CalEEMod Assumptions and Output

Claremont McKenna Phase 1 Construction Detailed Report

Table of Contents

1. Basic Project Information

- 1.1. Basic Project Information
- 1.2. Land Use Types
- 1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

- 2.1. Construction Emissions Compared Against Thresholds
- 2.2. Construction Emissions by Year, Unmitigated
- 2.3. Construction Emissions by Year, Mitigated

3. Construction Emissions Details

- 3.1. Site Prep: Roberts Sports Bowl Site (2024) - Unmitigated
- 3.2. Site Prep: Roberts Sports Bowl Site (2024) - Mitigated
- 3.3. Site Prep: Street Improvement (2024) - Unmitigated
- 3.4. Site Prep: Street Improvement (2024) - Mitigated
- 3.5. Site Prep: Street Improvement (2025) - Unmitigated

- 3.6. Site Prep: Street Improvement (2025) - Mitigated
- 3.7. Site Prep: Tunnel (2024) - Unmitigated
- 3.8. Site Prep: Tunnel (2024) - Mitigated
- 3.9. Grading: Roberts Sports Bowl Site (Rough) (2024) - Unmitigated
- 3.10. Grading: Roberts Sports Bowl Site (Rough) (2024) - Mitigated
- 3.11. Grading: Roberts Sports Bowl Site (Rough) (2025) - Unmitigated
- 3.12. Grading: Roberts Sports Bowl Site (Rough) (2025) - Mitigated
- 3.13. Grading: Roberts Sports Bowl Site (Fine) (2025) - Unmitigated
- 3.14. Grading: Roberts Sports Bowl Site (Fine) (2025) - Mitigated
- 3.15. Grading: Street Improvements (Fine) (2025) - Unmitigated
- 3.16. Grading: Street Improvements (Fine) (2025) - Mitigated
- 3.17. Grading: Tunnel (Rough) (2024) - Unmitigated
- 3.18. Grading: Tunnel (Rough) (2024) - Mitigated
- 3.19. Grading: Tunnel (Fine) (2025) - Unmitigated
- 3.20. Grading: Tunnel (Fine) (2025) - Mitigated
- 3.21. BC: Structures + Parking (2024) - Unmitigated
- 3.22. BC: Structures + Parking (2024) - Mitigated

- 3.23. BC: Structures + Parking (2025) - Unmitigated
- 3.24. BC: Structures + Parking (2025) - Mitigated
- 3.25. BC: Street Improvements (2025) - Unmitigated
- 3.26. BC: Street Improvements (2025) - Mitigated
- 3.27. BC: Roberts Sports Bowl Utilities (2024) - Unmitigated
- 3.28. BC: Roberts Sports Bowl Utilities (2024) - Mitigated
- 3.29. BC: Roberts Sports Bowl Utilities (2025) - Unmitigated
- 3.30. BC: Roberts Sports Bowl Utilities (2025) - Mitigated
- 3.31. BC: Pathways + Parking (2025) - Unmitigated
- 3.32. BC: Pathways + Parking (2025) - Mitigated
- 3.33. BC: Tunnel (2024) - Unmitigated
- 3.34. BC: Tunnel (2024) - Mitigated
- 3.35. BC: Tunnel (2025) - Unmitigated
- 3.36. BC: Tunnel (2025) - Mitigated
- 3.37. Arch Coating: Structures (2025) - Unmitigated
- 3.38. Arch Coating: Structures (2025) - Mitigated
- 3.39. Arch Coating: Street Improvements (2025) - Unmitigated

3.40. Arch Coating: Street Improvements (2025) - Mitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

4.10.4. Soil Carbon Accumulation By Vegetation Type - Mitigated

4.10.5. Above and Belowground Carbon Accumulation by Land Use Type - Mitigated

4.10.6. Avoided and Sequestered Emissions by Species - Mitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.2.2. Mitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.3.2. Mitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

5.18.2.2. Mitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Claremont McKenna Phase 1 Construction
Construction Start Date	8/1/2024
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.80
Precipitation (days)	2.40
Location	34.10354503733571, -117.7007727686169
County	San Bernardino-South Coast
City	Upland
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5227
EDFZ	10
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.24

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Arena	50.0	1000sqft	16.1	50,000	0.00	0.00	—	—

Unenclosed Parking Structure	470	Space	4.23	10,500	0.00	0.00	—	—
Parking Lot	240	Space	2.16	0.00	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-13	Use Low-VOC Paints for Construction

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2

Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	88.7
AQ-PM	95.3
AQ-DPM	80.9
Drinking Water	97.1
Lead Risk Housing	31.1
Pesticides	2.66
Toxic Releases	58.9
Traffic	29.8
Effect Indicators	—
CleanUp Sites	43.6

Groundwater	10.6
Haz Waste Facilities/Generators	46.8
Impaired Water Bodies	12.5
Solid Waste	39.3
Sensitive Population	—
Asthma	60.1
Cardio-vascular	70.9
Low Birth Weights	64.5
Socioeconomic Factor Indicators	—
Education	40.1
Housing	69.5
Linguistic	54.6
Poverty	64.9
Unemployment	29.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	19.74849224
Employed	14.1537277
Median HI	26.85743616
Education	—
Bachelor's or higher	76.02977031
High school enrollment	100
Preschool enrollment	57.52598486
Transportation	—

Auto Access	68.11240857

2016 Voting	48.9

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	71.0
Healthy Places Index Score for Project Location (b)	38.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A
-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	84.6
AQ-PM	94.4
AQ-DPM	81.2
Drinking Water	98.0
Lead Risk Housing	—
Pesticides	19.8
Toxic Releases	56.7
Traffic	28.1

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A
-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	88.7
AQ-PM	95.3
AQ-DPM	80.9
Drinking Water	97.1
Lead Risk Housing	31.1
Pesticides	2.66
Toxic Releases	58.9
Traffic	29.8
Effect Indicators	—
CleanUp Sites	43.6
Groundwater	10.6
Haz Waste Facilities/Generators	46.8
Impaired Water Bodies	12.5
Solid Waste	39.3
Sensitive Population	—
Asthma	60.1
Cardio-vascular	70.9
Low Birth Weights	64.5
Socioeconomic Factor Indicators	—
Education	40.1
Housing	69.5
Linguistic	54.6
Poverty	64.9
Unemployment	29.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	19.74849224
Employed	14.1537277

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	71.0
Healthy Places Index Score for Project Location (b)	38.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

memorandum

date April 30, 2024

to Elizabeth Camacho, Loeb & Loeb, LLP

from Douglas Gordon-Blackwood, ESA
Michael Houlihan, ESA

subject Biological Resources Evaluation for the Claremont McKenna College Roberts Campus Sports Bowl.

1.0 Introduction

The biological resources on Roberts Campus East (formerly known as Claremont Colleges East Campus) (the Project site) were evaluated in a Final EIR that was certified by the cities of Upland and Claremont in 2016 in connection with the approval of the development of a portion of the Project site with collegiate athletic facilities (the Approved Project). Claremont McKenna College became the owner of the entire Project site after approval of the Approved Project, and currently proposes to modify and refine the approved conceptual site plan for the Project site (Revised Project).

This memorandum documents the findings of 2023 and 2024 general biological reconnaissance surveys conducted by Environmental Science Associates (ESA) on the Roberts Campus East for the Revised Project (also known as the Roberts Campus Sports Bowl) located in the cities of Claremont and Upland, CA.

2.0 Project Location

The Project site is a 74.4-acre site that encompasses the approximately 74-acre Roberts Campus East site and an area outside of Roberts Campus East that would contain a proposed tunnel (approximately 0.4 acres). Approximately 66.4 acres of the 74-acre Roberts Campus East site is proposed for the Roberts Campus Sports Bowl (Sports Bowl) while the remaining 7.6 acres are proposed to be graded as part of the landfill closure, but not developed. Roberts Campus East is located partially within the City of Upland on the east and the City of Claremont on the west. The proposed tunnel is located within the City of Claremont. The Project site is bound by Foothill Boulevard to the north, Arrow Route on the south, Monte Vista Avenue on the east, and Claremont Boulevard on the west. The proposed tunnel extends west of the Roberts Campus East under and west of Claremont Boulevard. The Project site is situated within an unsectioned portion of Township 1 South, Range 8 West of the Ontario CA U.S. Geological Survey (USGS) 7.5-minute topographic quadrangles.

3.0 Project Description

Claremont McKenna College (CMC) proposes to modify and refine the conceptual site plan for the approved sports facilities and associated improvements on the Project site. In addition, CMC proposes the construction of an

access and utility tunnel access from west of Claremont Boulevard to east of Claremont Boulevard. The Revised Project's proposed sports facilities include a baseball field, softball field, football/track/lacrosse field, multi-purpose fields, all-purpose athletic fields, and golf practice facility. The Project also includes surface parking and a parking structure along Claremont Boulevard and surface parking in the southeast and northeast corners of the Project site.

4.0 Background

Sand and gravel mining on the Project site began in the 1920's and ended in 1972. Portions of the gravel pit reach depths of up to 100 feet below its original ground surface. In late 1972, the site was permitted for disposal of inert debris consisting of non-decomposable, non-water soluble, inert solids. Landfill activities continued until the fourth quarter of 2023, when the landfill ceased acceptance of inert debris.

Claremont McKenna College is the owner of the entire Project site and proposes to modify and refine the 2016 Approved Project to develop the Revised Project. The Revised Project requires review in accordance with the California Environmental Quality Act (CEQA) and approval from the City of Upland and the City of Claremont. To evaluate the potential impacts of the Revised Project on biological resources located on the Project site, ESA updated the evaluation of biological conditions on the Project site to consider changes to the site that have occurred since approval of the Approved Project.

5.0 Biological Reconnaissance Surveys

Since 2016, there have been changes to vegetation on the site as a result of continued inert landfill activities and ongoing landfill maintenance activities, and construction staging and parking on the site. In addition, due to the modifications and changes proposed as part of the Revised Project, an update to the existing onsite vegetation and the potential for plant and wildlife species to occur onsite is necessary.

Prior to conducting the onsite biological reconnaissance surveys in 2023 and 2024 (see Appendix A, Biological Reconnaissance Surveys), ESA reviewed the biological resources survey information and evaluation contained in the 2016 Final EIR for the Approved Project. Following is the methodology for the updated surveys, a description of the existing plant communities, a discussion of the results of the surveys, and an assessment of the potential for special-status plant and wildlife species that were evaluated in the 2016 Final EIR to occur on the Project site based on changes to the onsite vegetation since 2016.

ESA biologists also reviewed relevant literature on the biological resources of the Project site and surrounding vicinity. The California Natural Diversity Database (CNDDB), a California Department of Fish and Wildlife (CDFW) species account database, was reviewed for all pertinent information regarding the localities of known observations of special-status species and habitats in the vicinity of the Project site (CDFW, 2023 and CDFW, 2024). The Project site is within the Ontario USGS quadrangle, and the vicinity of the Project site included the following surrounding USGS topographic quadrangles: Prado Dam, Guasti, Mt. Baldy, Cucamonga Peak, Corona North, San Dimas, Glendora, and Yorba Linda. Other data sources reviewed included USFWS critical habitat maps (USFWS, 2023 and USFWS, 2024) and United States Department of Agriculture Natural Resources Conservation Service (NRCS) soils mapping (NRCS, 2023). In addition, the regional flora (Baldwin, 2012) was utilized to assist in the identification of plant species, California Natural Community List for vegetation classification (CDFW, 2023 and CDFW, 2024).

To determine the presence and/or absence of special status plant species, spring biological reconnaissance surveys were conducted by ESA biologist Douglas Gordon-Blackwood on May 11, 2023 and March 12, 2024. The biological reconnaissance survey in 2024 also provided updated vegetation mapping for the Project site.

6.0 Survey Methodology

For both surveys, the biologist conducted the survey by walking the entire Project site to map existing vegetation and assess the potential for special-status plants and wildlife to occur. The vegetation mapping and focused rare plant survey efforts were conducted pursuant to Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities (CDFW, 2018). All incidental visual observations of flora and fauna, including sign (i.e., presence of scat), as well as any audible detections were noted during the site investigations and photographs of the site were taken. All native and non-native natural communities and land cover types located on the Project site were mapped based on the March 12, 2024 survey, and then digitized on aerial maps using Geographic Information System software (i.e., ArcGIS). Most descriptions of vegetation were characterized in the field in accordance with A Manual of California Vegetation (Manual) (Sawyer et al. 2009); however, others were based on dominant species or notable features when a vegetation alliance listed in the Manual was not appropriate. A detailed description of each natural community and land cover type is provided below in Existing Conditions. The Project site, bounded by Foothill Boulevard to the north, Claremont Boulevard to the West, Monte Vista Avenue to the East, and West Arrow Route to the South are referred to herein as the Biological Survey Area (BSA).

7.0 Existing Conditions

Natural Communities and Land Cover Types

The natural communities and land cover types that occur on the Project site are depicted in **Figure 1 – Natural Communities and Land Cover**, and a summary of acreages within the Project site are presented below in **Table 1, Natural Communities and Land Cover Types**.

TABLE 1
NATURAL COMMUNITIES AND LAND COVER TYPES

Natural Communities and Land Cover Types	Project Site (acres)
Laurel Sumac Scrub	1.98
California Buckwheat Scrub	9.89
Coyote Brush Scrub	2.42
Brittle Bush Scrub	1.50
Ruderal	46.64
Open Water	0.64
Disturbed	11.35
Total	74.42

SOURCE: Nearmap, 2022; ESA, 2024

Claremont McKenna Roberts Campus East

Figure 1
Natural Communities and Land Cover

Laurel Sumac Scrub

Laurel sumac scrub (*Malosma laurina* Shrubland Alliance) consists of laurel sumac (*Malosma laurina*) as the dominant scrub with an open or continuous canopy with other herbaceous plants in low cover. This community typically occurs on slopes, in shallow or fine textured soils, and encompasses 1.98 acres on the Project site.

California buckwheat scrub

California buckwheat scrub (*Eriogonum fasciculatum* Shrubland Alliance) consists of California buckwheat (*Eriogonum fasciculatum*) as dominant in the shrub canopy with California sagebrush (*Artemisia californica*) as subdominant and other shrub or herbaceous species present in low cover. This community naturally occurs on upland slopes, intermittently flooded arroyos, channels and washes in course, well drained soils. Within the BSA, this community grows along the eastern portion of the BSA along the west facing slope along Monte Vista Avenue and encompasses 9.89 acres. This community was established with the construction of Monte Vista Avenue adjacent to the Project site in the 1990s (Nationwide Environmental Title Research, LLC 2024).

Coyote brush scrub

Coyote brush scrub (*Baccharis pilularis* Shrubland Alliance) consists of coyote brush as the dominant species in the shrub layer with a variable canopy and herbaceous layer. This community is found within stream terraces, open slopes, coastal bluffs, and ridges. Within the BSA, Coyote brush scrub is newly emergent in flat areas in the center of the site and encompasses 2.42 acres.

Brittle bush scrub

Brittle bush scrub (*Encelia farinosa* Shrubland Alliance) consists of a shrub canopy dominated by brittlebush (*Encelia farinosa*), interspersed with various other native and non-native herbaceous species. Brittle bush scrub typically occurs on steep, rocky sites, especially south-facing slopes. Within the BSA, brittle bush scrub is newly emergent in recently disturbed areas in the northern portion of the Project site and encompasses 1.50 acres.

Open Water

A small seasonally ponded area is present at the lowest elevation location in the BSA and is the result of storm runoff and sheet flow accumulation from the surrounding areas. The infiltration rate of the seasonal pond water has decreased over the past few years due to sediment build-up at the bottom of the pond area. The area consists of barren soils and lacks any riparian vegetation. Periodically, maintenance activities remove the sediment build-up to increase the infiltration rate. The size of the open water within the BSA fluctuates based on direct input from precipitation and the infiltration rate. At the time of the 2024 site visit, the open water encompassed 0.64 acres.

Ruderal

Ruderal communities are dominated by ruderal, non-native plant species in the herbaceous layer, with no single species identified as the dominant species. These communities frequently occur in areas where regular disturbance occurs, preventing the establishment of native cover. Within the BSA, ruderal lands encompass 46.64 acres and is the dominant community throughout the BSA.

Disturbed

Disturbed conditions occur throughout much of the Project site. The majority of the Project site is routinely subject to disturbance as a result of landfill maintenance activities for fuel modification purposes, and the disturbed areas encompass 11.35 acres. Vegetation in this area is largely absent.

8.0 Sensitive Biological Resources

The Project site is isolated from most other natural areas by the arterial roadways that border all four sides of the rectangular Project site. The Project site is located within a patchwork of development within the Cities of Upland and Claremont and is not directly adjacent to any significant area of undisturbed natural habitat. A small culvert connects the Project site under Foothill Boulevard to a small patch of natural habitat which is also isolated and somewhat disturbed. The Project site consists of native and ruderal vegetation communities. Native communities present on the Project site include patches of laurel sumac scrub, brittle bush scrub, and California buckwheat scrub.

The natural communities discussed above are composed of numerous plant species. A list of all plant species observed is provided in each individual survey memorandum within Appendix A, Biological Reconnaissance Surveys. Special-status plant species occurring or potentially occurring within the Project site are discussed below.

Special-Status Plants

Special-status plants are defined as those plants that, because of their recognized rarity or vulnerability to various causes of habitat loss or population decline, are recognized by federal, State, or other agencies as under threat from human-associated developments. Some of these species receive specific protection that is defined by federal or State endangered species legislation. Others have been designated as special-status on the basis of adopted policies and expertise of State resource agencies or organizations with acknowledged expertise, or policies adopted by local governmental agencies such as counties, cities, and special districts to meet local conservation objectives. Special-status plants are defined as follows:

- Plants that are listed or proposed for listing as threatened or endangered, or are candidates for possible future listing as threatened or endangered, under the FESA or the CESA
- Plants that meet the definitions of rare or endangered under State CEQA Guidelines Section 15380
- Plants considered by the California Native Plant Society (CNPS) to be rare, threatened, or endangered (Rank 1A, 1B, 2A and 2B plants) in California
- Plants listed as rare under the California Native Plant Protection Act (CFGCA 1900 et seq.)

A review of the Final EIR that was certified in 2016 revealed 5 special-status plant species recorded within the USGS 9-quadrangle search. Six focused surveys were conducted on the Project site in 2003, 2007, 2010, 2014, 2023 and 2024. During these surveys, no special status plant species were observed on the Project site. The potential for special-status plant species to occur is based on vegetation and habitat quality, topography, elevation, soils, surrounding land uses, habitat preferences and geographic ranges are included in **Table 2, Special-Status Plant Species**.

The special-status plants listed in Table 2 were determined to have varying levels of potential to occur based on the following criteria:

- **Not Expected:** The study area or immediate vicinity do not support suitable habitat for a particular species, and therefore the species is not expected to occur within the study area.
- **Low Potential:** The BSA supports limited habitat for a particular species. For example, the appropriate vegetation assemblage may be present while the substrate preferred by the species may be absent.
- **Moderate Potential:** The BSA provides marginal habitat for a particular species. For example, the habitat may be heavily disturbed and/or may not support all stages of a species' life cycle.
- **High Potential:** The BSA provides suitable habitat conditions for a particular species and/or known populations occur in the immediate area.
- **Present:** The species was observed within the BSA during the site visit.

A discussion of each species with a potential to occur within the BSA is included in Table 2 – Special-Status Plants Considered. Based on the absence of suitable habitat, known geographic distributions and/or range restrictions, it was determined that special-status plant species do not have the potential to occur within the BSA; and are therefore, omitted from further discussion in this report.

TABLE 2
SPECIAL-STATUS PLANT SPECIES CONSIDERED

Common Name Scientific Name	Sensitivity Status ¹	Preferred Habitat/Known Distribution ²	Potential to Occur and/or be Affected by Proposed Activities.
PLANTS			
ANGIOSPERMS (DICOTYLEDONS)			
Berberidaceae (Barberry Family)			
Nevin's barberry <i>Berberis nevinii</i>	Federal: FE State: CE CRPR: 1B.1	Flowers March-June. Sandy soils in low-gradient washes, alluvial terraces, and canyon bottoms, along gravelly wash margins, or on coarse soils on steep, generally north-facing slopes in alluvial scrub, cismontane (e.g., chamise) chaparral, coastal sage scrub, oak woodland, and/or riparian scrub or woodland. Elevation range extends from 274-825 meters. Found in Los Angeles, Riverside, San Bernardino, San Diego counties.	Not Expected. This species is not expected to occur within the site due to lack of suitable habitat. Notably, this species occurs as an ornamentally planted species along the west side of Claremont Boulevard. The species is highly conspicuous and has not been observed within the BSA.
Brassicaceae (Cabbage Family)			
Robinson's pepper-grass <i>Lepidium virginicum</i> var. <i>robinsonii</i>	Federal: None State: None CRPR: 4.3	Flowers January through July. Chaparral and coastal scrub. Elevation range extends from 1-885 meters. Found in Los Angeles, Orange, Riverside, San Bernardino, San Diego, Ventura counties.	Not Expected. This species is not expected to occur due to lack of suitable undisturbed habitat. Species prefers primarily undisturbed soils, which are absent within the BSA.

Common Name Scientific Name	Sensitivity Status ¹	Preferred Habitat/Known Distribution ²	Potential to Occur and/or be Affected by Proposed Activities.
Polygonaceae (Buckwheat Family)			
Parry's spineflower <i>Chorizanthe parryi</i> var. <i>parryi</i>	Federal: None State: None CRPR: 1B.1	Flowers April through June. Openings/clearings in coastal or desert sage scrub, chaparral or interface; dry slopes or flat ground; sandy soils. Elevation range extends from 275-1,220 meters. Found in Los Angeles, Riverside, San Bernardino counties.	Not Expected. This species is not expected to occur due to lack of suitable habitat. Species prefers primarily undisturbed soils, which are absent within the BSA.
ANGIOSPERMS (MONOCOTYLEDONS)			
Liliaceae (Lily Family)			
Plummer's mariposa lily <i>Calochortus plummerae</i>	Federal: None State: None CRPR: 4.2	Flowers May through July. Chaparral (openings), cismontane woodland, coastal scrub, valley and foothill grassland, granitic/rocky. Elevation range extends from 100- 1,700 meters. Found in Los Angeles, Orange, Riverside, San Bernardino, Ventura counties.	Not Expected. This species is not expected to occur because the study area is outside of the known range of the species.
Intermediate mariposa lily <i>Calochortus weedii</i> var. <i>intermedius</i>	Federal: None State: None CRPR: 1B.2	Flowers May through July. Coastal scrub, chaparral, valley and foothill grassland on rocky soil and rocky outcrops. Elevation range extends from 105-855 meters. Found in Los Angeles, Orange, Riverside, San Bernardino counties.	Not Expected. This species is not expected to occur because the study area is outside of the known range of the species.
SOURCE: ESA, 2024.			

Based on previous site visits, no special-status plant species are expected to occur in the BSA.

Special-Status Wildlife

Special-status wildlife are defined as those animals that, because of their recognized rarity or vulnerability to various forms of habitat loss or population decline, are considered by federal, State, or other agencies to be under threat from human-associated developments. Some of these species receive specific protection that is defined by this federal or State endangered species legislation and others have been designated as special-status on the basis of adopted local policies (i.e., city and county) or the educated opinion of respected resource interest groups (i.e., Western Bat Working Group [WBWG]). Special-status wildlife is defined as follows:

- Wildlife listed or proposed for listing as threatened or endangered, or are candidates for possible future listing as threatened or endangered, under the FESA or CESA;
- Wildlife that meets the definitions of rare or endangered under CEQA Guidelines Section 15380;
- Wildlife designated by CDFW as species of special concern, included on the Watch List or are considered Special Animals;
- Wildlife "fully protected" in California (CFGF Sections 3511, 4700, and 5050);
- USFWS Birds of Conservation Concern (BCC) as identified in the USFWS Information for Planning and Consultation (IPaC) resource list generated for the project (USFWS 2023b);

- Bird species protected by the MBTA; and
- Bat species considered priority by the WBWG.

The Final EIR identified 16 wildlife species¹ that were classified as species of special concern and have a potential to occur on the Project site. Six surveys were conducted on the Project site in 2003, 2007, 2010, 2014, 2023 and 2024. During these surveys, nine special status wildlife species were observed on the Project site. A complete list of the species identified in the EIR are provided in **Table 3 – Special-Status Wildlife Species Considered**.

The special-status wildlife listed in Table 3 were determined to have varying levels of potential to occur based on the following criteria:

- **Not Expected:** The study area or immediate vicinity do not support suitable habitat for a particular species, and therefore the species is not expected to occur within the study area.
- **Low Potential:** The BSA supports limited habitat for a particular species. For example, the appropriate vegetation assemblage may be present while the substrate preferred by the species may be absent.
- **Moderate Potential:** The BSA provides marginal habitat for a particular species. For example, the habitat may be heavily disturbed and/or may not support all stages of a species life cycle.
- **High Potential:** The BSA provides suitable habitat conditions for a particular species and/or known populations occur in the immediate area.
- **Present:** The species was observed within the BSA during previous site visits.

TABLE 3
SPECIAL-STATUS WILDLIFE SPECIES CONSIDERED

Common Name Scientific Name	Sensitivity Status ¹	Preferred Habitat/Known Distribution ²	Potential to Occur and/or be Affected by Proposed Activities.
WILDLIFE			
REPTILES			
Whiptails & relatives Teiidae			
coastal western whiptail <i>Aspidoscelis tigris stejnegeri</i>	Federal: None State: SSC	Found in deserts and semi-arid areas with sparse vegetation and open areas. Also found in woodland and riparian areas. Ground may be firm soil, sandy, or rocky.	Observed. Species was previously observed in the BSA in 2007 and 2010. This species has a moderate potential to occur within areas of sparse vegetation within the site but was not observed in 2023 or 2024 surveys.
Egg-Laying Snakes Colubridae			
coast patch-nosed snake <i>Salvadora hexalepis virgultea</i>	Federal: None State: SSC	Known to inhabit semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains with sandy soils and leaf litter.	Not Expected This species is not likely to occur as species prefers relatively undisturbed habitat, and current site activities contribute to the regular disturbance throughout the site.

¹ One additional species, Lesser Nighthawk was not previously included in the Final EIR but was observed during the 2023 site survey. This brings the total of wildlife species of special concern with potential to occur to 17.

Common Name Scientific Name	Sensitivity Status ¹	Preferred Habitat/Known Distribution ²	Potential to Occur and/or be Affected by Proposed Activities.
BIRDS			
Hawks, Kites, Harriers, & Eagles Accipitridae			
Cooper's hawk <i>Accipiter cooperii</i>	Federal: None State: WL	Inhabits cismontane woodland, riparian forest, riparian woodland, upper montane coniferous forest, or other forest habitats near water. Nests and forages near open water or in riparian vegetation.	Observed. This species was previously observed within the BSA in 2007 and 2010 but is not expected to nest within the BSA due to lack of suitable nesting habitat. While the species may forage in urban forested areas associated with the adjacent neighborhoods and college facilities, the species is unlikely to nest within the BSA due to lack of suitable forested or riparian vegetation.
Tyrant Flycatchers Tyrannidae			
southwestern willow flycatcher <i>Empidonax traillii extimus</i>	Federal: FE State: SE	For nesting, species require dense riparian habitats (cottonwood/willow and tamarisk vegetation) with microclimatic conditions dictated by the local surroundings. Saturated soils, standing water, or nearby streams, pools, or cienegas are a component of nesting habitat that also influences the microclimate and density vegetation component. Habitat not suitable for nesting may be used for migration and foraging. Recurrent flooding and a natural hydrograph are important to withstand invading exotic species (tamarisk).	Observed. This species was previously observed in the BSA in 2007 and 2010 and noted as a migrant in the area. This species is not expected to nest within the BSA due to the absence of suitable riparian habitat for foraging or nesting. Small patches of riparian habitat once present within the low elevation portions of the BSA no longer exist. The site also lacks sufficient riparian habitat with microclimatic conditions necessary to support this species.

Common Name Scientific Name	Sensitivity Status ¹	Preferred Habitat/Known Distribution ²	Potential to Occur and/or be Affected by Proposed Activities.
Hummingbirds Trochilidae			
Allen's hummingbird <i>Selasphorus sasin</i>	Federal: BCC State: None	Breed in a narrow strip of coastal forest, scrub, and chaparral from sea level to around 1000 feet elevation along the West Coast of California. They sip nectar from flowers such as bush monkeyflower, Indian paintbrush, columbine, currant, gooseberry, twinflower, penstemon, ceanothus, sage, eucalyptus, and manzanita. They get their protein by capturing small insects in midair or picking them off plants.	Observed. This species has previously been observed within the BSA. Disturbed/ruderal habitat within the site provides limited foraging and/or nesting habitat for the species, and the species is more likely to nest in urban forested areas associated with the adjacent college properties.
Costa's hummingbird <i>Calypte costae</i>	Federal: BCC State: None	Occur in Sonoran and Mojave Desert scrub, coastal California chaparral and sage scrub, and deciduous forest and desert scrub in Baja California, Mexico. Along the California coast they use sage scrub and chaparral.	Observed. This species was previously observed in the BSA in 2007 and could use California buckwheat scrub for foraging.
Nightjars and Nighthawks Caprimulgidae			
Lesser nighthawk <i>Chordeiles acutipennis</i>	Federal: None State: None Other: LAA Part I	Breeds (or summers) along the Santa Clara River and tributaries (e.g., Bouquet Canyon), Big Tujunga Wash (upstream of Hansen Dam), San Gabriel River (upstream of Santa Fe Dam), and San Antonio Wash (upstream of Arrow Highway). Species is characteristic of Riversidean alluvial fan scrub and characterized by sparse coastal sage scrub amid boulder-strewn riverbeds at the base of mountains.	Observed. This species has previously been observed nesting in the area in 2007 and perching and foraging within the study area in 2023. Species has potential to continue to nest in the BSA.
Gnatcatchers Poliopitidae			
coastal California gnatcatcher <i>Poliopitila californica californica</i>	Federal: FT State: SSC	Species is an obligate, permanent resident of coastal sage scrub habitats dominated by California sagebrush and flat-topped buckwheat, mainly on cismontane slopes below 1,500 feet in elevation. Low coastal sage scrub in arid washes, on mesas and slopes.	Not Expected. This species is not expected to occur within the study area due to lack of suitable habitat. Coastal California gnatcatcher occurrences in Claremont/Upland believed to be extirpated since 1994 and no observations of the species have ever been made within the BSA (CDFW 2024).
Larks Alaudidae			
California horned lark <i>Eremophila alpestris actia</i>	Federal: None State: WL	Found from grasslands along the coast and deserts near sea level to alpine dwarf-shrub habitat above the tree-line. During the winter, this species typically flocks in desert lowlands.	Observed. This species was previously observed foraging within the disturbed portions of the site in 2007, 2010, and 2023. Disturbed / ruderal habitat within the site provides limited foraging habitat, and due to ongoing landfill maintenance activities, the species is unlikely to nest within the BSA.
Sparrows Passerellidae			
southern California rufous-crowned sparrow <i>Aimophila ruficeps canescens</i>	Federal: None State: WL	Known to frequent relatively steep, often rocky hillsides with grass and forb species. Resident in southern California coastal sage scrub and mixed chaparral habitats.	Moderate Potential. This species has a moderate potential to occur within the study area due to the presence of California buckwheat scrub along the eastern slope of the study area.

Common Name Scientific Name	Sensitivity Status ¹	Preferred Habitat/Known Distribution ²	Potential to Occur and/or be Affected by Proposed Activities.
Finches Fringillidae			
Lawrence's goldfinch <i>Spinus lawrencei</i>	Federal: BCC State: None	Occurs in valley foothill hardwood, valley foothill hardwood-conifer, desert riparian, palm oasis, pinyon-juniper and lower montane habitats	Observed. This species was previously observed within the study area in 2007 but is unlikely to nest within the study area due to lack of suitable nesting habitat.
MAMMALS			
Evening Bats Vespertilionidae			
pallid bat <i>Antrozous pallidus</i>	Federal: None State: SSC	Occurs in a wide variety of habitats including chaparral, coastal scrub, desert wash, Great Basin grassland, Great Basin scrub, Mojavean desert scrub, riparian woodland, Sonoran Desert scrub, upper montane coniferous forest, valley and foothill grasslands. Most common in open, dry habitats with rocky areas for roosting. For roosting, prefers rocky outcrops, cliffs and crevices with access to open habitats for foraging. Roosts must protect species from high temperatures. Very sensitive to disturbance of roosting sites.	Not Expected. This species is not expected to occur within the BSA due lack of suitable roosting and foraging habitat. Disturbed/ruderal habitat within the site provides limited foraging and/or roosting habitat for the species.
Free-Tailed Bats Molossidae			
western mastiff bat <i>Eumops perotis</i> <i>californicus</i>	Federal: None State: SSC	Known to occur in habitat consisting of extensive open areas within dry desert washes, flood plains, chaparral, cismontane oak woodland, coastal scrub, open ponderosa pine forest, and grasslands. Roosts primarily in crevices in rock outcrops and buildings.	Not Expected. This species is not expected to occur within the BSA due to a lack of suitable roosting and foraging habitat. Disturbed/ruderal habitat within the BSA provides limited foraging and/or roosting habitat for the species.
Rabbits & Hares Leporidae			
San Diego black- tailed jackrabbit <i>Lepus californicus</i> <i>bennettii</i>	Federal: None State: SSC	Inhabits open grasslands, agricultural fields, and sparse coastal scrub where they occur primarily in arid regions with short grass.	Observed. This species was previously observed within the BSA in 2003 but has not been observed since. This conspicuous species is likely extirpated from the site.
Kangaroo rats, Pocket mice, & Kangaroo mice Heteromyidae			
northwestern San Diego pocket mouse <i>Chaetodipus fallax</i> <i>fallax</i>	Federal: None State: SSC	Moderate canopy coverage of coastal scrub, sagebrush, chaparral, grasslands, pinyon- juniper, and desert wash and scrub. Found in sandy, herbaceous areas with nearby shrubs for cover. Burrows are typically dug within gravelly or sandy soil.	High Potential. This species has a high potential to occur within California buckwheat scrub and other natural communities observed in the northern and eastern portions of the BSA. Species is sensitive to disturbance and is unlikely to burrow within disturbed and compacted soils associated with the majority of the site.

Common Name Scientific Name	Sensitivity Status ¹	Preferred Habitat/Known Distribution ²	Potential to Occur and/or be Affected by Proposed Activities.
Los Angeles pocket mouse <i>Perognathus longimembris brevinasus</i>	Federal: None State: SSC	Found in lower elevation grasslands, alluvial fans and coastal sage scrub communities.	Not Expected. While marginally suitable habitat is present within the BSA in the form of California buckwheat scrub, this onsite vegetation community is greatly disturbed and does not provide suitable foraging habitat for the species. The nearest recorded occurrence of the species is 9 miles to the east, in Rancho Cucamonga.
Mice, Rats, & Voles Muridae			
San Diego desert woodrat <i>Neotoma lepida intermedia</i>	Federal: None State: SSC	Found in a variety of coastal scrub, desert scrub, chaparral, cactus, and rocky habitats. Nests primarily against rock outcroppings, boulders, cacti, or areas of dense undergrowth.	High Potential. This species has a high potential to occur in the laurel sumac scrub and woodrat nest belonging to an unknown species have been observed within the laurel sumac scrub in the northern portion of the BSA.
SOURCE: ESA, 2024.			

Special-Status Reptiles

Coastal whiptail may forage and/or breed within open areas throughout the BSA and were previously observed during surveys in 2007 and 2010. While the species were previously observed on the site, the species has not been observed in the past 14 years. Additionally, although coast patch-nosed snake was previously listed as potentially occurring within the BSA, the results of past surveys have observed none within the BSA, and it is not expected to occur within the BSA.

Special-Status Birds

Coopers hawk, southwestern willow flycatcher, California horned lark, Costa's hummingbird, Lawrence's goldfinch, Allen's hummingbird, and lesser nighthawk have been observed foraging within the study area. In addition, while Southern California rufous-crowned sparrow was not observed in previous surveys, it has a moderate potential to forage within California buckwheat scrub on the site.

Special-status Mammals

San Diego black-tailed jackrabbit, San Diego desert woodrat, and northwestern San Diego pocket mouse all have a high potential to occur within the study area due to the presence of suitable habitat. Although San Diego black-tailed jackrabbit was previously observed within the BSA, the species is highly conspicuous and has not been observed within the site since 2003. The species is likely extirpated from the site. Woodrat nests of an unknown species were also observed in laurel sumac scrub in the northern portion of the site.

Sensitive Natural Communities

Sensitive natural communities are of limited distribution statewide or within a county or region. These communities may or may not contain special-status species or their habitat and are independently considered sensitive by CDFW. For purposes of this evaluation, sensitive natural communities include vegetation communities identified in the California Natural Communities List with Holland Types (CDFW, 2023 and CDFW, 2024) with a CNDDDB state rank of S1, S2, or S3.

Based on the previous site visits, none of the natural communities identified in the California Natural Communities List were observed to occur within the BSA. The mapped natural communities which include California buckwheat scrub (S4), coyote brush scrub (S4), brittle bush scrub (S4), as well as disturbed and ruderal areas are not considered sensitive natural communities as they are either not ranked or have a rank of S4 or higher.

Critical Habitat

Under the FESA, to the extent feasible, the USFWS is required to designate critical habitat for endangered and threatened species. Critical habitat is defined as areas of land, water, and air space containing the physical and biological features essential for the survival and recovery of endangered and threatened species. Designated critical habitat includes sites for breeding and rearing, movement or migration, feeding, roosting, cover, and shelter that are essential to the survival and recovery of the species, whether the habitat is currently occupied by the species or not. Designated critical habitats require special management and protection of existing resources, including water quality and quantity, host animals and plants, food availability, pollinators, sunlight, and specific soil types.

The BSA is not located within designated critical habitat. The nearest critical habitat to the Project site is for the coastal California gnatcatcher (*Polioptila californica californica*) associated with Frank G. Bonelli Regional Park, that is located 4.2 miles to the southwest (USFWS, 2024).

9.0 Project Impacts and Mitigation Measures

Approach to the Analysis

The analysis of the Revised Project impacts on biological resources and corresponding recommendations for avoidance, minimization, and mitigation are discussed in this section. Generally, impacts may be defined as direct or indirect, and permanent or temporary. Definitions of these impact types are provided below.

- **Direct Impacts:** Any alteration, disturbance, or destruction of biological resources that would result from project-related activities is considered a direct impact. Examples include loss of individual species and/or their associated plant communities, diversion of surface water flows, and encroachment into wetlands. Under the FESA, direct impacts are defined as the immediate impacts of a project on a species or its habitat, including construction noise disturbance, sedimentation, or habitat loss.
- **Indirect Impacts:** As a result of project-related activities, biological resources may also be affected in an indirect manner. Under the FESA, indirect impacts are defined as those impacts that are caused by, or would result from, a proposed project but occur later in time and are reasonably certain to occur (50 CFR, Section 402-02). An example of indirect impacts may include irrigation runoff from a developed area into surrounding natural vegetation. Indirect impacts could also include increased wildfire frequency as a result of power line failures.
- **Temporary Impacts:** Any impacts to biological resources that are considered reversible can be viewed as temporary. Examples include the generation of fugitive dust during construction activities and temporary access or staging areas that will be returned to pre-project conditions.
- **Permanent Impacts:** All impacts that result in the irreversible removal of biological resources are considered permanent. Examples include constructing a building or permanent road on an area with native vegetation, such that the native vegetation is permanently removed and replaced with a developed structure.

Impacts Analysis

Special-Status Plants

There are no special-status plant species identified as having a moderate or high potential to occur within the BSA (see Table 2). Construction and operational activities would not affect any special-status plant species. Therefore, the Revised Project would result in no impacts to special-status plants.

Special-Status Mammals

Unknown woodrat nests (*Neotoma* spp.) were observed in laurel sumac scrub in the northern portion of the BSA. While there is potential for the species to occur within this area, loss of a small number of this species in a completely isolated location would not be considered a significant impact. The San Diego desert woodrat, despite being identified as a species of special concern, is actually quite widely distributed and not presently at risk over most of its range. Only large projects that may result in loss of occupied habitat over large areas and/or that sever landscape linkages that connect populations, thus resulting in detrimental effects to this species at the landscape level, should be considered to have significant adverse effects on this species. In fact, if nothing occurs on the Project site, it is highly likely that the extant small population would cease to be viable in a relatively short time, either as the result of stochastic (random) events (e.g., disease, drought, low birth rate, etc.) or due to inbreeding leading to weakened individuals that cannot compete with other woodrats. Therefore, the Revised Project's potential impacts during construction activities to San Diego desert woodrat would be less than significant.

Northwestern San Diego pocket mouse has a high potential to occur within the BSA, but as the species prefers undisturbed sites, the species is unlikely to burrow throughout most of the site. Furthermore, San Diego black-tailed jack rabbit is likely extirpated from the site. Direct impacts to these two species are not expected to occur, and impacts are considered less than significant.

Special-Status Reptiles

The majority of the site is greatly disturbed and does not provide suitable habitat for other special-status reptiles. While the open space and natural vegetation throughout the study area provides marginal habitat for coastal whiptail, ongoing landfill maintenance activities continue to disturb the Project site. The species has not been observed since 2010. As the species has likely been extirpated from the Project site, impacts to special-status reptiles are not expected to occur and would be less than significant.

Special-Status Birds

Cooper's hawk, Costa's hummingbird, Allen's hummingbird, Lawrence's goldfinch, California horned lark, lesser nighthawk, and southwestern willow flycatcher were all previously observed in the BSA. Additionally, Southern California rufous-crowned sparrow was identified as having a moderate potential to occur in the BSA. While none of these species have been observed nesting in the study area, project activities could negatively impact nesting birds that are protected in accordance with the MBTA and CFGC through the removal of an active nest or the disruption of breeding/nesting behavior (e.g., copulation, nesting building, or incubation). Therefore, construction activities associated with the Revised Project could result in significant impacts to bird species during nesting activities.

Mitigation Measures

No mitigation measures are required for special-status plants, mammals, or reptiles.

