potential to be difficult to control and have the potential for impacts on various assets and values susceptible to fire.

Table 3.22-2. Fire Threat Zones Within the Project Area

Fire Threat Classification	Acres Within the Project Study Area
Low	27
Moderate	68
High	74
Very High	10
Unmapped	1,093

CALFIRE 2019b

Fire Suppression Access/Evacuation Routes

Access and evacuation routes typically overlap, with fire crews traveling towards an advancing fire as residents and visitors to an area travel away from the fire. Existing access roads to the Project site in case of emergency and potential evacuation routes within the study area include:

Highway 101: A north-south freeway extending northward to San Francisco and southward through Gilroy. US 101 is an eight-lane freeway (three mixed-flow lanes and one HOV lane in each direction) north of Cochrane Road. South of Cochrane Road, US 101 narrows to a six-lane freeway with no HOV lanes. Access to and from the Project Area and the San Pedro Avenue staging area is provided via the US 101 interchanges at Cochrane Road, Dunne Avenue, and Tennant Avenue. US 101 would also serve as the collector route for evacuations.

Las Animas Road: A two-lane local road that extends from the Las Animas Road eastern terminus to San Felipe Road. Las Animas Road would provide direct access to the Project Area via the constructed Shingle Valley Road Haul Road. Emergency vehicles may use this road to enter the Project Area while visitors to the surrounding recreational areas may use the road to evacuate, depending on the specific wildfire behavior.

Shingle Valley Road: A two-lane local road that extends from Las Animas Road in the east to Metcalf Road. Shingle Valley Road would provide direct access to the Project Area via the constructed Shingle Valley Road Haul Road. Emergency vehicles could use this road to enter the Project Area while visitors to the surrounding recreational areas could use the road to evacuate, depending on the specific wildfire behavior.

Shingle Valley Haul Road ~~Haul~~: The Project would include the construction of an extension of Shingle Valley Road that would provide direct access to the northwest side of Anderson Reservoir along Las Animas Creek. Emergency vehicles could use this road, once constructed, to gain further access to the Project Area, depending on the specific wildfire behavior.

Main Avenue: As designated as an arterial per the 2035 City of Morgan Hill General Plan, Main Avenue is a two-lane east-west roadway that extends from Cochrane Road to the east to John Telfer Drive to the west. Main Avenue provides access to the Project Area via Cochrane Road and access to the San Pedro staging area via Hill Road.

Cochrane Road: An east-west arterial per the 2035 City of Morgan Hill General Plan, Cochrane Road extends from Main Avenue to the east to Monterey Road to the west. Cochrane Road is a four-lane divided roadway west of Mission View Drive and a two-lane undivided roadway east of Mission View Drive. Cochrane Road provides direct access to the Project Area and provides access to Coyote Road. This road may be used by emergency vehicles to access the Project Area, and the roadway may also be used as an evacuation route for the surrounding area, depending on the specific wildfire behavior.

Monterey Road ~~Highway~~: A east-west arterial that extends from Cochrane Road to the east to First Street in San José to the west. Monterey Highway is a six-lane divided roadway that provides access to the Ogier Ponds CM area via Ogier Avenue from Monterey Highway.

Dunne Avenue: An east-west arterial per the 2035 City of Morgan Hill General Plan, Dunne Avenue transverses the City of Morgan Hill. The roadway provides access to the San Pedro Avenue staging area via Hill Road and provides access to Anderson Reservoir via Holiday Drive. This road may be used by emergency vehicles to access the Project Area, and the roadway may also be used as an evacuation route for the surrounding area, depending on the specific wildfire behavior.

Hill Road: A two-lane north-south undivided road that extends from Main Avenue to the north to Maple Avenue to the south. Hill Road provides direct access to the San Pedro Avenue staging area from East Dunne Avenue, an exit off US 101.

Holiday Drive: A two lane north-south undivided road that connects to East Dunne Avenue. This road has been identified as an evacuation route for the Holiday Lakes Estates and Jackson Oaks communities.

Quail Lane/ Copper Hill Drive: A two lane north-south undivided road that connects to Holiday Drive. This road has been identified as an evacuation route for the Holiday Lakes Estates and Jackson Oaks communities.

Jackson Oaks Drive: A two lane east-west undivided road that connects to Holiday Drive and East Dunne Avenue. This road has been identified as an evacuation route for the Holiday Lakes Estates and Jackson Oaks communities.

Oak Leaf Drive: A two lane north-south undivided road that connects to East Dunne Avenue. This road has been identified as an evacuation route for the Holiday Lakes Estates and Jackson Oaks communities.

Thomas Grade: A two lane east-west road that connects East Dunne Avenue at both ends, providing an alternative route to East Dunne Avenue. This road has been identified as an evacuation route for the Holiday Lakes Estates and Jackson Oaks communities

In general, despite these regional access/evacuation routes, the Project is located in an area where wildfire risk and associated evacuation challenges are a community concern. Residents in the surrounding areas, namely Holiday Lakes Estates and Jackson Oaks, have expressed concerns to Valley Water regarding the adequacy of evacuation routes during a wildfire event.

These communities have limited existing evacuation options, with a single primary route (East Dunne Avenue) available for residents to leave the area in the event of a wildfire. Regarding the lack of identified evacuation routes through the Rosendin Park area, please see discussion "Regulatory Setting, Community Wildfire Protection Plan" below.

3.22.2 Regulatory Setting

There are no federal laws, regulations, or policies that are pertinent to the Project's impacts related to wildfire. This section summarizes State and local laws, regulations, and policies pertinent to the evaluation of the Project's wildfire impacts.

3.22.2.1 State Laws, Regulations, and Policies

California Public Resources Code

The PRC includes fire safety regulations restricting the use of certain equipment that could produce sparks or flames and specifies requirements for the safe use of gasoline-powered tools in fire hazard areas.

PRC Sections 4125-4137 (Responsibility for Fire Protection) requires the State Board of Forestry and Fire Protection to classify all state lands for the purpose of determining areas in which the financial responsibility of preventing and suppressing fires is primarily the responsibility of the State, or SRA, and therefore under the jurisdiction of CALFIRE. All state lands that are not classified as an SRA are considered to be the responsibility of local or federal agencies and are considered LRAs or Federal Responsibility Areas. There are no Federal Responsibility Areas in the vicinity of the Project Area.

PRC Sections 4201-4204 (Fire Hazard Severity Zones) directs CALFIRE to map and periodically review FHSZ within SRAs, based on determining factors such as fuel loading, slope, and fire weather and winds. These FHSZs are the basis for identifying requirements for fire protection found in other regulations such as the California Fire Code.

California Fire Code

The California Fire Code (Title 24 of the CCR, Part 9) establishes minimum requirements to safeguard public health, safety, and general welfare from the hazards of fire, explosion, or dangerous conditions in new and existing buildings. Chapter 33 of the CCR contains requirements for fire safety during construction and demolition as follows:

> **3304.1 Smoking.** Smoking shall be prohibited except in approved areas. Signs shall be posted in accordance with Section 310. In approved areas where smoking is permitted, approved ashtrays shall be provided in accordance with Section 310.
>
> **3304.2 Combustible debris, rubbish, and waste.** Combustible debris, rubbish, and waste material shall comply with the requirements of Sections 3304.2.1 through 3304.2.4.
>
> **3304.2.1 Combustible waste material accumulation.** Combustible debris, rubbish, and waste material shall not be accumulated within buildings.
>
> **3304.2.2 Combustible waste material removal.** Combustible debris, rubbish, and waste material shall be removed from buildings at the end of each shift of work.
>
> **3304.2.3 Rubbish containers.** Where rubbish containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m^3 [cubic meter]) are used for temporary storage of combustible debris, rubbish, and waste material, they shall have tight-fitting or self-closing

lids. Such rubbish containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with American Society for Testing Materials E1354 at an incident heat flux of 50kW/m^2 in the horizontal orientation.

3304.2.4 Spontaneous ignition. Materials susceptible to spontaneous ignition, such as oily rags, shall be stored in a listed disposal container.

3304.6 Cutting and welding. Operations involving the use of cutting and welding shall be done in accordance with Chapter 35.

3304.7 Electrical. Temporary wiring for electrical power and lighting installations used in connection with the construction, alteration, or demolition of buildings, structures, equipment, or similar activities shall comply with the California Electrical Code.

3308.1 Program superintendent. The owner shall designate a person to be the fire prevention program superintendent who shall be responsible for the fire prevention program and ensure that it is carried out through completion of the Project. The fire prevention program superintendent shall have the authority to enforce the provisions of this chapter and other provisions, as necessary, to secure the intent of this chapter. Where guard service is provided, the superintendent shall be responsible for the guard service.

3308.2 Prefire plans. The fire prevention program superintendent shall develop and maintain an approved prefire plan in cooperation with the fire chief. The fire chief and the fire code official shall be notified of changes affecting the utilization of information contained in such prefire plans.

3310.1 Required access. Approved vehicle access for firefighting shall be provided to all construction or demolition sites. Vehicle access shall be provided to within 100 feet of temporary or permanent fire department connections. Vehicle access shall be provided by either temporary or permanent roads, capable of support vehicle loading under all weather conditions. Vehicle access shall be maintained until permanent fire apparatus access roads are available.

3316.1 Conditions of use. Internal combustion–powered construction equipment shall be used in accordance with all of the following conditions:

1. Equipment shall be located so that exhausts do not discharge against combustible material.
2. Exhausts shall be piped to the outside of the building.
3. Equipment shall not be refueled while in operation.
4. Fuel for equipment shall be stored in an approved area outside of the building.

CCR Title 14, Division 1.5, Chapter 7, Subchapter 2 contains the SRA Fire Safe regulations. These regulations apply to all new construction within SRAs. Local agencies may adopt ordinances that meet or exceed these minimum standards.

California Building Code

The California Building Code Chapter 7A and California Fire Code Chapter 49 includes regulations adopted to increase the ability of buildings constructed in any Fire Severity Zone to resist the intrusion of flames or burning embers projected by a vegetation fire. The intent is to reduce structure loss associated with wildfire.

California Department of Forestry and Fire Protection

CALFIRE provides fire protection and stewardship of over 31 million acres of California's privately-owned wildlands. In addition, CALFIRE provides varied emergency services in 36 of the state's 58 counties via contracts with local governments. Portions of the Project Area are located within lands subject to an SRA designation. These are lands where the State of California bears financial responsibility for the prevention and suppression of wildfires.

Portions of the Project Area are also located within the CALFIRE Santa Clara Unit (SCU). The SCU prepares an annual Strategic Fire Management Plan for the upcoming fire season. The plan documents an assessment of the fire situation in the SCU, includes stakeholder contributions and priorities, and identifies strategic targets for pre-fire solutions as defined by the people who live and work within the local fire problem area.

2018 Strategic Fire Plan for California

The Strategic Fire Plan, developed by the State Board of Forestry and Fire Protection, provides direction and guidance to CALFIRE and its 21 field units. The 2018 Strategic Fire Plan sets forth a number of goals focused on fire prevention, natural resource management, and fire suppression efforts. These goals are summarized below:

a. Improve the availability and use of consistent, shared information on hazard and risk assessments

b. Promote the role of local planning processes, including general plans, new development, and existing developments, and recognize individual landowner/ homeowner responsibilities

c. Foster a shared vision among communities and the multiple fire protection jurisdictions, including county-based plans and community-based plans such as Community Wildfire Protection Plans (CWPP)

d. Increase awareness and actions to improve fire resistance of man-made assets at risk and fire resilience of wildland environments through natural resource management

e. Integrate implementation of fire and vegetation fuels management practices consistent with the priorities of landowners

f. Determine and seek the needed level of resources for fire prevention, natural resource management, fire suppression, and related services

g. Implement needed assessments and actions for post-fire protection and recovery

Space for Fire Protection

The State of California requirements regarding defensible-space are contained in PRC Section 4291 and Government Code Section 51182. PRC Section 4291 primarily directs the creation of defensible space in SRAs. The code generally includes a requirement to maintain defensible space of 100 feet from each side and from the front and rear of structures, but not beyond the property line except under specific circumstances.

California Public Utilities Commission

The CPUC has a significant role in permitting investor-owned utility transmission and substation facilities. This oversight applies to the Project's power transmission lines and substations as they were constructed and are operated by PG&E under the jurisdiction of the CPUC. General Order (GO) 95 applies to the construction, operation, and maintenance of overhead lines that are subject to CPUC jurisdiction.

Wildfire Mitigation Plans

California SB 901 was enacted in 2018. SB 901 requires every electric utility to prepare a wildfire mitigation plan. California AB 1054, signed into law July 2019, created the California Wildfire Safety Advisory Board, a board of independent expert advisors, to advise a new Wildfire Safety Division within the CPUC on wildfire safety measures, including plans written by utilities, so that the CPUC can more effectively regulate the safety of investor-owned utilities.

3.22.2.2 Regional and Local Laws, Regulations, and Policies

Santa Clara County Emergency Operations Plan and Wildfire Annex

The Santa Clara Office of Emergency Management updated the County EOP in 2022 ~~2017~~ (Santa Clara Office of Emergency Management 2022 ~~2017~~). The EOP provides a comprehensive, single source of guidance and procedures for the County to prepare for, respond to, and manage significant or catastrophic natural or man-made threats, crises, incidents, or events that produce situations requiring a coordinated response.

The Santa Clara County Emergency Operations Plan Wildfire Annex (Wildfire Annex) was updated in 2019 (Santa Clara County Office of Emergency Management 2019). The Wildfire Annex is intended as a reference guide for readers to consult at key moments during preparedness and response, as well as by organizational planners during annex review and revision. In addition, the Wildfire Annex includes resources and tools available for use to successfully manage a wildfire event and includes a section on evacuation considerations. Under the procedures outlined in the Wildfire Annex, field-level Unified Command will act as the lead in evacuating the public from designated evacuation areas with support from the Santa Clara County Fire Department and other mutual aid partners.

Santa Clara County Fire Department/Fire Marshal

The Fire Chief serves as the County Fire Marshal and provides management oversight for Santa Clara County's Office of Emergency Management and 9-1-1 Communication Center. The County Fire Marshal's Office is responsible for fire prevention activities in most unincorporated areas of the county. The department also provides emergency response to over 226,000 residents in the communities of Campbell, Cupertino, Los Altos, Los Altos Hills, Los Gatos, Monte Sereno, Redwood Estates, Saratoga, and adjacent unincorporated areas.

Santa Clara County Fire Marshal Standards and Specifications

Section A33-47 of Santa Clara County Code and Section 101 of the California Fire Code give the County Fire Marshal the authority to make and enforce such rules and regulations for the prevention and control of fire and fire hazards that may be necessary to carry out the intent of the Code. Copies of the Santa Clara County Fire Marshall Standards and the County Fire Code Amendments can be found on the Santa Clara County Department of Planning and Development website (County 2021).

The Fire Marshal's Office also has the responsibility for enforcing Title 19 of the CCR, and portions of the California Building Code, as adopted by the County. A copy of the County Fire Code is kept at the County Clerk of the Board's Office (County ~~Santa Clara County Fire Marshal~~ 2021).

Santa Clara County Community Wildfire Protection Plan

The Santa Clara County CWPP was developed in 2016 (County ~~Santa Clara Fire~~ 2016) to provide a countywide strategic plan with goals for creating a safer WUI community, accompanied by report annexes that address specific issues and projects by jurisdiction and stakeholder organizations to meet the strategic goals.

As described in the CWPP, there are potential emergency evacuation routes that utilize trails within Anderson Lake County Park and the Rosendin Park Area. However, according to the CWPP website FAQ, the CWPP and various annexes are considered final drafts that have not been officially approved or adopted. Specifically, the FAQ states: "The most recent [CWPP] final draft was completed in August 2016 and couldn't be approved before the Loma Fire started in September 2016. With the Loma Fire burning 4,474 acres before the CWPP could be approved, many priority fire prevention projects identified in various CWPP Annexes became no longer applicable. Representatives from Santa Clara County Fire Department (SCCFD) and CALFIRE then agreed to postpone the approval and adoption process until the affected portions of the CWPP could be updated" (County 2023). Thus, the existing CWPP at the time of Final EIR preparation, including its Annex 18, is not an adopted emergency evacuation plan. Additionally, the County has clarified that any routes identified through the Rosendin Park Area, including the Rancho Laguna Seca Trail, are intended solely for the evacuation of park visitors and are not designated as formal public evacuation routes, nor were they designed, built or maintained for this purpose (E. Ross, Pers. Comms., December 19, 2024). CALFIRE (South Santa Clara County Fire District) has also stated that trails through Rosendin Park are not evacuation routes (C. Alcantar, Pers. Comms., December 18, 2024).

Furthermore, there is a new draft of CWPP Annex 18, *County of Santa Clara Department of Parks and Recreation*, that does not identify any evacuation routes, including in the Anderson Lake vicinity or in any other county parks facilities (County 2024). The updated Annex 18 is planned to be considered for adoption in 2025 as part of the updated countywide CWPP (R. Eisner, Pers. Comms., December 23, 2024). Based on the above information, trails within the Rosendin Park Area were not evacuation routes at the time of EIR preparation and are not included as future evacuation routes in the planned 2025 updated CWPP.

Santa Clara County General Plan

The Santa Clara County General Plan does not provide specific policies around wildfire but does include policies regarding general natural hazards. These policies include:

- **C-HS 29**: Inventories and mapping of natural hazards should be adequately maintained for use in planning and decision-making.
- **C-HS 30**: Local jurisdictions' urban development and land use policies should minimize the resident population within areas subject to high natural hazards in order to reduce the overall risk to life and property, and the cost to the general public of providing urban services and infrastructure to urban development.
- **C-HS 32**: Areas of significant natural hazards shall be designated in the County's General Plan as Resource Conservation Areas with low development densities in order to minimize public exposure to avoidable risks.
- **C-HS 33**: Development in areas of natural hazards should be designed, located, and otherwise regulated to reduce associated risks, by regulating the type, density, and placement of development where it will not be directly jeopardized by hazards, increase hazard potential, and increase risks to neighboring properties.
- **C-HS 35**: Information about the prevalence and threats of natural hazards shall be provided to the public to maintain general awareness and support for governmental actions needed to improve public safety.

City of Morgan Hill General Plan

The Goal of the City of Morgan Hill's General Plan for fire hazards is to minimize threats to persons, property, and the environment. The policies include:

- **SSI-3.1 Development in Fire Hazard Areas**: Minimize development in fire hazard areas and plan and construct permitted development so as to reduce exposure to fire hazards and to facilitate fire suppression efforts in the event of a wildfire.
- **SSI-3.2 Wildfire Risks**: Avoid actions which increase fire risk, such as increasing public access roads in fire hazard areas, because of the great environmental damage and economic loss associated with a large wildfire.
- **SSI-3.3 Public Facilities Location**: Locate, when feasible, new essential public facilities outside of high fire risk areas, including, but not limited to, hospitals and health care facilities, emergency shelters, emergency command centers, and emergency communications facilities, or identify construction methods or other methods to minimize damage if these facilities are located in a state responsibility area or very high fire hazard severity zone.
- **SSI-3.4 Adequate Infrastructure**: Design adequate infrastructure if a new development is located in a state responsibility area or in a very high fire hazard severity zone or high fire hazard severity zone as indicated on the City of Morgan Hill Wildland Urban Interface map, including safe access for emergency response vehicles, visible street signs, and water supplies for structural fire suppression.
- **SSI-3.5 Fire Risks**: Work cooperatively with CALFIRE and other public agencies with responsibility for fire protection to reduce fire risks in Morgan Hill.

- **SSI-3.6 Fire Hazard Severity Zones**: Continue to support special High Fire Hazard Severity Zone requirements.
- **SSI 3.7 Inspection Program**: Maintain a long-range inspection program for fire prevention with highest priority established by the level of occupancy and the nature of occupancy. Update all information regarding hazardous areas to reflect current knowledge.

Envision San José 2040 General Plan

The goal of the Envision San José 2040 General Plan for Wildland and Urban Fire Hazards is to protect lives and property from risks associated with fire-related emergencies at the urban/wildland interface. The policies include:

- **EC-8.1:** Minimize development in very high fire hazard zone areas. Plan and construct permitted development so as to reduce exposure to fire hazards and to facilitate fire suppression efforts in the event of a wildfire.
- **EC-8.2:** Avoid actions which increase fire risk, such as increasing public access roads in very high fire hazard areas, because of the great environmental damage and economic loss associated with a large wildfire.
- **EC-8.3:** For development proposed on parcels located within a very high hazard severity zone or wildland-urban interface area, implement requirements for building materials and assemblies to provide a reasonable level of exterior wildfire exposure protection in accordance with City-adopted requirements in the California Building Code
- **EC-8.4:** Require use of defensible space vegetation management best practices to protect structures at and near the urban/wildland interface.

3.22.3 Methodology and Approach to Impact Analysis

This impact analysis considers whether the construction and operation of the Project would result in significant adverse impacts to the environment related to wildfire. This analysis focuses on an evaluation of whether or not the Project's construction and operations would exacerbate wildfire risks and thereby expose the area to wildfire or the uncontrolled spread of wildfire. The evaluation was performed using geographic information systems and information available from CALFIRE and the General Plans for the County of Santa Clara, City of Morgan Hill, and City of San José to analyze the threat of wildfire throughout and within the vicinity of the Project Area. The analysis considers temporary impacts, or short-term impacts, that may occur during the 7-year construction period, and permanent impacts, or impacts considered to be long-term and/or those that would result from ongoing operations and maintenance activities.

The direct effects of the Project are described and evaluated according to the significance criteria from Appendix G of the *CEQA Guidelines*, discussed below. The baseline used for the analysis of wildfire impacts consist of existing conditions at the time of the EIR's preparation, as modified by FOCP implementation.

Impacts associated with wildfire are evaluated within the context of the effectiveness of standard wildfire risk abatement methods as they relate to the construction and operation of the Project. The general rule employed in this analysis is that if wildfire risk can be effectively lessened through implementation of standard regulatory requirements (e.g., compliance with the regulatory requirements described above in Section 3.22.2, then the impact would be less than significant.

The assessment of impacts for the purposes of this section has been divided into construction-related impacts and operation-related impacts by Project component, as identified and described in **Table 2-1** of Chapter 2, *Project Description*. Each Project component has been analyzed to determine if the Project's construction and operation would expose persons within the Project Area and adjoining vicinity to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire; require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; expose people or structures to significant risks as a result of post-fire slope instability; or expose people or structures to significant effects involving wildland fires.

3.22.3.1 Seismic Retrofit Construction

The potential for the Seismic Retrofit component construction activities to result in a significant impact to the environment and public related to the risk of wildfire is evaluated. As described in Section 3.0, *Introduction*, the baseline for evaluating Seismic Retrofit construction effects is the existing conditions following completion of the FOCP upgrades to the existing dam and reservoir facilities. Applicable Valley Water BMPs have been included in the Project and are also applicable to the impact analysis. The applicable BMPs are discussed below in Section 3.22.3.7 *Applicable Best Management Practices, VHP Conditions, Project Specific Avoidance and Minimization Measures*. The significance of impacts is evaluated following the incorporation of the applicable BMPs, as well as other State, regional, and local wildfire risk abatement requirements as described previously in Section 3.22.3. The general rule employed in this analysis is that if wildfire risk can be effectively lessened through implementation of standard regulatory requirements and BMPs, then the impact would be less than significant.

3.22.3.2 Conservation Measures Construction

The potential for the Conservation Measures component construction activities to result in a significant impact to the environment and public related to the risk of wildfire is evaluated. Conservation Measures that have been included in the Project and require construction activities are:

- Ogier Ponds CM
- Maintenance of the North Channel Reach ~~Extension~~
- Maintenance Activities at Live Oak Restoration Reach
- Sediment Augmentation Program
- Phase 2 Coyote Percolation Dam CM

As described in Section 3.0, *Introduction*, the baseline for evaluating impacts related to the construction of the Conservation Measures component is the existing conditions following implementation of the FOCP upgrades to the existing dam and reservoir facilities. Applicable Valley Water BMPs have been included in the Project and are applicable to the impact analysis. The applicable BMPs are discussed below in Section 3.22.3.7 *Applicable Best Management Practices, VHP Conditions, Project Specific Avoidance and Minimization Measures*. The significance of impacts is evaluated following the incorporation of the applicable BMPs, as well as other State, regional, and local wildfire risk abatement requirements as described previously in Section 3.22.3. The general rule employed in this analysis is that if wildfire risk can be effectively lessened through implementation of standard regulatory requirements and BMPs, then the impact would be less than significant.

3.22.3.3 Construction Monitoring

Construction monitoring activities are not further considered in the impact analysis, as monitoring would involve data and information collection and assessment and would not result in direct or indirect adverse impacts related to wildfire.

3.22.3.4 Post-Construction Anderson Dam Facilities Operations and Maintenance

Operational changes that would be implemented following the completion of the construction of the Seismic Retrofit component may result in significant impacts to the environment related to wildfire. As described in Section 3.0, *Introduction*, the baseline for evaluating post-construction operation effects is the existing conditions following implementation of the FOCP upgrades to the existing dam and reservoir facilities. Applicable Valley Water BMPs have been included in the Project and are applicable to the impact analysis. The applicable BMPs are discussed below in Section 3.22.3.7 *Applicable Best Management Practices, VHP Conditions, Project Specific Avoidance and Minimization Measures*. The significance of impacts is evaluated following the incorporation of the applicable BMPs, as well as other State, regional, and local wildfire risk abatement requirements as described previously in Section 3.22.3. The general rule employed in this analysis is that if wildfire risk can be effectively lessened through implementation of standard regulatory requirements and BMPs, then the impact would be less than significant.

Maintenance activities associated with Anderson Dam facilities were previously evaluated in the Final Dam Maintenance Program EIR (DMP EIR) prepared in January 2012 (SCH No. 2011082077; Valley Water 2012) and have been implemented throughout the Project Area since that time. The impacts identified in the DMP EIR would not be made more severe with implementation of the Project. The DMP EIR included **Mitigation Measure HAZ-1** that requires implementation of fire prevention measures where motorized equipment will be operated, restricts the areas where soldering and welding may occur, and requires fire extinguishers in areas where any of these activities will occur. Through implementation of this existing requirement, impacts related to wildfire associated with Post-Construction Dam Facility Maintenance Activities would be largely the same as the impacts identified in the DMP EIR. Therefore, no new impacts would occur as a result of Post-Construction Dam Maintenance Project activities. For these reasons, Post-Construction Dam Facility Maintenance activities are not discussed further in this section.

3.22.3.5 Post-Construction Conservation Measures Operations and Maintenance

Post-Construction Conservation Measures Operations and Maintenance activities would be focused on improving fish habitat (e.g., gravel augmentation, separation of Coyote Creek from Ogier Ponds, and fish passage enhancement throughout Coyote Creek). As described in Section 3.0, *Introduction*, the baseline for evaluating Post-Construction Conservation Measures

Operation and Maintenance effects is the existing conditions following implementation of the FOCP upgrades to the existing dam and reservoir facilities.

The Conservation Measures would operate passively, without mechanical or human intervention, and are planned in accordance with proposed Anderson Dam Reservoir flow releases that are included in the *Project Description*.

Additionally, as described in Chapter 2, *Project Description*, Valley Water would maintain Coyote Percolation Dam per Valley Water's existing DMP. Maintenance of Coyote Percolation Dam facilities was previously evaluated in the Final DMP EIR (Valley Water 2012), Applicable BMPs and avoidance and minimization measures associated with the DMP would be implemented that would minimize potential impacts related to wildfire during maintenance activities (e.g., ongoing vegetation management in-stream, weed abatement). All maintenance activities associated with the Conservation Measures would be done in accordance with existing Valley Water maintenance plans, including the Stream Maintenance Program (SMP), and no additional impacts would occur. Therefore, Post-Construction Conservation Measures maintenance activities are not discussed further in this section.

3.22.3.6 Post-Construction Project and FAHCE Adaptive Management

The FAHCE AMP would guide post-construction adaptive management of Project ~~project~~ flow operations and Conservation Measures that have met their specified success criteria, as defined through the regulatory permitting process. As required by the FAHCE AMP framework, the Project and FAHCE AMP includes four key elements: measurable objectives, monitoring, adaptive actions, and reporting. Monitoring and adaptive actions involve physical activities that could have environmental impacts.

The Project and FAHCE AMP monitoring program would inform selection of adaptive management measures to implement in response to management triggers, and includes compliance, validation, effectiveness, and long-term monitoring. Validation, effectiveness, and long-term trend monitoring would build on existing Valley Water monitoring infrastructure (e.g., hydrologic monitoring network), water quality monitoring (e.g., water temperature monitoring network), habitat monitoring (e.g., habitat mapping), and fisheries monitoring (e.g., VAKI Riverwatcher, PIT tag detectors, genetics sampling, electrofishing surveys). Impacts of these monitoring activities are not evaluated in the impact analysis because they would have very minor impacts on the potential for wildfires within or adjacent to the Project area.

The Project and FAHCE AMP identifies triggers for adaptive actions to help meet measurable objectives. Adaptive actions for FAHCE flows and imported water storage/releases would include refinements of reservoir releases, which would have impacts and benefits similar to the original FAHCE flows and imported water storage/releases. Adaptive actions for Conservation Measures would generally include minor construction and maintenance actions, whose impacts would be similar but less than those from original Conservation Measure construction. Impacts of these adaptive actions are not evaluated in the impact analysis because they would have very minor impacts on the potential for wildfires within or adjacent to the Project area.

3.22.3.7 Applicable Best Management Practices <u>and</u> VHP Conditions

As noted in Chapter 2, *Project Description*, Valley Water would incorporate BMPs, VHP Conditions, and AMMs to avoid and minimize adverse effects on the environment that may result from Project implementation. All relevant BMPs, VHP Conditions, and AMMs for the Project are included in Appendix A, *Best Management Practices and Santa Clara Valley Habitat ~~Conservation~~ Plan Conditions<u>, Avoidance and Minimization Measures, and Mitigation Measures</u> ~~Incorporated in the Project~~*~~. Project specific AMMs have been customized for the Project to specifically achieve the intended goals for minimizing Project effects.~~

There are no relevant VHP Conditions or Project specific AMMs that would apply to wildfire. BMPs relevant to wildfire risk include the following:

HM-12: Incorporate Fire Prevention Measures – would reduce the potential for fire ignition as a result of Project actions.

TR-1: Incorporate Public Safety Measures – would reduce the potential for safety impacts to the public from additional traffic that would result from Project construction.

3.22.3.8 Thresholds of Significance

For the purposes of this analysis, the Project would result in a significant impact related to wildfire if it would:

WF-1: Exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors (criterion b);

WF-2: Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment (criterion c);

WF-3: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes (criterion d); or,

WF-4: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires (Hazards and Hazardous Materials criterion g).

3.22.3.9 Issues Dismissed from Further Review

CEQA Guidelines Appendix G also suggests that projects may have a significant impact related to wildfire if they would substantially impair an adopted emergency response plan or emergency evacuation plan (criterion a). This criterion is evaluated in Section 3.10, *Hazards and Hazardous Materials*, and Section 3.19, *Transportation*, and that evaluation is not repeated here.

3.22.4 Impact Analysis

***Impact WF-1: Exacerbate wildfire risks and expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors* (Less than Significant)**

Seismic Retrofit Construction

As discussed in Section 3.17, *Public Services*, following the complete dewatering of Anderson Reservoir (Year 2), CALFIRE would be unable to access water in the reservoir for firefighting purposes until the reservoir begins refilling (Year 6). Currently, Anderson Reservoir is used as a water supply for regional firefighting service. From Year 2 through Year 6, the water supply available for firefighting uses would be temporarily inaccessible due to the fully dewatered reservoir. Therefore, if there were no alternative water sources the temporary restrictions on available water for emergency services could exacerbate existing wildfire risks.

Within the general vicinity of Anderson Reservoir there are several alternative water sources for firefighting that would remain available throughout the Seismic Retrofit component construction, including Coyote, Chesbro, and Uvas Reservoirs. During a November 2, 2020, meeting between Valley Water and CALFIRE, CALFIRE did not express any concerns over the lack of access to water for firefighting during the time when Anderson Reservoir would be drawn down to deadpool or fully dewatered during Seismic Retrofit Years 2 through 6 (Valley Water 2018 ~~2020~~). Therefore, the reduction in the water supply available for emergency services that would be present within Anderson Reservoir throughout construction activities would not result in a significant impact related to an increased risk of wildfire. Conditions for exposing Project workers to pollutant concentrations from wildfire, or the contribution of the Project to the uncontrolled spread of wildfire would therefore also not increase beyond those conditions that were present following the construction of the FOCP improvements.

The construction of the Seismic Retrofit component would also not result in the creation of new wildland areas that may increase the risk of fire dangers within the vicinity of the Project Area; all work would occur in areas that have been previously disturbed, there would be no change in access within or from the Project Area, or creation of areas that would provide additional fuel load for wildfires beyond those conditions present following the construction of the FOCP improvements.

Seismic Retrofit component construction would include the use of construction equipment in and around vegetated areas (including HFHSZs) that may generate sparks or extreme heat during the dry summer months when fire danger is the highest. Smoking by construction workers or other persons on the Project site could also cause accidental fires. ~~;therefore,~~ Therefore, there is potential for accidental ignition of a wildland fire during construction activities. However, construction-related vehicular traffic would primarily occur on existing roadways and within cleared areas (e.g., established access roads), and parking or refueling would only occur in designated, vegetation-free areas, reducing the likelihood of ignition. Further, the access roads and stockpile areas within the reservoir, generally 30 to 60 feet wide, comprised of dirt, and devoid of vegetation, span most of the reservoir from north to south and would act as partial fire or fuel breaks, helping to limit the spread of wildfire between the east and west sides of the reservoir and provide access to fire agencies in responding to a potential wildfire.

Implementation of BMP HM-12 (Incorporate Fire Prevention Measures) will also minimize these impacts by requiring onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines and prohibiting smoking except in designated staging areas. Construction would also be required to comply with the requirements of the California Fire Code, which would include the removal of combustible materials, proper containment of oily, combustible materials, the development and implementation of pre-fire plans, compliance with the California Electrical Code for the provision of temporary electrical facilities, and provision of fire access within 100 feet of construction activities. Through the implementation of these measures, construction of the Seismic Retrofit component would not exacerbate wildfire risks, and this impact would be less than significant.

Conservation Measures Construction

Construction activities associated with the construction of the Conservation Measures component may result in similar construction-related impacts related to wildfire ignition as described above for the Seismic Retrofit portion of the Project, when compared to conditions following FOCP implementation. Furthermore, the Conservation Measure Project ~~project~~ components are not located within mapped high fire severity zones. Implementation of BMP HM-12, which requires onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines, and prohibits smoking, except in designated staging areas, would further minimize potential impacts from wildland fires, as would compliance with Fire Code provisions described under Seismic Retrofit component impacts.

Construction of the Conservation Measures component would not involve the placement of people or habitable structures in areas without adequate fire protection and would not result in the creation of new wildland areas or extend the existing WUI, which could increase fire dangers. Therefore, impacts to exacerbation of wildfire risks that would occur as a result of the construction of the Conservation Measures component would be less than significant.

Significance Conclusion Summary

Infrastructure associated with construction of the Seismic Retrofit and Conservation Measures components may result in the accidental ignition of a wildfire. Implementation of BMP HM-12 (requires fire suppression equipment and measures, and spark arrestors on equipment) and implementation of California Fire Code provisions and CALFIRE requirements will reduce the risk of accidental ignition from construction equipment, minimizing the impacts of the Project on exacerbation of wildfire risks. Post-construction operations would not require the use of equipment that could generate sparks or extreme heat; therefore, there would be no impact related to wildfire. Based upon these considerations, the Project would not exacerbate wildfire risks, and the impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact WF-2: Require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment **(Less than Significant)**

Seismic Retrofit Construction

Seismic Retrofit component construction would involve the installation and maintenance of new and modified infrastructure that, as discussed above under Impact WF-1, has the potential to result in the accidental ignition of a wildland fire. Wildfires could be accidentally ignited through the generation of sparks or heat generated by construction equipment during the dry summer months when fire danger is the highest. Implementation of BMP HM-12 (Incorporate Fire

Prevention Measures) would minimize this risk by requiring onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines and prohibiting smoking except in designated staging areas. All construction activities would also comply with the requirements of the California Fire Code, which would require the removal of combustible materials, proper containment of oily and combustible materials, the development and implementation of pre-fire plans, compliance with the California Electrical Code for the provision of temporary electrical facilities, and provision of fire access within 100 feet of construction activities.

Construction of the Seismic Retrofit component would include the permanent modification of Coyote Road. The roadway would be widened, and a permanent access road would be constructed leading to public parking areas that would be constructed at the base of the dam. The roadway modifications would not expand into new wildland areas or improve access to new wildland areas that may introduce new wildfire risks; the modifications would, however, improve access for emergency vehicles to the Project Area. The roadway modifications would also implement BMP HM-12 (Incorporate Fire Prevention Measures) that will require onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines and prohibit smoking except in designated staging areas. Therefore, the construction of the roadway modifications would not exacerbate wildfire risk.

Electrical power for the Seismic Retrofit component would be supplied by PG&E through an existing overhead 12.47 kV power distribution line along Coyote Road. This existing distribution line crosses Coyote Creek with medium-voltage power cables to a pole and distribution transformer. The Seismic Retrofit component construction would include the removal of the distribution line, power cables over Coyote Creek, power pole, and distribution transformer. PG&E would replace this infrastructure with new underground power cables that would connect to a new distribution transformer at a permanent location that is closer to the low-level outlet structure. The construction of the new transformer would be required to adhere to the Rules for Overhead Electric Line Construction (CPUC 2015). Adherence to these standards would reduce the potential for this infrastructure to exacerbate wildfire risk as these standards would require clearance from buildings and vegetation, and proper grounding and insulation which would minimize the accidental ignition of materials as a result of construction activities. Construction of the underground power cables would be required to adhere to the Rules for Construction of Underground Electric Supply and Communication Systems (CPUC 2006). Adherence to these standards would reduce the potential for accidental ignition of materials by providing that the underground lines are properly documented, insulated, and buried at a sufficient depth. The replacement of the existing overhead lines with underground lines would remove the risk of accidental ignition of vegetation or ignitable materials as the potential for incidental powerline contact would be removed.

Based in the above analysis, including implementation of BMP-HM-12 and applicable California Fire Code requirements, and infrastructure improvements that would lessen the risk of wildfire, wildfire risks would not be exacerbated, and this impact would be less than significant.

Conservation Measures Construction

Construction of the Conservation Measures component would include the use of heavy equipment for the construction of the Ogier Ponds CM, Maintenance of the North Channel Reach ~~Extension~~, Maintenance Activities at Live Oak Restoration Reach, Sediment Augmentation

Program, and Phase 2 Coyote Percolation Dam CM. The areas surrounding the work areas are located within or adjacent to waterways, where the risk of accidental of ignition of a wildfire is low; however, the work areas all contain vegetation, and accidental ignition would still be possible. Through the implementation of BMP HM-12 (Incorporate Fire Prevention Measures), onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines would be required, and smoking would be prohibited except in designated staging areas. Once construction is completed, the Conservation Measures infrastructure would not introduce new facilities or uses that would exacerbate wildfire risk or adversely affect the environment. Therefore, infrastructure associated the Conservation Measures component would not exacerbate wildfire fire risks.

Significance Conclusion Summary

Infrastructure associated with construction of the Seismic Retrofit and Conservation Measures components may result in the accidental ignition of a wildfire. Through the implementation of BMP HM-12 (Incorporate Fire Prevention Measures), onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines will be required, and smoking would be prohibited except in designated staging areas. Implementation of applicable Fire Code Provisions would further reduce wildfire risks. The Project would include the modification, construction, and/or relocation of roads and electrical transmission infrastructure; however, access throughout the Project Area and existing power lines would be relocated and improved through Project implementation, thus providing an improvement over existing conditions. Post-construction operations of the powerlines would also be similar to post-FOCP implementation conditions. Therefore, infrastructure associated with the Project would not exacerbate wildfire risks, and this impact would be **less than significant.**

Mitigation Measures

No mitigation is required.

Impact WF-3: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes (Less than Significant)

Seismic Retrofit Construction

Anderson Dam is located in an area surrounded by rolling hills with steep slopes susceptible to landslides. As described in Section 3.8, *Geology and Soils*, five major landslides exist along the southern portion of Anderson Dam on the east and west side; these slides have a history of movement during previous drawdowns of the reservoir and during months of heavy rainfall (see **Figure 3.8-5**). However, and as described elsewhere in this EIR, this existing condition is a function of environmental factors that are not related to wildfire.

Existing landslides along the reservoir could become unstable following a wildfire as moderate to high severity wildfire can greatly increase the likelihood of debris sliding, land sliding, and debris flows (Haas et al. 2017). In addition, rainstorms after wildfires can result in flash floods, debris flows, and post-fire instability, which can adversely impact people or structures that are located below an area that has burned. However, as discussed in the previous impact evaluations under Impacts WF-1 and WF-2, implementation of the Project would not exacerbate or increase the risk of wildfire in the vicinity. It thus follows that the Project would not increase the risk of post-fire landslides beyond the level of risk that is already present, and the impact from the Project would be less than significant. Implementation of the FOCP resulted in drainage changes to Coyote Creek immediately downstream of Anderson Dam with the re-establishment of the North Channel. The construction of the Seismic Retrofit component would modify portions of the North Channel to accommodate the inclusion of an in-channel weir, and releases from the new HLOW and LLOW, as described in Chapter 2, *Project Description*. The increased releases from Anderson Reservoir that may occur as a result of these Project features would not result in increased flooding in a post-wildfire scenario because these components are directly downstream of the dam, and releases may be monitored and adjusted by Valley Water depending on downstream conditions. Similarly, the temporary diversion system that would allow releases to bypass the Seismic Retrofit construction area at the dam into Coyote Creek would result in temporary changes in creek flows, but would not result in increased flood risk during a post-wildfire scenario as releases would be monitored and adjusted by Valley Water depending on downstream conditions. The ongoing low water levels within the reservoir that would be present throughout Seismic Retrofit component construction activities would also limit releases into downstream Coyote Creek.

Based on the above analysis, construction of the Seismic Retrofit component would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. This impact would therefore be less than significant.

Conservation Measures Construction

The downstream portions of Coyote Creek where the Ogier Ponds CM, Maintenance of the North Channel Reach, ~~Extension,~~ Maintenance Activities at Live Oak Restoration Reach, Sediment Augmentation Program, and Phase 2 Coyote Percolation Dam CM would be constructed and/or implemented do not contain steep slopes that could result in landslides. Construction of the Conservation Measures component would modify and enhance downstream portions of Coyote Creek to improve fish habitat and/or passage but would not impact drainage patterns in a way that would substantially increase flooding risks or otherwise expose people or structures to the risk of flooding or landslides following a wildfire. Although the Ogier Ponds CM would alter the Coyote Creek drainage to re-establish the original creek channel, it would still allow high flow events to spill over into the expanded floodplain. Thus, construction of the Conservation Measures component would not increase flooding risks or otherwise expose people or structures to risk from flooding in a post-wildfire scenario as Coyote Creek would continue to provide adequate capacity to accommodate increased flows following a wildfire. Additionally, no steep slopes would be created that would increase the potential for landslides. Therefore, construction of the Conservation Measures component would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. This impact therefore would be less than significant.

Significance Conclusion Summary

The Project would not exacerbate or increase wildfire risks in the area, and therefore would not increase the risks of post-fire effects, such as landslides and flooding. Therefore, the Project would not result in significant risks to people or structures from downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes, and this impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact WF-4: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires (Less than Significant with Mitigation)

Seismic Retrofit Construction

The construction of the Seismic Retrofit component would occur over 7 years, spanning seven or eight fire seasons. Construction would include use of construction equipment in and around vegetated areas (including HFHSZs) that could generate sparks or extreme heat during the dry summer months when fire danger is the highest. Construction-related vehicular traffic would primarily occur on existing roadways and within cleared areas (e.g., established access roads), and parking or refueling would only occur in designated, vegetation-free areas, reducing the likelihood of ignition. Smoking by construction workers or other persons on the Project site could also cause accidental fires. Therefore, there is potential for accidental ignition of a wildland fire during construction.

Two housing developments, Holiday Lake Estates and Jackson Oaks, are located to the south of Anderson Reservoir just outside the Project Area. Throughout construction of the Seismic Retrofit component, these residents, in addition to construction workers, could be subject to wildfire risks from accidental ignition of vegetation or flammable materials. The Holiday Lake Estates and Jackson Oaks neighborhoods have limited existing evacuation routes and the Project itself would not exacerbate the existing wildfire risk. As discussed in Impact WF-1, however, ~~However,~~ implementation of BMP HM-12 (Incorporate Fire Prevention Measures) would minimize impacts by requiring onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines and prohibiting smoking except in designated staging areas. Furthermore, construction activities would be required to comply with the requirements of the California Fire Code, which would include the removal of combustible materials, proper containment of oily combustible materials, the development and implementation of pre-fire plans, compliance with the California Electrical Code for the provision of temporary electrical facilities, and provision of fire access within 100 feet of construction activities. Also, construction-related vehicular traffic would primarily occur on existing roadways and within cleared areas (e.g., established access roads), and parking or refueling would only occur in designated, vegetation-free areas, reducing the likelihood of ignition. Lastly, the access roads and stockpile areas within the reservoir, generally 30 to 60 feet wide, comprised of dirt, and devoid of vegetation, span most of the reservoir from north to south and would act as partial fire or fuel breaks, helping to limit the spread of wildfire between the east and west sides of the reservoir and provide access to fire agencies in responding to a potential wildfire.

During construction of the Seismic Retrofit component, a section of Cochrane Road would be closed on four occasions, which would disrupt traffic flows and require use of adjacent roads, which could impede emergency response or evacuation procedures in the event of a wildland fire. A significant impact would occur if local roadways were to be impacted from construction activities such that emergency response and evacuation procedures would be substantially hindered during a wildfire, thus exposing people or structures to a significant risk of loss, injury, or death. Currently, the Holiday Lake Estates and Jackson Oaks neighborhoods have limited evacuation options, with a single primary route (East Dunne Avenue) available for residents to leave the area in the event of a wildfire; however, the Project would not result in partial or full closure of East Dunne Avenue and would not exacerbate evacuation risks associated with this existing evacuation route condition. During Years 2 through 7 of Seismic Retrofit construction, the north and south haul roads would provide emergency access. Specifically, the north haul road (Shingle Valley Haul Road) would provide access from US 101 to Metcalf Road to Shingle Valley Road (private) to Stockpile Area L. The south haul road (Holiday Estates) would provide access from US 101 to Dunne Avenue to Holiday Drive to Staging Area 6 (Holiday Lake Estates Boat Ramp Parking Lot). Usage of these haul roads would reduce emergency response and evacuation impacts associated with the closure of a section of Cochrane Road.

Implementation of BMP TR-1 (Incorporate Public Safety Measures) would reduce this impact. It requires construction warning that would minimize the potential for changes in local roadway access to impact emergency response and/or evacuation routes. Mitigation measures would further reduce this impact to less-than-significant levels. Implementation of **Mitigation Measure PS-1** (Traffic Management Plan) will reduce impacts on emergency response and evacuation by requiring the preparation and implementation of a TMP and coordination with local and state agencies. The notification and communication requirements of the TMP would require that local emergency managers, such as CALFIRE, the Morgan Hill Fire Department, the San José Fire Department, and SSCFPD be made aware of any traffic management issues and would share that information with first responders. Coordination with these agencies would minimize the impact on evacuation and emergency response access in the event of a wildfire and thus minimize the exposure of people or structures to significant loss from a wildfire. Implementation of **Mitigation Measure WF-1** (Reduce Emergency Response and Evacuation Interference during Construction and develop a Response and Evacuation Strategy ~~Coordinate with Emergency Response Agencies~~) will minimize the impact of roadway closures in the vicinity of the Project Area by requiring Valley Water to coordinate with local and State emergency response and fire agencies and prepare a Response and Evacuation Strategy to maintain adequate emergency response and evacuation routes throughout construction of the Project in locations where Project construction substantially interferes with emergency access and evacuation ~~identify an alternative temporary refuge area or provide emergency access to the Woodchopper's Flat Picnic Area during Seismic Retrofit component construction~~ in the event of a wildfire.

Construction workers could be exposed to existing wildfire risks, even if Seismic Retrofit component construction does not substantially exacerbate them. This is a significant impact. **Mitigation Measure PS-1** will reduce this impact to less-than-significant levels by providing efficient evacuation routes for construction workers. The plan would include the identification of evacuation routes that are not reliant on the Holiday Lake Estates neighborhood road system to avoid exacerbating egress/ingress for wildfire fighting and public access. This plan would also include ongoing coordination with the County and CALFIRE to ensure that local authorities are aware of the access conditions throughout the Project.

With implementation of **Mitigation Measures PS-1** and **WF-1** construction of the Seismic Retrofit component will not expose people or structures to a significant risk of loss, injury or death involving wildland fires. Therefore, this impact would be less than significant with mitigation.

Conservation Measures Construction

Construction activities associated with the Conservation Measures component would include the implementation of the Ogier Ponds CM, Maintenance of the North Channel Reach ~~Extension~~, Maintenance Activities at Live Oak Restoration Reach, Sediment Augmentation Program, and Phase 2 Coyote Percolation Dam CM. These activities would be similar to those described above for construction of the Seismic Retrofit component. Construction activities associated with Conservation Measures component may result in similar construction-related impacts related to wildfire ignition as described above for the Seismic Retrofit component. The work area for the Conservation Measure components are not located within areas mapped as high fire severity zones, reducing the risk of wildland fires in these areas. As explained above, implementation of **BMP HM-12** would minimize impacts by requiring onsite fire suppression equipment, spark arrestors on all equipment with internal combustion engines, and prohibiting smoking except in designated staging areas. Construction of the Conservation Measures components would involve the operation and temporary storage of large construction equipment and transportation of construction materials that have the potential to disrupt traffic flow along roads adjacent to staging and construction areas required for the Conservation Measures. The presence of large construction equipment and haul trucks could impede movement and access of emergency response vehicles or cause localized congestion, thereby interfering with emergency response or evacuation in the event of a wildfire.

As described above, implementation of BMP TR-1 (Incorporate Public Safety Measures) requires the implementation of construction warning signs, safety fencing, and detours. Furthermore, implementation of **Mitigation Measure PS-1** will reduce impacts on emergency response and evacuation by requiring the preparation and implementation of a TMP and coordination with local and state agencies, including local emergency response managers and first responders. Thus, coordination with these agencies would minimize the impact on evacuation and emergency response access in the event of a wildfire and thus minimize exposing people or structure to significant risk of loss, injury, or death from a wildfire. Impacts would be less than significant with mitigation.

Significance Conclusion Summary

The construction of the Seismic Retrofit and Conservation Measures components could result in accidental ignition of a wildfire. However, implementation of **BMP HM-12,** and compliance with the California Fire Code would reduce the risk of accidental ignition from construction equipment such that the Project would be unlikely to exacerbate wildfire risk. Post-construction operations would not require the use of equipment that could generate sparks or extreme heat.

Construction traffic and road closures would result in impacts on emergency response and evacuations, in the event of a wildland fire. Traffic impacts on emergency response and evacuations would be reduced through implementation of **BMP TR-1** which requires implementation of construction warning signs, safety fencing, and detours; however, a significant impact would still occur. Implementation of **Mitigation Measure PS-1** (Traffic Management Plan), which requires preparation and implementation of a TMP and coordination with State and local agencies and **Mitigation Measure WF-1** (Reduce Emergency Response and

Evacuation Interference during Construction and develop a Response and Evacuation Strategy ~~Coordinate with Emergency Response and Fire Agencies~~), which requires coordination with emergency response and fire agencies and preparation of the Response and Evacuation Strategy to maintain adequate emergency response and evacuation routes in locations where Project construction substantially interferes with emergency access and evacuation ~~to identify an alternative temporary refuge area or access to the Woodchoppers Flat Picnic Area during a wildfire will minimize impacts on emergency response and evacuation procedures~~.

Construction workers could be exposed to existing wildfire risks, a significant impact, but **Mitigation Measure PS-1**, which would provide efficient evacuation routes for construction workers to minimize this risk. With the above mitigation measures, the Project would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires. This impact would be **less than significant with mitigation.**

Mitigation Measures

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~an Emergency Action Plan~~

Before construction of Project components, Valley Water will prepare an RES ~~EAP~~ and coordinate with local and state emergency response agencies through regular meetings, written communications, and review of construction schedules so that adequate emergency response and evacuation routes are maintained through construction of the Project in locations where Project construction substantially interferes with emergency access and evacuation. Emergency response agencies will be notified in advance of all lane and road closures, reducing the potential for construction activities to significantly interfere with emergency response or designated and functional community evacuation routes. The RES will include a communication protocol outlining how Valley Water will provide construction updates to local agencies, such as traffic control plans and road closure schedules, to assist with emergency response planning and facilitate timely evacuation notifications to residents. The communication protocol will also establish procedures for how Valley Water and/or the construction contractor will quickly notify emergency responders should a wildfire or other emergency situation be detected.

Prior to commencement of the Project construction, Valley Water will coordinate with local and state emergency response agencies to allow emergency response vehicles to access all areas affected by construction activities. In locations where Project construction substantially interferes with use of designated and functional community evacuation routes, the RES ~~The EAP~~ will also include alternate ~~routes to certain areas to provide~~ evacuation routes that are passable to allow residents to evacuate an affected area. The draft RES, including the alternate evacuation routes and communication protocol, will be provided to representatives of Holiday Lakes Estates and Jackson Oaks for review before being finalized. ~~Furthermore, prior to commencement of the Project, Valley Water will coordinate with local and state emergency response agencies and identify an alternative temporary refuge area to replace the Woodchoppers Flat Picnic Area or will provide emergency access to the Woodchoppers Flat Picnic Area. Emergency access may be provided through a system such as an electromagnetic lock that can be remotely unlocked via satellite during a wildfire or other emergency, or other method that allows for emergency use of Woodchoppers Flat Picnic Area as a temporary refuge area.~~

PS-1 Prepare and Implement Traffic Management Plan.

3.22.5 Cumulative Impacts

The geographic study area for the cumulative impact analysis for wildfire are areas near projects listed in Table 3.0-2, in particular residential, commercial, and industrial development in the county. This section describes the Project's contribution to cumulative wildfire impacts, as summarized in **Table 3.22-3**.

Cumulative impact thresholds for wildfire are the same as the impact thresholds presented in Section 3.22.3.8, *Thresholds of Significance*.