Mitigation is required to reduce impacts to nesting birds to less than significant. The applicant shall avoid the nesting bird season or conduct a pre-construction survey to determine the presence of active bird nests if construction activities occur during the nesting bird season. If the pre-construction survey does not identify nests, then construction can commence. If active nests are identified, an avoidance buffer of up to 300 feet for most bird species and 500 feet for raptors, or as determined appropriate by the qualified biologist (based on species-specific tolerances and site-specific conditions), shall be delineated, flagged, and avoided until the nesting cycle is complete (i.e., the qualified biologist determines that the young have fledged or the nest has failed).

10.0 Conclusions

Within the Final EIR, five plant communities were identified on the Project site based on a February 2014 field survey. The Final EIR identified that the Project site's previous use as an aggregate quarry and the use as an inert landfill, at the time of the Final EIR preparation, resulted in extensive disturbance of the Project site over many years. Apparent attempts at revegetation have resulted in several transitional vegetation types that are not explicitly recognized in the California classification system for vegetation types. Therefore, the classification system's species dominant method was used in 2014 to create a new name for one of the vegetation types. The five vegetation communities that were identified in the 2014 survey included (1) Buckwheat and Buckwheat – Mulefat Alliances, (2) Laurel Sumac Alliance, (3) Scalebroom Alliance, (4) Willow-Mulefat Alliance, and (5) Non-Native and Transitional Vegetation Types. None of the five vegetation communities were recognized as sensitive vegetation communities.

Current 2024 mapping of the Project site includes seven natural vegetation communities and land cover types. They include (1) laurel sumac scrub, (2) California buckwheat scrub, (3) coyote brush scrub, (4) brittle brush scrub, (5) open water, (6) ruderal, and (7) disturbed. None of the seven existing vegetation communities are recognized as sensitive vegetation communities. The Project site is primarily ruderal or disturbed, with laurel sumac scrub in the north, California buckwheat scrub on the eastern slope and small patches of brittle bush scrub and coyote brush scrub in the center of the site. Similar to the finding for the Approved Project in the Final EIR, there is no Riversidean alluvial fan sage scrub currently present within the Project site.

While alluvial fan scrub was the predominant vegetation type on the Project site and vicinity at the time of certification of the Final EIR, the Project site no longer contains this vegetation as the area is subject to frequent and regular disturbance previously associated with inert landfill activities and currently associated with ongoing site maintenance activities.

The Final EIR identified 5 plant species and 16 wildlife species that were classified as species of special concern and have a potential to occur on the Project site. Prior to and after certification of the Final EIR, there have been six surveys conducted on the Project site (2003, 2007, 2010, 2014, 2023 and 2024). During these surveys, no special status plant species and nine special status wildlife species were observed on the Project site. The nine special status wildlife species observed during one of the six surveys included the following:

- Coopers hawk (observed in 2007 and 2010)
- Costa's hummingbird (observed in 2007)
- Southwestern willow flycatcher (observed in 2007 and 2010)
- California Horned lark (observed in 2007, 2010, and 2023)

- Lawrence's goldfinch (observed in 2007)
- Allen's Hummingbird (observed in 2010, 2014, and 2023)
- Coastal whiptail (observed in 2007 and 2010)
- San Diego black-tailed jackrabbit (observed in 2003)
- Lesser nighthawk (observed in 2007 and 2023)

As discussed above, based on the current conditions on the Project site, construction activities would result in less than significant impacts to special-status plants, mammals, and reptiles. There is a potential for construction activities to result in significant impacts to nesting bird species. To reduce this potential significant impact, construction activities would avoid the nesting bird season or bird nest surveys would occur prior to construction activities and any identified bird nests would be avoided. The implementation of this avoidance measure would reduce the potential impact on nesting birds to less than significant.

The Final EIR identified that the Project site is not a wildlife nursery because the site did not include facilities and protected habitat for the rehabilitation of injured or rare species for eventual release into the wild. Based on the current conditions, the Project site is still not a wildlife nursery.

Furthermore, the Final EIR identified that the Project site, and specifically the seasonal ponding area, did not include the presence of hydrophytic vegetation, hydric soils, and wetland hydrology. Therefore, the Project site did not contain wetlands as defined under Title 33, Part 328.3(a) of the Code of Federal Regulations. Based on current conditions, the open water on the Project site occurs from storm events and then infiltrates into the ground. Because the open water on the site is temporary, the Project site does not contain riparian vegetation or wetlands.

Since the certification of the Final EIR and approval of the Approved Project in 2016, biological conditions on the Project site have substantially changed due to the long-term landfill activities that occurred on the Project site until 2023 and continued maintenance, construction staging, or parking activities.

subject Results of a 2023 Biological Reconnaissance Survey for the Claremont McKenna College Roberts Campus East Property

This memorandum documents the findings of a general biological reconnaissance survey conducted by Environmental Science Associates (ESA) for the Claremont McKenna Roberts Sports Bowl (Project) on the Roberts Campus East property located in the cities of Upland and Claremont. The 2023 biological reconnaissance survey was conducted to determine the presence of special-status species within the project.

Project Location

The Project site is a 74.4-acre site that encompasses the approximately 74-acre Roberts Campus East site and an area outside of Roberts Campus East that would contain a proposed tunnel (approximately 0.4 acres). Approximately 66.4 acres of the 74-acre Roberts Campus East site is proposed for the Roberts Campus Sports Bowl (Sports Bowl) while the remaining 7.6 acres are proposed to be graded as part of the landfill closure, but not developed. Roberts Campus East is located partially within the City of Upland on the east and the City of Claremont on the west. The proposed tunnel is located within the City of Claremont. The Project site is bound by Foothill Boulevard to the north, Arrow Route on the south, Monte Vista Avenue on the east, and Claremont Boulevard on the west. The proposed tunnel extends west of the Roberts Campus East under and west of Claremont Boulevard. The Project site is situated within an unsectioned portion of Township 1 South, Range 8 West of the Ontario CA U.S. Geological Survey (USGS) 7.5-minute topographic quadrangles.

Survey Methodology

Prior to the site visit, ESA reviewed relevant literature on the biological resources of the Project site and surrounding vicinity including the Claremont College East Campus Final EIR that was certified in May 2016. In addition to the Final EIR, the California Natural Diversity Database (CNDDB), a California Department of Fish and Wildlife (CDFW) species account database, was reviewed for all pertinent information regarding the localities of known observations of special-status species and habitats in the vicinity of the Project site (CDFW 2023). The Project site is within the Ontario USGS quadrangle, and the vicinity of the Project site included the following surrounding USGS topographic quadrangles: Prado Dam, Guasti, Mt. Baldy, Cucamonga Peak, Corona North, San Dimas, Glendora, and Yorba Linda. Other data sources reviewed included USFWS critical habitat maps (USFWS 2023) and United States Department of Agriculture Natural Resources Conservation Service

(NRCS) soils mapping (NRCS 2023). In addition, the regional flora (Baldwin 2012) were utilized to assist in the identification of plant species, *California Natural Community List* for vegetation classification (CDFW 2023).

A biological reconnaissance survey was conducted by ESA biologist Douglas Gordon-Blackwood on May 11, 2023. The survey began at 6:45 a.m. and ended at 12:15 p.m. The weather included a range of cloud cover from 100 percent to 60 percent, and the temperature ranged from 56 degrees to 68 degrees. The survey consisted of walking transects throughout the Project site to determine the presence of special-status plants and wildlife species on the Project site. Those areas which were deemed inaccessible were scanned with binoculars. All incidental, visual observations of wildlife, including sign (i.e. presence of scat) and audible detections were noted during the assessment and photographs of the site were taken and have been included in **Attachment A, 2023 Field Notes**. The site consists of primarily ruderal or disturbed habitat, with large amounts of nonnative vegetation, and barren or disturbed soils. Pockets of laurel sumac chaparral are located in the northern portion of the Project site and sage scrub is present along the eastern border of the Project site.

Results

Two special-status wildlife species were observed during the site visit. A Lesser nighthawk (*Chordeiles acutipennis*), a Bird of Conservation Concern and Los Angeles County Sensitive Bird Species (Part I), was observed perching within the center of the Project site. A juvenile California horned lark (*Eremophila alpestris*), also a Los Angeles County Sensitive Bird Species (Part I), was also observed foraging in the southern portion of the Project site. No special-status plant species were observed within the BSA. Both special-status bird species have the potential to nest within the property; however, no nests attributed to either species were observed during the visit. Woodrat nests were observed in laurel sumac chaparral.

memorandum

date March 29, 2024

to Elizabeth Camacho, Loeb & Loeb, LLP

from Douglas Gordon-Blackwood, ESA
Michael Houlihan, ESA

subject Results of a 2024 Biological Reconnaissance Survey for the Claremont McKenna College Roberts Campus East Property

This memorandum documents the findings of a general biological reconnaissance survey conducted by Environmental Science Associates (ESA) for the Claremont McKenna Roberts Sports Bowl (Project) on the Roberts Campus East property located in the cities of Upland and Claremont. The 2024 biological reconnaissance survey was conducted to supplement a survey conducted by ESA in 2023.

Project Location

The Project site is a 74.4-acre site that encompasses the approximately 74-acre Roberts Campus East site and an area outside of Roberts Campus East that would contain a proposed tunnel (approximately 0.4 acres). Approximately 66.4 acres of the 74-acre Roberts Campus East site is proposed for the Roberts Campus Sports Bowl (Sports Bowl) while the remaining 7.6 acres are proposed to be graded as part of the landfill closure, but not developed. Roberts Campus East is located partially within the City of Upland on the east and the City of Claremont on the west. The proposed tunnel is located within the City of Claremont. The Project site is bound by Foothill Boulevard to the north, Arrow Route on the south, Monte Vista Avenue on the east, and Claremont Boulevard on the west. The proposed tunnel extends west of the Roberts Campus East under and west of Claremont Boulevard. The Project site is situated within an unsectioned portion of Township 1 South, Range 8 West of the Ontario CA U.S. Geological Survey (USGS) 7.5-minute topographic quadrangles.

Survey Methodology

Prior to the site visit, ESA reviewed relevant literature on the biological resources of the Project site and surrounding vicinity including the Claremont College East Campus Final EIR that was certified in May 2016. In addition to the Final EIR, the California Natural Diversity Database (CNDDDB), a California Department of Fish and Wildlife (CDFW) species account database, was reviewed for all pertinent information regarding the localities of known observations of special-status species and habitats in the vicinity of the Project site (CNDDDB, 2024a). The Project site is within the Ontario USGS quadrangle, and the vicinity of the Project site included the following surrounding USGS topographic quadrangles: Prado Dam, Guasti, Mt. Baldy, Cucamonga Peak, Corona North, San Dimas, Glendora, and Yorba Linda. Other data sources reviewed included USFWS critical habitat maps (USFWS, 2024) and United States Department of Agriculture Natural Resources Conservation Service

(NRCS) soils mapping (NRCS, 2024). In addition, the regional flora (Baldwin 2012) were utilized to assist in the identification of plant species, *California Natural Community List* for vegetation classification (CDFW, 2024b). Natural communities were mapped directly in the field utilizing Collector for ArcGIS and an EOS Arrow Surveyor GPS unit. Natural community names and descriptions follow *A Manual of California Vegetation, Second Edition* (Sawyer, Keeler-Wolf and Evans 2009). A detailed description of each natural community and land use is provided in the *Natural Communities and Land Cover Types* section of this memorandum.

A biological reconnaissance survey was conducted by ESA biologist Douglas Gordon-Blackwood on March 13, 2024. The survey began at 6:37 a.m. and ended at 12:25 p.m. The weather included 100 percent cloud cover during the entire survey, and the temperature ranged from 53 degrees to 56 degrees. The survey consisted of walking transects throughout the Project site to determine the presence of special-status plants and wildlife species on the Project site. Those areas which were deemed inaccessible were scanned with binoculars. All incidental, visual observations of wildlife, including sign (i.e. presence of scat) and audible detections were noted during the assessment. The plant and wildlife species observed during the survey are provided in **Attachment 1, Floral and Faunal Compendia**. Photographs of the Project site were taken and have been included in **Attachment 2, 2024 Field Notes**.

Existing Conditions

Natural Communities and Land Cover Types

Based on observations during the 2024 biological reconnaissance survey, the natural communities and land cover types were mapped and are depicted in **Figure 1, Natural Communities and Land Cover**. A summary of acreages within the Project site is presented below in **Table 1, Natural Communities and Land Cover Types**.

TABLE 1
NATURAL COMMUNITIES AND LAND COVER TYPES

Natural Communities and Land Cover Types	Project Site (acres)
Laurel sumac scrub	1.98
California buckwheat scrub	9.89
Coyote brush scrub	2.42
Brittle Bush Scrub	1.50
Ruderal	46.64
Open Water	0.64
Disturbed	11.35
Total	74.42

Source: ESA, 2024.

SOURCE: Nearmap, 2022; ESA, 2024

Claremont McKenna Roberts Campus East

Figure 1
Natural Communities and Land Cover

Laurel Sumac Scrub

Laurel sumac scrub (*Malosma laurina* Shrubland Alliance) consists of laurel sumac (*Malosma laurina*) as the dominant scrub with an open or continuous canopy with other herbaceous plants in low cover. This community typically occurs on slopes, in shallow or fine textured soils.

California buckwheat scrub

California buckwheat scrub (*Eriogonum fasciculatum* Shrubland Alliance) consists of California buckwheat (*Eriogonum fasciculatum*) as dominant in the shrub canopy with California sagebrush (*Artemisia californica*) as subdominant and other shrub or herbaceous species present in low cover. This community naturally occurs on upland slopes, intermittently flooded arroyos, channels and washes in course, well drained soils. Within the BSA, this community is located along the eastern portion of the BSA along the west facing slope adjacent to Monte Vista Avenue and encompasses 9.89 acres. This community was established with the construction of Monte Vista Avenue adjacent to the Project site in the 1990s (Nationwide Environmental Title Research, LLC 2024).

Coyote brush scrub

Coyote brush scrub (*Baccharis pilularis* Shrubland Alliance) consists of coyote brush as the dominant species in the shrub layer with a variable canopy and herbaceous layer. This community is found within stream terraces, open slopes, coastal bluffs, and ridges. Within the BSA, Coyote brush scrub is newly emergent in flat areas in the center of the site and encompasses 2.42 acres.

Brittle bush scrub

Brittle bush scrub (*Encelia farinosa* Shrubland Alliance) consists of a shrub canopy dominated by brittlebush (*Encelia farinosa*), interspersed with various other native and non-native herbaceous species. Brittle bush scrub typically occurs on steep, rocky sites, especially south-facing slopes. Within the BSA, brittle bush scrub is newly emergent in recently disturbed areas in the northern portion of the Project site and encompasses 1.50 acres.

Open Water

A small seasonally ponded area is present at the lowest elevation location in the BSA and is the result of storm runoff and sheet flow accumulation from the surrounding areas. The infiltration rate of the seasonal pond water has decreased over the past few years due to sediment build-up at the bottom of the pond area. Periodically, maintenance activities remove the sediment build-up to increase the infiltration rate. The size of the open water within the BSA fluctuates based on direct input from precipitation and the infiltration rate. At the time of the 2024 site visit, the open water encompassed 0.64 acres.

Ruderal

Ruderal communities are dominated by ruderal, non-native plant species in the herbaceous layer, with no single species identified as the dominant species. These communities frequently occur in areas where regular disturbance occurs, preventing the establishment of native cover. Within the BSA, ruderal lands encompass 46.64 acres and is the dominant community throughout the BSA.

Disturbed

Disturbed conditions occur throughout much of the Project site. The majority of the Project site is routinely subject to disturbance as a result of landfill maintenance activities for fuel modification purposes, and the disturbed areas encompass 11.35 acres. Vegetation in this area is largely absent.

General Plant Inventory

The natural communities discussed above are composed of numerous plant species. A list of all plant species observed is provided in Attachment 1, Floral and Faunal Compendium. Photographs of the Project site are provided in Attachment 2, 2024 Field Notes.

General Wildlife Inventory

The natural communities discussed above provide habitat for common wildlife species, including the following that were observed: American kestrel (*Falco sparverius*), California quail (*Callipepla californica*), Anna's hummingbird (*Calypte anna*), common raven (*Corvus corax*), house finch (*Haemorhous mexicanus*), black phoebe (*Sayornis nigricans*), lesser goldfinch (*Spinus psaltria*), mourning dove (*Zenaida macroura*), white-crowned sparrow (*Zonotrichia leucophrys*), Say's phoebe (*Sayornis saya*), yellow-rumped warbler (*Setophaga coronata*), northern mockingbird (*Mimus polyglottos*), California towhee (*Melospiza crissalis*), brush rabbit (*Sylvilagus bachmani*), and raccoon (*Procyon lotor*). A list of all species observed is provided in Attachment 2, 2024 Field Notes.

Results

No special-status plant or wildlife species were observed within the BSA during the survey conducted on March 13, 2024. On-going landfill maintenance activities are anticipated to continue throughout the year. Natural communities throughout the Project site, including California buckwheat scrub, laurel sumac scrub, brittle bush scrub, and coyote brush scrub, may provide suitable foraging habitat for common and special-status species. However, due to the regular and ongoing maintenance activities, onsite natural communities are unlikely to provide suitable habitat for nesting or roosting.

to Loeb & Loeb, LLP

from Environmental Science Associates, Fatima Clark and Kyle Garica, M.A., RPA

subject Cultural Resources Assessment for the Claremont McKenna College Roberts Campus Sports Bowl, Cities of Upland and Claremont, California

Introduction

The Claremont Colleges East Campus Project was evaluated in a Final EIR that was certified and the Project approved (Approved Project) by the cities of Upland and Claremont in 2016. Following approval of the Approved Project, Claremont McKenna College (CMC) became owner of the entire East Campus (now known as Roberts Campus East) which comprises the site for the Approved Project. CMC currently proposes to modify and refine the approved conceptual site plan for Roberts Campus East, referred to as the Roberts Campus Sports Bowl (Revised Project). The Revised Project also includes an arcade connecting Roberts Campus East to CMC's campus west of Claremont Boulevard, a portion of which lies outside of Roberts Campus East.

In 2007, a Historical/Archaeological Resources Survey Report was conducted for Roberts Campus East. According to the Survey Report, a records search and an intensive-level, on-foot field survey of Roberts Campus East were conducted in 2007. Based on the record search and the field survey, no historical or archaeological resources were identified.

Environmental Science Associates (ESA) has prepared this cultural resources assessment to address potential effects of implementing the Revised Project pursuant to the California Environmental Quality Act (CEQA).

This assessment included review of the Final EIR for the Approved Project, and updated cultural resources records search through the South-Central Coastal Information Center (SCCIC), an updated Sacred Lands File (SLF) search through the California Native American Heritage Association (NAHC), review of known Native American villages in the vicinity, review of the *Geotechnical Investigation Report* prepared for the Revised Project, review of historic maps and aerial photographs, and preparation of an archaeological sensitivity assessment. This memorandum presents the methods, results, and recommendations of this assessment. ESA personnel involved in the preparation of this report are as follows: Kyle Garcia, M.A., RPA., Project Director; Fatima Clark, B.A., report author; and Jaclyn Anderson, GIS Specialist.

Project Location

The project site for the Revised Project (Project Site) is an approximately 74.4-acre site comprised of the approximately 74-acre Roberts Campus East and an approximately 0.4 acre area adjacent to but outside of Roberts Campus East that would contain a portion of the proposed arcade. Approximately 66.4 acres of the 74-acre Roberts Campus East site is proposed for development of the Roberts Campus Sports Bowl (Sports Bowl) while the remaining 7.6 acres are proposed to be graded, but not developed. Roberts Campus East is located partially within the City of Upland on the east and the City of Claremont on the west. The proposed arcade is located within the City of Claremont. Roberts Campus East is bound by Foothill Boulevard to the north, Arrow Route on the south, Monte Vista Avenue on the east, and Claremont Boulevard on the west. The proposed arcade extends west of Roberts Campus East under and west of Claremont Boulevard, connecting Roberts Campus East to CMC's campus west of Claremont Boulevard. The Project Site is situated within an unsectioned portion of Township 1 South, Range 8 West of the Ontario CA U.S. Geological Survey (USGS) 7.5-minute topographic quadrangles (**Figures 1 and 2**).

Project Description

Claremont McKenna College (CMC) proposes to modify and refine the Approved Project, which consists of collegiate sports facilities and associated improvements, on a portion of the Project Site, without changes of the type of use or intensity of use of the Project Site. In addition, CMC proposes the construction of a pedestrian and emergency/maintenance vehicle access and utility arcade extending from west of Claremont Boulevard to east of Claremont Boulevard. The Revised Project proposed sports facilities include a baseball field, softball field, football/track/lacrosse field multi-purpose fields, soccer/rugby field and golf practice facility. The Revised Project also includes surface parking and a parking structure along Claremont Boulevard, surface parking in the southeast and northeast corners of the Project Site and ancillary support structures. The City of Upland is the lead agency pursuant to CEQA and the City of Claremont is a Responsible Agency.

Archival Research

Cultural Resources Records Search

A cultural resources records search for the Revised Project was conducted on May 2, 2023 by ESA at the California Historical Resources Information System (CHRIS) - SCCIC housed at California State University, Fullerton. The records search included a review of all recorded cultural resources and previous studies within the Project Site and a 0.5-mile radius.

Previous Cultural Resources Investigations

The records search results revealed 10 cultural resources studies have been conducted within a 0.5-mile radius of the Project Site (**Table 1**). Of the ten previous studies, one study (SB-05725) encompasses the entirety of Roberts Campus East. The area of the portion of the proposed arcade extending outside of Roberts Campus East was not included in study SB-05725. A summary of study SB-05725 is provided below Table 1. Approximately 25 percent of the 0.5-mile records search radius has been included in previous cultural resources studies.

SB-05725

This study was conducted in 2007 by CRM Tech and consisted of a cultural resources records search within a one-mile radius, historical research, and a pedestrian survey. The records search yielded the identification of a road, railroads, bridges, buildings, a railroad station and refuse scatters. The historical research indicates that two buildings once existed within Roberts Campus East; however, between 1894 and 1939 the buildings were removed. Roberts Campus East remained vacant into the early 1950s. By the mid-1950s, a gravel pit was established in the southern portion of the Roberts Campus East. By the late 1960s and 1970s, the gravel pit was expanded to include most of Roberts Campus East. In some areas, the gravel pit reaches depths of up to 100 feet. Grading and subsequent filling are also mentioned as having taken place within the Roberts Sports Bowl. No cultural resources were encountered during the field survey (CRM Tech, 2007).

Previously Recorded Archaeological Resources

The records search results revealed that 10 cultural resources are recorded within a 0.5-mile radius of the Project Site. Of the 10 resources, five are historic-period archaeological resources (CA-SBR-7792H, -7793H, -7794H, -33017H, and -33018H); one is a California Historical Landmark (CHL # 781/CA-SBR-2910H, an old Native American Trail); and four are historic architectural resources (P-36-18721, P-36-018723, P-36-020273, and P-36-024507) (**Table 2**). No prehistoric archaeological resources have been previously recorded within the Project Site or 0.5-mile radius. However, one resource (CHL # 781/CA-SBR-2910H) is recorded immediately north, but outside of the Project Site. A brief description of resource CHL # 781/CA-SBR-2910H is provided below Table 2.

TABLE 2
PREVIOUSLY RECORDED ARCHAEOLOGICAL RESOURCES

Primary #	Permanent Trinomial	Resource Description	Dates Recorded	Eligibility	Direction from Project
P-36-002910	CA-SBR-002910H	California Historical Landmark: Segment of National Old Trails Highway/US Route 66, described as an old Native American trail. This is also the route followed by Francisco Garcés and Jedediah Smith. A portion of the resource in Needles is listed as a California Historical Landmark #781	1962-2020	CHL# 781	North
P-36-007792	CA-SBR-007792H	Historic-period archaeological resource: trash dump mostly including hole-in-top cans, but also other artifacts such as clear glass shards, a ceramic candle holder, a metal telephone box, baby food jars, oil cans, and miscellaneous pieces of metal	1993	Not eligible	East
P-36-007793	CA-SBR-007793H	Historic-period archaeological resource: sparse scatter of artifacts including one piece of sun-colored amethyst glass, 10 sherds of china/white ware, and yellow and red California color ware.	1993	Not eligible	East
P-36-007794	CA-SBR-007794H	Historic-period archaeological resource: trash dump (sun-colored amethyst glass, hole-in-top cans, brown and beige crockery, porcelain, china, and walls composed of cobbles and mesh of fence wire.	1993	Unknown	East
P-36-018721	-	Historic architectural resource: bridge #54-39 with 11 reinforced concrete T-beams on reinforced concrete struttled abutment on spread footings.	1979	Unknown	East
P-36-018723	-	Historic architectural resource: bridge #54-39 is a single span structure with 13 reinforced concrete T-beams on reinforced concrete struttled abutments, on spread footings.	1979	Unknown	East

Primary #	Permanent Trinomial	Resource Description	Dates Recorded	Eligibility	Direction from Project
P-36-020273*	-	Historic architectural resource: reinforced concrete bridge. Department of Parks and Recreation form indicates resource is immediately south of Project Site. However, per review of historic and current aerials, this resource does not appear to be located south of Project Site.	2004	Not eligible	South
P-36-024507	-	Historic architectural resource: industrial building	2004	Not eligible	Southeast
P-36-033017	CA-SBR-033017H	Historic-period archaeological resource: refuse deposit from the 1920s, including sanitary cans, condensed milk cans, paint cans, bottle and jar, debris.	2018	Not eligible	North
P-36-033018	CA-SBR-033018H	Historic-period archaeological resource: refuse deposit from the 1950s, including steel beverage cans and fragments, miscellaneous debris.	2018	Not eligible	Northeast

Resource P-36-002910/CA-SBR-002910H/CHL #781

Resource P-36-002910/CA-SBR-002910H consists of a paved segment (approximately 0.25-miles in length) of the National Old Trails Road/Highway (currently known as Route 66), which is located immediately north and outside of the Project Site. The resource is listed as California Historical Landmark # 781. The monument for the landmark was erected in Needles, California to commemorate the completion of the last portion of the National Old Trails Highway across the continental United States. The monument describes that the desert crossing was used by the Mojave Indians in the past, as well as by early explorers such as Francisco Garcés in 1776 and Jedediah Smith in 1826-1827 (Arbuckle, 1982). The segment of the resource located north of the Project Site does not appear to have been previously recorded. However, another recorded segment along Foothill Boulevard indicates that the Foothill Boulevard alignment was originally known as the San Bernardino Road in the 1850s. Later in the early 20th century, San Bernardino Road became linked to a larger network of trails/roads known as the “ocean-to-ocean” road and later renamed the National Old Trails Road (Lindgren, 2016).

Sacred Lands File Search

The NAHC maintains a confidential SLF which contains sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted on April 17, 2023 to request a search of the SLF. The NAHC responded to the request in a letter dated June 26, 2023. The results of the SLF search conducted by the NAHC returned negative results for the Project Site (Green, 2023).

Native American Villages

Archival research indicates that a Gabrielino village (*Tooypinga*) was once located near the present-day California Botanical Gardens in Claremont, and approximately 0.75 miles northwest of the Project Site (Claremontheritage.org, 2020).

Review of Historic Maps and Aerial Photographs

Historic maps and aerial photographs were examined to provide historical information about the Project Site and to contribute to an assessment of the Project Site's archaeological sensitivity. The available historic maps reviewed include the 1897 Cucamonga 15-minute quadrangle (TopoView, 2024) and the *Kirkman-Harriman Pictorial and Historical Map of Los Angeles County* (Kirkman, 1937). Aerial photographs were reviewed for the years of 1938, 1948, 1953, 1959, 1964, 1966, 1980, 1992, 2002, 2012, and 2022-2024 (historicaerials.com, 2024; Google Earth, 2024).

Review of the 1897 historic topographic map shows Roberts Campus East and proposed arcade area outside of Roberts Campus East as located within an alluvial fan of the San Antonio Canyon. Review of the 1928 historic aerial shows some gravel mining in the southeastern portion of Roberts Campus East. Review of the Kirkman (1937) map shows the Roberts Campus East area as located immediately south of the "LA County Road." Per review of the legend found in Kirkman's (1937) map, the LA County Road is described as an ancient road. Review of the 1938 aerial photograph continues showing Roberts Campus East and the proposed arcade area outside of Roberts Campus East within the alluvial fan of the San Antonio Canyon. The 1948 and 1953 aeriels depict the southern portion of the Roberts Campus East partially graded as part of gravel mining operations, while the proposed arcade area is undeveloped. By 1959, approximately 75 percent of Roberts Campus East is graded as part of the gravel mining operations, while the portion of the proposed arcade area outside of Roberts Campus East is undeveloped. No changes to Roberts Campus East or the proposed arcade area outside of Roberts Campus East are observed in the 1964 aerial photograph. The 1966 aerial photograph shows that approximately 90 percent of Roberts Campus East is graded, while no changes are observed in the proposed arcade area outside of Roberts Campus East. By 1972, Claremont Boulevard and a baseball field are observed as constructed within the portion of the proposed arcade area outside of Roberts Campus East. No major changes to Roberts Campus East or the proposed arcade area outside of Roberts Campus East are observed in the 1980, 1992, 2002, 2012 aerial photographs. The 2022-2024 aerial photographs show that a portion of the proposed arcade area outside of Roberts Campus East (west of Claremont Boulevard, where a baseball field once existed) has been graded in connection with the construction for the Robert Day Science Center.

Review of Geotechnical Report

ESA reviewed the *Geotechnical Investigation Report* dated March 1, 2024 (Geotechnical Report) prepared for the Revised Project (Langan, 2024). A total of 49 borings (B14 through B-62) were drilled by Langan (2024) within Roberts Campus East and the portion of the proposed arcade area outside of Roberts Campus East. The borings were drilled to depths ranging from 10 to 60 feet below ground surface. Figure 2, Proposed Roberts Campus Sports Bowl Conceptual Plan depicts the locations of the borings by Langan (2024). Per review of the boring logs (found in Appendix A of Langan, 2024), the majority of Roberts Campus East is underlain by documented fill materials, undocumented inert landfill debris, and older alluvial fan deposits. Younger alluvial fan deposits (Qyf) were found in the northeastern portion, as well as along the western perimeter of Roberts Campus East, and along the area of the portions of the proposed arcade outside of Roberts Campus East.

Review of Langan (2024) also indicates that prior geotechnical explorations (test pits and exploration borings) were conducted within the Roberts Campus East. Specifically, Figure 3A, Scenario 2 Conceptual Plan (Langan, 2024) depicts the previous work by GPI and indicates that younger alluvial fan deposits (Qyf) are located along the northeastern portion of the site and the perimeter of the Roberts Campus East site. (Langan, 2024).

Subsurface Sensitivity Assessment

The potential for finding buried prehistoric archaeological deposits during grading activities associated with the Revised Project within Roberts Campus East as well as the portions of the proposed arcade area outside of Roberts Campus East has been assessed based on the following concepts: 1) age of the underlying soil contemporaneous with period of human occupation of the area; 2) proximity to permanent or semi-permanent water sources capable of supporting long-term or seasonal occupation of the area; 3) flat or gently sloped topography conducive to human habitation, 4) proximity of the Project Site to known cultural resources, 5) land use history of the Project Site, and 6) the proposed excavation parameters of the Revised Project. Previous research conducted elsewhere in California has indicated that the presence of buried archaeological sites is positively correlated with proximity to water, as well as flat to gently sloped landforms (Meyer et al., 2010).

Roberts Campus East

The SLF search through the NAHC yielded negative results. However, the results of the SCCIC indicate that several historic-period refuse deposits have been recorded within the 0.50-mile radius of the Project Site. No prehistoric archaeological resources have been previously recorded within the 0.50-mile radius of the Project Site. However, a Native American village site known as *Tooypinga* is known to exist in the general vicinity of the Project Site (within 0.75 miles). A California Historical Landmark #781 known as the National Old Trails Highway/US Route 66 is also located immediately north of Roberts Campus East. The landmark has been described as an old Native American trail and as a route followed by early explorers Francisco Garcés and Jedediah Smith. These results would suggest that the Roberts Campus East has at least a moderate potential for yielding archaeological resources (historic and prehistoric). Nevertheless, review of the Geotechnical Report indicates that the majority of Roberts Campus East is underlain by documented fill materials, undocumented inert landfill debris, and older alluvial fan deposits. These soils are not conducive to the preservation of archaeological materials, as they are either man-made or too old. Only the periphery and an area in the northeastern portion of Roberts Campus East are underlain by younger alluvial fan deposits, which are contemporaneous with the period for which there is widely accepted evidence for human occupation of Southern California (Byrd and Raab, 2007). However, based on a review of historic maps, Roberts Campus East is known to have been located within an alluvial fan that was likely subject to periodic flood events. Additionally, Roberts Campus East served as a gravel pit facility that was graded from the 1920s until the 1970s and covered approximately 90 percent of the Roberts Campus East. Therefore, if resources once existed within Roberts Campus East, it is likely that either the flood events and/or the gravel pit operation have disturbed or displaced archaeological resource that may have existed. As a result, Roberts Campus East has a low potential for yielding buried archaeological resources.

Proposed Arcade Area

As previously mentioned, the SLF search through the NAHC yielded negative results. However, the results of the SCCIC have indicated that California Historical Landmark #781 is located immediately north of Roberts Campus East. A Native American village (*Tooypinga*) is also known to exist in the general vicinity of the Project Site. Several historic-period refuse deposits have also been recorded within the 0.50-mile radius. These results would indicate at least a moderate potential for yielding archaeological resources (historic and prehistoric). However, based on a review of historic maps, the proposed arcade area outside of Roberts Campus East is known to have been located within an alluvial fan that was likely subject to periodic flood events. Additionally, the proposed arcade area outside of Roberts Campus East has been subject to previous ground disturbance. For instance, by 1972, Claremont Boulevard and a baseball field had been constructed. Later, between 2022 and 2024, aerial

photographs show that a portion of the proposed arcade area (west of Claremont Boulevard) is graded as part of the construction for the Robert Day Science Center. As a result, if resources once existed within the proposed arcade area outside of Roberts Campus East, it is likely that the flood events and/or previous grading for Claremont Boulevard and the area west of Claremont Boulevard may have disturbed or displaced archaeological resource that may have existed. As a result, the proposed arcade area outside of Roberts Campus East has a low potential for yielding buried archaeological resources.

Conclusions and Recommendations

A total of 10 cultural resources were recorded within the 0.5-mile radius, none of which are located within the Roberts Campus East or the area of the portion of the arcade outside of Roberts Campus East. However, California Historical Landmark #781 known as the National Old Trails Highway/US Route 66 is located immediately north of Roberts Campus East. The archaeological sensitivity assessment conducted by ESA concluded that the Roberts Campus East and proposed arcade areas outside of Roberts Campus East have a low potential for yielding buried archaeological resources (historic and prehistoric) based on the previous flood events and/or ground disturbance which have likely disturbed or displaced any archaeological resource that may have existed. Based on the areas having a low potential for yielding buried archaeological resources (historic and prehistoric), no mitigation measures are required.

However, as a typical precaution (i.e., best management practice) for construction contractors, the Revised Project proposes that the project contractor will retain a Qualified Archaeologist in the event that archaeological resources are encountered during construction. As part of construction mobilization activities, the Qualified Archaeologist will conduct a cultural resources sensitivity training for construction personnel so that the personnel can be informed during construction activities of the types of resources that may be encountered. If resources are encountered, the construction personnel will halt construction activities in the vicinity of the find and notify the Qualified Archaeologist to assess and treat, if necessary, the resource in accordance with the Public Resources Code Sections 5024.1 and 21083.

In addition, as required by State Health and Safety Code Section 7050.5, in the unlikely event that human remains are discovered, no further disturbance of a site containing human remains shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to Public Resources Code Section 5097.98.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Claremont McKenna Phase 1 Construction
Construction Start Date	8/1/2024
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.80
Precipitation (days)	2.40
Location	34.10354503733571, -117.7007727686169
County	San Bernardino-South Coast
City	Upland
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5227
EDFZ	10
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.24

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Arena	50.0	1000sqft	16.1	50,000	0.00	0.00	—	—

Unenclosed Parking Structure	470	Space	4.23	10,500	0.00	0.00	—	—
Parking Lot	240	Space	2.16	0.00	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-13	Use Low-VOC Paints for Construction

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2

Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	88.7
AQ-PM	95.3
AQ-DPM	80.9
Drinking Water	97.1
Lead Risk Housing	31.1
Pesticides	2.66
Toxic Releases	58.9
Traffic	29.8
Effect Indicators	—
CleanUp Sites	43.6

Groundwater	10.6
Haz Waste Facilities/Generators	46.8
Impaired Water Bodies	12.5
Solid Waste	39.3
Sensitive Population	—
Asthma	60.1
Cardio-vascular	70.9
Low Birth Weights	64.5
Socioeconomic Factor Indicators	—
Education	40.1
Housing	69.5
Linguistic	54.6
Poverty	64.9
Unemployment	29.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	19.74849224
Employed	14.1537277
Median HI	26.85743616
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	71.0
Healthy Places Index Score for Project Location (b)	38.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A
-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	84.6
AQ-PM	94.4
AQ-DPM	81.2
Drinking Water	98.0
Lead Risk Housing	—
Pesticides	19.8
Toxic Releases	56.7
Traffic	28.1

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A
-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	88.7
AQ-PM	95.3
AQ-DPM	80.9
Drinking Water	97.1
Lead Risk Housing	31.1
Pesticides	2.66
Toxic Releases	58.9
Traffic	29.8
Effect Indicators	—
CleanUp Sites	43.6
Groundwater	10.6
Haz Waste Facilities/Generators	46.8
Impaired Water Bodies	12.5
Solid Waste	39.3
Sensitive Population	—
Asthma	60.1
Cardio-vascular	70.9
Low Birth Weights	64.5
Socioeconomic Factor Indicators	—
Education	40.1
Housing	69.5
Linguistic	54.6
Poverty	64.9
Unemployment	29.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	19.74849224
Employed	14.1537277
Median HI	26.85743616
Education	—
Bachelor's or higher	76.02977031
High school enrollment	100
Preschool enrollment	57.52598486
Transportation	—
Auto Access	68.11240857
Active commuting	41.48594893
Social	—

Langan Proposal No. 700114101**

Dear Michelle, Andres and Matt:

Langan Engineering & Environmental Services, Inc. is pleased to submit this geotechnical engineering report for the Proposed Roberts Campus Sports Bowl to be constructed for Claremont McKenna College (CMC) in Claremont and Upland, California.

This report was prepared in general accordance with our proposal dated March 21, 2022 and our contract for professional services with CMC that was executed on June 28, 2022.

We sincerely appreciate the opportunity to be of service to you on this project. Please contact us if you have questions regarding this report.

Sincerely,
Langan Engineering & Environmental Services, Inc.

Christopher J. Zadoorian, G.E., F. ASCE

1.0 INTRODUCTION

1.1 General

Langan Engineering and Environmental Services, Inc. (LANGAN) has completed a geotechnical investigation for the proposed Roberts Campus Sports Bowl development. The proposed development will be constructed primarily within a portion of the existing Claremont Landfill (aka Roberts Campus East; previously known as East Campus) noting a pedestrian tunnel is also planned that will extend from the Claremont Landfill west beneath Claremont Boulevard and provide access to the Sports Bowl from the main campus. The site location is shown on Figure 1.

The existing landfill site is approximately 74 acres and is bound on the east by Monte Vista Avenue, on the west by Claremont Boulevard, on the north by Foothill Boulevard and on the south by West Arrow Route. The proposed Roberts Campus Sports Bowl is to be developed on approximately 66.5 acres of the 74-acre site.

The boundary between the City of Claremont (Los Angeles County) and the City of Upland (San Bernardino County) crosses the site diagonally with the northwesterly approximately 29 acres located with the City of Claremont and the southeasterly approximately 45 acres located in the City of Upland (San Bernardino County).

1.2 Site Background

The existing inert debris landfill site began as a quarry in the 1920s. Quarry operations ended in 1972. In late 1972, the site was permitted for disposal of inert debris consisting of non-decomposable, non-water soluble, inert solids. In 1984, landfilling operations were suspended pending potential development. Inert debris landfill operations resumed in 1991. By 1994, significant inert debris fills were placed in the northwestern corner and along the western side of the site.

The landfill is in Los Angeles and San Bernardino counties, however, in 1987 staff from the Regional Water Quality Control Board (RWQCB) for both Los Angeles and Santa Ana agreed that the Los Angeles RWQCB would assume jurisdictional responsibility for the entire landfill, including those portions within San Bernardino County.

In 1998, the inert debris landfill was purchased by The Claremont Colleges Services (TCCS) (formerly known as the Claremont University Consortium) which is the central coordinating and support organization for the seven independent colleges (including CMC) known as The Claremont Colleges.

Following TCCS's purchase of the inert debris landfill, waste disposal was restricted to inert debris from construction projects within TCCS, including CMC, Pomona College, Scripps College, Harvey Mudd College, Pitzer College, and Claremont Graduate University.

On May 4, 2000, updated Waste Discharge Requirements (WDR) were adopted by Los Angeles RWQCB Order 00-070, reflecting, among other things, the change to TCCS's ownership. Because TCCS limited disposal to material from construction sites or projects by TCCS or its associated colleges, the updated WDR included exemptions from certain provisions including the waste load checking program.

On August 19, 2019, a superseding WDR was issued, Order R4-2019-0087 (Current WDRs; 2019 RWQCB). These superseding WDRs were issued in anticipation of the commencement of an Inert Debris Engineered Fill Operation (IDEFO) on the site, which would have accepted inert debris from the general public (i.e. sources other than construction projects within TCCS). An IDEFO also would have been regulated by the California Department of Resources Recycling and Recovery (CalRecycle), through its Local Enforcement Agencies (LEAs), in accordance with Division 7, Chapter 3 of Title 14

of the California Code of Regulations (Title 14). Accordingly, the WDRs were revised to include updated requirements, including waste characterization, waste load checking, and groundwater quality monitoring, as required for the anticipated IDEFO. These superseding WDRs also reflected a change of the operator (to Arcadia Reclamation Inc.). The superseding WDRs did not change the acceptable materials that include soil, rock, gravel, broken concrete, broken asphalt, glass, brick, and other inert debris. Additionally, the superseding WDRs state that asphaltic material shall not be dumped into standing water, nor shall it be placed below the highest anticipated groundwater elevation.

However, despite the fact that the Current WDR (Order R4-2019-0087) anticipated operation of an IDEFO, the landfill was never operated as an IDEFO. Instead, the site has consistently continued to operate as it had since acquisition by TCCS. Thus, with one exception, operations since at least May, 2000 have been continuously limited to acceptance of inert debris waste from TCCS and its associated colleges, and this limited use continues to the present. The one exception consisted of disposal of soil and construction debris from a City of Upland stormwater basin expansion project in 2004 and 2007. The Los Angeles RWQCB approved waivers to allow the one-time acceptance of waste material from projects outside of TCCS. Although an IDEFO was never commenced on the site, the Detection Monitoring Program (DMP) reporting has occurred as required by the Current WDR. Because the landfill has only accepted inert debris, the landfill is unlined and does not include environmental control provisions for gas and leachate collection.

In 2021, CMC completed acquisition of all parcels comprising the inert debris landfill. CMC plans to close the landfill and implement existing entitlements approved by the cities of Claremont and Upland in 2016, with some modifications, to develop the majority of the property (i.e. approximately 66.5 acres) with sports fields, parking and related uses.

Based on our review of a topographic survey prepared by Atlas Civil Design, the ground surface level around the site perimeter ranges from approximately 1,330 feet at the northeast corner to 1,240 at the southwest corner. Existing slopes descend from the perimeter to a low point of approximately Elevation 1,184 near within the southerly portion of the site.

Concurrent with this geotechnical investigation and report, Langan also prepared a landfill closure plan dated December 15, 2023.

1.3 Proposed Sports Bowl Development

1.3.1 General

The following information describes currently contemplated development scenarios and is presented in this report to provide context for evaluation of geotechnical feasibility and development of geotechnical design recommendations provided herein. The development scenarios summarized herein may be subject to change as the planning process evolves.

Three alternative development options are currently contemplated for the site and are designated as Scenarios 1, 2 and 2B.

We were furnished with conceptual plans for the three alternative scenarios dated December 6, 2023, provided by BIG Architects and grading plans dated April 27, 2023 and December 11, 2023 for Scenarios 1 and 2/2B, respectively, provided by Atlas Civil Design.

The contemplated scenarios include development of athletic playing fields, a pedestrian access tunnel and various 'minor' structures with relatively small footprints, limited occupancy and relatively light foundation loading to service the planned athletic field development.

Scenarios 2 and 2B will also include a large-footprint parking structure and an adjacent maintenance facility structure.

The proposed pedestrian tunnel will be constructed by cut-and-cover methodology and the invert will be established approximately 21 feet below Claremont Boulevard and four to approximately nine feet of soil cover are planned above the top of the tunnel structure.

Surface parking is also planned along the northern end of the site, and along portions of the east and west sides of the site. Vehicular access driveways will be located along Claremont Boulevard, Foothill Boulevard and Monte Vista Avenue. Parking and vehicular access driveways vary with the three alternative development scenarios.

Another component of the proposed development is a network of paths and trails surrounding the proposed playing fields.

Mass grading will be required to accomplish the planned finish grades and the mass grading will include excavation, processing, and re-placement of the existing landfill materials. The planned grading will establish permanent slopes and will likely require construction of retaining walls at one or more locations.

Each of the alternate scenarios will include development of approximately 66.5 acres of the landfill site. The 66.5 acres encompass lots 1-4 of the Upland Parcel Maps 18989 and Lots 1-2 of the Claremont Parcel Map 70243.

Development is not currently contemplated as part of the Sports Bowl project within the southerly 10 acres, approximately 15 percent of the site (Lot 3 of the Claremont Parcel Map 70243 and Lots 5 and 6 of Upland Parcel Map 18989).

The following sections describe each of the alternate development scenarios.

1.3.2 Development Scenario 1

Scenario 1 would develop the northerly 66.5 acres and would consist of construction of a football / track / lacrosse field, three multi-purpose fields, a soccer / rugby field, and a baseball field, a softball field, and a golf practice facility.

Minor structures are planned that include an approximately 15,000 square foot (sf) sports pavilion (Field Sports Pavilion) along the north side of the football / track / lacrosse field, an approximately 14,000 sf field house (North Field House) south of the proposed baseball and softball fields, and an approximately 11,000 sf maintenance facility structure northeast of the proposed softball field. Dugout structures, batting cages and bullpens are planned adjacent to the baseball and softball fields.

A pedestrian access tunnel is planned to connect the Sports Bowl to the main (west) CMC campus adjacent to the football / track / lacrosse field. The invert of the tunnel will be established approximately 21 feet below Claremont Boulevard grade.

Surface parking lots are also planned along the southeast, west, and northerly sides of the site. Scenario 1 is depicted on Figure 2A.

1.3.3 Development Scenario 2

Scenario 2 would also develop the northerly 66.5 acres and would consist of construction of a football / track / lacrosse field, three multi-purpose fields, a soccer / rugby field, a baseball field, a softball field, and a golf practice facility.

A large-footprint subterranean parking structure is planned along the west side of the site. A preliminary concept for the proposed parking structure indicates it will consist of one-subterranean level that will be established approximately 11.5 feet below the existing ground surface level (bgs).

Minor structures are planned that include an approximately 11,200 sf field house (North Field House) south of the baseball and softball fields, an approximately 3,200 sf press box along the south side of the football / track / lacrosse field, three field storage support structures ranging from approximately 4,000 sf to 9,000 sf at the east, west and north sides of the football / track / lacrosse field. Dugout structures, batting cages, bullpens and approximately 1,800 sf support facilities are planned adjacent to the baseball and softball fields.

A pedestrian access tunnel is planned to connect the Sports Bowl to the main (west) CMC campus adjacent to the football / track / lacrosse field. The invert of the tunnel will be established approximately 21 feet below Claremont Boulevard grade.

A maintenance facility structure is planned immediately south of the parking structure and pedestrian tunnel. The lowest finish floor level for the maintenance facility structure will be established at Elevation 1,235.5.

Surface parking lots are also planned at the southeast, northerly and southwestern sides of the site. Scenario 2 is depicted on Figure 3A.

Phasing of Scenario 2 development is also being considered wherein the football / track / lacrosse fields, baseball and softball fields and golf practice facility will be constructed first and will utilize fill materials borrowed from the northerly side of the site.

1.3.4 Development Scenario 2B

Scenario 2B would also develop the northerly 66.5 acres and would consist of construction of a football / track / lacrosse field, three multi-purpose fields, a soccer / rugby field, a baseball field, a softball field, and a golf practice facility.

A large-footprint subterranean parking structure is planned along the west side of the site. A preliminary concept for the proposed parking structure indicates it will consist of one-subterranean level that will be established approximately 11.5 feet below the existing ground surface level (bgs).

Minor structures are planned including an approximately 29,200 sf field house (aka North Field House) along the north side of the football / track / lacrosse field, and an approximately 3,200 sf press box along the south side of the football / track / lacrosse field. Please note the North Field House planned in Scenario 2B consolidates several smaller structures planned in Scenario 2. Dugout structures, batting cages, bullpens, and approximately 1,800 sf support facilities are planned adjacent to the baseball and softball fields.

A pedestrian access tunnel is planned to connect the Sports Bowl to the main (west) CMC campus adjacent to the football/ track/ lacrosse field. The invert of the tunnel will be established approximately 21 feet below Claremont Boulevard grade.

Surface parking lots are also planned at the southeast, northerly, and southwestern sides of the site. Scenario 2B is depicted on Figure 3B.

Phasing of Scenario 2B development is also being considered wherein the football / track / lacrosse fields, baseball and softball fields and golf practice facility will be constructed first and will utilize fill materials borrowed from the northerly side of the site.

1.3.5 Summary of Alternative Development Scenarios 1, 2 and 2B

Each of the proposed alternative development concepts will require mass grading and the installation temporary shoring. To achieve the planned playing field finish surface level, cuts up to approximately 46 feet and fills up to approximately 24 feet are required for Scenario 1 and cuts and fills each up to approximately 40 feet are required for Scenarios 2 and 2B as summarized in Tables 1 and 2.

Table 1 – Summary of Development Scenario 1

Playing Field / Structure	Finish Playing Field Surface Level or Lowest Finish Floor Level (feet, msl)	Approximate Cut/Fill ¹ (Feet)	
		Max Cut	Max Fill
Football / Track / Lacrosse Field	1,209.0	31	24
Multi-purpose Field	1,224.0	21	9
Soccer / Rugby Field	1,243.0	7	15
Baseball Field	1,257.0	46	20
Softball Field	1,257.0	3	7
Golf Practice Area	1,257.0	39	7
Pedestrian Tunnel	1,233.0	21	0

¹To achieve finish playing surface level / lowest finish floor level

Table 2 – Summary of Development Scenarios 2 and 2B

Playing Field / Structure	Finish Playing Field Surface Level or Lowest Finish Floor Level (feet, msl)	Approximate Cut/Fill ¹ (Feet)	
		Max Cut	Max Fill
Football / Track / Lacrosse Field	1,216.0	24	31
Multi-purpose Field	1,260.0	40	17
Soccer / Rugby Field	1,251.0	4	16
Baseball Field	1,226.0	19	0
Softball Field	1,226.0	14	11
Golf Practice Area	1,226.0	19	11
Maintenance Facility Structure	1,235.5	27	0
Parking Structure	1,243.0 to 1,263.0	13	0
Pedestrian Tunnel	1,233.0	21	0

¹To achieve finish playing surface level / lowest finish floor level

Lowest finish floor elevations for the proposed structures remain a work in progress and will be provided in an addendum once finalized.

1.3.6 Stormwater Management

The proposed stormwater management concept will include infiltration as well as retention beneath the football / track / lacrosse field playing surface.

1.4 Prior Geotechnical Investigation

We have reviewed reports of prior geotechnical investigations for the landfill site dated December 23, 2020 and January 28, 2022 that were prepared by Geotechnical Professionals Inc. (GPI).

We have also reviewed a prior geotechnical report for the landfill site dated June 6, 2001, June 15, 2005, and August 21, 2007 prepared by RMA that summarize RMA's field observations during earthwork and grading within the southerly portion of the site.

We have reviewed the data presented in the prior reports and assume the responsibility for the use and interpretation of the prior available geotechnical data.

2.0 SUBSURFACE EXPLORATIONS AND CONDITIONS

2.1 Current Geotechnical Explorations

We drilled 49 borings (B-14 through B-62) at the site using truck-mounted and track-mounted hollow-stem auger drilling equipment. The borings were drilled to depths ranging from ten to 60 feet below the existing ground surface level (bgs).

We also performed field percolation testing at six locations (FP-1 through FP-6) and installed three soil gas (methane) wells at the site during subsequent mobilizations. Field percolation testing and soil-gas (methane) testing are summarized in Sections 2.5 and 2.6, respectively.

During each of our initial and subsequent exploration programs, our field representative maintained a log of the subsurface conditions, collected relatively undisturbed and bulk samples and performed standard penetration tests (SPT) at regular intervals during drilling. The samples collected from the borings were transported to our office for further review, classification, and assignment of geotechnical laboratory testing. Our laboratory testing program is summarized in Section 3.0.

Upon completion of drilling and/or percolation testing, the borings were backfilled with the drill cuttings.

The locations of our current explorations are shown on Figures 2A, through 3B and logs of our current explorations are presented in Appendix A.

2.2 Prior Geotechnical Explorations

GPI excavated 32 test pits to depths ranging from approximately three to 21 feet bgs, drilled 13 exploration borings to depths ranging from approximately six to 61 feet bgs as part of a prior investigation.

GPI also engaged a subconsultant to perform seismic refraction testing at 11 locations. Seismic refraction is a passive geophysical technique that utilizes a low-strain signal at the ground surface level that propagates through the subsurface materials and is redirected (refracted) at interfaces between subsurface materials. The refracted waves are detected by the geophones and a subsurface profile is developed to estimate the stiffness and/or uniformity of the subsurface conditions.

The locations of the prior test pits, exploration borings and seismic refraction lines are shown on Figures 2A through 3B and logs of the prior explorations and geophysical testing are presented in Appendix B.

2.3 Subsurface Conditions

Documented fill materials were encountered at the south side of the site and ranged from one to 45 feet in thickness. The documented fill materials consisted of dry to moist silty sand with various amount of gravel and cobbles.

Undocumented inert landfill debris was encountered over a majority of the site. Fill thickness ranges from a few feet to over 30 feet in the central portion of the site to as much as 55 feet thick in the western and northern portions of the site. These materials consisted of dry silty sand with various amounts of gravel and cobbles, and various amounts of asphalt, brick, concrete, and metallic debris. A thin layer of scattered fills, less than a few feet thick, cover most of the old quarry bottom. Local stockpiles scatter the bottom of the quarry, consisting of undocumented fill soils and inert debris. A majority of the quarry bottom contains surficial undocumented fill that form a thin mantle over native alluvial soils.

Native soils consist of young and old alluvial fan deposits. Younger alluvial fan deposits are present at the northern end of the site and along the site boundaries, generally near street grade. Older alluvial fan deposits are present near surface and underlying fill soils. These units primarily consist of dense to very dense silty sands with various amounts of gravel and cobbles. More detailed description of on-site soils and units is presented in Sections 4.1 and 4.2.

Generalized subsurface conditions are presented on Figures 4A through 4H for development Scenario 1 and Figures 5A through 5H for development Scenarios 2 and 2B.

2.4 Groundwater

The site is somewhat unique in that a distinctive groundwater barrier, the San Jose fault, transects the site diagonally from the northeast to the southwest. The San Jose fault acts as a groundwater barrier and the depth to groundwater is very deep on the east side of the fault and is shallower on the west side of the fault as discussed below.

Based on our review of the California Geologic Survey (CGS) Seismic Hazard Zone Report (SHZR) 040 for the Ontario Quadrangle, the historical high groundwater level at the site ranges between depths of approximately 50 to 150 feet bgs (CGS, 2000) as shown on Figure 6 west of the San Jose fault.

Groundwater contour data prepared by Carson and Matti (1985) indicates that groundwater is estimated to be greater than 600± feet in depth east of the San Jose fault.

Groundwater data for a well located less than 2,000± feet to the west (Well 341006N1177096W001), indicates that groundwater has ranged from a depth of approximately 156 to 184 feet between the time period of 2011 to 2022 (CDWR, 2022). This well is west of the San Jose Fault.

In 1983 groundwater was reported to be at a depth of 195 and 140 feet in the northwest and southwest portions of the site, respectively (RMA, 2007).

Three groundwater monitoring wells are located on the site. Pit Well No. 1, located at the north end of the site was installed in the 1980's and has been used for periodic water quality testing. r Additional groundwater monitoring wells we installed in August 2021, and, along with Pit Well No.1, make up the revised ground water monitoring network. Anacapa Geoservices has performed groundwater

monitoring and prepared semi-annual reports that are submitted to the State Water Board and available for reference on the GeoTracker data system (GeoTracker Global ID L10002913798).

Groundwater was measured in Pit Well 1 in 2004 at a depth of 417 feet bgs. Attempts in 2010 and 2011 to read this well were unsuccessful due to access limitations and/or complications with the measuring devices. No other measurements were made available.

Groundwater was not encountered to the maximum explored depths during prior field explorations at the site.

Tri-annual groundwater sampling events were conducted at the inert debris landfill from 2001 through 2017 as required by the Los Angeles RWQCB. These sampling events were conducted in accordance with the guidelines set by WDR (File No. 66-016) and Amended Monitoring and Reporting Program (MRP) No. 5766.

Groundwater data was collected from the one monitoring well located on site during this time period, Pit Well No. 1 (formerly Well No. A), located at the northernmost area of the Site, approximately 200 feet south of Foothill Boulevard. No exceedances of the California Primary or Secondary MCLs were reported, indicating that the inert landfill has not impacted the quality of groundwater represented by Pit Well No. 1 (Earthcon, 2017).

On 21 August 2019, the Los Angeles RWQCB issued the current WDRs (file No. 66-016, order number R4-2019-0087), which require semi-annual groundwater monitoring at Pit Well No. 1 and two additional groundwater wells. The two additional groundwater wells (CMW-1 and CMW-2) were installed by Arcadia Reclamation, Inc. (Arcadia) as the downgradient Point of Compliance as shown on Figures 2A through 3B. The wells were installed to the depth of approximately 150 below ground surface (bgs) (Arcadia, 2021).

Semi-annual monitoring and testing have been provided by Anacapa Geoservices Inc. (Anacapa) since 2021. Due to drought-induced declining groundwater elevation, none of the two onsite monitoring wells detected water during monitoring and sampling events. Therefore, calculation of the gradient and flow direction was not possible and no samples were collected. The production well (Pit Well No. 1) was reconditioned (repair pump, repair electrical, etc.) and was not monitored and sampled in 2021 (Arcadia, 2021).

Geotechnical and multiple phases of environmental investigations and on-going monitoring programs have been completed at the landfill, as described above. The investigation results and monitoring data obtained have not indicated any contamination of groundwater at the site. Because the former quarry and landfill have only accepted inert debris, the landfill is unlined and does not include environmental control measures for gas and leachate collection.

2.5 Field Percolation Testing

FP-1 was located within Los Angeles County and we performed field percolation testing in FP-1 within general conformance with the *Boring Percolation Test Procedure* outlined in the *County of Los Angeles, Department of Public Works, Guidelines for Geotechnical Investigation and Reporting Low Impact Development Stormwater Infiltration Manual (LA County Guidelines, GS200.2)*, dated June 30, 2021.

FP-2 through FP-6 were located within San Bernardino County and we performed field percolation testing within FP-2 through FP-6 in general conformance with the *Technical Guidance Document Appendix VII. – Infiltration Rate Evaluation Protocol and Factor of Safety Recommendations*, provided in the *San Bernardino County technical guidance document* dated May 19, 2011.

Upon the completion of drilling, we installed solid and slotted 3-inch outside diameter PVC piping and filled the annular space between the PVC piping and the borehole sidewalls with gravel. The borings were drilled between approximately 10 to 70 feet bgs. The slotted PVC pipe was installed within the lower five feet of each boring to allow introduction of water for the percolation test.

After completion of the well construction, the well was pre-soaked in advance of field percolation testing. Pre-soaking and subsequent field percolation testing was performed in general conformance with LA County Guidelines (FP-1) and San Bernardino Guidelines (FP-2 through FP-6).

The testing was repeated in the test well until the measured rate of percolation stabilized and county testing requirements were achieved. Six trials were performed within each test well.

The results of the field percolation testing are presented in the Tables 3 (LA County) and 4 (San Bernardino County).

Table 3 – Field Percolation Test Results (LA County)

Field Percolation Test #	Depth (Feet)	Ground Surface Elevation (feet/msl)	Soil Type ¹	Measured Field Percolation Rate (inches/hour)
FP-1	12	1,235	SM	1.08

Table 4 – Field Percolation Test Results (SB County)

Field Percolation Test #	Depth (Feet)	Ground Surface Elevation (feet/msl)	Soil Type ¹	Measured Field Percolation Rate (inches/hour)
FP-2	10	1,215	SP-SM	3.79
FP-3	10	1,229	SP-SM	3.18
FP-4	19	1,195	SP-SM	1.14
FP-5	70	1,247	SP-SM	5.37
FP-6	40	1,185	SP-SM	9.69

¹Field percolation testing was performed in native soils, in each case

The results of the field percolation testing are presented in Appendix C.

Please note the above test results do not include factors of safety that may be required by each respective county.

2.6 Soil-Gas (Methane) Monitoring Well Installation

We installed three soil-gas (methane) monitoring probes on site, MW-1 through MW-3, within the footprint of the proposed parking structure along the west side of the site (included in Scenarios 2 and 2B) on August 14th and 15th, 2023.

The methane wells boreholes were drilled using track-mounted hollow-stem auger drilling equipment and the construction of the methane wells consisted of installing a four-inch diameter PVC pipe within the borehole. Three one-inch diameter PVC pipes were installed within the four-inch diameter PVC section and the HDPE tubing was installed within the one-inch PVC pipes. The one-inch PVC pipes consisted of solid casing with the exception the sampling interval that consisted of slotted casing to allow soil-gas testing, also referred to as screened intervals. Screened intervals were established at depths of 17, 22, and 33 feet bgs, corresponding with depths of approximately five, ten and 20 feet below the currently planned lowest finish floor level of the parking structure. Each depth interval was

isolated from the below interval by placing concrete slightly above and the remaining annular space was filled with fine gravel.

Soil-gas testing was performed in MW-1 through MW-3 using a Landtec GEM 5000 Plus Landfill Gas Monitor on two subsequent days. The results of the testing indicated zero methane gas was present at each screened depth interval.

Logs of the methane wells and results of the methane testing are presented in Appendix D.

3.0 GEOTECHNICAL LABORATORY TESTING

3.1 Current Laboratory Testing

As part of our current investigation, we performed the following geotechnical laboratory testing:

- In-situ moisture content and in-place dry-density
- Maximum dry density and optimum moisture content
- Direct Shear Strength
- Consolidation
- Corrosion Potential
- Expansion Index
- Percent Passing # 200 Sieve

The results of our current geotechnical laboratory testing are presented in Appendix A.

3.2 Prior Laboratory Testing

As part of their prior investigations, GPI performed the following geotechnical laboratory testing:

- Moisture Content and Dry Density
- Maximum Dry-Density and Optimum Moisture Content
- Direct Shear
- Grain-size Distribution

The results of the prior geotechnical laboratory testing are presented in Appendix B.

4.0 GEOLOGIC AND SEISMIC HAZARDS EVALUATION

4.1 Regional and Local Geologic Setting

The site is located in the northern portion of the Peninsular ranges Geomorphic Province along the southern side of the San Gabriel Mountains.

Regional topography is dominated by the presence of the faults that define the mountains and hills of the Southern California region including the Cucamonga Fault that locally defines the southern boundary of the San Gabriel Range, the Chino Fault to the west of the site that bounds the Chino Hills in that area, and the San Jacinto and San Andreas Faults to the east of the site. The Santa Ana River is located about ten miles south of the site where it flows to the southwest through the Prado Dam area (CDMG, 2007 and Morton & Miller, 2006). Figure 7 presents a local geologic map.

Based on review of available geologic maps (Morton & Miller, 2006), the site is specifically on the western extent of an alluvial fan deposit emanated from the San Antonio Creek at the base of the San Gabriel Mountains. The large, well-formed fan is largely mapped as mixtures of unconsolidated sand, gravel, and boulders deposited through braided streams.

Sediments at the site were mined for sand and gravel beginning in the 1920s and ending in 1972. In late 1972, the site was permitted for disposal of inert debris consisting of non-decomposable, non-water soluble, inert solids. In 1984, landfilling operations were suspended pending potential development. Inert debris landfill operations resumed in 1991. By 1994, significant inert debris fills were placed in the northwestern corner and along the western side of the site. Since at least May 2000, waste disposal has been restricted to inert debris from construction projects within TCCS and its associated colleges. Because the landfill only accepted inert debris, the landfill is unlined and does not include environmental control measures for gas and leachate collection. Previous filling operations were undocumented except for fill placed the southeast corner of the site. Large quantities of landfill generally consisting of silty sand were placed across the site up to thicknesses of approximately 55 feet.

Figures 2A through 3B also include geologic mapping conducted in this investigation in conjunction with GPI (2022) overlaying the Sports Bowl site plan. Figures 4A through 5H present geotechnical cross-sections of subsurface soils. A description of units in order of relative age, from youngest to oldest is presented below.

A historical summary of aerial photographs for the site is presented in Appendix E.

4.1.1 Undocumented Surficial Fill

Local stockpiles scatter the bottom of the quarry, consisting of undocumented fill soils and inert debris. A majority of the quarry bottom contains surficial undocumented fill that form a thin mantle over native alluvial soils.

4.1.2 Compacted Fill (a_{fc})

Between 2004 and 2005, up to approximately 75 feet of compacted fill was placed within Parcel 6 of Upland Parcel Map 18989 and a portion of Parcel 5 in the southeastern portion the site along Arrow Route (RMA, 2004 & 2005). Prior to placement of the compacted fill, undocumented fills and loose soils were reportedly removed, and a keyway was excavated along the toe of the north facing fill slope. Removals did not include the road embankment fill on the east side of Parcel 6 or landfill materials on the west side within Parcel 5. The compacted fill was reportedly benched into the road embankment fill placed along Monte Vista Avenue. Based on the report by RMA and the explorations, the compacted fill consists of silty sands and gravelly sands with variable amounts of silt, gravel, and cobbles and was compacted to at least 90 percent relative compaction.

4.1.3 Undocumented Fill (a_{fu})

Undocumented fill soils stockpiled and spread over the central portion of the site on the former quarry bottom range in thickness from a few feet to over 30 feet. These deposits consist generally of inert construction debris (concrete and asphalt rubble), sand, gravel, cobbles and occasional boulders. These undocumented rubble fills were likely end dumped and spread and contain significant voids. A thin layer of scattered fills, less than a few feet thick, cover most of the old quarry bottom.

4.1.4 Undocumented Inert Debris Landfill (a_{lr})

Undocumented inert debris fills up to approximately 55 feet thick were encountered overlying older alluvial fan deposits near the upper terrace area in the northwest and southwest corners and western side of the site. These materials consist of sand and gravel with varying amounts of silts, cobbles and local boulders and inert debris consisting primarily of concrete and asphalt rubble were encountered at variable depths throughout the unit. Pieces of concrete and asphalt up to three feet in size were

encountered by GPI (2022) in their test pits. Larger pieces of concrete and asphalt debris, and lesser deposits of clay pipe, brick, masonry block, and pieces of metal were observed near the surface. The inert debris fill soils were likely placed in an uncontrolled manner resulting in poorly compacted conditions. Based on surface expression, as well as drilling and sampling characteristics, these deposits likely include layers of nested concrete and asphalt rubble intermixed with layers of sand, gravel, cobbles, and boulders.

4.1.5 Old Access Road Fill (a_{rf})

Based on historic aerial photography, old access road fill was placed for site access to the quarry beginning between 1953 and 1959. Fill was likely placed on an ongoing basis as the quarry deepened. Where investigated near the quarry bottom, soils consisted of loose gray silty sand with zones of gravel, and some buried metal. Fill depth was observed at nine feet bgs, though actual depths may be deeper toward Monte Vista Avenue.

4.1.6 Road Embankment Fill (a_{re})

Research conducted by GPI (2020) utilized historic aerial photos to constrain the age of the road embankment fill associated with the construction of Monte Vista Avenue on the eastern side of the site to the early 1990s. The approximately 2:1 (horizontal:vertical, h:v) slope was constructed with fills between 30 to 50 feet in thickness, with a mid-slope terrace drain. GPI reports (2022) that the fill was placed under the jurisdiction of San Bernardino County prior to incorporation into the City of Upland, though geotechnical documentation of the fill has not been made available.

4.1.7 Alluvial Fan Deposits (Q_{yf} and Q_{of})

Native alluvial soils encountered in explorations generally consisted of sand and silty sands with gravel and cobbles. Surficial boulders mantle a majority of the site. The younger alluvial fan deposits were observed near the ground surface in the northeastern and perimeter portions of the site at higher elevations. The older alluvial fan deposits are exposed sporadically on the quarry bottom, and beneath landfill deposits at variable depths. Where observed, these deposits generally consist of an orangish brown silty sand with gravel. Many of these deposits contain manganese oxide-stained clasts and signs of oxidation.

4.2 Reclamation Backfill

Undocumented fill soils were encountered in a majority of geotechnical borings and test pits. These fill soils were divided into categories based on relative age to generalize materials imported to the site. Based on field explorations and surface mapping, these units consisted of soil, concrete, asphalt, brick, and metal debris and rubble. These units are delineated on Figures 2A, 2B, 3A and 3B. These units are classified into four generalized fill units based on prevailing material as soil fill (more than 50 percent soil), oversize cobbles and boulders (more than 50 oversize), concrete debris (more than 50 percent concrete), asphalt (more than 50 percent asphalt), brick (more than 50 percent brick), and miscellaneous debris including rebar, old pipes, plastic, and variable metals (misc. debris more than 50 percent). The estimated percentages of materials from each boring and their weighted averages are summarized in Table 5 and presented in detail in Appendix F.

Table 5: Weighted Average Summary of Debris in Reclamation Fill Units

Fill Type	Approximate Percentage of Debris Generalized Fill Units Weighted Averages %				
	>50% Oversize	>50% Concrete	>50% Asphalt	>50% Brick	Miscellaneous Debris
a _{sf}	12	1	1	0	1
a _{fc}	28	0	1	1	1
a _{fu}	14	2	2	3	2
a _{lf}	14	4	6	1	1

Based on the weighted averages of the fill units listed in the above table, fill units are predominately composed of soil, complemented by significant amounts of oversized cobbles and boulders, and lesser amounts of concrete, asphalt, brick, and other miscellaneous debris. The distributions of these materials with depth in each fill unit is highly variable.

4.3 Geologic and Seismic Hazard Evaluation

We evaluated the geologic and seismic hazards at the site in general accordance with California Geological Survey (CGS) Special Publication 117A, "Guidelines for Evaluating and Mitigating Seismic Hazards in California." The results of our evaluation are summarized below.

4.4 Regional Faulting

We reviewed the CGS 2010 Fault Activity Map (FAM) of California and the USGS Quaternary Fault and Fold Database (QFFD), to identify mapped faults within 100 kilometers of the site. The FAM and QFFD show that the closest mapped fault to the site is the Indian Hills fault, located approximately 1 mile (1.6 km) to the northwest and the San Jose Fault, located approximately 1.1 mile (1.8 km) to the southwest. A queried portion of the San Jose fault has been mapped beneath the site. Additional discussions are presented in Section 4.6.

Figures 8A and 8B show the site location relative to the nearby seismic sources.

4.5 Regional Seismicity

The site is located in an active seismic area that has historically been affected by generally moderate to occasionally high levels of ground motion. Therefore, the proposed development will probably experience moderate to occasionally high levels of ground motion from nearby faults as well as ground motions from other active seismic areas of the southern California region.

A search of the USGS ANSS Comprehensive Earthquake Catalog (ComCat) using a web-based Earthquake Archive Search and URL builder tool, found that as of December 17, 2023, 66 earthquakes with magnitudes of 5.0 or greater have occurred within a 100-km radius of the site since 1800 as shown on Figure 8A and 8B.

4.6 Ground Surface Rupture Potential

Historically, ground surface displacements closely follow the traces of geologically young faults. The site is not located within a California Geological Survey (CGS) Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act.

GPI noted that a queried strand of the San Jose Fault running across the site warranted a surface rupture fault hazard investigation by RMA Group in 2001 to investigate suspected mapped traces. It

was concluded that the San Jose Fault does not pose a hazard toward surface fault rupture, and no setbacks were required.

Since active or potentially active faults are not present at the site, the potential for ground surface rupture is considered very low.

4.7 Liquefaction Potential

Liquefaction may occur in loose to medium dense granular soils and low-plasticity silts and clays below the groundwater level due to strong ground shaking.

Liquefaction occurs when the cyclic loading to the soil due to strong ground shaking results in a buildup of excessive pore-water pressure in the pore spaces between the soil grains and the grain-to-grain contact of the soils is disrupted temporarily resulting in settlement as the soil particles reconstitute.

Typically, liquefaction occurs within the upper approximately 50 feet bgs; at greater depths, the confining stress of the overburden soils is typically sufficient to preclude liquefaction.

The site is not located within a City- or State-designated liquefaction hazard zone as shown on Figure 9. Groundwater was not encountered within the upper 50 feet and the soils encountered in the explorations consist of medium dense to very dense granular material.

Thus, the potential for liquefaction at the site is negligible.

4.8 Lateral Spreading Potential

Lateral spreading is a seismically-induced slope instability phenomenon wherein slope failure can occur as a result of liquefaction. The site is not located within a liquefaction hazard zone as noted in Section 5.7, the potential for liquefaction at the site is negligible and therefore by definition, the potential for lateral spreading is also considered to be negligible.

4.9 Seismic (aka 'Dry') Settlement

Seismically-induced (aka 'dry') settlement may occur in loose granular soils due to strong ground shaking as the loose granular particles tend to redistribute during shaking resulting in settlement.

The native soils on site consist of dense to very dense granular deposits that are not subject to seismically induced settlement based on field blow count data.

Existing engineered fill materials present at the southerly portion of the site are also sufficiently dense to preclude seismically-induced settlement.

Existing landfill materials, however, are more challenging to evaluate since the field blow count data available is in some cases skewed (overly high) due to the presence of large concrete rubble or other similar debris.

As an alternative method to evaluate the potential for seismically-induced settlement of the existing landfill debris, we reviewed the geophysical data available from the prior GPI report noting that the prior data provides an indication of the stiffness of on-site materials as well as data available from shear strength testing on samples of the inert landfill materials. Based on our evaluation, the stiffness of the on-site landfill materials is generally comparable or greater than the stiffness of the engineering fill materials.

Therefore, the potential for seismically-induced settlement within the landfill debris very low.

4.10 Earthquake-Induced Landslides

Portions of the site are located in a zone of potential earthquake induced landsliding per the CGS Seismic Hazard Zones map for the Ontario Quadrangle as shown on Figure 9.

These areas consist of steep natural and man-made quarry slopes. However, the planned grading will generally remove the overly-steep existing slopes and the permanent condition will consist of slopes with a gradient of 2:1 (horizontal:vertical) or flatter. Therefore, the risk for earthquake-induced landsliding subsequent to site improvement is considered low.

4.11 Flood Mapping

Based on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) Number 06037C1750F, the landfill site is located outside the 0.2 percent annual chance floodplain (Zone X).

4.12 Tsunamis, Seiche, and Dam Inundation

Based on information and maps available from the CGS, the site is not located within a Tsunami inundation hazard zone. Based on review of adjacent water bodies, the site is not subject to inundation from seiche. A review of the California Dam Breach Inundation Maps hosted by the California Division of Safety of Dams shows that the site is not located within an inundation boundary in the case of dam breach. Based on the City of Claremont General plan, the subject site is located within a flood zone from failure of the San Antonio Dam.

4.13 Subsidence

Land subsidence may be induced from withdrawal of oil, gas, or water from wells. Based on a search of the CalGEM (formerly known as Division of Oil, Gas, and Geothermal Resources [DOGGR]) GIS Well Finder online tool, there are no wells within 2.5 miles of the site. Thus, the likelihood of land subsidence caused by oil or gas withdrawal from oil wells is very low.

4.14 Expansive Soils

Expansive soils swell and shrink when the moisture content in the soil changes as a result of cyclic - wet/dry weather cycles, installation of irrigation systems, change in landscape plantings, or changes in grading.

Swelling and shrinking soils can result in differential movement of structures including floor slabs and foundations, and site work including hardscape, utilities, and sidewalks.

The materials encountered during the current and prior investigations at the site generally consist of sand with gravels, cobbles, and boulders and associated debris (primarily concrete and asphalt) and these materials have a low potential for expansion.

4.15 Soil-gas (Methane)

We installed three soil-gas wells at the site and performed soil gas measurements; the results of the soil-gas readings do not indicate the presence of methane gas at the site. These results are consistent with the inert (non-reactive) nature of the landfill materials.

Based on the data available, the potential for the accumulation of methane gas in confined spaces at the site is negligible.

5.0 CONCLUSIONS

5.1 General

The site is generally free from geologic or seismic hazards that would preclude the proposed development. Proposed development Scenarios 1, 2 and 2B are each feasible from a geotechnical perspective, provided that the recommendations presented herein are followed.

The proposed development will include mass grading and consist of construction of athletic playing fields and various support structures, a pedestrian tunnel, surface parking lots, and, in some scenarios, a large-footprint subterranean parking structure and a maintenance facility. Walking paths and site retaining walls are also planned as part of each alternate development scenario.

The primary geotechnical condition at the site that will impact the proposed development is the presence of undocumented landfill materials where these materials are present below the planned finish playing field surface levels and/or below the foundation and floor slab levels of the proposed structures.

The planned mass grading will include cuts into on-site landfill materials. Thus, sorting and processing of these materials will be required to allow reuse in required fills.

Existing landfill debris is not considered suitable for support of the proposed pedestrian tunnel planned for each scenario nor the proposed parking structure the maintenance facility structure planned as part of Scenarios 2 and 2B. For these structures, existing landfill debris should be removed and replaced as properly compacted fill as recommended herein.

Existing landfill debris may remain in place beneath the planned minor structures provided the recommendation presented herein are followed. In this regard, it's worth noting that the data collected from the existing landfill debris including field blow count data, laboratory test data, and the results of the prior geophysical testing, indicate these materials are reasonably firm and dense with isolated, discontinuous zones that are less firm and dense. Notably, the seismic refraction data collected as part of the prior investigation generally shows the landfill debris to be comparable to or stiffer than engineered fill that was placed at the south side of the site and generally comparable to the upper native soils at the site.

5.2 Parking Structure, Pedestrian Tunnel and Maintenance Facility Structure (Primary Structures)

The lowest finish floor level for each the proposed parking structure, the pedestrian tunnel and maintenance facility support structure are underlain by varying thickness of undocumented landfill materials. Although foundation loading information was not available for these structures at the time this report was prepared, we anticipate the magnitude of foundation loading and/or variation in thickness of landfill materials beneath the structures would preclude allowing existing landfill materials to remain in place beneath these structures.

Therefore, existing landfill materials present beneath foundation and floor slab level for these structures should be removed and replaced as properly compacted fill. Each structure may be supported on spread, continuous and/or mat-type foundations established in properly compacted fill and/or dense native soils where dense native soils are present at the foundation levels for the westerly side of the pedestrian tunnel.

For general reference, Table 6 summarizes the approximate thickness of landfill materials present beneath the lowest finish floor level for the proposed parking structure and maintenance facility structure and invert of the proposed pedestrian tunnel.

Table 6 – Summary of Landfill Materials Thickness Beneath Primary Structures

Structure	Lowest Finish Floor Level (feet, msl)	Landfill Thickness Beneath Lowest Finish Floor Level (feet)
Parking Structure	1,243.0 to 1,263.0	Up to ~ 35 feet
Maintenance Facility Structure	1,235.5	Up to ~ 26 feet
Pedestrian Tunnel	1,233.0	Up to ~ 33 feet

Recommendations for foundation design for the proposed structures are presented in Section 6.1. and recommendations for permanent walls below grade are presented in Section 6.4.

5.3 Press Box, Field House, Storage, Field Structures, Dugouts (Minor Structures)

As noted above, the existing landfill materials are generally firm and dense noting there are localized and apparently discontinuous zones that are less firm and dense. Based on this information, minor structures may be supported on spread and continuous footings established in a nominally thick layer of properly compacted select fill so that existing landfill materials present below the recommended properly compacted select fill may remain in place provided the recommendations presented herein are followed.

Spread and continuous footings should also be connected by grade beams to minimize potential differential settlement.

It would also be prudent to install settlement monuments after and possibly during the placement of the fill within the footprints of the planned minor structures to assure that any settlement due to placement of new fill, although expected to be minor, has sufficiently occurred to allow foundation and floor slab construction.

Recommendations for foundation support for minor structures are presented in Section 6.1.

5.4 Building Floor Slabs / Pedestrian Tunnel Bottom Slab

The proposed building floor slabs and pedestrian tunnel bottom slab may be established in properly compacted select fill and/or in dense native soils.

Properly compacted select fill should extend a minimum of two feet vertically below building and tunnel floor slabs on-grade and a minimum of two feet horizontally beyond the outside edges of the floor slabs-on-grade.

Recommendations for floor slab support are presented in Section 6.2.

5.5 Seismic Design

The site is also subject to strong ground shaking that would result from an earthquake occurring on a nearby or distant fault source; however, this hazard is common in Southern California and can be mitigated by following the seismic design requirements of the 2019 California Building Code and ASCE 7-16.

Due to the presence of undocumented landfill materials, the seismic site classification should be taken as S_D . Recommendations for seismic design are presented in Section 6.3.

5.6 Playing Fields

The finish levels of the planned playing field surfaces range from Elevation 1,209.0 to 1,257.0 for Scenario 1 and from 1216.0 to 1260.0 for Scenarios 2 and 2B. In each case, existing undocumented landfill materials are present beneath the planned playing field surfaces ranging on the order of seven to 36 feet as summarized in Tables 7 and 8 for development Scenarios 1 / 1B and 2 / 2B.

Table 7 – Scenario 1
Summary of Landfill Materials Thickness by Playing Field

Playing Field	Lowest Playing Surface (msl)	Existing Ground Surface Level (msl)	Planned Grading	Landfill Thickness Beneath Lowest Playing Surface
Football / Track / Lacrosse Field	1,209.0	1,185 to 1,240	Cut up to 31 feet Fill up to 24 feet	Up to ~ 29 feet
Multi-purpose Field	1,224.0	1,215 to 1,245	Cut up to 21 feet Fill up to 9 feet	Up to ~ 26 feet
Soccer / Rugby	1,243.0	1,228 to 1,250	Cut up to 7 feet Fill up to 15 feet	Up to ~ 23.5 feet
Golf Practice Area	1,257.0	1,250 to 1,296	Cut up to 39 feet Fill up to 7 feet	Up to ~ 7 feet
Baseball Field	1,257.0	1,237 to 1,303	Cut up to 46 feet Fill up to 20 feet	Up to ~ 13 feet
Softball Field	1,257.0	1,250 to 1,260	Cut up to 3 feet Fill up to 7 feet	Up to ~ 25 feet

Table 8 – Scenarios 2 and 2B
Summary of Landfill Materials Thickness by Playing Field

Playing Field	Lowest Playing Surface (msl)	Existing Ground Surface Level (msl)	Planned Grading	Landfill Thickness Beneath Lowest Playing Surface
Football / Track / Lacrosse Field	1,216.0	1,185 to 1,240	Cut up to 24 feet Fill up to 31 feet	Up to ~ 36 feet
Multi-purpose Field (Phase 2)	1,260.0	1,243 to 1,300	Cut up to 40 feet Fill up to 17 feet	Up to ~ 36 feet
Soccer / Rugby (Phase 2)	1,251.0	1,235 to 1,255	Cut up to 4 feet Fill up to 16 feet	Up to ~ 36 feet
Golf Practice Area	1,226.0	1,215 to 1,245	Cut up to 19 feet Fill up to 11 feet	Up to ~ 10 feet
Baseball Field	1,226.0	1,230 to 1,245	Cut up to 19 feet Fill up to 0 feet	Up to ~ 15 feet
Softball Field	1,226.0	1,215 to 1,240	Cut up to 14 feet Fill up to 11 feet	Up to ~ 28 feet

Based on the field blow count and geophysical data from our current and the prior investigations, landfill materials present below the lowest playing surface levels is generally stiff to dense noting there are localized and apparently discontinuous zones that are less dense and less stiff.