Table 3.22-3. Summary of Project Impact Contribution to Cumulative Wildfire Impacts

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
Cumulative Impact WF-1: Exacerbate wildfire risks and expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors	No	No	NCC	None	No
Cumulative Impact WF-2: Require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment	No	No	NCC	None	No
Cumulative Impact WF-3: Expose people or structures to significant risks, including downslope or downstream flooding or	No	No	NCC	None	No

Impact	Cumulatively Significant with FOCP?	Cumulatively Significant with other projects?	Incremental Project Contribution	Applicable Project Mitigation	Cumulatively Considerable after Mitigation?
landslides, as a result of runoff, post-fire slope instability, or drainage changes					
Cumulative Impact WF-4: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires	No	Yes	CC	WF-1 PS-1	No

Key: CC = cumulatively considerable; NCC = not cumulatively considerable

***Cumulative Impact WF-1: Exacerbate wildfire risks and expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors* (*Not Cumulatively Considerable*)**

Wildfires could be accidentally ignited through the generation of sparks or heat generated by construction equipment during the dry summer months when fire danger is the highest. Implementation of BMP HM-12 (Incorporate Fire Prevention Measures) would minimize this risk by requiring onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines and prohibiting smoking except in designated staging areas. All construction activities would also comply with the requirements of the California Fire Code, which would require the removal of combustible materials, proper containment of oily and combustible materials, the development and implementation of pre-fire plans, compliance with the California Electrical Code for the provision of temporary electrical facilities, and provision of fire access within 100 feet of construction activities.

Construction of the Seismic Retrofit and Conservation Measures components would not involve the placement of people or habitable structures in areas without adequate fire protection and would not result in the creation of new wildland areas or extend the existing WUI, which could increase fire dangers. Therefore, impacts to exacerbation of wildfire risks that would occur as a result of the construction of the Seismic Retrofit and Conservation Measures components would be less than significant.

Cumulative Effects of Project with the FOCP

The FOCP improvements would cause the reduction in the water supply available for emergency services within Anderson Reservoir; however, this reduction would not result in a significant impact related to an increased risk of wildfire. Also, FOCP improvements would not cause conditions for exposing Project workers to pollutant concentrations from wildfire or contribute to the uncontrolled spread of wildfire and construction of the FOCP would be completed prior to construction of the Project. Therefore, the cumulative impact on wildfire resulting from the

Project in combination with the FOCP would not be significant, and the Project's contribution would not be cumulatively considerable.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Probable future projects, programs, and plans would be required to adhere to state, regional and local policies and regulations to reduce wildfire risks and minimize exposing project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors. Therefore, the cumulative impact on wildfire resulting from the Project in combination with other probable future projects, programs, and plans would not be significant and the Project's contribution would not be cumulatively considerable.

Significance Conclusion Summary

The cumulative impact on exacerbating wildfire risks or exposing project occupants to pollutant concentrations from a wildfire from the Project, FOCP, and other probable future projects, programs and plans would not be cumulatively significant, and the Project's contribution would be **not cumulatively considerable**.

Mitigation Measures

No mitigation is required.

Cumulative Impact WF-2: Require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment **(*Not Cumulatively Considerable*)**

Construction of the Seismic Retrofit component would include the permanent widening of Coyote Road. The roadway modifications would not expand into new wildland areas or improve access to new wildland areas that may introduce new wildfire risks; the modifications would, however, improve access for emergency vehicles to the Project Area. The roadway modifications would also implement BMP HM-12 (Incorporate Fire Prevention Measures) that require onsite fire suppression equipment and spark arrestors on all equipment with internal combustion engines and prohibit smoking except in designated staging areas. Therefore, the construction of the roadway modifications would not exacerbate wildfire risk.

In addition, as described in Section 2, *Project Description*, PG&E would replace aboveground electric infrastructure with new underground power cables that would connect to a new distribution transformer at a permanent location that is closer to the low-level outlet structure. Adherence to state standards would reduce the potential for this infrastructure to exacerbate wildfire risk as these standards would require clearance from buildings and vegetation, and proper grounding and insulation which would minimize the accidental ignition of materials as a result of construction activities. Adherence to state standards would also reduce the potential for accidental ignition of materials by providing that the underground lines are properly documented, insulated, and buried at a sufficient depth. The replacement of the existing overhead lines with underground lines would remove the risk of accidental ignition of vegetation or ignitable materials as the potential for incidental powerline contact would be removed. Therefore, infrastructure associated with the Project would not exacerbate wildfire risks, and this impact would be less than significant.

The Conservation Measures infrastructure would not introduce new infrastructure that would exacerbate wildfire risk or adversely affect the environment. The Project would not exacerbate wildfire risks, and the impact would be less than significant.

Cumulative Effects of Project with the FOCP

As described in Section 2, *Project Description*, PG&E would construct a distribution line that crosses Coyote Creek with medium-voltage power cables to a pole and distribution transformer as part of the FOCP. However, during construction of the Seismic Retrofit component, PG&E would underground these cables as described in Impact WF-2. Therefore, the cumulative impact on wildfire resulting from the Project infrastructure in combination with the FOCP would not be significant, and the Project's contribution is not cumulatively considerable.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

There are no known probable future projects, programs, plans that would expand infrastructure around Anderson Reservoir or the areas of the Conservation Measures that could increase wildfire risk. Any future project would be required to comply with state, regional and local policies and regulations regarding the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment. Therefore, the cumulative impact on wildfire resulting from the Project infrastructure in combination with other probable future projects, programs, and plans would not be significant, and the Project's contribution would not be cumulatively considerable.

Significance Conclusion Summary

The cumulative impact on wildfire risk and the environment resulting from the installation of associated infrastructure from the Project, FOCP, and other probable future projects, programs and plans would not be cumulatively significant, and the Project's contribution would be **not cumulatively considerable**.

Mitigation Measures

No mitigation is required.

Cumulative Impact WF-3: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes **(*Not Cumulatively Considerable*)**

Existing landslides along the reservoir could become unstable following a wildfire as moderate to high severity wildfire can greatly increase the likelihood of debris sliding, land sliding, and debris flows (Haas et al. 2017). In addition, rainstorms after wildfires can result in flash floods, debris flows, and post-fire instability, which can adversely impact people or structures that are located below an area that has burned. The downstream portions of Coyote Creek where the Ogier Ponds CM, Maintenance of the North Channel Reach ~~Extension~~, Maintenance Activities at Live Oak Restoration Reach, Sediment Augmentation Program, and Phase 2 Coyote Percolation

Dam CM would be constructed and/or implemented do not contain steep slopes that could result in landslides.

The Project would not exacerbate or increase wildfire risks in the area, and therefore would not increase the risks of post-fire effects, such as landslides and flooding. Therefore, the Project would not result in significant risks to people or structures from downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes, and this impact would be less than significant.

Cumulative Effects of Project with the FOCP

Implementation of the FOCP would result in drainage changes to Coyote Creek immediately downstream of Anderson Dam with the re-establishment of the North Channel. However, the increased releases from Anderson Reservoir would not result in increased flooding in a post-wildfire scenario because these components are directly downstream of the dam, and releases may be monitored and adjusted by Valley Water depending on downstream conditions. Also, construction of the FOCP would be completed prior to construction of the Project so there would be no overlap of wildfire risk during the two projects. Therefore, the cumulative impact on wildfire risk and post-fire effects resulting from the Project in combination with the FOCP would not be significant, and the Project’s contribution would not be cumulatively considerable.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

As discussed in the impact evaluations for Impacts WF-1 and WF-2, implementation of the Project would not exacerbate or increase the risk of wildfire in the vicinity. It thus follows that the Project would not increase the risk of post-fire landslides beyond the level of risk that is already present. Probable future projects, programs, plans would be required to comply with state, regional and local policies and regulations regarding exposing people or structures to significant wildfire risks, and are also unlikely to increase risk from downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Therefore, the cumulative impact on wildfire risk and post-fire effects resulting from the Project in combination with other probable future projects, programs, and plans would not be significant, and the Project’s contribution would not be cumulatively considerable.

Significance Conclusion Summary

The cumulative impact on the environment resulting from exposing people or structures to risks caused wildfires and post-fire effects from the Project, FOCP, and other probable future projects, programs and plans would not be cumulatively significant, and the Project’s contribution would be **not cumulatively considerable**.

Mitigation Measures

No mitigation is required.

***Cumulative Impact WF-4: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires* (*Not Cumulatively Considerable*)**

The construction of the Seismic Retrofit component would occur over 7 years, spanning seven or eight fire seasons. Construction would include use of construction equipment in and around vegetated areas (including HFHSZs) that could generate sparks or extreme heat during the dry summer months when fire danger is the highest. In addition, during construction of the Seismic Retrofit component, a section of Cochrane Road would be closed on four occasions, which would disrupt traffic flows and require use of adjacent roads, which could impede emergency response or evacuation procedures in the event of a wildland fire. Also, Seismic Retrofit construction workers would be exposed to wildfire risks. Construction of Conservation Measures could cause similar impacts on emergency response and evacuation, and on construction workers in the event of a wildland fire. Implementation of BMP TR-1 (Incorporate Public Safety Measures) would reduce these impacts because it requires construction warning that would minimize the potential for changes in local roadway access to impact emergency response and/or evacuation routes during a wildland fire, but impacts would still be significant.

Mitigation Measure PS-1 (Traffic Management Plan) requires the preparation and implementation of a TMP and coordination with local and state agencies, and **Mitigation Measure WF-1** (Reduce Emergency Response and Evacuation Interference during Construction and develop a Response and Evacuation Strategy ~~Coordinate with Emergency Response Agencies~~) requires Valley Water to coordinate with local and State emergency response and fire agencies and prepare a Response and Evacuation Strategy, to maintain adequate emergency response and evacuation routes ~~to identify an alternative temporary refuge area or provide emergency access to the Woodchopper's Flat Picnic Area during Seismic Retrofit component construction~~ in the event of a wildfire. Implementation of **Mitigation Measures PS-1 and WF-1** would reduce impacts from exposing people or structures to a significant risk of loss, injury or death involving wildland fires to less than significant.

Cumulative Effects of Project with the FOCP

Construction of the FOCP would create similar wildfire risks through the generation of sparks or heat from construction equipment as the Project. However, construction of the FOCP would be completed prior to construction of the Project so there would be no overlap of wildfire risk during the two projects. Therefore, the cumulative impact on wildfire risks resulting from the Project in combination with the FOCP would not be significant, and the Project's contribution would not be cumulatively considerable.

Cumulative Effects of Project with Probable Future Projects, Programs, and Plans

Probable future projects, programs, and plans could exacerbate wildfire risks to people or structures through the use of construction equipment in dry vegetated area or through road closures or increased congestion from truck traffic which could impact emergency response and evacuation during wildfires. These projects would be required to comply with state, regional and local policies and regulations regarding exposing people or structures to wildfire risks; however, many of the areas around Anderson Reservoir are at high risk for wildfire. Therefore, the cumulative impact on wildfire risks resulting from the Project in combination with other probable future projects, programs, and plans is significant, and the Project's contribution would be cumulatively considerable.

Significance Conclusion Summary

Construction of the FOCP would be completed prior to construction of the Project so there would be no overlap of wildfire risk during the two projects. Therefore, the cumulative impact on wildfire resulting from the Project in combination with the FOCP would not be significant, and the Project's contribution would not be cumulatively considerable.

The construction of the Seismic Retrofit component, when combined with other probable future projects in the area surrounding Anderson Reservoir, would have a cumulatively significant impact to risk from wildland fires, and the Project's contribution is cumulatively considerable. **Mitigation Measures PS-1 and WF-1** would reduce the Project's contribution to this risk to less than significant. After mitigation, the Project's impact to cumulative wildfire risks would be **not cumulatively considerable**.

Mitigation Measures

WF-1 *Reduce Emergency Response and Evacuation Interference during Construction and develop a Response and Evacuation Strategy ~~an Emergency Action Plan~~*

PS-1 *Prepare and Implement Traffic Management Plan.*

Chapter 4
OTHER STATUTORY REQUIREMENTS

4.1 Introduction

Chapter 4 covers the other statutory requirements required under California Environmental Quality Act (CEQA). In addition to identifying the effects of the Proposed Project, No Project Alternative, and other alternatives and measures to mitigate significant effects, the CEQA Guidelines require the following additional discussions:

- Significant irreversible environmental changes [*CEQA Guidelines* section 15126.2(d)]
- Significant and unavoidable environmental impacts [*CEQA Guidelines* section 15126(b) and 15126.2(c)]
- Growth-inducing impacts [*CEQA Guidelines* section 15126.2(e)]

4.2 Irreversible Impacts

CEQA section 21100(b)(2)(B) and *CEQA Guidelines* section 15126.2(d) require that an EIR identify significant irreversible environmental changes caused by implementation of the P~~p~~roject. Construction of the Project would indirectly result in the commitment of nonrenewable natural resources used in the construction process. These include gravel, concrete, soils, petroleum products, construction-related chemicals and paints, steel, and other materials. The Project would also result in the commitment of slowly renewable materials, such as wood products. This would not, however, be considered a significant adverse impact.

4.3 Significant and Unavoidable Impacts

In accordance with section 21100(b)(2)(A) of CEQA and with sections 15126(b) and 15126.2(c) of the *CEQA Guidelines*, the purpose of this section is to identify project-related environmental impacts that could not be eliminated or reduced to a less-than-significant level with implementation of all feasible mitigation measures, as identified in Chapter 3, *Regulatory and Environmental Setting and Impact Analysis*.

Significant and unavoidable Project impacts identified in Chapter 3 are as follows:

- Impact AES-2: Substantial degradation of the existing visual character or quality of public views of the site and its surroundings
- Impact AQ-1: Conflict with or obstruct implementation of the applicable air quality plan

- Impact ~~AIR~~ AQ-2: Cumulatively considerable net increase of any criteria pollutant for which the P~~p~~roject region is non-attainment under an applicable federal or state ambient air quality standard
- Impact AQ-3: Expose sensitive receptors to substantial pollutant concentrations
- Impact TERR-1(h): Have a substantial adverse effect, either directly or through habitat modifications, on pallid bat
- Impact TERR-4: Interfere substantially with the movement of any native resident or migratory species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites
- Impact HYD-1(i): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site
- Impact WQ-1: Impair beneficial uses of surface waters OR violate any applicable surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality OR conflict or obstruct implementation of a water quality control plan
- Impact NOI-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the P~~p~~roject in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, or generation of substantial incremental increase in noise levels

Cumulative Impacts that remain cumulatively considerable after mitigation identified in Chapter 3 are as follows:

- Cumulative Impact AES-2: Substantial degradation of the existing visual character or quality of public views of the site and its surroundings
- Cumulative Impact AQ-1: Conflict with or obstruct implementation of the applicable air quality plan
- Cumulative Impact ~~AIR~~ AQ-2: Cumulatively considerable net increase of any criteria pollutant for which the P~~p~~roject region is non-attainment under an applicable federal or state ambient air quality standard
- Cumulative Impact TERR-1(h): Have a substantial adverse effect, either directly or through habitat modifications, on pallid bat
- Cumulative Impact TERR-4: Interfere substantially with the movement of any native resident or migratory species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites
- Cumulative Impact HYD-1(i): Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site

- Cumulative Impact WQ-1: Impair beneficial uses of surface waters OR violate any applicable surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality OR conflict or obstruct implementation of a water quality control plan
- Cumulative Impact NOI-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the P~~p~~roject in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, or generation of substantial incremental increase in noise levels

4.4 Growth Inducement

Section 15126.2(e) of the *CEQA Guidelines* requires that an EIR discuss “the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth (a major expansion of a wastewater treatment plant might, for example, allow for more construction in service areas)”… “It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.”

The Project would not directly induce growth, because it does not involve the development of new housing or businesses that would attract additional population. Project construction would not extend roads or include other infrastructure that could indirectly induce growth, and it would not displace substantial numbers of housing or people. Given the relatively small size of the construction workforce, with the largest workforce occurring during Year 4 of the Seismic Retrofit activities (shown in **Table 2-2**, Seismic Retrofit Workers by Construction Phase, Chapter 2, *Project Description*), Project construction would not be expected to induce demand for housing by attracting workers from outside the area, as workers are expected to be drawn from the local labor pool. Long-term operation of the Anderson Dam Seismic Retrofit Project also would not increase the number of workers employed by Valley Water and Santa Clara County Parks and Recreation Department, as discussed in section 2.8~~7~~, *Post-Construction Anderson Dam Facilities Operations and Maintenance*. Furthermore, the Project would not create or expand a water supply source that could remove water supply limitations as a potential obstacle to growth.

Based on this analysis, the Project would not have a substantial growth-inducing impact.

This page intentionally left blank.

Chapter 5
ALTERNATIVES

5.1 Introduction

The purpose of the alternatives analysis in an EIR is to describe a range of reasonable alternatives to the Project that can feasibly attain most of the identified Project objectives but would reduce or avoid one or more of the Project's significant impacts. This chapter presents the Project objectives, summarizes the significant effects of the Project including those that cannot be avoided or reduced to a less-than-significant level, and describes the methodologies used to develop alternatives and analyze their impacts. Later sections in this chapter describe the potential alternatives that were considered but dismissed from further evaluation and the alternatives that were evaluated in detail. The chapter then evaluates the impacts of each of the alternatives evaluated in detail relative to those of the Project and evaluates the relationship of the alternatives to the Project ~~project~~ objectives. An environmentally superior alternative is identified at the end of this chapter.

5.2 CEQA Requirements

Section 15126.6 of the *CEQA Guidelines* requires that an EIR "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project and evaluate the comparative merits of the alternatives." Additionally, the *CEQA Guidelines* state the following:

- The specific "no project" alternative shall be evaluated along with its impact. If the environmentally superior alternative is the "no project" alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives [*CEQA Guidelines* Section 15126.6(e)(1)(2)].
- An EIR need not consider every conceivable alternative to a project. Rather, it must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation. An EIR is not required to consider alternatives that are infeasible. The range of potential alternatives to the proposed project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects. The EIR should briefly discuss the rationale for selecting the alternatives to be discussed. The EIR should also identify any alternatives that were considered by the lead agency but were rejected as infeasible during the scoping process and briefly explain the reasons underlying the lead agency's determination. Among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are (i) failure to meet most

of the basic project objectives, (ii) infeasibility, or (iii) inability to avoid significant environmental impacts [*CEQA Guidelines* Section 15126.6(a)(c)].

- The "range of alternatives" is governed by the "rule of reason," which requires the EIR to describe and consider only those alternatives necessary to permit informed public participation, and an informed and reasoned choice by the decision-making body [*CEQA Guidelines* Sections 15126.6(a) and (f)]. The description or evaluation of alternatives does not need to be exhaustive, and an EIR need not consider alternatives for which the effects cannot be reasonably determined and for which implementation is remote or speculative. An EIR need not describe or evaluate the environmental effects of alternatives in the same level of detail as the proposed project, but must include enough information to allow meaningful evaluation, analysis, and comparison with the proposed project [*CEQA Guidelines* Section 15126.6(d)].

Regarding the feasibility of alternatives, feasible means "capable of being accomplished in a reasonable period of time taking into account economic, environmental, legal, social and technological factors" (*CEQA Guidelines* Section 15364). The concept of feasibility also encompasses whether a particular alternative promotes the project's underlying goals and objectives, and whether an alternative is impractical or undesirable from a policy standpoint. (See City of *Del Mar v. City of San Diego* [1982] 133 Cal. App. 3d 410 and *California Native Plant Society v. City of Santa Cruz* [2009] 177 Cal. App. 4th 957.)

Also, CEQA does not require EIRs to include multiple variations of the alternatives it considers in detail (*Village Laguna of Laguna Beach v. Board of Supervisors* [1982] 134 Cal. App. 3d 1022).

5.3 Alternatives Development Process

Project purpose, objectives, and benefits, and significant and unavoidable environmental impacts proposed to result from the Project, are identified below as they inform and direct the development of alternatives.

5.3.1 Project Purpose and Objectives,

As described in Section 2.3, *Project Purpose, Objectives, and Benefits*, the purpose of the Project is to seismically retrofit, maintain, and operate Anderson Dam and Reservoir to meet FERC and DSOD requirements, thereby allowing Valley Water to maximize water supply and groundwater recharge capacity and benefits, while avoiding and minimizing environmental impacts of the implementation of those safety directives and requirements.

The Project objectives are as follows:

- Seismically retrofit and maintain the dam so that Valley Water may continue to operate it at capacity. This objective would be achieved by:
    - Replacing the existing dam to withstand the MCEs[1] on the Calaveras and Coyote Creek Range Front faults

[1] The MCE is the maximum considered earthquake for a specific area. It is generally considered an earthquake that is expected to occur once every 2,500 years, or with a 2 percent exceedance in 50 years.

  - Replacing the existing spillway to meet FERC and DSOD safety requirements related to the safe passage of the PMF
  - Replacing the outlet works to meet current DSOD outlet works requirements and accommodate fault offset
- Improve cost efficiency of dam operations by decommissioning the hydroelectric facility
- Avoid and minimize impacts of construction and operations

5.3.2 Significant Environmental Impacts of the Project

Table 5-1 summarizes those resource topic areas found to have significant impacts resulting from the Project as analyzed in Chapter 3, *Regulatory and Environmental Setting and Impact Analysis*. For most of these significant impacts, corresponding cumulative impacts are also cumulatively considerable, with the same mitigation measure effectiveness in reducing them to less-than-cumulatively-considerable levels. For a complete summary of all Project impacts and mitigation measures, see **Table ES-1** in the *Executive Summary*.

Table 5-1. Significant Project Impacts

Impact	Significance before Mitigation [a]	Significance after Mitigation [b]
Aesthetics		
AES-2: Substantial degradation of the existing visual character or quality of public views of the site and its surroundings	S	SU
AES-3: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area	S	LSM
Air Quality		
AQ-1: Conflict with or obstruct implementation of the applicable air quality plan	S	SU
AQ-2: A cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard	S	SU
AQ-3: Expose sensitive receptors to substantial pollutant concentrations	S	SU
Biological Resources – Wildlife and Terrestrial Resources		
TERR-1: A substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS Service		
TERR-1a: Special-Status Plants	S	LSM
TERR-1c: California Tiger Salamander, California Red-legged Frog, and Foothill Yellow-legged Frog	S	LSM
TERR-1e: Bald Eagle and Golden Eagle	S	LSM
TERR-1g: Nonbreeding Special-Status Birds	S	LSM
TERR-1h: Pallid Bat	S	SU

Impact	Significance before Mitigation [a]	Significance after Mitigation [b]
TERR-1j: San Francisco Bay Special-Status Species	S	LSM
TERR-2: A substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by CDFW or USFWS	S	LSM
TERR-3: A substantial adverse effect on State or federally protected wetlands through direct removal, filling, hydrological interruption, or other means	S	LSM
TERR-4: Interfere substantially with the movement of any native resident or migratory species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites	S	SU
Cultural Resources		
CR-2: Cause a substantial adverse change in the significance of an archaeological resource	S	LSM
CR-3: Disturb Human Remains	S	LSM
Geology and Soils		
GEO-4: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides	S	LSM
GEO-7: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature	S	LSM
Greenhouse Gas Emissions		
GHG-1: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment	S	LSM
GHG-2: Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases	S	LSM
Hazards and Hazardous Materials		
HAZ-2: Create a Significant Hazard to the Public or the Environment through Reasonably Foreseeable Upset or Accident Conditions Involving the Release of Hazardous Materials	S	LSM
HAZ-3: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school	S	LSM
HAZ-4: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment	S	LSM
HAZ-5: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan	S	LSM

Impact	Significance before Mitigation [a]	Significance after Mitigation [b]
Hydrology		
HYD-1a: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner ~~matter~~ which would result in substantial erosion or siltation on- or offsite	S	SU
Groundwater Resources		
GW-1: Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin	S	LSM
GW-2: Violate groundwater water quality standards or substantially degrade groundwater quality	S	LSM
GW-3: Conflict with or obstruct implementation of the San Francisco Bay Basin Plan groundwater provisions or the District's GWMP	S	LSM
Water Supply		
WS-2: Require or result in the relocation or construction of new or expanded water facilities, the construction of which could cause significant environmental effects	S	LSM
Water Quality		
WQ-1: Impair beneficial uses of surface waters OR violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality OR conflict or obstruct implementation of a water quality control plan	S	SU
Noise		
NOI-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, or generation of substantial incremental increase in noise levels	S	SU
NOI-2: Generate excessive groundborne vibration or groundborne noise levels	S	LSM
Public Services		
PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection	S	LSM

Impact	Significance before Mitigation [a]	Significance after Mitigation [b]
Impact PS-2: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection	S	LSM
Recreation		
REC-1a: Temporary increased use of neighboring land-based recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated	S	LSM
Transportation		
TR-1: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities	S	LSM
TR-4: Inadequate emergency access	S	LSM
Tribal Cultural Resources		
TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource listed or eligible for listing in the California Register of Historical Resources or determined by Valley Water, to be significant	S	LSM
Wildfire		
WF-4: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires	S	LSM

Notes

[a.] S = significant

[b.] SU = significant and unavoidable, LSM = less than significant with mitigation

As summarized in **Table 5-1** and described in detail in Chapter 3, significant impacts were identified resulting from the Project on the following environmental resources: aesthetics, air quality, wildlife and terrestrial resources, cultural resources, energy, geology and soils, GHG emissions, hazards and hazardous materials, hydrology, groundwater resources, water supply, water quality, noise and vibration, public services, recreation, transportation, tribal cultural resources, and wildfire. Some of the significant impacts could be reduced to a less-than-significant level by applying mitigation measures as described in Chapter 3. However, impacts could not be mitigated to a less-than-significant level for all or some thresholds for the following resource topics: aesthetics, air quality, wildlife and terrestrial resources (pallid bat and wildlife nurseries), hydrology (erosion or siltation), water quality, and noise. Therefore, the Project would result in significant and unavoidable impacts on those resources.

5.3.3 Alternatives Development and Screening

As part of early Project planning, an alternatives development process was initiated by Valley Water. In addition to the No Project Alternative required by CEQA, Valley Water considered a number of potential alternatives to the Project and individual components based on the Project objectives, FERC and DSOD requirements, feasibility, input from Valley Water staff and the FAHCE Initialing Parties, the FAHCE TWG, and public scoping comments.

The process for identifying alternatives included consideration of alternatives for both construction and post-construction operations phases of the Project. Alternatives were formulated based on the following planning rationales:

- Address the dam embankment seismic instability
- Minimize the size of excavation and buttress
- Provide for operational flexibility
- Minimize costs associated with the Project
- Avoid impacts on Cochrane Road
- Minimize the time to construct the Project
- Adherence to FAHCE *Settlement Agreement*
- Quality of the Project and ease of construction
- Reduction of environmental impacts
- Maintain community and stakeholder relations

The process for identifying alternatives included:

- Reviewing ideas and alternative measures suggested during EIR scoping and from input from regulatory agencies and stakeholders
- Determining whether identified strategies and alternative concepts meet Project objectives or could reduce impacts
- Reviewing feasibility issues with respect to technical, institutional, and regulatory concerns. If an identified strategy or alternative concept was determined to be infeasible, it was eliminated from further consideration.
- Developing and refining alternatives for detailed CEQA analysis in Section 5.5, *Alternatives Evaluated in the Draft EIR*.

5.3.4 Preliminary Conceptual Design Process

During the conceptual design process, various conceptual design options were considered and used as building blocks to ultimately develop conceptual alternatives that were further reviewed for feasibility. Some of these preliminary conceptual design options included a combination of the following measures:

- Different reservoir elevations during construction (i.e., options to complete construction without fully draining the reservoir)
- Different types of cofferdams for upstream remediation work

- In situ treatment (e.g., jet grouting) versus remove-and-replace approaches to remediate liquefiable lower fine fill and alluvium
- Underwater dredging excavation for upstream construction work versus working in the dry behind cofferdams
- Varying sizes of upstream and downstream buttresses
- Modification of the existing intake structure for lower outlet works versus construction of new intake
- Use of steel pipelines in an enlarged tunnel to address potential fault offsets for the lower outlet works
- Use of an upper-level outlet for reservoir drawdown capacities
- Left versus right abutment alignments for the LLOWs
- Raising the spillway walls and dam to various elevations versus widening or deepening the spillway to various depth capacities to accommodate increased PMF (HDR 2017)

After screening various combinations involving these options, alternatives were further conceptualized and evaluated for feasibility, the ability to meet Project objectives, and potential significant impacts resulting from carrying out such options. Alternatives which met these planning criteria are discussed below in further detail.

5.3.5 Alternatives Submitted during EIR Scoping

Participants in the EIR scoping process presented topics for consideration during the alternative project development process. **Table 5-2** summarizes alternative considerations and concepts raised during the public scoping process and states how they were integrated into the Project or other alternative projects or provides the reason for their elimination from detailed consideration, as appropriate.

Table 5-2. Concepts Proposed during Scoping

Proposed Alternative Consideration	Disposition
Cofferdam alternatives	Cofferdam alternatives were evaluated based on ability to withstand reservoir conditions for the timeline of construction, and long-term impacts on water quality. This included an evaluation of the degradation of cofferdam materials over time to both support the project during construction and not impair water quality within the reservoir during future operation.
Dredging the reservoir as part of the project	This concept was incorporated into the Increased Dredge Alternative.
Development of alternatives for both wet and dry years	Evaluation of the Project schedule for flexibility in the order of implementation of Project elements for aboveground construction (e.g., not including tunneling) included a statistical evaluation of weather delay days to determine feasibility of changes in Project implementation order. This included an evaluation of Project timelines depending on the order of Project component implementation.

Proposed Alternative Consideration	Disposition
Cofferdam to be built to protect the reservoir	A cofferdam is included in the Project to manage incoming waters into the reservoir throughout Project construction activities.
Inclusion of fish passage facilities for native steelhead and other fish	Fish passage facilities were included in the downstream Phase 2 Coyote Percolation Dam CM.
Construction of a second cofferdam on the upper, north end of the reservoir to protect wildlife	Continuous flows will be released from Coyote Reservoir, in accordance with current operations, to support wildlife and habitat at the north end of the reservoir. Therefore, an additional water feature is not necessary to support wildlife; habitat will be maintained between Coyote and Anderson Reservoirs.
Inclusion of outlet works with capability for selective withdrawal from various elevations in reservoir for purpose of controlling water temperature in Coyote Creek downstream of the dam	The Project includes a LLOW, which would be used, among other purposes, to control water temperature in Coyote Creek downstream of the dam.
Inclusion of outlet works with ability to release a range of flows for the various life history stages of anadromous salmonids downstream of the dam	The Project outlet works would support a range of flows. Releases from the reservoir would be governed by the FAHCE rule curves, which were formulated to improve outcomes for various life history stages of anadromous salmonids downstream of the dam.
Avoid impacts to historic resources (Cochrane Road properties)	The Project was redesigned to avoid impacts on historic Cochrane Road properties. These include structures located along Cochrane Road that are over 50 years in age (historic homes and barns).
Alternatives to using Live Oak Picnic Area as a staging area.	Other open parcels were considered for staging areas throughout Project construction; however, the proximity of the Live Oak Area minimizes impacts to the environment and provides the most efficient access to the work area by minimizing air quality, GHG, and traffic impacts with the close proximity of the Live Oak Area to the Project area.

5.4 Potential Alternatives Considered and Dismissed

Various alternatives to the Project were developed that could meet Project objectives and/or reduce impacts of the Project. Those alternative projects that were considered and eliminated from further consideration are discussed below. Potential project alternatives were eliminated based on one of the following conditions:

- The alternative was not substantially different from one of the considered alternatives.
- The alternative failed to meet most of the basic Project objectives.

- The alternative was for an individual Project component, rather than the Project as a whole.[2]
- The alternative would be infeasible to implement or operate.
- The alternative would not avoid or lessen one or more significant environmental impacts.[3]

Those alternatives carried forward for detailed evaluation are described in Section 5.5, *Alternatives Evaluated in the Draft EIR*.

5.4.1 Operation of Anderson Dam for Flood Risk Reduction Only

The Operation of Anderson Dam for Flood Risk Reduction Only Alternative (Flood Risk Reduction Alternative) would leave the existing Anderson Dam in place following completion of the FOCP and the Anderson Dam Tunnel Project. No Project construction would occur as described in the *Project Description* (Section 2). Following completion of the FOCP, Anderson Dam would be operated at a reduced capacity, consistent with FERC orders, to allow for incidental flood risk reduction, but the reservoir's ability to sufficiently support current and future regional water supply needs with water would be eliminated.

Under the Flood Risk Reduction Alternative there would be no changes to Anderson Dam beyond the FOCP. The maximum water elevation would be maintained at 492 feet, just above deadpool and Anderson Reservoir would no longer provide water supply benefits to the county. Valley Water would procure water to meet water demand from other sources such as expanded water conservation efforts, water transfers, and water recycling and purified water.

Valley Water would not construct flood risk reduction measures in Anderson Reservoir. Flows from San Felipe Creek, Packwood Creek, and Coyote Reservoir would be conveyed directly to Coyote Creek, up to the capacity of Stage 1 diversion structure constructed under FOCP. Valley Water would not implement changes to Coyote Dam under this alternative, which would continue to be subject to ~~seismic~~ restrictions on storage. With no storage in Anderson Reservoir the FAHCE rule curves would not be implemented, and Valley Water would not manage a cold-water management zone for fish downstream on Coyote Creek.

This alternative would not require excavation of borrow material, so there would be no excavation at PGBS or BHBA. The hydroelectric facility would remain inactive. While decommissioning the hydroelectric facility is not included in the description of this alternative, the Flood Risk Reduction Alternative is not incompatible with decommissioning the facility.

Coyote Creek would continue to flow through Ogier Ponds rather than in a dedicated channel as under the Conservation Measures, and Valley Water would not implement a Sediment Augmentation Program, geomorphic flows to manage fish habitat, as under the Fish Habitat Restoration Plan, as under Project Conservation Measures.

It is speculative at this time to project how the existing dam and infrastructure would be operated under this alternative, considering FERC and DSOD restrictions on Anderson Dam operations.

[2] Valley Water elected to evaluate some alternatives for individual Project components, even though not required to do so.
[3] This EIR screened and carried forward one alternative that did not reduce any significant impacts, the Anderson Dam Operated with FAHCE-Plus Modified Rule Curves. This alternative, however, improves outcomes for fisheries resources.

Under this alternative construction-related impacts on aesthetics, air quality, terrestrial species, energy, GHG emissions, and noise would be avoided. The alternative would meet the objective to avoid and minimize impacts of construction and operation but may not be feasible to implement given that it would not meet DSOD requirements to have the capacity to lower the maximum storage by 10 percent in 7 days and the full content within 90 days, and that the spillway be able to contain the probably maximum flood.

This alternative would not meet the Project objective to meet FERC, DSOD, and Valley Water safety requirements, thereby allowing Valley Water to operate Anderson Dam safely at capacity through seismic retrofit. It could also generate new significant impacts to water supply, groundwater in Coyote Valley, and aquatic species as it would eliminate Valley Water's ability to control flows downstream of Anderson Reservoir and the ability to store and release local water for the benefit of groundwater recharge and water supply.

The Flood Risk Reduction Alternative was dismissed from further consideration, because it would not meet the Project objective to meet FERC and DSOD safety requirements, thereby allowing Valley Water to operate Anderson Dam safely at capacity through seismic retrofit.

5.4.2 Removal of Anderson Dam and Provision of Alternative Water Supply Sources (Removal of Anderson Dam Alternative)

The Removal of Anderson Dam Alternative proposes the complete removal of Anderson Dam, with no replacement.

Under the Removal of Anderson Dam Alternative, it is assumed that FERC would approve decommissioning Anderson Dam subject to conditions to be determined. Decommissioning would involve removal of all structural components of the dam, spillway, and hydroelectric power generation facility. A design to demolish the reservoir and restore Coyote Creek would be prepared and environmental impacts of the decommissioning would be analyzed and disclosed, as required by FERC (Manahan and Verville 2005). Mitigation and Conservation Measures would be developed and implemented to mitigate for dam deconstruction.

- Flows to downstream Coyote Creek would be directly connected to San Felipe Creek and Packwood Creek. Valley Water would not implement changes to Coyote Dam under this alternative and Coyote Dam would continue to be subject to ~~seismic~~ restrictions on storage. The FAHCE rule curves would not be implemented, and Valley Water would not manage a cold-water management zone for fish downstream on Coyote Creek. Flows would be based on natural hydrology and releases from Coyote Reservoir. Pulse flows for fish would result from stream flows rather than managed releases but barriers to fish migration upstream to Coyote Dam would be removed.
- Valley Water would procure water supply from alternate sources, potentially including expanded water conservation, water transfers, and water recycling and purified water to meet future water demand as projected in Valley Water's UWMP.
- Coyote Creek would continue to flow through Ogier Ponds rather than in a dedicated channel as under the Conservation Measures and Valley Water would not implement a Sediment Augmentation Program, geomorphic flows to manage fish habitat, as under the Fish Habitat Restoration Plan, as under Project Conservation Measures.

The Removal of Anderson Dam Alternative would avoid significant impacts on aesthetics (removal of mature oak trees and changes to topography at BHBA) and terrestrial resources (plants, wildlife, and wetlands). The alternative is feasible to implement and would meet the objective to avoid and minimize impacts of construction and operation.

However, this alternative would not meet the Project objective to meet FERC, DSOD, and Valley Water safety requirements, thereby allowing Valley Water to operate Anderson Dam safely at capacity through seismic retrofit. It does not allow Valley Water to implement its mission under the District Act to provide groundwater recharge for water supply and to prevent subsidence or allow Valley Water to provide incidental flood protection under the 1982 rule curve. It would also not meet the Project ~~project~~ purpose of meeting FERC and DSOD requirements while allowing Valley Water to maximize water supply and groundwater recharge capacity and benefits. The health and safety and ecological benefits that accompany Valley Water's operation of Anderson Reservoir (specifically, the mission to protect sustainable groundwater recharge and water supply and provide flood risk reduction) using an integrated water management approach would be eliminated. This includes benefits such as the provision of environmental instream flows in otherwise intermittent reaches of Coyote Creek to support aquatic, riparian and wetland habitats and support related beneficial uses, management of creek temperatures to provide cooler water in the CWMZ to benefit fish and other aquatic species. Incidental flood protection provided by Anderson Dam would be eliminated.

The Dam Removal Alternative would not meet the Project objective to operate Anderson Dam safely at capacity through seismic retrofit and would not meet the Project purpose of meeting FERC and DSOD requirements while allowing Valley Water to maximize water supply and groundwater recharge capacity and benefit. It would also not allow Valley Water to meet its obligations under the District Act, providing sufficient water for groundwater recharge for water supply and to reduce subsidence. For these reasons, this alternative was dismissed from further consideration.

5.4.3 Project with Downstream Fix Only

This alternative proposes restricting excavation to the downstream shell of the embankment only by removing and replacing portions of the potentially liquefiable material and reconstructing the dam and constructing a large buttress on the downstream slope of the embankment. For this alternative, the water surface level in the reservoir would be maintained at the FERC-restricted level (deadpool), so no further dewatering would be required during construction. The crest of the dam would be raised to elev. 656 feet (approximately 8 feet) to maintain the freeboard required during a PMF event.

This alternative would involve less borrow and fill material than the Project as it would eliminate the teardown and reconstruction of the dam. For this reason, significant impacts of the Project associated with the mining of borrow materials (e.g., noise and vibration impacts related to blasting, air pollutants and greenhouse gas emissions associated with equipment used to excavate, and movement of borrow materials) would be lessened under this alternative. In addition, because this alternative would not involve complete dewatering of the reservoir, downstream water quality impacts related to sediments and temperature would be reduced relative to the Project impacts because the presence of a pool would decrease the amount of sediment suspended near the dam during rain events and increase settling of suspended sediment entering the reservoir.

This alternative would meet the Project objective to avoid and minimize impacts of construction and operation. While decommissioning the hydroelectric facility is not included in the description of this alternative, it is not incompatible with decommissioning the facility.

However, this alternative would not fully meet the Project ~~project~~ objective to seismically retrofit the dam. Shoring up the dam would fail to address the safety issues identified by FERC, DSOD, and Valley Water. This alternative would not remove all liquefiable materials from within the dam, and therefore would still be subject to liquefaction and surface fault rupture stresses. Therefore, this alternative would not meet the Project objective to seismically retrofit and maintain the dam so that it can be operated at capacity. Because this alternative would not meet this Project objective, this alternative was dismissed from further consideration.

5.4.4 Reduction of Excavation from Anderson Dam Embankment

The Reduction of Excavation from Anderson Dam Embankment Alternative would reduce the volume of material to be excavated compared to the Project, particularly during the middle year when the dam is excavated to its lowest level and the new embankment is built back to starting elevation for that year (URS 2019). The reduction in volume would be achieved by retaining a larger portion of the core and portions of the upstream and downstream shells of the existing dam than proposed for the Project. Because of the reduced volume of earthwork, this alternative could be constructed in 5 years: Year 1 to prepare in-reservoir access roads and disposal areas, Year 2 through Year 4 to remove and replace the new dam, and Year 5 for restoration activities. This alternative would include all the other elements described for the Project.

This alternative would reduce construction-related impacts (air quality, GHG emissions, noise and vibration, and transportation) relative to the Project, because less excavation of the embankment would be involved and less borrow material would need to be excavated and transported to reconstruct the dam. This alternative would meet the Project objective to avoid and minimize impacts of construction and operation. While decommissioning the hydroelectric facility is not included in the description of this alternative, it is not incompatible with decommissioning the facility.

However, it is unknown whether this alternative would fully meet the Project objective to meet FERC, DSOD, and Valley Water safety requirements to allow Valley Water to operate and maintain Anderson Dam at capacity through seismic retrofit. Because of uncertainties regarding seismic performance due to the larger existing dam remnant and retention of some liquefiable material, FERC and DSOD have indicated that this alternative would not be approved. Furthermore, the Board of Consultants (BOC) indicated that it would reject this alternative for the same reasons. Because this alternative is therefore infeasible, and because the alternative addresses construction options for only one Project component, this alternative was dismissed from further consideration.

5.4.5 Use of Offsite Borrow Materials and Cut Material Off-Hauled

This alternative would be similar to the Project, except that all borrow material for retrofitting the dam would be hauled in from an offsite borrow location and cut material would be hauled off rather than reused to avoid impacts to the BHBA and avoid putting materials in the reservoir. This alternative assumes that borrow material could be mined from offsite locations and would be hauled to the Project area via US 101 and Cochrane Road. There is no known alternative borrow sites are available in the county that would provide the amount of material needed for dam construction (source), so these materials, approximately 4,300,000 cy of appropriate materials, would have to be obtained from outside the county.

This alternative would achieve all the Project objectives and would avoid the significant and unavoidable aesthetic impact associated with grading the BHBA. However, this alternative would increase the severity of significant and unavoidable impacts associated with truck trips including air quality, GHG emissions, and noise, and increase traffic impacts to local and regional roadways, as materials would need to be transported from areas in further reaches of the county instead of within the Project Area. This alternative would also greatly increase the cost of the Project in hauling and dumping fees. Because this alternative would increase the severity of several significant impacts, and because the alternative addresses construction options for only one Project component, it was dismissed from further consideration.

5.4.6 Extended Construction Schedule Alternative

The Extended Construction Schedule would involve extending the construction schedule from a total of 10 years to a total of 15 years to reduce the impact from NOx emissions. The Extended Construction Schedule would meet the Project objective to seismically retrofit and maintain the dam so that Valley Water may continue to operate it at capacity. In addition, it is feasible to construct. It would lower significant construction impacts on air quality from NOx emissions. However, this alternative is not feasible because the additional time required for construction would create an increased and unacceptable risk to public health and safety and would increase the severity of several significant impacts that are caused by the drained reservoir, such as hydrology, water quality, and geology and soils. For this reason, and because the alternative addresses construction options for only one Project component, this alternative was dismissed from further consideration.

5.5 Alternatives Evaluated in the Draft EIR

5.5.1 No Project Alternative

CEQA Guidelines Section 15126.5(e) requires an EIR to evaluate the No Project Alternative. The purpose of evaluating the No Project Alternative is “to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project.” The No Project Alternative does not necessarily correspond strictly to existing conditions. Instead, the No Project Alternative must describe reasonably foreseeable conditions if the Project were not approved.

Under the No Project Alternative, the Project would not proceed, and existing (post-FOCP) environmental conditions and Valley Water operations would be maintained. Following completion of the FOCP (which includes construction of ADTP), the existing Anderson Dam would be left in place, eliminating Project construction and other Conservation Measures as described in the Project Description (Section 2). Valley Water would not undertake new construction at Anderson Dam but would continue to maintain the facility consistent with the DMP. FOCP construction avoidance and minimization measures, including imported water releases using chillers if necessary, would not be continued following FOCP construction.

Accordingly, the liquefiable materials in the dam embankment and other materials vulnerable to seismic movement would not be removed and replaced. No increased outlet capacity would be accommodated; the maximum outlet capacity would remain at 2,500 cfs (2,000 cfs from the newly constructed tunnel under the ADTP plus the existing outlet with 500 cfs of capacity). Because the No Project Alternative would not address seismic vulnerability, including potential deformation due to seismically induced liquefaction, the maximum water elevation would remain at the restricted level (deadpool) as ordered by FERC. This order also directed Valley Water to construct the proposed low-level outlet as soon as possible to allow for faster drawdown of reservoir water levels. This low-level outlet is underway as the ADTP. Finally, the February 20, 2020 FERC Order directed Valley Water to expedite design, permitting, and implementation of the Seismic Retrofit.

The No Project Alternative would provide flood risk reduction because of FERC requirements to restrict Anderson Reservoir water levels to a near deadpool. Since the outflow capacity from Anderson Reservoir would be capped at 2,500 cfs, it is likely that water levels in very wet years would rise above the FERC-restricted level. However, the ADTP would increase the ability of Valley Water to release flows quickly from the reservoir to avoid long-term storage of water behind the dam, but not to the level required by DSOD.

The No Project Alternative would not provide a full reservoir to support water supply and managed groundwater recharge, or incidental supplemental in-stream flows or cooler flow for Coyote Creek. Anderson Reservoir provided approximately 89,000 AF of storage for both local and imported water supplies. Stored water could be discharged to Coyote Creek for in-stream groundwater recharge or could be provided to Valley Water's water treatment plants. Under the No Project Alternative local water could no longer be stored at Anderson Reservoir and would be discharged downstream as it enters the reservoir. This would result in an overall increase in temperatures of water stored within the reservoir as the depth of the reservoir would never increase, and the historic stratification that resulted in a cold pool of water that was released through the existing outlet structure would no longer exist. Imported water would not be stored at Anderson Reservoir; Calero Reservoir is the only other reservoir in the county that can store imported water but has a capacity of only about 9,700 AF (currently restricted to 4,400 AF due to seismic concerns).

Imported water could continue to be released to Coyote Creek for groundwater recharge. The No Project Alternative would not implement the FAHCE program providing pulse flows for fish habitat.

The No Project Alternative would avoid construction and ground disturbance related impacts to aesthetics, air quality, wildlife and terrestrial resources, cultural resources, energy, GHG emissions, paleontological resources, hazards and hazardous materials, water quality (from blasting), and noise and vibration, public services, transportation, tribal cultural resources, and wildfire relative to the Project. However, it would also cause new or substantially more severe significant impacts compared to the Project, as explained in Section 5.

The No Project Alternative would not meet the Project to seismically retrofit, maintain, and operate Anderson Dam and Reservoir to meet FERC and DSOD safety requirements, thereby allowing Valley Water to maximize water supply and related incidental benefits, while avoiding and minimizing environmental impacts of the implementation of those safety directives and requirements. It also would not meet the fundamental Project objective to seismically retrofit and maintain the dam so that Valley Water may continue to operate it at capacity consistent with providing groundwater recharge and protecting public safety. Furthermore, the No Project Alternative would not be feasible because it would conflict with the February 20, 2020 FERC Order, which directed Valley Water to "continue to work with all haste to design and secure the necessary permits and complete the design for the larger Anderson Dam Seismic Retrofit Project" and DSOD requirements to have the ability to lower the maximum storage by 10 percent in 7 days and the full content within 90 days, and that the spillway be able to contain the probably maximum flood. Although the No Project Alternative is infeasible because it would not comply with the FERC directive of February 20, 2020, and DSOD requirements, the No Project Alternative was retained because it is required by CEQA. This alternative also informs the decision-makers and public of the impacts of the No Project Alternative compared to impacts of the Project and action alternatives.

5.5.2 Increased Dredge Alternative

The Increased Dredge Alternative[4] would remove a larger volume of sediment from the Anderson Reservoir bed compared to the Project, but all other components of the Project would remain the same. The purpose of this alternative is to reduce temporary downstream turbidity impacts during the construction of the Project which would result in significant unavoidable impacts to hydrology and water quality. By excavating a large amount of sediment from the reservoir bed and providing area for upstream sediment to settle and deposit, this alternative reduces downstream sediment transport and thereby meaningfully reduces the potential for increased temporary erosion and sediment transport during certain-sized storm events the 7-year Project construction period.

5.5.2.1 Construction Process, Equipment, Schedule, Workforce, and Staging

Prior to the start of the Seismic Retrofit construction, approximately 1,400,000 cy of sediments would be dredged from the bed of the reservoir in the dead pool. Dredged sediments would be transported by pipeline to Stockpile K (North and South) and Stockpile Area M for sediment drying. Dried sediments would be transported to Ogier Ponds or South San Francisco Bay Salt Ponds for beneficial reuse by truck. Construction activities would take place in the 2 years preceding the start of construction (Year Minus 2 and Year Minus 1), during the dry season. Site mobilization would take place from April 15 to April 30. Sediment dredging would take place from May 1 to August 31 (4 months). Truck transport of dried sediments would take place from June 15 to October 15 (4 months). Site demobilization would take place from October 1 to October 15. Equipment would be mobilized and demobilized each construction year.

Hauling activities and work at the drying piles would be conducted during a single 8-hour shift between 8:00 a.m. and 4:30 p.m., Monday through Friday. However, sediment dredging would be conducted 24 hours a day, 7 days a week. An average of 40 workers would be required between 8:00 a.m. and 4:30 p.m., reducing to an average of 20 workers outside these hours and on weekends. The maximum number of workers required at any one time is estimated to be 80 workers.

[4] Although this alternative addresses construction options for only one Project component, it was nevertheless retained for detailed consideration.

The types of equipment needed for construction and durations of use would vary based on the construction activity. A detailed summary of typical construction equipment required for each construction activity is provided in **Table 5-3**. The number of hours per day that each type of equipment would be operated is provided in **Table 5-4**.

Table 5-3. Types of Construction Equipment – Increased Dredge Alternative

Construction Year	Construction Activity	Approximate Duration (Months)	Equipment Type
Year Minus 2	Site mobilization	0.5	Bulldozers, excavators, loaders
Year Minus 2	Sediment dredging, drying, and disposal	5	Barges, cranes, skiffs, bulldozers, excavators, loaders, highway dump trucks, generators
Year Minus 2	Site demobilization	0.5	Bulldozers, excavators, loaders
Year Minus 1	Site mobilization	0.5	Bulldozers, excavators, loaders
Year Minus 1	Sediment dredging, drying, and disposal	5	Barge, crane, bulldozers, excavators, loaders, highway dump trucks, generators
Year Minus 1	Site demobilization	0.5	Bulldozers, excavators, loaders

Table 5-4. Construction Equipment Utilization

Equipment Type	Quantity	Hours/Day
Barge	2	24
Crane	2	24
Skiff	1	12
Bulldozer	4	8
Excavator	4	8
Loader	4	8

Similar to the Project, Staging Area K (North and South) and Stage Area M would be graded as required. Haul roads would be constructed from Staging Area 5 to Staging Area K (North and South) and Stage Area M. The boat ramp would be used for staging. This construction activity is the same as proposed for the Project except that the timing of using these sites differs from the Project.

5.5.2.2 Sediment Dredging, Transport, and Drying

Sediments would be dredged using barge-mounted cranes equipped with cable-deployed dredge pumps. Dredged sediments would be transported by pipeline to Stockpile K (North and South) and Stockpile Area M for sediment drying using a system of geotextile tubes. **Table 5-5** shows the quantity of sediment to be dredged from the deadpool in Year Minus 2 and Year Minus 1.

Table 5-5. Material Handling – Sediment Dredging

Construction Year	Sediments, In Place (cy)
Year Minus 2	700,000
Year Minus 1	700,000

There would be no releases from Anderson Reservoir during sediment dredging. Downstream flow would come from imported water via the CDL and Cross Valley Pipeline Extension.

5.5.2.3 Sediment Disposal

Dried sediments would be removed from geotextile tubes at Staging Areas K and M and loaded onto highway dump trucks using bulldozers, excavators, and loaders. Hauling would take place from 8:00 a.m. to 4:30 p.m., Monday to Friday. Dried sediments would be trucked to Ogier Ponds or South San Francisco Bay Salt Ponds for beneficial reuse via Staging Area 5, Holiday Drive, East Dunne Avenue, and US 101. **Table 5-6** shows the anticipated total number of truck trips per year for sediment transport to the reuse sites.

Table 5-6. Truck Traffic, Sediment Hauling to Sediment Reuse Sites Only

Construction Year	Total Truck Trips	Avg Daily Truck Trips
Year Minus 2	63,000	750
Year Minus 1	63,000	750

It is assumed that materials would be dry enough for transport to the reuse sites after 6 weeks of drying. As stated above in Section 5.5.2.1, truck transport of dried sediments would take place from June 15 to October 15.

The Increased Dredge Alternative is feasible and includes all the other elements as the Project, with a change only in removal of sediment from the reservoir bed starting two years prior to planned construction. It would meet the first Project objective, to seismically retrofit and maintain the dam so that Valley Water can continue to operate it at capacity. The Increased Dredge Alternative would reduce the magnitude of impacts of the Project related to turbidity and downstream sedimentation during the construction period because the sediment removal would create an area where sediments picked up by flows could be deposited. However, the alternative would increase the severity of significant and unavoidable impacts associated with earth movement and truck trips including aesthetics, air quality, energy, GHG emissions, and noise, and increase traffic impacts to local and regional roadways, as 2 additional years of excavation (1.4 million cy of material) and trucking (750 truck trips per day) would be needed. The alternative would significantly increase costs through additional hauling of materials. Thus, it would not fully achieve the Project objective to avoid and minimize the environmental effects of construction and operation.