The only significant load increase within the planned playing fields is where new fill is planned to raise the ground surface level. In these areas, it would be prudent to install settlement monuments after and possibly during the placement of the fill to document the performance of the underlying landfill materials on a case-by-case basis.

Noting that the landfill materials are typically coarse-grained and/or over-sized particles, it's reasonable to conclude that settlement due to new loading may be considered 'immediate' meaning the settlement will occur as the fill is placed.

To assure uniform performance within each playing field, it would also be prudent to place a rigid cap of select backfill materials to bridge local softer or less stiff zones. Recommendations for each playing field are presented herein.

Recommendations for playing field support are presented in Section 6.5.

5.7 Pavement and Site Flatwork

To assure uniform support for pavement and site flatwork, the upper 12 inches of existing materials should be removed and replaced as properly compacted select fill. The results of laboratory testing indicate an R-value of 40 may be assumed for pavement design.

Recommendations for pavement are presented in Section 6.6 and recommendations for site flatwork are presented in Section 6.7.

5.8 Free-standing Site Retaining Walls

Free-standing site retaining walls may be supported on a properly compacted selected fill materials as recommended in Section 6.8.

5.9 Temporary Shoring

Temporary shoring may be utilized during construction of the pedestrian tunnel, parking structure and maintenance facility structure. A suitable method of temporary shoring is soldier pile and timber lagging and recommendations for temporary shoring are presented in Section 6.9.

5.10 Groundwater

The groundwater level at the site is relatively deep and in general is not anticipated to impact the proposed development scenarios. Localized zones of perched water, however, may be seasonally present on less permeable layers within the overall granular landfill materials and coarse-grained native deposits at the site.

If encountered, localized perched groundwater could be routed away from excavations and discharged off-site through a groundwater discharge permit process, removed from site in pump trucks and disposed off-site. Alternatively localized perched groundwater may be re-injected into the permeable native soils at the site if allowed to do so by permit.

5.11 Slope Stability, Earthwork and Grading

Permanent unreinforced slopes should not exceed a gradient of 2:1 (h:v) and earthwork and grading for the planned mass grading will need to be performed in accordance with an approved landfill closure plan and post closure land use plan, when available.

Recommendations for grading for permanent slopes as well as for general earthwork and grading are presented in Section 6.10.

5.12 Soil-Gas (Methane) Considerations

Based on the results of soil-gas testing performed as part of our current investigation, special provisions for methane gas are not required for the planned buildings, parking structure and pedestrian tunnel.

5.13 Corrosion Potential

Corrosion testing was performed as part of our investigation and the prior RMA investigation. The results of the current and prior testing indicate that the on-site materials have negligible potential for sulfate attack on concrete and are not corrosive to ferrous metals.

6.0 RECOMMENDATIONS

6.1 Foundation Design

6.1.1 Parking Structure, Pedestrian Tunnel and Maintenance Facility Structure (Primary Structures)

The proposed parking structure, pedestrian tunnel and maintenance facility structure may be supported on spread and continuous or mat-type footings established in properly compacted select fill materials or dense native soils where present noting that native soils are present at the planned foundation level within the pedestrian tunnel alignment west of the landfill west property line.

Where required, the select fill should extend a minimum of three horizontal feet beyond the limits of the footings.

Existing landfill materials should be removed to expose dense native soils and the exposed excavation bottoms should be observed and documented by a Langan field representative. Excavation bottoms should be scarified for a depth of eight inches, moisture conditioned and compacted as recommended in Section 6.10.

Spread and continuous footings a minimum of two feet in width and established at least two feet below the lowest adjacent grade or top of floor slab in properly compacted select fill and/or dense native soils may be designed using an allowable bearing pressure of 5,500 psf. The recommended bearing pressure may be increased by one-third when considering short term wind and seismic loading conditions.

We estimate the total static settlement for foundations designed as recommended herein will be on the order of one inch or less and the differential static settlement will be on the order of ¼ inch or less.

Lateral loading may be resisted by passive pressure of the soils acting against the sides of the footings and friction along the bottom of the footing.

To resist lateral loading, an ultimate passive resistance equal to 800 psf per foot of embedment up to a maximum value of 8,000 psf and an ultimate coefficient of friction equal to 0.6 may be used. The ultimate passive pressure and the ultimate coefficient of friction may be combined noting that the ultimate passive resistance should be reduced in this case by 50 percent in consideration of the deformation required to mobilize the full passive resistance.

An allowable passive resistance equal to 400 psf per foot of embedment up to a maximum value of 6,000 psf and an allowable coefficient of friction equal to 0.4 may be used. The allowable passive pressure and the allowable coefficient of friction may be combined without reduction.

6.1.2 Press Box, Field House, Storage, Field Structures, Dugouts (Minor Structures)

Proposed minor structures may be supported on three feet of properly compacted select fill materials. The select fill should extend three horizontal feet beyond the limits of the footings.

The exposed excavation bottom should be compacted using a minimum 16-ton steel-drum vibratory compactor or similarly heavy vibratory equipment. The intent of the vibratory roller is to impart vibration to the existing landfill materials and provided an added measure of densification to these materials.

Settlement monitoring should be performed during and/or after the placement of the fill to confirm that any settlement due to the placement of the new fill has occurred to a sufficient degree to allow the construction of the support structure building foundations in the properly compacted select fill materials. A settlement monitoring program shall be developed by Langan in collaboration with the selected grading contractor prior to the start of earthwork.

Spread and continuous footings a minimum of two feet in width and established at least two feet below the lowest adjacent grade or top of floor slab in properly compacted select fill may be designed using an allowable bearing pressure of 2,500 psf. The recommended bearing pressure may be increased by one-third when considering short term wind and seismic loading conditions.

We estimate the total static settlement for foundations designed as recommended herein will be on the order of 1 ½ inch or less and the differential static settlement will be on the order of ½ inch or less.

Lateral loading may be resisted by passive pressure of the soils acting against the sides of the footings and friction along the bottom of the footing.

To resist lateral loading, an ultimate passive resistance equal to 600 psf per foot of embedment up to a maximum value of 6,000 psf and an ultimate coefficient of friction equal to 0.6 may be used. The ultimate passive pressure and the ultimate coefficient of friction may be combined noting that the ultimate passive resistance should be reduced in this case by 50 percent in consideration of the deformation required to mobilize the full passive resistance.

An allowable passive resistance equal to 400 psf per foot of embedment up to a maximum value of 6,000 psf and an allowable coefficient of friction equal to 0.4 may be used. The allowable passive pressure and the allowable coefficient of friction may be combined without reduction.

6.2 Building Floor Slabs / Pedestrian Tunnel Bottom Slab

The proposed building floor slabs and entire pedestrian tunnel bottom slab may be established in properly compacted select fill and/or in dense native soils.

Properly compacted select fill should extend a minimum of two feet vertically below building and tunnel floor slabs on-grade and a minimum of two feet horizontally beyond the outside edges of the floor slabs-on-grade.

Where moisture-sensitive flooring is planned, a capillary break section should be installed beneath the building floor slab. The capillary break section should consist of six inches of gravel underlying a 15-mil visqueen moisture barrier. A capillary break section is not required for floor slabs where moisture-sensitive flooring is not planned.

6.3 Seismic Design Considerations

Considering undocumented landfill materials will remain in place, we determined the seismic site class to be Site Type D in accordance with Chapter 20 of ASCE-7-16. Seismic design parameters for Site Type D are presented in Table 9.

Table 9 – CBC Prescriptive Seismic Design Parameters

Criteria	Value
MCE_R Ground Motion at Short Periods, S_s	1.697
MCE_R Ground Motion at 1Second Period, S_1	0.638
Site-Modified Spectral Acceleration Value at Short Periods, S_{MS}	1.697
Site-Modified Spectral Acceleration Value at 1 Second Period, S_{M1}	0.893
Design Spectral Response Acceleration at short periods, S_{DS}	1.131
Design Spectral Response Acceleration at 1 second period, S_{D1}	0.595
MCE_G Peak Ground Acceleration, PGA_M	0.794

Requirements outlined in Chapter 11 of ASCE 7-16 should be followed in determining the base shear for each proposed structure.

6.4 Permanent Below Grade Walls

6.4.1 Design Lateral Earth Pressures

For static conditions, drained below-grade building internally braced walls should be designed to resist a trapezoidal-shaped at-rest lateral earth pressure distribution equal to 28H psf as shown on Figure 10.

For seismic loading conditions, drained below-grade internally-braced building walls should be designed to resist a triangular-shaped active lateral earth pressure distribution equal to 35H psf in conjunction and a triangular-shaped seismic lateral earth pressure distribution equal to 15H psf as shown on Figure 11.

The upper 10 feet of the below-grade building walls should also be designed to resist a uniform lateral pressure of 100 psf to account for normal traffic loading as shown on Figures 10 and 11.

The recommended traffic surcharge is applicable where traffic loading is anticipated adjacent to walls below grade. Please note that the recommended surcharge should be increased by 50 percent when considering fire truck loading. For other areas subject to live loading conditions (non-traffic), we recommend applying one-third of the live load to the wall-below grade within the upper 10 feet. The geotechnical engineer of record can review any such cases and provide specific recommendations if needed.

The load combination (active and seismic earth pressure) and the shape of the seismic pressure distribution are each based on *Seismic Earth Pressures on Cantilevered Retaining Structures* (Atik and Sitar, 2010) and *Seismic Earth Pressures: Fact or Fiction* (Lew, Sitar, and Atik, 2010).

If the surface at the top of the wall is sloped, the recommended lateral earth pressures should be increased as indicated in Table 10.

Table 10 - Permanent Below-Grade Walls – Lateral Earth Pressures

Slope Inclination at Top of Wall (H:V)	Increase in Lateral Earth Pressure (percent)
1:1	200
1.5:1	165
2:1	150

6.4.2 Wall Back Drainage

For static conditions, drained below-grade permanent retaining walls should be constructed with adequate back-drainage to prevent the buildup of hydrostatic pressure behind the walls.

For shored walls, we recommend the use of a pre-fabricated geo-composite drainage board that is fixed to the shoring wall, and the below-grade building wall is constructed by the placement of shotcrete directly against the drainage board.

In cases where temporary construction slopes and retaining walls are utilized, a perimeter collector pipe could be installed at the base of the walls noting a suitable discharge outlet for the collector pipe will be required.

6.5 Playing Fields

Cuts up to approximately 46 feet in height and fills up to approximately 24 feet will be required for development Scenario 1 and cuts up to approximately 40 feet and fills up to approximately 31 feet will be required for development Scenarios 2 and 2B.

The finish levels of the planned playing field surfaces range from Elevation 1,209.0 to 1,257.0 for Scenario 1 and from 1216.0 to 1260.0 for Scenarios 2 and 2B. In each case, existing undocumented landfill materials are present beneath the planned playing field surfaces ranging on the order of seven to 39 feet.

The proposed playing fields may be established on three feet of properly compacted select fill materials where greater than ten feet of landfill materials are present and two feet of properly compacted select fill materials where ten feet or less.

The exposed excavation bottom should be compacted using a minimum 16-ton steel-drum vibratory compactor. The intent of the vibratory roller is to impart vibration to the existing landfill materials and provided an added measure of densification to these materials.

Settlement monitoring should be performed during and/or after the placement of the fill to confirm that any settlement due to the placement of the new fill has occurred to a sufficient degree to allow the construction of the playing fields on the properly compacted select fill materials.

Settlement monitoring requirements are presented in Section 6.10.

6.6 Pavement Design Recommendations

6.6.1 General

To provide uniform support for the proposed perimeter surface parking lot pavement sections, the upper 12 inches of existing soil should be removed and replaced as properly compacted fill. Based on the results of prior geotechnical laboratory testing, an R-value of 40 may be assumed in the design of AC and PCC pavement sections.

Excavation bottoms for pavement support should be carefully evaluated by a Langan field representative during construction to assure locally loose, soft or otherwise unsuitable materials are not present.

Pavement design recommendations for asphalt concrete (AC) and Portland cement concrete (PCC) are presented below.

6.6.2 Asphalt-Concrete Pavement Design

AC pavement for surface parking shall be designed in accordance with the CALTRANS method. Table 11 summarizes our AC pavement recommendations for assumed TIs of 4.5, 5, 6, and 7.

Table 11 – AC Pavement Design Recommendations

Traffic Use	TI	AC (inches)	AB (inches)
Parking Areas	4.5	3.0	4.0
Automobile Drive Lanes	5.0	3.5	4.0
Truck and Trailer Drive Lanes	6.0	4.0	6.0
Delivery Access and Loading Docks	7.0	5.0	6.5

Our Langan team can determine the recommended pavement and aggregate base thickness for other TIs if required. Careful inspection is recommended to confirm that the recommended thickness or greater is achieved and that proper construction procedures are followed.

The aggregate base should conform to requirements of Section 26 of State of California Standard Specifications for Public Works Construction (Green Book). The aggregate base should be compacted to at least 95 percent relative compaction.

6.6.3 Portland Concrete Pavement Design

Table 12 summarizes our Portland cement concrete (PCC) pavement recommendations for assumed TIs of 4.5, 5, 6, and 7 based on minimum compressive strength of 3,000 psi for the PCC.

Table 12. PCC Pavement Design Recommendations

Traffic Use	TI	PCC (inches)	AB (inches)
Parking Areas	4.5	5.0	4.0
Automobile Drive Lanes	5.0	5.5	4.0
Truck and Trailer Drive Lanes	6.0	6.0	4.0
Delivery Access and Loading Docks	7.0	7.0	4.0

Our Langan team can determine the recommended pavement and aggregate base thickness for other TIs if required. Careful inspection is recommended to confirm that the recommended thickness or greater is achieved and that proper construction procedures are followed.

PCC pavement should be reinforced with Number 3 bars spaced 24 inches on-center in each direction.

Careful inspection is recommended to check that the recommended thickness or greater is achieved and that proper construction procedures are followed.

State of California Department of Transportation Type 2 base, or equivalent, should be used in the required sections. The base should be compacted to at least 95 percent relative compaction.

6.7 Site Flatwork

Site flatwork, including sidewalks, shall consist of five inches decomposed granite (DG) placed on a geotextile fabric placed on 12 inches of properly compacted select fill materials.

The select fill should be processed, placed and compacted as recommended in Section 6.10.

6.8 Site Retaining Walls

Site retaining walls may be supported on continuous footings established on 12 inches of properly compacted select fill. The select fill should consist of 1-inch minus crushed rock and should extend at least two horizontal feet beyond the limits of the footing.

Continuous retaining wall footings a minimum of two feet in width and established at least 18 inches below the lowest adjacent grade or top of floor slab in properly compacted select fill may be designed using an allowable bearing pressure of 2,000 psf. The recommended bearing pressure may be increased by one-third when considering short term wind and seismic loading conditions.

We estimate the total static settlement for retaining wall foundations designed as recommended herein will be on the order of 1 inch or less and the differential static settlement will be on the order of ½ inch or less.

For drained conditions, unrestrained, free-standing retaining walls should be designed to resist a triangular lateral earth pressure distribution with a maximum value equal to $35H$ psf, where H is the height of the wall.

Per Section 1807A.2.2 of the 2019 CBC, seismic loading conditions shall be included in design of retaining walls supporting at least six feet of soil. Seismic lateral earth pressure distribution in this case should be taken as a triangular-shaped active lateral earth pressure with the maximum value equal to $35H$ psf in conjunction with a triangular-shaped seismic lateral earth pressure distribution with the maximum value equal to $15H$ psf.

In cases where free-standing below grade walls are situated adjacent to roadways, parking areas, or loading docks the upper 10 feet of the below-grade walls should also be designed to resist a uniform lateral earth pressure equal to 100 psf to account for normal traffic loading.

Additional surcharge loading may be required if below grade walls are situated in close proximity to any of the proposed building foundations and can be provided on a case-by-case basis.

If the surface at the top of the walls is slope, the recommended lateral earth pressures should be increased as indicated in Table 10.

Below-grade walls should be constructed with adequate back-drainage to prevent the build-up of hydrostatic pressure behind the walls. Pre-fabricated geo-composited drainage boards affixed to the back of the wall prior to backfill may be utilized.

Alternatively, a 12-inch wide zone of relatively free-draining aggregate material can be utilized behind walls to provide adequate drainage. To prevent water accumulation at the bottom of the wall weep holes should be provided or otherwise suitably discharged.

6.9 Temporary Shoring

6.9.1 Design Lateral Earth Pressure

Typically, cantilevered shoring is feasible for temporary shoring when the retained height is less than approximately 15 feet. Braced shoring typically becomes economical for retained heights in excess of 15 feet.

Cantilever shoring may be designed to resist a triangular lateral earth pressure distribution where the maximum value is $30H$ psf.

Internally brace shoring may be designed to resist a trapezoidal lateral earth pressure distribution where the maximum value is $26H$ psf.

Temporary shoring, should also be designed to resist a nominal surcharge load of 100 psf distributed uniformly within the upper 10 feet to account for vehicular traffic where adjacent to temporary roadways and parking areas.

For cantilevered shoring design, where the surface at the top of the shoring is sloped, the recommended lateral earth pressures should be increased as indicated in Table 10.

The design of temporary shoring walls should consider the location of construction cranes and other potentially heavy equipment or loads that may act against the shoring system. Surcharge loading for these features may be determined by using NAVFAC DM 7.2 Chapter 3, Section 4. If needed, we can provide additional surcharge loading on a case-by-case basis.

6.9.2 Soldier Pile Design and Installation

For the design of soldier piles spaced at least two diameters on-center, the allowable lateral bearing value (passive pressure) of the native soils below the planned bottom of the excavation may be assumed to be 400 psf per foot of depth, up to a maximum value of 6,000 psf. To develop the full lateral bearing value, provisions should be taken to assure firm contact between the soldier piles and the undisturbed native soils.

If the embedded portion of the soldier pile shafts are filled with lean-mix concrete, the effective width of the soldier pile shaft for use in developing passive resistance may be assumed to be twice the diameter of the soldier pile shaft. If the embedded portion of the soldier pile shaft is filled with other material (such as low-strength sand-cement slurry, for instance), the effective width of the soldier pile should be limited to be the diagonal dimension of the soldier beam.

The portion of the soldier piles below the bottom of the excavation may also be relied on to support downward loading. For soldier piles that are drilled and filled with structural concrete below the bottom of the excavation, the frictional resistance between the concrete and surrounding soil may be taken as 600 psf. For soldier piles that are vibrated into place, the frictional resistance may be taken as 800 psf.

6.9.3 Timber Lagging Design

Continuous lagging will be required between the soldier piles. The soldier piles should be designed for the full anticipated lateral earth pressure; however, the pressure on the lagging will be less due to arching in the soil. For clear spans of up to six feet, we recommend the lagging be designed for a triangular where the maximum pressure is 400 psf at the mid-point between the soldier piles and zero at the soldier piles.

6.9.4 Tiebacks

The capacities of anchors should be determined by testing the initial anchors as outlined below. We anticipate that gravity-filled anchors will achieve an allowable bond strength of 1 kips to 2 kips per lineal foot of anchor in the on-site terrace deposits, depending on the method of construction. A variety of methods are available for construction of anchors. If post-grouted anchors are used, we estimate the anchors will develop resistance on the order of three times the estimated value. We recommend that the shoring designer and contractor be responsible for selecting the appropriate bond length and installation methods to achieve the required capacity. Only the frictional resistance developed beyond the active wedge would be effective in resisting lateral loads. If the anchors are spaced at least 6 feet on-center, reduction in the capacity of the anchors do not need to be considered due to group action.

The anchors are commonly installed at angles of 15 to 40 degrees below the horizontal; however, in some cases it is necessary to use steeper inclinations where adjacent private property is present. Caving of the anchor holes should be anticipated and provisions made to minimize such caving.

The geotechnical engineer of record representative should select a representative number of the initial anchors for 24-hour, 200 percent tests and 200 percent quick tests. The purpose of the 200 percent test is to verify the friction value assumed in design. The anchors should be tested to develop twice the assumed friction value. Where satisfactory tests are not achieved on the initial anchors, the anchor diameter and/or length should be increased until satisfactory test results are obtained.

For post-grouted anchors where concrete is used to backfill the anchor along its entire length, the test load should be computed as required to develop the appropriate friction along the entire bonded length of the anchor. We estimate that the influence of the post-grouting and the adjacent soil within the bonded length of the anchors will be less than 5 feet from the anchor.

Total deflection during the 24-hour, 200 percent test should not exceed 12 inches during loading. Anchor deflection should not exceed 0.75 inch during the 24-hour period. Measured after the 200 percent test load is applied. If the anchor movement after the 200 percent load has been applied for six hours is less than 0.5 inch and the movement over the previous four hours has been less than 0.1 inch, the test may be terminated.

For the quick 200 percent tests, the 200 percent test load should be maintained for 30 minutes. The total deflection of the anchor during the quick 200 percent tests should not exceed 12 inches. Anchor deflection after the 200 percent test load has been applied should not exceed 0.75 inch during the 30 minute period. Where satisfactory tests are not achieved on the initial anchors, the anchor diameter and/or length should be increased until satisfactory test results are obtained.

All the production anchors should be pre-tested to at least 150 percent of the design load. Total deflection during the tests should not exceed 12 inches. The rate of creep under the 150 percent test should not exceed 0.1 inch over a 15-minute period for the anchor to be approved for the design loading.

After satisfactory test, each production anchor should be locked off at the design load. The locked-off load should be verified by rechecking the load in the anchor. If the locked-off load varies by more than 10 percent from the design load, the load should be until the anchor is locked off within 10 percent of the design load. Installation of the anchors and testing of the completed anchors should be observed by a representative of the geotechnical engineer of record.

6.9.5 Lateral Deflection and Shoring Monitoring

Some means of monitoring the performance of the shoring system is recommended. The monitoring should consist of periodic surveying of the lateral and vertical deflections of top of each soldier pile. When design of the shoring system is finalized, the geotechnical engineer of record can discuss appropriate monitoring methods with the design consultants and shoring contractor.

It is difficult to accurately predict the amount of deflection of a shoring system and it should be understood that the shoring system is designed to deflect at the top. We recommend the shoring system be designed to limit deflection at the top to be 0.5 inch or less where the shoring provides lateral support for existing buildings, and 1 inch or less where existing buildings are not present. If greater deflection occurs during construction, additional vertical support or lateral bracing may be required.

6.9.6 Construction Considerations

Drilling for soldier piles will encounter large-size granular particles and will likely require the use of core barrels or chopping buckets to advance. Additionally, caving of the soldier pile shaft walls is also possible since the shafts will be advanced through predominantly granular materials. It's unlikely drilling mud will be very effective in the on-site soil conditions as we anticipate that circulation of the drilling mud will be difficult due to the large-particle sizes and corresponding void spaces. Casing or other provisions to mitigate caving may be required to advance the soldier pile shafts to the design depths.

The shoring contractor should include appropriate provisions to achieve soldier pile installation.

6.10 Earthwork Considerations

6.10.1 Temporary Construction Slopes

Temporary, unsurcharged slopes may be excavated into the on-site engineering fill, undocumented fill and landfill materials may be constructed at a 1:1 (h:v) gradient for slopes less than 15 feet in height, 1¼:1 (h:v) for slopes less than 25 feet in height, and 1½:1 (h:v) for slopes greater than 25 feet in height.

Temporary construction slopes should be protected from erosion by directing surface water away from the top of the slope, by placing sand-bags at the top of the slope cuts, and/or covering the slopes with plastic sheeting during rain events.

6.10.2 Permanent Slope Construction

The planned mass grading includes construction of permanent slopes. Permanent slopes should be constructed at a maximum gradient of 2:1 (h:v). In cases where steeper permanent slopes are planned, the steeper slopes should include geotextile reinforcement and/or soil-cement. Design of either geotextile reinforced or cement-improved permanent slopes should be done in collaboration with the selected grading contractor and/or specialty contractor.

Permanent slopes should be over-filled and trimmed back. Horizontal benches should be included for every 25 vertical feet of permanent slope; noting that if only one bench is required it should be constructed at the mid-height of the slope.

New fill should be benched into the existing slope using a minimum horizontal bench width of two feet for every four vertical feet. All benches should be observed by a representative of our firm noting that we anticipate significant degree of variation throughout the site.

A keyway should be constructed at the toe of each planned permanent slope; the keyway should be a minimum of five feet in width and four feet in height for slopes less than 25 feet in height and a minimum of ten feet in width and six feet in height for slopes great than 25 feet in height. The bottom of the keyway inclined two degrees towards the slope in each case.

6.10.3 Excavation Bottom Preparation

Exposed excavation bottoms should be carefully probed or otherwise evaluated by our field representative and any localized deposits of loose, soft or otherwise unsuitable soils should be removed and replaced as determined in the field with our Langan field technician.

The exposed bottom should be scarified for a depth of six inches to the extent possible, moisture-conditioned and compacted as recommended below.

If the exposed bottom of the excavation consists of soft, compressible, wet and/or otherwise unsuitable materials, removal of an additional six to 12 inches of soil and replacement with $\frac{3}{4}$ -inch crushed rock should be placed to provide a firm working surface suitable to receive new fill.

As recommended previously, where existing landfill materials are present in excavation bottoms, and these materials are allowed to remain in place as recommended herein, these materials should be densified using a 16-ton vibratory roller, or other suitable equipment, prior to placement and compaction of new fill.

6.10.4 Materials for Fill

Existing landfill materials are suitable for use in required fill provided these materials are processed so that less than one third of the materials is larger than one inch in maximum dimension and only five percent of the materials exceed eight inches in maximum particle size.

On-site alluvial materials are also suitable for use in required fills noting also the alluvial materials should be processed, if necessary, so that less than one third of the materials is larger than one inch in maximum dimension and only five percent of the materials exceed eight inches in maximum particle size.

In general, suitable materials to be included within inert debris fill include soil, gravel, rock, concrete, fully cured asphalt, glass, plaster products (except for plasterboard), brick, and clay products. Deleterious materials, materials other than those listed, should be removed; noting that reinforcing steel that is embedded in concrete should be cut flush to allow re-use.

Landfill debris and alluvial materials great than 12 inches in any dimension may be used in deep fills provided these materials are placed at least ten feet below the finish fill surface and placed in windrows are recommended in Section 6.10.5.

6.10.5 Fill Placement and Compaction

Fill soils shall be moisture conditioned as recommended herein, placed in loose lifts not exceeding 12-inches in thickness and mechanically compacted using heavy equipment. If lightweight equipment is used, the lift thickness should be limited to 8 inches in thickness.

The processed fill materials should be moisture conditioned within two percent of the optimum moisture content and compacted to at least 90 percent of the maximum dry density obtained per ASTM D-1557 when possible, and using large ring tests in accordance with ASTM D4914 or D5030 or other methods deem suitable and/or practical.

It should be understood that while performing field density testing is key quality control quality assurance provision, documentation of the number of passes (compactive effort), the response of the fill materials to the equipment (i.e. yielding / non-yielding bottom) and frequent probing of the fill as compacted by a qualified geotechnical engineer noting that these observations are equally important to confirm the adequacy of the compacted fill as field density testing.

Materials greater than 12 inches in largest dimension and up to 36 inches in largest dimension may be utilized in the deeper fills, defined as at least ten feet below the finish surface. The over-sized particles may be placed in trenches to create windrows that are spaced at least 15 horizontal feet center-to-center and at least five vertical feet. Windrows should be less than 100 feet in length. The trenches containing the over-sized particles should be filled with granular materials and densified using heavy compaction equipment.

6.10.6 Development of Detailed Grading Control and Settlement Monitoring Plan

A customized grading control plan should be developed prior to start of mass grading that takes into consideration the geotechnical requirements outlined herein and well as applicable environmental requirements outlined in our landfill closure report.

Settlement monitoring should be performed during the mass grading at locations where more than ten feet of new fill is planned over existing landfill materials. The primary purpose of the monitoring is to observe any potential settlement that may occur within existing landfill materials due to the increased weight of the new fill. The settlement monuments can be established at the planned finish surface.

Foundation and floor slab construction should not commence until satisfactory readings are obtained from the settlement monuments in accordance with a formal settlement monitoring program. The formal settlement monument program should be developed as part of the pre-construction phase of the project and included in the grading control plan.

7.0 GEOTECHNICAL FIELD OBSERVATION AND TESTING

Geotechnical field observation and testing is necessary during the construction phase of the project and that testing should be performed by a licensed geotechnical engineer including the following primary items:

- Observation and approval of excavation bottoms
- Processing and sorting of proposed fill materials
- Moisture-conditioning, placement and compaction of fill materials
- Installation of temporary shoring and lagging
- Observation and approval of foundation bottoms
- Observation and testing of utility trench backfill
- Observation and testing of pavement subgrade and base materials
- Observation and testing of retaining wall backfill and wall backdrainage provisions

8.0 LIMITATIONS

The conclusions and recommendations provided in this report are based on subsurface conditions inferred from available boring and test pit data, as well as project information provided to date. This report was prepared for CMC, their design consultants and subcontractors for use in the proposed development.

If changes to the proposed development are made, we should be notified to review our conclusions and recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of investigation.

9.0 CLOSING

We sincerely appreciate the opportunity to provide professional services for this project and look forward to working with you on this project. Please contact us at your convenience to discuss any questions you may have regarding this report.

Sincerely,

Langan Engineering and Environmental Services, Inc.

NOTES:

1. CROSS SECTION DISPLAYS GENERALIZED SUBSURFACE CONDITIONS; FOR A DETAILED DESCRIPTION OF CONDITIONS ENCOUNTERED REFER TO BORING AND TEST PIT LOGS.
2. GROUND SURFACE ELEVATIONS REFERENCED FROM AERIAL TOPOGRAPHIC SURVEY FROM CONCEPTUAL GRADING PLANS PROVIDED BY ATLAS CIVIL DESIGN.
3. REFER TO SITE PLAN FOR LOCATION OF CROSS SECTION.

Magnitude 6.0 to 6.9

Magnitude 7.0 to 7.4

Magnitude 7.5 to 8.0

Fault Symbols

Bar and ball on downthrown side (relative or apparent).

Relative or apparent direction of lateral movement.

Direction of dip.

Low angle fault (barbs on upper plate). Fault surface generally dips less than 45° but locally may have been subsequently steepened.

Numbers refer to annotations listed in the appendices of the accompanying report.

Structural discontinuity (offshore) separating differing Neogene structural domains.

Brawley Seismic Zone.

Fault Classification

Fault along which historic (last 200 years) displacement has occurred and is associated with one or more of the following:

- (a) a recorded earthquake with surface rupture. (Also included are some well-defined surface breaks caused by ground shaking during earthquakes, e.g. extensive ground breakage, not on the White Wolf fault, caused by the Arvin-Tehachapi earthquake of 1952). The date of the associated earthquake is indicated. Where repeated surface ruptures on the same fault have occurred, only the date of the latest movement may be indicated, especially if earlier reports are not well documented as to location of ground breaks.
- (b) fault creep slippage - slow ground displacement usually without accompanying earthquakes.
- (c) displaced survey lines.

A triangle to the right or left of the date indicates termination point of observed surface displacement. Solid red triangle indicates known location of rupture termination point. Open black triangle indicates uncertain or estimated location of rupture termination point.

Date bracketed by triangles indicates local fault break.

No triangle by date indicates an intermediate point along fault break.

Fault that exhibits fault creep slippage. Hachures indicate linear extent of fault creep. Annotation (creep with leader) indicates representative locations where fault creep has been observed and recorded.

Square on fault indicates where fault creep slippage has occurred that has been triggered by an earthquake on some other fault. Date of causative earthquake indicated. Squares to right and left of date indicate terminal points between which triggered creep slippage has occurred (creep either continuous or intermittent between these end points).

Old Alluvial Fan Deposits (Qof)

Silty SAND with Gravel (SM), orangish brown, very dense, slightly moist to moist, fine gravel, manganese oxide staining, some clay rinds around gravel

Total depth = 54.0 feet bgs.
Groundwater not encountered.
Borehole backfilled with soil cuttings.
Drilling fluids (H2O) added at 40 feet.

Young Alluvial Fan Deposit (Qya)

Sandy SILT with Gravel (ML): yellowish brown, dry, hard, occasional weathered/angular gravel, sample pulverized.

No Recovery, sampler shoe contained yellowish brown sluff.

Total depth = 57 feet
No groundwater encountered.
Boring backfilled with cuttings.
Note: Native at 55 feet (possibly as early as 30 feet).

Young Alluvial Fan Deposit (Qya)

Silty SAND with Gravel (SM): orangish brown and gray, very dense, slightly moist, fine to very coarse gravel (potentially cobble).

Silty SAND with some Gravel (SM): orangish brown, very dense, slightly moist, iron oxide or limonite staining, some fine to medium gravel, manganese oxide stained gravel.

Total Depth = 60.5 feet
No groundwater encountered.
Boring backfilled with cuttings.

APPENDIX B
Prior Explorations and Laboratory Testing

EXPLORATORY BORINGS

We investigated the subsurface conditions at the site by drilling and sampling a total of 13 exploratory borings. Borings B-1 and B-3 through B-12 were drilled on August 24 and 25, 2020 using hollow-stem auger drilling equipment. Borings B-2 and B-13 were drilled on September 8, 2020 using bucket auger drilling equipment. The approximate locations of the explorations are shown on Figure 2.

The borings were advanced to depths of 6 to 61 feet below the existing ground surface. The borings were drilled to their target depths unless natural soils or refusal conditions were encountered at shallower depths. Multiple attempts were made a few feet away from the original boring location if shallow refusal conditions were encountered. Refusal conditions were commonly caused by cobbles, boulders, and inert debris (concrete, asphalt, etc.) being encountered.

The field explorations discussed herein were performed under the continuous technical supervision of GPI's representative, who visually inspected the site, maintained detailed logs of the borings, classified the soils encountered, and obtained relatively undisturbed and bulk samples for examination and laboratory testing. The soils encountered in the borings were classified in the field and through further examination in the laboratory in accordance with the Unified Soils Classification System. Detailed logs of the borings are presented in Figures A-1 to A-13 in this appendix.

The locations of the borings were laid out in the field by measuring from existing site features. Ground surface elevations at the exploration locations were estimated from a topographic survey plan prepared by Andreasen Engineering dated March 15, 2018 and should be considered approximate.

Hollow-Stem Auger Borings

Borings B-1 and B-3 through B-12 were drilled using truck-mounted hollow-stem auger drill equipment. An 8-inch outside diameter auger was used. Relatively undisturbed samples were obtained using a brass ring lined sampler (ASTM D 3550). The brass rings have an inside diameter of 2.42 inches. The ring samples were driven into the soil by a 140-pound hammer dropping 30 inches. The number of blows needed to drive the sampler into the soil was recorded as the penetration resistance.

At selected locations, disturbed samples were obtained using a split-spoon sampler by means of the Standard Penetration Test (SPT, ASTM D 6066). The spoon sampler was driven into the soil by a 140-pound hammer dropping 30 inches, employing the "free-fall" hammer described above. After an initial seating drive of 6 inches, the number of blows needed to drive the sampler into the soil a depth of 12 inches or portion thereof was recorded as the penetration resistance. These values are the raw uncorrected blow counts.

After completion, the borings were backfilled with the drill cuttings. Groundwater was not encountered.

Bucket Auger Borings

Borings B-2 and B-13 were drilled using truck mounted bucket auger drilling equipment. A 36-inch outside diameter bucket was used. Relatively undisturbed samples were obtained using a brass ring lined sampler as described above. The ring samples were driven into the soil by using the Kelly bar as a hammer. The number of blows needed to drive the sampler into the soil was recorded as the penetration resistance.

After completion, the borings were backfilled with the drill cuttings. Groundwater was not encountered.

APPENDIX B

APPENDIX B

TEST PITS

Test Pits (TP-1 through TP-18)

We investigated the subsurface conditions at the site by excavating eighteen test pits (TP-1 through TP-18) using a backhoe on August 26 and 27, 2020. These test pits were excavated to depths of approximately 3 to 10 feet below the existing ground surface. The approximate locations of the pits are shown Figure 3. Bulk samples of the materials encountered were obtained for examination and testing in our laboratory.

The test pits were performed under the continuous technical supervision of GPI's representative, who maintained detailed logs of the test pits, classified the soils encountered, and obtained bulk samples of the soils encountered for examination and laboratory testing. The soils encountered in the test pits were classified in the field and through further examination in the laboratory in accordance with the Unified Soils Classification System. After completion, the test pits were backfilled with the soil cuttings with only limited compaction. Detailed logs of the test pits TP-1 through TP-18 test pits are presented in Figures B-1 to B-18 in this appendix.

Test Pits (TP-19 through TP-32):

On November 5, 2021, an Engineering Geologist from GPI observed and logged 14 exploratory test pits excavated with a track mounted excavator operated by Arcadia Reclamation Inc. (ARI). The approximate locations of test pits TP-19 through TP-32 are shown on Figure 2. The materials encountered in each test pit are summarized in Table B-1 included in this appendix.

Test Pit Location and Elevation

The locations of the test pits were laid out in the field by measuring from existing site features. Ground surface elevations at the exploration locations were estimated from a topographic survey plan prepared by Andreasen Engineering dated March 15, 2018 and should be considered approximate.

**Table B-1: Summary of Test Pits TP19-TP32
Excavated 11/5/2021; Logged TGH**

TEST PIT	FILL	NATIVE
TP-19	0-3' Fill: Gray sand and gravel w/well stratified sand & silt deposits from 0-12"	3-21': Interbedded reddish brown silty sand/sandy silt with beds and lenticular channels of sand and gravel.
TP-20	No Fill, Test pit excavated on steep natural slope	0-21'±: Existing near vertical embankment (old quarry wall?), scrapped with excavator. Older Alluvium: gray and reddish brown, interbedded sandy gravel, gravelly sand and silty sand. Horizontally stratified slightly moist, dense.
TP-21	No Fill, Test pit excavated on steep natural slope	20'±: Existing near vertical embankment (old quarry wall?), scrapped with excavator. Older Alluvium: Interbedded sand and gravel bed. Silty sand beds and dark reddish brown, silty sand/sandy silt, massive dense/stiff.
TP-22	0-8' Fill: Brown sand, gravel, and oversize asphalt fragments at alluvial contact	8-12': Older Alluvium: Brown silty sand fine to coarse sand w/gravel, cobbles, boulders, moist, and dense.
TP-23	0-9' Fill: (Old Access Road Fill): Gray, silty, fine to coarse sand, with zones of gravel, cobble/boulders, dry, loose caving. 4" iron pipe observed in fill	9-12': At 9', vegetation line above yellow brown, native alluvium consisting of silty, fine to coarse sand, with gravel, cobbles, and boulders.
TP-24	0-12' Fill: Brown silty sand with gravel, cobbles and boulders 18-24", concrete rubble to 36", dry, loose, and moderately caving. Steel railroad rail observed in bottom of excavation.	Native materials were not encountered
TP-25	0-4' Fill: Brown silty sand w/gravel, some plastic, sandbags, other debris	4-12': Older Alluvium: Dark reddish brown, silty sand/sandy silt. Moist stiff/dense, few thin beds and lenses of sand and gravel
TP-26	0-2' Fill: Brown, sand and gravel, little oversize, dry, loose	2-8': Older Alluvium: Horizontally stratified sand and gravel, slightly moist, dense
TP-27	0-2' Fill: Brown and gray sand and gravel, dry, loose	2-3': Older Alluvium: Dark reddish brown, sandy silt/silty sand, dry to slightly moist, dense/stiff
TP-28	0-5' Fill: Brown sand, gravel, and cobbles with few boulders, dry, loose	5-7.5' Older alluvium: Gray, horizontally stratified sand and gravel, slightly moist, dense
TP-29	0-2', Fill: Brown, sand, gravel, and cobbles, dry, loose	2-4': Older Alluvium: Yellow brown, horizontally stratified sand, gravel and cobbles, slightly moist, dense.
TP-30	0-2' Fill: Brown sand, gravel and cobbles, loose	2-5': Older Alluvium: Brown and reddish brown, horizontally stratified sand and gravel and reddish brown, sandy silt/silty sand, slightly moist, dense/stiff.
TP-31	0-1' Fill: Brown sand and gravel, loose	1-5': Older Alluvium: Yellow brown, horizontally stratified sand and gravel, with cobbles, slightly moist, dense.
TP-32	0-2.5" Fill: Gray sand, gravel and cobble. Trace concrete rubble and plastic debris.	2.5-5': Older Alluvium: Yellow brown, horizontally stratified sand, gravel, and cobbles, slight moist, dense.

APPENDIX D

INTRODUCTION

Representative relatively undisturbed soil samples and bulk samples from the explorations conducted in August 2020 and September 2020 were carefully packaged in the field and sealed to prevent moisture loss. The samples were then transported to our Cypress office and laboratory for examination and testing assignments. Laboratory tests were performed on selected representative samples as an aid in classifying the soils and to evaluate the physical properties of the soils affecting foundation design and construction procedures. Detailed descriptions of the laboratory tests are presented below under the appropriate test headings. Test results are presented in the figures that follow.

MOISTURE CONTENT AND DRY DENSITY

Moisture content and dry density were determined from a number of the ring samples. The samples were first trimmed to obtain volume and wet weight and then were dried in accordance with ASTM D2216. After drying, the weight of each sample was measured, and moisture content and dry density were calculated. Moisture content tests were also conducted on bulk/disturbed soil samples. Moisture content and dry density values are presented on the boring logs in Appendix A.

GRAIN SIZE DISTRIBUTION

Seven samples from the soil borings and test pits were dried and run through a standard set of sieves in accordance with ASTM D422. The portion of the sample passing the No. 4 sieve was then soaked in water until individual soil particles were separated, and then washed on the No. 200 sieve. That portion of the material retained on the No. 200 sieve was oven-dried and weighed to determine the percentage of the material passing the No. 200 sieve. The grain size distribution obtained from the full sieve analysis and the percentages passing the No. 200 sieve (%Silt and %Clay) for the samples tested are presented in Figures D-1 and D-2.

COMPACTION TEST

Maximum dry density/optimum moisture tests were performed in accordance with ASTM D1557 on representative bulk samples of the surficial soils. The test results are as follows. Because the maximum density curves were used to prepare remolded test samples for direct shear testing, the samples were screened through a No. 4 Sieve prior to conducting the test.

BORING NO.	DEPTH (ft)	SOIL DESCRIPTION	OPTIMUM MOISTURE (%)	MAXIMUM DRY DENSITY (pcf)
B-7	0-4	Poorly Graded Gravel with Silt and Sand (GP-GM)	7.5	134
TP-5	0-5	Silty Sand with Gravel (SM)	8.5	131
TP-7	5-10	Poorly Graded Sand with Silt and Gravel (SP-SM)	9.0	132
TP-15	4-7	Well Graded Gravel with Sand (GW)	9.0	133

DIRECT SHEAR

Direct shear tests were performed on three undisturbed and five remolded samples in accordance with ASTM D3080. The remolded samples were compacted to a dry density of 90% of the maximum dry density for the material. The samples were placed in the shear machine, and a normal load comparable to the in-situ overburden stress was applied. The samples were inundated, allowed to consolidate, and then was sheared to failure. The tests were repeated on additional test specimens under increased normal loads. Shear stress and sample deformation were monitored throughout the test. The results of the direct shear tests are presented in Figures D-3 to D-10.

APPENDIX C

GEOPHYSICAL SURVEY

Terra Geosciences conducted a seismic refraction survey at the subject site on August 25, 26 and 28, 2020. Eleven refraction survey lines were performed (Seismic Lines S-1 through S-11). Details of the seismic refraction survey and the results of the survey are presented in the report dated August 31, 2020, by Terra Geosciences, which is included in this appendix.

The traverses were located in the field by use of Google™ Earth imagery (2020) and GPS coordinates and ranged from 125 to 250 feet in length. The approximate locations of the refraction survey lines are shown on Figure 2 and in the August 31, 2020 report by Terra Geosciences.

INTRODUCTION

In accordance with your request, we have completed a non-invasive geophysical survey using the seismic refraction method along selected portions of the subject site as referenced above. We understand that the subject site was previously used a sand and gravel quarry that has been partially backfilled with both compacted and uncompacted fill, of which the limits and depth are unknown at this time. This report describes in further detail the seismic refraction methodology, field procedures used, data processing of the various seismic modeling programs utilized, and the results of this survey, along with presentation of the subsurface seismic models, associated data, and representative survey line photographs. As authorized by you, the following services were performed:

- **Review of available pertinent published and unpublished geologic and geotechnical data in our files pertaining to the site, along with a field reconnaissance.**
- **Conducting a geophysical survey using the seismic refraction method, which consisted of eleven survey traverses, to aid in evaluating the deeper subsurface lithology and geologic structure present beneath the subject site. The field survey and the data analysis were performed by a licensed State of California Professional Geophysicist.**
- **Preparation of representative geologic seismic models and associated data, created from a compilation of various computer data analytical programs.**
- **Preparation of this report, presenting the results of our interpretation of the geophysical data.**

Appendix B - References

PROJECT SUMMARY

As requested, we have performed a geophysical survey using the seismic refraction method along selected portions of the subject site as directed by you. The subject study area is located at the northwest corner of Monte Vista Avenue and Arrow Route, which straddles the cities of both Upland (San Bernardino County) to the east and Claremont (Los Angeles County) to the west. We understand that the subject site was previously occupied by a gravel quarry which had subsequently been partially filled both with undocumented and engineered fill materials. Additionally, the exact composition, limits, and depth of the fill materials are not known at this time.

The purpose of this geophysical study therefore, was to provide both a qualitative and quantified geophysical analysis of the subsurface earth materials, using the seismic refraction method, in order to ascertain the approximate contact boundaries between the native earth materials at depth, where practical, and the overlying landfill materials. The premise is that there may be a discernable seismic velocity differential between the presumed higher-velocity native earth materials at depth and the overlying lower-velocity uncontrolled landfill materials.

Our study involved using various seismic refraction computer modeling programs for both quality control and comparative purposes, which allowed for an unbiased and more thorough analysis. Each of these modeling programs, as described in more detail further in this report, have both strengths and limitations and it was our intention to compile these models to form a more coherent representation of the interpreted subsurface geologic structure. The traverses were located by your firm and are approximated on the Seismic Line Location Map, Plate 1, of which the base map is a captured Google™ Earth (2020) image.

SUMMARY OF SEISMIC REFRACTION SURVEY

Methodology

The seismic refraction method is well suited to identify whether there is a distinct velocity change at depth which could represent a possible subsurface structural differential. The seismic refraction method consists of measuring (at known points along the surface of the ground) the travel times of compressional waves generated by an impulsive energy source and can be used to estimate the layering, structure, and seismic acoustic velocities of subsurface horizons. Seismic waves travel down and through the soils and rocks, and when the wave encounters a contact between two earth materials having different velocities, some of the wave's energy travels along the contact at the velocity of the lower layer. The fundamental assumption is that each successively deeper layer has a velocity greater than the layer immediately above it. As the wave travels along the contact, some of the wave's energy is refracted toward the surface where it is detected by a series of motion-sensitive transducers (geophones).

The arrival time of the seismic wave at each of the geophone locations can be related to the relative seismic velocities of the subsurface layers in feet per second (fps), which can then be used to aid in interpreting both the depth and type of materials encountered.

Field Procedures

Eleven refraction survey lines were performed (Seismic Lines S-1 through S-11) along various portions of the subject site as directed. The traverses were located in the field by use of Google™ Earth imagery (2020) and GPS coordinates and have been delineated on the Seismic Line Location Map, as presented on Plate 1. The survey traverses ranged from 125 to 250 feet in length (depending of the local depth of interest), which consisted of a total of twenty-four 14-Hertz geophones, spaced at regular five- to ten-foot intervals, in order to detect both the direct and refracted waves. A 16-pound sledge-hammer was used as the energy source to produce the seismic waves at seven locations along each survey traverse. Multiple hammer impacts were utilized at each shot point in order to increase the signal to noise ratio, which enhanced the primary seismic “P”-waves.

The seismic wave arrivals were digitally recorded in SEG-2 format on a Geometrics StrataVisor™ NZXP model signal enhancement refraction seismograph. Seven shot points were utilized along each spread using forward, reverse, and several intermediate locations in order to obtain high resolution survey data for velocity analysis and depth modeling purposes. The data was acquired using a sampling rate of 0.0625 milliseconds having a record length of 0.08 to 0.220 seconds. No acquisition filters were used during data collection.

During acquisition, the seismograph displays the seismic wave arrivals on the computer screen which were used to analyze the arrival time of the primary seismic “P”-waves at each geophone station, in the form of a wiggle trace for quality control purposes in the field. If spurious “noise” was observed, the shot location was resampled during relatively quieter periods. Each geophone and seismic shot location were surveyed using a hand level and ruler for topographic correction, with “0” being the lowest point along each survey line.

Data Reduction

All of the recorded seismic data was subsequently transferred to our office computer for further processing and analyzing, using the computer programs **SIPwin** (Seismic Refraction Interpretation Program for **Windows**) developed by Rimrock Geophysics, Inc. (2004) and **Refractor** (Geogig, 2001-2019), and are summarized below.

- **SIPwin** is a ray-trace modeling program that evaluates the subsurface using layer assignments based on time-distance curves and is better suited for layered media, using the “Seismic Refraction Modeling by Computer” method (Scott, 1973). The first step in the modeling procedure is to compute layer velocities by least-squares

techniques. Then the program uses the delay-time method to estimate depths to the top of layer-2. A forward modeling routine traces rays from the shot points to each geophone that received a first-arrival ray refracted along the top of layer-2. The travel time of each such ray is compared with the travel time recorded in the field by the seismic system.

The program then adjusts the layer-2 depths so as to minimize discrepancies between the computed ray-trace travel times and the first arrival times picked from the seismic waveform record. The process of ray tracing and model adjustment is repeated a total of three times to improve the accuracy of depths to the top of layer-2. The layers that were used for the analysis have been established by the creation of a Time-Distance Plot which displays the curve derived from the arrival times of the first P-wave impulse for each geophone receiver in reference to its respective shot point.

➤ **Refractor** is seismic refraction software that also evaluates the subsurface using selected layer assignments from the Time-Distance Plots (see Appendix A) utilizing interactive and interchangeable analytical methods that include the Delay-Time method, the ABC method, and the Generalized Reciprocal Method (GRM). These methods are used for defining irregular non-planar refractors and are briefly described below.

1. The Delay-Time method will measure the delay time depth to a refractor beneath each geophone rather than at shot points. Delay-time is the time spent by a wave to travel up or down through the layer (slant path) compared to the time the wave would spend if traveling along the projection of the slant path on the refractor.
2. The ABC (intercept time) method makes use of critically refracted rays converging on a common surface position. This method involves using three surface to surface travel times between three geophones and the velocity of the first layer in an equation to calculate depth under the central geophone and is applied to all other geophones on the survey line.
3. The GRM method is a technique for delineating undulating refractors at any depth from in-line seismic refraction data consisting of forward and reverse travel-times and is capable of resolving dips of up to 20% and does not over-smooth or average the subsurface refracting layers. In addition, the technique provides an approach for recognizing and compensating for hidden layer conditions.

The combined use of these computer programs provided a more thorough analysis of the subsurface structure and velocity characteristics with respect to evaluating the contact boundary between the landfill materials and the underlying native alluvial deposits. All of the computer programs perform their analysis using exactly the same input data which includes first-arrival "P"-waves and survey line geometry.

SUMMARY OF DATA ANALYSIS

As previously discussed, the primary purpose of the seismic refraction survey was to attempt to discern the approximate contact boundaries between the native earth materials at depth and the overlying fill materials. In general, the site where locally surveyed, was noted to be characterized by two major subsurface layers (Layers V1 and V2) with respect to seismic velocities.

The following velocity layer summaries have been prepared using the **SIPwin** and **Refractor computer** analysis, with the representative Layer Velocity Models (Seismic Line S-1 through S-11) presented within Appendix A along with their respective Time-Distance Plots. The Time-Distance plots, also referred to as “travel-time curves”, display the time it takes (in milliseconds) for the induced seismic waves (shot points) to arrive at each of the seismic receivers (geophones), with respect to their location along the survey line (distance, in feet).

Velocity Layer V1:

The predominance of the uppermost velocity layer (V1) is most likely comprised of uncompacted fill and/or landfill debris, having an average weighted velocity of 1,940 to 2,608 fps, which is typical for these types of unconsolidated surficial earth materials. This velocity range is consistent with some landfill velocities, which can vary widely due to both the composition of the materials and the compactive effort (if any) during disposal.

The V1 velocity layer(s) for Seismic Line S-7 (noted as V1a and V1b in Appendix A) were found to be 2,801 fps and 4,177 fps, respectively, and are comprised of compacted engineered fill. The relatively lower velocity for the upper layer V1a may be due to the use of finer-grained fill materials when approaching final grade.

Locally along Seismic Line S-10, a relatively lower-velocity of 1,802 fps was obtained, which is most likely comprised of recent and active alluvial sedimentation along the lower portion of the quarry bottom in the east.

Velocity Layer V2:

The second layer (V2) predominantly yielded a seismic velocity range of 3,285 to 3,960 fps, which is typical for native, deeper undisturbed and more consolidated older alluvial sediments. Locally along Seismic Line S-10, a relatively lower-velocity of 2,416 fps was obtained, which may be comprised of a localized finer-grained (i.e., lacking significant cobbles and/or boulders) older alluvial deposit at depth. Locally along Seismic Line S-11, there was not overlying lower-velocity V1 layer.

The following table summarizes the results of the survey lines with respect to the “weighted average” seismic velocities for each layer, as indicated on the Layer Velocity Models, as presented within Appendix A.

TABLE 1- VELOCITY SUMMARY OF SEISMIC SURVEY LINES

Seismic Line	V1 Layer (fps)	V2 Layer (fps)
S-1	2,608	3,926
S-2	2,233	3,867
S-3	2,111	3,689
S-4	2,071	3,849
S-5	2,164	3,285
S-6	1,940	3,587
S-7	V1a- 2,801	-----
	V1b- 4,177	-----
S-8	2,480	3,507
S-9	2,209	3,622
S-10	1,802	2,416
S-11	-----	3,960

SUMMARY OF FINDINGS AND CONCLUSIONS

The raw field data was considered to be of fair to good quality with minor to moderate amounts of ambient “noise” that was introduced during our survey. The noise sources most likely were produced by a combination of vehicular traffic originating along the adjacent roadways, air traffic, and local high-frequency communication noise (possibly from the nearby airport to the northeast of the subject site. Analysis of the data and picking of the primary “P”-wave arrivals was therefore performed with some difficulty, with minor to moderate amounts of interpolation of the data being necessary. Application of both high- and low-frequency filters were partially necessary during processing as the raw first-wave distant arrivals were generally masked by the noise.

The Time-Distance Plots, as presented within Appendix A, have been included to present the results of the data picks of the first-arrivals of the “P”-Waves recorded during our survey. It can be seen that the data points vary somewhat both in linearity and slope, suggesting the heterogenous nature of the underlying landfill materials. There may be many inconsistencies in the landfill, which could include dense pockets from local compactive effort, loose areas of fill including decomposing organics, large areas of concrete debris, etc. Wave-path travel through these conditions can be very complicated and convoluted, which most likely added to the difficulty in interpretation of the data.

It was noted that the seismic velocities recorded in both the fill/landfill materials (V1) and the native older alluvial deposits (V2) were fairly consistent across the site where locally surveyed, suggesting a good correlation, with a higher confidence level in the resultant data and models as a result.

We understand that there are documented compacted fill materials present along the southern portion of the site (locally along Seismic Line S-7). The contact between the native older alluvial materials and the documented compacted fill materials at depth may be difficult to differentiate, especially if the velocities are similar. It is generally considered to be a “rule-of-thumb” that a seismic velocity differential of around 50 percent is needed to produce another velocity layer boundary at depth. If the two earth materials are similar with respect to seismic velocities, then it is not possible to detect the contact between them.

Additionally, if the seismic velocities of the native alluvial materials are less than the overlying compacted fill, this would create a “blind zone” wherein the sound waves would be refracted downward at the contact, being undetectable at the surface, rendering this contact boundary unidentifiable. Noting that the seismic velocity of the deeper compacted fill materials was greater than 4,000 fps and that the velocities of the native older alluvial materials were less than 4,000 fps, this condition would be expected and therefore, the contact and conversely the depth between the two materials cannot be discerned.

In summary, despite the challenges in the data processing, the final seismic models appear to have close similarities with respect to seismic velocities, indicating the reliability of the data. Additionally, the average of the seismic velocities for both velocity layers appear to be within the typical range for their respective materials types. The only variance across the site, with respect to the undocumented fill and native materials, was found along Seismic Line S-10, wherein it is possible that a localized finer-grained lens of alluvial materials is present (lacking significant cobbles and/or boulders), resulting in a relatively lower seismic velocity, with the upper layer consisting of recent alluvial deposition. The compacted engineered fill locally found along the southern portion of the site (Seismic Line S-7) appears to have a high relative seismic velocity, most likely due to the addition of water and the compactive effort during the grading process.

CLOSURE

The field survey was performed by the undersigned during August 2020 using "state of the art" geophysical equipment and techniques along selected portions of the subject site as directed by you. It should be noted that our data was obtained along only eleven specific locations therefore other areas in the local vicinity beyond the limits of our seismic lines may contain different velocity layers, depths, and structures not encountered during this field survey. As a rule-of-thumb, the estimates of the layer velocity boundaries are generally considered to be within 10± percent of the total depth of the contact.

It is important to understand that the fundamental limitation for seismic refraction surveys is known as nonuniqueness, wherein a specific seismic refraction data set does not provide sufficient information to determine a single "true" earth model. Therefore, the interpretation of any seismic data set uses "best-fit" approximations along with the geologic models that appear to be most reasonable for the local area being surveyed. Client should also understand that when using the theoretical geophysical principles and techniques discussed in this report, sources of error are possible in both the data obtained and in the interpretation and that the results of this survey may not represent actual subsurface conditions.

These are all factors beyond **Terra Geosciences** control and no guarantees as to the results of this survey can be made. We make no warranty, either express or implied. If the client does not understand the limitations of this geophysical survey, additional input should be sought from the consultant.

This opportunity to be of service is sincerely appreciated. If you should have any questions regarding this report or do not understand the limitations of this study or the data that is presented, please do not hesitate to contact our office at your earliest convenience.

Respectfully submitted,
TERRA GEOSCIENCES

PERCOLATION TEST DATA SHEET

Project:		Claremont McKenna College				Project No.:		700114101		Date:		10/21/2022	
Test Hole No.:		FP-1				Tested By:		S. Wilkins					
Depth of Test Hole (ft):		10				USCS Soil Classification:				SM			
PVC Pipe Dimension:		3-in I.D. Perforated by 10 Feet				Test Hole Diameter (in):				8			
Trial No.	Date	Time of Measurement	Initial Depth to Water (ft)	Time of Measurement	Final Depth to Water (ft)	Volume of Water Infiltrated (cu.in.)	Surface Area (sq.in.)	Time Interval (min)	Infiltration Rate (in/hr)				
#1 (Refill)	10/21/2022	1:16 PM	5.00	1:46 PM	6.56	941	1558	30	1.21				
#2 (Refill)	10/21/2022	1:48 PM	5.00	2:18 PM	6.47	887	1558	30	1.14				
#3 (Refill)	10/21/2022	2:20 PM	5.00	2:50 PM	6.38	832	1558	30	1.07				
#4 (Refill)	10/21/2022	2:55 PM	5.00	3:25 PM	6.44	869	1558	30	1.11				
#5 (Refill)	10/21/2022	3:26 PM	5.00	3:56 PM	6.40	844	1558	30	1.08				
#6 (Refill)	10/21/2022	3:58 PM	5.00	4:28 PM	6.36	820	1558	30	1.05				
Comments:	1. Percolation test was performed in accordance with the Boring Percolation Test Procedure provided in the "Guidelines for Design, Investigation, and Reporting - Low Impact Development Stormwater Infiltration," prepared by County of Los Angeles Department of Public Works, dated 30 June 2021. 2. Weather: Sunny and warm.					Average Stabilized Rate		1.08					
						Reduction Factors RF _t =1, RF _v =1, RF _s =1		3					
						Design Infiltration Rate (in/hr)		0.36					

PERCOLATION TEST DATA SHEET

Project:	Claremont McKenna College	Project No.:	700114101	Date:	10/21/2022				
Test Hole No.:	FP - 2	Tested By:	shaun wilkins	Updated:	11/11/2022				
Depth of Test Hole (ft):	10	USCS Soil Classification:	SP-SM						
PVP Pipe Dimension:	2-in I.D. x 10 ft long (10 ft slotted) with 10 ft screen	Test Hole Diameter (in):	8						
SANDY SOIL CRITERIA TEST*									
Trial No.	Date	Start Time	Stop Time	Time Interval (min)	Initial Depth to Water (ft)	Final Depth to Water (ft)	Change in water Level (in.)	Greater than or Equal to 6" (Y/N)	
1	10/21/2022	11:10 AM	11:12 AM	2.0	5	5.5	6	Y	
2	10/21/2022	11:12 AM	11:15 AM	3.0	5.5	6	6	Y	
* If two consecutive measurements show that six inches of water seeps away in less than 25 minutes, the test shall be run for an additional hour with measurements taken every 10 minutes. Otherwise, pre-soak (fill) overnight. Obtain at least twelve measurements per hole over at least six hours (approximately 30 minute intervals) with a precision of at least 0.25 inches.									
Trial No.	Date	Time of Measurement	Initial Depth to Water (ft)	Time of Measurement	Final Depth to Water (ft)	Volume of Water Infiltrated (cu.in.)	Surface Area (sq.in.)	Time Interval (min)	Infiltration Rate (in/hr)
#1 (Refill)	10/21/2022	11:15 AM	5.00	11:25 AM	6.50	905	1332	10.0	4.08
#2 (Refill)	10/21/2022	11:26 AM	5.00	11:36 AM	6.42	857	1344	10.0	3.82
#3 (Refill)	10/21/2022	11:37 AM	5.00	11:48 AM	6.43	863	1343	10.0	3.85

Comments:	1. Percolation test was performed in accordance with the Technical Guidance Document Appendices provided on San Bernardino Gov. website. (https://www.sbcounty.gov/uploads/DPW/docs/AppendixD-OCInfiltrationRateEvaluationProtocol.pdf) 2. Infiltration Rate is calculated based on Porchet Method (aka inverse borehole method) 3. Weather: Partly cloudy and cool				Tested Infiltration Rate (in/hr)	5.37		
					Combined Safety Factor, $S_{TOT}=S_A \times S_B$ ($S_A=1$, $S_B=2$)	2		
					Design Infiltration Rate (in/hr)	2.69		

PERCOLATION TEST DATA SHEET

Project:	Claremont McKenna College Sports Complex	Project No.:	700114101	Date Tested:	11/29/2022			
Test Hole No.:	FP - 6	Tested By:	SHW	Updated:	12/15/2023			
Depth of Test Hole (ft):	40	USCS Soil Classification:	SP-SM					
PVP Pipe Dimension:	3-in I.D. x 40 ft long (20 ft perforated and 20 ft solid)	Test Hole Diameter (in):	8					
SANDY SOIL CRITERIA TEST*								
Trial No.	Start Time	Stop Time	Time Interval (sec)	Initial Depth to Water (ft)	Final Depth to Water (ft)	Change in water Level (in.)	Greater than or Equal to 6" (Y/N)	
1	3:30 PM	3:30 PM	9	29.00	29.50	6	Y	
2	3:30 PM	3:30 PM	11	29.50	30.00	6	Y	
* If two consecutive measurements show that six inches of water seeps away in less than 25 minutes, the test shall be run for an additional hour with measurements taken every 10 minutes. Otherwise, pre-soak (fill) overnight. Obtain at least twelve measurements per hole over at least six hours (approximately 30 minute intervals) with a precision of at least 0.25 inches.								
Trial No.	Start Time	Stop Time	Time Interval (min)	Initial Depth to Water (ft)	Final Depth to Water (ft)	Change in Water Level (ft)	Percolation Rate (min/in)	Infiltration Rate (in/hr)
#1 (Refill)	3:30 AM	3:40 AM	10.0	30.00	37.40	7.40	0.11	13.73
#2 (Refill)	5:16 PM	5:26 PM	10.0	30.00	34.90	4.90	0.17	7.62
#3 (Refill)	5:27 PM	5:37 PM	10.0	30.00	36.22	6.30	0.13	10.58
#4 (Refill)	5:39 PM	5:49 PM	10.0	30.00	36.19	6.28	0.13	10.50
#5 (Refill)	5:50 PM	6:00 PM	10.0	30.00	35.90	6.12	0.14	9.81
#6 (Refill)	6:02 PM	6:12 PM	10.0	30.00	35.85	5.85	0.14	9.69
Comments:	1. Percolation test was performed in accordance with the Technical Guidance Document Appendices provided on San Bernardino Gov. website. (https://www.sbcounty.gov/uploads/DPW/docs/AppendixD-OCInfiltrationRateEvaluationProtocol.pdf) 2. Infiltration Rate is calculated based on Porchet Method (aka inverse borehole method) 3. Weather: Partly cloudy and cool				Tested Infiltration Rate (in/hr)		9.69	
					Combined Safety Factor, $S_{TOT} = S_A \times S_B$ ($S_A = 1$, $S_B = 2$)		2	
					Design Infiltration Rate (in/hr)		4.85

- 3.26. BC: Street Improvements (2025) - Mitigated
- 3.27. BC: Roberts Sports Bowl Utilities (2024) - Unmitigated
- 3.28. BC: Roberts Sports Bowl Utilities (2024) - Mitigated
- 3.29. BC: Roberts Sports Bowl Utilities (2025) - Unmitigated
- 3.30. BC: Roberts Sports Bowl Utilities (2025) - Mitigated
- 3.31. BC: Pathways + Parking (2025) - Unmitigated
- 3.32. BC: Pathways + Parking (2025) - Mitigated
- 3.33. BC: Tunnel (2024) - Unmitigated
- 3.34. BC: Tunnel (2024) - Mitigated
- 3.35. BC: Tunnel (2025) - Unmitigated
- 3.36. BC: Tunnel (2025) - Mitigated
- 3.37. Arch Coating: Structures (2025) - Unmitigated
- 3.38. Arch Coating: Structures (2025) - Mitigated
- 3.39. Arch Coating: Street Improvements (2025) - Unmitigated

3.40. Arch Coating: Street Improvements (2025) - Mitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

4.10.4. Soil Carbon Accumulation By Vegetation Type - Mitigated

4.10.5. Above and Belowground Carbon Accumulation by Land Use Type - Mitigated

4.10.6. Avoided and Sequestered Emissions by Species - Mitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.2.2. Mitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.3.2. Mitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

5.18.2.2. Mitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Claremont McKenna Phase 1 Construction
Construction Start Date	8/1/2024
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.80
Precipitation (days)	2.40
Location	34.10354503733571, -117.7007727686169
County	San Bernardino-South Coast
City	Upland
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5227
EDFZ	10
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.24

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Arena	50.0	1000sqft	16.1	50,000	0.00	0.00	—	—

Unenclosed Parking Structure	470	Space	4.23	10,500	0.00	0.00	—	—
Parking Lot	240	Space	2.16	0.00	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-13	Use Low-VOC Paints for Construction

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2

Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	88.7
AQ-PM	95.3
AQ-DPM	80.9
Drinking Water	97.1
Lead Risk Housing	31.1
Pesticides	2.66
Toxic Releases	58.9
Traffic	29.8
Effect Indicators	—
CleanUp Sites	43.6

Groundwater	10.6
Haz Waste Facilities/Generators	46.8
Impaired Water Bodies	12.5
Solid Waste	39.3
Sensitive Population	—
Asthma	60.1
Cardio-vascular	70.9
Low Birth Weights	64.5
Socioeconomic Factor Indicators	—
Education	40.1
Housing	69.5
Linguistic	54.6
Poverty	64.9
Unemployment	29.4

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	19.74849224
Employed	14.1537277
Median HI	26.85743616
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	71.0
Healthy Places Index Score for Project Location (b)	38.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A
-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	84.6
AQ-PM	94.4
AQ-DPM	81.2
Drinking Water	98.0
Lead Risk Housing	—
Pesticides	19.8
Toxic Releases	56.7

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Claremont McKenna Operations v2
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.80
Precipitation (days)	2.40
Location	34.1033741482496, -117.70077931750569
County	San Bernardino-South Coast
City	Upland
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5227
EDFZ	10
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.22

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Arena	50.0	1000sqft	16.1	50,000	0.00	0.00	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Area Sources	AS-2	Use Low-VOC Paints

2. Emissions Summary

2.4. Operations Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	20.9	annual days of extreme heat
Extreme Precipitation	6.20	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	8.23	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about $\frac{3}{4}$ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A
-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

**Cable Airport Land Use
Compatibility Plan Consistency
Review**

TECHNICAL MEMORANDUM

To: Elizabeth Camacho, Loeb & Loeb LLP

From: Ken Brody, Senior Airport Planner

Date: March 5, 2024

Subject: Cable ALUCP Consistency Review of Roberts Campus Sports Bowl

1. OVERVIEW

Claremont McKenna College (CMC) proposes to construct a sports field complex known as the Roberts Campus Sports Bowl (the “Sports Bowl”) on a 66.5-acre portion of an approximately 74-acre site known as the “Roberts Campus East” (formerly known generally as East Campus). The site straddles the boundary between San Bernardino County on the east and Los Angeles County on the west and is situated in the Cities of Upland and Claremont in those counties, respectively. The project site is also located within the influence area of Cable Airport as established in the *Cable Airport Land Use Compatibility Plan (ALUCP)* adopted by the City of Upland. The current proposal modifies and refines the project that was approved by the two cities in 2016 but has not been constructed.

Mead & Hunt reviewed the prior proposal in April 2016. Our findings were detailed in a Memorandum to the City of Upland Development Services Director. This present Memorandum updates the previous one, focusing on concerns noted at that time and changes that have been made to the project since then. As was the case previously, the purpose of this Memorandum is to evaluate whether the proposed project is consistent with the criteria set forth in the ALUCP.

As documented herein and further described in the conclusions section of this Memorandum, Mead & Hunt finds that the Sports Bowl project can be deemed consistent with the ALUCP criteria provided that the City of Upland determines, based on appropriate findings, that the proposed football/track/lacrosse stadium and soccer/rugby field bleachers are compatible in accordance with ALUCP Policy 3.1.6. The proposed capacities of each of these facilities exceed the single-acre intensity safety criterion of the ALUCP. However, the soccer/rugby facility would meet, or come close to meeting, this criterion under typical less-than-capacity usage and its design alleviates the safety concern. Similarly, the proposed design of the stadium addresses the safety concern represented by this criterion. ALUCP Policy 3.1.6 provides for consideration of special conditions unique to a project when a local agency assesses a project's compatibility with Cable Airport. As discussed in detail below, the design and other features of the proposed football/track/lacrosse stadium and soccer/rugby field bleachers are among the types of findings that Policy 3.1.6 is intended to take into account and therefore would support a City of Upland determination of compatibility under the provisions of this policy.

A. Background

Mead & Hunt began work with the City of Upland and its General Plan consultants in 2008 to prepare an airport land use compatibility plan (ALUCP) for Cable Airport. State law requires that an ALUCP be prepared

for each public-use and military airport in the state. In most counties, this work is accomplished by a countywide airport land use commission (ALUC). San Bernardino County, however, has opted to utilize a provision of the state law known as the “alternative process” which delegates the ALUCP preparation process to each local agency—city or county—that has an airport in its territory.

Preparation of an ALUCP must be guided by information in the *California Airport Land Use Planning Handbook (Handbook)* published by the Caltrans Division of Aeronautics. The current edition is dated 2011. Mead & Hunt was the primary author or a major contributor to all editions of the *Handbook*. With regard to airport land use compatibility criteria, the *Handbook* dictates that four types of compatibility concerns be addressed: noise, overflight, safety, and airspace protection. Each of these factors as reflected in the Cable ALUCP and as they relate to the proposed Sports Bowl project are examined in this Memorandum. The City of Upland adopted the Cable ALUCP in September 2015. A new General Plan was adopted at that time as well. The ALUCP replaced the previous plan, *Cable Airport Comprehensive Airport Land Use Plan*, dated 1981. The older plan was greatly outdated and did not meet the guidelines of the state *Handbook*.

Importantly, the ALUCP officially applies only to the parts of the airport influence area that are within the Cities of Upland and Montclair. Although relevant to the City of Claremont, that city is in Los Angeles County and therefore the ALUCP has no enforceability there. The ALUCP encourages the Los Angeles County Airport Land Use Commission to adopt compatibility policies for its part of the Cable Airport environs, but that Commission has yet to do so. Nevertheless, it is Mead & Hunt’s understanding that the Los Angeles County ALUC staff advises project applicants to voluntarily comply with the Cable ALUCP. Furthermore, Mead & Hunt understands that CMC desires for its project to comply with the ALUCP policies not only for the portions within the City of Upland but also the area within the City of Claremont. Our review in this Memorandum applies the Cable ALUCP criteria to the entire project site.

B. Proposed Project

Proposals for construction of sports fields on Roberts Campus East go back to before 2008 and have evolved over time. A February 2008 memorandum prepared by Walter E. Gillfillan and Associates evaluates the land use compatibility issues associated with a prior proposal. An exhibit included with that memo identified a proposed project consisting of baseball, softball, soccer, club sports, and multipurpose fields plus various other smaller facilities. None of the facilities in the 2008 proposal appear to have any large amount of spectator seating. A September 2008 letter from the Cable Airport management commented on the proposal and the Gillfillan analysis and found the project to be “acceptable,” although acknowledging that the site is in the airport’s direct departure route and the ability to limit aircraft overflights is “minimal at best.”

The 2008 proposal was later modified to add a football/track stadium with spectator seating to the mix of proposed sports fields. In 2016, the cities of Upland and Claremont approved a project that included the football/track stadium as well as other sports fields. Furthermore, a letter dated April 2016 from Robert Cable, President of Cable Airport, Inc., stated that “Cable Airport is in full support of the project and has no issues with the project’s proposed purpose and proposed use.”

The current proposal, details of which were provided to Mead & Hunt by CMC, includes the same types of uses approved in 2016 but has fewer playing fields and modifies the layout and positions of the various components. No changes to the types or intensity of uses are proposed. The proposed project calls for development of approximately 66.5 acres of the approximately 74-acre site. The current project area includes approximately 8.87 acres in the northeastern corner of the site that was not part of the conceptual site plan approved in 2016 but does not include the approximately 7.6 acres along the southern edge of the site which is not proposed for development as part of this project. Approximately 60% of the site falls within the City of Upland and the western 40% within the City of Claremont.

The corner of the site nearest to Cable Airport, the northeast corner, is approximately 2,500 feet southwest of the western end of the runway and the southern edge of the site is about 4,500 feet distant. The ground elevation at the northeast corner is approximately 60 feet below the nearby runway end and perimeter elevations slope downward from there. Because the site is a former quarry, elevations elsewhere within it are even lower.

As with the 2016 plan, the current proposal contains a mixture of different types of playing fields plus supporting facilities and automobile parking. Five playing areas are designed for specific sports with some areas usable by more than one sport: baseball; softball; soccer/rugby; football plus track and field and lacrosse; and golf practice. A sixth, large playing area is multi-purpose and can also function as several smaller fields for simultaneous use. The soccer/rugby field, football/track/lacrosse venue and the baseball and softball fields will each have spectator seating. As depicted in Attachment 1, the current plan places the football/ track/lacrosse stadium at the south end of the site. The baseball and softball fields and the golf practice facility are in the central area and the soccer/rugby and multi-purpose facilities are in the northern portion.

Support facilities, including locker rooms, classrooms, office space, and maintenance and equipment areas, are to be situated close to the stadium and baseball and softball fields. Most automobile parking will be located in a parking structure on the west side of the site. Smaller surface parking lots are planned for adjacent to the south end of the parking structure and in the northeast and southeast corners of the site. Solar panels are proposed for the roofs of most of the structures including on the shade structures over the spectator seating bleachers and above the parking structure and the surface parking along Claremont Boulevard. Pedestrian paths wrap around each venue and along the site's perimeter.

The only difference between the proposed primary plan and its variation shown in Attachment 2 is that the latter consolidates the football stadium field structures into one building on the north side of the stadium as opposed to having two smaller structures, one at each end of the stadium and a separate field house between the baseball and softball fields. The two individual structures are primarily locker rooms and restrooms. In either the primary plan or the alternate, the north field house will contain a multipurpose room, office space, and at least some locker room and restroom facilities.

As documented in the analysis that follows, a key factor regarding the proposed project is its usage intensity; that is, the number of people who could be on the site at one time or concentrated in one area. CMC provided the following details regarding the maximum numbers of people, including participants and spectators, likely to occupy each facility at one time.

Facility	Maximum Participants	Spectator Capacity	Notes
Multi-Purpose Fields (3)	150	—	- Participant number includes all three fields - No fixed spectator seating
Baseball Field	100	250	Bleacher seating with shaded covering
Softball Field	100	250	Bleacher seating with shaded covering
Soccer / Rugby Field	100	500	- Bleacher seating with shaded covering - All on north side of field
Football Field / Track / Lacrosse	250	1,800	- Bleacher seating with shaded covering - Located on both sides of field - Maximum 900 seats on either side
Golf Practice	25	—	No fixed spectator seating

2. AIRPORT LAND USE CONSISTENCY EVALUATION

A. ALUCP Criteria

The Cable ALUCP addresses the four airport land use compatibility factors required by the state *Handbook*: noise, overflight, safety, and airspace protection.

- *Noise and Overflight*: The noise factor deals with high noise levels that may be disruptive to activities on the ground. Overflight addresses noise from individual aircraft overflights in locations outside of the noise contours and not necessarily disruptive to activities, but which may nevertheless be annoying to some people.
- *Airspace Protection*: The objective of airspace protection criteria is to ensure that proposed land uses do not have features that can cause or contribute to causing an aircraft accident. These features can be physical, visual, or electronic in character. The primary component of airspace protection criteria is a limitation on the height of structures and other objects. The specific limits are set by the Federal Aviation Administration (FAA) in Part 77 of the Code of Federal Regulations (14 CFR 77), *Safe, Efficient Use and Preservation of Navigable Airspace*. Another important component of airspace protection is glare. Bright lights along routes flown by aircraft at low altitudes can create hazards by momentarily blinding pilots. Yet another concern is any land use that attracts birds near a runway or its approach and departure paths. FAA guidance with regard to bird strike hazards is noted in Cable ALUCP Policy 3.4.3 and Footnote 12.
- *Safety*: The safety factor addresses the potential consequences of an aircraft accident should one occur. Safety compatibility criteria limit the density (dwelling units per acre) of proposed residential uses and intensity (people per acre) of proposed nonresidential uses and also restrict creation of certain particularly risk-sensitive uses such as children's schools. The ALUCP safety criteria take into account two different types of aircraft accidents. For events in which the aircraft is descending but under control, the pilot will try to land on any available relatively flat and open area free of large objects and people. Because buildings and other development of most projects are not evenly spread over the site, the risks to people on the ground can be reduced by limiting the overall usage intensity, thus creating areas that are relatively unoccupied. Clustering of people in one part of a site presents

a different type of risk, however. This risk arises from accidents in which the aircraft is not under the pilot's control and will fall on whatever is in its path. The ALUCP addresses this potential consequence by restricting the number of people concentrated in a small area, specifically a single acre, and by limiting the percent lot coverage of the building footprint.

To facilitate compatibility reviews by the City of Upland, Table 3A of the ALUCP addresses most aspects of the four factors in a composite manner. The table provides a list of land use categories and indicates whether that use is "Normally Compatible," "Conditional," or "Incompatible" depending upon proximity to the airport runway. The criteria in Table 3A are supplemented and further detailed in Sections 3.2 through 3.5 containing policies for each of the four compatibility factors separately. The airport influence area within which the compatibility criteria apply is illustrated in Map 3A (included here as Attachment 3). This map divides the airport environs into nine compatibility zones having varying degrees of airport impacts. Although each zone is affected to different degrees by the four compatibility factors, the boundaries of the zones take into account the impacts of all factors in a composite manner.

B. Compatibility Evaluation

The project site falls within three compatibility zones, B1, B2, and B3 (see Attachment 4). As indicated in Table 3B of the ALUCP, these are zones within which noise impacts are moderate to high, safety concerns range from low/moderate in B3 to high in B1, and airspace protection is critical. Zones B1 and B2 are both exposed to a high concentration of aircraft overflights, particularly departures. Unlike at most airports where aircraft typically proceed on the runway heading until they gain altitude, aircraft departing to the west at Cable Airport turn left shortly beyond the departure end of the runway. This procedure keeps aircraft over the currently uninhabited area that is the Sports Bowl project site and enables them to avoid overflight of the Claremont Colleges campus but means many overfly the project site at altitudes below that of the airport traffic pattern (800 feet above the airport elevation).

The northern edge of the project site is proposed to be devoted to 80 parking spaces for nearby campus facilities. Nearly all of the parking area along the northern edge is within Compatibility Zone B1. No functions other than the northern parking lot and a segment of walking path are in Zone B1. In Zone B2, the only sports facilities are the eastern half of the multi-purpose field, about two-thirds of the soccer/rugby field, and small pieces of the baseball outfield and the golf practice area. All of the occupied structures and most of the sports facilities are placed in the Zone B3 part of the site.

3. NOISE AND OVERFLIGHT FACTORS

Noise and overflight are not a concern for the Sports Bowl project. Although aircraft departing Cable Airport already overfly the project site on a routine basis, will continue to do so, and will certainly be audible, the activities that would take place at the sports complex would not be materially impacted by the noise.

4. AIRSPACE PROTECTION

The height of objects to be placed on the site is also not a concern for the Sports Bowl project. Due to the site's elevation at least 60 feet below that of the runway, any object would need to be nearly 150 feet tall to become an airspace penetration even at the most critical northeast corner. The ground elevation at the

western end of the runway is 1,393 feet above mean sea level (MSL). At the northeast corner of the project site, the FAR Part 77 airspace protection surface is about 1,480 feet MSL and the ground elevation is about 1,330 feet MSL—a difference of about 150 feet.

Even if light poles and trees on the site would not penetrate the airport airspace, federal aviation regulations could require that notice be given to the FAA so that they can conduct an Aeronautical Study to determine whether the objects would be a hazard to flight. Notice is required for most proposed objects (permanent or temporary such as construction cranes) exceeding a 100:1 slope from the runway end. However, at 2,500 feet from the runway end, an object at the northeast corner would need to be taller than 85 feet ($2,500/100 + 60$) to necessitate FAA notice. Objects elsewhere on the site would need to be even taller. None of the light towers, trees, or any other tall objects contemplated on the site thus appear to represent a potential hazard to flight. That said, if any objects on the site would reach an elevation higher than light poles or other objects along the surrounding streets, notice to the FAA would be warranted to determine if obstruction lighting would be beneficial.

With respect to glare, the criteria for evaluating it are less precise than those for the height of objects. In general, any lighting that has an upward component would be a concern. Shielding of the sports field lights may be required. The project does not propose upward lighting, but the applicant should nonetheless provide an analysis by a lighting expert, preferably one who is familiar with aviation, to document that glare will be minimized. The solar panels proposed for building roofs, stadium seating canopies, and above the parking structure and surface parking on Claremont Boulevard do not present a concern provided that, as proposed, they will be comprised of flat panels similar to ones typically found on residences and businesses.