5.5.3 Anderson Dam Operated with FAHCE-Plus Modified Rule Curves (FAHCE-Plus Modified) Alternative

The FAHCE-Plus Modified Alternative[5] was developed through consultation with the Project TWG which includes state and federal resource agencies to create an alternate regime of flow releases designed to increase and better diversify salmonid migration on Coyote Creek. The FAHCE-Plus Modified Alternative evolved from the FAHCE rule curves (evaluated as part of the Project in this EIR) and the FAHCE-Plus rule curves proposed for implementation in consultation with the AMT in Stevens Creek and Guadalupe watersheds; ~~River proposed for implementation in consultation with the AMT in Stevens Creek and Guadalupe watersheds;~~ they were included ~~(included~~ in the FAHCE Fish Habitat Restoration Plan, Appendix A to the FAHCE Final EIR (Valley Water 2024 ~~2023~~).

As part of this alternative, as suggested by NMFS during Endangered Species Act technical assistance recommendations developed in consultation with the TWG, Valley Water would develop an Anderson Dam Operations Work Group (OWG) to discuss and provide updates on FAHCE-Plus Modified operations. The OWG would include representatives from NMFS and CDFW. Three key responsibilities of Valley Water within the OWG are: (1) to hold an annual coordination meeting, (2) to provide frequent operational updates, and (3) to schedule additional coordination as needed during dry or low storage years. The annual meeting would be scheduled to occur no later than February 15th of each year, with a focus on potential modifications to operations based on current conditions in the watershed and projections of 90 percent historical flow exceedance for the remainder of the water year. More frequent coordination would occur as needed in low storage and/or dry and very dry years, which could include monthly meetings. The Valley Water Operations team would provide updates to the OWG via email as changes occur associated with multi-purpose and smolt pulse releases, geomorphic flows, winter baseflow changes, and operations that lead to a deviation from FAHCE-Plus Modified operations. The OWG would acknowledge required trade-offs among steelhead life history stages and provide consensus-based management decisions. The purpose of the coordination meetings is to:

- Review, discuss, and provide input on pulse flows (including variability in the pulse), winter baseflows, and implementation of the security pulse; and
- Discuss any in-season changes to modify program actions based on hydrologic conditions such as drought, low storage, or other hydrologic factors.

To ensure agreement is reached on proposed actions, when applicable, the Kaner (1996) consensus gage would be used in the decision-making process. It is not expected that changes to winter baseflows and pulse flows would be needed in most years. The OWG would be used to make in-season flow release adjustments to benefit fish as different conditions arise, such as during low storage and dry years. Any long-term changes associated with operations would occur through the AMT.

[5] Although this alternative addresses only one Project component, it was nevertheless retained for detailed consideration.

The FAHCE-Plus Modified Alternative would retain all other components of the Project, including long-term post-construction adaptive management pursuant to the Project and FAHCE AMP in consultation with the AMT, except that the FAHCE-Plus Modified rule curves ~~curve~~ rather than the FAHCE rule curves ~~curve~~ would govern Anderson Dam ~~dam~~ releases after completion of Project construction, including construction of all Conservation Measures, as described below.

The FAHCE-Plus Modified rule curves are intended to increase the benefit of reservoir releases for fisheries during key salmonid life stages. Based on hydrologic modeling outputs, the FAHCE-Plus rule curves for Coyote Creek combine concepts of the FAHCE flow measures (comprised generally of winter base flows, winter and spring migration period pulse flows, and summer cold water management releases) with an enhanced set of rules for spring attraction, safeguard and outmigration pulse flows designed to maximize fish migration. The FAHCE-Plus Modified operational rules are similar to those for FAHCE, with the following modifications:

- ~~Summer base flow is adjusted to include a slight increase in temperature limits of summer cold water releases, still within the normal temperature range for steelhead rearing, to enhance summer rearing habitat. This allows a greater portion of the reservoir volume to be used to provide summer flows.~~
- FAHCE-Plus Modified rule curves contain differences in the timing and release of pulse flows compared to the FAHCE scenario. Generally, in Coyote Creek FAHCE-Plus Modified:
    - Expands the time window available for pulse releases to December 1 through/including May 31
    - Initiates higher magnitude and more frequent pulse flows compared to FAHCE intended to increase passage opportunities for adult steelhead by increasing water depths through critical riffles
    - Includes prioritization of attraction and outmigration pulse flows to aid in both up- and outmigration of steelhead, as well as late season outmigration specific pulse flows. In addition to attraction and outmigration pulse flows, a safeguard pulse flow (described in more detail below) is also initiated if triggers for the other pulse flows are not met by January 15, combined storage in Anderson and Coyote Reservoirs is above a certain threshold, and downstream flows are above a certain threshold of any given water year.
    - Adds a security pulse. If no pulse has been released by March 1 and other conditions are met a security pulse flow (described in more detail below) may be released at the discretion of the OWG.

~~To accommodate increased magnitude, duration, and number of pulse flow releases under FAHCE-Plus Modified, the definition of the cold pool within Anderson Reservoir was also modified. The increases in pulse flow releases made prior to May 31 deplete cold water storage in Anderson reservoir to a greater deter than pulse flow releases under FAHCE. To expand the volume of the cold-water pool available for the summer cold water release program, FAHCE Plus Modified revises the summer steelhead rearing period (May 31 to October 1) local cold water release temperature limitation for flows from the reservoir from 14°C or less under FAHCE to 16°C or less under FAHCE-Plus Modified. This increased reservoir release temperature restriction is based on modeling and observed water temperatures showing that releases with a~~

~~temperature of 16°C or less are typically sufficient to maintain temperatures of 18°C or less throughout the FCWMZ, and, after completion of Ogier Ponds restoration, throughout the CWMZ.~~

The performance of FAHCE and the original FAHCE-Plus rule curves with respect to providing in-stream flows beneficial to steelhead was evaluated for Coyote Creek in WEAP modeling (Appendix F) and is summarized below:

- Pulse Flow Revisions: Review of the hydrologic modeling results suggest that additional and more diverse migration opportunities could be provided if adjustments were made to the Project pulse flow (or FAHCE) design. A new safeguard pulse flow was developed for FAHCE-Plus specific to Coyote Creek Watershed. In addition to increases ~~changes~~ in magnitude and duration, the timing of pulse flows was expanded to include pulse checks throughout the adult salmonid upstream migration period. To produce connection flows in as many years as possible, the safeguard pulse flow was added in March with a lower reservoir storage threshold than standard pulse flows. The safeguard pulse flow would be activated if upstream steelhead migration flows (or attraction flows) were not available by March 1 of any given water year. In addition, a regular outmigration pulse flow was added in mid-April of each year regardless of migratory opportunities earlier in the year. Safeguard and outmigration pulse releases would occur in years when storage is available to support summer rearing while still enabling a minimum reservoir carryover.
- Summer Base Flow Adjustments: Summer base flows under the FAHCE rule curves would be more reliable and cooler compared to the Pre-FERC Order Conditions Baseline. WEAP modeling for the FAHCE Plus rule curves shows that to ~~To~~ enhance summer rearing habitat with the FAHCE-Plus rule curves, temperature criteria used to calculate cold pool volumes could be raised ~~were raised~~ from 14°C or less to 16°C or less, while still maintaining a temperature not to exceed a daily average of ~~attaining~~ 18 °~~C or less~~ within the Coyote Creek CWMZ to support steelhead rearing. The FAHCE-Plus Modified Alternative has not been modeled at this time so the FAHCE-Plus modeling results are used as a proxy for estimating relative habitat changes between FAHCE-Plus Modified and the Project, which assumes FAHCE flows. This increase in temperature criteria could allow ~~allows~~ a greater portion of the reservoir volume to be used to provide summer flows and would provide additional rearing habitat downstream, according to the model. However, consistent with NMFS technical recommendations agreed upon by the TWG, Valley Water would use the 14 degrees Celsius (°C) criterion pursuant to the Project for calculating the cold water pool under the FAHCE-Plus Modified Alternative and this is not anticipated to cause major changes in habitat relative to the modeled FAHCE-plus.

Flows under the FAHCE-Plus Modified Alternative compared to the original FAHCE-Plus flows differ by ~~minor~~ changes in pulse timing, frequency, a downstream flow trigger, and flow for the safeguard flow, which would occur in winter if conditions had not been met to release an attraction flow. FAHCE Plus Modified also uses the original FAHCE Settlement Agreement threshold of 14°C for calculating the cold pool volume. In addition, the FAHCE-Plus Modified rule curves retain the ~~provide~~ longer pulse flow duration and increased volume of pulse flow from FAHCE Plus, with an increase in number of years with a pulse flow, and an increase in the number of pulses to comprise attraction, outmigration pulse, and safeguard pulses through the period December 1 to May 31, and vary the length of each type of pulse under some conditions in order to provide a diversity in migratory opportunity.

- Safeguard flows for adult steelhead upmigration and juvenile steelhead outmigration would occur between mid-January and the end of March (rather than waiting to check only once on March 1) and would be shorter in duration than FAHCE-Plus flows, allowing for two pulses to occur over a more diverse timeframe. A downstream flow trigger at stream gage 5058 was added so that managed pulse flows would coincide with natural precipitation events.
- Outmigration flows would occur between April 1 and the end of May (rather than waiting to check on April 15) and would be shorter in duration than FAHCE-Plus flows, allowing for two pulses to occur over a more diverse timeframe. A downstream flow trigger at stream gage 5058 was added so that managed pulse flows would coincide with natural precipitation events. Outmigration pulses can trigger regardless of whether attraction, safeguard, or security pulses have already been released.

The FAHCE Plus Modified rules also include the addition of a "security pulse flow" which may be released at the discretion of the OWG if certain conditions are met indicating a need for the pulse. The security pulse would be a magnitude of 90 cfs for four days (variations using the same volume of water allowable) and would be available to release if:

- By March 1st, no pulse has been released during the current water year and the safeguard pulse storage threshold is not met.
- Connection from Anderson Reservoir to San Francisco Bay has been made.
- Local inflows into Anderson and Coyote reservoir for the current water year have been greater than the 90 percent exceedance probability (i.e., dry year inflows) based on historical records (1936 to current water year).
- Valley Water is not pursuing, receiving, or planning to receive emergency water supply allocations from the State Water Project (i.e., Human Health and Safety allocations) or the Central Valley Project (i.e., Public Health and Safety allocations) during the current water year.
- Storage in Anderson and Coyote reservoirs would remain above the 20,000 Acre-Feet required for emergency water supply after the pulse is completed.

Table 5-7 compares details of the rule curves for the Project (FAHCE rule curves) to the FAHCE-Plus Modified Alternative.

Compared to the Project, which would implement FAHCE, the FAHCE-Plus Modified Alternative would:

- Extend the duration for Attraction Pulse flows from February 11 through/including April 1 to the annual period from December 1 through/including April 1.
- Increase the Attraction Pulse flows from 50 cfs for 5 days for up to 2 total pulses, to 90 cfs for 10 days, up to 2 pulses per month and 9 total pulses.
- Add a new safeguard pulse flow of 90 cfs for 10 days between mid-January and the end of March if the triggers described in **Table 5-7** are met. This pulse is tailored for

attraction flows, but also provides suitable depth and velocities for outmigration of steelhead.

- Add a new security pulse flow of 90 cfs for four days to be released at the discretion of the OWG when conditions are met.
- Add a new outmigration pulse flow between April 1 and the end of May. When triggers described in **Table 5-7** are met, outmigration release would be 60 cfs for 3 days; up to two pulses possible during period; after the end of the first pulse, there would be a pause of at least 7 days before another pulse would be initiated. Outmigration pulses are triggered regardless of juvenile migration opportunities earlier in the year.
- ~~Raise temperature criteria used to calculate cold pool volumes for summer releases (May 31 to October 1) of Anderson reservoir flows to 16 from 14°C or less to 16°C or less, while still attaining 18 °C or less within Coyote Creek FCWMZ (and, after completion of Ogier Ponds, the CWMZ) to the maximum extent feasible to allow a greater portion of the reservoir volume to be used to provide summer flows and to provide additional rearing habitat downstream.~~
- To help offset any depletion of the reservoir cold water pool during the FAHCE-Plus Modified pulse flow period under FAHCE-Plus Modified, summer reservoir releases may be augmented with releases from the CDL for groundwater water recharge and incidental summer cold water flow management within the CWMZ If imported water from the CDL is 14°C or less. The releases from the CDL to Coyote Creek would be combined with releases from Anderson Reservoir to meet the target of providing water with a temperature of 18°C or less and a minimum flow of 1 cfs at the downstream end of the CWMZ. Prior to the completion of the Ogier Ponds Restoration Project, benefits of cold water pool management may only be observed in the FCWMZ, due to warming that occurs in the pond complex.

Table 5-7. Comparison of Project (FAHCE Rule Curves) and FAHCE-Plus Modified Alternative (FAHCE-Plus Modified Rule Curves)

Pulse Type	Pulse Details	FAHCE	FAHCE-Plus Modified	Notes
Attraction Pulse	Magnitude (cfs)	50	90	
Attraction Pulse	Duration (days)	5	10	
Attraction Pulse	Calendar Window	2/01 - 4/30	12/01 - 04/01	
Attraction Pulse	Storage Threshold (combined Anderson + Coyote Reservoirs in acre-feet)	80,000	80,000	
Attraction Pulse	Number of Events	Up to 2 per Year	Up to 2 per month; up to 9 total	
Attraction Pulse	Approximate Water Volume per Event (acre-feet)	52	1,012	
Attraction Pulse	Approximate Water Volume Total (acre-feet)	104	9,104	
Safeguard Pulse	Magnitude (cfs)	-	90	
Safeguard Pulse	Duration (days)	-	5	
Safeguard Pulse	Calendar Window	-	01/15 - 03/31	
Safeguard Pulse	Storage Threshold (combined Anderson + Coyote Reservoirs)	-	55,000	
Safeguard Pulse	Number of Events	-	Up to 2 total	FAHCE-Plus Modified: Begin pulse if storage >= 55,000 and streamflow station 5058 flow >= 30 cfs for at least two consecutive days FAHCE-Plus Modified: If 30 cfs trigger is not met by March 1 and combined storage >= 55,000, then make pulse release of 90 cfs for 10 days FAHCE-Plus Modified: If Attraction Pulse initiates, the Safeguard will not trigger
Safeguard Pulse	Approximate Water Volume per Event (acre-feet)	-	516	

Pulse Type	Pulse Details	FAHCE	FAHCE-Plus Modified	Notes
Safeguard Pulse	Approximate Water Volume Total (acre-feet)	-	1,031	
Security Pulse	Magnitude (cfs)	-	90	
Security Pulse	Duration (days)	-	4	
Security Pulse	Calendar Window	-	Timing of pulse will be determined by the OWG if conditions are met.	
Security Pulse	Storage Threshold (combined Anderson + Coyote Reservoirs in acre-feet)	-	20,000	FAHCE-Plus Modified: Begin pulse if storage >= emergency supplies (20,000) and flow is connected to San Francisco Bay. FAHCE-Plus Modified: If Attraction or Safeguard Pulse initiates, the Security Pulse will not trigger
Security Pulse	Number of Events	-	1	
Security Pulse	Approximate Water Volume per Event (acre-feet)	-	417	Volume calculated using the same method used for other pulses. Valley Water may use up to 800 AF of storage to satisfy this pulse.
Security Pulse	Approximate Water Volume Total (acre-feet)	-	417	
Outmigration Pulse	Magnitude (cfs)	-	60	
Outmigration Pulse	Duration (days)	-	3	
Outmigration Pulse	Calendar Window	-	04/01 - 05/31	
Outmigration Pulse	Storage Threshold (combined Anderson + Coyote Reservoirs)	-	45,000	FAHCE-Plus Modified: Begin pulse if storage >= 45,000 and streamflow station 5058 flow >= 10 cfs for at least two consecutive days FAHCE-Plus Modified: If 10 cfs trigger is not met by May 15 and combined

Pulse Type	**Pulse Details**	**FAHCE**	**FAHCE-Plus Modified**	**Notes**
				storage >= 45,000, then make pulse release of 60 cfs for 7 days FAHCE-Plus Modified: Outmigration pulse triggers regardless of attraction, safeguard, or security pulses already released.
Outmigration Pulse	Number of Events	-	Up to 2 total	
Outmigration Pulse	Approximate Water Volume per Event (acre-feet)	-	119	
Outmigration Pulse	Approximate Water Volume Total (acre-feet)	-	238	

The Project and FAHCE Adaptive Management Program would be implemented under this alternative, with the FAHCE-plus Modified rule curves adaptively managed together with the Project's Conservation Measures. For the FAHCE-Plus Modified Alternative, Appendix D summarizes the adaptive management goals, measurable objectives, monitoring types, methods and frequency, triggers for potential management actions, and potential management actions to be considered for implementation by Valley Water in coordination with the regulatory agencies of the FAHCE AMT (Project AMT). Valley Water would also collaborate with the National Oceanic and Atmospheric Administration (NOAA) Fisheries Southwest Fisheries Science Center regarding sampling methodologies to ensure that fisheries population status and trends can be established over time.

Because the FAHCE-Plus Modified Alternative includes the same non-rule curve elements as the Project, and is a feasible alternative, it would meet the first Project objective, to seismically retrofit and maintain the dam so that Valley Water can continue to operate it at capacity. In addition, this alternative would meet the objectives to improve cost efficiency of dam operations and avoid and minimize impacts. This alternative would not reduce any significant impacts of the Project, it was selected for detailed consideration because it would improve outcomes for anadromous fish.

5.5.4 Modification of Ogier Ponds Lands West of Pond 1 and Pond 2 to Protect Ponds and to Avoid Trucking (Ogier Ponds Alternative)

The Ogier Ponds Alternative[6] would retain all components of the Project; however, the Ogier Ponds CM would be modified (Valley Water 2024 ~~2023~~). The Ogier Ponds Alternative includes excavating a new channel for Coyote Creek with associated floodplain, habitat area, and separation berm, in the agricultural field west of Pond 1 and reestablishing the Coyote Creek alignment that was originally constructed by SCCPRD at the close of gravel mining activities. This alternative would avoid the filling of Ponds ~~Pond~~ 1 and 5 and partial filling of Pond 2, as would be done under the Ogier Ponds CM. Under both the Ogier Ponds CM and this alternative, Pond 4 ~~Ponds 2 and 5~~ would be partially filled.

The benefits of this alternative include: (1) avoiding impacts to open water areas at Ogier Ponds; (2) retaining substantial open water areas in Pond 2, Pond 3, ~~and~~ Pond 4, and Pond 5 for open water habitat and recreational use; and (3) generating a surplus of earth ~~reducing generated soil~~ material, which would reduce trucking impacts, and provide material for reuse for pond ~~reusing the soil to create habitat~~ enhancements. About half of the work for this alternative would be done on County Parks property; however, approximately 36 ~~18~~ acres of private property along the west side of the new channel would be affected, including 18 acres in agricultural use and on Prime Farmland. ~~would be affected~~. The affected property includes the cherry orchard to the west of Pond 1 and the agricultural buildings just north of Barnhart Avenue. As such, real estate acquisition of some portion of these private properties would be necessary. This alternative includes all components of the Project with a revised configuration of the Ogier Ponds CM, is feasible to implement, would meet the Project objective to seismically retrofit and maintain the dam so that Valley Water can continue to operate it at capacity, as well as the objectives to

[6] Although this alternative addresses options for only one Project component, it was nevertheless retained for detailed consideration.

improve cost efficiency of dam operations and avoid and minimize impacts. This alternative would reduce impacts on terrestrial resources, riparian habitat, and wetlands. Construction of this alternative would generate about 210,000 cy of potentially reusable soil; however, because the Project area was previously mined for over five decades, the potential exists for unknown subsurface mining wastes or soil and/or groundwater contaminated at levels of regulatory significance in the Project area. As such, there is a risk of additional Project costs for remediation of contaminated materials, similar to under the Project.

Implementation of this alternative would require Valley Water to acquire property rights from up to nine ~~six~~ private property owners. The timeline for acquisition of these property rights is uncertain and could result in schedule delays. However, this effort would not affect the schedule for implementation of the seismic retrofit components. Accordingly, it would not result in increased risks to public health and safety related to seismic vulnerabilities of the dam and the schedule uncertainties would not affect the feasibility of this alternative.

5.6 Methodology for Evaluating Alternatives

Each of the four alternatives identified above is evaluated using the same general methods described in Chapter 3, *Regulatory and Environmental Setting and Impact Analysis*, for the Project. The impacts of these alternatives are evaluated using the existing conditions baseline, Pre-FERC Order Conditions Baseline, and future conditions baseline, as applicable. These impacts are then compared to those of the Project for each resource. For model-dependent water-related resource evaluations (e.g., fisheries resources) relating to changed rule curves for the FAHCE-Plus Modified Alternative, the impact analysis generally considers comparison against both the Pre-FERC Order and the future conditions baselines. BMPs and VHP implementation are considered part of each alternative's impact analysis, consistent with the Project analysis in Chapter 3. Descriptions of the BMPs and VHP conditions are provided in Appendix A. When impacts are found to be significant, feasible mitigation measures are described, and a post-mitigation significance conclusion is provided. Impacts and mitigation measures follow the same naming and numbering structure as in Chapter 3.

The analysis then compares the determination and magnitude of the impacts under each alternative to those of the Project. The analysis focuses on those impacts that are significant before mitigation and for which the determination or magnitude of the impact differs between the Project and alternative are discussed.

5.7 Organization for Alternatives Impact Analysis

The alternatives analysis is organized first by alternative—No Project Alternative, Increased Dredge Alternative, FAHCE-Plus Modified Alternative, and Ogier Ponds Alternative—and then followed by resource.

Under each alternative, each resource topic area follows the same order as the Project analysis in Chapter 3, *Environmental Setting and Impact Analysis*.

Section 5.8 provides a textual analysis under each alternative regarding those impacts whose determination or magnitude differs from the determination or magnitude under the Project.

5.8 Comparative Summary of Alternatives

Table 5-8 summarizes impacts of the alternatives and compares Project impacts with the impacts of each of the alternatives evaluated in the EIR. Project impacts fall into the following categories:

- No impact (NI)
- Less than significant impact (LTS)
- Less than significant impact with mitigation (LTSM)
- Significant and unavoidable impact (SU); no feasible mitigation measures are available to reduce impacts to a less than significant level

Table 5-8 also compares the magnitude of impacts of the alternatives to those of the Proposed Project, with a "+" indicating that the alternative would have a greater adverse impact than the Proposed Project; a "-" indicating that the alternative would have a less adverse impact than the Proposed Project; or an "=" indicating that the alternative would have the same level of impact as the Project.

1 **Table 5-8. Summary of Impact Determinations for the Project and Alternatives**

Impact	Level of Impacts with Mitigation				
	Project	No Project	Increased Dredge	FAHCE-Plus <u>Modified</u> ~~Enhanced~~	Ogier Ponds
Aesthetics					
Impact AES-1: Substantial damage to scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact AES-2: Substantial degradation of the existing visual character or quality of public views of the site and its surroundings	SU	SU (+)	SU (+)	SU (=)	SU (=)
Impact AES-3: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (=)
Agricultural and Forestry Resources					
Impact AG-1: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to nonagricultural use	LTS	NI (-)	LTS (=)	LTS (=)	SU (+)
Impact AG-2: Conflict with existing zoning for agricultural use or a Williamson Act contract	LTS	NI (-)	LTS (=)	LTS (=)	LTS (+)
Air Quality					
Impact <u>AQ-1</u> ~~AIR-1~~: Conflict with or obstruct implementation of the applicable air quality plan	SU	NI (-)	SU (+)	SU (=)	SU (-)
Impact <u>AQ-2</u> ~~AIR-2~~: Cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard	SU	NI (-)	SU (+)	SU (=)	SU (-)
Impact AQ-3: Expose sensitive receptors to substantial pollutant concentrations	SU	NI (-)	SU (+)	SU (=)	SU (-)
Impact AQ-4: Other emissions adversely affecting a substantial number of people	LTS	NI (-)	LTS (+)	LTS (=)	LTS (-)
Biological Resources – Fisheries Resources					
Impact FR-1: Have a substantial adverse effect, either directly, through habitat modifications, or through substantial interference with movement on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW, NMFS, or USFWS in the fisheries resources study area					

Impact	Level of Impacts with Mitigation				
	Project	**No Project**	**Increased Dredge**	**FAHCE-Plus Modified ~~Enhanced~~**	**Ogier Ponds**
FR-1a: Central California Coast Steelhead	LTS	SU (+)	LTS (+)	LTS (=)	LTS (=)
FR-1b: Chinook Salmon	LTS	SU (+)	LTS (+)	LTS (=)	LTS (=)
FR-1c: Pacific Lamprey	LTS	SU (+)	LTS (+)	LTS (=)	LTS (=)
FR-1d: Sacramento Hitch	LTS	SU (+)	LTS (+)	LTS (=)	LTS (=)
FR-1e: Southern Coastal Roach	LTS	SU (+)	LTS (+)	LTS (=)	LTS (=)
FR-1f: Longfin Smelt	LTS	NI (-)	LTS (+)	LTS (=)	LTS (=)
FR-1g: White Sturgeon	LTS	NI (-)	LTS (+)	LTS (=)	LTS (=)
FR-1h: Green Sturgeon	NI	NI (=)	NI (=)	NI (=)	NI (=)
FR-1i: Riffle Sculpin	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Biological Resources – Wildlife and Terrestrial Resources					
Impact TERR-1: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS					
TERR-1a: Special-Status Plants	LTSM	LTS (-)	LTSM (+)	LTSM (=)	LTSM (-)
TERR-1b: Bay Checkerspot Butterfly, Monarch Butterfly, and Crotch's Bumble Bee	LTS	NI (-)	LTS (=)	LTS (=)	LTS (-)
TERR-1c: California Tiger Salamander, California Red-legged Frog, and Foothill Yellow-legged Frog	LTSM	SU (+)	LTSM (=)	LTSM (=)	LTSM (-)
TERR-1d: Northwestern ~~Western~~ Pond Turtle	LTS	SU (+)	LTS (=)	LTS (=)	LTS (-)
TERR-1e: Bald Eagle and Golden Eagle	LTSM	LTS (-)	LTSM (+)	LTSM (=)	LTSM (=)
TERR-1f: Tricolored Blackbird, Yellow Warbler, White-tailed Kite, Northern Harrier, and Other Breeding Birds	LTS	NI (-)	LTS (=)	LTS (=)	LTS (-)
TERR-1g: Nonbreeding special-status birds	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (-)
TERR-1h: Pallid Bat	SU	NI (-)	SU (=)	SU (=)	SU (=)
TERR-1i: Other special-status mammals	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)

Impact GEO-5: Result in substantial soil erosion or the loss of topsoil	LTS	NI (-)	LTS (+)	LTS (=)	LTS (=)
Impact GEO-6: Located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact GEO-7: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (+)
Greenhouse Gas Emissions					
Impact GHG-1: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (-)
Impact GHG-2: Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (-)
Hazards and Hazardous Materials					
Impact HAZ-1: Create a significant hazard to the public or the environment from the routine transport, use, or disposal of hazardous materials	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HAZ-2: Create a significant hazard to the public or the environment through reasonably foreseeable upset or accident conditions involving the release of hazardous materials into the environment	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (=)
Impact HAZ-3: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (=)

Impact	Level of Impacts with Mitigation				
	Project	No Project	Increased Dredge	FAHCE-Plus <u>Modified</u> ~~Enhanced~~	Ogier Ponds
Impact HAZ-4: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (+)
Impact HAZ-5: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (=)
Impact HAZ-6: Create a significant hazard to construction workers or the public through exposure to Valley Fever during Construction Activities	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (=)
Hydrology					
Impact HYD-1i: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site	SU	SU (+)	SU (-)	SU (=)	SU (=)
Impact HYD-1ii: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a <u>manner</u> ~~matter~~ which would substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HYD-1iii: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a <u>manner</u> ~~matter~~ which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HYD-1iv: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a <u>manner</u> ~~matter~~ which would impede or redirect flood flows	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact HYD-2: Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of dam failure	LTS	SU (+)	LTS (=)	LTS (=)	LTS (=)

Impact	Level of Impacts with Mitigation				
	Project	No Project	Increased Dredge	FAHCE-Plus Modified ~~Enhanced~~	Ogier Ponds
Impact HYD 3: In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Groundwater Resources					
Impact GW-1: Substantially decrease groundwater supplies or interfere substantially with ground-water recharge such that the project may impede sustainable groundwater management of the basin	LTSM	SU (+)	LTSM (=)	LTSM (=)	LTSM (=)
Impact GW-2: Violate groundwater water quality standards or substantially degrade groundwater quality	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (=)
Impact GW-3: Conflict with or obstruct implementation of the San Francisco Bay Basin Plan groundwater provisions or the District's GWMP	LTSM	SU (+)	LTSM (=)	LTSM (=)	LTSM (=)
Water Supply					
Impact WS-1: Substantially alter or reduce Valley Water's ability to have sufficient water supplies from existing entitlements and resources based on reasonably foreseeable future development during normal, dry, and multiple dry years	LTS	SU (+)	LTS (=)	LTS (=)	LTS (=)
Impact WS-2 ~~GW-2~~: Require or result in the relocation or construction of new or expanded water facilities, the construction of which could cause significant environmental effects	LTSM	SU (+)	LTSM (=)	LTSM (=)	LTSM (=)
Water Quality					
Impact WQ-1: Impair beneficial uses of surface waters OR violate any applicable surface water quality standards or waste discharge requirements or otherwise substantially degrade surface water quality OR conflict or obstruct implementation of a water quality control plan	SU	SU (+)	SU (-)	SU (=)	SU (=)
Land Use and Planning					
Impact LU-1: Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect	LTS	NI (-)	LTS (=)	LTS (=)	LTS (+)

Impact	Level of Impacts with Mitigation				
	Project	No Project	Increased Dredge	FAHCE-Plus Modified ~~Enhanced~~	Ogier Ponds
Noise and Vibration					
Impact NOI-1: Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, or generation of substantial incremental increase in noise levels	SU	NI (-)	SU (+)	SU (=)	SU (=)
Impact NOI-2: Generate excessive groundborne vibration or groundborne noise levels	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (=)
Public Services					
Impact PS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (=)
Impact PS-2: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or result in need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for police protection	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (=)
Recreation					
Impact REC-1a: Temporary increased use of neighboring recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated	LTSM	SU (+)	LTSM (=)	LTSM (=)	LTSM (=)
Impact REC-1b: Permanent loss of recreational facilities resulting in substantial physical deterioration, or the acceleration of physical deterioration, of neighboring facilities	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact REC-2: Construction or expansion of recreational facilities which might have an adverse physical effect on the environment	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Transportation					
Impact TR-1: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities	LTSM	SU (+)	LTSM (=)	LTSM (=)	LTSM (=)

Impact	Level of Impacts with Mitigation				
	Project	No Project	Increased Dredge	FAHCE-Plus Modified ~~Enhanced~~	Ogier Ponds
Impact TR-2: Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)	LTS	NI (-)	LTS (=)	LTS (=)	LTS (-)
Impact TR-3: Substantially increase hazards due to a geometric design feature or incompatible use	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact TR-4: Inadequate emergency access	LTSM	NI (-)	LTSM (+)	LTSM (=)	LTSM (=)
Tribal Cultural Resources					
Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource listed or eligible for listing in the California Register of Historical Resources or determined by Valley Water to be significant	LTSM	LTS (-)	LTSM (+)	LTSM (=)	LTSM (=)
Utilities and Service Systems					
Impact UTL-1: Require or result in the replacement, relocation, or construction of new or expanded stormwater drainage, telecommunication, or electric power facilities, the construction or relocation of which could cause significant environmental effects	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact UTL-2: Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, otherwise impair the attainment of solid waste reduction goals, or fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste	LTS	NI (-)	LTS (=)	LTS (=)	LTS (+)
Wildfire					
Impact WF-1: Exacerbate wildfire risks and expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire due to slope, prevailing winds, and other factors	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact WF-2: Require the installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)
Impact WF-3: Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes	LTS	NI (-)	LTS (=)	LTS (=)	LTS (=)

Impact	Level of Impacts with Mitigation				
	Project	No Project	Increased Dredge	FAHCE-Plus Modified ~~Enhanced~~	Ogier Ponds
Impact WF-4: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires	LTSM	NI (-)	LTSM (=)	LTSM (=)	LTSM (=)

5.9 Alternatives Impact Analysis

5.9.1 No Project Alternative

5.9.1.1 Aesthetics

The No Project Alternative would perpetuate views of barren banks and low water storage conditions and degrade views of the reservoir from trails around the reservoir indefinitely which would be a significant impact. However, the No Project Alternative would not involve Project-related construction and would avoid specific Project-related aesthetic impacts. This alternative would not require the removal of more than 650 mature trees for construction of the Seismic Retrofit component and approximately 70 trees for construction of the Conservation Measures. Therefore, public views of the BHBA and Coyote Creek would not be disturbed under the No Project Alternative. The aesthetic impact of the No Project Alternative on visual quality and the quality of public views would be **significant and unavoidable**. There is no mitigation available to reduce the public views of barren bank until the banks would have an opportunity to revegetate. This impact would be greater than the Project given its wider area of impact.

In addition, the No Project Alternative would not create a new source of light or glare. Construction lighting, a source of nighttime light and glare which could adversely affect nighttime public views, would not be required under the No Project Alternative. There would be **no impact**. This impact would be less than the Project.

Regarding cumulative aesthetics impacts, the No Project Alternative would have **cumulatively considerable impacts.** No Project Alternative cumulative impacts would be greater than the Project's cumulative impacts.

5.9.1.2 Agriculture and Forestry Resources

The No Project Alternative would not affect Important Farmland. Because the No Project Alternative would not construct the Ogier Ponds CM, the only Project feature that would affect agricultural lands, this alternative would not require temporary use or permanent conversion of Important Farmland. There would be **no impact**. This impact would be less than the Project.

In addition, this alternative would not affect land under Williamson Act contract or zoned for agricultural use. Because the No Project Alternative would not construct the Ogier Ponds CM, the only Project feature that would affect agricultural lands, this alternative would not affect these types of agricultural land. There would be **no impact**. This impact would be less than the Project.

Regarding cumulative agricultural resource impacts, the No Project Alternative would have **no cumulative impacts.** No Project Alternative cumulative impacts would be less than the Project's cumulative impacts.

5.9.1.3 Air Quality

The No Project Alternative does not involve operation of construction vehicles or create new sources of dust generation, this alternative would avoid all construction impacts related to the

Project. As such, the No Project Alternative would not result in impacts related to conflicts with applicable air quality plans, cumulatively considerable net increase on criteria pollutants for which the Project region is in non-attainment, or exposure of sensitive receptors to substantial pollutant concentrations. There would be **no impact**. This impact would be less than the Project.

Regarding cumulative air quality impacts, the No Project Alternative would have **no cumulative impacts.** No Project Alternative cumulative impacts would be less than the Project's cumulative impacts.

5.9.1.4 Biological Resources—Fisheries Resources

The No Project Alternative would continue to pass flows through the reservoir at deadpool to Coyote Creek downstream of the dam. In the winter, flows downstream would be closer to an unimpeded hydrograph from upstream tributaries and the reservoir would not attenuate storm-induced flows downstream of the dam as the outlet capacity would be increased to 2,500 cfs from a maximum of 500 cfs in the Pre-FERC Order Baseline. Less attenuation of precipitation-induced pulse flows compared to the Project would promote steelhead and Pacific lamprey migration in and out of Coyote Creek relative to Pre-FERC Order Baseline. However, during the summer, the reservoir would not have a cold-water pool to provide cool flows that are important for rearing steelhead, pre-spawning holding Pacific lamprey, and rearing larval Pacific lamprey. Steelhead and Pacific lamprey rearing habitat downstream of the dam would be more reliant on imported water discharged by Valley Water to Coyote Creek for managed groundwater recharge through the dry season. Imported water releases would not be run through chillers to help lower temperatures in the CWMZ. Therefore, flows downstream of the dam would warm greatly in the summer and early fall months relative to Pre-FERC Order Baseline. Warmer water in the summer would decrease the quality of habitat for steelhead and lampreys. This could lead to more competition within and between species for habitat for cooler areas in the creek and would also promote more predation by concentrating fish into less habitat that is warmer than under Pre-FERC Order Baseline.

Natural winter flows would enhance in and out-migration which would be a benefit if considered in isolation but when combined with a decrease in quality of summer habitat it would result in a situation where steelhead and lamprey are attracted into the system but with less likelihood of surviving through the dry season. This would have **significant and unavoidable** impacts to the steelhead, Chinook, and Pacific lamprey populations with no feasible mitigation identified that would avoid or minimize impacts.

Changes in steelhead habitat are used as a surrogate to understand how the alternative would impact southern coastal roach and Sacramento hitch. Longfin smelt, green sturgeon, and white sturgeon occur in the intertidal sloughs of the study area where their habitat is greatly influenced by tidal action and freshwater inputs from tributaries; therefore, any change in flow operations is likely muted and negligible by the time water from the reservoir reaches the intertidal zone. There will be **no impact** on longfin smelt, green sturgeon, and white sturgeon.

The No Project Alternative would adversely impact steelhead, Pacific lamprey, Chinook, southern coastal roach and Sacramento hitch more than the Project. Longfin smelt, green sturgeon, and white sturgeon would have the same impact as the Project.

Regarding cumulative fisheries resource impacts, the No Project Alternative's impact on special-status species in south San Francisco Bay would not be cumulatively considerable; however, impacts to species in Coyote Creek downstream of Anderson Reservoir (steelhead, Pacific lamprey, Chinook, southern coastal roach and Sacramento hitch) would be **cumulatively considerable,** and greater over the long-term than Project cumulative impacts.

5.9.1.5 Biological Resources—Wildlife and Terrestrial Resources

The No Project Alternative would not involve construction of the Seismic Retrofit or any Conservation Measures, so there would be **no impact** short-term on wildlife and terrestrial biological resources from construction and construction monitoring, which is less than with the Project.

Over the long-term, the No Project Alternative could have different effects on special-status plants, bald eagles, special-status species, and jurisdictional resources than the Project. Because Anderson Reservoir would be maintained at the deadpool elevation and would not be refilled under the No Project Alternative, the No Project Alternative would not impact special-status plants, such as San Francisco collinsia and Coyote ceanothus, that have colonized the rim of the lowered reservoir, as would occur under the Project during refilling. Thus, the No Project Alternative would have less impact on these plants than the Project.

Conversely, the lowered reservoir under the No Project Alternative would support less foraging habitat for bald eagles than the refilled reservoir, and it is likely that the number of pairs of bald eagles that the reservoir could support would be lower under the No Project Alternative than with the Project. The No Project Alternative would not affect bald eagles relative to the existing conditions baseline in which the reservoir is maintained at the deadpool elevation, but the No Project Alternative would not result in the benefits to bald eagles as the Project would.

Over the long-term, the lowered reservoir under the No Project Alternative would also result in warmer releases throughout Coyote Creek as the cold pool would not exist within the reservoir. During the dry season, areas of Coyote Creek downstream of the dam would also be void of water when imported water resources are not available to supplement creek flows. The increased temperatures of the waters, and overall reduction in flows, would negatively impact jurisdictional resources (e.g., wetlands and riparian habitat) that support species-status species (western pond turtle, California red-legged frog) within and along the Coyote Creek corridor. The reduction in overall habitat for special-status species may result in a reduction in breeding, foraging, and aestivation habitat, and would also reduce movement corridors for these species between areas of suitable habitat. This reduction in habitat would limit overall jurisdictional habitats along the creek, and would reduce habitat to support special-status species beyond the Project. The No Project Alternative also would not result in the benefits to jurisdictional habitats and special-status species that the Project would.

With no construction and no guarantee of imported water sources, the No Project would have a significant unavoidable impact on other sensitive species (Impact TERR-1); riparian habitat or other sensitive natural communities (Impact TERR-2); wetlands (Impact TERR-3); and wildlife movement or nurseries (Impact TERR-4). The No Project would not conflict with tree ordinances (Impact TERR-5); or Conflict with an HCP/NCCP (Impact TERR-6).

With a reduction in imported water releases, and no change in reservoir operations under the No Project Alternative, the warmer, reduced flows within Coyote Creek would differ substantially from the existing conditions baseline, and therefore impacts of the No Project Alternative on terrestrial biological resources related to long-term operations would be significant and unavoidable. The overall impact of the No Project Alternative would be **significant and unavoidable** relative to the existing conditions baseline. The long-term impact would be greater under the No Project Alternative than under the Project.

Regarding cumulative wildlife and terrestrial resource impacts, the No Project Alternative's impacts would be **cumulatively considerable.** No Project Alternative cumulative impacts would be less than the Project's cumulative impacts over the short-term, but greater than the Project's cumulative impacts over the long-term.

5.9.1.6 Cultural Resources

The No Project Alternative would not cause a substantial adverse change in the significance of a build environment historical resources. This alternative would not involve construction, so it would not involve construction-related impacts on the Rhoades Ranch Historic District. There would be **no impact** from construction, which is less than the Project.

Because there would be no ground disturbance, this alternative would not directly affect known or unknown subsurface archaeological resources. However, like the Project, the No Project Alternative could cause an adverse change in the significance of archaeological resources. The lowered reservoir would have fluctuating reservoir levels. As water levels rise and fall, wave action would cause erosion of the soil and for artifacts within the soil matrix of archaeological sites to move. However, because some known cultural sites would be above the lowered maximum water level for this alternative, the potential for wave action to affect them would be less than under the Project. In addition, because boating would not return to the reservoir, waves generated from boats would not affect archaeological sites. The impact on subsurface cultural resources from operation would be **less than significant**. The magnitude of the impact would be less under the No Project Alternative than under the Project.

Regarding cumulative cultural resource impacts, the No Project Alternative's impact on archaeological resources would not be cumulatively considerable. No Project Alternative cumulative impacts would be less than the Project's cumulative impacts.

5.9.1.7 Energy

The No Project Alternative would avoid all Project impacts related to energy consumption. No construction vehicles would be operated, and no new demands on other energy sources such as electricity would result. Therefore, this alternative would not result in impacts related to wasteful, inefficient, or unnecessary consumption of energy resources or conflicts with a state or local plan for renewable energy or energy efficiency. There would be **no impact to energy resources**, which is less than under the Project.

Regarding cumulative energy impacts, the No Project Alternative would have **no cumulative impacts.** No Project Alternative cumulative impacts would be less than the Project's cumulative impacts.

5.9.1.8 Geology and Soils

The No Project Alternative would not exacerbate risk of loss, injury, or death involving liquefaction or unstable soil conditions. This alternative would not involve construction of the

Project or Conservation Measures, including construction of new channels through liquefiable soil that could be subject to lateral spreading in case of earthquake. Therefore, there would be **no impact**. The risk of exacerbating liquefaction, lateral spreading, or other unstable soil conditions would be less under the No Project Alternative than under the Project.

Regarding exacerbation of landslide risks, the fluctuating water levels of the reservoir during the wet and dry season could increase risk of landslide activation, as discussed in Section 3.8, *Geology and Soils*. Fluctuation of water levels would be less under this alternative than under the Project, but the same as under the existing conditions baseline, because as water enters the reservoir, it would be released as quickly as possible through the existing outlet works and the ADTP constructed as part of FOCP. Accordingly, the risk of landslide would be the same under the No Project Alternative and there would be **no impact**.

The No Project Alternative would avoid all construction impacts and have **no impact** related to soil erosion and loss topsoil.

The No Project Alternative would not directly or indirectly destroy a unique paleontological resource or site. This alternative does not involve excavation of sediments at the two borrow areas for the Seismic Retrofit component and at the Conservation Measure sites to create the new creek channels. Accordingly, this alternative would involve no excavation into sediments that could contain fossils, that is, sediments with high paleontological sensitivity or sediments that are adjacent to sediments with high paleontological sensitivity and that therefore can be assumed to overlie sediments with high paleontological sensitive at unknown but suspected shallow depth. Therefore, there would be **no impact**. The likelihood of damaging or destroying a unique paleontological resource would be less under the No Project Alternative than the Project.

Regarding cumulative geology and soil impacts, the No Project Alternative would have **no cumulative impacts.** No Project Alternative cumulative impacts would be less than the Project's cumulative impacts.

5.9.1.9 Greenhouse Gas Emissions

The No Project Alternative would avoid all construction impacts related to the Project. No construction vehicles would be operated, and no new demands on other energy sources, such as electricity would result. Therefore, the No Project Alternative would not generate GHG emissions during construction or cause conflicts with applicable plans, policies, or regulations adopted to reduce GHG emissions. The No Project Alternative would be **no impact**, which is less than under the Project.

Regarding cumulative GHG emission impacts, the No Project Alternative would have **no cumulative impacts.** No Project Alternative cumulative impacts would be less than the Project's cumulative impacts.

5.9.1.10 Hazards and Hazardous Materials

The No Project Alternative would not create a hazard to the public or environment from the transport, use, or disposal of hazardous materials or through accident conditions involving the release of hazardous materials. In addition, this alternative would not emit hazardous materials within 0.25 miles of a school. Because the No Project Alternative does not involve ground disturbance during construction, it does not incur a risk of disturbing unknown hazardous waste materials in the soil or groundwater or NOA and would further not endanger sensitive receptors within 0.25 miles of the Project through exposure to such materials through release into the environment. Therefore, there would be **no impact** from the release of hazardous materials, which is less than under the Project.

The No Project Alternative would not impair implementation of or interfere with an adopted emergency response plan or emergency evacuation plan. The No Project Alternative does not involve construction-related disruptions to traffic or temporary or permanent changes to traffic flow. Therefore, there would be **no impact** to emergency plans, which is less than under the Project.

With no ground-disturbing activities, there would be **no impact** from Valley Fever.

Regarding cumulative hazards and hazardous material impacts, the No Project Alternative would have **no cumulative impacts.** No Project Alternative cumulative impacts would be less than the Project's cumulative impacts.

5.9.1.11 Hydrology

The No Project Alternative would result in impacts related to increased erosion and sediment transport and increase the risk of flooding downstream of Anderson Dam on Coyote Creek; ~~, and~~ however, the No Project Alternative would not increase exposure of people or structures to risk of loss, injury, or death as a result of dam failure compared to existing conditions.

As described in Section 3.11, *Hydrology*, runoff water would flow over and through deposited sediment on the reservoir bed that were previously submerged. During Project construction flows that erode and entrain sediment would carry the sediment downstream. This would generally apply to finer sediments that are carried in suspension versus larger and coarser grained sediment which would be transported along the bed of the lake as bedload. Under the No Project Alternative, by maintaining a higher deadpool that could capture sediment coming into the reservoir, there would be less erosion of exposed lakebed sediment and less transport of this eroded material downstream compared to the construction period of the Project when reservoir sediment capture would be greatly reduced.

While erosion and sediment transport conditions would be lower under the No Project Alternative than compared to the Project during the construction period; over the longer-term, erosion and sediment transport conditions under the No Project Alternative would be substantially greater compared to the Project. Under the Project, following the construction period, the reservoir would be refilled, restoring reservoir water levels to higher elevations than under the No Project Alternative or as found under the existing conditions baseline. As reservoir levels return to higher elevations under the Project, the ability for the reservoir to trap eroding sediments from the upstream watershed and the lakebed itself would return and the potential to send sediment downstream would decline. In contrast, in the longer-term under the No Project Alternative, the reservoir would not refill, flows and sediment from the upper watershed and lake bed would be captured by the deadpool as described above, but the ability for the deadpool to continue trapping flows and sediment would reduce over time compared to the Project, and the trap efficiency of the deadpool under the No Project Alternative would never be as great as under a restored and refilled reservoir as would exist under the Project. In conclusion, impacts of the No Project Alternative would be similar to the existing conditions baseline in the near-term and during the Project's construction period. However, over the longer-term following Project construction, the No Project Alternative would have higher erosion and sediment transport effects when compared to the Project under which higher lake levels would be restored. The impact would be **significant and unavoidable**. The magnitude of the impact related to erosion and sedimentation would be greater under the No Project Alternative than under the Project.

~~The No Project Alternative would decrease the risk of flooding downstream of Anderson Dam on Coyote Creek during the Project construction period compared to the Pre-FERC Order Conditions Baseline, but flooding risk~~ Flooding risk under the No Project Alternative would be similar compared to the existing conditions baseline. The No Project Alternative would provide additional flood risk reduction as the reservoir would remain empty and provide a large amount of storage for storm flows. Accordingly, areas along Coyote Creek would be inundated less frequently under the No Project Alternative compared to under the operating Project. ~~The construction period impact would be smaller under the No Project Alternative than under the Project.~~

~~The No Project Alternative has the~~ The potential to expose people or structures to risk of loss, injury, or death as a result of dam failure under the No Project Alternative would be the same as existing conditions. This alternative would not implement Seismic Retrofit components to lower risk of dam failure due to seismically induced dam deformation from either liquefaction or surface fault rupture when the reservoir is full. ~~The~~ Therefore, reservoir storage would be limited ~~would store water~~ up to the FERC-restricted level (deadpool). A restriction has also been in place for Coyote Reservoir since 1992, limiting storage in this reservoir to 52.5 percent of total capacity. DSOD determined that such a restriction was necessary based on fault rupture concerns at Coyote Dam. The downstream effects would be reduced by the presence of Anderson Reservoir in the event Coyote Dam failed ~~could fail~~ during a seismic event along the Calaveras Fault. ~~Though low in likelihood, if such a failure of Coyote Dam occurred during the wet season concurrently with a high flow event, then there would be a tremendous amount of flow and sediment that could significantly increase the risk for additional downstream flooding. In contrast, the Project during the operations period would retain this increased flow in the restored reservoir.~~ Though the likelihood of such a situation is very low, the impact relating ~~would relate~~ to increased downstream flood risk from dam failure would be less than significant. Overall, the impacts on hydrology under the No Project Alternative would be **significant and unavoidable**. The magnitude would be greater under the No Project Alternative than under the Project. ~~No mitigation is available to reduce the impact. Therefore, this impact is **significant and unavoidable**. The magnitude of the impact would be greater under the No Project Alternative than under the Project when a restored Anderson dam and reservoir could provide additional buffer to such flooding risks~~.

Regarding cumulative hydrology impacts, the No Project Alternative's impact on sedimentation in Coyote Creek and risk from dam failure would be **cumulatively considerable**. No Project Alternative cumulative impacts would be greater than the Project's cumulative impacts.

5.9.1.12 Groundwater Resources

The No Project Alternative would have potential to affect and reduce potential groundwater recharge along Coyote Creek. While under the No Project Alternative, Valley Water would release imported water to support groundwater recharge along Coyote Creek downstream of the dam, the ability to release local watershed water from the reservoir water would not exist. In dry years when imported supplies may not be as available it could be possible that inadequate water is available for recharge in Coyote Creek. This could be a significant impact to Coyote Valley groundwater. If imported water was not available over the long-term, it would be a **significant and unavoidable** impact to groundwater supplies.

Additionally, this alternative could affect the productivity and water quality of groundwater wells located close to the reservoir rim. As described in Section 3.14, *Groundwater*, given that Anderson Reservoir was constructed in 1950, all or most of these wells were likely constructed after the reservoir. Thus, the groundwater conditions under which the wells were completed may have been influenced by the presence of the reservoir. Generally, reservoirs raise the groundwater level in the surrounding area, as some of the water stored in the reservoir seeps through the fractures in the surrounding bedrock, potentially affecting water levels in nearby wells that are also screened in the bedrock. If groundwater levels in the fractured bedrock were to decline at the location of the nearby wells, principally as a result of the dewatered state of the reservoir during the Project construction period, this could adversely affect the productivity of these wells, potentially causing the wells to go dry. The No Project Alternative, like the Project, would maintain Anderson Reservoir at deadpool, and could cause these wells to go dry. However, under the No Project Alternative, a dewatered reservoir would continue over the long-term, not just for the 7-year construction period of the Project. The near-term and longer-term impact to groundwater resources of the No Project Alternative is **significant**. Because the dewatering condition of the reservoir under No Project Alternative would occur in perpetuity, the duration of the impact is unlimited and greater under this alternative than during the 7-year construction period of the Project.

The No Project Alternative would not require construction activities including blasting at the BHBA, therefore there would be **no impact** associated with the use of perchlorates or other nitrogen-based chemicals that could degrade groundwater.

The possibility that there would be inadequate supplies to support groundwater recharge in Coyote Valley would be a significant impact in complying with the Basin Plan and the GWMP. This impact would be **significant and unavoidable**.

Regarding cumulative groundwater resource impacts, the No Project Alternative's impact on groundwater resources and compliance with groundwater plans would be **cumulatively considerable**. No Project Alternative cumulative impacts would be greater than the Project's cumulative impacts.

5.9.1.13 Water Supply

The No Project Alternative would restrict and constrain Valley Water's available water supply portfolio and could require construction or expansion of other water facilities. The 2020 UWMP assumes that Anderson Dam would be back online in between 2030 and 2035. Starting with the 2035 projection, the UWMP analysis assumes that Anderson Dam would be operational. Under the No Project Alternative, Anderson Dam would not be operated at capacity. The UWMP's assumption that water from the reservoir operated at capacity from 2035 on would no longer be correct. This impact is **significant and unavoidable**. Valley Water would need to take action to ensure adequate long-term water supplies which would likely involve expanded water conservation efforts, future water transfers, construction of water recycling or desalination facilities, or construction of water storage facilities. These types of facilities would have their own environmental impacts that would need to be analyzed in project specific environmental review.

In addition, as described in Groundwater Resources above, the No Project alternative would have potential to affect the productivity of groundwater wells located close to the reservoir rim by the prolonged dewatering of the reservoir. An indefinitely dewatered reservoir could cause small private well owners to drill new wells or deepen existing wells to address the reduced productivity of their existing wells. This impact is **significant and unavoidable**.

Regarding cumulative water supply impacts, the No Project Alternative's impact on water supply would be **cumulatively considerable,** and greater than the Project's cumulative impacts.

5.9.1.14 Water Quality

The No Project Alternative would not require construction activities including blasting at the BHBA, therefore there would be **no impact** associated with the use of perchlorates or other nitrogen-based chemicals that could degrade water quality. However, the short-term in-reservoir degraded water quality impacts caused by maintaining the reservoir at deadpool would continue indefinitely, creating a greater impact than the Project.

The No Project Alternative maintains the existing deadpool water elevation, whereby erosion and sediment transport opportunities would remain consistent with the existing conditions baseline indefinitely. During the increased drawdown of the Project construction period, the Project would have a higher potential for increased erosion and sediment transport than would the No Project Alternative because the opportunity for more direct runoff from the watershed above the reservoir to flow across the exposed and erosive lakebed and downstream through the outlet works would be greater. Following construction of the Project, the operational reservoir would once again have lower levels of erosion and downstream sediment transport compared to the reservoir maintained at deadpool indefinitely under the No Project Alternative. In addition, water temperatures of water released through the dam downstream to Coyote Creek would be higher under the No Project Alternative than under the Project. Chillers would be employed under the Project to lower temperatures during the Project construction period, but chillers would not be implemented for this alternative. When the Project is in operation, the reservoir would generally have a volume of water that allows lower layers to remain colder. Discharges from the reservoir to Coyote Creek would come from this colder layer. Under the No Project Alternative future discharges from the reservoir would be passed through the outlet from upstream flows at the ambient temperature of those upstream sources, or from imported water sources that would be at the temperature from San Luis Reservoir. Given these circumstances, water temperatures downstream of Anderson Dam on Coyote Creek would be higher under the No Project Alternative than under the Project. This impact is significant. The No Project would not have a significant impact on DO as water released through the Anderson Dam outlets would become oxygenated.

Because no mitigation is available to decrease the impacts to temperature and turbidity, the impact to water quality would be **significant and unavoidable**. The magnitude of this impact under the No Project Alternative would be greater than under the Project.

Regarding cumulative water supply impacts, the No Project Alternative's impact on water quality would be **cumulatively considerable**. Cumulative impacts would be greater than Project cumulative impacts.

5.9.1.15 Land Use

The No Project Alternative would not conflict with any land use plan, policy, or regulation adopted to avoid or mitigate an environmental effect. Because the No Project Alternative would not involve construction, it would not change land uses, whether recreational, residential, agricultural, open space, or utility. There would be **no impact**, which is less than under the Project.

Regarding cumulative land use impacts, the No Project Alternative would have **no cumulative impacts.** Cumulative impacts would be the same as Project cumulative impacts.

5.9.1.16 Noise and Vibration

The No Project Alternative would not involve construction activity, so it would not generate either noise or vibration through construction. In addition, operation of the No Project Alternative would not involve any activities that would change the existing noise and vibration environment. Thus, the No Project Alternative would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project ~~project~~ in excess of standards or generate a substantial incremental increase in noise levels. Similarly, this alternative would not generate excessive groundborne vibration or groundborne noise levels. There would be **no impact**, which is less than under the Project.

Regarding cumulative noise and vibration impacts, the No Project Alternative would have **no cumulative impacts.** Cumulative impacts would be less than Project cumulative impacts.

5.9.1.17 Public Services

The No Project Alternative would not result in substantial adverse physical impacts associated for the provision of new or altered governmental facilities. This alternative would not involve construction activity, so construction would not increase the need for police or fire protection and operation would not involve any activities that would increase the need for police or fire protection. The No Project Alternative does not include any features that would affect enrollment at schools or contribute to any change in population or other land use modification that would affect the local school district or increase demand on recreational facilities. There would be **no impact**, which is less than under the Project.

Regarding cumulative impacts to public services, the No Project Alternative would have **no cumulative impacts.** Cumulative impacts would be less than Project impacts.

5.9.1.18 Recreation

The No Project Alternative would not require closure of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond, and would allow those parks that are currently closed for the FOCP to re-open sooner. The No Project Alternative would continue modified flows greater than 500 cfs to Coyote Creek and portions of the Coyote Creek Trail and Hellyer Park may be inundated during heavy storms, causing recreators to concentrate within the portions of the facility that remain open. The concentrated use of the open areas, in combination with high water conditions, could result in impacts to SCCDPR facilities, which would be **significant and unavoidable.** As this impact would continue indefinitely, they would be of greater magnitude than the Project.

The No Project would not require removal of unmarked trails from the BHBA, access by private vehicles along a portion of Coyote Road, parking along the dam crest, trees at Live Oak Picnic Area, or alter the Ogier Ponds complex. The No Project would have no impact on permanent recreational facilities. The No Project Alternative does not include construction or expansion of recreational resources. Accordingly, there would be no impact on the environment resulting from construction of expansion of such resources. This impact would be less under this alternative than under the Project.

Regarding cumulative recreation impacts, the No Project Alternative's impact on SCCDPR facilities from high water conditions would be **cumulatively considerable**. Cumulative impacts would be greater than Project cumulative impacts.

5.9.1.19 Transportation

The No Project Alternative would not involve construction, so all construction-related impacts on Transportation would be avoided. The No Project would not conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities; increase VMT; increase hazards due to geometric design feature or other incompatible use; or cause inadequate emergency access. In addition, operations under the No Project Alternative would not change transportation patterns or safety.

As discussed in the recreation impact analysis, the No Project Alternative would continue modified flows greater than 500 cfs to Coyote Creek, and portions of the Coyote Creek Trail and Hellyer Park may be inundated during heavy storms, causing recreators to concentrate within the portions of the facility that remain open. The concentrated use of the open areas, in combination with high water conditions, could result in impacts to SCCDPR pedestrian facilities, which would be **significant and unavoidable.** As this impact would continue indefinitely, it would be of greater magnitude than the Project.

Regarding cumulative transportation impacts, the No Project Alternative's impact on pedestrian facilities would be **cumulatively considerable.** Cumulative impacts would be greater than Project cumulative impacts.

5.9.1.20 Tribal Cultural Resources

The No Project Alternative could result in a substantial adverse change in the significance of a tribal cultural resource. The No Project Alternative would not involve construction-related ground-moving activities and would therefore not directly affect subsurface Tribal cultural resources. However, like the Project, the No Project Alternative would have fluctuating reservoir levels. As water levels rise and fall, wave action would cause erosion of the soil and for artifacts within the soil matrix of archaeological sites to move. However, because some of the sites are above the lowered maximum water level, the potential for wave action to affect them would be less than under the Project. In addition, because boating would not return to the reservoir, waves generated from boats would not affect archaeological sites. The impact on Tribal cultural resources from operation of the No Project Alternative would be **less than significant**. The magnitude of the impact would be less under the No Project Alternative than under the Project.

Regarding cumulative tribal cultural resource impacts, the No Project Alternative would have **no cumulative impacts.** Cumulative impacts would be less than Project cumulative impacts.

5.9.1.21 Utilities and Service Systems

The No Project Alternative would not require or result in the replacement, relocation, or construction of new or expanded stormwater drainage, telecommunication, or electric power facilities, the construction or relocation of which could cause significant environmental effects. Impacts to water supply are addressed separately. There would be **no impact**, which is less than the Project.

In addition, this alternative would not generate solid waste because no construction is involved. There would be **no impact**, which is less than the Project.

Regarding cumulative impacts to utilities and service systems, the No Project Alternative would have **no cumulative impacts**. Cumulative impacts would be less than Project cumulative impacts.

5.9.1.22 Wildfire

The No Project Alternative would not exacerbate wildfire risks and expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. The No Project Alternative would not involve use of construction equipment in and around vegetated areas that could generate sparks or extreme heat and would not increase exposure of people or structures to significant loss, injury, or death involving wildland fires. There would be **no impact**, which is less than the Project.

Regarding cumulative wildfire impacts, the No Project Alternative would have **no cumulative impacts.** Cumulative impacts would be less than Project cumulative impacts.

5.9.2 Increased Dredge Alternative

5.9.2.1 Aesthetics

The Increased Dredge Alternative would extend the period of construction in the reservoir an additional 2 years and the extended dredging operations would include nighttime lighting on the reservoir. Impacts to aesthetics would be like those discussed in Section 3.1, *Aesthetics*.

Visual Character

The Increased Dredge Alternative would cause the same Project-related impacts including the removal of more than 650 mature trees for construction of the Seismic Retrofit component and approximately 70 trees for construction of the Conservation Measures resulting in degradation of the existing visual character or quality of public views. Therefore, public views of the BHBA and Coyote Creek would similarly be disturbed under the Increased Dredge Alternative. Mitigation measures to replace trees along Coyote Creek (**Mitigation Measure AES-1**) and screen construction staging areas (**Mitigation Measure AES-2**) will reduce construction related impacts, but not to a level of less than significant. The alternative would result in **significant unavoidable** impacts with no additional feasible mitigation measures available to fully mitigate the impacts. The impact to visual character would be greater than as the Project from the extended construction period at the reservoir.

Nighttime Lighting

The Increased Dredge Alternative would create the same source of light and glare as the Project in addition to work from a barge on the reservoir for 2 additional years for the increased dredging that would add an additional source of nighttime lighting. A mitigation measure to minimize the impact from construction lightning (**Mitigation Measure AES-3**) will be implemented to reduce this impact to a less than significant level. The Increased Dredge Alternative would have a **less than significant impact with mitigation** on nighttime views. This impact would be greater than the Project with 2 additional years of work that involves nighttime lighting.

Mitigation Measures

AES-1 Replacement Tree on Santa Clara County Parkland

AES-2 Visual Screening of Construction Staging Areas

AES-3 Construction Lighting

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **cumulatively considerable** impacts on visual character, but **not cumulatively considerable** impacts on nighttime lighting. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.2 Agriculture and Forestry Resources

The Increased Dredge Alternative would have no changes in impacts to Farmland as they are discussed in Section 3.2, *Agriculture and Forestry Resources*.

Farmlands are located outside the Project construction area; however, 3.8 acres of Farmland of Local Potential southwest of the Ogier Ponds would be temporarily used for materials and equipment staging during the construction of the Ogier Ponds CM, which would impact locally important farmland.

Farmland

The staging area would be restored to agricultural use after 3 years, and implementation of BMPs AQ-1 (dust control), BI-11 (minimize predator-attraction), WQ-4 (limit impacts from staging and stockpiling), WQ-11 (maintain clean work sites), and TR-1 (public safety measures) would help prevent impact to surrounding Farmland of Local Potential at this site. Post-construction operations associated with the retrofitted dam could result in minor flooding in some Farmland areas but would not rise to the level of conversion. Adaptive management actions, if required, would not take place in Farmland. Thus, the Alternative would not permanently convert areas of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to nonagricultural uses. The alternative would result in a **less than significant impact** to Important Farmland. This impact would be the same as the Project.

Williamson Act Lands and Lands Zoned Agriculture

No lands under a Williamson Act contract are present within the study area; therefore, there would be no impacts to Williamson Act lands during construction or operation of the Project. Temporary construction activities within the Seismic Retrofit Project Area would not conflict with existing agricultural zoning. Lands zoned for agricultural use would be temporarily used for materials and equipment staging during the construction of the Ogier Ponds CM, but implementation of BMPs would minimize the potential for temporary impacts to conflict with existing zoning. Adaptive management actions, if required, would take place in agricultural areas. Ogier Ponds is in area zoned as agricultural land uses and would be adaptively managed. However, the Project would not conflict with existing agricultural zoning or Williamson Act contracts, this impact would therefore be **less than significant**. This impact would be the same as the Project.

Regarding cumulative impacts, like the Project, the Increased Dredge Alternative would have **not cumulatively considerable** impacts on agricultural resources. Cumulative impacts would be the same as Project cumulative impacts.

5.9.2.3 Air Quality

The Increased Dredge Alternative would involve an additional ten months of construction over 2 years including as additional 1,500 truck trips for the increased dredging of sediments from the reservoir bottom using heavy equipment, as outlined in **Table 5-3.** Dried sediments would be transported from the staging areas to the ultimate reuse placement sites at Ogier Ponds and San Francisco Bay, as described in **Table 5-6**. Other impacts would be like those discussed in Section 3.3, *Air Quality*.

Air Quality Plans

The criteria air pollutant emissions from construction of the Seismic Retrofit component and the Ogier Ponds CM, ~~and the Sediment Augmentation Program~~ would exceed BAAQMD thresholds. The emissions from the additional 2 years of construction were not modeled but would be in addition to the already significant emissions. Implementation of **Mitigation Measure AQ-1** will require all construction equipment greater than 25 hp and operating for more than 20 hours over the entire duration of construction activities to be equipped with Tier 4 engines and would require all on-road truck engines and boats to be year 2010 or newer. Implementation of **Mitigation Measure AQ-1** will also minimize construction equipment idling time and require regular maintenance for all equipment. However, even with implementation of **Mitigation Measure AQ-1**, construction of the Increased Dredge Alternative will exceed BAAQMD thresholds for NOx. As such, Project construction would conflict with the BAAQMD 2017 Clean Air Plan goal to attain established air quality standards while Project operation would not exceed any BAAQMD thresholds for the various criteria air pollutants. The Project overall would conflict with or obstruct the implementation of an applicable air quality plan, and impacts would be **significant and unavoidable**. The Increased Dredge Alternative would have greater impacts in regard to conflicting with the 2017 Clean Air Plan than the Project.

Criteria Pollutants

As with the Project construction as discussed in Section 3.3 Impact 2, the Increased Dredging Alternative would exceed the BAAQMD average daily thresholds for criteria air pollutants, while operational impacts related to criteria air pollutants would be less than significant. The Seismic Retrofit construction emissions would exceed the BAAQMD average daily thresholds for ROG in Year 1 through Year 6 and for NOx in Year 1 ~~2~~ through Year 7. Ogier Ponds CM construction emissions would exceed the BAAQMD average daily threshold for NO_X in ~~Year~~ Years 6 through ~~and~~ Year 8 ~~7~~. Sediment Augmentation Program construction emissions would not exceed the BAAQMD average daily thresholds for criteria air pollutants ~~thresholds for NO_X during every year of construction from Year 2 through Year 15~~. Maintenance ~~Construction~~ of the North Channel Reach ~~Extension~~ and Phase 2 Coyote Percolation Dam CM would not exceed the BAAQMD average daily thresholds for criteria air pollutants.

An additional 2 years of dredging and hauling would be added in Year 1 and Year 2. These emissions were not calculated but would be in addition to Project emissions. Even with implementation of **Mitigation Measure AQ-1**, Seismic Retrofit construction emissions will exceed the BAAQMD average daily thresholds for ROG in Year 1 and for NOx in Year 2 through Year 6 ~~7~~. Mitigated Ogier Ponds CM construction emissions would exceed the BAAQMD average daily thresholds for NO_X in Year 6 and Year 7. Mitigated Sediment Augmentation Program construction emissions would not exceed the BAAQMD average daily thresholds for criteria air pollutants ~~NO_X during every year of construction from Year 2 through Year 10, and overall~~. Overall mitigated Project construction emissions would exceed the BAAQMD average daily threshold for ROG during Year 6 and for NO_X during Year 2 through Year 7 ~~15~~. Since criteria air pollutant exhaust emissions will remain above the BAAQMD significance threshold even with implementation of **Mitigation Measure AQ-1**, the impact related to regional air quality will be **significant and unavoidable**. The Increased Dredge Alternative would have greater impacts in regard to increases in criteria pollutants than the Project.

Dust

Fugitive dust impacts from blasting emissions will be less than significant with implementation of **Mitigation Measure AQ-2**. **Mitigation Measure AQ-2** will require the installation of wind screens during blasting activities to reduce fugitive dust emissions. Construction-related fugitive dust impacts would be significant even with implementation of BAAQMD basic BMPs (BMP AQ-1) and advanced BMPs in **Mitigation Measure AQ-3. Mitigation Measure AQ-3** will implement BAAQMD's Enhanced Construction BMPs, which includes limiting the occurrence of simultaneous construction activities, installing erosion control measures, planting vegetative ground cover, minimizing the amount of excavated material, and hydroseeding. These measures will apply the Project components as discussed in Section 3.3 in addition to the dredging, sediment drying, and hauling elements of the Increased Dredging Alternative. The Increased Dredge Alternative would have a **significant impact** from fugitive dust which is greater than the Project given the 2 extra years of ground disturbing activities.

Health Risks

As with the Project as discussed in Section 3.3 Impact 3, the Increased Dredge Alternative construction activities would exceed BAAQMD's significance thresholds for excess lifetime cancer risk, acute HI, and $PM_{2.5}$ concentration. The alternative would add 2 years of dredging and hauling in addition to the analysis is Section 3.3. Operational impacts related to TAC emissions would be less than significant. Implementation of **Mitigation Measure AQ-1** will be required, but even with this measure the overall Project construction risks would exceed the BAAQMD thresholds for excess lifetime cancer risk, acute HI, and $PM_{2.5}$ concentration. Therefore, the Project overall would expose receptors to substantial pollutant concentrations, and impacts would be **significant and unavoidable**. The Increased Dredge Alternative would have greater impacts from pollutant concentrations to sensitive receptors than the Project given the 2 extra years of construction activities.

Odors

Construction equipment used in the alternative would emit diesel exhaust odors, and the disturbance of soils, dewatered channels, drained reservoir, and drying sediments in the first two years of construction could emit organic matter odors. These odors would be temporary and intermittent. Implementation of BMP AQ-2 will require construction avoid stockpiling of odorous material near sensitive receptors. Currently, there have been no reported odor complaints to BAAQMD. Construction odors are not anticipated to be notably different for the Project compared to the existing baseline conditions at the time of the EIR preparation modified by the FOCP implementation. Odors associated with operations and maintenance are not expected. Thus, based on the odor complaint history, implementation of BMP AQ-2, and the temporary nature of construction activities, the overall alternative impact related to exposure to odors will be **less than significant**. The Increased Dredge Alternative would have greater impact from odors than the Project given the two extra years of sediment drying and additional truck trips.

Mitigation Measures

AQ-1 Implement Construction Criteria Air Pollutants Reduction Measures

AQ-2 Implement Construction Blasting Fugitive Dust Emissions Reduction Measure

AQ-3 Implement BAAQMD Enhanced Construction BMPs

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **cumulatively considerable** impacts on attaining air quality plans, criteria pollutants, and health risk, but **not cumulatively considerable** impacts on odors. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.4 Biological Resources—Fisheries Resources

The Increased Dredge Alternative would not change the impacts to fisheries in Coyote Creek as discussed in Section 3.4, *Biological Resources – Fisheries Resources*.

Overall, any adverse impacts on CCC steelhead, Chinook, Pacific lamprey, Sacramento hitch, and southern coastal roach would be periodic and temporary, and less than significant during the construction phase. The alternative would benefit these species in the long term through increased and enhanced habitat supporting a larger and more resilient fisheries populations and the overall impact is **less than significant**.

The alternative could impact longfin smelt and white sturgeon and their habitat with increased sediment transport to the intertidal reaches of Coyote Creek during Seismic Retrofit construction, and this impact would be **less than significant**. Increased sediment transport may benefit longfin smelt in both the short-term and long-term.

The Increased Dredge Alternative would have a greater impact to fisheries than the Project as it would require 2 additional years of construction that can send sediment laden water down Coyote Creek during large storms.

Regarding cumulative impacts, like the Project, the Increased Dredge Alternative would have **no** ~~**not**~~ **cumulatively considerable** impacts on fisheries resources. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.5 Biological Resources—Wildlife and Terrestrial Resources

The Increased Dredge Alternative would result in differences in how the Project affects riparian habitats along Coyote Creek downstream from Anderson Dam and San Francisco Bay baylands habitats and species, and differences in impacts of nitrogen emissions on sensitive serpentine plant communities and the special-status plants and invertebrates supported by those communities.

Under the Increased Dredge Alternative, less sediment would be washed out of Anderson Reservoir during Seismic Retrofit construction than under the Project. As a result, less sediment would be mobilized into Coyote Creek downstream from Anderson Dam, and then downstream into San Francisco Bay. Sediment mobilized into Coyote Creek under the Project could have adverse effects on wetland and riparian vegetation through scour and deposition but also provide sediment necessary for colonization by riparian plant species. Under the Increased Dredge Alternative, there would likely be less loss of riparian vegetation but also less regeneration, so that the uneven-aged stands that provide high habitat and wildlife diversity would be less prevalent under the Increased Dredge Alternative than with the Project. The Increased Dredge Alternative would also mobilize less sediment into tidal areas within South San Francisco Bay. Such sediment is important to raise the elevations of former salt ponds that have been restored to tidal action, and to raise the elevations of existing tidal marshes, so that those areas can maintain vegetated marsh in the face of sea level rise. However, trucking the dredged sediment to South San Francisco Bay salt ponds would occur under the Increased Dredge Alternative, providing this sediment to ponds prior to tidal restoration providing sediment directly to future tidal restoration sites, elevating those areas so that they could more easily achieve elevations conducive to colonization by tidal marsh. Thus, the Increased Dredge Alternative may reduce the potential for sediment mobilized by the Seismic Retrofit construction to elevate existing marshes but increase the benefits of such sediment for future tidal restoration efforts. In both cases, the sediment would benefit tidal marshes and the species that depend on them. Thus, the impacts on terrestrial biological resources of the Increased Dredge Alternative resulting from the different mechanisms by which sediment would exit the reservoir, and the different locations to which sediment would be mobilized, would not differ substantially from the Project and would be **less than significant**.

Trucking the dredged material would result in increased nitrogen emissions from vehicles and equipment, thus increasing the amount of nitrogen deposited on serpentine grasslands (especially on Coyote Ridge to the east) and the effects of nitrogen deposition on serpentine-associated, special-status plants and animals. Valley Water would pay nitrogen impact fees in compliance with the VHP to help offset this impact, so although nitrogen deposition impacts would be greater under the Increased Dredge Alternative than with the Project, these impacts would be **less than significant** with payment of VHP impact fees.

Other impacts from the Increased Dredge Alternative would be like those discussed in Section 3.4 *Biological Resources—Wildlife and Terrestrial Resources*.

Special-Status Plants

Construction activities could impact special-status plants through direct destruction, the spread of invasive plant propagules and pathogens, refilling of the reservoir where populations have colonized areas within the rim of the reservoir, and indirectly through dust that could coat plants interfering with normal gas exchange, photosynthesis, or pollination. Dust may also infect plants with *Phytophthora* within dust particles. Nitrogen emitted by construction vehicles and equipment may impact serpentine-associated special-status plants by fertilizing the soils and allowing nonnative grasses and forbs that would not otherwise be able to colonize.

Nine of the 12 special-status plants that could be impacted are VHP-covered species. General and serpentine impact fees would be used by the SCVHA to offset adverse impacts to the nine VHP-covered plant species. The potential for *Phytophthora* to be spread will be reduced via a Project-specific *Phytophthora* Pathogen Management and Monitoring Plan. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1a(1)** will manage invasive plants at ~~Valley Water's~~ Coyote Ridge population of Tiburon paintbrush by preventing the Project's nitrogen emissions from benefitting populations of invasive plants that would compete with Tiburon paintbrush. **Mitigation Measure TERR-1a(2)** will reduce the potential for spread of *Phytophthora*. **Mitigation Measures TERR-1a(3)** and **TERR-1a(4)** will survey for San Francisco collinsia in the previously unsurveyed portions of the Seismic Retrofit Area (to help quantify impacts on the species) and establishing a mitigation population commensurate with the population size. With implementation of BMPs, compliance with VHP conditions and AMMs, and **Mitigation Measures TERR-1a(1), TERR-1a(2), TERR-1a(3),** and **TERR-1a(4)** (all as fully described in Section 3.3 *Biological Resources—Wildlife and Terrestrial Resources*) Project impacts on special-status plants will be **less than significant with mitigation**. The Increased Dredge Alternative would have a greater impact to special-status plants than the Project from additional nitrogen emissions.

Bay Checkerspot Butterfly, Monarch Butterfly, and Crotch's Bumble Bee

Construction activities would impact 2.6 acres of designated critical habitat for the Bay checkerspot butterfly, contribute to the cumulative effects of nitrogen deposition on serpentine grasslands, remove milkweed needed by monarch butterflies, destroy subterranean Crotch's bumble bee nests, clear vegetation that serves as pollen and nectar sources, and affect pollen and nectar sources through dust mobilization or changes in drainage patterns.

Special-status invertebrates would benefit from Valley Water's payment of VHP impact fees. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Implementation BMPs and compliance with VHP conditions would reduce impacts on the Bay checkerspot butterfly, monarch butterfly, and Crotch's bumble bee to a less-than-significant level. The Increased Dredge Alternative would have the same impact to Bay Checkerspot Butterfly, Monarch Butterfly, and Crotch's Bumble Bee as the Project.

California tiger salamander, California red-legged frog, and foothill yellow-legged frog

Construction activities could result in direct take of special status amphibians, loss of habitat, increased predation from nighttime lighting, hazardous material spills, and spread of pathogens. Project impacts on the foothill yellow-legged frog are unlikely to occur therefore the Project would have a less-than-significant impact on this species.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1c(1)** provides additional avoidance and minimization during activities in the dewatered reservoir. **Mitigation Measure TERR-1c(2)** compensates for any impacts of fish locations to Upper Penitencia Creek by removing nonnative species that could affect special-status amphibians from Valley Water-owned properties in the Upper Penitencia Creek watershed. Implementation of VHP mitigation payments, BMPs, compliance with applicable VHP conditions, and **Mitigation Measures TERR-1c(1)** and **TERR-1c(2)** will reduce Project impacts on the California tiger salamander and California red-legged frog and reduce any adverse effects on the foothill yellow-legged frog that could occur to less than significant with mitigation. The Increased Dredge Alternative would have the same impact to California tiger salamander, California red-legged frog, and foothill yellow-legged frog as the Project.

Western Pond Turtle

Construction activities could impact western pond turtle habitat and nests. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. The western pond turtle is covered by the VHP, and most of the activities that could impact this species (including post-construction operations under FAHCE rule curves) are explicitly VHP-covered. With implementation of BMPs, DMP measures, and compliance with the VHP, Project impacts on the western pond turtle would be less than significant. The Increased Dredge Alternative would have the same impact to western pond turtle as the Project.

Bald Eagle and Golden Eagle

Up to two pairs of bald eagles have nested near Anderson Reservoir in recent years and at least two golden eagle territories overlap the reservoir with recently occupied nests located 0.34 and 0.83 miles from the edge of the reservoir. Construction would impact foraging habitat and disturb nests. Following completion of construction, foraging habitat for the bald eagle would be enhanced as the reservoir is allowed to refill. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water would obtain a BGEPA permit from the USFWS to obtain authorization for the loss of any eagle productivity and would comply with permit conditions. **Mitigation Measure TERR-1e** implements additional AMMs to minimize impacts on nesting eagles. With implementation of BMPs, DMP measures, compliance with the VHP and BGEPA permit conditions, and **Mitigation Measure TERR-1e**, Project impacts on bald eagle and golden eagle will be **less than significant with mitigation**. The Increased Dredge

Alternative would have a greater impact to bald eagle and golden eagle than the Project from a longer construction period.

Tricolored Blackbird, Yellow Warbler, White-Tailed Kite, Northern Harrier, and Other Breeding Birds

A variety of bird species protected by the MBTA and Fish and Game Code breed, forage, and roost in the Project Area. Construction activities could result in the physical disturbance or destruction of active nests and affect the behavior of birds. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With creek flow augmentation, groundwater monitoring, and dryback monitoring (with additional flow augmentation, and payment of VHP impact fees for impacted wetland and riparian habitat, as necessary), implementation of BMPs, DMP measures, and compliance with VHP conditions impacts on nesting special-status and nonspecial-status birds would be **less than significant**. The Increased Dredge Alternative would have the same impact to protected breeding birds as the Project.

Nonbreeding Special-Status Birds

Several special-status bird species including the Swainson's hawk, burrowing owl, and peregrine falcon, are not known or expected to breed in any areas where they could be impacted by Project activities, but they could occur there as nonbreeding foragers, particularly during migration and in winter. Construction could disturb foraging individuals, burrowing owls could be injured or killed if they are present in burrows when grading occurs, and construction activities could disturb roosting owls to the point of abandonment of their burrows. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1g** will identifies locations of burrowing owls prior to initiation of Project activities to avoid injury or mortality. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1g**, Project impacts on nonbreeding special-status birds will be **less than significant with mitigation**. The Increased Dredge Alternative would have the same impact to nonbreeding special-status birds as the Project.

Pallid Bat

A maternity colony of the pallid bat has been located just outside of the Seismic Retrofit Area, in the Cochrane Road barn. This colony likely represents the largest and most stable colony of the species known in Santa Clara County. Construction would not result in direct impacts on the Cochrane Road barn; however, given the intensity of construction activities, which would include some nighttime work, and the extent to which foraging habitat on Anderson Dam would be disturbed during construction, it is possible that pallid bats may abandon the roost within the barn while construction is ongoing. If pallid bats abandon the roost during construction, they may return once construction has been completed. However, unless high-quality alternative roost sites are present in the vicinity, the population may decline before the bats can re-occupy the barn. When trees, structures, or rock outcrops containing roosting colonies or individual bats are removed or modified, individual bats could also be physically injured, killed, or subjected to physiological stress resulting from being disturbed during torpor. Construction activities would result in the short-term loss of foraging habitat as well as a temporary impact on foraging individuals through the alteration of foraging patterns.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1h(1)** will minimize construction activities near the barn. If buffers in **TERR-1h(1)** are not feasible, **Mitigation Measure TERR-1h(2)** will develop an eviction plan for pallid bats to be implemented if deemed necessary. **Mitigation Measure TERR-1h(3)** will minimize the potential for males and nonbreeding females outside the barn to be injured or killed during Project activities. **Mitigation Measure TERR-1h(4)** will provide temporary roosting sites near the Project during construction and additional permanent roosting sites if the roost population is not restored to at least 75 percent by three years following construction. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1h(1)**, **TERR-1h(2)**, **TERR-1h(3)**, and **TERR-1h(4)**, Project impacts on pallid bats will be reduced. The Project could cause the number of females at this site to drop below 75 percent of existing numbers, and a substantial proportion of the regional population would have been affected. No other mitigation would be feasible to reduce this impact therefore the impact is **significant and unavoidable**. The Increased Dredge Alternative would have the same impact to pallid bat as the Project.

Other Special-Status Mammals

This impact analysis addresses San Francisco dusky-footed woodrat, mountain lion, ringtail, American badger, Townsend's big-eared bat, and western red bat. San Francisco dusky-footed woodrat has been detected around Basalt Hill and likely resides in crevices there. Seismic retrofit construction would result in the loss of 43.2 acres of suitable habitat for the species. In addition, construction could result in the injury or mortality of individual woodrats and disturbance or destruction of nests and young. Construction and monitoring could disrupt the habitat of these species and their foraging. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With implementation of BMPs, DMP measures, and compliance with the VHP conditions, Project impacts on special-status mammals would be **less than significant.** The Increased Dredge Alternative would have the same impact to California special-status mammals as the Project.

San Francisco Bay Special-Status Species

Valley Water modeled potential effects of construction-period flows on tidal habitats along lower Coyote Creek and Coyote Slough. This modeling assumed that higher flows would be coupled with tide height equaling mean higher-high water (MHHW) to represent the conditions that would occur if higher flows down Coyote Creek coincided with high tides. Modeling suggests that reservoir releases could result in increased frequency, depth, and/or duration of inundation of tidal marsh habitats far downstream from the dam. Such increased inundation would reduce the vegetative cover available to special-status species associated with San Francisco Bay tidal marshes, increasing predation of special-status tidal marsh animals that have to seek out more limited patches of vegetation that is not inundated. Such impacts would be infrequent and would occur only during the construction period but would be significant. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation**

Measure TERR-1j requires contributing to predator management activities in the South Bay and high tide refugia enhancement, thereby offsetting increases in predation resulting from the Project for each year flows exceed 2,500 cfs. With implementation of BMPs, compliance with the VHP conditions, and **Mitigation Measure TERR-1j**, Project impacts on San Francisco Bay special-status species will be **less than significant with mitigation**. The Increased Dredge Alternative would have the same impact to San Francisco Bay special-status species as the Project.

Riparian Habitat and Other Sensitive Natural Communities

The Project will result in permanent impacts on a total of 20.79 ~~25.77~~acres of mixed riparian woodland and forest and willow riparian forest and scrub, including 1.29 ~~4.14~~ acres from Seismic Retrofit construction and 19.50 ~~21.63~~acres from Conservation Measures construction. However, approximately 39.5 acres of riparian habitat will be restored as part of the Ogier Ponds CM. Therefore, the Project will result in a net increase in the acreage of riparian woodland, forest, and scrub habitat. This net increase will help to compensate for the temporal loss of riparian functions and services.

The Project will permanently impact a total of 15 acres of coast live oak woodland and forest, 11.2 acres of foothill pine-oak woodland, and 2.5 acres of mixed serpentine chaparral, mostly from Seismic Retrofit construction. VHP fees to be paid by Valley Water for the Project include specialty fees for mixed riparian woodland and forest, willow riparian forest and scrub, and mixed serpentine chaparral, in addition to general land cover fees. The Project's impact fees would contribute directly to the conservation of sensitive natural communities, including not only these riparian and serpentine communities, but also the coast live oak woodland and forest, and foothill pine-oak woodland, land cover types that will be impacted by the Project.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Existing BMPs, DMP measures, and AMMs do not address the risk of introduction or spread of *Phytophthora*. **Mitigation Measure TERR-1a(2)** includes procedures to reduce the risk of *Phytophthora*. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1a(2)**, Project impacts on riparian habitat and other natural communities will be less than significant with mitigation. The Increased Dredge Alternative would have the same impact to riparian habitat as the Project.

Wetlands

Construction activities would result in the placement of fill, and related hydrological interruption, alteration of bed and bank, degradation of water quality, and other direct impacts on the acreages and linear footage of wetlands (coastal and valley freshwater marsh), non-wetland other waters (perennial stream, intermittent stream, pond, and reservoir), and mixed riparian woodland and forest as indicated in **Table 3.5-13**. The Project will result in permanent impacts to 4.16 ~~4.2~~ acres of freshwater marsh, but in addition to paying VHP permanent wetlands impacts fees in accordance with VHP procedures, the Ogier Ponds CM will create 4.5 acres of emergent freshwater marsh. The Project will result in ~~permanent~~ impacts to 374.8 ~~5.99~~ acres of the reservoir land cover type, but all ~~All~~ impacted reservoir acres will be restored or will recover to reservoir after construction with the exception of 3 acres that will be lost due to expansion of the Anderson Dam footprint and 15 acres that will be converted to other habitats (resulting in a net improvement in ecological functions and services) by the Ogier Ponds CM. Valley Water predicts that approximately 12.5 acres of riverine aquatic habitat below the OHWM would be restored as part of the Ogier Ponds CM~~, with additional acres of riverine aquatic habitat from the North Channel Extension CM~~.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water will pay VHP impact fees for wetlands, other waters, and riparian habitats, which include specialty fees for these important land cover types. The Interagency Review Team, including USACE, CDFW, and the RWQCB, have approved the VHP as an In Lieu Fee Program for impacts to water of the united state and waters of the state. the implementation of the Conservation Measures more than offsets and compensates for the Project's net impacts on jurisdictional waters and wetlands.

Existing BMPs, DMP measures, and AMMs do not address the risk of introduction or spread of *Phytophthora.* **Mitigation Measure TERR-1a(2)** includes procedures to reduce the risk of *Phytophthora.* With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1a(2)**, Project impacts on wetlands will be **less than significant with mitigation**. The Increased Dredge Alternative would have the same impact to wetlands as the Project.

Wildlife Corridors

Seismic retrofit construction would have both adverse and beneficial effects, all temporary, on wildlife movement. Construction activities, especially nighttime activities, could disrupt wildlife movement. Although Project activities may temporarily affect wildlife movement during construction, animals would still be able to move through the Project Area during construction, and the drained reservoir improves wildlife movement in the area around the reservoir. No long-term impacts on wildlife movement would result from the Project. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With implementation of BMPs, DMP measures, and compliance with the VHP conditions, Project impacts on wildlife movement would be **less than significant.** However, considering the impacts to pallid bats discussed about, the Project would have a **significant and unavoidable** impact to wildlife nursery sites. The Increased Dredge Alternative would have the same impact to wildlife nurseries as the Project.

Tree Ordinance

Seismic Retrofit construction would result in the removal of approximately 270 ordinance-sized trees. The Ogier Ponds CM and Coyote Percolation Dam CMs~~, and the North Channel Extension improvements~~ would result in the removal of 40 trees protected by County tree removal regulations. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water is exempt from compliance with the County tree ordinance under either Government Code sections 53091(d) and (e) (which state that County or City building and zoning ordinances do not apply to the construction of facilities for water storage or transmission) meaning there would be **no impact**. Nevertheless, recognizing the importance of protected trees to the County and the terms of the County ordinance, Valley Water will implement **Mitigation Measure AES-1**, calling for the planting of replacement trees removed on

County Park land. The Increased Dredge Alternative would have the same impact to tree ordinances as the Project.

Conflict with Habitat Conservation Plan/Natural Community Conservation Plan

Valley Water is a signatory on one conservation plan: the VHP, which is an HCP and NCCP for terrestrial species and related habitats. As described in *Project Description*, the VHP explicitly included the Project in its list of covered activities, and most impacts of the Project were included in the VHP's analysis of the effects of covered activities. Valley Water would apply for VHP coverage for the Project and adhere to all applicable VHP Conditions during Project implementation. Therefore, the Project would not conflict with the VHP. The impact is **less than significant**. The Increased Dredge Alternative would have the same impact to HCP/NCCP compliance as the Project.

Mitigation Measures

TERR-1a(1) *Invasive Plant Management at Coyote Ridge ~~Valley Water's~~ Tiburon Paintbrush Populations ~~Population~~*

TERR-1a(2) *Implementation of Avoidance and Minimization Measures during Post-Construction Maintenance at Anderson Dam and Conservation Measures Facilities to Reduce the Potential for Introduction or Spread of Phytophthora*

TERR-1a(3) *Special-Status Plant Survey in the Previously Unsurveyed Portions of the Seismic Retrofit Are*

TERR-1a(4) *~~Seed Collection and Creation of a New Population of~~ San Francisco Collinsia Conservation Measures*

TERR-1c(1) *Special-Status Species Avoidance and Minimization Measures During Year 6 Reservoir Dewatering*

TERR-1c(2) *Nonnative Species Management in Upper Penitencia Creek Watershed*

TERR-1e *Nesting Eagle Avoidance and Minimization Measures*

TERR-1g *Burrowing Owl Impact Avoidance*

TERR-1h(1) *Avoid Disturbance of the Cochrane Road Barn Roost*

TERR-1h(2) *Evict Pallid Bats prior to Initiating Maternity-Season Disturbance near the Cochrane Road Barn Roost*

TERR-1h(3) *Minimize Impacts on Pallid Bats Roosting Outside the Cochrane Road Barn*

TERR-1h(4) *Provide Alternative Pallid Bat Maternity Roost Structures*

TERR-1j Contribution to Baylands Predator Management and High Tide Refugia Enhancement

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **cumulatively considerable** impacts on pallid bats and the pallid bat nursery site, but **not cumulatively considerable** impacts on other wildlife species and habitats. Overall cumulative impacts would be greater than Project cumulative impacts.

5.9.2.6 Cultural Resources

The Increased Dredge Alternative would have greater impacts to cultural resources than the Project as were discussed in Section 3.6, *Cultural Resources*.

Historic Resources

The Rhoades Ranch Historic District is near the Seismic Retrofit area, but there would be no direct impact on the historical resource. Dust and noise from construction would cause minor impacts; however, they would be temporary and would not alter the elements that contribute to the significance of the resource. The Coyote Percolation Dam, which is a contributing element to the Santa Clara Valley Water District Dams Historic District, is in the construction limits of the Phase 2 Coyote Percolation Dam CM. However, implementation of this Conservation Measure would have no impact on the dam because, prior to Project implementation, the resource will have been demolished and replaced by an inflatable bladder dam as part of FOCP. Therefore, the Increased Dredge Alternative will have a **less-than-significant impact** to the built environment historical resources. The alternative would have the same impact as the Project.

Archeological Resources

Archaeological resources that have been determined to be eligible for listing for the NRHP/CRHR through formal evaluation, or that have not been formally evaluated but are assumed eligible for the purpose of this analysis, are in the Seismic Retrofit Project Area, and within the boundaries of the Ogier Ponds CM and the Phase 2 Coyote Percolation Dam CM. Ground disturbance during construction at archaeological resources in both the Seismic Retrofit construction area and the Ogier Ponds CM areas could have significantly impact elements of sites that contribute to their NRHP/CRHR-eligibility. In addition, erosion and recreational power boating within Anderson Reservoir related to the operation of the Seismic Retrofit component of the Project could create wave action along the exposed shoreline of the reservoir as the reservoir is refilled after Project completion, during the regular rise and fall of the reservoir due to Project operation and the resumption of recreational boating. These actions may erode archaeological historical resources and displace the artifacts within them.

BMP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will require that work will cease in areas where archaeological materials are discovered during construction until the finds can be analyzed and evaluated for NRHP/CRHR-eligibility, and that any eligible resources either be avoided or subject to data recovery studies. **Mitigation Measure CR-1** (Preconstruction Cultural Resources Awareness Training) will provide construction workers with awareness training about the nature of archaeological materials that might be discovered during ground disturbing activities and the protocols to be followed, should they be found. **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided) will develop and implement a Data Recovery and Treatment Plan for archaeological resources that cannot be avoided. Lastly, **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require an archaeological and tribal monitor in areas sensitive for cultural resources during Project construction, the monitoring of sensitive areas during Project operations, and will implement protocols of the Monitoring and Unanticipated Discoveries Plan should archaeological materials be discovered. With implementation of these mitigation measures, substantial adverse changes in the significance of an archaeological resource would not occur, and significant impacts to archaeological historical resources within the Project areas would be reduced to **less than significant through mitigation**. The alternative would have a greater impact on archeological resources than the Project with greater construction activities around Anderson Reservoir.

Human Remains

Two archaeological sites with human remains and one with a high potential to contain as-yet unidentified human remains are known to exist within Anderson Reservoir. All three of these sites in the reservoir could be damaged by erosion from fluctuating water levels during Seismic Retrofit operations and wave action caused by power boating. Therefore, Project impacts on disturbance of human remains would be significant. Compliance with Health and Safety Code section 7050.5 and PRC section 5097.98 would reduce impacts related to disturbance of human remains and **Mitigation Measures CR-1, CR-2,** and **CR-3** will reduce impacts to disturbing human remains to **less than significant with mitigation**. The alternative would have a greater impact to disturbance of human remains than the Project with greater activities around Anderson Reservoir.

Mitigation Measures

CR-1 Preconstruction Cultural Resources Awareness Training

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **cumulatively considerable** impacts on cultural resources. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.7 Energy

The Increased Dredge Alternative would extend the construction period of the Seismic Retrofit Component 10 more months over 2 years compared to the time period required for the Project, energy consumption due to use of construction equipment and truck traffic would be greater than the Project. Other impacts would be like those discussed for the Project in Section 3.7, *Energy*.

Energy Consumption

Construction of the Seismic Retrofit and Conservation Measures components would consume approximately 17,842,000 ~~21,150 thousand~~ gallons of diesel and 780,000 ~~2,103 thousand~~ gallons of gasoline and result in increased demand on local and regional. However, compared to the northern California region’s annual average production of fuel over the 5-year period of 2018-2022, the total annual average energy demand of the Project be approximately 0.01 ~~0.03~~ percent of the region’s gasoline production throughput and approximately 0.75 ~~0.89~~ percent of the region’s diesel production throughput (CEC 2023). Dredging and hauling of sediment associated with the Increased Dredge Alternative would increase these numbers, but the impacts of Project construction on local and regional fuel supplies would still be temporary and minimal.

Although the energy related impact is less than significant, the Project will implement **Mitigation Measures AQ-1** and **GHG-1** to address air quality and greenhouse gas emission impacts. These measures would further minimize Project energy impacts by increasing the efficiency of energy usage and decreasing the amount of non-renewable energy usage during construction. **Mitigation Measure AQ-1** requires all construction equipment greater than 25 hp and operating for more than 20 hours over the entire duration of construction activities to be equipped with Tier 4 engines and would require all on-road truck engines and boats to be year 2010 or newer and minimizes construction equipment idling time and requires regular maintenance for all equipment. **Mitigation Measure GHG-1** requires engine electrification and use of renewable fuels as feasible.

Project construction would utilize fuel-efficient equipment consistent with State and federal regulations and would comply with state measures to reduce the inefficient, wasteful, or unnecessary consumption of energy. Per applicable regulatory requirements of CALGreen, Project construction activities would comply with construction waste management practices to divert construction and demolition debris from landfills. These practices would result in efficient use of energy by Project construction. The Increased Dredging Alternative's impact on energy use would be **less-than-significant impact with mitigation**. The alternative would have a greater impact on energy use than the Project.

State and Local Efficiency Plans

Project construction would be consistent with renewable energy and energy efficiency targets, standards, and guidance included in California Green Building Standards Code (CALGreen or Title 24 Part 11), California Building Energy Efficiency Standards (Title 24 Part 6), SB 100, Valley Water CCAP, Santa Clara County General Plan, Santa Clara County Sustainability Master Plan, Morgan Hill 2035 General Plan, and Envision San José 2040 General Plan with implementation of **Mitigation Measures AQ-1** and **GHG-1**. Project operation related to equipment and vehicle energy use would be consistent with these regulations and plans without mitigation. Therefore, Project construction and operation would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency, and overall impacts would be **less than significant with mitigation**. The alternative would have a greater impact on energy use than the Project.

Mitigation Measures

AQ-1 Implement Construction Criteria Air Pollutants Reduction Measures

GHG-1 Utilize Electrification and Renewable Fuels During Construction

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts ~~on~~ due to wasteful, inefficient, or unnecessary consumption of energy. The Increased Dredge Alternative would have **not cumulatively considerable** impacts related to conflict or obstruction of renewable energy and energy efficiency plans. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.8 Geology and Soils

The Increased Dredging Alternative would have similar impacts on geology and soils as discussed in Section 3.8, *Geology and Soils*. Two (2) additional years of dredging and hauling would increase impacts related to soil erosion and potential to destroy paleontological resources.

Fault Rupture and Shaking

The nearby active Calaveras fault lies just east of Anderson Reservoir and the active Coyote Creek Range fault transects Anderson Dam. However, construction and operation of the Project would not exacerbate the risk of fault rupture. The reservoir is not deep enough to cause RIS, vibrations associated with blasting and tunneling activities would not affect the earth at depths of where the underlying faults are locked (URS 2022), and no Project-related actions would increase the likelihood of seismic activity and associated surface fault rupture. As the Project would not increase the likelihood of an earthquake, exacerbate the likelihood of surface fault rupture, or increase the likelihood of seismic ground shaking in the Project area the Increased Dredge Alternative would have a **less than significant impact** on seismic related hazards. The Increased Dredge Alternative would have the same impact as the Project.

Liquefaction

The Project is in an area susceptible to liquefaction. Placement of dam materials could increase the load on liquefiable soils, which may densify and settle during an earthquake. Placement of structures associated with the Conservation Measures, namely the levee at Ogier Ponds and the fish ramp at the Coyote Percolation Pond on liquefiable soils could exacerbate liquefaction hazards in those areas. The impact from liquefaction would be **less than significant**. The Increased Dredge Alternative would have the same impact as the Project.

Landslides

Anderson Dam is in a mountainous area with steep slopes and unstable ground conditions that are susceptible to landslides due to faults and historic landslides that predate the reservoir. Ground disturbance associated with construction of the seismic retrofit of Anderson Dam, including drawdown of the reservoir, construction of stockpiles near landslides, removal of materials from the BHBA and the PGBS, and refilling of the reservoir could exacerbate likelihood of landslide, lateral spreading, and settlement by destabilizing landslide deposits.~~ Excavation associated with the North Channel Extension conservation measure would occur near slopes that are mapped by CGS (2004) as susceptible to landslide.~~ Excavation and construction of new stream channels associated with the Ogier Ponds CM ~~North Channel Extension, ~~and Phase 2 Coyote Percolation Dam CM into liquefiable soils could increase risk of lateral spreading. All construction activities would be performed in accordance with DSOD, IBC, and CBC standards as applicable. In addition, Valley Water would continue to monitor slope stability and landslide movement through installed survey monuments and satellite reflectors within the reservoir as part of its normal operations. Valley Water implemented the Reservoir Bank and Rim Stability Mitigation and Monitoring Plan, Dewatering and Sediment Management Plan, and Slope Stability Plan. All these measures serve to reduce any landslide risks by taking action to minimize soil instability and monitoring for signs of land movement. The Project will also implement **Mitigation Measure GEO-1** (Repair Landslides Caused by Construction Activities) to reduce the risk of landslide, as such that the Project's landslide risk is less than **significant with mitigation.** The Increased Dredge Alternative would have the same impact as the Project.

Soil Erosion

Excavation and ground-disturbing activities associated with construction of the Project could result in soil erosion or the loss of topsoil. Such activities include clearing and preparing staging and stockpile areas; constructing, using, and maintaining stockpiles; excavating materials at borrow sites and conservation measures sites; placing sediment; and constructing and using unpaved roads. For construction activities outside of the reservoir, the ~~The~~ Project would implement a SWPPP in compliance with the Construction General Permit, and a set of erosion control BMPs (BMPs GEN-20, GEN-21, WQ-4, WQ-5, BI-3, BI-8, WQ-9, AQ-1, BANK-1, and REVEG-1) to minimize erosion around stockpiled soils and staging areas, stabilizing construction entrances and exits, removing any temporary fills, restoring the site to its pre-construction condition, and reducing fugitive dust. With adherence to requirements of the SWPPP and BMPs for out-of-reservoir construction activities, substantial soil erosion or loss of topsoil resulting from the projects would be less than significant. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. The Increased Dredge Alternative would have a greater impact as the Project as it would increase ground disturbing and hauling activities for 2 additional years.

Paleontological Resources

Santa Clara Valley is known for yielding significant fossils from alluvium (Maguire and Holroyd 2016). In addition, other geologic units of Pleistocene age and older in the county are documented to have yielded significant fossils, including vertebrate fossils. One of these is the Santa Clara Formation in the Project area known locally as the Packwood Gravels. Excavation and ground-disturbing activities associated with Seismic Retrofit construction occurring in regions underlain by the Santa Clara Formation could expose paleontological resources. In addition, higher peak flows released from Anderson Dam during Project operation could increase risk of erosion downstream, which could increase risk of erosion uncovering significant paleontological resources and removing them from the original context, thereby potentially reducing their scientific significance. Excavation and ground-disturbing activities associated with the Project could expose paleontological resources. The Project will implement **Mitigation Measure GEO-3** (Paleontological Initial Survey), **Mitigation Measure GEO-4** (Paleontological Detailed Survey and Construction Monitoring), and **Mitigation Measure GEO-5** (Paleontological Discoveries Treatment Plan) that will require a pre-construction survey, construction monitoring, and plan for discovery of resources. The Project's impact on paleontological resources would **be less than significant with mitigation**. The Increased Dredge Alternative would have a greater impact as the Project as the alternative would increase dredging in Anderson Reservoir.

Mitigation Measures

GEO-1 Repair Landslides Caused by Construction Activities

GEO-2 Paleontological Initial Survey

GEO-3 Paleontological Detailed Survey and Construction Monitoring

GEO-4 Paleontological Discoveries Treatment Plan

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on geology and soils. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.9 Greenhouse Gas Emissions

Similar to the Project, the Increased Dredge Alternative would result in emissions of GHG during construction. However, because the construction period of the Seismic Retrofit Component would involve 10 more months of construction and truck traffic over 2 years compared to the time period required for the Project, GHG emissions due to use of construction equipment and truck traffic would be greater than the Project as discussed in Section 3.9, *Greenhouse Gas Emissions*.

Greenhouse Gas Emissions

Project construction would generate approximately 186,966 ~~235,240~~ MT CO2e of GHG emissions, which is a significant impact; and the Increased Dredge Alternative would increase this amount. Project operation would result in negligible generation of GHG emissions. Implementation of **Mitigation Measure GHG-1** will require Valley Water and/or its contractor to implement construction-related GHG emission reduction measures, such as using zero-emission and hybrid-powered equipment, minimizing idling time, using renewable diesel fuel, using USEPA SmartWay certified trucks, requiring proper maintenance of construction equipment, encouraging and providing carpool, transit, and alternative modes of transportation, recycling or salvaging nonhazardous debris, and efficiently using water. Implementation of **Mitigation Measure GHG-2** will require Valley Water to offset GHG emissions ~~purchase carbon offsets~~ before construction activities commence in an amount sufficient to reduce any GHG emissions remaining after implementation of **Mitigation Measure GHG-1** to less-than-significant levels. With implementation of **Mitigation Measures GHG-1** and **GHG-2**, Project construction GHG emissions impacts will be **less than significant with mitigation**. The Increased Dredge Alternative would have a greater impact of GHG emissions than the Project.

GHG Plans

Project construction would be consistent with SB 32, AB 1279, the 2022 Scoping Plan, the Valley Water CCAP, the Morgan Hill CAP, and Climate Smart San José with implementation of **Mitigation Measures GHG-1** and **GHG-2**. Project operation would not conflict with these GHG reduction policies and plans without mitigation. Therefore, the Project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions, and overall impacts would be **less than significant with mitigation**. The Increased Dredge Alternative would have the same impact to GHG reduction plans as the Project.

Mitigation Measures

GHG-1 Utilize Electrification and Renewable Fuels During Construction

GHG-2 ~~Purchase Carbon Offsets~~ Offset GHG Emissions Prior to and During Construction

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on GHG emissions. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.10 Hazards and Hazardous Materials

The Increased Dredging Alternative would have impacts like those discussed in Section 3.10, *Hazards and Hazardous Materials*. The alternative would add 2 years on dredging and hauling activities that would extend the risk from the use of hazardous materials during construction and interfere with emergency response due to the greater number of truck trips.

Use and Accidental Release of Hazardous Material

During the construction of the Seismic Retrofit and Conservation Measures, hazardous materials commonly associated with construction activities (e.g., gasoline, diesel fuel, paints, solvents, hydraulic fluid) would be present and handled onsite, as well as transported to and from the Project Area and would create impacts if accidentally released. These materials would be primarily found within construction equipment but may also be stored onsite at the staging areas, and transported, as necessary, to work areas. NOA is known to be present in the rock types that underlay much of the dam and spillway area. Excavation of serpentinite and other materials containing NOA could expose the public and construction workers to airborne asbestos, which would be a significant impact.

The Project ~~project~~ is required to comply with federal, State, and local laws, regulations, and policies designed to minimize hazardous materials impacts to the public and environment. The Project would implement Valley Water BMPs (~~HM-7~~, HM-8, WQ-6, WQ-17) to minimize the chance of release of hazardous materials. For Seismic Retrofit construction, compliance with BAAQMD's ATCM for Construction, and BMP-AQ-1 and BMP HM-13, would minimize potential impacts from NOA. The implementation of **Mitigation Measure HAZ-1** (Construction and Grading Operations Dust Control Measures), **Mitigation Measure HAZ-2** (Track Out Control Measures for Roads from NOA-Containing Areas), **Mitigation Measure HAZ-3** (Traffic Control Measures within NOA-Containing Construction Areas), **Mitigation Measure HAZ-4** (Dust Control Measures During Earthmoving Activities), **Mitigation Measure HAZ-5** (Dust Control Measures During Tunneling Activities), and **Mitigation Measure HAZ-6** (Separation of Rock Containing NOA) will reduce the Project's impact from hazardous material to **less than significant with mitigation**. The Increased Dredging Alternative would have the same impact as the Project.