Finally, with respect to the bird attraction aspect of airspace protection, the proposed Sports Bowl project does not appear to contain any components that might tend to attract more birds than now visit the undeveloped site (e.g., new retention basins or other water features). Nevertheless, the proximity of the project site to the airport warrants that this potential concern be considered in the selection of plants and design of drainage features. Because the proposed project as reviewed in this Memorandum consists of conceptual site plans and does not provide all design details, Mead & Hunt has not conducted a review of the plant selection or drainage design. However, it is understood that the drainage system will not allow for any ponding water for more than 48 hours and will avoid a need for an aboveground retention pond by using a system of drywells and belowground retention for stormwater. On this basis, bird attraction due to water retention should not be an issue. Nevertheless, prior to issuance of vertical building permits, the applicant should be required to provide additional design detail, including landscape plans, which can be reviewed by the approving cities for consistency with this criterion.

5. SAFETY FACTOR

Safety is the primary issue to be considered for the proposed Sports Bowl. The large number of people expected to be on the site and particularly the large number that would be in the several spectator stands requires careful evaluation. Among the land use categories listed in Table 3A of the ALUCP, the two most relevant to the proposed sports complex are:

- Outdoor Major Assembly Facilities (capacity $\geq 1,000$ people): spectator-oriented outdoor stadiums, amphitheaters, fairgrounds, zoos.
- Group Recreation (limited spectator stands): athletic fields, water recreation facilities, picnic areas.

Table 3A sets site-wide average intensity limits of 40, 80, and 120 people per acre in Compatibility Zones B1, B2, and B3, respectively, and 80, 160, and 300, people per any 1-acre area. Outdoor Major Assembly Facilities are therefore considered incompatible within all three of these zones as they are presumed to be unable to meet these criteria. Group recreation uses are deemed incompatible only in the zones adjacent to the runway: A, B1 and C1. In Compatibility Zones B2 and B3, as well as C2, this type of use is conditional, with the condition being that the intensity criteria must be met, and farther away from the runway it is compatible. The major issue presented by Outdoor Major Assembly Facilities as compared to Group Recreation uses is the high concentration of people in a confined area. Moreover, an outdoor stadium provides no protection that the structure of an indoor arena would offer from a crash by a small airplane like those that operate at Cable Airport. *Important to emphasize here is that both the overall site and each of its individual components are subject to the intensity criteria regardless of which land use categories apply.*

CMC proposes to limit the football/track/lacrosse stadium facility's spectator capacity to be no more than 1,800 people split into two bleachers, one on each side of the field, with neither having more than 900 seats as was conditioned in the 2016 approval.¹ The combined fixed seating capacities of the soccer/rugby, baseball and softball venues are also within the range approved by the 2016 approval. Together with the site plan shown in Attachments 1 and 2, conceptual designs of the seating areas including capacity data (Attachment 5), egress locations (Attachment 6), and cross-sections (Attachment 7), have served as the basis for this review.

To determine whether the 2023 Sports Bowl project meets the ALUCP safety criteria, average-acre and single-acre intensities within each of the three affected compatibility zones must be examined individually. Compatibility Zone B1 contains approximately 3.0 acres of the 66.5-acre project site; Zone B2 is 16.0 acres; and Zone B3 is 47.5 acres. The intensity numbers can be calculated as described below. For the purposes of these calculations, no distinction need be made for the portions of each zone that are in San Bernardino County (City of Upland) versus Los Angeles County (City of Claremont).

Compatibility Zone B1

- *Average-Acre Intensity:* At the intensity limit of 40 people per average acre, the 3.0 acres in this most highly restricted zone is allowed to have up to 120 people. The major use of this area is 80 automobile parking spaces. If there were to be an average of two people per vehicle, 60 vehicles could be occupied or have people walking to or from them in the lot and remain consistent with the criterion. Assuming that the lot will be used in a typical manner for campus facilities with vehicles coming and going at various times and people not loitering in the parking lot (e.g., tailgate parties), it seems doubtful that more than 120 people would be present at the same time, even allowing for

¹ The condition from the 2016 approval limited seating to no more than 999 seats on each side, but the present Sports Bowl proposal reduces this limit to a maximum of 900 seats on each side.

some people to be walking along the nearby paths. The planned uses for Compatibility Zone B1 therefore are deemed consistent with the average-acre criterion.

- *Single-Acre Intensity:* Assuming that the number of people in vehicles or walking in the parking lot are distributed relatively equally, the number of people concentrated in a 1.0-acre area would be well below the limit of 80 people.

Compatibility Zone B2

- *Average-Acre Intensity:* The average-acre intensity limit of 80 people per acre for Zone B2 will be met if no more than 1,280 people are present in the 16.0-acre area. The only sports facilities in Zone B2 are about half of the multi-purpose field and two-thirds of the soccer/rugby field. Although the latter facility is proposed to have up to 500 spectator seats, the multi-purpose facility will have no fixed seating.
- *Single-Acre Intensity:* The most highly concentrated occupancies within Zone B2 are the soccer/rugby field bleachers. A 1-acre area encompasses the soccer/rugby bleachers and a portion of the playing field, thus giving a maximum capacity of nearly 600 people. The 500-seat soccer/rugby bleachers by themselves would exceed the 160-persons-per-acre intensity limit for Zone B2 even if half of the seats are on each side of the field. Most of the soccer/rugby field is in this zone and therefore its 500-seat bleachers would exceed the single-acre intensity limit even if half were to be on each side of the field. However, under typical low-capacity usage, the proposed plan likely would come close to meeting the intensity limit. Also, as shown in Attachment 6 and discussed below with regard to the football/track/lacrosse stadium in Zone B3, an important safety benefit is that the bleachers are designed to follow the slope of the ground, thus enabling egress from both the front and back edges.

Compatibility Zone B3

- *Average-Acre Intensity:* The preponderance of the Sports Bowl project site, some 47.5 acres, falls within Zone B3. The most intensive uses of the proposed Sports Bowl are also within this zone. For All of the major sports facilities except the soccer/rugby field are in Zone B3, thus creating a maximum occupancy of 2,750. Even using the 2,750-people number and adding some for people who might remain in parking areas which total 710 spaces, the average-acre intensity would be only about 60 people per acre, well below the limit of 120 people per acre.
- *Single-Acre Intensity:* The most highly concentrated usage within Zone B3 is in the football/track/lacrosse stadium spectator stands and field house facilities. Also, the baseball and softball field bleachers, each with 250 seats, are situated nearby although neither are quite within the same 1-acre area as each other or the stadium stands. In any case, simultaneous use of these three facilities would be rare and certainly not all at their capacities. Considered separately, the baseball and softball bleachers together with these venues' participants each will typically meet the ALUCP's 300-people-per-single-acre criterion. Thus, the single-acre intensity issue with Compatibility Zone B3 is realistically just with the football/track/lacrosse stadium.

As noted earlier the difference between the primary plan (Attachment 1) and the alternate configuration (Attachment 2) involves the stadium field house arrangement. The primary plan has

three separate structures while the alternate configuration has one combined building. The stadium seating is the same with both options.

The alternate field house configuration would result in a higher potential number of people in a single acre than is the case for the primary configuration. However, heavy usage of the larger field house in the alternate configuration and nearby spectator stands for multiple sports simultaneously is unlikely and, for the purpose of this analysis, is assumed not to occur. Thus, considering just the football/track/lacrosse stadium, its anticipated maximum occupancy as provided by CMC is 2,050 people including participants and spectators. No more than half of the stadium fits within a single acre. Nevertheless, half of the total occupancy means that over 1,000 people could be in a 1-acre area and this number could theoretically be somewhat higher if there were to be moderate use of the three proximate spectator stands at the same time. As noted above, the ALUCP's single-acre limit for Zone B3 is 300 people, therefore the facility is inconsistent with that criterion. Also, as noted earlier, Table 3A of the ALUCP deems Outdoor Major Assembly Facilities (capacity >1,000 people) as incompatible within Zone B3.

The ALUCP, however, acknowledges that the specified intensity limits may not be the only way to evaluate compatibility of a proposed use and that other factors can be considered where appropriate. The intensity limits are intended to address the issue of whether high concentrations of people in a small area are able to quickly get out of harm's way if an aircraft were to crash into that area. This is particularly an issue with respect to most sports bleachers in that they typically are built on flat ground with egress only from the front edge as the upper rows would be too far above ground for people to exit unless stairs are provided. However, the proposed design of the football/track stadium at the CMC Sports Bowl is different. Because it is literally to be built in a bowl, the seating would be on the ground as the terrain rises, thus enabling egress not only from the front but also the back and ends of the seating area as depicted in Attachment 6. Another drawing provided to Mead & Hunt by CMC shows that each set of seats would have no more than 20 rows (Attachment 7). The length of these stands is not indicated, but for 900 seats could be about 200 feet. If several aisles are provided in the middle of the rows plus at the ends, emergency egress would be significantly enhanced over that of a typical set of bleachers.

Another relevant factor is that the project proposes a layout that orients the football stadium east/west. This orientation is perpendicular to the north/south direction of aircraft overflights of this area with virtually all being departures. Thus, if an aircraft were to strike one of the bleachers it is more likely to do so in the narrow direction rather than along its length. This factor also likely reduces the number of people who would be in harm's way. We note that the east/west orientation of the football stadium is a change, and improvement, from the project approved in 2016, which oriented the football stadium north/south.

A third consideration is that, unlike most facilities on the main CMC campus, the football/track/lacrosse stadium will not be in use on a daily basis. Moreover, even on days it is used, it likely will be at or near capacity on only a few days per year. The ALUCP compatibility criteria generally use seating capacity as the basis for intensity calculations for facilities with fixed seating. For most other uses, retail stores for example, the criteria focus on "the total number of occupants during normal busiest periods" (see Policy 3.3.2(e)). Thus, if this methodology is applied and,

say, only two-thirds of the stadium is occupied during most games, the single-acre intensity would drop to about 700, but would still exceed the 300-persons-per-acre limit.

One more point to consider comes from the 2011 Caltrans *Airport Land Use Planning Handbook*, the document that provides statewide guidance in preparation of ALUCPs. The Handbook suggests that for Safety Zone 4, a zone with similar runway proximity as Cable Airport's Compatibility Zone B3, a single-acre intensity limit of three times the average-acre limit be used. Applying this multiplier to the Cable ALUCP's average-acre limit of 120 people per acre, the single-acre limit would increase from 300 to 360. While this still does not bring the proposed project within the specified intensity criteria, it would bring it a little closer.

6. CONCLUSIONS AND RECOMMENDATIONS

Based upon the preceding analysis, Mead & Hunt concludes that the Claremont McKenna College Sport Bowl project meets the compatibility criteria established in the *Cable Airport Land Use Compatibility Plan* with the exception of the single-acre intensity limits as applied to the occupant capacities of the football/track/lacrosse stadium and soccer/rugby field spectator stands. Nevertheless, the project could be found consistent with the ALUCP policies if the City of Upland were to determine that the project meets the criteria for a consistency finding based on ALUCP Policy 3.1.6. In essence, Policy 3.1.6 enables a normally "Incompatible" use to "be considered compatible because of terrain, specific location, or other extraordinary factors or circumstances related to the site."

To utilize this provision, the decision-making body must make specific findings tied to the state statutes governing airport land use compatibility planning (Public Utilities Code Section 21670). These findings must be aeronautically based, demonstrating that the proposed land use "will neither create a safety hazard to people on the ground or aircraft in flight nor result in excessive noise exposure for the proposed use." Statements presenting other factors such as the importance of a project to the community are not relevant to the objectives of airport land use compatibility and therefore are not suitable as findings. In accordance with ALUCP Policy 3.1.6(e), approval of a special conditions exception requires a two-thirds vote of the local agency's decision-making body for the project voting on the matter.

The factors noted in the above analysis are aeronautically based and would support the required findings for a compatibility determination based on Policy 3.1.6. Policy 3.1.6 was utilized by the City of Upland in 2016 as the basis for its consistency finding in connection with its approval of the previous version of the Sports Bowl project. As discussed above, the changes to the layout in the proposed project to an east/west orientation for the football field provide an even stronger basis for determining compatibility based on Policy 3.1.6 as compared to the project approved in 2016.

The ALUCP and its Policy 3.1.6 only apply to the City of Upland. The City of Claremont has not formally adopted the ALUCP as its policy, so it can presumably evaluate the project through its normal approval process.

Also, while the project is consistent with the other ALUCP criteria, the following conditions should be required to be met:

- Documentation that the football/track/lacrosse stadium seating is designed in the manner discussed in this review including maximum capacity of 900 seats per side and sufficient aisles to enable rapid egress from both the front and back of the bleachers onto the ground.
- Documentation of Notice of Proposed Construction submitted to the FAA if any structures, objects such as antennas, light standards, construction cranes, or trees would protrude through any of the 14 CFR 77 100:1 notification surfaces. The outcome of the FAA Aeronautical Study needs to be provided as well. Also, agreement to comply with any conditions that the FAA may attach to its findings needs to be stated in the application package.
- Documentation that field lighting will not be directed upward so as to create glare in the eyes of aircraft pilots.
- Once a final landscape plan is prepared, documentation that none of the facilities or proposed landscaping and drainage features will attract an increased number of birds and create a bird strike hazard.
- Agreement, as required by ALUCP Policy 3.6.1, that the project proponent dedicate an avigation easement to Cable Airport to ensure the prevention of airspace obstructions and other hazards to flight and acknowledge the impacts generated by aircraft overflights. Avigation easements were previously dedicated and recorded following approval of the 2016 project and are expected to remain sufficient for purposes of compliance with Policy 3.6.1.
- Lastly, during those limited times when the football stadium is anticipated to attract larger crowds, CMC will comply with EIR Mitigation Measure 4.6.B-2, which requires CMC to issue advance notice to Cable Airport management to issue a "Notice to Airmen" to avoid overflight of the event.

Introduction

This Hydrology Study is for the proposed Roberts Campus Sports Bowl Project in the city of Claremont and Upland, CA to satisfy the Los Angeles County Department of Public Works Hydrology requirements. The development project proposes new athletic fields, ancillary facilities and an underground infiltration system within the limits of an existing quarry bounded by Foothill Boulevard to the north, Monte Vista Boulevard to the east, Arrow Route to the south, and Claremont Boulevard to the west.

The Quarry site is divided between the County of Los Angeles and the County of San Bernardino. Within the Los Angeles County portion of the project site, the City of Claremont maintains jurisdiction, while the portion of land located within the County of San Bernardino is in the City of Upland's jurisdiction.

The purpose of this report is to analyze the 24-hour, 50 and 100-year storm events of the pre- and post-developed conditions.

Existing Site Drainage Condition

The total area of the existing undeveloped site is 74.42 acres. The site is a former sand and gravel quarry that has been partially backfilled and graded to control surface runoff.

There are two on-site drainage basins and two off-site basins that drain through culverts onto the property. The two off-site basins flow into DA-3 where the runoff drains south through multiple sub-basins as it infiltrates. The lowest sub-basin is near the south of the site with an elevation of 1184. There is no outlet from basin DA-3 as the runoff infiltrates on-site. Basin DA-4 runs along the west property line in a shallow swale and along the southern property line. From the southwest corner of the site, surface stormwater currently drains onto Claremont Boulevard. Stormwater is then conveyed with surface stormwater in Claremont Boulevard south in the gutter until it is captured by a catch basin at the northeast intersection of Claremont Boulevard and Huntington Drive. Drainage then flows west in a 27" RCP storm drain (LACFCD BI 1122) along East 1st Street until it joins a 66" RCP and then turns south. The storm drain then generally flows southeast until it discharges into San Antonio Creek Channel south of Arrow Highway in San Bernardino County. San Antonio Creek Channel flows south until it merges with Chino Creek and the flow southeast where it joins the Santa Ana River. The Santa Ana River flows southwest until it reaches the Pacific Ocean.

Proposed Site Drainage

There are twenty on-site drainage basins (DA-3 & DA-22) and two off-site basins (DA-1 & DA-2) that drain through box culverts onto the property. The two off-site basins are currently conveyed under Foothill Boulevard within existing culverts and will flow into a 232' x 20' riprap lined swale. There will be two 48-inch inlets that will then connect to a 36-inch storm drainpipe. The 36-inch storm drainpipe will convey stormwater to the proposed underground storage facility on-site. A riprap lined emergency overflow spillway will be provided downstream of the swale at the top of the steep slope for an overflow condition in the upper parking lot. Under Phase 1, the emergency overflow would be connected to the sediment pond in phase 1.

Stormwater within the proposed onsite basins will be directed to an adjoining sediment basin in the north half of the project in the undeveloped condition. Overflow runoff will be conveyed to a storm drain and captured within a series of dry wells, eventually being conveyed to the underground storage facility.

Runoff within the remaining onsite basins will be captured in a series of dry wells as the runoff flows south to the underground storage facility. Incoming water from the surface grated inlets or connecting pipes is received

in the Primary Settling Chamber of the dry well, where silt and other heavy particles settle to the bottom. A PureFlo Debris Shield ensures containment by trapping floating debris and pavement oil. The pre-treated flow is then regulated to a design rate of up to 0.25cfs and directed to a Secondary Settling Chamber. The settling and Containment process is repeated, thereby effectively achieving controlled, Uniform treatment. The system is drained as water rises under the PureFlo Debris Shield and spills into the top of the overflow pipe. The drainage assembly returns the cleaned water into the surrounding soil through the FloFast® Drainage Screen thus reducing the overall volume of project runoff. Excess runoff that cannot be infiltrated will then drain through an overflow outlet to storm pipes that will be directed to the underground storage facility.

Bio-swales will be utilized to capture runoff from the steep slopes of the project for pre-treatment. Stormwater will then be captured in catch basins and directed to the underground storage facility. These areas will not retain water beyond 48-hours after a storm event.

Under Phase 1, a temporary sediment pond will capture surface stormwater from the northern half of the site via temporary interceptor swales. There will be two 48" drop inlets with beehive type grates that will serve as outlets from the pond where stormwater will be conveyed to the underground storage facility via 18" storm pipes. The proposed capacity of the sediment pond is 141,686 cf, with 117,571 cf of stormwater being contributed from the north basin.

The total volume of the sediment pond is equal to the amount of import soil needed to construct the south half of the project.

Surface water will not be retained beyond 48-hours after a storm event due to the natural infiltration of the pond soils. The field percolation test performed in the area of the pond was 5.37 in/hr. Under Phase 1, no stormwater will be conveyed off of the site but will be directed to the underground storage facility.

The 100-year storm event will be captured and infiltrated onsite through an underground storage facility and then into adjacent dry wells. The underground storage facility has dimensions of 434' long by 247' wide and 7.75' in height. In the proposed condition the site will generate 480,632 cubic feet.

The volume capacity of the underground storage facility is 481,992.8 cubic feet per manufacturer. The capacity is adequate to accommodate a 100-year storm event without causing overflow onto the track and field/football field.

Infiltration rates based on Geotechnical Engineer's infiltration testing)

Unit Of Measurement, Inches Per Hour.

Table 1 – Field Percolation Test Results (LA County)

Field Percolation Test #	Depth (Feet)	Ground Surface Elevation (Feet, NAVD88)	Soil Type	Measured Field Percolation Rate
FP-1	12	1,235	SM	1.08

Table 2 – Field Percolation Test Results (SB County)

Field Percolation Test #	Depth (Feet)	Ground Surface Elevation (Feet, NAVD88)	Soil Type	Measured Field Percolation Rate

Unit Of Measurement, Inches Per Hour.

FP-2	10	1,215	SP-SM	3.79
FP-3	10	1,229	SP-SM	3.18
FP-4	19	1,195	SP-SM	1.14
FP-5	70	1,247	SP-SM	5.37
FP-6	40	1,185	SP-SM	9.69

The results of the field percolation testing are presented in Appendix A.

Please note the above test results do not include factors of safety that may be required by each respective county.

In the existing condition, basin DA-4 flows offsite and into Claremont Boulevard. In the proposed condition this area will now be captured onsite and directed to the underground storage facility. No stormwater will be conveyed off-site.

In the interim phase 1 condition the south half of the site will be constructed to a final build out while the north half of the site will be rough graded with erosion control measures in place. the rough graded northerly area is expected to be approximately 8 acres.

Vicinity Map

HYDROLOGY ANALYSIS / METHODOLOGY

The requirements and recommendations found in the Los Angeles County Hydrology Manual (January 2006) provided by the Los Angeles County Department of Public Works was used as the basis for the methodology and calculations found in this Study. On-site and Off-site calculations were performed for the 50-year and 100-year, 24-hour storm using HydroCalc software (Kinematic Wave Method) provided by the County, per County requirements for the Los Angeles River watershed.

DESIGN PARAMETERS

1. The onsite drainage area was analyzed using the HydroCalc software from Los Angeles County.
2. The drainage area is located in Soil Type 015.
3. The rainfall intensity for all of the storm events varies.
4. All flows are based on the complete future development of land and roads.
5. The Hydrology Maps attached to the back of this study are made a part of the study.
6. There is pre-existing off-tract flow that is being directed toward the proposed storm drain.

User Inputs

Chamber Model:	MC-7200
Outlet Control Structure:	Yes
Project Name:	21-055
Engineer:	GREG HOWELL
Project Location:	California
Measurement Type:	Imperial
Required Storage Volume:	480632 cubic ft.
Stone Porosity:	40%
Stone Foundation Depth:	9 in.
Stone Above Chambers:	12 in.
Average Cover Over Chambers:	24 in.
Design Constraint Dimensions:	(300 ft. x 450 ft.)

Results

System Volume and Bed Size

Installed Storage Volume:	481992.84 cubic ft.
Storage Volume Per Chamber:	175.90 cubic ft.
Number Of Chambers Required:	1767
Number Of End Caps Required:	56
Chamber Rows:	28
Maximum Length:	433.82 ft.
Maximum Width:	256.18 ft.
Approx. Bed Size Required:	108954.24 square ft.

System Components

Amount Of Stone Required:	15645 cubic yards
Volume Of Excavation (Not Including Fill):	27239 cubic yards
Total Non-woven Geotextile Required:	30304 square yards
Woven Geotextile Required (excluding Isolator Row):	192 square yards
Woven Geotextile Required (Isolator Row):	998 square yards
Total Woven Geotextile Required:	1189 square yards
Impervious Liner Required:	0 square yards

*MINIMUM COVER TO BOTTOM OF FLEXIBLE PAVEMENT. FOR UNPAVED INSTALLATIONS WHERE RUTTING FROM VEHICLES MAY OCCUR, INCREASE COVER TO 30" (750 mm).

An evolution of McGuckin Drilling

MaxWell® Plus

DRAINAGE SYSTEM

Product Information and Design Features

The **MaxWell® Plus**, as manufactured and installed exclusively by Torrent Resources Incorporated, is the industry standard for draining large paved surfaces, nuisance water and other demanding applications. This patented system incorporates state-of-the-art pre-treatment technology.

THE ULTIMATE IN DESIGN

Since 1974, nearly 65,000 MaxWell® Systems have proven their value as a cost-effective solution in a wide variety of drainage applications. They are accepted by state and municipal agencies and are a standard detail in numerous drainage manuals. Many municipalities have recognized the inherent benefits of the MaxWell Plus and now require it for drainage of all paved surfaces.

SUPERIOR PRE-TREATMENT

Industry research, together with Torrent Resources' own experience, have shown that initial storm drainage flows have the greatest impact on system performance. This "first flush" occurs during the first few minutes of runoff, and carries the majority of sediment and debris. Larger paved surfaces or connecting pipes from catch basins, underground storage, etc. can also generate high peak flows which may strain system function. In addition, nuisance water flows require controlled processing separate from normal storm runoff demands.

In the **MaxWell® Plus**, preliminary treatment is provided through collection and separation in deep large-volume settling chambers. The standard MaxWell Plus System has over 2,500 gallons of capacity to contain sediment and debris carried by incoming water. Floating trash, paper, pavement oil, etc. are effectively stopped by the **PureFlo®** Debris Shields in each chamber. These shield-ing devices are equipped with an effective screen to filter suspended material and are vented to prevent siphoning of floating surface debris as the system drains.

EFFECTIVE PROCESSING

Incoming water from the surface grated inlets or connecting pipes is received in the Primary Settling Chamber where silt and other heavy particles settle to the bottom. A PureFlo Debris Shield ensures containment by trapping floating debris and pavement oil. The pre-treated flow is then regulated to a design rate of up to 0.25cfs and directed to a Secondary Settling Chamber. The settling and containment process is repeated, thereby effectively achieving controlled, uniform treatment. The system is drained as water rises under the PureFlo Debris Shield and spills into the top of the overflow pipe. The drainage assembly returns the cleaned water into the surrounding soil through the **FloFast®** Drainage Screen.

ABSORBENT TECHNOLOGY

Both MaxWell Plus settling chambers are equipped with absorbent sponges to provide prompt removal of pavement oils. These floating pillow-like devices are 100% water repellent and literally wick petrochemical compounds from the water. Each sponge has a capacity of up to 128 ounces to accommodate effective, long-term treatment. The absorbent is completely inert and will safely remove runoff constituents down to rainbow sheens that are typically no more than one molecule thick.

SECURITY FEATURES

MaxWell Plus Systems include bolted, theft-deterrent, cast iron gratings and covers as standard security features. Special inset castings which are resistant to loosening from accidental impact are available for use in landscaped applica-tions. Machined mating surfaces and "Storm Water Only" wording are standard.

THE MAXWELL FIVE-YEAR WARRANTY

Innovative engineering, quality materials and exacting construction are standard with every MaxWell System designed, manufactured and installed by Torrent Resources Incorporated. The MaxWell Drainage Systems Warranty is the best in the industry and guarantees against failures due to workmanship or materials for a period of five years from date of completion.

Manufactured and Installed Exclusively by Torrent Resources Incorporated
Please see reverse side for additional information
U.S. Patent No. 4,923,330

MAXWELL® PLUS DRAINAGE SYSTEM DETAIL AND SPECIFICATIONS

CALCULATING MAXWELL PLUS REQUIREMENTS:

The type of property, soil permeability, rainfall intensity and local drainage ordinances determine the number and design of MaxWell Systems. For general applications draining retained stormwater, use one standard **MaxWell® Plus** per the instructions below for up to 5 acres of landscaped contributory area, and up to 2 acres of paved surface. To drain nuisance water flows in storm runoff systems, add a remote inlet to the system. For smaller drainage needs, refer to our **MaxWell® IV**. For industrial drainage, our **Envibro® System** may be recommended. For additional considerations, please refer to “**Design Suggestions For Retention And Drainage Systems**” or consult our Design Staff.

COMPLETING THE MAXWELL PLUS DRAWING

To apply the MaxWell Plus drawing to your specific project, simply fill in the blue boxes per the following instructions. For assistance, please consult our Design Staff.

PRIMARY SETTLING CHAMBER DEPTH

The overall depth of the Primary Settling Chamber is determined by the amount of surface area being drained. Use a standard depth of **15 feet** for the initial acre of contributory drainage area, **plus 2 feet** for each additional acre, up to the design limits of the property type noted in “Calculating MaxWell Plus Requirements” noted above. Other conditions that would require increased chamber depths are property usage, maintenance scheduling, and severe or unusual service conditions. Connecting pipe depth may dictate deeper chambers so as to maintain the effectiveness of the settling process. Maximum chamber depth is 25 feet. A pump and lift station is recommended for systems with deeper requirements.

ESTIMATED TOTAL DEPTH

The Estimated Total Depth is the approximate total system depth required to achieve 10 continuous feet of penetration into permeable soils, based upon known soil information. Torrent utilizes specialized “**crowd**” equipped rigs to get through the difficult cemented soil and to reach clean drainage soils at depths up to **180 feet**. An extensive drilling log database is available to use as a reference.

SETTLING CHAMBER DEPTH

On MaxWell Plus Systems of over 30 feet overall depth and up to 0.25cfs design rate, the standard Settling Chamber Depth is **18 feet**. Maximum chamber depth is 25 feet.

OVERFLOW HEIGHT

The Overflow Height and Secondary Settling Chamber Depth determine the effectiveness of the settling process. The higher the overflow pipe, the deeper the chamber, the greater the settling capacity. An overflow height of **13 feet** is used with the standard settling chamber depth of **18 feet**.

DRAINAGE PIPE

This dimension also applies to the **PureFlo®** Debris Shields, the **FloFast®** Drainage Screen, and fittings. The size is based upon system design rates, multiple primary settling chambers, soil conditions, and need for adequate venting. Choices are 6", 8", or 12" diameter. Refer to our company's “**Design Suggestions for Retention and Drainage Systems**” for recommendations on which size best matches your application.

BOLTED RING & GRATE/COVER

Standard models are quality cast iron and available to fit 24" Ø or 30" Ø manhole openings. All units are bolted in two locations with wording “Storm Water Only” in raised letters. For other surface treatments, please refer to “Design Suggestions for Retention and Drainage Systems.”

INLET PIPE INVERT

Pipes up to 12" in diameter from catch basins, underground storage, etc. may be connected into the primary settling chamber. Larger pipe diameters dictate the use of manhole material for the primary setting chamber with 48” grates on the cone. Inverts deeper than 5 feet will require additional depth in both system settling chambers to maintain respective effective settling capacities.

INTAKE INLET HEIGHT

The Intake Inlet Height determines the effectiveness of the settling process in the Primary Settling Chamber. A minimum inlet height of **11 feet** is used with the standard primary settling chamber depth of 15 feet. Greater inlet heights would be required with increased system demands as noted in Primary Settling Chamber Depth. Freeboard Depth Varies with inlet pipe elevation. Increase primary/secondary settling chamber depths as needed to maintain all inlet pipe elevations above connector pipe overflow.

CHAMBER SEPARATION

The standard separation between chambers is **10 feet** from center to center.

Soil conditions and deeper inverts may dictate required variations in chamber separation.

The MaxWell® Plus Drainage System Detail And Specifications

The referenced drawing and specifications are available on CAD either through our office or web site. This detail is copyrighted (2004) but may be used as is in construction plans without further release. For information on product application, individual project specifications or site evaluation, contact our Design Staff for no-charge assistance in any phase of your planning.

ITEM NUMBERS

1. Manhole Cone - Modified flat bottom.
2. Stabilized Backfill - 1-Sack Slurry.
3. Bolted Ring & Grate/Cover - Diameter as shown. Clean cast iron with wording “Storm Water Only” in raised letters. Bolted in 2 locations and secured to cone with mortar. Rim elevation ±0.02' of plans.
4. Graded Basin or Paving (by Others).
5. Compacted Base Material (by Others).
6. PureFlo® Debris Shield - Rolled 16 Ga. steel X 24" length with vented anti-siphon and internal .265" Max. SWO flattened expanded steel screen X 12" length. Fusion bonded epoxy coated.
7. Pre-cast Liner - 4000 PSI concrete 48" ID. X 54" OD. Center in hole and align sections to maximize bearing surface.
8. Min. 6' Ø Drilled Shaft.
9. Support Bracket - Formed 12 Ga. steel. Fusion bonded epoxy coated.
10. Overflow Pipe - Sch. 40 PVC mated to drainage pipe at base seal.
11. Drainage Pipe - ADS highway grade with TRI-A coupler. Suspend pipe during backfill operations to prevent buckling or breakage. Diameter as noted.
12. Base Seal - Geotextile or concrete slurry.
13. Rock - Washed, sized between 3/8" and 1-1/2" to best complement soil conditions.
14. FloFast® Drainage Screen - Sch. 40 PVC 0.120" slotted well screen with 32 slots per row/ft. Diameter varies 120" overall length with TRI-B coupler.
15. Min. 4' Ø Shaft - Drilled to maintain permeability of drainage soils.
16. Fabric Seal - U.V. Resistant Geotextile - To be removed by customer at project completion.
17. Absorbent - Hydrophobic Petrochemical Sponge. Min 128 oz. capacity.
18. Connector Pipe - 4" Ø Sch. 40 PVC.
19. Anti-Siphon Vent with flow regulator.
20. Intake Screen - Sch. 40 PVC 0.120" modified slotted well screen with 32 slots per row/ft. 48" overall length with TRI-C end cap.
21. Freeboard Depth Varies with inlet pipe elevation. Increase primary/secondary settling chamber depths as needed to maintain all inlet pipe elevations above connector pipe overflow.
22. Optional Inlet Pipe (by Others).
23. Moisture Membrane - 6 mil. Plastic. Place securely against eccentric cone and hole sidewall. Used in lieu of slurry in landscaped areas.
24. Eight - (8) perforations per foot, 2 row minimum.

Peak Flow Hydrologic Analysis

File location: C:/Local Cloud/Shared/2021/21-055 CMC East Campus/Civil/reports/Hydrology/Working/21-055 - DA-4 PRE 100YR.pdf
Version: HydroCalc 1.0.3

Input Parameters

Project Name	21-055
Subarea ID	DA-4 PRE 100YR
Area (ac)	11.86
Flow Path Length (ft)	2629.0
Flow Path Slope (vft/hft)	0.033
50-yr Rainfall Depth (in)	6.8
Percent Impervious	0.045
Soil Type	15
Design Storm Frequency	100-yr
Fire Factor	0
LID	False

Output Results

Modeled (100-yr) Rainfall Depth (in)	7.6296
Peak Intensity (in/hr)	2.0605
Undeveloped Runoff Coefficient (Cu)	0.2976
Developed Runoff Coefficient (Cd)	0.3247
Time of Concentration (min)	27.0
Clear Peak Flow Rate (cfs)	7.9362
Burned Peak Flow Rate (cfs)	7.9362
24-Hr Clear Runoff Volume (ac-ft)	1.166
24-Hr Clear Runoff Volume (cu-ft)	50793.0824

POST DEVELOPEMENT CALCULATIONS

Peak Flow Hydrologic Analysis

File location: C:/Local Cloud/Shared/2021/21-055 CMC East Campus/Civil/reports/Hydrology/Working/21-055 - DA-3 POST 50 YR.pdf

Version: HydroCalc 1.0.3

Input Parameters

Project Name	21-055
Subarea ID	DA-13 POST 100YR
Area (ac)	5.36
Flow Path Length (ft)	737.0
Flow Path Slope (vft/hft)	0.089
50-yr Rainfall Depth (in)	6.8
Percent Impervious	0.112
Soil Type	15
Design Storm Frequency	100-yr
Fire Factor	0
LID	False

Output Results

Modeled (100-yr) Rainfall Depth (in)	7.6296
Peak Intensity (in/hr)	3.8862
Undeveloped Runoff Coefficient (Cu)	0.4954
Developed Runoff Coefficient (Cd)	0.5407
Time of Concentration (min)	7.0
Clear Peak Flow Rate (cfs)	11.2627
Burned Peak Flow Rate (cfs)	11.2627
24-Hr Clear Runoff Volume (ac-ft)	0.7254
24-Hr Clear Runoff Volume (cu-ft)	31599.0447

Peak Flow Hydrologic Analysis

Source:
 Federal Transit Administration, *Transit Noise and Vibration Impact Assessment Manual*, 2018.

Notes:
 * Values taken from Table 7-4.
 ** Based on the formula $VdB(D) = VdB(25ft) - 30 \times \log_{10}(D/25)$, where D is equal to the distance (see page 185).
 *** Based on the formula $PPV(D) = PPV(25 ft) \times (25/D)^N$, where D is equal to the distance (see page 185).
 N = soil type classification factor (typically ranges from 1 to 1.5)

EXECUTIVE SUMMARY

Introduction

This Traffic Impact Analysis report addresses the potential traffic effects and circulation needs associated with the proposed development (hereinafter referred to as the Project) on the Claremont McKenna College Roberts Campus East (formerly known as the Claremont Colleges East Campus). The Project is a revision of a project previously approved for the site by the cities of Upland and Claremont in 2016. This Traffic Impact Analysis analyzes the Project in accordance with the Traffic Analysis – Memorandum of Understanding (MOU) dated February 14, 2024, with the cities of Claremont and Upland (Appendix J) and in compliance with the California Environmental Quality Act (CEQA) guidelines (California Code of Regulations, Title 14, Section 15000 and following).

The CEQA-related analysis was conducted in accordance with State of California Senate Bill 743 (Steinberg, 2013) (SB 743), which required a change in the CEQA guidelines regarding the analysis of transportation impacts. Under SB 743, the focus of the CEQA transportation analysis shifted from vehicular delay, as measured by Level of Service (LOS) or similar measures of vehicular capacity or traffic congestion, to vehicle miles traveled (VMT). The CEQA-related analysis also includes evaluation of active transportation and transit (consistency with program, plan, ordinance or policy addressing the circulation system).

A non-CEQA transportation analysis of the Project was also conducted in accordance with the MOU and includes analysis of the anticipated LOS at the study intersections and roadway segments as per the City of Upland's Traffic Impact Analysis Guidelines (July 2020) and the City of Claremont's Transportation Study Guidelines for Vehicle Miles Traveled and Level of Service Assessment (August 2020). The non-CEQA transportation analysis is not required for determination of potential CEQA impacts.

Project Description

The Claremont McKenna College Roberts Campus East (formerly known as the Claremont Colleges East Campus) (Project site) is approximately 74.44 acres of land that is bound by Foothill Boulevard on the north, Arrow Route (also known as Sixth Street in the City of Claremont) on the south, Monte Vista Avenue on the east, and Claremont Boulevard on the west.¹ The site is a Class III landfill for inert materials and was formerly used as a sand and gravel quarry. Landfill maintenance, and construction staging and construction-worker-related parking (providing when-needed support for campus construction activities) currently continue on the Project site. The site does not contain permanent structures except for a previously established archery range, which is not currently in use. The Project's primary objective is to provide for the construction of collegiate sports facilities, known as the Roberts Campus Sports Bowl. Those facilities will be used by students participating in Claremont McKenna College's collegiate athletic programs and are depicted in the Conceptual Site Plan as presented in Figure 2.1. Additional objectives include the following:

¹ The area within the approximately 74-acre Project site that is proposed for development consists of approximately 66.5 acres. The Project site also includes an approximately 0.4 acre area underneath and west of Claremont Boulevard where the proposed tunnel would be located. The approximately 7.6 acres at the southern end of the Project site are not proposed for development as part of the Project.

- Reclaim the Project site while minimizing environmental impacts;
- Enhance the visual quality of the site and neighborhood;
- Provide additional parking; and
- Provide improved and expanded sports facilities.

Project Study Area

This traffic report includes an analysis of twenty-nine (29) study intersections and eleven (11) study roadway segments that are located in the project vicinity, consistent with the MOU with the cities of Claremont and Upland. The study locations are listed below:

Study Intersections		Intersection Control Type
1	Base Line Rd & Indian Hill Blvd	Signalized
2	Base Line Rd & Mills Ave	Signalized
3	Base Line Rd & Monte Vista Ave/Padua Ave	Signalized
4	Base Line Rd & I-210 Ramps	Signalized
5	Claremont Blvd & Monte Vista Ave	Signalized
6	Foothill Blvd & Indian Hill Blvd	Signalized
7	Foothill Blvd & College Ave	Signalized
8	Foothill Blvd & Dartmouth Ave	Signalized
9	Foothill Blvd & Mills Ave	Signalized
10	Foothill Blvd & Claremont Blvd	Signalized
11	Foothill Blvd & Monte Vista Ave	Signalized
12*	Foothill Blvd & Central Ave	Signalized
13	6 th St & Indian Hill Blvd	Unsignalized
14	6 th St & College Ave	Unsignalized
15	6 th St & Mills Ave	Unsignalized
16	6 th St/Arrow Rt & Claremont Blvd	Signalized
17	Arrow Rt & Monte Vista Ave	Signalized
18	Harrison Ave/5 th St & Indian Hill Blvd	Signalized
19	1 st St & Indian Hill Blvd	Signalized
20	1 st St & College Ave	Unsignalized
21	1 st St & Claremont Blvd	Signalized
22	Arrow Hwy & Indian Hill Blvd	Signalized
23	Arrow Hwy & College Ave	Signalized
24	Arrow Hwy & Claremont Blvd/Mills Ave	Signalized
25	Claremont Blvd & 9 th St	Unsignalized (proposed signal)
26	Foothill Blvd & Project Dwy N	Unsignalized (proposed driveway)
27	Claremont Blvd & Project Dwy SW	Unsignalized (proposed driveway)
28	Monte Vista Ave & Project Dwy SE	Unsignalized
29	Monte Vista Ave & 1 st St/Richton St	Signalized

No.	Roadway Segments
1	Foothill Boulevard East of Monte Vista Avenue
2	Monte Vista Avenue south of Foothill Boulevard
3	Claremont Boulevard between Arrow and Foothill Boulevard
4	Arrow Route between College Park and Monte Vista Avenue
5	Huntington Drive East of Claremont Boulevard
6	6 th Street West of Mills Avenue
7	Arrow Route Between Claremont Boulevard and Apartment Driveway
8	9 th Street East of Mills Avenue
9	9 th Street West of Claremont Boulevard
10	Claremont Boulevard North of 9 th Street
11	Claremont Boulevard South of 6 th Street

Study Periods

AM and PM peak hour intersection capacity analyses for the twenty-nine (29) key study intersections (including four Project driveways) were conducted under the following scenarios:

- Existing Year 2023 Traffic Conditions (weekday)
- Existing Year 2023 Traffic Conditions (weekend)
- Opening Year 2027 Without Project Traffic Conditions (Weekday)
- Opening Year 2027 Without Project Traffic (weekend)
- Opening Year 2027 Plus Project Traffic Conditions (weekday)
- Opening Year 2027 Plus Project Traffic Conditions (weekend)
- Horizon Year 2045 Without Project Traffic Conditions (weekday)
- Horizon Year 2045 Without Project Traffic Conditions (weekend)
- Horizon Year 2045 Plus Project Traffic Conditions (weekday)
- Horizon Year 2045 Plus Project Traffic Conditions (weekend)

Project Trip Generation

- The “Weekday: Practice Day” trip forecasts result in 1 added Project trip during the weekday AM peak hour, and a total of 160 added vehicle trips during the weekday PM peak commuter hour. Over a 24-hour period, this scenario is forecast to add 359 daily trips during a typical weekday.
- The “Weekday: Game Day” scenario addresses Project traffic activity on the fifth weekday of that illustrative week. Substitution of a “full-house” baseball, and softball game, with a spring football practice or track and field, or soccer practice on the four spectator fields, would increase the weekday PM peak hour Project trip generation to 260 trips, and the daily generation to 559 trips. These trip totals are also consistent with occasional simultaneous baseball and softball games with a combined attendance of 500 spectators, and a home as well as a visitor team on each of those two fields. This scenario illustrates the “worst case” weekday condition for the proposed Project.
- The defining “worst case” weekend scenario (occurring roughly five Fall Saturdays per year) is that of a “full house” home football game (“Weekend: Game Day-Fall). On such days, the 24-hour trip generation total would grow to a forecast of 947 trips (evenly divided between inbound and outbound movements), with 377 trips occurring in the hour before the start of the game, and 535 trips in the hour following it.
- The more frequent weekend scenario, but with trip generation potential less than one-half of its fall counterpart, is that of the “Weekend: Game Day (Spring)” scenario. Its 24-hour trip-making

potential would total 593 trips (one-half arriving and one-half departing), with 237 trips forecast for the peak arrival hour, and 321 trips forecast for the peak departure hour.

- It is important to note that in order to provide a conservative analysis, it was assumed that no trip credits were assumed resulting from the relocation of the athletic fields.

Cumulative Project Trip Generation

A total of thirty-three (33) cumulative development projects within a two-mile radius of the Project site were identified by the Cities of Claremont and Upland. Most of the cumulative developments are anticipated to be built and occupied by the Project's Opening Year of 2027. Combined, the 33 cumulative projects are forecast to generate a total of 38,801 daily trips on a "typical" weekday, with 2,969 trips (1,664 inbound and 2,876 outbound) occurring during the AM peak hour and 3,262 trips (2,963 inbound and 2,023 outbound) occurring during the PM peak hour.

The cumulative projects are forecast to generate a combined total of 43,838 daily trips on a "typical" weekend, with 4,369 trips (3,965 inbound and 3,321 outbound), occurring during the AM peak hour and 4,210 trips (3,486 inbound and 3,658 outbound) occurring during the PM peak hour.

Non-CEQA Traffic Analysis Findings

- Under the Existing (Weekday) traffic conditions, only one (1) key study intersection operates at an unacceptable level of service (LOS). The remaining study intersections currently operate at acceptable LOS during the AM and PM peak hours. The intersection operating at an adverse LOS is as follows:

Intersection	Peak Hour	Existing Year 2023 – Weekday Conditions	
		LOS	Delay (sec/veh)
3. Base Line Road and Monte Vista Ave	AM	F	97.7
	PM	F	97.4

- Under the Existing Year (Weekend) traffic conditions, all study intersections currently operate at an acceptable LOS during the AM and PM peak hours.
- To forecast the Opening Year (2027) With Project conditions, the Existing Year 2023 traffic volumes were growth-factored up by a total of four percent to account for annual ambient traffic growth in the Project vicinity. Cumulative development and Project traffic volumes were then added to the Opening Year baseline traffic volumes to derive the Opening Year With Project traffic volumes.
- Under the Opening Year (2027) With Project conditions, all the study intersections are expected to operate at acceptable LOS "D" or better during the weekday AM and PM peak hours. Based on the Cities' traffic deficiency criteria, the proposed Project traffic would not result in a traffic deficiency at any of the study intersections, except at Base Line Road and the I-210 Ramps.
- Under the Horizon Year (2045) With Project conditions, four (4) key study intersections are forecast to operate at an unacceptable level of service with the addition of Project traffic, based on the applicable LOS deficiency criteria. The remaining key study intersections are forecast to operate at an acceptable LOS during the AM and PM peak hours for the Year 2045 Cumulative Plus Project condition, under all event scenarios: Weekday – Practice Day; Weekday – Game Day; Weekend – Game Day [Fall]; and Weekend – Game Day [Spring] traffic conditions. The intersections forecast to operate at an unacceptable LOS during the Horizon Year (2045) With

Project conditions are listed below:

Intersection	Weekday: Practice Day		
	Peak Hour	LOS	Delay (sec/veh)
13. 6 th St & Indian Hill Blvd	AM	E	54.9
	PM	F	77.1
14. 6 th St & College Ave	AM	-	-
	PM	E	42.5
20. 1 st St & College Ave	AM	-	-
	PM	F	80.5

Intersection	Weekday: Game Day		
	Peak Hour	LOS	Delay (sec/veh)
13. 6 th St & Indian Hill Blvd	AM	E	54.9
	PM	E	85.3
14. 6 th St & College Ave	AM	-	-
	PM	E	44.1
20. 1 st St & College Ave	AM	-	-
	PM	F	81.3

Intersection	Weekend: Game Day [Fall]		
	Peak Hour	LOS	Delay (sec/veh)
4. Base Line Road & I-210 Ramps	AM	F	86.7
	PM	-	-
13. 6 th St & Indian Hill Blvd	AM	E	74.5
	PM	E	148.3
14. 6 th St & College Ave	AM	-	-
	PM	E	45.2
20. 1 st St & College Ave	AM	-	-
	PM	E	45.4

Intersection	Weekend: Game Day [Spring]		
	Peak Hour	LOS	Delay (sec/veh)
4. Base Line Road & I-210 Ramps	AM	F	85.7
	PM	-	-
13. 6 th St & Indian Hill Blvd	AM	E	73.1
	PM	F	127.8
14. 6 th St & College Ave	AM	-	-
	PM	E	42.3
20. 1 st St & College Ave	AM	-	-
	PM	E	44.3

The intersections listed above are forecast to operate at a deficient level of service during the Year 2045 Cumulative Plus Project traffic conditions under the (non-CEQA) LOS criteria identified in this report. The implementation of recommended improvements outlined in this report would offset the Year 2045 Cumulative Plus Project traffic conditions, and restore the affected intersections to acceptable traffic conditions in accordance with applicable (non-CEQA) LOS criteria.

Recommended Improvements (Non-CEQA)

The results of the Opening Year 2027 and Horizon Year 2045 Cumulative Plus Project traffic LOS analyses indicate that the proposed Project traffic would result in unacceptable traffic conditions at four (4) out of the thirty-three (33) key study intersections. The following off-site improvements are recommended to offset conditions under each "With Project" analysis scenario. Claremont McKenna College will coordinate with the appropriate municipality and regulatory agency having jurisdiction over the roadways and public right-of-way where the recommended off-site improvements are located.

- Intersection #4 – Base Line Road & I-210 Ramps (Claremont): Widen and/or restripe and reconfigure the southbound off-ramp approach to provide a second (dual) southbound right-turn lane. Install traffic signal modifications to accommodate the additional lane and volumes.
- Intersection #13 – 6th Street & Indian Hill Boulevard: Implement active traffic management measures during Game Day events to divert westbound (outbound) event traffic away from the Indian Hill Boulevard/6th Street intersection, to travel south along Yale Avenue toward the traffic signal at 5th Street and Indian Hill Boulevard. Reconfigure the northbound approach lanes by adding a dedicated right-turn (curbside) lane. Restripe the westbound approach lanes from a single shared left/through/right-turn lane to one (1) left and one (1) shared through/right lane.
- Intersection #14 – 6th Street & College Avenue: Modify the southbound, westbound and eastbound approaches on 6th Street and College Avenue to provide a shared through-right turn while maintaining one left-turn lane.
- Intersection #20 – 1st Street & College Avenue: Restripe the northbound and southbound approach lanes provide a dedicated left-turn lane, through lane, and shared through/right-turn lane, as well as two receiving lanes. Adjust the existing bicycle lanes to accommodate the proposed geometry.

Applying the (non-CEQA) recommended improvements described above to the affected intersections would result in an acceptable peak-hour intersection LOS, as shown in the summary tables below:

Intersection	Weekday: Practice Day		
	Peak Hour	LOS	Delay (sec/veh)
4. Base Line Rd & I-210 Ramps	AM	C	27.6
	PM	C	30.0
13. 6 th St & Indian Hill Blvd	AM	D	33.3
	PM	C	20.9
14. 6 th St & College Ave	AM	C	19.4
	PM	D	27.7
20. 1 st St & College Ave	AM	C	16.3
	PM	D	29.8

Intersection	Weekday: Game Day		
	Peak Hour	LOS	Delay (sec/veh)
4. Base Line Rd & I-210 Ramps	AM	C	27.6
	PM	C	30.0
13. 6 th St & Indian Hill Blvd	AM	D	33.3

VTM Analysis Conclusions

The Project will primarily serve the student and faculty population of the adjacent Claremont McKenna College campus. The proposed Project uses can be considered to be local-serving and will reduce VMT within the surrounding community. Thus, based on the proposed project type, the Project meets the City of Claremont's and the City of Upland's VMT screening requirements and is not required to prepare additional VMT analysis. Most of the proposed Project athletic facilities will replace existing facilities at other locations on the CMC campus and the trips generated by the proposed Project facilities will primarily shift from these existing facilities. Nonetheless, to provide a comprehensive VMT analysis for the Project, a quantitative VMT analysis has been prepared for the proposed Project uses to demonstrate that the Project will generate VMT below the region average.

Estimates for daily VMT and VMT per service population were calculated for the Project uses based on the SCAG Travel Model (for Claremont) and SBTAM (for Upland) average trip length data. Based on data from the SCAG Travel Model, the Project is estimated to generate VMT at a rate between 2.28 and 4.76 VMT per service population for the four trip generation scenarios analyzed for the Project. This rate is much lower than the City of Claremont VMT threshold of 30.61 VMT per service population. Thus, the Project is not expected to result in a significant VMT impact per the City of Claremont Transportation Study Guidelines for Vehicle Miles Traveled and Level of Service Assessment. Additionally, based on data from the SBTAM, the Project is estimated to generate VMT at a rate between 2.48 and 5.18 VMT per service population for the four trip generation scenarios analyzed for the Project. This rate is much lower than the City of Upland VMT threshold of 24.60 VMT per service population. Thus, the Project is not expected to result in a significant VMT impact per the City of Upland Traffic Impact Analysis Guidelines.

Jurisdiction	Worst-Case VMT per Service Population	Jurisdiction VMT Baseline	Jurisdiction VMT Threshold	Significant?
Claremont	4.76	36.02	30.61 (15% below)	No
Upland	5.18	24.60	24.60	No

Guidelines for both cities provide that a project has no cumulative VMT impact if it is consistent with the local RTP/SCS. The Project is an infill project that reduces the urban heat island effect and is in close proximity to most of its users on the adjacent college campus. As a result, the Project has no significant cumulative project generated VMT impact.

Thus, the Project is expected to generate VMT well below the thresholds set by the Cities of Claremont and Upland. Therefore, the Project will not result in a significant VMT impact.

PART 1 – INTRODUCTION

1.0 PROJECT INTRODUCTION

This Traffic Impact Analysis report addresses the potential traffic effects and circulation needs associated with the development (hereinafter referred to as the Project) on the Claremont McKenna College Roberts Campus East (formerly known as the Claremont Colleges East Campus). The Project site is approximately 74.44 acres of land that is generally located south of Foothill Boulevard and east of Claremont Boulevard in the Cities of Claremont and Upland, California.² Elements of the Project are collegiate sports venues (including soccer/rugby, baseball, softball, football/track/lacrosse), golf practice and multi-purpose fields, related support facilities, and on-site surface and covered structure parking. These elements are generally upgraded and replacement facilities for existing sports venues and parking that have or will be removed on the Claremont McKenna College (CMC) campus. The Project also adds some additional parking for the campus. The Project is a revision of a project previously approved for the site by the cities of Upland and Claremont in 2016.

This Traffic Impact Analysis analyzes the Project in accordance with the Traffic Analysis – Memorandum of Understanding (MOU) dated February 14, 2024, with the cities of Claremont and Upland (Appendix J) and in compliance with the California Environmental Quality Act (CEQA) guidelines (California Code of Regulations, Title 14, Section 15000 and following). The CEQA-related analysis was conducted in accordance with State of California Senate Bill 743 (Steinberg, 2013) (SB 743), which required a change in the CEQA guidelines regarding the analysis of transportation impacts. Under SB 743, the focus of the CEQA transportation analysis shifted from vehicular delay, as measured by Level of Service or similar measures of vehicular capacity or traffic congestion, to vehicle miles traveled (VMT). A non-CEQA transportation analysis of the Project was also conducted in accordance with the MOU and includes analysis of the anticipated LOS at the study intersections and roadway segments as per the City of Upland's Traffic Impact Analysis Guidelines (July 2020) and the City of Claremont's Draft Transportation Study Guidelines for Vehicle Miles Traveled and Level of Service Assessment (August 2020). The non-CEQA transportation analysis is not required for the determination of potential CEQA impacts.

The non-CEQA portion of this traffic analysis evaluates the existing and future operating conditions at twenty-nine (29) key intersections within the Project vicinity and along the site's periphery, inclusive of 26 existing street intersections (one of which will become a signalized project driveway), and 3 proposed unsignalized site access driveways. Estimates of the proposed Project's trip generation potential were studied for four different scenarios: Weekday – Practice Day; Weekday – Game Day; Weekend – Fall Game Day; and Weekend – Spring Game Day. Future traffic forecasts both without and with the Project, as well as the cumulative inclusion of other planned development projects in the area, were compared to assess the potential impacts of the Project on the local circulation network spanning the Cities of Claremont and Upland. This evaluation focuses on key intersections and driveways that will directly serve traffic accessing

² The area within the approximately 74-acre Project site that is proposed for development consists of approximately 66.5 acres. The Project site also includes an approximately 0.4 acre area underneath and west of Claremont Boulevard where the proposed tunnel would be located. The approximately 7.6 acres at the southern end of the Project site are not proposed for development as part of the Project.

the site, and where applicable, identifies intersection-level improvements to maintain an acceptable level of service.

The Project site and study areas were visited, and an inventory of the surrounding transportation network was completed to document the existing traffic and roadway conditions. Existing turning movement traffic volume count information was collected and compiled to support detailed intersection capacity analyses. This effort was supported by the collection of 24-hour machine traffic counts on key roadways, to illustrate the daily profile of traffic volumes in the study area. The work program for this traffic study was developed in conjunction with the Cities of Claremont and Upland staff as documented in the MOU and includes the most current and available list of related development projects and any future roadway improvement projects.

The non-CEQA traffic analysis evaluates the existing and future AM and PM peak hour traffic conditions at the key study intersections, specifically under the “Existing Base Line” Year (2023), Project Opening Year (2027), and Horizon Year (2045) traffic settings, both without and with the proposed Project. Cumulative traffic growth estimates were calculated using a 1% annual ambient growth factor. The ambient traffic growth factor is intended to include unknown and future cumulative projects in the study area, as well as account for regular growth in traffic volumes due to the development of other auxiliary projects outside of the study area.

1.1 STUDY AREA

Non-CEQA Project impacts on the surrounding street network were determined by evaluating twenty-nine (29) key intersections, inclusive of four (4) proposed Project driveways. Study intersections were selected for evaluation based on the previously approved 2016 traffic study for the project, as well as staff input and consultant peer reviews provided by both the Cities of Claremont and Upland. The intersections listed below were included in the scope of the study as documented in the MOU, provide local and regional access to the study area, and generally define the extent and boundaries for the traffic impact assessment:

**List of Study Intersections
(By Study Intersection ID #, Intersection Cross Streets, and Jurisdiction)**

1. Base Line Road at Indian Hill Boulevard	(Claremont)
2. Base Line Road at Mills Avenue	(Claremont)
3. Base Line Road at Monte Vista Avenue/Padua Avenue	(Claremont)
4. Base Line Road at I-210 Ramps	(Claremont/Caltrans)
5. Claremont Boulevard at Monte Vista Avenue	(Claremont)
6. Foothill Boulevard at Indian Hill Boulevard	(Claremont)
7. Foothill Boulevard at College Avenue	(Claremont)
8. Foothill Boulevard at Dartmouth Avenue	(Claremont)
9. Foothill Boulevard at Mills Avenue	(Claremont)
10. Foothill Boulevard at Claremont Boulevard	(Claremont)
11. Foothill Boulevard at Monte Vista Avenue	(Upland)
12. Foothill Boulevard at Central Avenue	(Upland)
13. 6 th Street at Indian Hill Boulevard	(Claremont)
14. 6 th Street at College Avenue	(Claremont)
15. 6 th Street at Mills Avenue	(Claremont)
16. 6 th Street/Arrow Route at Claremont Boulevard	(Upland)
17. Arrow Route at Monte Vista Avenue	(Upland)
18. Harrison Avenue/5 th Street at Indian Hill Boulevard	(Claremont)
19. 1 st Street at Indian Hill Boulevard	(Claremont)
20. 1 st Street at College Avenue	(Claremont)
21. 1 st Street/Huntington Drive at Claremont Boulevard	(Claremont)
22. Arrow Highway at Indian Hill Boulevard	(Claremont)
23. Arrow Highway at College Avenue	(Claremont)
24. Arrow Highway at Claremont Boulevard/Mills Avenue	(Claremont)
25. Claremont Boulevard at 9 th Street	(Claremont)
26. Foothill Boulevard at Project Driveway N	(Claremont)
27. Claremont Boulevard at Project Driveway SW	(Claremont)
28. Monte Vista Avenue at Project Driveway SE	(Upland)
29. Monte Vista Avenue at 1 st Street/Richton Street	(Upland/Montclair)

All twenty-nine (29) intersections and driveways were analyzed under both future weekday and weekend traffic conditions. This analysis recognizes and confirms that the weekday (versus weekend) traffic volume and level of service evaluation govern isolating the greatest non-CEQA impact potential of the Project. This aspect is discussed in more detail later in this report.

Figure 1.1 presents a Vicinity Map, which illustrates the general location of the Project, and locations of the key study intersection and depicts the surrounding street system.

1.2 NON-CEQA TRAFFIC IMPACT ANALYSIS SCENARIOS

AM and PM peak hour intersection capacity analysis for the twenty-nine (29) key study intersections (including four Project driveways) have been conducted for the following scenarios:

- Existing Year 2023 Traffic Conditions (weekday)
- Existing Year 2023 Traffic Conditions (weekend)
- Opening Year 2027 Without Project Traffic Conditions (Weekday)
- Opening Year 2027 Without Project Traffic (weekend)
- Opening Year 2027 Plus Project Traffic Conditions (weekday)
- Opening Year 2027 Plus Project Traffic Conditions (weekend)
- Horizon Year 2045 Without Project Traffic Conditions (weekday)
- Horizon Year 2045 Without Project Traffic Conditions (weekend)
- Horizon Year 2045 Plus Project Traffic Conditions (weekday)
- Horizon Year 2045 Plus Project Traffic Conditions (weekend)

It should be noted that the weekend scenarios are based on Saturday AM and PM peak-hour traffic counts. The weekend AM peak hour is the sum of the peak consecutive 15 minutes between 10:00 AM and 1:00 PM and coincides with the arrival pattern of scheduled games on the weekend. The weekend PM peak hour is the sum of the peak consecutive 15 minutes between 3:00 PM and 5:00 PM and coincides with the departure pattern of those same games. Twenty-nine intersections around the perimeter of the Project site were analyzed for weekend traffic conditions as discussed in more detail later in this report.

The peak hour Delay/LOS calculations were based on the Highway Capacity Manual (HCM) 6th methodology for signalized and unsignalized intersections and are consistent with the Cities of Claremont and Upland as well as Caltrans capacity analysis methodology. It should be noted that the HCM 6th edition methodology does not support turning movements with shared and exclusive lanes; therefore, the HCM 2000 methodology was used for certain signalized intersections as indicated in this report. The Project's potential for "Non-CEQA traffic impacts" was determined based on the Cities of Claremont and Upland's level of service (LOS) criteria.

FIGURE 1.1 VICINITY MAP

2.0 PROJECT DESCRIPTION AND UTILIZATION

The Roberts Campus East site is bound by Foothill Boulevard on the north, Arrow Route (also known as Sixth Street in the City of Claremont) on the south, Monte Vista Avenue on the east, and Claremont Boulevard on the west. The site is a Class III landfill for inert materials and was formerly (1920 – 1972) used as a sand and gravel quarry. Landfill maintenance, and construction staging and construction-worker-related parking (providing when-needed support for campus construction activities) currently continue on the Project site. The site does not contain permanent structures except for a previously established archery range, which is not currently in use. The Project's primary objective is to provide for the construction of collegiate sports facilities. These facilities will be used by students participating in Claremont McKenna College's collegiate athletic programs. Additional objectives include the following:

- Reclaim the Project site while minimizing environmental impacts;
- Enhance the visual quality of the site and neighborhood;
- Provide additional parking; and
- Provide improved and expanded sports facilities

Figure 2.1 presents the proposed conceptual Site Plan for the Project, which is a revision to the conceptual site plan previously approved for the site in 2016. The proposed conceptual site plan also includes an alternative configuration for certain field house structures. The proposed conceptual site plan (both the primary site plan and the alternate field house configuration) will include fields for baseball, softball, soccer/rugby, football/track/lacrosse, as well three multi-purpose fields for practice activities only, and an area for golf practice. The majority of these fields would be relocated to the Project site from their existing (or former) locations on the CMC campus on the west side of Claremont Boulevard. The southern portion of the proposed development (i.e., Phase 1)—including the baseball, softball, golf, and football/track/lacrosse fields and associated support structures, as well as the surface and structure parking along Claremont Boulevard and tunnel beneath Claremont Boulevard—is slated for completion in December 2025, and potentially in use by June 2026. The northern portion (i.e., Phase 2), which includes the soccer/rugby field and multi-purpose practice fields, is anticipated to be completed by the Year 2027.

As shown in Figure 2.1, the Claremont-Upland city boundary line extends diagonally through the Project site in a northeast/southwest direction, from approximately 220 feet west of Monte Vista Avenue on Foothill Boulevard, to the northeast corner of the intersection of Claremont Boulevard and Arrow Route. This boundary also forms the Los Angeles County-San Bernardino County line, with Los Angeles County and the City of Claremont (29.14 acres) lying to the west, and San Bernardino County and the City of Upland (45.30 acres) lying to the east. The play fields and related facilities shown in the Site Plan Figure 2.1 will provide facilities for Claremont-McKenna College's collegiate athletic programs (Claremont-Mudd-Scripps (CMS) Athletics and Claremont College Club Sports Programs), including practice as well as intercollegiate team play/game venues.

Table 2.1 summarizes the typical characteristics of existing CMS practice or gameplay anticipated to be relocated from the main CMC campus to the Project site. This table reflects information provided by CMS Athletics. As indicated, these are generally all replacement venues. The table also offers insight into the relative schedule, participant totals, and historical spectator levels for each venue based on the empirical experience of CMC and CMS Athletics. From Table 2.1, the indicated weekday CMS event times are universally in the 3:00 – 6:30 PM period or involve limited night play (7:30 PM) start time. Night play is more likely to be in the form of practice, and not involving spectator traffic. These characteristics were carried over to the framing of trip generation analyses for the Project.

FIGURE 2.1 PROPOSED CONCEPTUAL SITE PLAN

TABLE 2.1 TYPICAL UTILIZATION FOR KEY CMC SPORTS FACILITY VENUES

Facility	Replacement Facility?	Sport Characteristics	Daily Use	Competition Use	Traffic activity
Baseball Facility	Yes. From the west side of Claremont Blvd.	Approximately 19 weeks of practice and competition primarily in the spring. Field lights necessary to support proper practice and game scheduling.	Small group (2-8 SAs) training sessions throughout the day plus 2-3 hour team practices Monday – Thursday. Team practice schedule may vary between “afternoon” 3-6pm and “evening” 6-9pm depending on SA Class Schedules.	Friday afternoon/evening games and/or Saturday double headers February through May. Limited mid-week and Sunday play.	Limited daily driving to practice by staff and students (5-10 vehicles). Spectators - ~ 100 normally, 20-30 cars. Visiting teams travel in buses and Vans, adding another 35 players and coaches.
Softball Facility	Yes. From the west side of Claremont Blvd.	Approximately 19 weeks of practice and competition primarily in the spring. Field lights necessary to support proper practice and game scheduling	Small group (2-8 SAs) training sessions throughout the day plus 2-3 hour team practices Monday – Thursday. Team practice schedule may vary between “morning” 6-9am, “afternoon” 3-6pm, and “evening” 6-9pm depending on SA Class Schedules.	Friday afternoon/evening games and/or Saturday double headers February through May. Limited mid-week and Sunday play.	Limited daily driving to practice by staff and students (4-8 vehicles). Spectators - ~ 100 normally, 20-30 cars. Visiting teams travel in buses and Vans, adding another 25 players and coaches.
Soccer/Rugby Facility	Yes. From the west side of Claremont Blvd.	Approximately 19 weeks of practice and competition primarily in the Fall. Two teams. 30 players and coaches for each gender. Field lights necessary to support proper practice and game scheduling.	Daily 3-10pm to cover both genders practices and competitions.	Wednesday evening games and Saturday day or evening games; occasional double headers with both genders at home.	Limited daily driving to practice by staff and students (4-8 vehicles). Spectators - ~ 100-200 on average; up to 500 for big games, 20-30 cars. Visiting teams travel in buses and Vans, adding another 30 players and coaches.

Multi-Purpose Fields	Yes	To be utilized by varsity teams (LAX, FB, Soccer) during their non-traditional seasons and Club Rugby during the Fall. Some LAX Spring practice based on Track & Field practice schedule to alleviate conflicts there. Football might occasionally utilize grass field to prep for a game on grass.	High usage M-F from 3-10pm—possible morning usage as well.	Could be utilized for club sport competition as well as varsity non-traditional competition.	Limited daily driving to practice by staff and students (10-15 vehicles).
Golf Practice Area	Yes	19 weeks spread between the fall and spring for official team practices and competitions. Individual students will practice and train year round. 10-15 SAs and coaches per gender Lighting preferred to accommodate SA training opportunities.	Small group (2-3 SAs) training sessions throughout the week.	None.	Limited daily driving to practice by staff and students (1-2 cars)
Football/Track & Field	Yes. Current facilities are adjacent to Roberts Pavilion.	<u>Football</u> - Approximately 19 weeks of practice and competition primarily in the Fall. 100 players, coaches, and support staff. Field lights necessary to support proper practice and game scheduling. <u>Track & Field</u> - Approximately 24 weeks of practice and competition in both fall and spring. 100 coaches and staff across both genders Lights necessary to support proper practice and meet scheduling	<u>Football</u> - Team practice Monday – Thursday from 6am – 10am with walk-thrus on Fridays. <u>Track & Field</u> - Event group practices from 6am to 9pm. Event groups range from 5 – 50 student-athletes across both genders.	<u>Football</u> - 4-5 home games on Saturdays in either the afternoon or evening.; game setup begins 4 hours prior to kickoff <u>Track & Field</u> - 4-5 home events per spring season. These are the largest events we host in any year. As many as 400-1000 competitors from a variety of institutions. As many as 50 event staff are required to conduct a large meet.	Limited daily driving to practice by staff and students (10-15 vehicles). Spectators – 800-1000 on average; up to 1500 (T&F: 500-1000 on average; up to 2000 for a very large meet. Most fans do not stay for the entire day but watch specific events.) Visiting teams travel in 3-5 buses, adding another 100-150 players and coaches (T&F: Visiting teams travel in 2-3 buses per teams plus individuals in vans, 150 players & coaches; for Large meets, 8-10 buses plus 25 participant vehicles.) Visiting team support staff will need vehicle access to the field level for equipment and supplies. Need access for on-field ambulance.

PART 2 – NON-CEQA TRANSPORTATION ASSESSMENT

3.0 METHODOLOGY AND THRESHOLDS

3.1 CAPACITY ANALYSIS METHODOLOGIES

3.1.1 Highway Capacity Manual (HCM) Method of Analysis – Signalized Intersections

In conformance with the Cities of Claremont and Upland as well as Caltrans non-CEQA requirements, morning (AM) and afternoon/evening (PM) operating conditions for the key study intersection were evaluated using the Highway Capacity Manual (HCM) 6th methodology for signalized intersections. Based on the HCM operations method of analysis, the level of service for signalized intersections is defined in terms of control delay (in seconds per vehicle), which is a measure of driver discomfort, frustration, fuel consumption and lost travel time. The delay experienced by a motorist is made up of several factors that relate to control, geometries, traffic and incidents. Total delay is the difference between the travel time experienced and the reference travel time that would result during ideal conditions: in the absence of traffic control, in the absence of geometric delay, in the absence of any incidents and when there are no other vehicles on the road.

In Chapter 16 of the HCM, only the portion of total delay attributed to the control facility (study intersection) is quantified. This delay is called control delay. Control delay includes initial deceleration delay, queue move-up time, stopped delay and final acceleration delay. Specifically, LOS criteria for traffic signals are stated in terms of the average control delay per vehicle. This is a weighted average in that it considers the individual delay for each movement or group of movements at the intersection and the total traffic volume on each of those movements. The six qualitative categories of Level of Service that have been defined along with the corresponding HCM control delay (seconds per vehicle) value range for signalized intersections are shown in **Table 3.1**.

3.1.2 Highway Capacity Manual (HCM) Method of Analysis – Unsignalized Intersections

The Highway Capacity Manual (HCM) 6th methodology for unsignalized intersections was utilized in the analysis of stop-controlled intersections. For all-way stop-controlled intersections, this methodology estimates the average control delay for each of the subject movements and determines the level of service for each movement. The overall average control delay measured in seconds per vehicle and level of service is then calculated for the entire intersection. The HCM control delay value translates to a Level of Service (LOS) estimate, which is a relative measure of the intersection performance.

For one-way and two-way stop-controlled (minor street stop-controlled) intersections, this methodology estimates the worst side street delay, measured in seconds per vehicle, and determines the level of service for that approach. The HCM delay value translates to a Level of Service (LOS) estimate, which is a relative measure of the intersection performance. The six qualitative categories of Level of Service have been defined along with the corresponding HCM control delay value range, as shown in **Table 3.2**.

3.2 NON-CEQA IMPACT CRITERIA AND THRESHOLD

The LOS standards and impact criteria described below were applied according to each intersection's jurisdiction.

3.2.1 City of Claremont Standards

According to the City of Claremont LOS criteria, LOS D and E are the minimum acceptable conditions that should be maintained during the peak commute hours for secondary and major arterials, respectively.

Based on the City of Claremont's General Plan, Monte Vista Avenue, Foothill Boulevard, Base Line Road, and Arrow Highway are designated as Major Arterials, indicating that the minimum LOS at the intersections located along each of these four roadways must be LOS E or better. Indian Hill Boulevard, Mills Avenue, Claremont Boulevard, First Street/Huntington Drive are designated as Secondary Arterials, indicating that the minimum LOS at the intersections located along these roadways must be LOS D or better. In addition, Sixth Street (east of Harvard Avenue), Harrison Avenue/Fifth Street (west of Harvard Avenue) and College Avenue are designated as a Collector Roadway, indicating that the minimum LOS at the intersections located along these roadways must be LOS D or better.

On that basis, the following Claremont intersections must operate at Level of Service E or better with the inclusion of Project trips:

- | | |
|---|------------------------------------|
| 1. Base Line Road at Indian Hill Boulevard | (Claremont) |
| 2. Base Line Road at Mills Avenue | (Claremont) |
| 3. Base Line Road at Monte Vista Avenue/Padua Avenue | (Claremont) |
| 4. Base Line Road at I-210 Ramps | (Claremont/Caltrans ³) |
| 6. Foothill Boulevard at Indian Hill Boulevard | (Claremont) |
| 7. Foothill Boulevard at College Avenue | (Claremont) |
| 8. Foothill Boulevard at Dartmouth Avenue | (Claremont) |
| 9. Foothill Boulevard at Mills Avenue | (Claremont) |
| 10. Foothill Boulevard at Claremont Boulevard | (Claremont) |
| 22. Arrow Highway at Indian Hill Boulevard | (Claremont) |
| 23. Arrow Highway at College Avenue | (Claremont) |
| 24. Arrow Highway at Claremont Boulevard/Mills Avenue | (Claremont) |

Further, the following Claremont intersections must operate at Level of Service D or better with the inclusion of Project trips:

- | | |
|---|-------------|
| 7. Foothill Boulevard at College Avenue | (Claremont) |
| 8. Foothill Boulevard at Dartmouth Avenue | (Claremont) |
| 13. 6 th Street at Indian Hill Boulevard | (Claremont) |
| 14. 6 th Street at College Avenue | (Claremont) |
| 15. 6 th Street at Mills Avenue | (Claremont) |
| 18. Harrison Avenue/5 th Street at Indian Hill Boulevard | (Claremont) |
| 19. 1 st Street at Indian Hill Boulevard | (Claremont) |
| 20. 1 st Street at College Avenue | (Claremont) |
| 25. Claremont Boulevard at 9 th Street | (Claremont) |

³ Refer to Section 3.2.3 for more information regarding jurisdictional requirements

The City of Claremont's performance criteria⁴ further stipulates that:

- If the intersection currently operates at a deficient LOS, the existing LOS shall be maintained.
- When an acceptable LOS cannot be maintained with a proposed development, improvements or other measures should be required to meet the City's standards. Such improvements or measures could include traffic signal improvements, additional turning, and merging lanes, and/or changes to the Project.

3.2.2 City of Upland Standards

For the study intersections in the City of Upland, LOS D is the minimum acceptable condition that should be maintained during peak commute hours. Hence any of the study intersections within the City of Upland's jurisdiction operating at LOS E or F is considered deficient/unsatisfactory. The following locations are subject to this standard:

11. Foothill Boulevard at Monte Vista Avenue	(Upland)
12. Foothill Boulevard at Central Avenue	(Upland)
16. 6 th Street/Arrow Route at Claremont Boulevard	(Upland)
17. Arrow Route at Monte Vista Avenue	(Upland)
28. Monte Vista Avenue at Project Driveway SE	(Upland)
29. Monte Vista Avenue at 1 st Street/Richton Street	(Upland/Montclair)

The City of Upland standards are silent on those situations where the background (no Project) condition exceeds the LOS D standard, and where the Project adds measurable traffic resulting in no change in the background LOS, but where the delay calculation may be affected. In those instances, consistent with other professional practices, the following interpretation has been applied:

- A measurable increase in intersection delay of less than one second/vehicle, at locations where the background condition exceeds LOS D, is not considered unacceptable and is consistent with the applicable standard.
- An increase in delay of one second/vehicle or more, at locations where the background condition exceeds LOS D, is considered unacceptable and inconsistent with the applicable cumulative standard.

In either case, as long as LOS D is exceeded, and a measurable change in the delay is forecast, a fair-share Project contribution has been calculated.

3.2.3 Regional and State Regulatory Standards

Southern California Association of Governments (SCAG)

The Southern California Association of Governments (SCAG) develops the Regional Transportation Plan (RTP), which presents the transportation vision for Los Angeles, Orange, San Bernardino, Imperial, Riverside, and Ventura Counties. Senate Bill 375 (SB 375) was enacted to reduce greenhouse gas emissions from automobiles and light trucks through integrated transportation, land use, housing and

⁴ Source: Claremont General Plan, Chapter 4: Community Mobility Plan

environmental planning. Under the law, SCAG is tasked with developing a Sustainable Communities Strategy (SCS), a newly required element of the Regional Transportation Plan (RTP) that provides a plan for meeting emissions reduction targets set forth by the California Air Resources Board.

The governing RTP/SCS (2020-2045) applicable to the Project, known as the "Connect SoCal 2020" Plan, was finalized and approved in September 2020. The Connect SoCal Plan presents the land use and transportation vision for the region through the year 2045, providing a long-term investment framework for addressing the region's challenges.

Connect SoCal 2020 also served as an update its predecessor, the 2016 RTP/SCS, to identify priorities for transportation planning within the Southern California region, set goals and policies, and identify performance measures for transportation improvements to ensure that future projects are consistent with other planning goals for the area. The RTIP, also prepared by SCAG based on the RTP, lists all of the regional funded/programmed improvements within a seven-year look-ahead timeframe.

County of San Bernardino Congestion Management Program (CMP) (for City of Upland facilities)

To address the increasing public concern that traffic congestion is impacting the quality of life and economic vitality of the State of California, Proposition 111 created the Congestion Management Program (CMP) in 1990. The intent of the CMP is to provide the analytical basis for transportation decisions through the State Transportation Improvement Program (STIP) process. Included with the provision for additional transportation funding was a requirement to undertake a Congestion Management Program (CMP) within each county with an urbanized area having a population of 50,000 or more, to be developed and adopted by a designated Congestion Management Agency (CMA). In 1990 the San Bernardino Associated Governments (SANBAG) was designated the CMA for San Bernardino County.

Although implementation of the CMP was made voluntary by the passage of AB 2419 (Bowler, 1996), the CMP requirement has been retained in all five urban counties within the SCAG region. In addition to its value as a transportation management tool, CMPs have been retained in these counties because of the Federal Congestion Management Process requirement that applies to all large urban areas that are not in attainment of federal air quality standards. These counties recognize that the CMP provides a mechanism through which locally implemented programs can fulfill most aspects of a regional requirement that would otherwise have to be addressed by the Regional Agency (SCAG).

The LOS at each CMP location is monitored by local jurisdictions in order to implement the statutory requirements of the CMP. If LOS standards deteriorate, then local jurisdictions must prepare a deficiency plan to meet conformance standards outlined by the countywide plan. The local CMP requires that a TIA report be prepared when a project's trip generation exceeds 250 two-way peak-hour trips. For the CMP roadway system, the LOS standard shall be E for all segments and intersections except those designated LOS F, as listed in Table 2-1 of the CMP (SANBAG 2016). However, per SB 743, LOS is no longer considered an environmental impact under CEQA.

County of Los Angeles Congestion Management Program (for City of Claremont facilities)

In Los Angeles County, the Los Angeles County Metropolitan Transportation Authority (Metro) is the designated CMA and is responsible for implementing the CMP. In 2018, Metro's Board approved to opt

out of the state's CMP program due to its framework that is grounded to the idea that congestion can be mitigated by continuing to add capacity to roadways. This is evidenced by the primary metric that drives the CMP program, which is LOS. Recent state laws and rulemaking, namely AB 32 (California Global Warming Solutions Act of 2006), SB 375 (Sustainable Communities and Climate Protection Act of 2008), SB 743 (Environmental quality: transit oriented infill projects, judicial review streamlining for environmental leadership development projects) and SB 32 (California Global Warming Solutions Act of 2006), all move away from LOS directly or indirectly.

Therefore, as the CMP primarily uses the LOS performance metric and these key state policies move towards other metrics such as VMT, the CMP contradicts these key state policies and Metro's own efforts to promote a more sustainable and equitable region. As stated in the June 25, 2019, Congestion Management Program Opt-Out Status Report, the decision to opt out of the CMP is not a unilateral decision made by Metro but a collective, majority decision of Metro and all 89 local jurisdictions in Los Angeles County (METRO 2019). The opting out of the CMP applies to Metro and all Los Angeles County local jurisdictions.

County of Los Angeles Public Works Department

Additionally, the County of Los Angeles Department of Public Works Board of Supervisors elected to be exempt from the CMP, pursuant to the California Code Section 65088.3. The resolution was adopted on July 16, 2019 and allows "the region to use different performance measures consistent with State-mandates to determine roadway deficiencies and ensure adequate planning" (County of Los Angeles 2019).

California Senate Bill 743

On September 27, 2013, Senate Bill (SB) 743 was signed into law, which created a process to change the way that transportation impacts are analyzed under California Environmental Quality Act (CEQA). SB 743 required the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide an alternative to level of service (LOS) for evaluating transportation impacts. Under the new transportation guidelines, LOS, or vehicle delay, is no longer considered an environmental impact under CEQA. The updates to the CEQA Guidelines required under SB 743 were approved on December 28, 2018. Under the new guidelines, VMT has been adopted as the most appropriate measure of transportation impacts under CEQA. The OPR's regulatory text indicates that a public agency may immediately commence implementation of the new transportation impact guidelines, and that the guidelines must be implemented statewide by July 1, 2020.

California Department of Transportation (Caltrans)

As the owner and operator of the State Highway System, the State of California Department of Transportation (Caltrans) implements established state planning priorities in all functional plans, programs, and activities. Caltrans has the responsibility to coordinate and consult with local jurisdictions when proposed local land use planning and development may impact state highway facilities. Pursuant to Section 21092.4 of the Public Resources Code (PRC), for projects of statewide, regional, or area-wide significance, the lead agency shall consult with transportation planning agencies and public agencies that have transportation facilities which could be affected by the project.

In anticipation of SB 743 implementation, Caltrans released the Draft Transportation Impact Study Guide (TISG) in February 2020, replacing the 2002 Guide for the Preparation of Traffic Impact Studies. Under the former 2002 guidance, a traffic impact study was required by Caltrans when a project generates and assigns over 100 peak hour trips to a state highway facility; or if the project generates and assigns 50 to 100 peak hours trips to a state highway facility causing the facility to approach LOS C or D; or 1 to 49 peak hour trips are generated and assigned to a state highway facility causing it to experience significant congestion (LOS E or F), increased risk for traffic collisions, or affect access to the facility (Caltrans 2002).

Per the 2020 TISG, Caltrans' primary review focus is now VMT, replacing LOS as the metric used in CEQA transportation analyses. Caltrans recommends use of OPR's recommended thresholds for land use projects and recommends following the guidance on methods of VMT assessment found in OPR's Technical Advisory (OPR 2018). Refer to Section 9 of this Traffic Impact Analysis for an impact analysis and summary of the applicable VMT thresholds pertaining to the Project.

In addition to VMT, the 2020 TISG also states that Caltrans may request a targeted operational and safety analysis to address a specific geometric or operational issue related to the State Highway System and connections with the State Highway System. Caltrans also notes that a future update of the TISG will include the basis for requesting transportation impact analysis not based on VMT and define elements to be included in non-VMT analysis. At the time of this study, this update has not been released; however, in order to provide a reasonable evaluation of the Project's potential traffic volume effects on State highway facilities in anticipation of Caltrans' forthcoming input, the I-210 interchange intersection with Baseline Road (i.e., Study Intersection #4) was added to the study area.

As detailed in latter sections of this report, the analysis included queuing and (non-CEQA) level of service (LOS) analyses for the intersection of Base Line Road at the I-210 On/Off-Ramps, and an evaluation of potential operational issues to address through recommended transportation improvements. Based on the Project volume forecasts presented in Figures 5.4 and 5.5, those impacts for the critical Weekday–Game Day condition represent no more than 26 vehicles travelling the SR-210 interchange intersection at Baseline Road during the weekday (Game Day) peak hour. Other more distant locations, including those in the I-10 corridor, would experience similar or lesser volume additions and impacts, and thus were not included in the key intersection locations listed in the traffic analysis scoping agreement (MOU).