Sensitive Receptors

The William F. James Boys Ranch (Boys Ranch) is located within 0.11 miles of Anderson Dam, which is considered a sensitive receptor for hazardous materials. During construction compliance with BAAQMD's ATCM for Construction, and BMP-AQ-1 and BMP HM-13, would minimize potential impacts from NOA. The implementation of MM HAZ-1 through HAZ-6 and **Mitigation Measure HAZ-7** (Soil Testing and Proper Disposal of Potentially Contaminated Soils) will reduce the Project's impact to sensitive receptors **less than significant with mitigation**. The Increased Dredging Alternative would have the same impact as the Project to sensitive receptors.

Discovery of Hazardous Materials

Based on a review of readily available public information for the Project Area, no listed hazardous materials sites or existing hazardous material contamination are present within the Project Area. Nevertheless, there is potential to discover unknown hazardous materials sites during construction activities, which would be a significant impact. Implementation of BMP HM-

9 would include measures for proper handling, storage, and disposal of hazardous materials and **Mitigation Measure HAZ-7** will minimize impacts to the public or environment should unknown contaminants or contaminated soil be encountered during construction activities. The Project's impact on the discovery of hazardous materials is **less than significant with mitigation**. The Increased Dredging Alternative would have the same impact as the Project to hazardous waste sites.

Emergency Response Plan

Construction would involve operation of large construction equipment, transport and storage of construction materials, and worker commute trips to and from the area, which could impede movement and access of emergency response vehicles or interfere with evacuation procedures, which would be a significant impact. Cochrane Road between Coyote Road and Malaguerra Avenue (or portions of this segment) would be closed to through traffic for varying durations throughout the construction period. Implementation of BMP TR-1, PS-AMM-2, **Mitigation Measure PS-1** (Prepare and Implement Traffic Management Plan) which requires the preparation and implementation of a TMP, and **Mitigation Measure WF-1** which requires coordination with local and state emergency response and fire agencies and preparation of a Response and Evacuation Strategy, which will maintain adequate emergency response and identify and maintain evacuation routes, ~~that all emergency response agencies are notified in advance of all lane and road closures and that evacuation routes are passable or alternate routes are available~~ will reduce impacts on emergency response to less-than-significant levels. Impacts related to impairing implementation of or interfering with an adopted emergency response plan or emergency evacuation routes/plans would be **less than significant with mitigation.** The Increased Dredging Alternative would have a greater impact than the Project on emergency response due to the 2 extra years of truck trips to haul sediments.

Valley Fever

As discussed in Section 3.10.1.6, *Valley Fever*, construction activities have the potential to release the soil-dwelling fungus (Coccidioides) that can cause Valley Fever. Such a release could pose a hazard to construction workers and/or the public, which would be a significant impact. BAAQMD's ATCM for Construction, BMP-AQ-1, and **Mitigation Measure HAZ-1** through **HAZ-5** will implement dust control measures to minimize potential impacts from Valley Fever. The risk of Valley Fever is **less than significant with mitigation**. The Increased Dredging Alternative would have the same impact as the Project to Valley Fever.

Mitigation Measures

HAZ-1 Construction and Grading Operations Dust Control Measures

HAZ-2 Track Out Control Measures for Roads from NOA-Containing Areas

HAZ-3 Traffic Control Measures within NOA-Containing Construction Areas

HAZ-4 Dust Control Measures During Earthmoving Activities

HAZ-5 Dust Control Measures During Tunneling Activities

HAZ-6 Separation of Rock Containing NOA

HAZ-7 Soil Testing and Proper Disposal of Potentially Contaminated Soils

PS-1 Prepare and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~Emergency Action Plan~~

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts ~~on hazards and hazardous materials~~ related to reasonably foreseeable upset or accident conditions, emission of hazardous materials within one-quarter mile of a school, a site included on a list of hazardous materials sites, and Valley Fever. The Increased Dredge Alternative would have **not cumulatively considerable** impacts related to routine transport, use, or disposal of hazardous materials and impairment or interference with an emergency response or evacuation plan. Cumulative impacts would be greater than Project cumulative impacts.

5.9.2.11 Hydrology

The goal of the Increased Dredge Alternative is to reduce erosion and sedimentation compared to the Project. Like the Project, this alternative would involve reservoir dewatering and dredging of sediments on the reservoir bottom. However, this alternative would remove an additional 1,400,000 cy of sediment from the deadpool compared to the Project. This sediment removal would increase the reservoir's ability to trap and store sediment and prevent sediment from transporting downstream. Although there would be no flow of water through the reservoir during the dredging period, water flow would resume after site demobilization during the wet season.

Erosion

As described in Section 3.11, *Hydrology*, under the Project, runoff water (e.g., generated by precipitation in the watershed upstream of the reservoir during the wet season) would flow over and through deposited sediment in previously inundated areas along the reservoir bed that would now be exposed during the drawdown conditions of the Project construction period. Flows that erode and entrain sediment in the water column would carry the sediment downstream. Under the Increased Dredge Alternative, the additional depth and area created in the deadpool by removal of this sediment would allow for more sediment deposition in the deadpool and less transport downstream. Modeling of reservoir hydrological conditions for the Project during Seismic Retrofit construction showed that substantial volumes of sediment could be mobilized and transported downstream during storms that occur while the reservoir is in a dewatered state (Valley Water 2020). The Increased Dredge Alternative both physically removes 1,400,000 cy of sediment from the lakebed that could be a source for downstream sediment transport and creates an expanded area for sediment settling and deposition in the deadpool upstream of the dam. This alternative would allow for less transport of sediment downstream of Anderson Dam. Despite the reduction in erosion and sediment transport this alternative would provide the Increased Dredge Alternative would not eliminate the potential for high levels of erosion and sediment transport entirely. **Mitigation Measure WQ-1** requires implementation of a WQMPP, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. However, impacts would remain significant even with implementation of **Mitigation Measure WQ-1**. Because additional mitigation is not available to decrease the magnitude of the impact to a less-than-significant level, the impact would be **significant and unavoidable**. While the magnitude of this impact under the Increased Dredge Alternative would still be significant and unavoidable, the erosion and sedimentation impact would be reduced compared to under the Project, as the removal of sediment and increasing the opportunity for sediment deposition upstream of the dam would help to substantially reduce the severity of the impact compared to the Project.

Construction and maintenance associated with the various components have the potential to loosen materials that could be washed downstream, thus contributing to accelerated rates of erosion and sedimentation. For construction activities outside of the reservoir, implementation ~~Implementation~~ of a SWPPP and erosion control BMPs such as: BMP AQ-1 (Use Dust Control Measures), BMP WQ-4 (Limit Impacts From Staging and Stockpiling Materials), BMP WQ-1 (Conduct Work from Top of Bank), BMP WQ-2 (Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms), BMP WQ-5 (Stabilize Construction Entrances and Exits), BMP WQ-9 (Use Seeding for Erosion Control, Weed Suppression, and Site Improvement), BMP WQ-10 (Prevent Scour Downstream of Sediment Removal), BMP WQ-11 (Maintain Clean Conditions at Work Sites), BMP WQ-16 (Prevent Stormwater Pollution) will reduce erosion and sedimentation. With the SWPPP and BMPs for out-of-reservoir construction activities, the impact of erosion aside from reduced sediment being carried downstream during certain-sized storm events would be **less than significant**. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. The Increased Dredging Alternative would have the same impact as the Project on construction erosion side from reduced sediment being carried downstream.

Runoff

Project construction and maintenance activities would involve denuding areas of vegetation to create access or stable surfaces, which reduce the capacity of these areas to absorb water and slow runoff. Utilization of areas by heavy equipment during construction would compact soils, making the ground surface harder and less conducive to infiltration of water to soil or groundwater. The Seismic Retrofit components of the Project would create relatively minor amounts of new impervious surface (widened/expanded existing roadways). Compliance with the SWPPP and erosion control BMPs for out-of-reservoir construction activities would assure that surface runoff would be **less than significant**. The Increased Dredging Alternative would not add impermeable surfaces and would have the same impact as the Project on sedimentation.

Surface Runoff

Due to the use of hazardous materials (e.g., fuel, oil, lubricants, etc. in construction equipment), there would be potential for discharge of polluted runoff if such materials were handled, stored, or disposed of improperly and/or if any accidental releases of such materials were to occur. The SWPPP, which would be implemented for out-of-reservoir construction, includes good housekeeping measures for: construction materials, waste management, and potential pollutant sources. Additional, BMPs will reduce potential impacts associated with hazardous materials releases: ~~BMP HM-7 (Restrict Vehicle and Equipment Cleaning to Appropriate Locations),~~ BMP HM-8 (Ensure Proper Vehicle and Equipment Fueling and Maintenance), BMP HM-9 (Ensure Proper Hazardous Materials Management), and BMP HM-10 (Utilize Spill Prevention Measures). These BMPs will include protocols for providing secondary containment for hazardous materials used in the field or stored at staging areas or at work sites and providing training spill cleanup materials for field personnel. The Project would have a **less than significant** impact on polluted runoff. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. The Increased Dredging Alternative would have the same impact as the Project on polluted runoff.

Flooding

During construction of the Seismic Retrofit component, there would be increased potential for flooding (i.e., higher flows could occur in Coyote Creek more frequently during storm events) relative to the existing conditions baseline for flows under the 50-year return period (approximately 4,000 cfs–5,000 cfs); however, this flooding risk would be largely reduced relative to Pre-FERC Order Conditions and would not result in widespread, damaging floods. During the post-construction period, flooding risk associated with operation of the dam would be reduced relative to the Pre-FERC Order Conditions Baseline. The impact from flooding would be **less than significant**. The Increased Dredging Alternative would have the same impact as the Project on flooding.

Dam Inundation

The objective of the Project is to reduce the long-term risk of flooding from dam failure. Construction of the Seismic Retrofit components would not ~~directly increase the risk of flooding due to dam failure and~~ exacerbate the impacts from a failure of Coyote Dam, which is located upstream of Anderson Dam and is also susceptible to seismic risks. A restriction has been in place for Coyote Reservoir since 1992, limiting storage in this reservoir 52.5 percent of total capacity. ~~Risk of flooding from dam failure increases marginally during construction of the Seismic Retrofit but is minimized through winterization measures in the wet season while the crest of the dam is lowered~~. If Coyote Dam were to fail, the downstream effects would be reduced by the presence of Anderson Reservoir, which itself has been under a restriction since 2009. During Seismic Retrofit construction, each interim reservoir at the end of each construction season would have capacity that exceeds the capacity of Coyote reservoir. Additionally, the seismic retrofit of Anderson Dam would not exacerbate the risk of failure of Coyote Dam or increase potential downstream flooding compared to existing conditions. In addition, the storage restriction on Coyote Reservoir limits the potential effects of severe damage to the dam from an earthquake and the possibility of uncontrolled flows. With restricted capacity the possibility of water overtopping damage caused by an earthquake is nearly completed avoided. Given the very low probability of dam failure, which would require a major earthquake in close proximity to Coyote Reservoir following a wet period that fills the reservoir beyond its capacity to release high flow, the Project's impact on risk from dam inundation is **less than significant**. The Increased Dredging Alternative would have the same impact as the Project on flooding from dam inundation.

<u>Mitigation Measures</u>

<u>WQ-1 Develop and Implement an In-Reservoir Construction Area Water Quality Monitoring and Protection Plan</u>

Regarding cumulative impacts, like the Project, the Increased Dredge Alternative would have **cumulatively considerable** impacts on erosion and downstream sedimentation, but **not cumulatively considerable** impacts on flooding, polluted runoff, or risk from dam failure. Cumulative impacts would be less than Project cumulative impacts.

5.9.2.12 Groundwater Resources

The Increased Dredge Alternative would have impacts like those described in Section 3.12 *Groundwater Resources*. The alternative would involve 2 extra years of dredging in Anderson Reservoir; however, the reservoir is already at deadpool in the existing conditions baseline, therefore it would not impact groundwater supplies and wells around Anderson Reservoir more that the Project. The alternative would require two more years of heavy equipment use, and that would extend the period that hazardous materials could be released and impact groundwater quality. The alternative would meet the Basin Plan and GWMP in the same manner as the Project with included mitigation.

Groundwater Supply

The loss of storage in Anderson Reservoir would greatly limit the amount of water that could be released from reservoir for the purpose of groundwater recharge along Coyote Creek. Seismic Retrofit construction would not substantially affect groundwater storage and supplies or recharge, as WEAP modeling has shown that groundwater storage in the Coyote Valley would remain above the 5,000 GWMP outcome measure, given implementation of imported water releases in Coyote Creek. Impacts to groundwater recharge would be **less than significant**. The Increased Dredge Alternative would have the same impact as the Project on groundwater recharge.

The dewatering of Anderson Reservoir during the 7-year Seismic Retrofit construction period could impact nearby wells outside of the groundwater basin and managed aquifer; however, this impact will be reduced to less than significant with implementation of **Mitigation Measure GW-1** (Provide Alternative Supplies). As such, the impact to surrounding wells would be **less than significant with mitigation**. The Increased Dredge Alternative would have the same impact as the Project on wells around Anderson.

Groundwater Quality

Construction equipment to be used during construction and maintenance activities would contain hazardous materials, such as fuel, oil, lubricants, etc. that can degrade groundwater quality if spilled or improperly handled. Implementation of a SWPPP <u>for construction activities outside the reservoir</u>, and hazardous materials BMPs including BMPs ~~HM-7,~~ HM-8, HM-9, and HM-10, which will include protocols for providing secondary containment for hazardous materials used in the field or stored at staging areas or at work sites and providing training and spill cleanup materials for field personnel will reduce impacts to groundwater quality to **less than significant.** While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements.

Blasting at the BHBA could release perchlorates and various other water-soluble nitrogen-compounds during the use of explosives. The risk from perchlorates and other water-soluble nitrogen-compounds is primarily in relation to groundwater. Perchlorate salts are highly soluble in water and sorbs poorly to mineral surfaces and organic material; therefore, it is typically very mobile in surface water and groundwater. It is persistent in the environment and at high enough concentrations can affect thyroid gland functions. The risk of groundwater contamination from perchlorates will be minimized by **Mitigation Measure GW-2** (Pollutants from Blasting Activities) which includes a set of BMPs for the proper use and disposal of perchlorate. The impact to groundwater quality is less than significant with mitigation and the Increased Dredge Alternative would have the same impact on groundwater quality as the Project.

The reduction in groundwater levels in the area immediately surrounding Anderson Reservoir could adversely affect groundwater quality in this area; however, these effects would be temporary and the impacts on well owners will be reduced to less-than-significant levels through implementation of **Mitigation Measure GW-1** (Provide Alternative Supplies). The Increased Dredge Alternative would have the same impact as the Project on local well groundwater quality.

Groundwater Plans

As described in Section 3.12.1.2, the San Francisco Bay Basin Plan identifies beneficial uses for groundwater within the San Francisco Bay region and establishes narrative and numerical WQOs to achieve the beneficial uses for those waters. Valley Water's GWMP for the Santa Clara and Llagas Subbasins (Valley Water 2021) describes a comprehensive groundwater management framework, including existing and potential actions to achieve basin sustainability goals and ensure continued sustainable groundwater management. As discussed above the Project would not substantially affect groundwater quantity or quality and with **Mitigation Measure GW-1** will not impact well owners around Anderson Reservoir. As such, Project impacts on groundwater plans would be less than significant with mitigation. The Increased Dredge Alternative would have the same impact as the Project on groundwater plans.

Mitigation Measures

GW-1 Provide Alternative Water Supplies

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on groundwater resources. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.2.13 Water Supply

The Increased Dredge Alternative would have the same impacts as those described in Section 3.13, *Water Supply*. Dredging of the reservoir in the first 2 years of construction would not impact water supplies.

Water Supply

During the Seismic Retrofit component construction, Anderson Reservoir would be almost completely dewatered which would limit supplies available for groundwater recharge and water supply. Modeling results indicate that there may be a reduction in groundwater recharge and storage downstream of the dam during construction, but that simulated groundwater storage would remain above the 5,000 AF outcome measure for Coyote Valley. With increased imported water releases, WEAP modeling has indicated that no significant impacts would occur to water supply conditions during the Seismic Retrofit construction period. Once Project construction has been completed, releases from the dam would be made in accordance with the FAHCE operating rule curves. The Project would not substantially alter or reduce Valley Water's ability to have sufficient water supplies from existing entitlements and resources, and this impact would be **less than significant**. The Increased Dredge Alternative would have the same impact to water supply as the Project.

Water Supply Infrastructure

No new water supplies facilities would be required due to construction and operation of the Project. Restoring the full capacity of Anderson Reservoir would support Valley Water's water supply portfolio. No new or expanded private wells along the rim of the reservoir will be constructed due to water table effects with implementation of **Mitigation Measure GW-1**. Additionally, implementation of **Mitigation Measure GW-2** will avoid any impacts on groundwater quality from blasting activities. Therefore, the water facility impact would be **less than significant with mitigation.** The Increased Dredge Alternative would have the same impacts on water supply facilities as the Project.

Mitigation Measures

GW-1 Provide Alternative Water Supplies

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on water supply. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.2.14 Water Quality

The goal of the Increased Dredge Alternative is to reduce erosion and sedimentation compared to the Project. The Increased Dredge Alternative would remove an additional 1,400,000 cy of sediment from the deadpool compared to the Project. This sediment removal would both remove a large volume of sediment that would be a source for potential erosion and transport downstream, and it would also create a large area of depth to accommodate additional sediment trapping and deposition in the reservoir. The additional volume created in the deadpool by removal of 1,400,000 cy of sediment would allow for the additional deposition eroded sediment in the deadpool.

Effects of Removing Additional Sediment

While the removal of the additional sediment would help reduce the erosion and sediment transport effects, the impact related to violation of the turbidity water quality objective would remain significant. **Mitigation Measure WQ-1** requires implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. However, impacts would remain significant even with implementation of **Mitigation Measure WQ-1**. Because no additional mitigation is available to decrease the impact to less than significant, the impact would be **significant and unavoidable**. The magnitude of this impact under the Increased Dredge Alternative would be substantially less than under the Project as the removal of 1,400,000 cy of sediment would both remove sediment source material and provide additional in-reservoir deposition.

In-Reservoir Water Quality

During construction with Anderson Reservoir at deadpool the limited storage would create higher temperatures and increase turbidity (especially following storms), substantially degraded in-reservoir water quality that would not support designated beneficial uses (COMM, COLD, SPWN, WARM, WILD, REC-1 and REC-2). **Mitigation Measure WQ-1** requires evaluation of the water quality monitoring data collected during construction and implementation of BMPs to address and control sediment and other pollutants associated with in-reservoir construction activities to the extent technically feasible in accordance with the CWA and Porter-Cologne Water Quality Control Act requirements; however, impacts would remain significant even with implementation of **Mitigation Measure WQ-1**. Because no additional mitigation is available to decrease the impact to less than significant, this ~~This~~ impact is **significant and unavoidable**. The Increased Dredging Alternative would have a greater impact than the Project to in-reservoir water quality as it would involve 2 years of dredging in Anderson Reservoir that could further degrade water quality.

Other Water Quality Impacts

The excavation of soils within or near the reservoir and creek, placement of fill within or near the reservoir or creek to construct dam improvements and Conservation Measures, vehicle travel on unpaved access and haul roads, exposed unvegetated work sites and staging areas, uncovered stockpiles, and mining activities could result in erosion of surface soils. Resultant erosion may cause turbidity and sedimentation, and impact water quality. Construction and maintenance activities would also involve the use of hazardous materials and herbicides, which could accidentally be released into the environment, resulting in adverse effects on water quality. Implementation of a SWPPP for out-of-reservoir construction and applicable erosion control BMPs for in-reservoir and out-of-reservoir construction including: BMP AQ-1 (Use Dust Control Measures), BMP WQ-4 (Limit Impacts From Staging and Stockpiling Materials), BMP WQ-1 (Conduct Work from Top of Bank), BMP WQ-2 (Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms), BMP WQ-5 (Stabilize Construction Entrances and Exits), BMP WQ-9

(Use Seeding for Erosion Control, Weed Suppression, and Site Improvement), BMP WQ-10 (Prevent Scour Downstream of Sediment Removal), BMP WQ-11 (Maintain Clean Conditions at Work Sites), and BMP WQ-16 (Prevent Stormwater Pollution); hazardous material BMPs: ~~BMPs HM-7 and~~ BMP HM-8 which reduces ~~reduce~~ the risk of vehicle-related pollutants and BMPs HM-9 and HM-10 which proper management of hazardous materials and the implementation of spill prevention measures; and herbicide BMPs: HM-1 (Comply with All Pesticide Application Restrictions and Policies), HM-2 (Minimize Use of Pesticides), HM-4 (Comply with All Pesticide Usage Requirements), HM-5 (Comply with Restrictions on Herbicide Use in Upland Areas), and HM-6 (Comply with Restrictions on Herbicide Use in Aquatic Areas) will help protect water quality. The SWPPP for out-of-reservoir construction activities and implementation of applicable BMPs for in-reservoir and out-of-reservoir construction would ensure water quality impacts are **less than significant** for construction and maintenance related activities. The Increased Dredging Alternative would have a greater impact than the Project from construction water quality due to the 2 additional years of dredging and hauling.

Some construction elements would require the removal of groundwater to keep work areas dry. To avoid water quality impacts this groundwater would be treated by an ATS system. Imported water would be chilled as needed prior to release to Coyote Creek to ensure cold water in the CWMZ, and Valley Water would comply with the Stormwater NPDES Permit as applicable to minimize impacts from new impervious surfaces. Other water quality impacts would **be less than significant**. The Increased Dredging Alternative would have the same impact as the Project to other water quality issues.

Over the long-term, the Project would generate substantial beneficial impacts to water quality and beneficial uses. The new reservoir outlet would allow for greater flexibility in releases that would allow greater use of the reservoir's cold-water pool and reduce the potential for uncontrolled reservoir spills. Live Oak Restoration Project, the ~~The~~ Ogier Ponds CM, Sediment Augment Program, Maintenance of the North Channel Reach ~~Extension~~, and Phase 2 Coyote Percolation CM would all provide water quality benefits and habitat enhancements the support beneficial uses

Mitigation Measures

WQ-1 Develop and Implement an In-Reservoir Construction Area Water Quality Monitoring and Protection Plan

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **cumulatively considerable** impacts on turbidity water quality objectives and in-reservoir water quality, but **not cumulatively considerable** impacts on other water quality objectives or on beneficial uses. Cumulative impacts would be less than the Project's cumulative impacts.

5.9.2.15 Land Use

The Increased Dredge Alternative would have the same impacts as those discussed in Section 3.15, *Land Use*. Increased dredging and hauling of sediments would not conflict with land use plans, polices, and regulations.

Conflict with Land Use Plans, Policies, and Regulations

The majority of the land that would be affected by the Project is designated as recreational. Portions of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond would be closed during construction of the Seismic Retrofit improvements and Conservation Measure components, affecting recreational land uses in the area. These effects would be temporary in nature. Implementation of BMP AQ-1, BMP AQ-2 BMP TR-1, BMPs GEN-36, GEN-37, and GEN-39 will minimize the level of disruption and impairment of onsite land uses during the Project construction period. Operation of the Project would minimize the risk of reservoir spill and downstream flooding and provide in-stream environmental flows consistent with land use policies and regulations. The Project would seismically upgrade a critical facility consistent with local goals and policies, and construction and operation would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, this impact would be **less than significant**. The Increased Dredge Alternative would have the same impact as the Project.

Regarding cumulative impacts, like the Project, the Increased Dredge Alternative would have **not cumulatively considerable** impacts on land use. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.2.16 Noise and Vibration

The Increased Dredge Alternative would result in increased noise during construction as discussed in Section 3.16, *Noise and Vibration*. The construction period would involve 10 more months of construction and truck traffic over 2 years compared to the time period required for the Project; thus noise impacts would persist for a longer time than the Project.

Noise

Construction of the Seismic Retrofit Component, Ogier Ponds CM, and the Sediment Augmentation Program would exceed applicable construction noise thresholds of significance, while Project operational noise impacts would be less than significant. Seismic Retrofit construction noise levels would exceed the 10 dBA increase above ambient threshold at key receptors as discussed in Section 3.16, *Noise*. Seismic Retrofit nighttime construction noise levels would exceed the nighttime construction noise threshold of 50 dBA L_{eq}.

Mitigation Measure NOI-1 will require Valley Water to implement a Construction Management Plan and **Mitigation Measure NOI-2** is specific to Seismic Retrofit construction and would require the installation of a temporary noise barrier, limiting of construction activity at Staging Area 1 ~~and Stockpile Area E~~, provide a noise complaint phone number and construction noise monitoring during nighttime periods of construction, and reduce speeds along haul routes. Implementation of **Mitigation Measure NOI-3** is specific to Ogier Ponds CM construction and would require the installation of a temporary noise barrier and the reduction of truck and vehicle speeds along Cochrane Road. Even with mitigation noise levels would still exceed the thresholds of significance and construction would result in generation of a temporary increase in ambient noise levels in excess of locally adopted standards. Impacts would be **significant and unavoidable**. The Increased Dredging Alternative would have the greater impacts to noise compared to the Project.

Vibration

Construction of the Seismic Retrofit components and the Sediment Augmentation Program would exceed construction vibration thresholds of significance of 72 VdB at sensitive receptors. Blasting activities during Seismic Retrofit construction could exceed applicable blasting thresholds.

Implementation of **Mitigation Measure NOI-4** will require the use of oscillatory or static rollers in lieu of a vibratory roller within 150 feet of residential structures ~~receptors~~. Implementation of **Mitigation Measure NOI-5** will require vibration and air overpressure monitoring be conducted while initial blasting activities occur. Monitoring results would be used to adjust blast loading limits to properly reflect site-specific conditions to ensure vibration impacts from blasting do not exceed the building damage thresholds. Mitigated vibration levels would not exceed the established thresholds. Therefore, Project construction would not generate excessive ground borne vibration or ground borne noise levels and impacts would be **less than significant with mitigation**. The Increased Dredging Alternative would have the same impacts to vibrations as the Project.

Mitigation Measures

NOI-1 Implement Construction Noise Reduction Measures

NOI-2 Implement Seismic Retrofit Construction Noise Reduction Measures

NOI-3 Implement Ogier Ponds CM Construction Noise Reduction Measures

NOI-4 Seismic Retrofit and Sediment Augmentation Program Construction Vibration Reduction ~~Measures~~

NOI-5 Implement Blasting Plan

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **cumulatively considerable** impacts on noise. ~~, but~~ The Increased Dredge Alternative would have **not cumulatively considerable** impacts on vibration. Cumulative impacts would be greater than the Project's cumulative impacts for noise and the same for vibrations.

5.9.2.17 Public Services

The Increased Dredge Alternative would generate an additional increase in vehicle traffic in the Project vicinity. Increased vehicle traffic could increase impacts on emergency service response times compared to those discussed in Section 3.17, *Public Services*.

Fire and Police Services

Temporary impacts on police and fire protection services would include accidental ignition of a wildfire, use of hazardous materials that may require additional fire protection services, and temporary increases and disruptions to vehicle traffic in the Project vicinity, which could impede emergency response timing. Implementation of BMPs HM-12, HM-8, and HM-9 will minimize the risk of accidental ignition. BMP TR-1 will require construction warning signs, safety fencing, and detours which would minimize potential impacts on emergency response times. Although construction traffic levels would increase emergency service response times, it would not disrupt emergency service response to the point that would require the construction or expansion of police or fire protection facilities other than potentially the need for temporary emergency access roads, which might cause significant impacts, which a significant impact. **Mitigation Measure PS-1** requires preparation of a TMP and coordination with fire protection services and first responders, and **Mitigation Measure WF-1**, which requires coordination with local and state emergency response agencies and preparation of a Response and Evacuation Strategy which will maintain adequate emergency response and identify and maintain evacuation routes, will reduce potential impacts associated with impeding emergency response times to a less-than-significant level. Impacts to police and fire services would be **less than significant with mitigation.** The Increased Dredge Alternative would have a greater impact than the Project as it would extend construction impacts, specifically up to 750 truck trips a day, over an additional 2 years.

Mitigation Measures

PS-1 Prepared and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~Emergency Action Plan~~

Regarding cumulative impacts, like the Project, ~~after mitigation~~ the Increased Dredge Alternative would have **not cumulatively considerable** impacts on public services. Cumulative impacts would be greater than the Project's cumulative impacts.

5.9.2.18 Recreation

The Increased Dredge Alternative would result in a longer temporary interruption to recreational facilities, potentially resulting in physical deterioration or the acceleration of physical deterioration of neighboring facilities. This alternative would extend construction an additional 2 years to accommodate dredging of sediment from the reservoir bed as that described in Section 3.18, *Recreation*.

Recreation Facilities

The Project would require closure of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond for the duration of construction; however, there are 100 other recreational facilities in the study area (i.e., all parks within 5 miles of the Project area as well as regional parks in the county), many of which include a variety of infrastructure and accommodate a wide range of recreational activities including hiking and fishing (see **Table 3.18-1** and **Figure 3.18-1**). Temporary impacts on recreational facilities resulting from the Seismic Retrofit components would be distributed across many nearby recreational facilities, so this impact is less than significant.

Coyote Creek Trail and portions of Hellyer Park would be periodically inundated by Coyote Creek at several low flow crossings more frequently during construction of the seismic retrofit. Longer recreational facility closures during the wet season could result in physical deterioration of other recreational facilities or the acceleration of the physical deterioration of those facilities. Therefore, this impact would be significant.

Implementation of **Mitigation Measure REC-1** will reduce impacts to **less than significant with mitigation** by requiring Valley Water to provide funding and implementation of the future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities. ~~compensating SCCPRD for anticipated extra maintenance costs.~~ The Increased Dredge Alternative would have the same impact to recreational facilities as the Project.

Permanent Modification to Recreation Facilities

The Project would result in several permanent modifications to recreational facilities. As described in Section 2.4.5.12, the Live Oak Picnic Area would include an improved walking loop, ~~a bridge over the North Channel and connection to the Serpentine Trail,~~ an interpretive trail along Coyote Creek, relocation of the group picnic area closer to restroom and parking areas, and tree replacement planting. Additionally, the existing boat ramp at Anderson Dam would be improved by constructing a second entrance off Cochrane Road, constructing a dedicated inspection area, and an electric vehicle charging area would be replaced and improved. These facility improvements would be minor and would not have a significant adverse physical effect on the environment. This impact would be **less than significant**. The Increased Dredge Alternative would have the same impacts to permanent facilities as the Project.

Mitigation Measure

REC-1 Funding and Implementation of ~~Maintenance Reimbursement for~~ Park Facility Improvements within the Coyote Creek Corridor ~~Closures During High Flow Events~~

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on recreation. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.2.19 Transportation

Emergency Access

The Project would generate additional construction roadway vehicle trips and include road closures that have the potential to impede emergency access. MP TR-1 would reduce this impact, but it would still be significant. With implementation of **Mitigation Measure PS-1** (Prepare and Implement Traffic Management Plan) and **Mitigation Measure WF-1** (Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy ~~Emergency Action Plan~~) impacts on emergency access will be **less than significant with mitigation**. Because the emergency access impacts would last for approximately 10 more months than under the Project, the magnitude is greater under this alternative than under the Project as discussed in Section 3.19, *Transportation*.

Transportation Plans

Project construction and operation would largely be consistent with plans and policies governing the circulation system. Therefore, impacts related to conflicts with programs, plans and policies addressing the circulation system generally would be less than significant. In addition, BMP TR-1 and **Mitigation Measure PS-1** will further reduce the less-than-significant impact regarding conflicts with policies governing roadway facility safety by ensuring safe handling of traffic detours, and trail closures would not conflict with plans and policies due to the temporary nature of closures and availability of alternatives.

However, as with the Project, modified flows expected in Coyote Creek could result in impacts to recreational facilities that are used by pedestrians. This would be a significant impact on pedestrian facilities. **Mitigation Measure REC-1** (Funding and Implementation of ~~Maintenance Reimbursement for~~ Park Facility Improvements within the Coyote Creek Corridor ~~Closures During High Flow Events~~) would reduce impacts on pedestrian facilities and prevent substantial conflicts with trails plans and policies. This impact would therefore be **less than significant with mitigation.**

The Increased Dredge Alternative would have the same impact to transportation plans as the Project.

VMT

The Project's construction-related VMT would be temporary and operation-related VMT would be negligible and would not contribute to a substantial change in long-term VMT. As a large infrastructure project, the Project would have little long-term effect on air quality and greenhouse gas benefits related to long-term reductions in VMT (as discussed under Section 3.19.3, *Methodology*). Because the increase in VMT during construction would be temporary, and there would be a negligible effect on VMT during operations, the Project would not conflict with or be inconsistent with *CEQA Guidelines* section 15064.3(b). Therefore, impacts related to VMT would be **less than significant.** The Increased Dredge Alternative would have the same impact to VMT as the Project.

Hazards

The Project would not include any new roadway or access improvements that would increase hazards due to a geometric design. Rather, the proposed roadway and access modifications would improve roadway conditions and increase public safety. Therefore, impacts regarding increased hazards due to a geometric design feature would be **less than significant.** The Increased Dredge Alternative would have the same impact to traffic hazards as the Project.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

REC-1 Funding and Implementation of ~~Maintenance Reimbursement for~~ Park Facility Improvements within the Coyote Creek Corridor ~~Closures During High Flow Events~~

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~Emergency Action Plan~~

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on transportation. Overall cumulative impacts would be greater than the Project's cumulative impacts.

5.9.2.20 Tribal Cultural Resources

The Increased Dredge Alternative would have greater impacts compared to those described in Section 3.20, *Tribal Cultural Resources*.

Tribal Cultural Resources

Ground disturbance during construction and maintenance around the dam and the Ogier Ponds areas could impact elements of tribal cultural resources. Erosion and recreational power boating within Anderson Reservoir could erode Native American archaeological resources that may qualify as tribal cultural resources buried along the shoreline of the reservoir. In addition, construction activities and future use of reservoir could expose undiscovered Native American archaeological resources that may qualify as tribal cultural resources. MP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will require that work will cease in areas where archaeological materials are discovered. Nevertheless, these impacts are significant.

Mitigation Measures CR-1 (Pre-construction Cultural Resources Awareness Training), **CR-2** (Prepare a Data Recovery and Treatment Plan for Tribal Cultural Resources that Cannot be Avoided), and **CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require construction crews to receive tribal cultural awareness training, provide guidance on treating resources with respect, require that all tribal cultural resources be included in the treatment plan, and require that work stop in the vicinity of any archaeological materials discovered during Project construction. Implementation of these BMPs and mitigation measures will reduce the Project's impact to tribal cultural resources to a **less than significant level with mitigation**. The Increased Dredge Alternative would have a greater impact on archeological resources than the Project with greater activities around Anderson Reservoir.

Mitigation Measures

CR-1 Pre-construction Cultural Resources Awareness Training

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on tribal cultural resources. Cumulative impacts would be greater than the Project's cumulative impacts.

5.9.2.21 Utilities and Service Systems

The Increased Dredge Alternative would have impacts similar to those discussed in Section 3.21, *Utilities and Service Systems*. The alternative would use sediments dredged from the reservoir in other parts of the Project or at the South San Francisco Bay Shoreline Project.

Utility Systems

The Project would not require construction of new stormwater, telecommunications, or electric facilities. Relocation of some power lines would be required as part of the Seismic Retrofit component. The utility infrastructure proposed to be relocated to serve Project would not affect other users. Decommissioning of the hydroelectric facility would not require Valley Water or PG&E to construct replacement electrical facilities. Impacts related to the replacement, relocation, or construction of public utilities would be **less than significant**. The Increased Dredge Alternative would have the same impact on utilities as the Project.

Solid Waste

The Project would comply with the Santa Clara County Integrated Waste Management Plan, the City of San José's Zero Waste Strategic Plan, and State regulations. Solid waste would not be generated in excess of the capacity of local solid waste management facilities. Therefore, the Project's impacts related to solid waste would be **less than significant**. The Increased Dredge Alternative would have the same impact on utilities as the Project.

Regarding cumulative impacts, like the Project, the Increased Dredge Alternative would have **not cumulatively considerable** impacts on utility systems. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.2.22 Wildfire

The Increased Dredge Alternative would not affect wildfire risk beyond the impacts discussed in Section 3.22, *Wildfire*.

Wildfire Risk Exacerbation

Implementation of BMP HM-12 (requires fire suppression equipment and measures, and spark arrestors on equipment) and implementation of California Fire Code provisions and CAL FIRE requirements will reduce the risk of accidental ignition from construction equipment, minimizing the impacts of the Project on exacerbation of wildfire risks. Post-construction operations would not require the use of equipment that could generate sparks or extreme heat; therefore, there would be no impact related to wildfire. Risk of wildfire is **less than significant**. The Increased Dredging Alternative would have the same impact related to increasing wildfire risk as the Project.

Wildfire Risk from Infrastructure

The Project would include the modification, construction, and/or relocation of roads and electrical transmission infrastructure; however, access throughout the Project Area and existing power lines would be relocated and improved through Project implementation, thus providing an improvement over existing conditions. Post-construction operations of the powerlines would also be similar to post-FOCP implementation conditions. Therefore, infrastructure associated with the Project would not exacerbate wildfire risks, and this impact would be **less than significant.** The Increased Dredge Alternative would have the same risk as the Project to wildfire from infrastructure.

Risk from Post-Fire Instability

The Project would not exacerbate or increase wildfire risks in the area, and therefore would not increase the risks of post-fire effects, such as landslides and flooding. The Project would not result in significant risks to people or structures from downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes, and this impact would be **less**

than significant. The Increased Dredge Alternative would have the same impact related to increased risk from post-fire instability as the Project.

Exposure to Wildfire Risk

Construction traffic and road closures would result in impacts on emergency response and evacuations, and expose construction workers to wildfire risks, in the event of a wildland fire. Traffic impacts on emergency response and evacuations would be reduced through implementation of **BMP TR-1** which requires implementation of construction warning signs, safety fencing, and detours; however, a significant impact would still occur. Implementation of **Mitigation Measure PS-1** (Traffic Management Plan)**,** which requires preparation and implementation of a TMP and coordination with State and local agencies and **Mitigation Measure WF-1** (Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy Emergency Action Plan), which requires coordination with local and state emergency response and fire agencies and preparation of a Response and Evacuation Strategy, which will maintain adequate emergency response and identify and maintain evacuation routes to identify an alternative temporary refuge area or access to the Woodchoppers Flat Picnic Area during a wildfire will minimize impacts on emergency response and evacuation procedures. This impact will be **less than significant with mitigation.** The Increased Dredge Alternative would have the same impact to wildfire safety as the Project.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan

Regarding cumulative impacts, like the Project, after mitigation the Increased Dredge Alternative would have **not cumulatively considerable** impacts on wildfire risks. Cumulative impacts would be the same as the Project’s cumulative impacts.

5.9.3.1 Aesthetics

The FAHCE-Plus Modified Alternative would only change post-construction flow operations, and therefore would cause the same Project construction-related impacts including the removal of more than 650 mature trees for construction of the Seismic Retrofit component and approximately 70 trees for construction of the Conservation Measures resulting in degradation of the existing visual character or quality of public views. Therefore, public views of the BHBA and Coyote Creek would similarly be disturbed under the FAHCE-Plus Modified Alternative. Mitigation measures to replace trees along Coyote Creek (**Mitigation Measure AES-1**) and screen construction staging areas (**Mitigation Measure AES-2**) would reduce construction related impacts, but not to a level of less than significant. The alternative would result in **significant unavoidable impacts** with no additional feasible mitigation measures available to fully mitigate the impacts. This impact would be the same as the Project.

For the same reason, the FAHCE-Plus Modified Alternative would cause the same Project-related impacts from nighttime lighting during construction around the reservoir. A mitigation measure to minimize the impact from construction lightning (**Mitigation Measure AES-3**) will be implemented to reduce this impact to a less than significant level. The FAHCE-Plus Modified Alternative would have a **less than significant impact with mitigation** on nighttime views. This impact would be the same as the Project.

Mitigation Measures

AES-1 Replacement Tree on Santa Clara County Parkland

AES-2 Visual Screening of Construction Staging Areas

AES-3 Construction Lighting

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **cumulatively considerable** impacts on visual character, but **not cumulatively considerable** impacts on nighttime lighting. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.2 Agriculture and Forestry Resources

The FAHCE-Plus Modified Alternative would only change post-construction flow operations, the FAHCE-Plus Modified Alternative would have not change Project construction-related impacts to farmland as discussed in Section 3.2, *Agriculture and Forestry Resources*.

Farmlands are located outside the Project construction area; however, 3.8 acres of Farmland of Local Potential southwest of the Ogier Ponds would continue to be used under this alternative for materials and equipment staging during the construction of the Ogier Ponds CM, which would impact locally important farmland.

Farmland

The staging area would be restored to agricultural use after 3 years, and implementation of BMPs AQ-1 (dust control), BI-11 (minimize predator-attraction), WQ-4 (limit impacts from staging and stockpiling), WQ-11 (maintain clean work sites), and TR-1 (public safety measures) will help prevent impact to surrounding Farmland of Local Potential at this site. Post-construction operations of the retrofitted dam under either FAHCE of FAHCE-plus modified rule curves associated with the retrofitted dam could result in minor flooding in some Farmland areas but would not rise to the level of conversion. Adaptive management actions, if required, whether for the Project or for this Alternative would not take place in Farmland. Thus, the Alternative would not permanently convert areas of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to nonagricultural uses. The alternative would result in a **Less than Significant Impact** to Important Farmland. This impact would be the same as the Project.

Williamson Act Lands and Lands Zoned Agriculture

No lands under a Williamson Act contract are present within the study area; therefore, there would be no impacts to Williamson Act lands during construction or operation of the Project. Temporary construction activities within the Seismic Retrofit Project Area would not conflict with existing agricultural zoning. Lands zoned for agricultural use would be temporarily used for materials and equipment staging during the construction of the Ogier Ponds CM, but implementation of BMPs would minimize the potential for temporary impacts to conflict with existing zoning. Adaptive management actions, if required, whether for the Project or for this Alternative would not take place in agricultural areas. Ogier Ponds is in area zoned as agricultural land uses and would be adaptively managed, but the Ogier Ponds CM is consistent with agricultural zoning uses. However, neither the Project nor the Alternative would conflict with existing agricultural zoning or Williamson Act contracts. This impact would therefore be **less than significant**. This impact would be the same as the Project.

Regarding cumulative impacts, like the Project, the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on agricultural resources. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.3 Air Quality

The FAHCE-Plus Modified Alternative would only change post-construction flow operations. Therefore, the FAHCE-Plus Modified Alternative would result in the same impacts as the Project described in Section 3.3, *Air Quality*.

Air Quality Plans

The criteria air pollutant emissions from construction of the Seismic Retrofit component <u>and the</u> Ogier Ponds CM~~, and the Sediment Augmentation Program~~ would exceed BAAQMD thresholds. Implementation of **Mitigation Measure AQ-1** will require all construction equipment greater than 25 hp and operating for more than 20 hours over the entire duration of construction activities to be equipped with Tier 4 engines and would require all on-road truck engines and boats to be year 2010 or newer. Implementation of **Mitigation Measure AQ-1** will also minimize construction equipment idling time and require regular maintenance for all equipment. However, even with implementation of **Mitigation Measure AQ-1**, construction of the FAHCE-Plus Modified Alternative will exceed BAAQMD thresholds for NOx. As such, Project construction would conflict with the BAAQMD 2017 Clean Air Plan goal to attain established air quality standards while Project operation would not exceed any BAAQMD thresholds for the various criteria air pollutants. The Project overall would conflict with or obstruct the implementation of an applicable air quality plan, and impacts would be **significant and unavoidable**. The FAHCE-Plus Modified Alternative would have the same impacts in regard to conflicting with the 2017 Clean Air Plan as the Project.

Criteria Pollutants

As with the Project construction as discussed in Section 3.3 Impact 2, the FAHCE-Plus Modified Alternative would exceed the BAAQMD average daily thresholds for criteria air pollutants, while operational impacts related to criteria air pollutants would be the same as the Project and less than significant. The Seismic Retrofit construction emissions would exceed the BAAQMD average daily thresholds for ROG in Year 1 through Year 6 and for NOx in Year <u>1</u> ~~2~~ through Year 7. Ogier Ponds CM construction emissions would exceed the BAAQMD average daily threshold for NO_X in Year 6 <u>through</u> ~~and~~ Year <u>8</u> ~~7~~. Sediment Augmentation Program construction emissions would not exceed the BAAQMD average daily threshold for <u>criteria air pollutants</u> ~~NO_x during every year of construction from Year 2 through Year 15~~. <u>Maintenance</u> ~~Construction~~ of the North Channel <u>Reach</u> ~~Extension~~ and Phase 2 Coyote Percolation Dam CM would not exceed the

BAAQMD average daily thresholds for criteria air pollutants. An additional 2 years of dredging and hauling would be added in Year 1 and Year 2. These emissions were not calculated but would be in addition to Project emissions. Even with implementation of **Mitigation Measure AQ-1**, Seismic Retrofit construction emissions will exceed the BAAQMD average daily thresholds for ROG in Year 1 and NOx in Year 2 through Year 6 7. Mitigated Ogier Ponds CM construction emissions would exceed the BAAQMD average daily thresholds for NO_X in Year 6 and Year 7. Mitigated Sediment Augmentation Program construction emissions would not exceed the BAAQMD average daily thresholds for criteria air pollutants. NO_X during every year of construction from Year 2 through Year 10, and overall Overall mitigated Project construction emissions would exceed the BAAQMD average daily threshold for ROG during Year 1 6 and for NO_X during Year 2 through Year 7 15. Since criteria air pollutant exhaust emissions would remain above the BAAQMD significance threshold even with implementation of **Mitigation Measures AQ-1**, the impact related to regional air quality will be **significant and unavoidable**. The FAHCE-Plus Modified Alternative would have the same impacts in regard to increases in criteria pollutants as the Project.

Dust

Fugitive dust impacts from blasting emissions would be less than significant with implementation of **Mitigation Measure AQ-2. Mitigation Measure AQ-2** will require the installation of wind screens during blasting activities to reduce fugitive dust emissions. Construction-related fugitive dust impacts will be significant even with implementation of BAAQMD basic BMPs (BMP AQ-1) and advance BMPs in **Mitigation Measure AQ-3**. **Mitigation Measure AQ-3** will implement BAAQMD's Enhanced Construction BMPs, which includes limiting the occurrence of simultaneous construction activities, installing erosion control measures, planting vegetative ground cover, minimizing the amount of excavated material, and hydroseeding. These measures would apply to all Project components as discussed in Section 3.3. The FAHCE-Plus Modified Alternative would have a **significant impact** from fugitive dust which is the same as the Project.

Health Risks

As with the Project as discussed in Section 3.3 Impact 3, the FAHCE-Plus Modified Alternative construction activities would exceed BAAQMD's significance thresholds for excess lifetime cancer risk, acute HI, and $PM_{2.5}$ concentration. Operational impacts related to TAC emissions would be less than significant. Implementation of **Mitigation Measure AQ-1** will be required, but even with this measure, the overall Project construction risks would exceed the BAAQMD thresholds for excess lifetime cancer risk, acute HI, and $PM_{2.5}$ concentration. Therefore, the Project overall would expose receptors to substantial pollutant concentrations, and impacts would be **significant and unavoidable**. The FAHCE-Plus Modified Alternative would have the same impacts from pollutant concentrations to sensitive receptors as the Project.

Odors

Construction equipment used in the alternative would emit diesel exhaust odors, and the disturbance of soils, dewatered channels, and the drained reservoir could emit organic matter odors. These odors would be temporary and intermittent. Implementation of BMP AQ-2 will require construction avoid stockpiling of odorous material near sensitive receptors. Currently, there have been no reported odor complaints to BAAQMD. Construction odors are not anticipated to be notably different for the Project compared to the existing baseline conditions at the time of the EIR preparation modified by the FOCP implementation. Odors associated with operations and maintenance are not expected. Thus, based on the odor complaint history, implementation of BMP AQ-2, and the temporary nature of construction activities, the overall alternative impact related to exposure to odors will be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impacts from odors as the Project.

Mitigation Measures

AQ-1 Implement Construction Criteria Air Pollutants Reduction Measures

AQ-2 Implement Construction Blasting Fugitive Dust Emissions Reduction Measure

AQ-3 Implement BAAQMD Enhanced Construction BMPs

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **cumulatively considerable** impacts on attaining air quality plans, criteria pollutants, and health risks, but **not cumulatively considerable** impacts on odors. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.4 Biological Resources—Fisheries Resources

The FAHCE-Plus Modified Alternative would not have a substantial adverse effect on species identified as a candidate, sensitive, or special-status fish species, and would benefit listed steelhead as compared to the Pre-FERC Order and future baselines and as compared to FAHCE rule curve operations. The WEAP model predictions of suitable habitat for each of the life stages for steelhead and Chinook salmon attained under FAHCE and FAHCE-Plus operations are compared side by side with Pre-FERC Order and future baselines in Appendix F. The WEAP model outputs for FAHCE-Plus are used proxy for quantitative suitable fisheries habitat estimates expected to result from implementation FAHCE-Plus Modified operations. FAHCE-Plus quantitative predictions of suitable habitat are used as a proxy for FAHCE-Plus Modified estimates of suitable habitat for steelhead life stage because they are the only quantitative, modeled estimates of suitable anticipated to result from post-construction operations at the time of analysis.

The FAHCE-Plus Modified Alternative is expected to provide the same amount of suitable habitat as estimated by the WEAP model for FAHCE-Plus operations, but the migration flows and the timing of suitable migration conditions would persist longer and promote and/or maintain run timing diversity in the steelhead populations. Additionally, qualitative assessment of the FAHCE-Plus Alternative described in Section 5.5.3 and **Table 5-7** supplements the quantitative estimate of suitable habitat for each steelhead life stage provided by WEAP modeling of the FAHCE-Plus rule curve operations. The quantitative estimate of suitable migratory habitat provided by analysis of FAHCE-Plus rule curve operations likely understates the actual suitable habitat for migration that would be provided by implementation of FAHCE-Plus Modified Operations. However, the combined quantitative and qualitative evaluation provides an adequate description of the way in which the FAHCE-Plus Modified Alternative would increase frequency and duration of improve steelhead migratory opportunities and through the OWG would increase temporal variability and diversify migration related pulse flows. The quantitative estimate of suitable rearing, incubation and spawning habitat for steelhead provided by analysis of FAHCE-Plus rule curve operations likely approximates the suitable habitat for those life stages provided by FAHCE-Plus Modified operations, with little change to other habitat types.

For steelhead, the FAHCE-Plus Modified Alternative is expected to have slightly less spawning/incubation habitat overall than the Project because it provides more migration pulse flows, but more of that habitat would be provided in the CWMZ (**Table 10** in Appendix F). The FAHCE-Plus Modified Alternative is predicted to create more rearing habitat overall for both steelhead fry and juveniles compared to the Project (**Tables 11-16** in Appendix F). For Chinook salmon, the FAHCE-Plus Modified Alternative is predicted to have slightly less spawning/incubation habitat overall than the Project (**Table 17** in Appendix F) but would provide more rearing habitat overall for both fry and juveniles compared to the Project (**Table 10-19** in Appendix F). Pacific lamprey would likely have the same change between the Project and the FAHCE-Plus Modified Alternative.

Table 5-9. Post-Construction Instream Flow Operations – WEAP Model Outputs. Central California Coast Steelhead Incubation-Adjusted Spawning Habitat in Coyote Creek under the Pre-FOCP Baseline, the Future Baseline, the FAHCE Operations (Project), and the FAHCE-plus Alternative.

POI [a]	Pre-FOCP Baseline (square feet)	Future Baseline (square feet)	FAHCE Operations (square feet)	FAHCE-plus Alternative (square feet)

Total COYO 1–10 [c]	40,600	36,100	44,500	40,600

Notes:

[a] *No FAHCE WEAP model results were available for the POIs not shown.*

[b] *Habitat is calculated as the FAHCE WEAP modeled average daily habitat availability averaged across the applicable life stage period. Where specified, this definition of habitat applies to the life stage period within a reservoir operation period.*

[c] *The total average daily habitat availability for the specified points of interest is the sum of the average daily habitat availability model results across all the specified points of interest.*

At almost all POIs within Coyote Creek, adult steelhead passage days would be higher on average and/or would have a higher minimum number of passage days under FAHCE-Plus Modified Alternative relative to FAHCE (**Figures 66-68** in Appendix F). The security pulse further increases the number of years in which pulse flows can be released. The only locations for which this alternative does not have predicted increases relative to FAHCE few exceptions would be the downstream POIs (COYO 1, COYO 2, and COYO 3) which have a substantial amount of passage days under all scenarios (**Figure 66-68** in Appendix F) which is understandable given these POIs are lower in the watershed, historically perennial, and receive flows from tributaries as well as Coyote Creek. In almost all cases, adult Chinook salmon passage days would be nearly identical under FAHCE-Plus Modified Alternative relative to FAHCE (**Figures 75-77** in Appendix F).

The FAHCE-Plus Modified Alternative would also have more average and/or minimum passage days for juvenile steelhead downstream migration most of the time compared to the Project (**Figures 69-74** in Appendix F). One exception is the one dry year in the model (**Figure 69** in Appendix F) that shows more passage days under the Project for that one dry year. A single model output is not enough data from which to draw conclusions with certainty.

FAHCE-Plus Modified Alternative also performs best (higher average and minimum) in March and April when most steelhead smolts outmigrate, although the Project and FAHCE-Plus Modified Alternative perform similarly in February and May (**Figure 70** in Appendix F) except for in wet water years where FAHCE-Plus Modified Alternative performs better in March and equally in February, April, and May FAHCE-Plus Modified also has more average and minimum passage days for juvenile Chinook downstream migration most of the time as compared to the Project (**Figures 78-79** in Appendix F). Pacific lamprey have similar migration timing so FAHCE-Plus Modified is expected to benefit Lamprey in the same manner as for steelhead, relative to the Project.

Overall, the FAHCE-Plus Modified Alternative is expected to have **less than significant** impacts on steelhead, Chinook, and Pacific lamprey with beneficial effects for steelhead, Chinook, and Pacific lamprey rearing habitat and conditions for migration than the Project.

The WEAP model did not analyze conditions specifically for southern coastal roach or Sacramento hitch. Changes in steelhead habitat under FAHCE-Plus Modified Alternative were used as a surrogate to understand how operations under the Alternative would impact these species. Any changes associated with steelhead spawning and rearing habitat attributed to the Alternative would be similar for these species as they require similar conditions, but would also be a more conservative estimate of suitable habitat provided by the Alternative for Sacramento hitch and southern coastal roach because those species are a more tolerant and do not require the same water depths for spawning and rearing as steelhead. The amount of spawning and incubation habitat for these species under the Project may shift slightly downstream as compared to the Pre-FERC Order and future conditions baselines as these species prefer warmer conditions for spawning, but habitat would still be maintained. If Sacramento hitch are present in Anderson Reservoir post construction operations would not influence access to spawning habitat. Changes associated with the FAHCE-Plus Modified Alternative are expected to have **less-than-significant impacts** to Sacramento hitch and southern coastal roach.

The FAHCE-Plus operations would not result in any changes associated with any life stage of riffle sculpin, white sturgeon, green sturgeon, or longfin smelt. Riffle sculpin are not found in Coyote Creek downstream of Anderson Dam, so operational changes will have no impact. Longfin smelt, green sturgeon, and white sturgeon occur in the intertidal sloughs of the study area. These tidally influenced areas are over 25 miles from Anderson Dam. These species likely occur too far downstream to be impacted by the Project flow operations, given that ongoing monitoring indicates effects of flow operations are only clearly detectable through the downstream end of the CWMZ. The intertidal species' habitat is greatly influenced by tidal action and freshwater inputs from tributaries; therefore, any change in flow operations is likely muted and negligible by the time water from the reservoir reaches the intertidal zone. The FAHCE-Plus Modified Alternative would have less than significant impacts on longfin smelt, green sturgeon, and white sturgeon.

The FAHCE-Plus Modified Alternative would have a greater beneficial impact to fisheries than the Project.

Regarding cumulative impacts, like the Project, the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on fisheries resources. Cumulative impacts would be the less than the Project's cumulative impacts.

5.9.3.5 Biological Resources—Wildlife and Terrestrial Resources

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, there would be no substantial difference in impacts for wildlife and terrestrial resources between the FAHCE-Plus Modified Alternative and the Project as discussed in Section 3.5 *Biological Resources—Wildlife and Terrestrial Resources*, though minor differences in potential impacts on special-status amphibians, western pond turtles, and riparian habitat may occur and are discussed here.

Differences between the FAHCE-Plus Modified Alternative and the Project (which would implement FAHCE operations) would have very little effect on most terrestrial biological resources, as these differences would only affect terrestrial biological resources within and along the edges of the low-flow channel of Coyote Creek downstream from Anderson Dam.

The FAHCE-Plus Modified Alternative would not change winter base flows or summer releases as compared to the Project, and the winter base flow and cold water release programs would still provide flows of at least 1 cfs at the downstream end of the FCWMZ (the CWMZ after completion of the Ogier Ponds CM), bypass flows at Coyote Perc Pond of at least 7.5 cfs, and flows of at least 2.5 cfs as measured at Station 5058 at Edenvale. In addition, Valley Water modeling indicates that FAHCE-Plus Modified and FAHCE post-construction operations have less-than-significant impacts on groundwater recharge volume. Consequently, FAHCE-Plus modified post-construction base winter flows and summer releases are not expected to differ from Project impacts and are expected to be less than significant with respect to special-status species and sensitive habitats, including those constituting waters of the United States, waters of the State, and groundwater dependent habitats.

The primary difference in the FAHCE-Plus Modified Alternative and the Project entails higher fish attraction pulse flows (90 cfs) than under the Project's FAHCE flows (50 cfs); the pulse would last for a longer duration (10 days instead of 5 days); the pulse could occur December 1 – April 1 instead of February 1 – April 30; and attraction pulse flows could occur up to nine times/year (twice/month) instead of twice/year as under the Project. In addition, the FAHCE-Plus Modified Alternative would involve one or two additional safeguard pulses of 90 cfs between January 15 and March 31 and one or two outmigration pulses of 60 cfs between April 1 and May 31, neither of which would occur under the Project. The FAHCE Plus Modified alternative also includes the addition of a security pulse which may be released at the discretion of the OWG if conditions are met. Thus, flow rates during pulse flows could be higher, and could extend farther up the creek bank, under the FAHCE-Plus Modified Alternative than under the Project during these winter and spring pulses.

FAHCE-Plus Modified Alternative pulse flows would have no substantial impact on special-status amphibians. Very few California red-legged frogs occur in Coyote Creek downstream from Anderson Dam due to the absence of high-quality breeding habitat near this reach of the creek. Flow ramping would occur to manage changes in the rate of water flow in a slow, stepwise fashion, allowing frogs to move to more sheltered refugia as flow rates are increased. Ramping would occur whenever Valley Water-controlled flows would be increased or decreased by 25 percent or more from the existing flow condition. High flows may displace an occasional California red-legged frog along Coyote Creek downstream from Anderson Dam, and such changes in effects could impact a red-legged frog egg mass. However, flows high enough to result in such effects will occur very infrequently, and would occur slightly less frequently under post-construction operations than under pre-FOCP conditions. California tiger salamanders are unlikely to be in burrows so close to the creek that they would be adversely affected by spring pulse flows. Any salamanders subjected to such increases would be able to relocate to higher ground, especially if flow increases were great enough that ramping of flows would occur.

Similarly, FAHCE-Plus Modified Alternative pulse flows would have no substantial impacts on western pond turtles. Increased flow rates during pulse flows may cause turtles to disperse away from areas with higher flow velocities, but such pulse flows would not be very high, and flow ramping would occur to manage changes in the rate of water flow in a slow, stepwise fashion, allowing individuals to move to more sheltered refugia as flow rates are increased. FAHCE operations and other post-construction flows would not impact western pond turtle nests, which would be located above the floodplain.

Special-Status Plants

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. Construction activities under both the Alternative and the Project could impact special-status plants through direct destruction, the spread of invasive plant propagules and pathogens, refilling of the reservoir where populations have colonized areas within the rim of the reservoir, and indirectly through dust that could coat plants interfering with normal gas exchange, photosynthesis, or pollination. Dust may also infect plants with *Phytophthora* within dust particles. Nitrogen emitted by construction vehicles and equipment may impact serpentine-associated special-status plants by fertilizing the soils and allowing nonnative grasses and forbs that would not otherwise be able to colonize.

Nine of the 12 special-status plants that could be impacted are VHP-covered species. General and serpentine impact fees would be used by the SCVHA to offset adverse impacts to the nine VHP-covered plant species. The potential for Phytophthora to be spread will be reduced via a Project-specific *Phytophthora* Pathogen Management and Monitoring Plan. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1a(1)** will manage invasive plants at ~~Valley Water's~~ Coyote Ridge population of Tiburon paintbrush by preventing the Project's nitrogen emissions from benefitting populations of invasive plants that would compete with Tiburon paintbrush. **Mitigation Measure TERR-1a(2)** will reduce the potential for spread of *Phytophthora*. **Mitigation Measures TERR-1a(3)** and **TERR-1a(4)** will survey for San Francisco collinsia in the previously unsurveyed portions of the Seismic Retrofit Area (to help quantify impacts on the species) and establishing a mitigation population commensurate with the population size. With implementation of BMPs, compliance with VHP conditions and AMMs, and **Mitigation Measures TERR-1a(1), TERR-1a(2), TERR-1a(3),** and **TERR-1a(4)** (all as fully described in Section 3.4, *Biological Resources—Wildlife and Terrestrial Resources*) Project impacts on special-status plants will be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact to special-status plants as the Project.

Bay Checkerspot Butterfly, Monarch Butterfly, and Crotch's Bumble Bee

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. Construction activities under both the Alternative and the Project would impact 2.6 acres of designated critical habitat for the Bay checkerspot butterfly, contribute to the cumulative effects of nitrogen deposition on serpentine grasslands, remove milkweed needed by monarch butterflies, destroy subterranean Crotch's bumble bee nests, clear vegetation that serves as pollen and nectar sources, and affect pollen and nectar sources through dust mobilization or changes in drainage patterns.

Special-status invertebrates would benefit from Valley Water's payment of VHP impact fees. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Implementation BMPs and compliance with VHP conditions would reduce impacts on the Bay checkerspot butterfly, monarch butterfly, and Crotch's bumble bee to a less-than-significant level. The FAHCE-Plus Modified Alternative would have the same impact to Bay Checkerspot Butterfly, Monarch Butterfly, and Crotch's Bumble Bee as the Project.

California tiger salamander, California red-legged frog, and foothill yellow-legged frog

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. Construction activities under both the Alternative and the Project could result in direct take of special status amphibians, loss of habitat, increased predation from nighttime lighting, hazardous material spills, and spread of pathogens. Project impacts on the foothill yellow-legged frog are unlikely to occur therefore the Project would have a less-than-significant impact on this species.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1c(1)** provides additional avoidance and minimization during activities in the dewatered reservoir. **Mitigation Measure TERR-1c(2)** compensates for any impacts of fish locations to Upper Penitencia Creek by removing nonnative species that could affect special-status amphibians from Valley Water-owned properties in the Upper Penitencia Creek watershed. Implementation of VHP mitigation payments, BMPs, compliance with applicable VHP conditions, and **Mitigation Measures TERR-1c(1)** and **TERR-1c(2)** will reduce Project impacts on the California tiger salamander and California red-legged frog and reduce any adverse effects on the foothill yellow-legged frog that could occur to less than significant with mitigation. The FAHCE-Plus Modified Alternative would have the same impact to California tiger salamander, California red-legged frog, and foothill yellow-legged frog as the Project.

Western Pond Turtle

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. Construction activities under both the Alternative and the Project could impact western pond turtle habitat and nests. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. The western pond turtle is covered by the VHP, and most of the activities that could impact this species (including post-construction operations under FAHCE rule curves) are explicitly VHP-covered. With implementation of BMPs, DMP measures, and compliance with the VHP, Project impacts on the western pond turtle would be less than significant. The FAHCE-Plus Modified Alternative would have the same impact to western pond turtle as the Project.

Bald Eagle and Golden Eagle

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. Construction activities under both the Alternative and the Project could affect up to two pairs of bald eagles have nested near Anderson Reservoir in recent years and at least two golden eagle territories overlap the reservoir with recently occupied nests located 0.34 and 0.83 miles from the edge of the reservoir. Construction would impact foraging habitat and disturb nests. Following completion of construction, foraging habitat for the bald eagle would be enhanced as the reservoir is allowed to refill. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water would obtain a BGEPA permit from the USFWS to obtain authorization for the loss of any eagle productivity and would comply with permit conditions. **Mitigation Measure TERR-1e** implements additional AMMs to minimize impacts on nesting eagles. With implementation of BMPs, DMP measures, compliance with the VHP and BGEPA permit conditions, and **Mitigation Measure TERR-1e**, Project impacts on bald eagle and golden eagle will be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact to bald eagle and golden eagle as the Project.

Tricolored Blackbird, Yellow Warbler, White-tailed Kite, Northern Harrier, and Other Breeding Birds

A variety of bird species protected by the MBTA and Fish and Game Code breed, forage, and roost in the Project Area. Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. Construction activities under both the Alternative and the Project could result in the physical disturbance or destruction of active nests and affect the behavior of birds. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With creek flow augmentation, groundwater monitoring, and dryback monitoring (with additional flow augmentation, and payment of VHP impact fees for impacted wetland and riparian habitat, as necessary), implementation of BMPs, DMP measures, and compliance with VHP conditions impacts on nesting special-status and nonspecial-status birds would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact to protected breeding birds as the Project.

Nonbreeding special-status birds

Several special-status bird species including the Swainson’s hawk, burrowing owl, and peregrine falcon, are not known or expected to breed in any areas where they could be impacted by Project activities, but they could occur there as nonbreeding foragers, particularly during migration and in winter. Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. Construction activities under both the Alternative and the Project could disturb foraging individuals, burrowing owls could be injured or killed if they are present in burrows when grading occurs, and construction activities could disturb roosting owls to the point of abandonment of their burrows. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1g** will identifies locations of burrowing owls prior to initiation of Project activities to avoid injury or mortality. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1g**, Project impacts on nonbreeding special-status birds will be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact to nonbreeding special-status birds as the Project.

Pallid Bat

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. A maternity colony of the pallid bat has been located just outside of the Seismic Retrofit Area, in the Cochrane Road barn. This colony likely represents the largest and most stable colony of the species known in the county. Construction activities under both the Alternative and the Project would not result in direct impacts on the Cochrane Road barn; however, given the intensity of construction activities, which would include some nighttime work, and the extent to which foraging habitat on Anderson Dam would be disturbed during construction, it is possible that pallid bats may abandon the roost within the barn while construction is ongoing. If pallid bats abandon the roost during construction, they may return once construction has been completed. However, unless high-quality alternative roost sites are present in the vicinity, the population may decline before the bats can re-occupy the barn. When trees, structures, or rock outcrops containing roosting colonies or individual bats are removed or modified, individual bats could also be physically injured, killed, or subjected to physiological stress resulting from being disturbed during torpor. Construction activities would result in the short-term loss of foraging habitat as well as a temporary impact on foraging individuals through the alteration of foraging patterns.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1h(1)** will minimize construction activities near the barn. If buffers in **TERR-1h(1)** are not feasible, **Mitigation Measure TERR-1h(2)** will develop an eviction plan for pallid bats to be implemented if deemed necessary. **Mitigation Measure TERR-1h(3)** will minimize the potential for males and nonbreeding females outside the barn to be injured or killed during Project activities. **Mitigation Measure TERR-1h(4)** will provide temporary roosting sites near the Project during construction and additional permanent roosting sites if the roost population is not restored to at least 75 percent by three years following construction. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1h(1)**, **TERR-1h(2)**, **TERR-1h(3)**, and **TERR-1h(4)**, Project impacts on pallid bats will be reduced. The Project could cause the number of females at this site to drop below 75 percent of existing numbers, and a substantial proportion of the regional population would have been affected. No other mitigation would be feasible to reduce this impact therefore the impact is **significant and unavoidable**. The FAHCE-Plus Modified Alternative would have the same impact to pallid bat as the Project.

Other special-status mammals

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts as the Project. The Project impact analysis addresses San Francisco dusky-footed woodrat, mountain lion, ringtail, American badger, Townsend's big-eared bat, and western red bat. San Francisco dusky-footed woodrat has been detected around Basalt Hill and likely resides in crevices there. Seismic retrofit construction would result in the loss of 43.2 acres of suitable habitat for the species. In addition, construction could result in the injury or mortality of individual woodrats and disturbance or destruction of nests and young. Construction and monitoring could disrupt the habitat of these species and their foraging. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With implementation of BMPs, DMP measures, and compliance with the VHP conditions, Project impacts on special status mammals would be **less than significant.** The FAHCE-Plus Modified Alternative would have the same impact to California special-status mammals as the Project.

San Francisco Bay special-status species

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction phase operations impacts as the Project. Valley Water modeled potential effects of construction-period flows on tidal habitats along lower Coyote Creek and Coyote Slough. This modeling assumed that higher flows would be coupled with tide height equaling MHHW to represent the conditions that would occur if higher flows down Coyote Creek coincided with high tides. Modeling suggests that reservoir releases could result in increased frequency, depth, and/or duration of inundation of tidal marsh habitats far downstream from the dam. Such increased inundation would reduce the vegetative cover available to special-status species associated with San Francisco Bay tidal marshes, increasing predation of special-status tidal marsh animals that have to seek out more limited patches of vegetation that is not inundated. Such impacts would be infrequent and would occur only during the construction period but would be significant. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1j** requires contributing to predator management activities in the South Bay <u>and high tide refugia enhancement</u>, thereby offsetting increases in predation resulting from the Project for each year flows exceed 2,500 cfs. With implementation of BMPs, compliance with the VHP conditions, and **Mitigation Measure TERR-1j**, Project impacts on San Francisco Bay special-status species will be less than significant with mitigation. The FAHCE-Plus Modified Alternative would have the same impact to San Francisco Bay special-status species as the Project.

Riparian Habitat and Other Sensitive Natural Communities

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts to non-wetland other waters (perennial stream, intermittent stream, pond, and reservoir), and mixed riparian woodland and forest as the Project. (See **Table 3.5-15**). The Project will result in permanent impacts on a total of <u>20.79</u> ~~25.77~~ acres of mixed riparian woodland and forest and willow riparian forest and scrub, including <u>1.29</u> ~~4.14~~ acres from Seismic Retrofit construction and <u>19.50</u> ~~21.63~~ acres from Conservation Measures construction. Valley Water will pay VHP permanent impact fees for specialty land cover types to offset this impact. In addition, approximately 39.5 acres of riparian habitat will be restored as part of the Ogier Ponds CM. Therefore, the Project will result in a net increase in the acreage of riparian woodland, forest, and scrub habitat. This net increase will help to compensate for the temporal and permanent loss of riparian habitat acreage, linear footage and ecological functions and services.

Similarly, the Project will permanently impact a total of 15 acres of coast live oak woodland and forest, 11.2 acres of foothill pine-oak woodland, and 2.5 acres of mixed serpentine chaparral, mostly from Seismic Retrofit construction. VHP permanent impact fees to be paid by Valley Water for the Project include specialty fees for mixed riparian woodland and forest, willow riparian forest and scrub, and mixed serpentine chaparral, in addition to general land cover fees. The Project's impact fees would contribute directly to the conservation of sensitive natural communities, including not only these riparian and serpentine communities, but also the coast live oak woodland and forest, and foothill pine-oak woodland, land cover types that will be impacted by the Project.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Existing BMPs, DMP measures, and AMMs do not address the risk of introduction or spread of *Phytophthora*. **Mitigation Measure TERR-1a(2)** includes procedures to reduce the risk of *Phytophthora*. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1a(2)**, Project impacts on riparian habitat and other natural communities will be less than significant with mitigation. The FAHCE-Plus Modified Alternative would have the same impact to riparian habitat as the Project.

Wetlands

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impacts to wetlands as the Project. Construction activities would result in the placement of fill, and related hydrological interruption, alteration of bed and bank on the acreages and linear footage of wetlands (coastal and valley freshwater marsh). The Project will result in permanent impacts to 4.2 acres of freshwater marsh, but in addition to paying VHP permanent wetlands impacts fees, the Ogier Ponds CM will create 4.5 acres of emergent freshwater marsh.

The Project will result in permanent impacts to 18 acres of reservoir (3 acres at Anderson Reservoir and 15 acres for the Ogier Ponds CM) and 2.32 acres of pond (.19 at Anderson Reservoir and 2.3 at Ogier Ponds (See **Table 3-15**). Valley Water will pay permanent impact fees for pond land cover type impacts, and loss of reservoir habitat is expected to be less than significant.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water will pay VHP impact fees for wetlands, other waters, and riparian habitats, which include specialty fees for these important land cover types. The Interagency Review Team, including USACE, CDFW, and the RWQCB, have approved the VHP as an In Lieu Fee Program for impacts to water of the United States and waters of the State. The implementation of these Conservation Measures more than offsets and compensates for the Project's net impacts on jurisdictional waters and wetlands.

Existing BMPs, DMP measures, SMP measures and AMMs do not address the risk of introduction or spread of *Phytophthora.* **Mitigation Measure TERR-1a(2)** includes procedures to reduce the risk of *Phytophthora.* With implementation of BMPs, DMP measures, SMP measures compliance with the VHP conditions, and **Mitigation Measure TERR-1a(2)**, Project impacts on wetlands will be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact to wetlands as the Project.

Wildlife Corridors

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impact to wildlife corridors as the Project**.** Seismic retrofit construction would have both adverse and beneficial effects, all temporary, on wildlife movement. Construction activities, especially nighttime activities, could disrupt wildlife movement. Although Project activities may temporarily affect wildlife movement during construction, animals would still be able to move through the Project Area during construction, and the drained reservoir improves wildlife movement in the area around the reservoir. No long-term impacts on wildlife movement would result from the Project. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With implementation of BMPs, DMP measures, and compliance with the VHP conditions, Project impacts on wildlife movement would be **less than significant.** However, considering the impacts to pallid bats discussed about, the Project would have a **significant and unavoidable** impact to wildlife nursery sites. The FAHCE-Plus Modified Alternative would have the same impact to wildlife corridors as the Project.

Tree Ordinance

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same construction impact to trees preserved by ordinance as the Project. Seismic Retrofit construction would result in the removal of approximately 270 ordinance-sized trees. The Ogier Ponds CM and Coyote Percolation Dam CMs, and the North Channel Extension improvements would result in the removal of 40 trees protected by County tree removal regulations. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water is exempt from compliance with the County tree ordinance under either Government Code sections 53091(d) and (e) (which state that County or City building and zoning ordinances do not apply to the construction of facilities for water storage or transmission) meaning there would be **no impact**. Nevertheless, recognizing the importance of protected trees to the County and the terms of the County ordinance, Valley Water will implement **Mitigation Measure AES-1**, calling for the planting of replacement trees removed on County Park land. The FAHCE-Plus Modified Alternative would have the same impact to tree ordinances as the Project.

Conflict with Habitat Conservation Plan/Natural Community Conservation Plan

Because the FAHCE-Plus Modified Alternative only affects post-construction flow operations, it would result in the same effects on implementation of the VHP as the Project. Valley Water is a signatory on one conservation plan: the VHP, which is an HCP and NCCP for terrestrial species and related habitats. As described in *Project Description*, the VHP explicitly included the Project in its list of covered activities, and most impacts of the Project were included in the VHP's analysis of the effects of covered activities. Valley Water would apply for VHP coverage for the Project and adhere to all applicable VHP Conditions during Project implementation. Therefore, the Project would not conflict with the VHP. The impact is **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact to HCP/NCCP compliance as the Project.

Mitigation Measures

TERR-1a(1) Invasive Plant Management at Coyote Ridge Valley Water's Tiburon Paintbrush Populations Population

TERR-1a(2) Implementation of Avoidance and Minimization Measures during Post-Construction Maintenance at Anderson Dam and Conservation Measures Facilities to Reduce the Potential for Introduction or Spread of Phytophthora

TERR-1a(3) Special-Status Plant Survey in the Previously Unsurveyed Portions of the Seismic Retrofit Are

TERR-1a(4) Seed Collection and Creation of a New Population of San Francisco Collinsia Conservation Measures

TERR-1c(1) Special-Status Species Avoidance and Minimization Measures During Year 6 Reservoir Dewatering

TERR-1c(2) Nonnative Species Management in Upper Penitencia Creek Watershed

TERR-1e Nesting Eagle Avoidance and Minimization Measures

TERR-1g Burrowing Owl Impact Avoidance

TERR-1h(1) Avoid Disturbance of the Cochrane Road Barn Roost

TERR-1h(2) Evict Pallid Bats prior to Initiating Maternity-Season Disturbance near the Cochrane Road Barn Roost

TERR-1h(3) Minimize Impacts on Pallid Bats Roosting Outside the Cochrane Road Barn

TERR-1h(4) Provide Alternative Pallid Bat Maternity Roost Structures

TERR-1j Contribution to Baylands Predator Management and High Tide Refugia Enhancement

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **cumulatively considerable** impacts on pallid bats and the pallid bat nursery site, but **not cumulatively considerable** impacts on other wildlife species and habitats. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.6 Cultural Resources

The FAHCE-Plus Modified Alternative would have the same impacts to cultural resources as described in Section 3.6, *Cultural Resources*.

Historic Resources

The Rhoades Ranch Historic District is near the Seismic Retrofit area, but there would be no direct impact on the historical resource. Dust and noise from construction would cause minor impacts; however, they would be temporary and would not alter the elements that contribute to the significance of the resource. The Coyote Percolation Dam, which is a contributing element to the Santa Clara Valley Water District Dams Historic District, is in the construction limits of the Phase 2 Coyote Percolation Dam CM. However, implementation of this Conservation Measure would have no impact on the dam because, prior to Project implementation, the resource will have been demolished and replaced by an inflatable bladder dam as part of FOCP. Therefore, the FAHCE-Plus Modified Alternative will have a **less-than-significant impact** to the built environment historical resources. The alternative would have the same impact as the Project.

Archeological Resources

Archaeological resources that have been determined to be eligible for listing for the NRHP/CRHR through formal evaluation, or that have not been formally evaluated but are assumed eligible for the purpose of this analysis, are in the Seismic Retrofit Project Area, and within the boundaries of the Ogier Ponds CM and the Phase 2 Coyote Percolation Dam CM. Ground disturbance during construction at archaeological resources in both the Seismic Retrofit construction area and the Ogier Ponds CM areas could have significantly impact elements of sites that contribute to their NRHP/CRHR-eligibility. In addition, erosion and recreational power boating within Anderson Reservoir related to the operation of the Seismic Retrofit component of the Project could create wave action along the exposed shoreline of the reservoir as the reservoir is refilled after Project completion, during the regular rise and fall of the reservoir due to Project operation and the resumption of recreational boating. These actions may erode archaeological historical resources and displace the artifacts within them.

BMP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will require that work will cease in areas where archaeological materials are discovered during construction until the finds can be analyzed and evaluated for NRHP/CRHR-eligibility, and that any eligible resources either be avoided or subject to data recovery studies. **Mitigation Measure CR-1** (Preconstruction Cultural Resources Awareness Training) will provide construction workers with awareness training about the nature of archaeological materials that might be discovered during ground disturbing activities and the protocols to be followed, should they be found. **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided) will develop and implement a Data Recovery and Treatment Plan for archaeological resources that cannot be avoided. Lastly, **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require an archaeological and tribal monitor in areas sensitive for cultural resources during Project construction, the monitoring of sensitive areas during Project operations, and will implement protocols of the Monitoring and Unanticipated Discoveries Plan should archaeological materials be discovered. With implementation of these mitigation measures, substantial adverse changes in the significance of an archaeological resource would not occur, and significant impacts to archaeological historical resources within the Project areas would be reduced to **less than significant through mitigation**. The alternative would have the same impact on archeological resources as the Project.

Human Remains

Two archaeological sites with human remains and one with a high potential to contain as-yet unidentified human remains are known to exist within Anderson Reservoir. All three of these sites in the reservoir could be damaged by erosion from fluctuating water levels during Seismic Retrofit operations and wave action caused by power boating. Therefore, Project impacts on disturbance of human remains would be significant. Compliance with Health and Safety Code section 7050.5 and PRC section 5097.98 would reduce impacts related to disturbance of human remains and **Mitigation Measures CR-1, CR-2, and CR-3** will reduce impacts to disturbing human remains to **less than significant with mitigation**. The alternative would have the same impact to disturbance of human remains as the Project with greater activities around Anderson Reservoir.

Mitigation Measures

CR-1 Preconstruction Cultural Resources Awareness Training

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on cultural resources. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.7 Energy

The FAHCE-Plus Modified Alternative would result in the same energy related impacts as described is Section 3.7, *Energy*.

Energy Consumption

Construction of the Seismic Retrofit and Conservation Measures components would consume approximately 17,842,000 21,150 thousand gallons of diesel and 780,000 2,103 thousand gallons of gasoline and result in increased demand on local and regional infrastructure. However, compared to the northern California region's annual average production of fuel over the 5-year period of 2018-2022, the total annual average energy demand of the Project be approximately 0.01 0.03 percent of the region's gasoline production throughput and approximately 0.75 0.89 percent of the region's diesel production throughput (CEC 2023). The impacts of Project construction on local and regional fuel supplies would be temporary and minimal.

Although the energy related impact is less than significant, the Project will implement **Mitigation Measures AQ-1** and **GHG-1** to address air quality and greenhouse gas emission impacts. These measures will further minimize Project energy impacts by increasing the efficiency of energy usage and decreasing the amount of non-renewable energy usage during construction. **Mitigation Measure AQ-1** requires all construction equipment greater than 25 hp and operating for more than 20 hours over the entire duration of construction activities to be equipped with Tier 4 engines and will require all on-road truck engines and boats to be year-2010 or newer and minimizes construction equipment idling time and requires regular maintenance for all equipment. **Mitigation Measure GHG-1** requires engine electrification and use of renewable fuels as feasible.

Project construction would utilize fuel-efficient equipment consistent with State and federal regulations and would comply with State measures to reduce the inefficient, wasteful, or unnecessary consumption of energy. Per applicable regulatory requirements of CALGreen, Project construction activities would comply with construction waste management practices to divert construction and demolition debris from landfills. These practices would result in efficient use of energy by Project construction. The FAHCE-Plus Modified Alternative's impact on energy use would be **less than significant impact with mitigation**. The alternative would have the same impact on energy use as the Project.

State and Local Efficiency Plans

Project construction would be consistent with renewable energy and energy efficiency targets, standards, and guidance included in California Green Building Standards Code (CALGreen or Title 24 Part 11), California Building Energy Efficiency Standards (Title 24 Part 6), SB 100, Valley Water CCAP, Santa Clara County General Plan, Santa Clara County Sustainability Master Plan, Morgan Hill 2035 General Plan, and Envision San José 2040 General Plan with implementation of **Mitigation Measures AQ-1** and **GHG-1**. Project operation related to equipment and vehicle energy use would be consistent with these regulations and plans without mitigation. Therefore, Project construction and operation would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency, and overall impacts would be less than significant with mitigation. The FAHCE-Plus Modified Alternative's impact on energy use would be **less than significant impact with mitigation**. The alternative would have the same impact on energy use as the Project.

Mitigation Measures

AQ-1 Implement Construction Criteria Air Pollutants Reduction Measures

GHG-1 Utilize Electrification and Renewable Fuels During Construction

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on due to wasteful, inefficient, or unnecessary consumption of energy. The FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts related to conflict or obstruction of renewable energy and energy efficiency plans. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.8 Geology and Soils

The FAHCE-Plus Modified Alternative would have the same impacts on geology and soils as described in Section 3.8, *Geology and Soils*.

Fault Rupture and Shaking

The nearby active Calaveras fault lies just east of Anderson Reservoir, and the active Coyote Creek Range fault transects Anderson Dam. However, construction and operation of the Project would not exacerbate the risk of fault rupture. The reservoir is not deep enough to cause RIS, vibrations associated with blasting and tunneling activities would not affect the earth at depths of where the underlying faults are locked (URS 2022), and no Project-related actions would increase the likelihood of seismic activity and associated surface fault rupture. As the Project would not increase the likelihood of an earthquake, exacerbate the likelihood of surface fault rupture, or increase the likelihood of seismic ground shaking in the Project area the FAHCE-Plus Modified Alternative would have **no impact** on seismic related hazards. The FAHCE-Plus Modified Alternative would have the same impact as the Project.

Liquefaction

The Project is in an area susceptible to liquefaction. Placement of dam materials could increase the load on liquefiable soils, which may densify and settle during an earthquake. Placement of structures associated with the Conservation Measures, namely the levee at Ogier Ponds and the fish ramp at the Coyote Percolation Pond on liquefiable soils could exacerbate liquefaction hazards in those areas. The impact from liquefaction would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact as the Project.

Landslides

Anderson Dam is in a mountainous area with steep slopes and unstable ground conditions that are susceptible to landslides due to faults and historic landslides that predate the reservoir. Ground disturbance associated with construction of the seismic retrofit of Anderson Dam, including drawdown of the reservoir, construction of stockpiles near landslides, removal of materials from the BHBA and the PGBS, and refilling of the reservoir could exacerbate likelihood of landslide, lateral spreading, and settlement by destabilizing landslide deposits. Excavation associated with the North Channel Extension conservation measure would occur near slopes that are mapped by CGS (2004) as susceptible to landslide. Excavation and construction of new stream channels associated with the Ogier Ponds CM North Channel Extension, and Phase 2 Coyote Percolation Dam CM into liquefiable soils could increase risk of lateral spreading. All construction activities would be performed in accordance with DSOD, IBC, and CBC standards as applicable. In addition, Valley Water would continue to monitor slope stability and landslide movement through installed survey monuments and satellite reflectors within the reservoir as part of its normal operations. Valley Water implemented the Reservoir Bank and Rim Stability Mitigation and Monitoring Plan, Dewatering and Sediment Management Plan, and Slope Stability Plan. All these measures serve to reduce any landslide risks by taking action to minimize soil instability and monitoring for signs of land movement. The Project will also implement **Mitigation Measure GEO-1** (Repair Landslides Caused by Construction Activities) to reduce the risk of landslide, as such the Project's landslide risk is **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project.

Soil Erosion

Excavation and ground-disturbing activities associated with construction of the Project could result in soil erosion or the loss of topsoil. Such activities include clearing and preparing staging and stockpile areas; constructing, using, and maintaining stockpiles; excavating materials at borrow sites and conservation measures sites; placing sediment; and constructing and using unpaved roads. For construction activities outside of the reservoir, the The Project would implement a SWPPP in compliance with the Construction General Permit, and a set of erosion control BMPs (BMPs GEN-20, GEN-21, WQ-4, WQ-5, BI-3, BI-8, WQ-9, AQ-1, BANK-1, and REVEG-1) to minimize erosion around stockpiled soils and staging areas, stabilizing construction entrances and exits, removing any temporary fills, restoring the site to its pre-construction condition, and reducing fugitive dust. With adherence to requirements of the SWPPP and BMPs for out-of-reservoir construction activities, substantial soil erosion or loss of topsoil resulting from the projects would be **less than significant.** While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and

<u>Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements.</u> The FAHCE-Plus Modified Alternative would have the same impact as the Project.

Paleontological Resources

Santa Clara Valley is known for yielding significant fossils from alluvium (Maguire and Holroyd 2016). In addition, other geologic units of Pleistocene age and older in the county are documented to have yielded significant fossils, including vertebrate fossils. One of these is the Santa Clara Formation in the Project area known locally as the Packwood Gravels. Excavation and ground-disturbing activities associated with Seismic Retrofit construction occurring in regions underlain by the Santa Clara Formation could expose paleontological resources. In addition, higher peak flows released from Anderson Dam during Project operation could increase risk of erosion downstream, which could increase risk of erosion uncovering significant paleontological resources and removing them from the original context, thereby potentially reducing their scientific significance. Excavation and ground-disturbing activities associated with the Project could expose paleontological resources. The Project would implement **Mitigation Measure GEO-3** (Paleontological Initial Survey), **Mitigation Measure GEO-4** (Paleontological Detailed Survey and Construction Monitoring), and **Mitigation Measure GEO-5** (Paleontological Discoveries Treatment Plan) that would require a pre-construction survey, construction monitoring, and plan for discovery of resources. The Project's impact on paleontological resource would **be less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project.

Mitigation Measures

GEO-1 Prepare a Geotechnical Investigation for Landslide Risk and Implement Recommendations

GEO-2 Prepare a Geotechnical Investigation for Lateral Spreading Risk and Implement Recommendations

GEO-3 Paleontological Initial Survey

GEO-4 Paleontological Detailed Survey and Construction Monitoring

GEO-5 Paleontological Discoveries Treatment Plan

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on geology and soils. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.9 Greenhouse Gas Emissions

The FAHCE-Plus Modified Alternative would have the same impacts on GHG emissions as described in Section 3.9, *Greenhouse Gas Emissions*.

Greenhouse Gas Emissions

Project construction would generate approximately 186,966 235,240 MT CO_2e of GHG emissions, which is a significant impact. Project operation would result in negligible generation of GHG emissions. Implementation of **Mitigation Measure GHG-1** will require Valley Water and/or its contractor to implement construction-related GHG emission reduction measures, such as using zero-emission and hybrid-powered equipment, minimizing idling time, using renewable diesel fuel, using USEPA SmartWay certified trucks, requiring proper maintenance of construction equipment, encouraging and providing carpool, transit, and alternative modes of transportation, recycling or salvaging nonhazardous debris, and efficiently using water. Implementation of **Mitigation Measure GHG-2** will require Valley Water to offset GHG emissions purchase carbon offsets before construction activities commence in an amount sufficient to reduce any GHG emissions remaining after implementation of **Mitigation Measure GHG-1** to less-than-significant levels. With implementation of **Mitigation Measures GHG-1** and **GHG-2**, Project construction GHG emissions impacts will be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact of greenhouse gas emissions as the Project.

GHG Plans

Project construction will be consistent with SB 32, AB 1279, the 2022 Scoping Plan, the Valley Water CCAP, the Morgan Hill CAP, and Climate Smart San José with implementation of **Mitigation Measures GHG-1** and **GHG-2**. Project operation would not conflict with these GHG reduction policies and plans without mitigation. Therefore, the Project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions, and overall impacts would be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact to GHG reduction plans as the Project.

Mitigation Measures

GHG-1 Utilize Electrification and Renewable Fuels During Construction

GHG-2 Purchase Carbon Offsets Offset GHG Emissions Prior to and During Construction

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on GHG emissions. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.10 Hazards and Hazardous Materials

The FAHCE-Plus Modified Alternative would have the same impacts to hazardous material as described in Section 3.10, *Hazards and Hazardous Materials*.

Use and Accidental Release of Hazardous Material

During the construction of the Seismic Retrofit and Conservation Measures, hazardous materials commonly associated with construction activities (e.g., gasoline, diesel fuel, paints, solvents, hydraulic fluid) would be present and handled onsite, as well as transported to and from the Project Area and would create impacts if accidentally released. These materials would be primarily found within construction equipment but may also be stored onsite at the staging areas, and transported, as necessary, to work areas. NOA is known to be present in the rock types that underlay much of the dam and spillway area. Excavation of serpentinite and other materials containing NOA could expose the public and construction workers to airborne asbestos, which would be a significant impact.

The Project project is required to comply with federal, State, and local laws, regulations, and policies designed to minimize hazardous materials impacts to the public and environment. The Project would implement Valley Water BMPs (HM-7, HM-8, WQ-6, WQ-17) to minimize the chance of release of hazardous materials. For Seismic Retrofit construction, compliance with BAAQMD's ATCM for Construction, and BMP-AQ-1 and BMP HM-13, would minimize potential impacts from NOA. The implementation of **Mitigation Measure HAZ-1** (Construction and Grading Operations Dust Control Measures), **Mitigation Measure HAZ-2** (Track Out Control Measures for Roads from NOA-Containing Areas), **Mitigation Measure HAZ-3** (Traffic Control Measures within NOA-Containing Construction Areas), **Mitigation Measure HAZ-4** (Dust Control Measures During Earthmoving Activities), **Mitigation Measure HAZ-5** (Dust Control Measures During Tunneling Activities), and **Mitigation Measure HAZ-6** (Separation of Rock Containing NOA) will reduce the Project's impact from hazardous material to **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project to hazardous material.

Sensitive Receptors

The William F. James Boys Ranch (Boys Ranch) is located within 0.11 miles of Anderson Dam, which is considered a sensitive receptor for hazardous materials. During construction compliance with BAAQMD's ATCM for Construction, and BMP-AQ-1 and BMP HM-13, would minimize potential impacts from NOA. The implementation of **MM HAZ-1 through HAZ-6** and **Mitigation Measure HAZ-7** (Soil Testing and Proper Disposal of Potentially Contaminated Soils) will reduce the Project's impact to sensitive receptors **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project to sensitive receptors.

Discovery of Hazardous Materials

Based on a review of readily available public information for the Project Area, no listed hazardous materials sites or existing hazardous material contamination are present within the Project Area. Nevertheless, there is potential to discover unknown hazardous materials sites during construction activities, which would be a significant impact. Implementation of BMP HM-9 would include measures for proper handling, storage, and disposal of hazardous materials and **Mitigation Measure HAZ-7** will minimize impacts to the public or environment should unknown contaminants or contaminated soil be encountered during construction activities. The Project's impact on the discovery of hazardous materials is **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project to hazardous waste sites.

Emergency Response or Evacuation Plan

Construction would involve operation of large construction equipment, transport and storage of construction materials, and worker commute trips to and from the area, which could impede movement and access of emergency response vehicles or interfere with evacuation procedures, which would be a significant impact. Cochrane Road between Coyote Road and Malaguerra Avenue (or portions of this segment) would be closed to through traffic for varying durations throughout the construction period. Implementation of BMP TR-1, PS-AMM-2, **Mitigation Measure PS-1** (Prepare and Implement Traffic Management Plan) which requires the preparation and implementation of a TMP, and **Mitigation Measure WF-1,** which requires coordination with local and state emergency response and fire agencies and preparation of a Response and Evacuation Strategy, which will maintain adequate emergency response and identify and maintain evacuation routes, that all emergency response agencies are notified in advance of all lane and road closures and that evacuation routes are passable or alternate routes are available will reduce impacts on emergency response to less-than-significant levels. Impacts related to impairing implementation of or interfering with an adopted emergency response plan or emergency evacuation routes and plans would be **less than significant with mitigation.** The FAHCE-Plus Modified Alternative would have the same impact as the Project on emergency response.

Valley Fever

As discussed in Section 3.10.1.6, *Valley Fever*, construction activities have the potential to release the soil-dwelling fungus (Coccidioides) that can cause Valley Fever. Such a release could pose a hazard to construction workers and/or the public, which would be a significant impact. BAAQMD’s ATCM for Construction, BMP-AQ-1, and **Mitigation Measures HAZ-1** through **HAZ-5** will implement dust control measures to minimize potential impacts from Valley Fever. The risk of Valley Fever is **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project related to Valley Fever.

Mitigation Measures

HAZ-1 Construction and Grading Operations Dust Control Measures

HAZ-2 Track Out Control Measures for Roads from NOA-Containing Areas

HAZ-3 Traffic Control Measures within NOA-Containing Construction Areas

HAZ-4 Dust Control Measures During Earthmoving Activities

HAZ-5 Dust Control Measures During Tunneling Activities

HAZ-6 Separation of Rock Containing NOA

HAZ-7 Soil Testing and Proper Disposal of Potentially Contaminated Soils

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on hazards and hazardous materials related to reasonably foreseeable upset or accident conditions, emission of hazardous materials within one-quarter mile of a school, a site included on a list of hazardous materials sites, and Valley Fever. The FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts related to routine transport, use, or disposal of hazardous materials and impairment or interference with an emergency response or evacuation plan. Cumulative impacts would be the same as the Project’s cumulative impacts.

5.9.3.11 Hydrology

The FAHCE-Plus Modified Alternative would have the same impacts on hydrology as described in Section 3.11, *Hydrology*. The FAHCE-Plus Modified Alternative modifies ~~the summer base flows and~~ pulse flows from the FAHCE rule curves as discussed in Section 5.5.3. These modifications affect normal baseflows that do not cause flooding, and pulse flows up to 90 cfs that may inundate some trails adjacent to Coyote Creek (see discussion in Section 3.18, *Recreation*) but are otherwise normal flow parameter of the creek and do not cause substantial downstream flooding.

Erosion

The Project would discharge large volumes of sediment following storms while the reservoir is dewatered given the exposure of sediments previously inundated on the bottom of Anderson Reservoir and the limited capacity to store water behind the coffer dam during construction. Construction and maintenance associated with the various components have the potential to loosen materials that could be washed downstream, thus contributing to accelerated rates of erosion and sedimentation. **Mitigation Measure WQ-1** requires evaluation of the water quality monitoring data collected during construction and implementation of BMPs to address and control sediment associated with in-reservoir construction activities to the extent technically feasible in accordance with the CWA and Porter-Cologne Water Quality Control Act requirements; however, impacts would remain significant even with implementation of **Mitigation Measure WQ-1**. However, because addition mitigation is not available to decrease the magnitude of the impact to a less-than-significant level, erosion to Coyote Creek from sediments on the bottom of Anderson Reservoir is **significant and unavoidable**.

~~Implementation~~ For construction activities outside of the reservoir, implementation of a SWPPP and erosion control BMPs such as: BMP AQ-1 (Use Dust Control Measures), BMP WQ-4 (Limit Impacts From Staging and Stockpiling Materials), BMP WQ-1 (Conduct Work from Top of Bank), BMP WQ-2 (Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms), BMP WQ-5 (Stabilize Construction Entrances and Exits), BMP WQ-9 (Use Seeding for Erosion Control, Weed Suppression, and Site Improvement), BMP WQ-10 (Prevent Scour Downstream of Sediment Removal), BMP WQ-11 (Maintain Clean Conditions at Work Sites), BMP WQ-16 (Prevent Stormwater Pollution) would reduce erosion and sedimentation. With the SWPPP and BMPs for out-of-reservoir construction activities, the impact of erosion aside from reduced sediment being carried downstream during certain-sized storm events would be **less than significant**. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. ~~However, erosion to Coyote Creek from sediments on the bottom of Anderson Reservoir is **significant and unavoidable**.~~ The FAHCE-Plus Modified Alternative would have the same impact as the Project on sedimentation.

Runoff

Project construction and maintenance activities would involve denuding areas of vegetation to create access or stable surfaces, which reduce the capacity of these areas to absorb water and slow runoff. Utilization of areas by heavy equipment during construction would compact soils, making the ground surface harder and less conducive to infiltration of water to soil or groundwater. The Seismic Retrofit components of the Project would create relatively minor amounts of new impervious surface (widened/expanded existing roadways). Compliance with the SWPPP and erosion control BMPs for out-of-reservoir construction would assure that surface runoff would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact as the Project on runoff.

Surface Runoff

Due to the use of hazardous materials (e.g., fuel, oil, lubricants, etc. in construction equipment), there would be potential for discharge of polluted runoff if such materials were handled, stored, or disposed of improperly and/or if any accidental releases of such materials were to occur. The SWPPP, which would be implemented for out-of-reservoir construction, includes good housekeeping measures for: construction materials, waste management, and potential pollutant sources. Additional, BMPs will reduce potential impacts associated with hazardous materials releases: BMP HM-7 (Restrict Vehicle and Equipment Cleaning to Appropriate Locations), BMP HM-8 (Ensure Proper Vehicle and Equipment Fueling and Maintenance), BMP HM-9 (Ensure Proper Hazardous Materials Management), and BMP HM-10 (Utilize Spill Prevention Measures). These BMPs will include protocols for providing secondary containment for hazardous materials used in the field or stored at staging areas or at work sites and providing training spill cleanup materials for field personnel. The Project would have a less-than-significant impact on polluted runoff. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. The FAHCE-Plus Modified Alternative would have the same impact as the Project on polluted runoff.

Flooding

During construction of the Seismic Retrofit component, there would be increased potential for flooding (i.e., higher flows could occur in Coyote Creek more frequently during storm events) relative to the existing conditions baseline for flows under the 50-year return period (approximately 4,000 cfs–5,000 cfs); however, this flooding risk would be largely reduced relative to Pre-FERC Order Conditions and would not result in widespread, damaging floods. During the post-construction period, flooding risk associated with operation of the dam would be reduced relative to the Pre-FERC Order Conditions Baseline. The impact from flooding would be **less than significant.** The FAHCE-Plus Modified Alternative would have the same impact as the Project on flooding.

Dam Inundation

The objective of the Project is to reduce the long-term risk of flooding from dam failure. Construction of the Seismic Retrofit components would not directly increase the risk of flooding due to dam failure but could potentially exacerbate the impacts from a failure of Coyote Dam, which is located upstream of Anderson Dam and is also susceptible to seismic risks. Risk of flooding from dam failure increases marginally during construction of the Seismic Retrofit but is minimized through winterization measures in the wet season while the crest of the dam is lowered. A restriction has been in place for Coyote Reservoir since 1992, limiting storage in this reservoir 52.5 percent of total capacity. If Coyote Dam were to fail, the downstream effects would be reduced by the presence of Anderson Reservoir, which itself has been under a restriction since 2009. During Seismic Retrofit construction, each interim reservoir at the end of each construction season would have capacity that exceeds the capacity of Coyote reservoir. Additionally, the seismic retrofit of Anderson Dam would not exacerbate the risk of failure of Coyote Dam or increase potential downstream flooding compared to existing conditions. In addition, the storage restriction on Coyote Reservoir limits the potential effects of severe damage to the dam from an earthquake and the possibility of uncontrolled flows. With restricted capacity the possibility of water overtopping damage caused by an earthquake is nearly completed avoided. Given the very low probability of dam failure, which would require a major earthquake in close proximity to Coyote Reservoir following a wet period that fills the reservoir beyond its capacity to release high flow, the Project's impact on risk from dam inundation is **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact as the Project on flooding from dam inundation.

Mitigation Measures

WQ-1 Develop and Implement an In-Reservoir Construction Area Water Quality Monitoring and Protection Plan

Regarding cumulative impacts, like the Project, the FAHCE-plus Modified Alternative would have **cumulatively considerable** impacts on erosion and sedimentation, but **not cumulatively considerable** impacts on flooding, polluted runoff, or risk from dam failure. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.12 Groundwater Resources

The FAHCE-Plus Enhance Alternative would have the same impact on groundwater as described in Section 3.12, *Groundwater Resources*. Flow and pulse changes in the FAHCE-Plus Modified scenario would not alter the ability to provide groundwater recharge or groundwater quality. Extra pulses may use more stored water from the reservoir, but modeling shows that it would not have a substantial impact of Coyote Valley groundwater levels.

Groundwater Supply

The loss of storage in Anderson Reservoir would greatly limit the amount of water that could be released from reservoir for the purpose of groundwater recharge along Coyote Creek. Seismic Retrofit construction would not substantially affect groundwater storage and supplies or recharge, as WEAP modeling has shown that groundwater storage in the Coyote Valley would remain above the 5,000 GWMP outcome measure, given implementation of imported water releases in Coyote Creek. Impacts to groundwater recharge would be **less than significant**. The

FAHCE-Plus Modified Alternative would have a slightly greater impact than the Project on groundwater recharge as more water would be used for pulses that cannot be captured through in-channel recharged.

The dewatering of Anderson Reservoir during the 7-year Seismic Retrofit construction period could impact nearby wells outside of the groundwater basin and managed aquifer; however, this impact will be reduced to less than significant with implementation of **Mitigation Measure GW-1** (Provide Alternative Supplies). As such, the impact to surrounding wells will be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project on wells around Anderson.

Groundwater Quality

Construction equipment to be used during construction and maintenance activities would contain hazardous materials, such as fuel, oil, lubricants, etc. that can degrade groundwater quality if spilled or improperly handled. Implementation of a SWPPP for construction activities outside the reservoir, and hazardous materials BMPs including BMPs HM-7, HM-8, HM-9, and HM-10, which will include protocols for providing secondary containment for hazardous materials used in the field or stored at staging areas or at work sites and providing training and spill cleanup materials for field personnel will reduce impacts to groundwater quality to **less than significant**. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements.

Blasting at the BHBA could release perchlorates and various other water-soluble nitrogen-compounds during the use of explosives. The risk from perchlorates and other water-soluble nitrogen-compounds is primarily in relation to groundwater. Perchlorate salts are highly soluble in water and sorbs poorly to mineral surfaces and organic material; therefore, it is typically very mobile in surface water and groundwater. It is persistent in the environment and at high enough concentrations can affect thyroid gland functions. The risk of groundwater contamination from perchlorates will be minimized by **Mitigation Measure GW-2** (Pollutants from Blasting Activities) which includes a set of BMPs for the proper use and disposal of perchlorate. The impact to groundwater quality is less than significant with mitigation and the FAHCE-Plus Modified Alternative would have the same impact as the Project on groundwater quality.

The reduction in groundwater levels in the area immediately surrounding Anderson Reservoir could adversely affect groundwater quality in this area; however, these effects would be temporary and the impacts on well owners will be reduced to less-than-significant levels through implementation of **Mitigation Measure GW-1 (**Provide Alternative Supplies). The FAHCE-Plus Modified Alternative would have the same impact as the Project on local well groundwater quality.

Groundwater Plans

As described in Section 3.12.1.2, the San Francisco Bay Basin Plan identifies beneficial uses for groundwater within the San Francisco Bay region and establishes narrative and numerical WQOs to achieve the beneficial uses for those waters. Valley Water's GWMP for the Santa Clara and Llagas Subbasins (Valley Water 2021) describes a comprehensive groundwater management framework, including existing and potential actions to achieve basin sustainability goals and ensure continued sustainable groundwater management. As discussed above, the Project will not substantially affect groundwater quantity or quality and with **Mitigation Measure GW-1** will not impact well owners around Anderson Reservoir. As such, Project impacts on groundwater plans would be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact as the Project on groundwater plans.

Mitigation Measures

GW-1 Provide Alternative Supplies

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts groundwater resources. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.13 Water Supply

The FAHCE-Plus Enhance Alternative would have the similar impacts on water supply as described in Section 3.13, *Water Supply*. Flow and pulse changes in the FAHCE-Plus Modified scenario would use more water from the reservoir than in the FAHCE rules, but modeling indicates this would not have a substantial effect on overall water supplies.

Water Supply

During the Seismic Retrofit component construction, Anderson Reservoir would be almost completely dewatered which would limit supplies available for groundwater recharge and water supply. Modeling results indicate that there may be a reduction in groundwater recharge and storage downstream of the dam during construction, but that simulated groundwater storage would remain above the 5,000 AF outcome measure for Coyote Valley. With increased imported water releases, WEAP modeling has indicated that no significant impacts would occur to water supply conditions during the Seismic Retrofit construction period. Once Project construction has been completed, releases from the dam would be made in accordance with the FAHCE operating rule curves. The Project would not substantially alter or reduce Valley Water's ability to have sufficient water supplies from existing entitlements and resources, and this impact would be **less than significant**. The FAHCE-Plus Modified Alternative would have a similar impact on water supply as the Project.

Water Supply Infrastructure

No new water supplies facilities would be required due to construction and operation of the Project. Restoring the full capacity of Anderson Reservoir would support Valley Water's water supply portfolio. No new or expanded private wells along the rim of the reservoir will be constructed due to water table effects with implementation of **Mitigation Measure GW-1**. Additionally, implementation of **Mitigation Measure GW-2** will avoid any impacts on groundwater quality from blasting activities. Therefore, the water facility impact will be **less**

than significant with mitigation. The FAHCE-Plus Modified Alternative would have the same impacts on water supply facilities as the Project.

Mitigation Measures

GW-1 Provide Alternative Water Supplies

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on water supply. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.14 Water Quality

The FAHCE-Plus Modified Alternative would have similar impacts to water quality as described in Section 3.14, *Water Quality*. The revised flow and pulse rules would support fisheries in the creek would not directly affect water quality parameters but are designed to better support the beneficial uses of Coyote Creek.

In-Reservoir Water Quality

During construction with Anderson Reservoir at deadpool the limited storage would create higher temperatures and increase turbidity (especially following storms) substantially degraded in-reservoir water quality that would not support designated beneficial uses (COMM, COLD, SPWN, WARM, WILD, REC-1 and REC-2). **Mitigation Measure WQ-1** requires evaluation of the water quality monitoring data collected during construction and implementation of BMPs to address and control sediment and other pollutants associated with in-reservoir construction activities to the extent technically feasible in accordance with the CWA and Porter-Cologne Water Quality Control Act requirements; however, impacts would remain significant even with implementation of **Mitigation Measure WQ-1**. Because no additional mitigation is available to decrease the impact to less than significant, this This impact is **significant and unavoidable**. The FAHCE-Plus Modified Alternative would have the same impact as the Project to in-reservoir water quality.

Other Water Quality Impacts

Reservoir dewatering would result in substantial discharges of sediment as storm runoff travels over previously inundated sediments at the bottom of the reservoir, and there is only limited water storage to settle out sediments from upstream. This temporary increase in turbidity following storms in **significant and unavoidable**. The FAHCE-Plus Modified Alternative would have the same impact as the Project to sedimentation from the reservoir bottom.

The excavation of soils within or near the reservoir and creek, placement of fill within or near the reservoir or creek to construct dam improvements and Conservation Measures, vehicle travel on unpaved access and haul roads, exposed unvegetated work sites and staging areas, uncovered stockpiles, and mining activities could result in erosion of surface soils. Resultant erosion may cause turbidity and sedimentation, and impact water quality. Construction and maintenance activities would also involve the use of hazardous materials and herbicides, which could accidentally be released into the environment, resulting in adverse effects on water quality. Implementation of a SWPPP for out-of-reservoir construction and applicable erosion control BMPs for in-reservoir and out-of-reservoir construction including: BMP AQ-1 (Use Dust Control Measures), BMP WQ-4 (Limit Impacts From Staging and Stockpiling Materials), BMP WQ-1 (Conduct Work from Top of Bank), BMP WQ-2 (Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms), BMP WQ-5 (Stabilize Construction Entrances and Exits), BMP WQ-9 (Use Seeding for Erosion Control, Weed Suppression, and Site Improvement), BMP WQ-10 (Prevent Scour Downstream of Sediment Removal), BMP WQ-11 (Maintain Clean Conditions at Work Sites), and BMP WQ-16 (Prevent Stormwater Pollution); hazardous material BMPs: BMP HM-7 and HM-8 which reduces reduce the risk of vehicle-related pollutants and BMPs HM-9 and HM-10 which proper management of hazardous materials and the implementation of spill prevention measures; and herbicide BMPs: HM-1 (Comply with All Pesticide Application Restrictions and Policies), HM-2 (Minimize Use of Pesticides), HM-4 (Comply with All Pesticide Usage Requirements), HM-5 (Comply with Restrictions on Herbicide Use in Upland Areas), and HM-6 (Comply with Restrictions on Herbicide Use in Aquatic Areas) will help protect water quality. The SWPPP for out-of-reservoir construction activities and implementation of applicable BMPs for in-reservoir and out-of-reservoir construction would ensure water quality impacts are **less than significant** for construction and maintenance related activities. The FAHCE-Plus Modified Alternative would have the same impact as the Project from construction water quality.

Some construction elements would require the removal of groundwater to keep work areas dry. To avoid water quality impacts, this groundwater would be treated by an ATS system; imported water would be chilled as needed prior to release to Coyote Creek to ensure cold water in the CWMZ; and Valley Water would comply with the Stormwater NPDES Permit as applicable to minimize impacts from new impervious surfaces. Other water quality impacts would **be less than significant**. The FAHCE-Plus Modified Alternative would have the same impact as the Project to other water quality issues.

The FAHCE-Plus-Modified alternative has the same goals associated with temperature as the FAHCE alternative, with a slight deviation associated with cold pool temperature requirements. The FAHCE-Plus-Modified alternative would use the same methodology to calculate the available cold-water pool in Anderson Reservoir and to determine a reservoir flow release to maintain a daily average water temperature not to exceed 18 °C throughout as much of the CWMZ as available cold-water storage will allow during the summer rearing period. The FAHCE-Plus-Modified alternative has the potential to increase the flow in the CWMZ, and thus the extent as it uses a cold pool volume target temperature of 16 °C. This allows for more of the cold-water pool to be used, while still achieving the daily average water temperature not to exceed 18 °C throughout as much of the CWMZ as will allow. The change associated with the 16 °C cold water pool volume will not change conditions downstream of the dam in a way that will cause negative effects to aquatic resources, as it still falls within the range of tolerance of the species and meets the goal of 18 °C throughout the CWMZ. All monitoring actions associated with FAHCE will occur under FAHCE-Plus Modified, and no changes are anticipated associated with the use of imported water. Detailed analysis and modeling of temperature effects as a result of FAHCE implementation during the post-construction period is included in Appendix F, Biological Resources -Fisheries Technical Appendix Report.

No change in dissolved oxygen, turbidity, or conductivity is expected to occur between FAHCE-Plus Modified and FAHCE. Changes associated with operations will not be to a degree that will result in noticeable changes.

Over the long-term, the Project would generate substantial beneficial impacts to water quality and beneficial uses. The FAHCE-Plus Modified Enhanced Alternative would provide no change associated with temperature targets within the CWMZ but would allow for more flexibility in cold water pool management and allow for increase flows to provide additional habitat for fish within the CWMZ and provide conditions that better support the fisheries related beneficial uses designated for Coyote Creek. The new reservoir outlet would allow for greater flexibility in releases that would allow greater use of the reservoir's cold-water pool and reduce the potential for uncontrolled reservoir spills. Live Oak Restoration Project, the The Ogier Ponds CM, Sediment Augment Program, Maintenance of the North Channel Reach Extension, and Phase 2 Coyote Percolation CM would all provide water quality benefits and habitat enhancements that support beneficial uses.

Mitigation Measure

WQ-1 Develop and Implement an In-Reservoir Construction Area Water Quality Monitoring and Protection Plan

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **cumulatively considerable** impacts on turbidity water quality objectives, but **not cumulatively considerable** impacts on other water quality objectives or on beneficial uses. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.15 Land Use

The FAHCE-Plus Modified Alternative would have the same impacts to land use as described in Section 3.15, *Land Use*. Flows would not alter surrounding land uses.

Conflict with Land Use Plans, Policies, and Regulations

The majority of the land that would be affected by the Project is designated as recreational. Portions of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond would be closed during construction of the Seismic Retrofit improvements and Conservation Measure components, affecting recreational land uses in the area. These effects would be temporary in nature. Implementation of BMP AQ-1, BMP AQ-2 BMP TR-1, BMPs GEN-36, GEN-37, and GEN-39 will minimize the level of disruption and impairment of onsite land uses during the Project construction period. Operation of the Project would minimize the risk of reservoir spill and downstream flooding and provide in-stream environmental flows consistent with land use policies and regulations. The Project would seismically upgrade a critical facility consistent with local goals and policies, and construction and operation would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, this impact would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact as the Project.

Regarding cumulative impacts, like the Project, the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on land use. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.16 Noise and Vibration

The FAHCE-Plus Modified Alternative would not generate any new noises or vibrations. The noise and vibration impacts would be the same as described in Section 3.16, *Noise and Vibration*.

Noise

Construction of the Seismic Retrofit Component, Ogier Ponds CM, and the Sediment Augmentation Program would exceed applicable construction noise thresholds of significance, while Project operational noise impacts would be less than significant. Seismic Retrofit construction noise levels would exceed the 10 dBA increase above ambient threshold at key receptors as discussed in Section 3.16, *Noise*. Seismic Retrofit nighttime construction noise levels would exceed the nighttime construction noise threshold of 50 dBA L_{eq}.

Mitigation Measure NOI-1 will require Valley Water to implement a Construction Management Plan, and **Mitigation Measure NOI-2** is specific to Seismic Retrofit construction and will require the installation of a temporary noise barrier, limiting of construction activity at Staging Area 1 ~~and Stockpile Area E~~, provide a noise complaint phone number and construction noise monitoring during nighttime periods of construction, and reduce speeds along haul routes. Implementation of **Mitigation Measure NOI-3** is specific to Ogier Ponds CM construction and will require the installation of a temporary noise barrier and the reduction of truck and vehicle speeds along Cochrane Road. Even with mitigation, noise levels would still exceed the thresholds of significance and construction would result in generation of a temporary increase in ambient noise levels in excess of locally adopted standards. Impacts would be **significant and unavoidable**. The FAHCE-Plus Modified Alternative would have the same impacts to noise as the Project.

Vibration

Construction of the Seismic Retrofit components and the Sediment Augmentation Program would exceed construction vibration thresholds of significance of 72 VdB at sensitive receptors. Blasting activities during Seismic Retrofit construction could exceed applicable blasting thresholds.

Implementation of **Mitigation Measure NOI-4** will require the use of oscillatory or static rollers in lieu of a vibratory roller within 150 feet of <u>residential structures</u> ~~receptors~~. Implementation of **Mitigation Measure NOI-5** will require vibration and air overpressure monitoring be conducted while initial blasting activities occur. Monitoring results would be used to adjust blast loading limits to properly reflect site-specific conditions to ensure vibration impacts from blasting do not exceed the building damage thresholds. Mitigated vibration levels would not exceed the established thresholds. Therefore, Project construction would not generate excessive ground borne vibration or ground borne noise levels and impacts would be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impacts to vibrations as the Project.

Mitigation Measures

NOI-1 <u>Implement</u> Construction Noise ~~BMPs~~ <u>Reduction Measures</u>

NOI-2 Implement Seismic Retrofit Construction Noise Reduction Measures

NOI-3 Implement Ogier Ponds CM Construction Noise Reduction Measures

NOI-4 Seismic Retrofit and Sediment Augmentation Program Construction Vibration Reduction Measures

NOI-5 Implement Blasting Plan

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **cumulatively considerable** impacts on noise. , but The FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on vibration. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.17 Public Services

The FAHCE-Plus Modified Alternative would not have increased impacts on emergency response. The impact to public services would be the same as described in Section 3.17, *Public Services*.

Fire and Police Services

Temporary impacts on police and fire protection services would include accidental ignition of a wildfire, use of hazardous materials that may require additional fire protection services, and temporary increases and disruptions to vehicle traffic in the Project vicinity, which could impede emergency response timing. Implementation of BMPs HM-12, HM-8, and HM-9 will minimize the risk of accidental ignition. BMP TR-1 will require construction warning signs, safety fencing, and detours which would minimize potential impacts on emergency response times. Although construction traffic levels would increase emergency service response times, it would not disrupt emergency service response to the point that would require the construction or expansion of police or fire protection facilities other than potentially the need for temporary emergency access roads, which might cause significant impacts, which a significant impact. **Mitigation Measure PS-1** requires preparation of a TMP and coordination with fire protection services and first responders, and **Mitigation Measure WF-1** requires coordination with local and state emergency response agencies and preparation of a Response and Evacuation Strategy, which will maintain adequate emergency response and identify and maintain evacuation routes, will reduce which reduces potential impacts associated with impeding emergency response times to a less-than-significant level. Impacts to police and fire services would be **less than significant with mitigation.** The FAHCE-Plus Modified Alternative would have the same impact than the Project to public services.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on public services. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.18 Recreation

The FAHCE-Plus Modified Alternative would have the same impacts to recreation as described in Section 3.18, *Recreation*.

Recreation Facilities

The Project would require closure of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond for the duration of construction; however, there are 100 other recreational facilities in the study area (i.e., all parks within 5 miles of the Project Area, as well as regional parks in the county), many of which include a variety of infrastructure and accommodate a wide range of recreational activities including hiking and fishing (see **Table 3.18-1** and **Figure 3.18-1**). Temporary impacts on recreational facilities resulting from the Seismic Retrofit components would be distributed across many nearby recreational facilities, so this impact is less than significant.

Coyote Creek Trail and portions of Hellyer Park would be periodically inundated by Coyote Creek at several low flow crossings more frequently during construction of the seismic retrofit. Longer recreational facility closures during the wet season could result in physical deterioration of other recreational facilities or the acceleration of the physical deterioration of those facilities. Therefore, this impact would be significant.

Implementation of **Mitigation Measure REC-1** will reduce impacts to **less than significant with mitigation** by requiring Valley Water to provide funding and implementation of the future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities. compensating SCCPRD for anticipated extra maintenance costs. The FAHCE-Plus Modified Alternative would have the same impact to recreational facilities as the Project.

Permanent Modification to Recreation Facilities

The Project would result in several permanent modifications to recreational facilities. As described in Section 2.4.5.12, the Live Oak Picnic Area would include an improved walking loop, a bridge over the North Channel and connection to the Serpentine Trail, an interpretive trail along Coyote Creek, relocation of the group picnic area closer to restroom and parking areas, and tree replacement planting. Additionally, the existing boat ramp at Anderson Dam would be improved by constructing a second entrance off Cochrane Road, constructing a dedicated inspection area, and an electric vehicle charging area would be replaced and improved. These facility improvements would be minor and would not have a significant adverse physical effect on the environment. This impact would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impacts to permanent facilities as the Project.

Mitigation Measure

REC-1 Funding and Implementation of Maintenance Reimbursement for Park Facility Improvements within the Coyote Creek Corridor Closures During High Flow Events

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on recreation. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.19 Transportation

The FAHCE-Plus Modified Alternative would not create different traffic impacts and would have the same impacts to traffic as described in Section 3.19, *Transportation*.

Transportation Plans

Project construction and operation would largely be consistent with plans and policies governing the circulation system. However, as with the Project, modified flows expected in Coyote Creek could result in impacts to recreational facilities that are used by pedestrians. This would be a significant impact on pedestrian facilities. **Mitigation Measure REC-1** (Funding and Implementation of Maintenance Reimbursement for Park Facility Improvements within the Coyote Creek Corridor Closures During High Flow Events) would reduce impacts on pedestrian facilities and prevent substantial conflicts with trails plans and policies. This impact would therefore be **less than significant with mitigation**.

The FAHCE-plus Modified Alternative would have the same impact to transportation plans as the Project.

Emergency Access

The Project would generate additional construction roadway vehicle trips and include road closures that have the potential to impede emergency access. BMP TR-1 would reduce this impact, but it would still be significant. With implementation of **Mitigation Measure PS-1** (Prepare and Implement Traffic Management Plan) and **Mitigation Measure WF-1** (Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan), impacts on emergency access will be **less than significant with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact on emergency access as the Project.

VMT

The Project's construction-related VMT would be temporary and operation-related VMT would be negligible and would not contribute to a substantial change in long-term VMT. As a large infrastructure project, the Project would have little long-term effect on air quality and GHG benefits related to long-term reductions in VMT (as discussed under Section 3.19.3, *Methodology*). Because the increase in VMT during construction would be temporary, and there would be a de minimis effect on VMT during operations, the Project would not conflict with or be inconsistent with *CEQA Guidelines* section 15064.3(b). Therefore, impacts related to VMT would be **less than significant. T**he FAHCE-Plus Modified Alternative would have the same impact to VMT as the Project.

Hazards

The Project would not include any new roadway or access improvements that would increase hazards due to a geometric design. Rather, the proposed roadway and access modifications would improve roadway conditions and increase public safety. Therefore, impacts regarding increased hazards due to a geometric design feature would be **less than significant.** The FAHCE-Plus Modified Alternative would have the same impact to traffic hazards as the Project.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

REC-1 Funding and Implementation of ~~Maintenance Reimbursement for~~ Park Facility Improvements within the Coyote Creek Corridor ~~Closures During High Flow Events~~

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) ~~Emergency Action Plan~~

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on transportation. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.20 Tribal Cultural Resources

The FAHCE-Plus Modified Alternative would not create different impacts to tribal resources from those described in Section 3.20, *Tribal Cultural Resources*.

Ground disturbance during construction and maintenance around the dam and the Ogier Ponds areas could impact elements of tribal cultural resources. Erosion and recreational power boating within Anderson Reservoir could erode Native American archaeological resources that may qualify as tribal cultural resources buried along the shoreline of the reservoir. In addition, construction activities and future use of reservoir could expose undiscovered Native American archaeological resources that may qualify as tribal cultural resources. MP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will require that work will cease in areas where archaeological materials are discovered. Nevertheless, these impacts are significant.

Mitigation Measures CR-1 (Pre-construction Cultural Resources Awareness Training), **CR-2** (Prepare a Data Recovery and Treatment Plan for Tribal Cultural Resources that Cannot be Avoided), and **CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require construction crews to receive tribal cultural awareness training, provide guidance on treating resources with respect, require that all tribal cultural resources be included in the treatment plan, and require that work stop in the vicinity of any archaeological materials discovered during Project construction. Implementation of these BMPs and mitigation measures would reduce the Project's impact to tribal cultural resources to a **less-than-significant level with mitigation**. The FAHCE-Plus Modified Alternative would have the same impact to tribal resources as the Project.

Mitigation Measures

CR-1 Pre-construction Cultural Resources Awareness Training

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on tribal cultural resources. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.21 Utilities and Service Systems

The FAHCE-Plus Modified Alternative would not affect utilities or generate waste beyond the impacts described in Section 3.21, *Utilities and Service Systems*.

Utility Systems

The Project would not require construction of new stormwater, telecommunications, or electric facilities. Relocation of some power lines would be required as part of the Seismic Retrofit component. The utility infrastructure proposed to be relocated to serve Project would not affect other users. Decommissioning of the hydroelectric facility would not require Valley Water or PG&E to construct replacement electrical facilities. Impacts related to the replacement, relocation, or construction of public utilities would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact on utilities as the Project.

Solid Waste

The Project would comply with the Santa Clara County Integrated Waste Management Plan, the City of San José's Zero Waste Strategic Plan, and State regulations. Solid waste would not be generated in excess of the capacity of local solid waste management facilities. Therefore, the Project's impacts related to solid waste would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact on utilities as the Project.

Regarding cumulative impacts, like the Project, the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on utility systems. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.3.22 Wildfire

The FAHCE-Plus Modified Alternative would not affect wildfire risk beyond that described in Section 3.22, *Wildfire*.

Wildfire Risk Exacerbation

Implementation of BMP HM-12 (requires fire suppression equipment and measures, and spark arrestors on equipment) and implementation of California Fire Code provisions and CAL FIRE requirements will reduce the risk of accidental ignition from construction equipment, minimizing the impacts of the Project on exacerbation of wildfire risks. Post-construction operations would not require the use of equipment that could generate sparks or extreme heat; therefore, there would be no impact related to wildfire. Risk of wildfire is **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact related to increasing wildfire risk as the Project.

Wildfire Risk from Infrastructure

The Project would include the modification, construction, and/or relocation of roads and electrical transmission infrastructure; however, access throughout the Project Area and existing power lines would be relocated and improved through Project implementation, thus providing an improvement over existing conditions. Post-construction operations of the powerlines would also be similar to post-FOCP implementation conditions. Therefore, infrastructure associated with the Project would not exacerbate wildfire risks, and this impact would be **less than significant.** The FAHCE-Plus Modified Alternative would have the same risk as the Project to wildfire from infrastructure.

Risk from Post-Fire Instability

The Project would not exacerbate or increase wildfire risks in the area, and therefore would not increase the risks of post-fire effects, such as landslides and flooding. The Project would not result in significant risks to people or structures from downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes, and this impact would be **less than significant**. The FAHCE-Plus Modified Alternative would have the same impact related to increasing risk from post-fire instability as the Project.

Exposure to Wildfire Risk

Construction traffic and road closures would result in impacts on emergency response and evacuations, and expose construction workers to wildfire risks, in the event of a wildland fire. Traffic impacts on emergency response and evacuations would be reduced through implementation of **BMP TR-1** which requires implementation of construction warning signs, safety fencing, and detours; however, a significant impact would still occur. Implementation of **Mitigation Measure PS-1** (Prepare and Implement Traffic Management Plan), which requires preparation and implementation of a TMP and coordination with State and local agencies and **Mitigation Measure WF-1 (**Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan), which requires coordination with local and state emergency response and fire agencies and preparation of a Response and Evacuation Strategy, which will maintain adequate emergency response and identify and maintain evacuation routes. to identify an alternative temporary refuge area or access to the Woodchoppers Flat Picnic Area during a wildfire will minimize impacts on emergency response and evacuation procedures. This impact would be **less than significant with mitigation.** The FAHCE-Plus Modified Alternative would have the same impact to wildfire safety as the Project.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan

Regarding cumulative impacts, like the Project, after mitigation the FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts on wildfire risks. Cumulative impacts would be the same as the Project’s cumulative impacts.

5.9.4.1 Aesthetics

The Ogier Ponds Alternative would cause the same Project-related impacts including the removal of more than 650 mature trees for construction of the Seismic Retrofit component and approximately 70 trees for construction of the Conservation Measures resulting in degradation of the existing visual character or quality of public views. Therefore, public views of the BHBA and Coyote Creek would similarly be disturbed under the Ogier Ponds Alternative. Mitigation measures to replace trees along Coyote Creek (**Mitigation Measure AES-1**) and screen construction staging areas (**Mitigation Measure AES-2**) will reduce construction related impacts, but not to a level of less than significant. The alternative would result in **significant unavoidable impacts** with no additional feasible mitigation measures available to fully mitigate the impacts. This impact would be the same as the Project.

The FAHCE-Plus Modified Alternative would cause the same Project-related impacts from nighttime lighting during construction around the reservoir. A mitigation measure to minimize the impact from construction lightning (**Mitigation Measure AES-3**) will be implemented to reduce this impact to a less-than-significant level. The Ogier Ponds Alternative would have a **less-than-significant impact with mitigation** on nighttime views. This impact would be the same as the Project.

Mitigation Measures

AES-1 Replacement Tree on Santa Clara County Parkland

AES-2 Visual Screening of Construction Staging Areas

AES-3 Construction Lighting

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **cumulatively considerable** impacts on visual character, but **not cumulatively considerable** impacts on nighttime lighting. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.2 Agriculture and Forestry Resources

Farmland

The Ogier Ponds Alternative would convert Farmland to non-agricultural use. The Ogier Ponds Alternative would involve temporary use of a larger area of Farmland than the Project for staging and would involve acquisition of 18 acres of land in agricultural use, permanently converting 18 acres of Prime Farmland. The impact would be significant. New **Mitigation Measure OP-AG-1, Fund a Conservation Easement on Prime Farmland** will reduce the impact by requiring Valley Water to purchase conservation easements on an equivalent area of Prime Farmland to ensure their continued use for agriculture. However, even with this mitigation, the impact would be **significant and unavoidable**, because the conservation easement would not replace the Pime Farmland acreage that is converted. This impact is greater than the Project's impact.

Valley Water will still implement BMPs AQ-1 (dust control), BI-11 (minimize predator-attraction), WQ-4 (limit impacts from staging and stockpiling), WQ-11 (maintain clean work sites), and TR-1 (public safety measures) to minimize impacts to surrounding Farmland of Local Potential. Post-construction operations associated with the retrofitted dam could result in minor flooding in some Farmland areas but would not rise to the level of conversion. Adaptive management actions, if required, would not take place in Farmland.

Williamson Act Lands and Lands Zoned Agriculture

In addition, this alternative would conflict with existing zoning for agricultural use. This alternative would require permanent use of approximately 18 acres of land zoned for agricultural use. This changed use would no longer allow for agricultural use on this land, which would represent a conflict with existing zoning. However, Valley Water is not obligated to comply with local zoning regulations. The impact would be **less than significant**. Because of the increased area that would conflict with local zoning regulations, the magnitude of the impact is greater than under the Project.

Mitigation Measure

OP-AG-1 Fund a Conservation Easement on Prime Farmland

Valley Water will coordinate with a qualified farmland conservation organization or agency prior to the construction of the Ogier Ponds CM to make a one-time donation to cover the actual costs of purchasing a conservation easement to compensate for the loss of Prime Farmland. The amount of Valley Water's contribution will provide for the conservation of one acre of agricultural land in the county for each acre of agricultural land converted by the Project, based on the market price for the commensurate agricultural land at the time of Ogier Ponds CM construction.

Regarding cumulative impacts after mitigation the Ogier Ponds Alternative would have **cumulatively considerable** impacts on agricultural lands, but **not cumulatively considerable** impacts on Willianson Act lands. Cumulative impacts would be greater than the Project's cumulative impacts.

5.9.4.3 Air Quality

The Ogier Ponds Alternative would result in similar impacts to air quality as described in Section 3.3, *Air Quality*; however, the magnitude of the impact would be reduced under this alternative compared to the Project because of the decreased area of excavation and reduced earth moving associated with filling Pond 1 as part of the Ogier Ponds CM.

Air Quality Plans

The criteria air pollutant emissions from construction of the Seismic Retrofit component and the Ogier Ponds CM~~, and the Sediment Augmentation Program~~ would exceed BAAQMD thresholds. Implementation of **Mitigation Measure AQ-1** will require all construction equipment greater than 25 hp and operating for more than 20 hours over the entire duration of construction activities to be equipped with Tier 4 engines and would require all on-road truck engines and boats to be year 2010 or newer. Implementation of **Mitigation Measure AQ-1** will also minimize construction equipment idling time and require regular maintenance for all equipment. However, even with implementation of **Mitigation Measure AQ-1**, construction of the Ogier Ponds Alternative ~~FAHCE-Plus Modified Alternative~~ will exceed BAAQMD thresholds for ROG and NOx. As such, Project construction would conflict with the BAAQMD 2017 Clean Air Plan goal to attain established air quality standards while Project operation would not exceed any BAAQMD thresholds for the various criteria air pollutants. The Project overall would conflict with or obstruct the implementation of an applicable air quality plan, and impacts would be

significant and unavoidable. The Ogier Ponds Alternative would have less impacts in regard to conflicting with the 2017 Clean Air Plan than the Project.

Criteria Pollutants

As with the Project construction as discussed in Section 3.3 Impact 2, the Ogier Ponds Alternative would exceed the BAAQMD average daily thresholds for criteria air pollutants, while operational impacts related to criteria air pollutants would be less than significant. The Seismic Retrofit construction emissions would exceed the BAAQMD average daily thresholds for ROG in Year 1 through Year 6 and for NOx in Year 1 2 through Year 7. Sediment Augmentation Program construction emissions would not exceed the BAAQMD average daily threshold for criteria air pollutants NO_X during every year of construction from Year 2 through Year 15. Maintenance Construction of the North Channel Reach Extension and Phase 2 Coyote Percolation Dam CM would not exceed the BAAQMD average daily thresholds for criteria air pollutants. Even with implementation of **Mitigation Measure AQ-1**, Seismic Retrofit construction emissions will exceed the BAAQMD average daily thresholds for ROG in Year 1 and NOx in Year 2 through Year 6 7. Mitigated Sediment Augmentation Program construction emissions would not exceed the BAAQMD average daily thresholds for criteria air pollutants. NO_X during every year of construction from Year 2 through Year 10, and overall Overall mitigated Project construction emissions would exceed the BAAQMD average daily threshold for ROG during Year 1 6 and for NO_X during Year 2 through Year 7 15. Since criteria air pollutant exhaust emissions would remain above the BAAQMD significance threshold even with implementation of **Mitigation Measures AQ-1**, the impact related to regional air quality will be **significant and unavoidable**. The Ogier Ponds Alternative would have less impacts in regard to increases in criteria pollutants than the Project.

Dust

Fugitive dust impacts from blasting emissions would be less than significant with implementation of **Mitigation Measure AQ-2. Mitigation Measure AQ-2** will require the installation of wind screens during blasting activities to reduce fugitive dust emissions. Construction-related fugitive dust impacts would be significant even with implementation of BAAQMD basic BMPs (BMP AQ-1) and advance BMPs in **Mitigation Measure AQ-3**. **Measure AQ-3** will implement BAAQMD's Enhanced Construction BMPs, which includes limiting the occurrence of simultaneous construction activities, installing erosion control measures, planting vegetative ground cover, minimizing the amount of excavated material, and hydroseeding. These measures would apply to all Project components as discussed in Section 3.3. The Ogier Pond Alternative would have a **significant impact** from fugitive dust which is the same as the Project; the alternative involves a reduction in fill required, but has a larger ground-disturbing footprint.

Health Risks

As with the Project as discussed in Section 3.3 Impact 3, the Ogier Ponds Alternative construction activities would exceed BAAQMD's significance thresholds for excess lifetime cancer risk, acute HI, and $PM_{2.5}$ concentration. Operational impacts related to TAC emissions would be less than significant. Implementation of **Mitigation Measure AQ-1** will be required, but even with this measure the overall Project construction risks would exceed the BAAQMD thresholds for excess lifetime cancer risk, acute HI, and $PM_{2.5}$ concentration. Therefore, the

Project overall would expose receptors to substantial pollutant concentrations, and impacts would be **significant and unavoidable**. The Ogier Ponds Alternative would have less impacts from pollutant concentrations to sensitive receptors than the Project given the reduction in construction activity at Ogier Ponds.

Odors

Construction equipment used in the alternative would emit diesel exhaust odors, and the disturbance of soils, dewatered channels, and the drained reservoir could emit organic matter odors. These odors would be temporary and intermittent. Implementation of BMP AQ-2 would require construction avoid stockpiling of odorous material near sensitive receptors. Currently, there have been no reported odor complaints to BAAQMD. Construction odors are not anticipated to be notably different for the Project compared to the existing baseline conditions at the time of the EIR preparation modified by the FOCP implementation. Odors associated with operations and maintenance are not expected. Thus, based on the odor complaint history, implementation of BMP AQ-2, and the temporary nature of construction activities, the overall alternative impact related to exposure to odors will be **less than significant**. The Ogier Ponds Alternative would have less impacts from odors than the Project given the reduction in construction activity at Ogier Ponds.

Mitigation Measures

AQ-1 Implement Construction Criteria Air Pollutants Reduction Measures

AQ-2 Implement Construction Blasting Mitigation Fugitive Dust Reduction Measure

AQ-3 Implement BAAQMD Enhanced Construction BMPs

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **cumulatively considerable** impacts on attainment of air quality plans, criteria pollutants, and health risk, but **not cumulatively considerable** impacts on odors. Cumulative impacts would be less than the Project’s cumulative impacts.

5.9.4.4 Biological Resources—Fisheries Resources

The Ogier Ponds Alternative would not change the impacts to fisheries in Coyote Creek as described in Section 3.4, *Biological Resources – Fisheries Resources*.

Overall, any adverse impacts on CCC steelhead, Chinook, Pacific lamprey, Sacramento hitch, and southern coastal roach would be periodic and temporary, and less than significant during the construction phase. The alternative would benefit these species in the long term through increased and enhanced habitat supporting a larger and more resilient fisheries populations and the overall impact is **less than significant**.

The alternative could impact longfin smelt and white sturgeon and their habitat with increased sediment transport to the intertidal reaches of Coyote Creek during Seismic Retrofit construction, and this impact would be **less than significant**. Increased sediment transport may benefit longfin smelt in both the short-term and long-term.

The Ogier Ponds Alternative would have the same impact to fisheries as the Project.

Regarding cumulative impacts, like the Project, the Ogier Ponds Alternative would have **no not cumulatively considerable** impacts on fisheries resources. Cumulative impacts would be the same as Project cumulative impacts.

5.9.4.5 Biological Resources—Wildlife and Terrestrial Resources

Relative to the Project, the Ogier Ponds Alternative would reduce the magnitude of impacts on riparian habitats, federally regulated or State-regulated wetlands or other jurisdictional waters, western pond turtle, breeding special-status birds, special-status mammals, and sensitive serpentine-associated communities and special-status species potentially affected by nitrogen deposition.

The Ogier Ponds Alternative would reduce impacts on terrestrial biological resources, relative to the Project, in three primary ways. First, the Ogier Ponds Alternative would avoid impacts to the vast majority of aquatic, wetland, pond, and riparian land cover types (including federally regulated and State-regulated wetlands and other jurisdictional waters) in Ponds 1, 2, and 5 that would be impacted by the Project, as the majority of construction of the realigned Coyote Creek channel under the Ogier Ponds Alternative would occur in areas that are currently occupied by upland agricultural land or, in downstream areas, would occupy the same alignment as the Project (using the pre-1997 creek channel). The Ogier Ponds Alternative would result in a narrower channel and floodplain along the realigned portion of the creek, thus reducing the amount of creek and riparian habitat that would be restored. However, the net benefits of the Ogier Ponds Alternative to sensitive and regulated aquatic, wetland, pond, and riparian land cover types would be greater than under the Project because extensive riverine and riparian habitats would be created and restored along the realigned creek with minimal impacts on existing sensitive and regulated habitats. Thus, the net increase in the extent of these habitats, and the net benefits to the wildlife that use such habitats, would be greater under the Ogier Ponds Alternative than under the Project.

Second, by minimizing impacts on aquatic, wetland, pond, and riparian land cover types, the Ogier Ponds Alternative would reduce direct impacts on sensitive species associated with those habitats that may occur during construction of the Ogier Ponds CM. Such species include western pond turtle; breeding special-status birds such as tricolored blackbird, yellow warbler, and white-tailed kite; and San Francisco dusky-footed woodrat. These species use habitats at the Ogier Ponds that would be impacted less under the Ogier Ponds Alternative than under the Project.

Third, the Ogier Ponds Alternative would involve less earthwork than the Project. This would reduce the nitrogen emissions from vehicles and equipment involved in the creek realignment, thus reducing the amount of nitrogen deposited on serpentine grasslands (especially on Coyote Ridge to the east) and the effects of nitrogen deposition on serpentine-associated, special-status plants and animals.

Special-Status Plants

Construction activities could impact special-status plants through direct destruction, the spread of invasive plant propagules and pathogens, refilling of the reservoir where populations have colonized areas within the rim of the reservoir, and indirectly through dust that could coat plants interfering with normal gas exchange, photosynthesis, or pollination. Dust may also infect plants with *Phytophthora* within dust particles. Nitrogen emitted by construction vehicles and equipment may impact serpentine-associated special-status plants by fertilizing the soils and allowing nonnative grasses and forbs that would not otherwise be able to colonize.

Nine of the 12 special-status plants that could be impacted are VHP-covered species. General and serpentine impact fees would be used by the SCVHA to offset adverse impacts to the nine VHP-covered plant species. The potential for Phytophthora to be spread will be reduced via a Project-specific *Phytophthora* Pathogen Management and Monitoring Plan. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1a(1)** will manage invasive plants at ~~Valley Water's~~ Coyote Ridge population of Tiburon paintbrush by preventing the Project's nitrogen emissions from benefitting populations of invasive plants that would compete with Tiburon paintbrush. **Mitigation Measure TERR-1a(2)** will reduce the potential for spread of *Phytophthora*. **Mitigation Measures TERR-1a(3)** and **TERR-1a(4)** will survey for San Francisco collinsia in the previously unsurveyed portions of the Seismic Retrofit Area (to help quantify impacts on the species) and establishing a mitigation population commensurate with the population size. With implementation of BMPs, compliance with VHP conditions and AMMs, and **Mitigation Measures TERR-1a(1), TERR-1a(2), TERR-1a(3),** and **TERR-1a(4)** (all as fully described in Section 3.4, *Biological Resources—Wildlife and Terrestrial Resources*) Project impacts on special-status plants will be **less than significant with mitigation**. The Ogier Ponds Alternative would have a smaller impact to special-status plants than the Project from a reduction in nitrogen emissions.

Bay Checkerspot Butterfly, Monarch Butterfly, and Crotch's Bumble Bee

Construction activities would impact 2.6 acres of designated critical habitat for the Bay checkerspot butterfly, contribute to the cumulative effects of nitrogen deposition on serpentine grasslands, remove milkweed needed by monarch butterflies, destroy subterranean Crotch's bumble bee nests, clear vegetation that serves as pollen and nectar sources, and affect pollen and nectar sources through dust mobilization or changes in drainage patterns.

Special-status invertebrates would benefit from Valley Water's payment of VHP impact fees. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Implementation BMPs and compliance with VHP conditions would reduce impacts on the Bay checkerspot butterfly, monarch butterfly, and Crotch's bumble bee to a less than significant level. The Ogier Ponds Alternative would have a smaller impact to Bay checkerspot butterfly, Monarch butterfly, and Crotch's bumble bee than the Project from a reduction in nitrogen emissions.

California tiger salamander, California red-legged frog, and foothill yellow-legged frog

Construction activities could result in direct take of special-status amphibians, loss of habitat, increased predation from nighttime lighting, hazardous material spills, and spread of pathogens. Project impacts on the foothill yellow-legged frog are unlikely to occur therefore the Project would have a less than significant impact on this species.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1c(1)** provides additional avoidance and minimization during activities in the dewatered reservoir. **Mitigation Measure TERR-1c(2)** compensates for any impacts of fish locations to Upper Penitencia Creek by removing nonnative species that could affect special-status amphibians from Valley Water-owned properties in the Upper Penitencia Creek watershed. Implementation of VHP mitigation payments, BMPs, compliance with applicable VHP conditions, and **Mitigation Measures TERR-1c(1)** and **TERR-1c(2)** will reduce Project impacts on the California tiger salamander and California red-legged frog and reduce any adverse effects on the foothill yellow-legged frog that could occur to less than significant with mitigation. The Ogier Ponds Alternative would have a smaller impact to California tiger salamander, California red-legged frog, and foothill yellow-legged frog than the Project by reducing habitat impacts at Ogier Ponds.

Western Pond Turtle

Construction activities could impact western pond turtle habitat and nests. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. The western pond turtle is covered by the VHP, and most of the activities that could impact this species (including post-construction operations under FAHCE rule curves) are explicitly VHP-covered. With implementation of BMPs, DMP measures, and compliance with the VHP, Project impacts on the western pond turtle will be less than significant. The Ogier Ponds Alternative would have a smaller impact to western pond turtle as the Project by reducing habitat impacts at Ogier Ponds.

Bald Eagle and Golden Eagle

Up to two pairs of bald eagles have nested near Anderson Reservoir in recent years and at least two golden eagle territories overlap the reservoir with recently occupied nests located 0.34 and 0.83 miles from the edge of the reservoir. Construction would impact foraging habitat and disturb nests. Following completion of construction, foraging habitat for the bald eagle would be enhanced as the reservoir is allowed to refill. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water would obtain a BGEPA permit from the USFWS to obtain authorization for the loss of any eagle productivity and would comply with permit conditions. **Mitigation Measure TERR-1e** implements additional AMMs to minimize impacts on nesting eagles. With implementation of BMPs, DMP measures, compliance with the VHP and BGEPA permit conditions, and **Mitigation Measure TERR-1e**, Project impacts on bald eagle and golden eagle will be **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impact to bald eagle and golden eagle as the Project.

Tricolored Blackbird, Yellow Warbler, White-tailed Kite, Northern Harrier, and Other Breeding Birds

A variety of bird species protected by the MBTA and Fish and Game Code breed, forage, and roost in the Project Area. Construction activities could result in the physical disturbance or destruction of active nests and affect the behavior of birds. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With creek flow augmentation, groundwater monitoring, and dryback monitoring (with additional flow augmentation, and payment of VHP impact fees for impacted wetland and riparian habitat, as necessary), implementation of BMPs, DMP measures, and compliance with VHP conditions impacts on nesting special-status and nonspecial-status birds would be **less than significant**. The Ogier

Ponds Alternative would have a smaller impact to protected breeding birds than the Project by reducing habitat impacts at Ogier Ponds.

Nonbreeding special-status birds

Several special-status bird species including the Swainson's hawk, burrowing owl, and peregrine falcon, are not known or expected to breed in any areas where they could be impacted by Project activities, but they could occur there as nonbreeding foragers, particularly during migration and in winter. Construction could disturb foraging individuals, burrowing owls could be injured or killed if they are present in burrows when grading occurs, and construction activities could disturb roosting owls to the point of abandonment of their burrows. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1g** would identifies locations of burrowing owls prior to initiation of Project activities to avoid injury or mortality. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1g**, Project impacts on nonbreeding special-status birds would be **less than significant with mitigation**. The Ogier Ponds Alternative would have a smaller impact to nonbreeding special-status birds as the Project by reducing habitat impacts at Ogier Ponds.

Pallid Bat

A maternity colony of the pallid bat has been located just outside of the Seismic Retrofit Area, in the Cochrane Road barn. This colony likely represents the largest and most stable colony of the species known in the county. Construction would not result in direct impacts on the Cochrane Road barn; however, given the intensity of construction activities, which would include some nighttime work, and the extent to which foraging habitat on Anderson Dam would be disturbed during construction, it is possible that pallid bats may abandon the roost within the barn while construction is ongoing. If pallid bats abandon the roost during construction, they may return once construction has been completed. However, unless high-quality alternative roost sites are present in the vicinity, the population may decline before the bats can re-occupy the barn. When trees, structures, or rock outcrops containing roosting colonies or individual bats are removed or modified, individual bats could also be physically injured, killed, or subjected to physiological stress resulting from being disturbed during torpor. Construction activities would result in the short-term loss of foraging habitat as well as a temporary impact on foraging individuals through the alteration of foraging patterns.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1h(1)** will minimize construction activities near the barn. If buffers in TERR-1h(1) are not feasible, **Mitigation Measure TERR-1h(2)** will develop an eviction plan for pallid bats to be implemented if deemed necessary. **Mitigation Measure TERR-1h(3)** will minimize the potential for males and nonbreeding females outside the barn to be injured or killed during Project activities. **Mitigation Measure TERR-1h(4)** will provide temporary roosting sites near the Project during construction and additional permanent roosting sites if the roost population is not restored to at least 75 percent by three years following construction. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1h(1)**, **TERR-1h(2)**, **TERR-1h(3)**, **and TERR-1h(4)**, Project impacts on pallid bats will be reduced. The Project could cause the number of females at this site to drop below 75 percent of existing numbers, and a substantial proportion of the regional population would have been affected. No other mitigation would be feasible to reduce this impact therefore the impact is **significant and unavoidable**. The Ogier Ponds Alternative would have the same impact to pallid bat as the Project.

Other special-status mammals

This impact analysis addresses San Francisco dusky-footed woodrat, mountain lion, ringtail, American badger, Townsend's big-eared bat, and western red bat. San Francisco dusky-footed woodrat has been detected around Basalt Hill and likely resides in crevices there. Seismic retrofit construction would result in the loss of 43.2 acres of suitable habitat for the species. In addition, construction could result in the injury or mortality of individual woodrats and disturbance or destruction of nests and young. Construction and monitoring could disrupt the habitat of these species and their foraging. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With implementation of BMPs, DMP measures, and compliance with the VHP conditions, Project impacts on special status mammals will be **less than significant.** The Ogier Ponds Alternative would have the same impact to California special-status mammals as the Project.

San Francisco Bay special-status species

Valley Water modeled potential effects of construction-period flows on tidal habitats along lower Coyote Creek and Coyote Slough. This modeling assumed that higher flows would be coupled with tide height equaling MHHW to represent the conditions that would occur if higher flows down Coyote Creek coincided with high tides. Modeling suggests that reservoir releases could result in increased frequency, depth, and/or duration of inundation of tidal marsh habitats far downstream from the dam. Such increased inundation would reduce the vegetative cover available to special-status species associated with San Francisco Bay tidal marshes, increasing predation of special-status tidal marsh animals that have to seek out more limited patches of vegetation that is not inundated. Such impacts would be infrequent and would occur only during the construction period but would be significant. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. **Mitigation Measure TERR-1j** requires contributing to predator management activities in the South Bay and high tide refugia enhancement, thereby offsetting increases in predation resulting from the Project for each year flows exceed 2,500 cfs. With implementation of BMPs, compliance with the VHP conditions, and **Mitigation Measure TERR-1j**, Project impacts on San Francisco Bay special-status species will be less than significant with mitigation. The Ogier Ponds Alternative would have the same impact to San Francisco Bay special-status species as the Project.

Riparian Habitat and Other Sensitive Natural Communities

The Project will result in permanent impacts on a total of 19.3 25.77 acres of mixed riparian woodland and forest and willow riparian forest and scrub, including 1.29 4.14 acres from Seismic Retrofit construction and 18 21.63 acres from Conservation Measures construction. However, approximately 39.5 acres of riparian habitat will be restored as part of the Ogier Ponds CM. Therefore, the Project will result in a net increase in the acreage of riparian woodland, forest, and scrub habitat. This net increase will help to compensate for the temporal loss of riparian functions and services.

The Project will permanently impact a total of 15 acres of coast live oak woodland and forest, 11.2 acres of foothill pine-oak woodland, and 2.5 acres of mixed serpentine chaparral, mostly from Seismic Retrofit construction. VHP fees to be paid by Valley Water for the Project include specialty fees for mixed riparian woodland and forest, willow riparian forest and scrub, and mixed serpentine chaparral, in addition to general land cover fees. The Project's impact fees would contribute directly to the conservation of sensitive natural communities, including not only these riparian and serpentine communities, but also the coast live oak woodland and forest, and foothill pine-oak woodland, land cover types that will be impacted by the Project.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Existing BMPs, DMP measures, and AMMs do not address the risk of introduction or spread of *Phytophthora*. **Mitigation Measure TERR-1a(2)** includes procedures to reduce the risk of *Phytophthora*. With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1a(2)**, Project impacts on riparian habitat and other natural communities will be less than significant with mitigation. The Ogier Ponds Alternative would have a smaller impact to riparian habitat than the Project by reducing habitat impacts at Ogier Ponds.

Wetlands

Construction activities would result in the placement of fill, and related hydrological interruption, alteration of bed and bank, degradation of water quality, and other direct impacts on the acreages and linear footage of wetlands (coastal and valley freshwater marsh), non-wetland other waters (perennial stream, intermittent stream, pond, and reservoir), and mixed riparian woodland and forest as indicated in **Table 3.5-13**. The Project will result in permanent impacts to 4.2 acres of freshwater marsh, but in addition to paying VHP permanent wetlands impacts fees, the Ogier Ponds CM will create 4.5 acres of emergent freshwater marsh. The Project will result in permanent impacts to 5.99 acres. All impacted reservoir acres will be restored or recovery to reservoir after construction. Valley Water predicts that approximately 12.5 acres of riverine aquatic habitat below the OHWM would be restored as part of the Ogier Ponds CM, ~~with additional acres of riverine aquatic habitat from the North Channel Extension CM~~.

BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water will pay VHP impact fees for wetlands, other waters, and riparian habitats, which include specialty fees for these important land cover types. The Interagency Review Team, including USACE, CDFW, and the RWQCB, have approved the VHP as an In Lieu Fee Program for impacts to waters of the United States and waters of the State. The implementation of the Conservation Measures more than offsets and compensates for the Project's net impacts on jurisdictional waters and wetlands.

Existing BMPs, DMP measures, and AMMs do not address the risk of introduction or spread of *Phytophthora.* **Mitigation Measure TERR-1a(2)** includes procedures to reduce the risk of *Phytophthora.* With implementation of BMPs, DMP measures, compliance with the VHP conditions, and **Mitigation Measure TERR-1a(2)**, Project impacts on wetlands will be **less than**

significant with mitigation. The Ogier Ponds Alternative would have a smaller impact to wetlands than the Project by reducing habitat impacts at Ogier Ponds.

Wildlife Corridors

Seismic retrofit construction would have both adverse and beneficial effects, all temporary, on wildlife movement. Construction activities, especially nighttime activities, could disrupt wildlife movement. Although Project activities may temporarily affect wildlife movement during construction, animals would still be able to move through the Project Area during construction, and the drained reservoir improves wildlife movement in the area around the reservoir. No long-term impacts on wildlife movement would result from the Project. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. With implementation of BMPs, DMP measures, and compliance with the VHP conditions, Project impacts on wildlife movement would be **less than significant.** However, considering the impacts to pallid bats discussed about, the Project would have a **significant and unavoidable** impact to wildlife nursery sites. The Ogier Ponds Alternative would have the same impact to wildlife corridors as the Project.

Tree Ordinance

Seismic Retrofit construction would result in the removal of approximately 270 ordinance-sized trees. The Ogier Ponds CM and Coyote Percolation Dam CMs, and the North Channel Extension improvements would result in the removal of 40 trees protected by County tree removal regulations. BMPs applicable to this impact are identified in **Table 3.5-6**. VHP conditions applicable to this impact are provided in **Table 3.5-7**, and VHP-related AMMs are provided in **Table 3.5-8**. Valley Water is exempt from compliance with the County tree ordinance under either Government Code sections 53091(d) and (e) (which state that County or City building and zoning ordinances do not apply to the construction of facilities for water storage or transmission) meaning there would be **no impact**. Nevertheless, recognizing the importance of protected trees to the county and the terms of the County ordinance, Valley Water will implement **Mitigation Measure AES-1**, calling for the planting of replacement trees removed on County Park land. The Ogier Ponds Alternative would have the same impact to tree ordinances as the Project.

Conflict with Habitat Conservation Plan/Natural Community Conservation Plan

Valley Water is a signatory on one conservation plan: the VHP, which is an HCP and NCCP for terrestrial species and related habitats. As described in *Project Description*, the VHP explicitly included the Project in its list of covered activities, and most impacts of the Project were included in the VHP's analysis of the effects of covered activities. Valley Water would apply for VHP coverage for the Project and adhere to all applicable VHP Conditions during Project implementation. Therefore, the Project would not conflict with the VHP. The impact is **less than significant**. The Ogier Ponds Alternative would have the same impact to HCP/NCCP compliance as the Project.

Mitigation Measures

TERR-1a(1) Invasive Plant Management at Coyote Ridge Valley Water's Tiburon Paintbrush Populations Population

TERR-1a(2) Implementation of Avoidance and Minimization Measures during Post-Construction Maintenance at Anderson Dam and Conservation Measures Facilities to Reduce the Potential for Introduction or Spread of Phytophthora

TERR-1a(3) Special-Status Plant Survey in the Previously Unsurveyed Portions of the Seismic Retrofit Are

TERR-1a(4) Seed Collection and Creation of a New Population of San Francisco Collinsia Conservation Measures

TERR-1c(1) Special-Status Species Avoidance and Minimization Measures During Year 6 Reservoir Dewatering

TERR-1c(2) Nonnative Species Management in Upper Penitencia Creek Watershed

TERR-1e Nesting Eagle Avoidance and Minimization Measures

TERR-1g Burrowing Owl Impact Avoidance

TERR-1h(1) Avoid Disturbance of the Cochrane Road Barn Roost

TERR-1h(2) Evict Pallid Bats prior to Initiating Maternity-Season Disturbance near the Cochrane Road Barn Roost

TERR-1h(3) Minimize Impacts on Pallid Bats Roosting Outside the Cochrane Road Barn

TERR-1h(4) Provide Alternative Pallid Bat Maternity Roost Structures

TERR-1j Contribution to Baylands Predator Management and High Tide Refugia Enhancement

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **cumulatively considerable** impacts on pallid bats and the pallid bat nursery site, but **not cumulatively considerable** impacts on other wildlife species and habitats. Cumulative impacts would be less than the Project’s cumulative impacts.

5.9.4.6 Cultural Resources

The Increased Ogier Ponds Alternative would have the similar but slightly greater impacts to Cultural Resources as described in Section 3.6, *Cultural Resources*.

Historic Resources

The Rhoades Ranch Historic District is near the Seismic Retrofit area, but there would be no direct impact on the historical resource. Dust and noise from construction would cause minor impacts; however, they would be temporary and would not alter the elements that contribute to the significance of the resource. The Coyote Percolation Dam, which is a contributing element to the Santa Clara Valley Water District Dams Historic District, is in the construction limits of the Phase 2 Coyote Percolation Dam CM. However, implementation of this Conservation Measure would have no impact on the dam because, prior to Project implementation, the resource will have been demolished and replaced by an inflatable bladder dam as part of FOCP. Therefore, the FAHCE-Plus Modified Alternative will have a **less-than-significant impact** to the built environment historical resources. The alternative would have the same impact as the Project.

Archeological Resources

Archaeological resources that have been determined to be eligible for listing for the NRHP/CRHR through formal evaluation, or that have not been formally evaluated but are assumed eligible for the purpose of this analysis, are in the Seismic Retrofit Project Area, and within the boundaries of the Ogier Ponds CM and the Phase 2 Coyote Percolation Dam CM. Ground disturbance during construction at archaeological resources in both the Seismic Retrofit construction area and the Ogier Ponds CM areas could have significantly impact elements of sites that contribute to their NRHP/CRHR-eligibility. In addition, erosion and recreational power boating within Anderson Reservoir related to the operation of the Seismic Retrofit component of the Project could create wave action along the exposed shoreline of the reservoir as the reservoir is refilled after Project completion, during the regular rise and fall of the reservoir due to Project operation and the resumption of recreational boating. These actions may erode archaeological historical resources and displace the artifacts within them.

BMP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will require that work will cease in areas where archaeological materials are discovered during construction until the finds can be analyzed and evaluated for NRHP/CRHR-eligibility, and that any eligible resources either be avoided or subject to data recovery studies. **Mitigation Measure CR-1** (Preconstruction Cultural Resources Awareness Training) will provide construction workers with awareness training about the nature of archaeological materials that might be discovered during ground disturbing activities and the protocols to be followed, should they be found. **Mitigation Measure CR-2** (Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided) will develop and implement a Data Recovery and Treatment Plan for archaeological resources that cannot be avoided. Lastly, **Mitigation Measure CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require an archaeological and tribal monitor in areas sensitive for cultural resources during Project construction, the monitoring of sensitive areas during Project operations, and will implement protocols of the Monitoring and Unanticipated Discoveries Plan should archaeological materials be discovered. With implementation of these mitigation measures, substantial adverse changes in the significance of an archaeological resource would not occur, and significant impacts to archaeological historical resources within the Project areas would be reduced to **less than significant through mitigation**. The alternative would have a greater impact on archeological resources than the Project with greater activities around Ogier Ponds that could uncover undiscovered resources.

Human Remains

Two archaeological sites with human remains and one with a high potential to contain as-yet unidentified human remains are known to exist within Anderson Reservoir. All three of these sites in the reservoir could be damaged by erosion from fluctuating water levels during Seismic Retrofit operations and wave action caused by power boating. Therefore, Project impacts on disturbance of human remains would be significant. Compliance with Health and Safety Code section 7050.5 and PRC section 5097.98 would reduce impacts related to disturbance of human remains and **Mitigation Measures CR-1, CR-2, and CR-3** will reduce impacts to disturbing human remains to **less than significant with mitigation**. The alternative would have a greater impact to disturbance of human remains than the Project with greater activities around Ogier Ponds that could uncover human remains.

Mitigation Measures

CR-1 Pre-construction Cultural Resources Awareness Training

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on cultural resources. Cumulative impacts would be greater than the Project's cumulative impacts.

5.9.4.7 Energy

The Ogier Ponds Alternative would involve less excavation for the Coyote Creek Channel and less earth moving for filling because Pond 1 would not be filled, energy consumption due to use of construction equipment and truck traffic would be less than the Project. Other impacts are the same as described is Section 3.7, *Energy*.

Energy Consumption

Construction of the Seismic Retrofit and Conservation Measures components would consume approximately 17,842,000 ~~21,150 thousand~~ gallons of diesel and 780,000 ~~2,103 thousand~~ gallons of gasoline and result in increased demand on local and regional infrastructure. However, compared to the northern California region's annual average production of fuel over the 5-year period of 2018-2022, the total annual average energy demand of the Project be approximately 0.01 ~~0.03~~ percent of the region's gasoline production throughput and approximately 0.89 0~~.75~~ percent of the region's diesel production throughput (CEC 2023). The impacts of Project construction on local and regional fuel supplies would be temporary and minimal.

Although the energy related impact is less than significant, the Project will implement **Mitigation Measures AQ-1 and GHG-1** to address air quality and greenhouse gas emission impacts. These measures would further minimize Project energy impacts by increasing the efficiency of energy usage and decreasing the amount of non-renewable energy usage during construction. **Mitigation Measure AQ-1** requires all construction equipment greater than 25 hp and operating for more than 20 hours over the entire duration of construction activities to be equipped with Tier 4 engines and would require all on-road truck engines and boats to be year 2010 or newer and minimizes construction equipment idling time and requires regular maintenance for all equipment. **Mitigation Measure GHG-1** requires engine electrification and use of renewable fuels as feasible.

Project construction would utilize fuel-efficient equipment consistent with State and federal regulations and would comply with State measures to reduce the inefficient, wasteful, or unnecessary consumption of energy. Per applicable regulatory requirements of CALGreen, Project construction activities would comply with construction waste management practices to divert construction and demolition debris from landfills. These practices would result in efficient use of energy by Project construction. The Ogier Ponds Alternative's impact on energy use would be **less than significant impact with mitigation**. The alternative would have less of an impact on energy use than the Project.

State and Local Efficiency Plans

Project construction would be consistent with renewable energy and energy efficiency targets, standards, and guidance included in California Green Building Standards Code (CALGreen or Title 24 Part 11), California Building Energy Efficiency Standards (Title 24 Part 6), SB 100, Valley Water CCAP, Santa Clara County General Plan, Santa Clara County Sustainability Master Plan, Morgan Hill 2035 General Plan, and Envision San José 2040 General Plan with implementation of **Mitigation Measures AQ-1** and **GHG-1**. Project operation related to equipment and vehicle energy use would be consistent with these regulations and plans without mitigation. Therefore, Project construction and operation would not conflict with or obstruct a State or local plan for renewable energy or energy efficiency, and overall impacts would be **less than significant with mitigation**. The alternative would have less of an impact on energy use than the Project.

Mitigation Measures

AQ-1 Implement Construction Criteria Air Pollutants Reduction Measures

GHG-1 Utilize Electrification and Renewable Fuels During Construction

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on due to wasteful, inefficient, or unnecessary consumption of energy. The FAHCE-plus Modified Alternative would have **not cumulatively considerable** impacts related to conflict or obstruction of renewable energy and energy efficiency plans. Cumulative impacts would be less than the Project's cumulative impacts.

5.9.4.8 Geology and Soils

The Ogier Ponds Alternative would have similar impacts to geology and soils as described in Section 3.8, *Geology and Soils*. Less fill would be needed as Pond 1 would not be filled, but the alternative would have a greater extend of ground disturbance as the new channel for Coyote Creek would be excavated to the west of the alignment in the Project.

Fault Rupture and Shaking

The nearby active Calaveras fault lies just east of Anderson Reservoir and the active Coyote Creek Range fault transects Anderson Dam. However, construction and operation of the Project would not exacerbate the risk of fault rupture. The reservoir is not deep enough to cause RIS, vibrations associated with blasting and tunneling activities would not affect the earth at depths of where the underlying faults are locked (URS 2022), and no Project-related actions would increase the likelihood of seismic activity and associated surface fault rupture. As the Project would not increase the likelihood of an earthquake, exacerbate the likelihood of surface fault rupture, or increase the likelihood of seismic ground shaking in the Project area the Ogier Ponds Alternative would have **less-than-significant impact** on seismic related hazards. The Ogier Ponds Alternative would have the same impact as the Project.

Liquefaction

The Project is in an area susceptible to liquefaction. Placement of dam materials could increase the load on liquefiable soils, which may densify and settle during an earthquake. Placement of structures associated with the Conservation Measures, namely the levee at Ogier Ponds and the fish ramp at the Coyote Percolation Pond on liquefiable soils could exacerbate liquefaction hazards in those areas. The impact from liquefaction would be **less than significant**. The Ogier Ponds Alternative would have the same impact as the Project.

Landslides

Anderson Dam is in a mountainous area with steep slopes and unstable ground conditions that are susceptible to landslides due to faults and historic landslides that predate the reservoir. Ground disturbance associated with construction of the seismic retrofit of Anderson Dam, including drawdown of the reservoir, construction of stockpiles near landslides, removal of materials from the BHBA and the PGBS, and refilling of the reservoir could exacerbate likelihood of landslide, lateral spreading, and settlement by destabilizing landslide deposits. Excavation associated with the North Channel Extension conservation measure would occur near slopes that are mapped by CGS (2004) as susceptible to landslide. Excavation and construction of new stream channels associated with the Ogier Ponds CM, North Channel Extension, and Phase 2 Coyote Percolation Dam CM into liquefiable soils could increase risk of lateral spreading. All construction activities would be performed in accordance with DSOD, IBC, and CBC standards as applicable. In addition, Valley Water would continue to monitor slope stability and landslide movement through installed survey monuments and satellite reflectors within the reservoir as part of its normal operations. Valley Water implemented the Reservoir Bank and Rim Stability Mitigation and Monitoring Plan, Dewatering and Sediment Management Plan, and Slope Stability Plan. All these measures serve to reduce any landslide risks by taking action to minimize soil instability and monitoring for signs of land movement. The Project will also implement **Mitigation Measure GEO-1** (Repair Landslides Caused by Construction Activities) to reduce the risk of landslide as such that the Project's landslide risk is **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impact as the Project.

Soil Erosion

Excavation and ground-disturbing activities associated with construction of the Project could result in soil erosion or the loss of topsoil. Such activities include clearing and preparing staging and stockpile areas; constructing, using, and maintaining stockpiles; excavating materials at borrow sites and conservation measures sites; placing sediment; and constructing and using unpaved roads. For construction activities outside of the reservoir, the The Project would implement a SWPPP in compliance with the Construction General Permit, and a set of erosion control BMPs (BMPs GEN-20, GEN-21, WQ-4, WQ-5, BI-3, BI-8, WQ-9, AQ-1, BANK-1, and REVEG-1) to minimize erosion around stockpiled soils and staging areas, stabilizing construction entrances and exits, removing any temporary fills, restoring the site to its pre-construction condition, and reducing fugitive dust. With adherence to requirements of the SWPPP for out-of-reservoir construction activities and BMPs, substantial soil erosion or loss of topsoil resulting from the Projects project would be **less than significant.** While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. The Ogier Ponds Alternative would have the same impact as the Project.

Paleontological Resources

Santa Clara Valley is known for yielding significant fossils from alluvium (Maguire and Holroyd 2016). In addition, other geologic units of Pleistocene age and older in the county are documented to have yielded significant fossils, including vertebrate fossils. One of these is the Santa Clara Formation in the Project area known locally as the Packwood Gravels. Excavation and ground-disturbing activities associated with Seismic Retrofit construction occurring in regions underlain by the Santa Clara Formation could expose paleontological resources. In addition, higher peak flows released from Anderson Dam during Project operation could increase risk of erosion downstream, which could increase risk of erosion uncovering significant paleontological resources and removing them from the original context, thereby potentially reducing their scientific significance. Excavation and ground-disturbing activities associated with the Project could expose paleontological resources. The Project will implement **Mitigation Measure GEO-3** (Paleontological Initial Survey), **Mitigation Measure GEO-4** (Paleontological Detailed Survey and Construction Monitoring), and **Mitigation Measure GEO-5** (Paleontological Discoveries Treatment Plan) that will require a pre-construction survey, construction monitoring, and plan for discovery of resources. The Project's impact on paleontological resource would **be less than significant with mitigation**. The Ogier Ponds Alternative would have a greater impact as the Project as the alternative would increase the extent of ground disturbance for the new Coyote Creek channel.

Mitigation Measures

GEO-1 Repair Landslides Caused by Construction Activities

GEO-2 Prepare a Geotechnical Investigation for Lateral Spreading Risk and Implement Recommendations

GEO-3 Paleontological Initial Survey

GEO-4 Paleontological Detailed Survey and Construction Monitoring

GEO-5 Paleontological Discoveries Treatment Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on geology and soils. Cumulative impacts would be greater than the Project's cumulative impacts.

5.9.4.9 Greenhouse Gas Emissions

The Ogier Ponds Alternative would result in emissions of GHGs during construction. However, because this alternative would involve less excavation for the Coyote Creek Channel and less earth moving for filling because Pond 1 would not be filled, GHG emissions would be less than the Project as described in Section 3.9, *Greenhouse Gas Emissions*.

Greenhouse Gas Emissions

Project construction would generate approximately 235,240 MT CO_2e of GHG emissions, which is a significant impact. The changes at Ogier Ponds would result in a small reduction in this total. Project operation would result in negligible generation of GHG emissions. Implementation of **Mitigation Measure GHG-1** will require Valley Water and/or its contractor to implement construction-related GHG emission reduction measures, such as using zero-emission and hybrid-powered equipment, minimizing idling time, using renewable diesel fuel, using USEPA SmartWay certified trucks, requiring proper maintenance of construction equipment, encouraging and providing carpool, transit, and alternative modes of transportation, recycling or salvaging nonhazardous debris, and efficiently using water. Implementation of **Mitigation Measure GHG-2** will require Valley Water to offset GHG emissions ~~purchase carbon offsets~~ before construction activities commence in an amount sufficient to reduce any GHG emissions remaining after implementation of **Mitigation Measure GHG-1** to less-than-significant levels. With implementation of **Mitigation Measures GHG-1** and **GHG-2**, Project construction GHG emissions impacts will be **less than significant with mitigation**. The Ogier Ponds Alternative would have a smaller impact on greenhouse gas emissions than the Project.

GHG Plans

Project construction would be consistent with SB 32, AB 1279, the 2022 Scoping Plan, the Valley Water CCAP, the Morgan Hill CAP, and Climate Smart San José with implementation of **Mitigation Measures GHG-1** and **GHG-2**. Project operation would not conflict with these GHG reduction policies and plans without mitigation. Therefore, the Project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing GHG emissions, and overall impacts would be **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impact to GHG reduction plans as the Project.

Mitigation Measures

GHG-1 Utilize Electrification and Renewable Fuels During Construction

GHG-2 ~~Purchase Carbon Offsets~~ Offset GHG Emissions Prior to and During Construction

~~GHG-1 Construction GHG Mitigation~~

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on GHG emissions. Cumulative impacts would be less than the Project's cumulative impacts.

5.9.4.10 Hazards and Hazardous Materials

The Ogier Ponds Alternative would have similar impacts to hazards materials are the Project as described in Section 3.10, *Hazards and Hazardous Materials*; however, the alternative may be located on sites that are included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and has the potential to encounter soil or groundwater contamination due to the previous agricultural and mining uses in the alternative Coyote Creek channel.

Use and Accidental Release of Hazardous Material

During the construction of the Seismic Retrofit and Conservation Measures, hazardous materials commonly associated with construction activities (e.g., gasoline, diesel fuel, paints, solvents, hydraulic fluid) would be present and handled onsite, as well as transported to and from the Project Area and would create impacts if accidentally released. These materials would be primarily found within construction equipment but may also be stored onsite at the staging areas, and transported, as necessary, to work areas. NOA is known to be present in the rock types that underlay much of the dam and spillway area. Excavation of serpentinite and other materials containing NOA could expose the public and construction workers to airborne asbestos, which would be a significant impact.

The Project project is required to comply with federal, State, and local laws, regulations, and policies designed to minimize hazardous materials impacts to the public and environment. The Project would implement Valley Water BMPs (HM-8, WQ-6, WQ-17) to minimize the chance of release of hazardous materials. For Seismic Retrofit construction, compliance with BAAQMD's ATCM for Construction, and BMP-AQ-1 and BMP HM-13, would minimize potential impacts from NOA. The implementation of **Mitigation Measure HAZ-1** (Construction and Grading Operations Dust Control Measures), **Mitigation Measure HAZ-2** (Track Out Control Measures for Roads from NOA-Containing Areas), **Mitigation Measure HAZ-3** (Traffic Control Measures within NOA-Containing Construction Areas), **Mitigation Measure HAZ-4** (Dust Control Measures During Earthmoving Activities), **Mitigation Measure HAZ-5** (Dust Control Measures During Tunneling Activities), and **Mitigation Measure HAZ-6** (Separation of Rock Containing NOA) will reduce the Project's impact from hazardous material to **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impact as the Project to hazardous material due.

Sensitive Receptors

The William F. James Boys Ranch (Boys Ranch) is located within 0.11 miles of Anderson Dam, which is considered a sensitive receptor for hazardous materials. During construction compliance with BAAQMD's ATCM for Construction, and BMP-AQ-1 and BMP HM-13, would minimize potential impacts from NOA. The implementation of MM HAZ-1 through HAZ-6 and **Mitigation Measure HAZ-7** (Soil Testing and Proper Disposal of Potentially Contaminated Soils) will reduce the Project's impact to sensitive receptors **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impact as the Project to sensitive receptors.

Discovery of Hazardous Materials

The alternative Coyote Creek channel at Ogier Ponds may be located on sites that are included on a list of hazardous materials sites compiled pursuant to Government Code section 65962.5 and has the potential to encounter soil or groundwater contamination due to the previous agricultural and mining uses. Other project sites that are the same as the Project as listed. There is also potential to discover unknown hazardous materials sites during construction activities, which would be a significant impact. Implementation of BMP HM-9 would include measures for proper handling, storage, and disposal of hazardous materials and **Mitigation Measure HAZ-7** will minimize impacts to the public or environment should unknown contaminants or contaminated soil be encountered during construction activities. For the Ogier Pond Alternative, Valley Water would implement **Mitigation Measure OP-HAZ-1** (Implement Recommendations in the Phase I HSLA) for APNs 725-04-002, 725-05-011, and 725-05-014. The Project's impact on hazardous sites and the discovery of hazardous materials is **less than significant with mitigation**. The Ogier Ponds Alternative would have a greater impact than the Project to hazardous waste sites.

Emergency Response and Evacuation Plan

Construction would involve operation of large construction equipment, transport and storage of construction materials, and worker commute trips to and from the area, which could impede movement and access of emergency response vehicles or interfere with evacuation procedures, which would be a significant impact. Cochrane Road between Coyote Road and Malaguerra Avenue (or portions of this segment) would be closed to through traffic for varying durations throughout the construction period. Implementation of BMP TR-1, PS-AMM-2, **Mitigation Measure PS-1** (Prepare and Implement Traffic Management Plan) which requires the preparation and implementation of a TMP, and **Mitigation Measure WF-1** which requires coordination with local and state emergency response and fire agencies and preparation of a Response and Evacuation Strategy, which will maintain adequate emergency response and identify and maintain evacuation routes, that all emergency response agencies are notified in advance of all lane and road closures and that evacuation routes are passable or alternate routes are available will reduce impacts on emergency response to less-than-significant levels. Impacts related to impairing implementation of or interfering with an adopted emergency response plan or emergency evacuation routes/plans would be **less than significant with mitigation.** The Ogier Ponds Alternative would have the same impact as the Project on emergency response.

Valley Fever

As discussed in Section 3.10.1.6, *Valley Fever*, construction activities have the potential to release the soil-dwelling fungus (Coccidioides) that can cause Valley Fever. Such a release could pose a hazard to construction workers and/or the public, which would be a significant impact. BAAQMD's ATCM for Construction, BMP-AQ-1, and **Mitigation Measures HAZ-1** through **HAZ-5** will implement dust control measures to minimize potential impacts from Valley Fever. The risk of Valley Fever is **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impact as the Project related to Valley Fever.

Mitigation Measures

HAZ-1 Construction and Grading Operations Dust Control Measures

HAZ-2 Track Out Control Measures for Roads from NOA-Containing Areas

HAZ-3 Traffic Control Measures within NOA-Containing Construction Areas

HAZ-4 Dust Control Measures During Earthmoving Activities

HAZ-5 Dust Control Measures During Tunneling Activities

HAZ-6 Separation of Rock Containing NOA

HAZ-7 Soil Testing and Proper Disposal of Potentially Contaminated Soils

OP-HAZ-1 Implement Recommendations in the Phase I HSLA

Valley Water will conduct a Phase I HSLA study on the properties to be acquired for the new Coyote Creek channel around the Ogier Ponds (APNs 725-04-002, 725-05-011, and 725-05-014 or other properties based on final design) and implement any recommendations that come out of the report to protect the surrounding environment and groundwater resources.

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on hazards and hazardous materials related to reasonably foreseeable upset or accident conditions, emission of hazardous materials within one-quarter mile of a school, a site included on a list of hazardous materials sites, and Valley Fever. The Ogier Ponds Alternative would have **not cumulatively considerable** impacts related to routine transport, use, or disposal of hazardous materials and impairment or interference with an emergency response or evacuation plan. Cumulative impacts would be greater than the Project's cumulative impacts.

5.9.4.11 Hydrology

The Ogier Ponds Alternative would have similar impacts to hydrology as the Project as described in Section 3.11, *Hydrology*. The alternative would create a new channel for Coyote Creek around Ogier Ponds, but this would not affect the impact of erosion from sediments on the bottom of Anderson Reservoir. A work area that is greater in extent for the new channel would slightly increase the risk of erosion and release of hazardous materials from construction. The alternative channel would be designed to convey flood flows and would not affect the risk of flooding from dam inundation.

Erosion

The Project would discharge large volumes of sediment following storms while the reservoir is dewatered given the exposure of sediments previously inundated on the bottom of Anderson Reservoir and the limited capacity to store water behind the coffer dam during construction. Construction and maintenance associated with the various components have the potential to loosen materials that could be washed downstream, thus contributing to accelerated rates of erosion and sedimentation. **Mitigation Measure WQ-1** requires implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. However, impacts would remain significant even with implementation of **Mitigation Measure WQ-1**. However, because addition mitigation is not available to decrease the magnitude of the impact to a less-than-significant level, erosion to Coyote Creek from sediments on the bottom of Anderson Reservoir is **significant and unavoidable**.

Implementation For construction activities outside of the reservoir, implementation of a SWPPP and erosion control BMPs such as: BMP AQ-1 (Use Dust Control Measures), BMP WQ-4 (Limit Impacts From Staging and Stockpiling Materials), BMP WQ-1 (Conduct Work from Top of Bank), BMP WQ-2 (Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms), BMP WQ-5 (Stabilize Construction Entrances and Exits), BMP WQ-9 (Use Seeding for Erosion Control, Weed Suppression, and Site Improvement), BMP WQ-10 (Prevent Scour Downstream of Sediment Removal), BMP WQ-11 (Maintain Clean Conditions at Work Sites), BMP WQ-16 (Prevent Stormwater Pollution) will reduce erosion and sedimentation. However, erosion to Coyote Creek from sediments on the bottom of Anderson Reservoir is **significant and unavoidable**. With the SWPPP and BMPs for out-of-reservoir construction activities, the impact of erosion aside from reduced sediment being carried downstream during certain-sized storm events would be **less than significant**. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. The Ogier Ponds Alternative would have the same impact as the Project on erosion from construction.

Runoff

Project construction and maintenance activities would involve denuding areas of vegetation to create access or stable surfaces, which reduce the capacity of these areas to absorb water and slow runoff. Utilization of areas by heavy equipment during construction would compact soils, making the ground surface harder and less conducive to infiltration of water to soil or groundwater. The Seismic Retrofit components of the Project would create relatively minor amounts of new impervious surface (widened/expanded existing roadways). Compliance with the SWPPP and erosion control BMPs for out-of-reservoir construction activities would assure that surface runoff would be **less than significant**. The Ogier Ponds Alternative would have the same impact as the Project on sedimentation.

Surface Runoff

Due to the use of hazardous materials (e.g., fuel, oil, lubricants, etc. in construction equipment), there would be potential for discharge of polluted runoff if such materials were handled, stored, or disposed of improperly and/or if any accidental releases of such materials were to occur. The SWPPP, which would be implemented for out-of-reservoir construction, includes good housekeeping measures for: construction materials, waste management, and potential pollutant sources. Additional, BMPs would reduce potential impacts associated with hazardous materials releases: BMP HM-7 (Restrict Vehicle and Equipment Cleaning to Appropriate Locations), BMP HM-8 (Ensure Proper Vehicle and Equipment Fueling and Maintenance), BMP HM-9 (Ensure Proper Hazardous Materials Management), and BMP HM-10 (Utilize Spill Prevention Measures). These BMPs would include protocols for providing secondary containment for hazardous materials used in the field or stored at staging areas or at work sites and providing training spill cleanup materials for field personnel. The Project would have a **less than significant** impact on polluted runoff. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. The Ogier Ponds Alternative would have the same impact as the Project on polluted runoff.

Flooding

During construction of the Seismic Retrofit component, there would be increased potential for flooding (i.e., higher flows could occur in Coyote Creek more frequently during storm events) relative to the existing conditions baseline for flows under the 50-year return period (approximately 4,000 cfs–5,000 cfs); however, this flooding risk would be largely reduced relative to Pre-FERC Order Conditions and would not result in widespread, damaging floods.

During the post-construction period, flooding risk associated with operation of the dam would be reduced relative to the Pre-FERC Order Conditions Baseline. The impact from flooding would be **less than significant.** The Ogier Ponds Alternative would have the same impact as the Project on flooding.

Dam Inundation

The objective of the Project is to reduce the long-term risk of flooding from dam failure. Construction of the Seismic Retrofit components would not directly increase the risk of flooding due to dam failure and would not but could potentially exacerbate the impacts from a failure of Coyote Dam, which is located upstream of Anderson Dam and is also susceptible to seismic risks. Risk of flooding from dam failure increases marginally during construction of the Seismic Retrofit but is minimized through winterization measures in the wet season while the crest of the dam is lowered. A restriction has been in place for Coyote Reservoir since 1992, limiting storage in this reservoir 52.5 percent of total capacity. If Coyote Dam were to fail, the downstream effects would be reduced by the presence of Anderson Reservoir, which itself has been under a restriction since 2009. During Seismic Retrofit construction, each interim reservoir at the end of each construction season would have capacity that exceeds the capacity of Coyote reservoir. Additionally, the seismic retrofit of Anderson Dam would not exacerbate the risk of failure of Coyote Dam or increase potential downstream flooding compared to existing conditions. In addition, the storage restriction on Coyote Reservoir limits the potential effects of severe damage to the dam from an earthquake and the possibility of uncontrolled flows. With restricted capacity the possibility of water overtopping damage caused by an earthquake is nearly completed avoided. Given the very low probability of dam failure, which would require a major earthquake in close proximity to Coyote Reservoir following a wet period that fills the reservoir beyond its capacity to release high flow, the Project's impact on risk from dam inundation is **less than significant**. The Ogier Ponds Alternative would have the same impact as the Project on flooding from dam inundation.

Mitigation Measures

WQ-1 Develop and Implement an In-Reservoir Construction Area Water Quality Monitoring and Protection Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **cumulatively considerable** impacts on erosion and sedimentation, but **not cumulatively considerable** impacts on flooding, polluted runoff, and risk of dam failure. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.12 Groundwater Resources

The Ogier Ponds Alternative would have similar impacts to groundwater as the Project as described in Section 3.12, *Groundwater Resources*. The alternative would create a new channel for Coyote Creek around Ogier Ponds; however, the geology around Ogier Ponds does not support groundwater recharge and the revised channel is not expected to affect in-channel recharge rates. Less fill would require less heavy equipment at Ogier Ponds, but the work would be over a greater surface area to construct the new channel, on balance the likelihood of spills of hazardous material that could affect groundwater are about the same as the Project. The alternative would not affect wells around Anderson Reservoir of the ability of the Project to comply with the Basin Plan or GWMP.

Groundwater Supply

The loss of storage in Anderson Reservoir would greatly limit the amount of water that could be released from reservoir for the purpose of groundwater recharge along Coyote Creek. Seismic Retrofit construction would not substantially affect groundwater storage and supplies or recharge, as WEAP modeling has shown that groundwater storage in the Coyote Valley would remain above the 5,000 GWMP outcome measure, given implementation of imported water releases in Coyote Creek. Impacts to groundwater recharge would be **less than significant**. The Ogier Ponds Alternative would have the same impact as the Project on groundwater recharge.

The dewatering of Anderson Reservoir during the 7-year Seismic Retrofit construction period could impact nearby wells outside of the groundwater basin and managed aquifer; however, this impact will be reduced to less than significant with implementation of **Mitigation Measure GW-1** (Provide Alternative Supplies). As such, the impact to surrounding wells would be **less than significant with mitigation**.

Blasting at the BHBA could release perchlorates and various other water-soluble nitrogen-compounds during the use of explosives. The risk from perchlorates and other water-soluble nitrogen-compounds is primarily in relation to groundwater. Perchlorate salts are highly soluble in water and sorbs poorly to mineral surfaces and organic material; therefore, it is typically very mobile in surface water and groundwater. It is persistent in the environment and at high enough concentrations can affect thyroid gland functions. The risk of groundwater contamination from perchlorates will be minimized by **Mitigation Measure GW-2** (Pollutants from Blasting Activities) which includes a set of BMPs for the proper use and disposal of perchlorate. The impact to groundwater quality is less than significant with mitigation and the Ogier Ponds Alternative would have the same impact as the Project on wells around Anderson.

Groundwater Quality

Construction equipment to be used during construction and maintenance activities would contain hazardous materials, such as fuel, oil, lubricants, etc. that can degrade groundwater quality if spilled or improperly handled. Implementation of a SWPPP for construction activities outside the reservoir, and hazardous materials BMPs, including BMPs HM-7, HM-8, HM-9, and HM-10, which will include protocols for providing secondary containment for hazardous materials used in the field or stored at staging areas or at work sites and providing training and spill cleanup materials for field personnel will reduce impacts to groundwater quality to **less than significant**. The Ogier Ponds Alternative would have the same impact as the Project on groundwater quality. While not required to reduce impacts to less than significant, Mitigation Measure WQ-1 would further reduce these impacts by requiring implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control hazardous materials and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements.

Blasting at the BHBA could release perchlorates and various other water-soluble nitrogen-compounds during the use of explosives. The risk from perchlorates and other water-soluble nitrogen-compounds is primarily in relation to groundwater. Perchlorate salts are highly soluble in water and sorbs poorly to mineral surfaces and organic material; therefore, it is typically very mobile in surface water and groundwater. It is persistent in the environment and at high enough concentrations can affect thyroid gland functions. The risk of groundwater contamination from perchlorates will be minimized by **Mitigation Measure GW-2** (Pollutants from Blasting Activities) which includes a set of BMPs for the proper use and disposal of perchlorate. The impact to groundwater quality is less than significant with mitigation and the Ogier Ponds Alternative would have the same impact as the Project on groundwater quality.

The reduction in groundwater levels in the area immediately surrounding Anderson Reservoir could adversely affect groundwater quality in this area; however, these effects would be temporary and the impacts on well owners will be reduced to less-than-significant levels through implementation of **Mitigation Measure GW-1** (Provide Alternative Supplies). The Ogier Ponds Alternative would have the same impact as the Project on local well groundwater quality.

Groundwater Plans

As described in Section 3.12.1.2, the San Francisco Bay Basin Plan identifies beneficial uses for groundwater within the San Francisco Bay region and establishes narrative and numerical WQOs to achieve the beneficial uses for those waters. Valley Water's GWMP for the Santa Clara and Llagas Subbasins (Valley Water 2021) describes a comprehensive groundwater management framework, including existing and potential actions to achieve basin sustainability goals and ensure continued sustainable groundwater management. As discussed above the Project would not substantially affect groundwater quantity or quality and with **Mitigation Measure GW-1** will not impact well owners around Anderson Reservoir. As such, Project impacts on groundwater plans would be **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impact as the Project on groundwater plans.

Mitigation Measures

GW-1 Provide Alternative Supplies

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on groundwater resources. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.13 Water Supply

The Ogier Ponds Alternative would have the same impacts to water supply as the Project as described in Section 3.13, *Water Supply*. The alternate Coyote Creek channel would not affect recharge rates or the overall water supply for the county.

Water Supply

During the Seismic Retrofit component construction, Anderson Reservoir would be almost completely dewatered which would limit supplies available for groundwater recharge and water supply. Modeling results indicate that there may be a reduction in groundwater recharge and storage downstream of the dam during construction, but that simulated groundwater storage would remain above the 5,000 AF outcome measure for Coyote Valley. With increased imported water releases, WEAP modeling has indicated that no significant impacts would occur to water supply conditions during the Seismic Retrofit construction period. Once Project construction has been completed, releases from the dam would be made in accordance with the FAHCE operating rule curves. The Project would not substantially alter or reduce Valley Water's ability to have sufficient water supplies from existing entitlements and resources, and this impact would be **less than significant**. The Ogier Ponds Alternative would have the same impacts to water supply as the Project.

Water Supply Infrastructure

No new water supplies facilities would be required due to construction and operation of the Project. Restoring the full capacity of Anderson Reservoir would support Valley Water's water supply portfolio. No new or expanded private wells along the rim of the reservoir would be constructed due to water table effects with implementation of **Mitigation Measure GW-1**. Additionally, implementation of **Mitigation Measure GW-2** will avoid any impacts on groundwater quality from blasting activities. Therefore, the water facility impact would be **less than significant with mitigation.** The Ogier Ponds Alternative would have the same impacts on water supply facilities as the Project.

Mitigation Measures

GW-1 Provide Alternative Water Supplies

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on water supply. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.14 Water Quality

The Ogier Ponds Alternative would have similar impacts to water quality as the Project as described in Section 3.14, *Water Quality*. The alternate channel alignment would not affect water quality parameters. The wider extent of ground-disturbing activities would slightly increase the risk of construction related erosion and released of hazardous materials.

In-Reservoir Water Quality

During construction with Anderson Reservoir at deadpool the limited storage would create higher temperatures and increase turbidity (especially following storms) substantially degraded in-reservoir water quality that would not support designated beneficial uses (COMM, COLD, SPWN, WARM, WILD, REC-1 and REC-2). **Mitigation Measure WQ-1** requires Mitigation Measure WQ-1 requires implementation of a WQMPP for in-reservoir construction activities, which would include evaluation of the water quality monitoring data collected during FOCP implementation and Project construction, and implementation of BMPs to control sediment and other pollutants associated with in-reservoir construction activities to the extent technically feasible and in accordance with regulatory requirements. However, impacts would remain significant even with implementation of **Mitigation Measure WQ-1**. Because no additional mitigation is available to decrease the impact to less than significant, this This impact is

significant and unavoidable. The Ogier Ponds Alternative would have the same impact as the Project to in-reservoir water quality.

Reservoir dewatering would result in substantial discharges of sediment as storm runoff travels over previously inundated sediments at the bottom of the reservoir, and there is only limited water storage to settle out sediments from upstream. This temporary increase in turbidity following storms is in **significant and unavoidable**. The Ogier Ponds Alternative would have the same impact as the Project to sedimentation from the reservoir bottom.

Other Water Quality Impacts

The excavation of soils within or near the reservoir and creek, placement of fill within or near the reservoir or creek to construct dam improvements and Conservation Measures, vehicle travel on unpaved access and haul roads, exposed unvegetated work sites and staging areas, uncovered stockpiles, and mining activities could result in erosion of surface soils. Resultant erosion may cause turbidity and sedimentation, and impact water quality. Construction and maintenance activities would also involve the use of hazardous materials and herbicides, which could accidentally be released into the environment, resulting in adverse effects on water quality. Implementation of a SWPPP for out-of-reservoir construction and applicable erosion control BMPs for in-reservoir and out-of-reservoir construction including: BMP AQ-1 (Use Dust Control Measures), BMP WQ-4 (Limit Impacts From Staging and Stockpiling Materials), BMP WQ-1 (Conduct Work from Top of Bank), BMP WQ-2 (Evaluate Use of Wheel and Track Mounted Vehicles in Stream Bottoms), BMP WQ-5 (Stabilize Construction Entrances and Exits), BMP WQ-9 (Use Seeding for Erosion Control, Weed Suppression, and Site Improvement), BMP WQ-10 (Prevent Scour Downstream of Sediment Removal), BMP WQ-11 (Maintain Clean Conditions at Work Sites), and BMP WQ-16 (Prevent Stormwater Pollution); hazardous material BMPs: BMP HM-7 and HM-8 which reduces reduce the risk of vehicle-related pollutants and BMPs HM-9 and HM-10 which proper management of hazardous materials and the implementation of spill prevention measures; and herbicide BMPs: HM-1 (Comply with All Pesticide Application Restrictions and Policies), HM-2 (Minimize Use of Pesticides), HM-4 (Comply with All Pesticide Usage Requirements), HM-5 (Comply with Restrictions on Herbicide Use in Upland Areas), and HM-6 (Comply with Restrictions on Herbicide Use in Aquatic Areas) will help protect water quality. The SWPPP for out-of-reservoir construction activities and implementation of applicable BMPs for in-reservoir and out-of-reservoir construction would ensure water quality impacts are **less than significant** for construction and maintenance related activities. The Ogier Ponds Alternative would have the same impact as the Project.

Some construction elements would require the removal of groundwater to keep work areas dry. To avoid water quality impacts this groundwater would be treated by a ATS system; imported water would be chilled as needed prior to release to Coyote Creek to ensure cold water in the CWMZ; and Valley Water would comply with the Stormwater NPDES Permit as applicable to minimize impacts from new impervious surfaces. Other water quality impacts would **be less than significant**. The Ogier Ponds Alternative would have the same impact as the Project to other water quality issues.

Overall, the Project would generate substantial beneficial impacts to water quality and beneficial uses. The new reservoir outlet would allow for greater flexibility in releases that would allow greater use of the reservoir’s cold-water pool and reduce the potential for uncontrolled reservoir spills. Live Oak Restoration Project, the The Ogier Ponds CM, Sediment

Augment Program, Maintenance of the North Channel Reach Extension, and Phase 2 Coyote Percolation CM would all provide water quality benefits and habitat enhancements the support beneficial uses.

Mitigation Measure

WQ-1 Develop and Implement an In-Reservoir Construction Area Water Quality Monitoring and Protection Plan

GW-2 Implement Perchlorate Best Management Practices

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **cumulatively considerable** impacts on turbidity water quality objectives, but **not cumulatively considerable** impacts on other water quality objectives or on beneficial uses, Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.15 Land Use

The Ogier Ponds Alternative could conflict with a land use plan, policy, or regulation through the acquisition of 18 acres of land zoned and used for agriculture. This acquisition would remove the agricultural use, which would result in a conflict with local zoning. However, Valley Water is not obligated to comply with local zoning regulations. The impact would be **less than significant**. Because of the increased area that would conflict with local zoning regulations, the magnitude of the impact is greater than under the Project as described in Section 3.15, *Land Use*.

Conflict with Land Use Plans, Policies, and Regulations

The majority of the land that would be affected by the Project is designated as recreational. Portions of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond would be closed during construction of the Seismic Retrofit improvements and Conservation Measure components, affecting recreational land uses in the area. These effects would be temporary in nature. Implementation of BMP AQ-1, BMP AQ-2 BMP TR-1, BMPs GEN-36, GEN-37, and GEN-39 will minimize the level of disruption and impairment of onsite land uses during the Project construction period. Operation of the Project would minimize the risk of reservoir spill and downstream flooding and provide in-stream environmental flows consistent with land use policies and regulations. The Project would seismically upgrade a critical facility consistent with local goals and policies, and construction and operation would not result in significant environmental impacts related to conflicts with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, this impact would be **less than significant**. The Ogier Ponds Alternative would have a greater impact than the Project as it would convert zoned agricultural land to a creek channel and floodplain.

Regarding cumulative impacts, like the Project, the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on land use. Cumulative impacts would be greater than the Project's cumulative impacts.

5.9.4.16 Noise and Vibration

The Ogier Ponds Alternative would have the same noise impacts for other Project components as the Project as described in Section 3.16, *Noise and Vibration*. The alternative would result in less fill and equipment use as Pond 1 would not be filled but work would occur over a larger area to construct the alternate channel.

Noise

Construction of the Seismic Retrofit Component, Ogier Ponds CM, and the Sediment Augmentation Program would exceed applicable construction noise thresholds of significance, while Project operational noise impacts would be less than significant. Seismic Retrofit construction noise levels would exceed the 10 dBA increase above ambient threshold at key receptors as discussed in Section 3.16, *Noise and Vibration*. Seismic Retrofit nighttime construction noise levels would exceed the nighttime construction noise threshold of 50 dBA L_{eq}.

Mitigation Measure NOI-1 will require Valley Water to implement a Construction Management Plan, and **Mitigation Measure NOI-2** is specific to Seismic Retrofit construction and will require the installation of a temporary noise barrier, limiting of construction activity at Staging Area 1 and Stockpile Area E, provide a noise complaint phone number and construction noise monitoring during nighttime periods of construction, and reduce speeds along haul routes. Implementation of **Mitigation Measure NOI-3** is specific to Ogier Ponds CM construction and will require the installation of a temporary noise barrier and the reduction of truck and vehicle speeds along Cochrane Road. Even with mitigation, noise levels would still exceed the thresholds of significance and construction would result in generation of a temporary increase in ambient noise levels in excess of locally adopted standards. Impacts would be **significant and unavoidable**. The Ogier Ponds Alternative would have the same impacts to noise as the Project. Less equipment would be required at Ogier Ponds, but over a wider area; however, all these changes are at the far end of Ogier Ponds complex where sensitive receptors are not located. Construction activities near the receptors would be the same.

Vibration

Construction of the Seismic Retrofit components and the Sediment Augmentation Program would exceed construction vibration thresholds of significance of 72 VdB at sensitive receptors. Blasting activities during Seismic Retrofit construction could exceed applicable blasting thresholds.

Implementation of **Mitigation Measure NOI-4** will require the use of oscillatory or static rollers in lieu of a vibratory roller within 150 feet of residential structures receptors. Implementation of **Mitigation Measure NOI-5** will require vibration and air overpressure monitoring be conducted while initial blasting activities occur. Monitoring results would be used to adjust blast loading limits to properly reflect site-specific conditions to ensure vibration impacts from blasting do not exceed the building damage thresholds. Mitigated vibration levels would not exceed the established thresholds. Therefore, Project construction would not generate excessive groundborne vibration or groundborne noise levels and impacts would be **less than significant with mitigation**. The Ogier Ponds Alternative would have the same impacts to vibrations as the Project.

Mitigation Measures

NOI-1 Implement Construction Noise BMPs Reduction Measures

NOI-2 Implement Seismic Retrofit Construction Noise Reduction Measures

NOI-3 Implement Ogier Ponds CM Construction Noise Reduction Measures

NOI-4 Seismic Retrofit and Sediment Augmentation Program Construction Vibration Reduction Measures

NOI-5 Implement Blasting Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **cumulatively considerable** impacts on noise*. , but* The Ogier Ponds Alternative would have **not cumulatively considerable** impacts on vibration. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.17 Public Services

The Ogier Ponds Alternative would not have increased impacts on police and fire services. The alternative would have the same impacts to public services as the Project as described in Section 3.17, *Public Services*.

Fire and Police Services

Temporary impacts on police and fire protection services would include accidental ignition of a wildfire, use of hazardous materials that may require additional fire protection services, and temporary increases and disruptions to vehicle traffic in the Project vicinity, which could impede emergency response timing. Implementation of BMPs HM-12, HM-8, and HM-9 will minimize the risk of accidental ignition. BMP TR-1 will require construction warning signs, safety fencing, and detours which would minimize potential impacts on emergency response times. Although construction traffic levels would increase emergency service response times, it would not disrupt emergency service response to the point that would require the construction or expansion of police or fire protection facilities other than potentially the need for temporary emergency access roads, which might cause significant impacts, which a significant impact. **Mitigation Measure PS-1** requires preparation of a TMP and coordination with fire protection services and first responders, and **Mitigation Measure WF-1** which requires coordination with local and state emergency response agencies and preparation of a Response and Evacuation Strategy, which will maintain adequate emergency response and identify and maintain evacuation routes, will reduce potential impacts associated with impeding emergency response times to a less-than-significant level. Impacts to police and fire services would be **less than significant with mitigation.** The Ogier Ponds Alternative would have the same impact as the Project.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on public services. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.18 Recreation

The Ogier Ponds Alternative would not affect the impact on recreation. The alternative would have the same impacts to public services as the Project as described in Section 3.18, *Recreation*.

Recreation Facilities

The Project would require closure of Anderson Lake County Park, Coyote Creek Parkway, Ogier Ponds, and the Coyote Percolation Pond for the duration of construction; however, there are 100 other recreational facilities in the study area (i.e., all parks within 5 miles of the Project area as well as regional parks in the county), many of which include a variety of infrastructure and accommodate a wide range of recreational activities including hiking and fishing (see **Table 3.18-1** and **Figure 3.18-1**). Temporary impacts on recreational facilities resulting from the Seismic Retrofit components would be distributed across many nearby recreational facilities, so this impact is less than significant.

Coyote Creek Trail and portions of Hellyer Park would be periodically inundated by Coyote Creek at several low flow crossings more frequently during construction the seismic retrofit. Longer recreational facility closures during the wet season could result in physical deterioration of other recreational facilities or the acceleration of the physical deterioration of those facilities. Therefore, this impact would be significant.

Implementation of **Mitigation Measure REC-1** will reduce impacts to **less than significant with mitigation** by requiring Valley Water to provide funding and implementation of the future relocation and/or modification of recreational facilities within the Coyote Creek corridor to mitigate for inundation and other Project impacts on those facilities compensating SCCPRD for anticipated extra maintenance costs. The Ogier Ponds Alternative would have the same impact to recreational facilities as the Project.

Permanent Modification to Recreation Facilities

The Project would result in several permanent modifications to recreational facilities. As described in Section 2.4.5.12, the Live Oak Picnic Area would include an improved walking loop, a bridge over the North Channel and connection to the Serpentine Trail, an interpretive trail along Coyote Creek, relocation of the group picnic area closer to restroom and parking areas, and tree replacement planting. Additionally, the existing boat ramp at Anderson Dam would be improved by constructing a second entrance off Cochrane Road, constructing a dedicated inspection area, and an EV charging area would be replaced and improved. These facility improvements would be minor and would not have a significant adverse physical effect on the environment. This impact would be **less than significant**. The Ogier Ponds Alternative would have the same impacts to permanent facilities as the Project.

Mitigation Measures

REC-1 Funding and Implementation of Maintenance Reimbursement for Park Facility Improvements within the Coyote Creek Corridor Closures During High Flow Events

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on recreation. Cumulative impacts would be the same as the Project's cumulative impacts.

5.9.4.19 Transportation

The Ogier Ponds Alternative would generate less construction trips compared to the Project as described in Section 3.19, *Transportation,* due to the reduced amount of excavation and the reuse of excavated materials onsite at Ogier Ponds.

Transportation Plans

Project construction and operation would largely be consistent with plans and policies governing the circulation system. However, as with the Project, modified flows expected in Coyote Creek could result in impacts to recreational facilities that are used by pedestrians. This would be a significant impact on pedestrian facilities. **Mitigation Measure REC-1** (Funding and Implementation of Maintenance Reimbursement for Park Facility Improvements within the Coyote Creek Corridor Closures During High Flow Events) would reduce impacts on pedestrian facilities and prevent substantial conflicts with trails plans and policies. This impact would therefore be **less than significant with mitigation.**

The Ogier Ponds Alternative would have the same impact to transportation plans as the Project.

Emergency Access

The Project would generate additional construction roadway vehicle trips and include road closures that have the potential to impede emergency access. MP TR-1 would reduce this impact, but it would still be significant. With implementation of **Mitigation Measure PS-1** (Prepare and Implement Traffic Management Plan) and **Mitigation Measure WF-1** (Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan), impacts on emergency access will be less than **significant with mitigation.** The Ogier Ponds Alternative would have less impacts on on emergency access than the Project due to less construction trips.

VMT

The Project's construction-related VMT would be temporary and operation-related VMT would be negligible and would not contribute to a substantial change in long-term VMT. As a large infrastructure project, the Project would have little long-term effect on air quality and greenhouse gas benefits related to long-term reductions in VMT (as discussed under Section 3.19.3, *Methodology*). Because the increase in VMT during construction would be temporary, and there would be a de minimis effect on VMT during operations, the Project would not conflict with or be inconsistent with *CEQA Guidelines* section 15064.3(b). Therefore, impacts related to VMT would be **less than significant.** The Ogier Ponds Alternative would have less impact to VMT compared to the Project due to less construction trips.

Hazards

The Project would not include any new roadway or access improvements that would increase hazards due to a geometric design. Rather, the proposed roadway and access modifications would improve roadway conditions and increase public safety. Therefore, impacts regarding increased hazards due to a geometric design feature would be **less than significant.** The Ogier Ponds Alternative would have the same impact to traffic hazards as the Project.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

REC-1 Funding and Implementation of Maintenance Reimbursement for Park Facility Improvements within the Coyote Creek Corridor Closures During High Flow Events

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on transportation. Cumulative impacts would be less than the Project's cumulative impacts.

5.9.4.20 Tribal Cultural Resources

The Ogier Ponds would have no substantial change in impacts to tribal cultural resources compared to Project impacts as described in Section 3.20, *Tribal Cultural Resources*.

Tribal Cultural Resources

Ground disturbance during construction and maintenance around the dam and the Ogier Ponds areas could impact elements of tribal cultural resources. Erosion and recreational power boating within Anderson Reservoir could erode Native American archaeological resources that may qualify as tribal cultural resources buried along the shoreline of the reservoir. In addition, construction activities and future use of reservoir could expose undiscovered Native American archaeological resources that may qualify as tribal cultural resources. BMP-CUL-1 (Accidental Discovery of Archaeological Artifacts or Burial Remains) will require that work will cease in areas where archaeological materials are discovered. Nevertheless, these impacts are significant.

Mitigation Measures CR-1 (Pre-construction Cultural Resources Awareness Training), **CR-2** (Prepare a Data Recovery and Treatment Plan for Tribal Cultural Resources that Cannot be Avoided), and **CR-3** (Prepare a Monitoring and Unanticipated Discoveries Plan) will require construction crews to receive tribal cultural awareness training, provide guidance on treating resources with respect, require that all tribal cultural resources be included in the treatment plan, and require that work stop in the vicinity of any archaeological materials discovered during Project construction. Implementation of these BMPs and mitigation measures will reduce the Project's impact to tribal cultural resources to a **less-than-significant level with mitigation**. The Ogier Ponds Alternative would have the same impact to tribal resources as the Project.

Mitigation Measures

CR-1 Pre-construction Cultural Resources Awareness Training

CR-2 Prepare a Data Recovery and Treatment Plan for Historical Resources that cannot be Avoided

CR-3 Prepare a Monitoring and Unanticipated Discoveries Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on tribal cultural resources. Cumulative impacts would be the same as the Project's cumulative impacts

5.9.4.21 Utilities and Service Systems

The Ogier Ponds Alternative would require less fill at Pond 1 than the Project; therefore, there would be more soils excavated from the reservoir that would need to be disposed of in some manner.

Solid Waste

Adequate capacity remains in local solid waste management facilities, or the extra soils could be disposed of within the reservoir. The alternative would comply with the Santa Clara County Integrated Waste Management Plan, the City of San José's Zero Waste Strategic Plan, and State regulations, and impacts related to solid waste would be **less than significant**. The Ogier Ponds Alternative would have the greater impact on utilities as the Project due to the increase in excavated soil that would need to be disposed of.

Utility Systems

The Project would not require construction of new stormwater, telecommunications, or electric facilities. Relocation of some power lines would be required as part of the Seismic Retrofit component. The utility infrastructure proposed to be relocated to serve Project would not affect other users. Decommissioning of the hydroelectric facility would not require Valley Water or PG&E to construct replacement electrical facilities. Impacts related to the replacement, relocation, or construction of public utilities would be **less than significant**. The Ogier Ponds Alternative would have the same impact on utilities as the Project.

Regarding cumulative impacts, like the Project, the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on utility systems. Cumulative impacts would be greater than the Project's cumulative impacts

5.9.4.22 Wildfire

The Ogier Ponds would have no substantial change in impacts to wildfire risk from the Project as described in Section 3.22, *Wildfire*.

Wildfire Risk Exacerbation

Implementation of BMP HM-12 (requires fire suppression equipment and measures, and spark arrestors on equipment) and implementation of California Fire Code provisions and CAL FIRE requirements will reduce the risk of accidental ignition from construction equipment, minimizing the impacts of the Project on exacerbation of wildfire risks. Post-construction operations would not require the use of equipment that could generate sparks or extreme heat; therefore, there would be no impact related to wildfire. Risk of wildfire is **less than significant**. The Ogier Ponds Alternative would have the same impact related to increasing wildfire risk as the Project.

Wildfire Risk from Infrastructure

The Project would include the modification, construction, and/or relocation of roads and electrical transmission infrastructure; however, access throughout the Project Area and existing power lines would be relocated and improved through Project implementation, thus providing an improvement over existing conditions. Post-construction operations of the powerlines would also be similar to post-FOCP implementation conditions. Therefore, infrastructure associated with the Project would not exacerbate wildfire risks, and this impact would be **less than significant.** The Ogier Ponds Alternative would have the same risk as the Project to wildfire from infrastructure.

Risk from Post-Fire Instability

The Project would not exacerbate or increase wildfire risks in the area, and therefore would not increase the risks of post-fire effects, such as landslides and flooding. The Project would not result in significant risks to people or structures from downstream flooding or landslides as a result of runoff, post-fire slope instability, or drainage changes, and this impact would be **less than significant**. The Ogier Ponds Alternative would have the same impact related to increasing risk from post-fire instability as the Project.

Exposure to Wildfire Risk

Construction traffic and road closures would result in impacts on emergency response and evacuations, and expose construction workers to wildfire risks, in the event of a wildland fire. Traffic impacts on emergency response and evacuations would be reduced through implementation of **BMP TR-1** which requires implementation of construction warning signs, safety fencing, and detours; however, a significant impact would still occur. Implementation of **Mitigation Measure PS-1** (Traffic Management Plan)**,** which requires preparation and implementation of a TMP and coordination with State and local agencies and **Mitigation Measure WF-1 (**Reduce Emergency Response and Evacuation Interference during Construction and Develop Response and Evacuation Strategy (RES) Emergency Action Plan), which requires coordination with local and state emergency response agencies and preparation of a Response and Evacuation Strategy and fire agencies to identify an alternative temporary refuge area or access to the 24 Woodchoppers Flat Picnic Area during a wildfire, will minimize impacts on emergency response and evacuation procedures. This impact would be **less than significant with mitigation.** The Ogier Ponds Alternative would have the same impact to wildfire safety as the Project.

Mitigation Measures

PS-1 Prepare and Implement Traffic Management Plan

WF-1 Reduce Emergency Response and Evacuation Interference during Construction and Develop a Response and Evacuation Strategy (RES) Emergency Action Plan

Regarding cumulative impacts, like the Project, after mitigation the Ogier Ponds Alternative would have **not cumulatively considerable** impacts on wildfire risks. Cumulative impacts would be the same as the Project's cumulative impacts

5.10 Environmentally Superior Alternative

An EIR must identify the environmentally superior alternative. If the no project alternative is the environmentally superior alternative, the EIR must identify an environmentally superior alternative among the other alternatives. For this EIR, the No Project Alternative is not environmentally superior. For this EIR, the No Project Alternative is not considered environmentally superior. Although it avoids some of the Project's significant impacts, as shown in **Table 5-8** it creates new significant and unavoidable impacts for many important resources, including fisheries resources, wildlife and terrestrial resources, hydrology, water quality, groundwater, water supply and recreation. It also would not meet the Project purpose and fundamental Project objectives, as explained in Section 5.5.1.

Of the alternatives considered in this chapter, the FAHCE-Plus Modified Alternative is considered the environmentally superior alternative. This alternative achieves all the Project objectives and provides more benefits than the Project for special status fish species, specifically for steelhead, Chinook, and Pacific lamprey rearing habitat and conditions for migration than the Project, thus better achieving the Project objective to avoid and minimize environmental impacts. It also does not cause new or worse significant impacts as compared to the Project.

The FAHCE-Plus Modified Alternative is expected to provide more suitable habitat for all life stages of steelhead and flows for migration would be improved by increasing the number of passage days and promoting and/or maintaining run timing diversity in the steelhead populations. The FAHCE-Plus Modified Alternative would improve steelhead migratory opportunities and diversify migration related pulse flows. Adult steelhead passage days would be higher on average and would have a higher minimum number of passage days under FAHCE-Plus Modified Alternative relative to FAHCE flows in the Project. For steelhead, the FAHCE-Plus Modified Alternative is expected to provide more fry rearing, juvenile rearing, and spawning habitat in the CWMZ and overall compared to the Project.

The FAHCE-Plus Modified Alternative is expected to provide more suitable habitat for fry and juvenile Chinook rearing. Adult passage opportunities would be similar to the Project, but juvenile migration opportunities would improve. The FAHCE-Plus Modified Alternative would increase juvenile Chinook migratory opportunities in most year types and diversify outmigration related pulse flows. Juvenile Chinook would also have a higher minimum number of passage days under FAHCE-Plus Modified Alternative relative to FAHCE flows in the Project. For Chinook, the FAHCE-Plus Modified Alternative is expected to result in a negligible decrease in spawning habitat but would provide more fry rearing and juvenile rearing habitat in the CWMZ and overall compared to the Project.

These habitat benefits are expected to be similar for other special-status fish in Coyote Creek including Pacific lamprey, southern coastal roach, and Sacramento hitch. Since Pacific lamprey are anadromous and have similar migratory tendencies as steelhead, benefits associated with migration with FAHCE-Plus Modified for migration will also benefit Pacific lamprey. Overall increases associated with suitable habitat for steelhead will benefit Pacific lamprey, southern coastal roach, and Sacramento hitch as they coinhabit and have adapted to similar conditions. As with the Project, FAHCE-Plus Modified will have no adverse impacts to longfin smelt, riffle sculpin, white sturgeon, or green sturgeon.