TABLE 3.1 LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS⁵

Level of Service (LOS)	Control Delay Per Vehicle (seconds per vehicle)	Level of Service Description
A	≤ 10.0	This level of service occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
B	> 10.0 and ≤ 20.0	This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of average delay.
C	> 20.0 and ≤ 35.0	Average traffic delays. These higher delays may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	35.0 and ≤ 55.0	Long traffic delays. At level D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high v/c ratios. Many vehicles stop and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	> 55.0 and ≤ 80.0	Very long traffic delays. This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths and high v/c ratios. Individual cycle failures are frequent occurrences.
F	≥ 80.0	Severe congestion. This level, considered to be unacceptable to most drivers, often occurs with over saturation, that is, when arrival flow rates exceed the capacity of the intersection. It may also occur at high v/c ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing factors to such delay levels.

TABLE 3.2 LEVEL OF SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS⁶

Level of Service (LOS)	Highway Capacity Manual (HCM) Delay Value (seconds per vehicle)	Level of Service Description
A	≤ 10.0	Little or no delay
B	> 10.0 and ≤ 15.0	Short traffic delays
C	> 15.0 and ≤ 25.0	Average traffic delays
D	> 25.0 and ≤ 35.0	Long traffic delays
E	> 35.0 and ≤ 50.0	Very long traffic delays
F	> 50.0	Severe congestion

⁶ Source: Highway Capacity Manual 6th Edition, Chapter 17 (Unsignalized Intersections).

4.0 EXISTING CONDITIONS

Regional access to the Project site is provided by the San Bernardino/Foothill Freeway (I-10) on the North and the State Route 210 (SR-210) Freeway on the South. Brief descriptions of these highways and other roadways within the study area are provided below.

4.1 EXISTING STREET NETWORK

4.1.1 Freeways

State Route 210 (SR-210) is an east/west oriented freeway, extending through Los Angeles and San Bernardino Counties, connecting Claremont with the neighboring communities. In the Project vicinity, four mainline travel lanes are provided in the eastbound direction and three mainline travel lanes are provided in the westbound direction. HOV lanes are also provided adjoining the median of SR-210 Freeway. In the Project vicinity, eastbound and westbound ramps are provided on the SR-210 Freeway at Baseline Road (east of Monte Vista Avenue/Padua Avenue) and at Towne Avenue. These are located approximately one-mile northeast of the Project and three miles northwest of the Project site, respectively.

4.1.2 Roadways

1. Claremont Boulevard

Claremont Boulevard is a four-lane, divided roadway oriented in the north/south direction. According to the City of Claremont's General Plan, Claremont Boulevard is classified as a secondary arterial. Parking is generally permitted on both sides of Claremont Boulevard. Claremont Boulevard is posted with a speed limit of 45 miles per hour in the Project vicinity. Claremont Boulevard provides Class II bicycle facilities. On-street parking is permitted within or adjoining bike lanes, depending on the location along Claremont Boulevard. It should be noted that in the future the City of Claremont may remove the on-street parking that is currently located within the bike lanes along Claremont Boulevard since the street lacks sufficient right of way for separate parking and bike lanes, particularly north of Ninth Street.

2. Monte Vista Avenue

Monte Vista Avenue is a six-lane public roadway, divided by a raised median, which extends in the north/south direction. According to the City of Upland's General Plan, Monte Vista Avenue is classified as a secondary arterial. Parking is not permitted on either side of this roadway. North of Arrow Route, the posted speed limit is 45 miles per hour. South of Arrow Route, the speed limit is 35 miles per hour. Monte Vista Avenue provides Class II bicycle facilities.

3. Foothill Boulevard

Foothill Boulevard is a four-lane, divided public roadway, oriented in the east/west direction. It is located north of the Project site. According to the City of Claremont's General Plan, Foothill Boulevard is classified as a major arterial. Parking is typically restricted on either side of this roadway within the vicinity of the Project but is permitted adjoining Harvey Mudd College. West of Monte Vista Avenue, the posted speed limit on Foothill Boulevard is 40 mph. East of Monte Vista Avenue, the speed limit is 45 mph. It should be noted that with a unanimous vote of approval by the Claremont City Council in May 2012, Foothill Boulevard, from Towne Avenue to the County line (near Monte Vista Avenue), has been acquired from Caltrans and is now under the jurisdiction of the City of Claremont.

4. Ninth (9th) Street

Ninth Street in the Project area extends westward from Claremont Boulevard to Mills Avenue as a two-lane public roadway. It primarily serves the eastern campuses of Claremont Colleges. The Project will construct and align an east intersection leg (Driveway 3) to the Claremont Boulevard at Ninth Street intersection as its Project access and install a traffic signal at this location as part of the Project's development.

5. Sixth (6th) Street

Sixth Street west of Claremont Boulevard and within the City of Claremont is a public two-lane, undivided roadway oriented in the east/west direction. East of Claremont Boulevard, Sixth Street is known as Arrow Route, a four-lane roadway divided by a raised median. According to the City of Claremont's General Plan, Sixth Street is classified as a collector roadway. West of College Avenue, parking is permitted on both sides of the roadway. East of College Avenue, parking is not permitted on either side of the roadway and Class II (on-street) bike lanes are provided instead. The speed limit is 35 miles per hour between Mills Avenue and Claremont Boulevard, and 30 miles per hour between College Avenue and Mills Avenue.

6. Arrow Route

The Arrow Route is oriented in an east/west direction. West of Monte Vista Avenue, Arrow Route has been improved to a four-lane section by the adjoining College Park commercial center along the roadway's south edge, and a signal installed at the center's access intersection (College Park Drive). A westbound left-turn pocket provides for entry to the College Park project. The College Park project also implemented intersection improvements at the Claremont Boulevard and Monte Vista Avenue intersections with Arrow Route. Those improvements are reflected in the inventories and analyses of this study. The posted speed limit on Arrow Route is 45 mph. West of Claremont Boulevard, Arrow Route becomes Sixth Street. The Upland General Plan Circulation Element and the Upland Bicycle and Pedestrian Facilities Master Plan designate Arrow Route as a Class II/III bike route.

7. First (1st) Street

First (1st) Street is oriented in the east/west direction. First Street, east of College Avenue, consists of two travel lanes with Class II bike lanes, which are part of the Citrus Regional Bikeway, and a two-way left-turn lane. Parking is permitted on the north side of First Street, east of College Avenue, and on the south side of First Street east of Columbia Avenue. Parking is not permitted on the south side of First Street, between College Avenue and Columbia Avenue. According to the City of Claremont's General Plan, First Street is classified as a secondary arterial roadway east of Indian Hill Boulevard. The posted speed limit on First Street is 40 mph.

8. Indian Hill Boulevard

Indian Hill is a two-lane, divided public roadway oriented in the north/south direction. According to the City of Claremont's General Plan, Indian Hill Boulevard is classified as a secondary arterial. Indian Hill Boulevard provides Class II bicycle facilities between Baseline Road and Butler Court. Class II bicycle facilities include a striped bike lane within the roadway cross-section. Parking is prohibited on both sides of Indian Hill Boulevard at the Foothill Boulevard intersection. Indian Hill Boulevard is posted for a speed limit of 30 miles per hour in the Project vicinity.

9. College Avenue

College Avenue is a two-lane, undivided public roadway oriented in a north/south direction. Parking is typically permitted on both the sides of College Avenue. The posted speed limit on College Avenue is 30 miles per hour north of Sixth Street and 25 miles per hour south of Sixth Street. With the exception of a Class III "sharrow" (indicating a shared lane for vehicles and bikes) between Sixth Street and Bonita Avenue, College Avenue provides Class II bicycle facilities. According to the City of Claremont's General Plan College Avenue is classified as a collector roadway.

10. Mills Avenue

Mills Avenue is a two-lane, divided roadway oriented in the north/south direction. It extends from Foothill Boulevard northward, where the City of Claremont's General Plan designates it as a secondary arterial. On-street parking is permitted on both sides, and the posted speed limit is 40 miles per hour. Mills Avenue provides Class II bicycle facilities. Parallel parking is provided at both curbs in that segment.

11. Central Avenue

Central Avenue is a four-lane, divided roadway, which extends in the north/south direction. It is located east of the Project site in the City of Upland. Parking is not permitted on either side of this roadway within the vicinity of the Project. The posted speed limit is 40 miles per hour.

12. Baseline Road

Baseline Road is a four-lane public roadway which extends in an east/west direction. It is located north of the Project site. According to the City of Claremont's General Plan, Baseline Road is classified as a major arterial. Parking is not permitted on either side of this roadway within the vicinity of the Project. The posted speed limit on Baseline Road is 40 mph. Baseline Road provides Class II bicycle facilities.

13. Harrison Avenue / Fifth Street

Harrison Avenue/Fifth (5th) Street is a two-lane, undivided public roadway oriented in the west/east direction. According to the City of Claremont's General Plan, Harrison Avenue/Fifth Street is classified as a collector roadway. Parking is generally permitted on both sides of this roadway within the vicinity of the Project. The prima facie speed limit on Harrison Avenue/Fifth Street is 25 mph.

14. Arrow Highway

Arrow Highway is oriented in the east/west direction. According to the City of Claremont's General Plan, Arrow Highway is classified as a secondary arterial roadway. Parking is generally permitted on both sides of this roadway within the vicinity of the Project. The posted speed limit on Arrow Highway is 40 mph.

15. Dartmouth Avenue

Dartmouth Avenue is a two-lane, undivided public roadway oriented in the north/south direction. According to the City of Claremont's General Plan, Dartmouth Avenue is classified as a local roadway. Parking is not permitted on both side of Dartmouth Avenue within the vicinity of the Project. The prima facie speed limit on Dartmouth Avenue is 25 mph.

Figure 4.1 illustrates the existing traffic controls and approach lane geometries at the study intersections.

FIGURE 4.1 EXISTING INTERSECTION GEOMETRY

4.2 EXISTING PUBLIC TRANSIT

Table 4.1 provides a description of the public transit lines that operate within the study area. These bus lines are those that are within a “reasonable walking distance” (approximately one-half mile) of the Project site. The existing transit service serving the study area is depicted in **Figure 4.2**.

TABLE 4.1 EXISTING TRANSIT SERVICE SUMMARY

Agency	Line	From	To	Via	Peak-Hour Frequency
Foothill Transit	188	Azusa	Montclair Transit Center	Claremont Blvd	20 min
Foothill Transit	292	Claremont Transit Center	Pomona Transit Center	Foothill Blvd / Claremont Blvd	60 min

FIGURE 4.2 EXISTING TRANSIT

4.3 EXISTING TRAFFIC VOLUMES

4.3.1 Peak Hour Intersection Traffic Counts

Eight-hour turning movement traffic volumes were collected at twenty-one (21) existing signalized intersections and five (5) unsignalized intersections. The data was collected on Tuesday, October 22, 2022 (Weekdays) between the hours of 7 AM-9 AM (AM peak period), and 4 PM-6 PM (PM peak period) for only perimeter intersections of the Project. The other intersection data was collected on Thursday, April 13, 2023 (Weekdays) and Thursday, January 25, 2024, between the same time duration as mentioned above. The data was collected on Saturday, October 1, 2022 (Weekend) between the hours of 11 AM-1:30 PM (AM peak period), and 3 PM-5 PM (PM peak period) for only perimeter intersections of the Project. The other intersection data was collected on Saturday, April 15, 2023 (Weekend), and Saturday, January 27, 2024, between the same duration as mentioned above. The counts were performed to gain insight as to the existing variation in daily weekday versus weekend traffic due to the presence (and number) or lack of scheduled events. All traffic volume data was adjusted to reflect an "Existing Year" baseline Year of 2023.

Intersection turning movement traffic counts (TMCs) at key intersections focus on the peak hours of the street system, and cover a minimum continuous four-hour period per day (i.e., 2 hours in the AM, and 2 hours in the PM). TMCs are counted for each through-moving and turning maneuver, on each approach of the intersection. This data is used to identify the peak 60-minute traffic volume demand at each intersection location, and is further isolated in the traffic model by 15-minute peak factors to identify the critical volume combinations that travel through that intersection in a single hour. The manual TMC counts were collected on typical Tuesdays, Wednesdays and Thursdays during normal non-holiday weeks, when the local colleges were in session, and during times when no construction activities were present which could otherwise skew the traffic volume data. Monday and Friday counts are typically avoided since they tend to be "less normal", and are probably subject to variations in motorist individual schedules, including 4-day work weeks, "Work From Home" schedules, flextime, etc.

The 26 key study intersections were identified for evaluation based on the Cities of Claremont and Upland criteria, discussions with each City's staff and their peer review traffic consultants, and overall knowledge of the area-wide circulation system. It should be noted that additional intersections located within the City of Montclair were originally considered for analysis; however, those candidate intersections were ultimately not included in the TIA because they failed to meet or exceed the practiced 50-trip analysis threshold. The Existing Year weekday AM and PM peak hour traffic turn movement volumes are illustrated in **Figures 4.3 and 4.4**. These volumes represent the highest consecutive four 15-minute count volumes from the collected morning and afternoon/evening count periods.

Since the Project's Game Day activities are anticipated to also occur during the weekend, existing traffic volumes at each of the signalized and unsignalized study intersections were collected on typical mid-day (MD) and PM peak-hour Saturday periods. **Figures 4.5 and 4.6** present the existing MD and PM turning movement traffic volumes for each study intersection during the anticipated Game Day hours for Saturday games.

Appendix A contains detailed intersection traffic count data.

FIGURE 4.3 EXISTING YEAR 2023 (WEEKDAY) TRAFFIC VOLUMES – AM PEAK HOUR

FIGURE 4.4 EXISTING YEAR 2023 (WEEKDAY) TRAFFIC VOLUMES – PM PEAK HOUR

FIGURE 4.5 EXISTING YEAR 2023 (WEEKEND) TRAFFIC VOLUMES – MID-DAY PEAK HOUR

FIGURE 4.6 EXISTING YEAR 2023 (WEEKEND) TRAFFIC VOLUMES – PM PEAK HOUR

4.3.2 Existing Roadway Segment Volumes

24-hour (daily) roadway traffic volume counts were collected at eleven (11) mid-block locations within close proximity to the Project site, as listed in **Figure 4.7.1** below. The daily roadway traffic volume counts were collected on Thursday, April 13, 2023; Saturday, April 15, 2023; Thursday, January 25, 2024; and Saturday, January 27, 2024. The counts were performed to gain insight as to the existing variation in daily weekday versus weekend traffic due to the presence or lack of scheduled events.

FIGURE 4.7.1 ROADWAY SEGMENT 24-HOUR TRAFFIC VOLUME COUNTS

Study Roadway Segment ID, Location and Local Jurisdiction*					
A.) Foothill Boulevard east of Monte Vista Avenue	U	E.) 9th Street west of Claremont Boulevard	C	I.) Arrow Route between College Park Dr. & Monte Vista Ave.	U
B.) Monte Vista Ave between Foothill Boulevard & 11th Street	U	F.) Claremont Boulevard between 9th Street & 6th St./Arrow Rt.	C	J.) Claremont Boulevard south of 6th Street / Arrow Route	C
C.) Claremont Boulevard between Foothill Boulevard & 9th Street	C	G.) 6th Street west of Mills Avenue	C	K.) 1st Street between Claremont Blvd. & Monte Vista Ave. (future segment)	U
D.) 9th Street east of Mills Avenue	C	H.) Arrow Route between Claremont Bl. & College Park Dr.	U	* C = City of Claremont; U = City of Upland	

Figure 4.7.2 presents the existing hour-by-hour and daily traffic volume profiles for each study roadway segment. A review of this data further isolates the existing weekend AM peak hour and PM peak hour traffic volumes representative of the peak arrival and departure hours for Saturday games. Comparing these weekend peak hour to their weekday counterparts (i.e., left side of chart vs. right side) confirms that the weekend volumes are meaningfully to substantially less. Figure 4.7.2 also confirms the dominance of the weekday commuter PM peak hour (generally around 4:00pm or 5:00pm) versus the weekday commuter AM peak hour (generally between 8:00-9:00am).

FIGURE 4.7.2 EXISTING ROADWAYS AVERAGE DAILY TRAFFIC PROFILE

4.4 EXISTING INTERSECTION LEVEL OF SERVICE (WEEKDAY)

Table 4.2 summarizes the existing peak hour level of service of the key study intersections during the weekday, based on the field-collected weekday traffic volumes and current street geometry. A review of Table 4.2 indicates that based on the HCM method of analysis and the LOS criteria outlined in this report, one (1) key existing study intersection currently operates at an unacceptable level of service (LOS) during the AM and PM peak hours, while the remaining intersections operate at acceptable LOS.

Figure 4.8 graphically illustrates the existing weekday LOS results for the AM and PM peak hours.

TABLE 4.2 EXISTING (WEEKDAY) INTERSECTION PEAK HOUR LEVELS OF SERVICE SUMMARY

Study Intersections		Minimum Acceptable LOS	AM Peak Hour		PM Peak Hour	
			LOS	Delay in Seconds	LOS	Delay in Seconds
1	Base Line Rd & Indian Hill Blvd	E	C	20.6	C	21.1
2	Base Line Rd & Mills Ave	E	C	21.0	B	16.8
3	Base Line Rd & Monte Vista Ave/Padua Ave	E	F	97.7	F	97.4

28	Monte Vista Ave & Project Dwy SE	-	-	-	-	-
29	Monte Vista Ave & 1 st St/Richton St	D	A	7.0	A	7.8

"-" Denotes that the proposed driveway intersection currently does not exist; therefore no LOS is reported.

Delay/LOS values indicate unacceptable service levels based on LOS Criteria identified in this report.

Appendix B contains the Existing Year Weekday Delay/LOS calculation worksheets for each key study intersection.

FIGURE 4.8 EXISTING (WEEKDAY) INTERSECTION LEVEL OF SERVICE – AM & PM PEAK HOURS

4.5 EXISTING (WEEKEND) LEVEL OF SERVICE RESULTS

Table 4.3 summarizes the existing weekend peak hour service level calculations for the existing study intersections selected for focused analysis. These results are based on existing weekend traffic volumes and current street geometry. A review of Table 4.3 indicates that based on the HCM method of analysis and the LOS criteria mentioned in this report, some of the key existing study intersections currently operate at acceptable LOS during the AM and PM peak hours.

TABLE 4.3 EXISTING (WEEKEND) INTERSECTION PEAK HOUR LEVELS OF SERVICE SUMMARY

Study Intersections		Minimum Acceptable LOS	AM Peak Hour		PM Peak Hour	
			LOS	Delay (sec/veh)	LOS	Delay (sec/veh)
1	Base Line Rd & Indian Hill Blvd	E	C	28.1	C	26.1

"-" Denotes that the proposed driveway intersection currently does not exist; therefore no LOS is reported.

Bold Delay/LOS values indicate unacceptable service levels based on LOS Criteria identified in this report.

Figure 4.9 graphically illustrates the existing weekend traffic conditions level of service results for AM and PM peak hours. **Appendix B** contains the Existing (Weekend) Traffic Conditions Delay/LOS calculation worksheets for the key existing study intersections.

FIGURE 4.9 EXISTING (WEEKEND) INTERSECTION LEVEL OF SERVICE – AM & PM PEAK HOURS

5.0 FUTURE CONDITIONS

This section defines the traffic that is expected to be generated by the proposed Project. The estimation of traffic volumes is completed through a three-step process, which includes trip generation, trip distribution, and trip assignment.

5.1 FUTURE TRAFFIC CONDITIONS

5.1.1 Ambient Traffic Growth

The ambient traffic growth factor is intended to account for unknown traffic-generating developments in the study area, as well as reflect regular socioeconomic growth the sub-region resulting in an increase in traffic volumes due to the development of projects outside the study area. A one percent (1%) annual growth rate was applied to the Existing Year 2023 traffic volumes to generate the base line Opening Year 2027 traffic volume conditions.

5.1.2 Cumulative Development Projects

Cumulative projects are defined as the collection of other related planned, approved, or otherwise pending trip-making development projects, which due to their close proximity within the study area, would constitute a shared impact on local traffic which must be accounted for in the analysis. Based on research and concurrence with the Cities of Claremont and Upland, there are thirty-three (33) such cumulative projects located within a two-mile radius of the project study area, in the Cities of Claremont and Upland. Thirty-two (32) of these projects were concluded to have the potential for adding measurable traffic to the area street system, and would do so in a timeframe after the performance of the “existing” traffic counts used in this study.

This traffic impact analysis assumes that the predominant majority of the cumulative projects will be developed and operational when the proposed Project is operational. As described in further detail below, some of the cumulative developments shown on the approved project list were identified as having a longer development timeframe, and were therefore included in the Horizon Year 2045 base line analysis. In addition, it should be noted that traffic impacts for these cumulative projects are likely to be, or have been, subject to mitigation measures or improvements or other measures were required, which could reduce their net potential impacts. Under this analysis, however, any such measures or improvements are conservatively not considered. The locations of the thirty-two (32) cumulative projects with measurable added traffic potential are presented in **Figure 5.1**.

Eighteen (18) out of 32 cumulative projects are located within the City of Claremont, while the remaining fourteen (14) cumulative projects are located in the City of Upland. All cumulative projects are divided between the Opening Year and Horizon Year based on the respective cumulative projects' opening year. Twenty-five (25) out of thirty-two cumulative projects were analyzed under the Opening Year scenario.

Table 5.1 identifies the locations and development totals of the thirty-two (32) cumulative projects. **Table 5.2** represents the resultant trip generation for all cumulative projects. As shown in Table 5.2, the cumulative projects are expected to generate a combined total of 38,801 daily trips on a typical weekday, with 2,969 trips (1,184 inbound and 1,786 outbound) forecast during the AM peak hour and 3,262 trips (1,871 inbound and 1,394 outbound) forecast during the PM peak hour. Table 5.2 also shows a total of 43,838 daily trips on a typical weekend, with 4,369 trips (2,358 inbound and 2,009 outbound) forecast

during the AM peak hour and 4,248 trips (2,093 inbound and 2,154 outbound) forecast during the PM peak hour.

It should be noted that the specific land uses, project descriptions and trip forecasts for many of the cumulative projects shown in Table 5.2 were, to the extent possible, extracted from the each project's formal traffic study report. As such, these cumulative trips reflect a combination of project trip generation forecasts determined using the Trip Generation Manual, 10th or 11th Editions, as well as approved traffic studies on file with each respective City, as listed in Table 5.1. Further, for projects without documented trip generation forecasts, those forecasts were prepared as part of this study using the cumulative project descriptions as presented in Table 5.1.

TABLE 5.1 LOCATION AND DESCRIPTION OF CUMULATIVE PROJECTS

No.	Project Name	Address	City	Description
1	Arbor Pointe SFRs	210 @ Monte Vista (SWC)	Claremont	Tentative Tract Map and Design Review for 13 lot subdivision consisting of 13 SFRs, 13 JADUs, and 11 detached ADUs.
2	CGU Master Plan	Generally bounded by Foothill Blvd., Dartmouth Avenue, Seventh Street, and College Avenue	Claremont	Potential addition of up to 475 regularly enrolled students, and 99 faculty and staff, and expansion, remodeling, and replacement of campus facilities, resulting in a potential increase in building area of approximately 170,000 assignable square feet
3	Doubletree Hotel/Old School House Specific Plan	North of Foothill Blvd. and west of Indian Hill Blvd.	Claremont	126-unit residential condominiums/townhomes (30 in building with new 240-space parking structure and 96 on Colby Circle)
4	Harvey Mudd College 2015 Master Plan Amendment	South of E. Foothill Blvd. and north of Platt Blvd, between N. Dartmouth Avenue and N. Claremont Blvd.	Claremont	Proposed HMC 2015 Master Plan Amendment includes increasing current building floor area from 738,079 GSF to 902,411 903,911 GSF, and increasing HMC enrollment entitlement from 800 students to 900 students.
5	Keck Science Center Expansion	925 N Mills Avenue (to the west of existing KSC at NW intersection of Ninth Ave and Mills on Scripps campus	Claremont	70,000-square foot, three-story, semi detached ground up building for Keck Science Center labs and classrooms. Located on existing surface level parking lot. Connected to existing KSC.
6	Knight's Inn Redevelopment (formerly proposed as new Hampton Inn & Suites)	701 S Indian Hill Blvd	Claremont	Originally proposed to include renovation of the two-story, 65-unit motel and construction of a four-story, 121-unit hotel. Specific Plan has been adopted.
7	La Popular Restaurant & Drezner Lofts	235 N Yale Ave	Claremont	New 3,000-SF restaurant with 850-SF new outdoor dining area. The Mexican restaurant would occupy the former Rhino Records space. 1,660 s.f. Coffee Shop to occupy rear ground floor tenant space. 5 new studios apt to be constructed through conversion of existing mezzanine and two new stories above rear tenant space. Total square footage is 3,225-SF

8	Med Density Housing Per Gen Plan Housing Element Update.	Citywide	Claremont	1,711 New Housing Units Planned for through Oct 15, 2029
9	Olson 56 Unit Townhomes	1030 W Foothill Blvd.	Claremont	56 Attached Townhomes with 12 Live work units 350 sf each work live
10	Pomona College 2015 Master Plan	Campus-Wide	Claremont	Includes increase of 50 students, 60 staff and faculty, and 205,400 new square feet of campus building area
11	Senior Low Income Housing	956 W. Base Line Road	Claremont	15-unit low-income senior housing project
12	South Village Development Project	Indian Hill to Bucknell, Rail ROW to Arrow Highway.	Claremont	Mixed-Use, Transit-oriented Development designed to expand the Claremont Village. Project plans include: 610 Residential Apartments in Mixed-use buildings 103 Flat-style Residential condos 21 Townhome residences 34,000 sq.ft. restaurants 52,000 sq.ft. retail 26,000 sq.ft. office space 1,195 parking spaces in structures or garages.
13	Trumark Homes	2323 Forbes Ave	Claremont	56 SFR detached Units with 6 internal ADUs
14	City Ventures Townhomes	840 S Indian Hill Blvd	Claremont	65 townhomes. Proposed total Net SF is 92,880-SF
15	Larkin Place - Jamboree Permanent Supportive Housing	731 Harrison Ave	Claremont	33-unit permanent supportive housing development.
16	TCCS Student Services Building	800 N Dartmouth Ave	Claremont	New Student Services Building for Claremont Colleges students. Located at Mudd Quadrangle on Dartmouth south of 10th Street. Approx 30,000-SF
17	Mercy Housing Affordable Housing	1364 N Towne Avenue	Claremont	74-unit 100% Affordable Housing Development (Veteran Housing)
18	TTM62814	365 San Jose Ave	Claremont	13 new residential townhomes at 365 W. San Jose
20	Quick Quak Car Wash	950 Monte Vista Avenue	Upland	2,596 square foot automated drive-thru car wash with ancillary vacuum stations
21	Bridge Point Upland Project	NEC of Central/Foothill	Upland	A 201,096 square foot warehouse/parcel delivery service building
22	Lennar at the Enclave	W. Foothill Boulevard	Upland	Development of 192 residential units comprised of 116 detached condominium units and 76 attached condominium units on 15.6 acres.
23	Mixed Commercial/Industrial Development	1750-1780 W. Foothill Blvd	Upland	A 3,570 square foot retail building and four industrial condominium units within two multi-tenant industrial buildings 45,476 square feet and 55,616 square feet in size on 6.05 acres.
24	T & T Industrial	1701 W. 11th Street	Upland	2 office and warehouse buildings totaling 56,000 square feet

25	Yellow Iron	2068 W. 11th Street	Upland	5 building light industrial park totaling approximately 77,000 square feet, including a 6-lot subdivision
26	Rose Glen Specific Plan	1400 E. Arrow Hwy	Upland	64 two-story single family detached residential homes
27	Bullwinkle's Family Fun Center	1500 W. 7th Street	Upland	Remodel of existing amusement park, including façade, parking lot, and interior improvements.
28	Citrus Village Senior Living	911 W. Arrow Highway	Upland	Potential senior housing development with 62 affordable housing units, 98 independent living units, 74 assisted living units, and a 30-bed facility for memory care residents.
29	The Courtyard at Upland (Rebuild)	968 W. 7th Street	Upland	The partial reconstruction of 36 apartment units within an existing legally non-conforming multi-family apartment complex, damaged by fire
30	Huntington Drive Apartments	1910 Huntington Drive	Upland	An 84-units, 3-story, multi-family residential apartment development on 1.38 acres. The developer proposes that 14 units are to be designated at the low-income affordability level
31	Upland Reliability Project	1975 N. Benson Ave	Upland	Construction and operation of a new battery energy storage system facility. The project includes the placement of battery energy storage enclosures and associated electrical equipment on concrete foundations, including medium voltage transformers and power conversation system, on an area approximately 12 acres in size
32	9th Street Apartments	1739 9th Street	Upland	A request to construct a 19-unit, 2-story apartment complex, with a density bonus, and 2 units made available at the low-income affordability level.
33	McDonalds	1590 W. Foothill Boulevard	Upland	Demolition of an existing 1,471 square foot McDonald's restaurant and construction of a new 4,266 square foot McDonald's restaurant with indoor dining and dual order point drive-through

¹ Per Table 8-30 *City of Claremont 2021-2029 Housing Element Draft*, 1,711 new housing units are required for Claremont's Regional Housing Needs Allocation (RHNA) of which at least 50% (556 DU's) allocated to very low-income units. The City of Claremont intends to provide 548 dwelling units for Above Moderate-Income, 297 units for Moderate-Income, 310 units for Low-Income, 278 units for Very Low-Income, and 278 units for Extremely Low-Income. We have assumed that Above Moderate-Income and Moderate-Income units will be provided as Single-Family Residence and that Low-Income, Very Low-Income, and Extremely Low-Income units will be provided as affordable housing, for a conservative analysis.

² Pass-by rate of 50% was used for the a.m. peak hour and a pass-by rate of 55% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE Trip Generation Manual, the average of a.m. and p.m. pass-by rate was used as the daily pass-by rate.

³ Weekend PM trip calculated by roadway segments' Average Daily Traffic (ADTs) volumes between study intersections average ratio and multiplied by the weekdays PM trip generation to get weekend PM trip generation.

5.2 PROJECT TRIP FORECASTING

5.2.1 Project Trip Generation Methodology

The Project will be used to support the needs of an otherwise existing college community and population (recognizing further that approved or pending campus Master Plans may add incrementally to that population) for general recreation, physical education, team practice, and scheduled team play. With regard to the latter, the primary user group will be CMS Athletics (made up by Claremont McKenna College, Harvey Mudd College, and Scripps College) whose activities will be focused to the Project's venues as a replacement for other existing play fields. Additionally, the site will be utilized for other CMC collegiate athletic programs such as the Claremont Colleges Club Sports.

It should be noted that recurring team play schedules of CMS Athletics and Claremont Colleges Club sports are already in place with those activities now occurring in other fields on the CMC campus. On that basis, the forecasts that follow have been constructed to be conservative estimates of the traffic that will be directed to these new facilities. The Project football/track/lacrosse field, baseball, and softball fields will have additional seating capacity as compared to existing capacity, and the Project traffic forecasts consider those expanded capacities (rather than historical attendance levels) in their derivation.

The process to identify the trips for games during the weekday and weekend peak hours:

- The Project components with significant traffic generation potential are identified, including CMC spectator venues (soccer/football/track/lacrosse, baseball, and softball), and support facilities.
- The HCM 6th Edition of Trip Generation by the Institute of Transportation Engineers (ITE) is used to determine trip generation rates for the Project except at the intersection of Monte Vista Avenue at Claremont Boulevard and Central Avenue at Foothill Boulevard. HCM 6th Edition methodology does not support turning movements with shared and exclusive lanes. 'Soccer Complex' used HCM 6th Edition to generate weekday and weekend AM-PM peak hour trip rates.
- The football/track/lacrosse, baseball, and softball fields, are not specifically considered by ITE. Instead, trip forecasting for these components was carried out in a series of analysis permutations that considered historical practice schedules, combined current CMS Athletics game schedules for play on those fields, team, and coaching staff totals, increased game attendance with a further distinction between weekday versus weekend characteristics, walk-in versus vehicular traffic proportions.
- Due to relatively modest weekday spectator attendance, the existing weekday traffic volumes related to CMS and/or Claremont Colleges Club Sports games are also concluded to be small, particularly during the commuter peak hours. On that basis, and as a conservative measure, any potential "credit" due to the existing sports activity underway during the collection of traffic counts used in this study has been ignored.

Using the above methodology, four (4) trip generation scenarios emerged as best representing the range of traffic activity thresholds for the Project. These scenarios are framed around the usage patterns of the four primary CMS fields (football/track/lacrosse, soccer/rugby, baseball, and softball), and the multi-purpose fields. Those scenarios are listed below:

1. Weekday: Practice Day

Baseball and softball are Spring sports and taken together with Spring football practice, track and field as well as Club Sports (rugby) practice activity, these combined practice and

weekday play schedules in the presence of other Roberts Campus East activities would exceed that of other sports at other times of the year. As such, they have been used to define a "Practice Day" weekday scenario. That other activity would not include scheduled games with visiting teams, but as a worst case could include spring football practice or track and field practice (both have team and coaching squads totaling roughly 100 participants; other sport squad totals are much less). Practices start about mid-afternoon and typically end at or after 6 PM. As a conservative measure, this scenario assumes that all vehicular traffic related to practices throughout the complex will exit the site during the weekday PM commuter hour peak. Club Sports Rugby also has a spring game schedule. Practices occur on weekday afternoons, and available schedule information indicates that conference play is on weekends.

2. Weekday: Game Day

Building on the above weekday scenario, the "Game Day" scenario further includes additional traffic activity for visiting teams and a "full house" event on either the baseball or softball field. As a worst case, this scenario further assumes that the "full house" game will end, and its traffic will exit the site in the PM commuter peak hour. While the Weekday "Game Day" scenario assumes 500 spectators total for simultaneous baseball and softball games, it is worth noting that actual historical weekday attendance levels for these sports are on the order of one-fourth to one-eighth of this planned 500-seat capacity (250 capacity for each baseball and softball). Those actual attendance levels may be influenced by the weekday/workday character of the event as well as the reality that weekday afternoon games are underway when other Claremont College students are still in class, and thus not able to attend a game.

3. Weekend: Game Day (Fall)

On a weekend, traffic activity related to the approximately five home Saturday football games will dominate as the basis of a traffic impact analysis. This study assumes a "full house" of the 1,800-spectator seating capacity of that field. Games are typically at 1 PM and end around 4 PM. Some night games (7 PM start) may also occur, but since evening traffic on the surrounding street system is generally less than during the afternoon, the afternoon football game is the focal point of the Weekend Fall-based traffic impact analysis.

4. Weekend: Game Day (Spring)

Simultaneous baseball and softball games (both with a "full house" of 250 spectators each) will dominate the Saturday picture on a Spring weekend. The one soccer/rugby field is assumed to add 500 spectators with a combined attendance potential for these three fields of 1,000 spectators (250+250+500).

5.2.2 Project Trip Generation

The Project trip generation forecasts for the four (4) scenarios described above are summarized in **Table 5.3**. The trip-making components that make up each scenario are also shown. Table 5.3 presents the basis of the trip-making forecast for each component and includes the use of ITE trip factors as well as the sport, team, practice, and game parameters for each field.

Among the ITE factors are those from Land Use Code 488. The former is for a "Soccer Complex", but the description for this code is concluded to closely align with the included components of the CMC fields and facilities. In its application, a 50 percent overlap ("walk-in") factor has been applied, which converts the freestanding nature of the ITE field study site to the support nature of the proposed parking facilities.

5.2.2a Weekday: Practice Day

As presented in Table 5.3, the “Weekday: Practice Day” trip forecasts over a 24-hour period, this scenario is forecast to add 359 daily trips during a typical “Practice” weekday. As defined above, this scenario and its related trips reflect practice activities on all four spectator fields (but without any scheduled gameplay), as well as Club Sports (rugby) practice. Its frequency would be on the order of four weekdays per week.

5.2.2b Weekday: Game Day

The “Weekday: Game Day” scenario addresses Project traffic activity on the fifth weekday of that illustrative week. Substitution of a “full house” baseball or softball game, with a Spring football practice or track and field practice on the four spectator fields, would increase the weekday PM peak hour Project trip generation to 260 trips, and the daily generation to 559 trips. These trip totals are also consistent with occasional simultaneous baseball and softball games with a combined attendance of 500 spectators, and a home as well as a visitor team on each of those two fields. This scenario illustrated the “worst case” weekday condition for the proposed Project’s Game Day activities.

5.2.2c Weekend: Game Day [Fall]

Looking further at Table 5.3, the defining “worst case” weekend scenario (occurring roughly five Fall Saturdays per year) is that of a “full house” home football game (“Weekend: Game Day-Fall”). On such days, the 24-hour trip generation total would grow to a forecast of 947 trips (evenly divided between inbound and outbound movements), with 377 trips occurring in the hour before the start of the game, and 535 trips in the hour following it.

5.2.2d Weekend: Game Day [Spring]

The more frequent weekend scenario, but with trip generation potential less than one-half of its fall counterpart, is that of the “Weekend: Game Day (spring)” scenario. Its 24-hour trip-making potential would total 593 trips (one-half arriving and one-half departing), with 237 trips forecast for the peak arrival hour, and 321 trips forecast for the peak departure hour.

5.2.3 Project Trip Distribution and Assignment

Trip distribution determines the inbound and outbound directional orientation of Project-related traffic. It is typically influenced by the location, intensity of use, and accessibility of existing and planned site users, population areas, employment centers, and other commercial activities. Traffic assignment is the determination of specific trip routes, given the previously developed traffic distribution pattern. Primary factors in route selection involve the generalized travel directions; quality, visibility and appropriateness of specific routes within the local street context; minimum travel times; and minimum distance paths.

Figure 5.1 presents the trip distribution pattern for the proposed Project, based on discussions and input from CMC and the Cities of Claremont and Upland. Project traffic volumes entering and exiting the Project site were distributed and assigned to the adjacent street system in the traffic model based on the following additional considerations:

- The site's proximity to key traffic carriers (i.e., Claremont Boulevard, Monte Vista Avenue, Foothill Boulevard, Arrow Route, Sixth Street and other arterial streets);
- An analysis of existing traffic volume patterns and distributions on the arterial street and neighborhood roadway-intersection network;
- Expected localized traffic flow patterns based on adjacent street channelization, presence of traffic signals (including the proposed main entrance traffic signal at Claremont/Ninth), and various turn restrictions at the study intersections;
- Driveway site access taken directly from Foothill Boulevard, Claremont Boulevard at Monte Vista Avenue; and
- Relative proximity of the site's proposed access driveways to on-site parking lot areas, and nearby athletics fields and facilities.

Figure 5.1 presents the approved trip distribution pattern for the proposed Project. The percentages illustrated in Figure 5.1 focus on the key intersection list of this study and show the percentage of forecast project trips expected to be added to each indicated movement. Percentage allocations to the "mid-block" locations adjoining each of the key intersections would be consistent with the indicated values.

5.2.3a Project Traffic (Weekday: Practice Day)

The anticipated AM and PM peak hour Project (Weekday: Practice Day) volumes at the key study intersections are presented in **Figures 5.2** and **5.3**, respectively. The traffic volume assignments presented in the above-mentioned figures reflect the traffic distribution characteristics shown in Figure 5.1 and the traffic generation forecast presented in Table 5.3.

FIGURE 5.1 PROJECT TRIP DISTRIBUTION

FIGURE 5.2 PROJECT TRIP ASSIGNMENT (WEEKDAY: PRACTICE DAY) – AM PEAK HOUR

FIGURE 5.3 PROJECT TRIP ASSIGNMENT (WEEKDAY: PRACTICE DAY) – PM PEAK HOUR

5.2.3b Project Traffic (Weekday: Game Day)

The anticipated AM and PM peak hour Project (Weekday: Game Day) volumes at the key study intersections are presented in **Figures 5.4** and **5.5**, respectively. The traffic volume assignments presented in the above-mentioned figures reflect the traffic distribution characteristics shown in Figure 5.1 and the traffic generation forecast are presented in Table 5.3.

5.2.3c Project Traffic (Weekend: Game Day [Fall])

The anticipated AM and PM peak hour Project (Weekend: Game Day [Fall]) volumes at the key study intersections are presented in **Figures 5.6** and **5.7**, respectively. The traffic volume assignments presented in the above-mentioned figures reflect the traffic distribution characteristics shown in Figure 5.1 and the traffic generation forecast presented in Table 5.3.

5.2.3d Project Traffic (Weekend: Game Day [Spring])

The anticipated AM and PM peak hour Project (Weekend: Game Day [Spring]) volumes at the key study intersections are presented in **Figures 5.8** and **5.9**, respectively. The traffic volume assignments presented in the above-mentioned figures reflect the traffic distribution characteristics shown in Figure 5.1 and the traffic generation forecast presented in Table 5.3.

5.3 OPENING YEAR 2027

The potential impact of Project traffic on the surrounding street network during the AM and PM peak hours was first evaluated by analyzing the Opening Year 2027 operating conditions, both with and without the Project's trip generation. The previously discussed capacity analysis procedures were utilized to investigate the effect of the Project on pre-project delay and level of service conditions, at each study intersection, once ambient growth and cumulative developments have been factored into consideration. The Project's potential "Non-CEQA impacts" at each key intersection was then determined using City traffic impact criteria previously described in this report.

5.3.1 Opening Year 2027 Without Project Conditions

Opening Year (OY) 2027 without Project conditions includes background traffic growth, as well as project trips from those cumulative developments assumed to be completed and generating their own site traffic during the Project's OY-2027 time frame. From the list shown on Table 5.1, cumulative project numbers 1-4, 6, 7, 9, 11, 13-18, 20, 22, 24-27, and 29-33 were included in the OY-2027 Without Project scenario.

The OY-2027 Without Project weekday AM and PM peak hour traffic turn movement volumes are illustrated in **Figures 5.10** and **5.11**. These volumes represent the upward adjustment of the highest consecutive four 15-minute turning movement count volumes at each intersection, during the morning and afternoon/evening count periods, factoring in additional ambient annual traffic growth plus cumulative project traffic.

In addition, OY-2027 Without Project traffic volumes were developed for the weekend MD and PM peak-hours, for each study intersection. **Figures 5.12** and **5.13** present the mid-day and evening peak hour turning movement traffic volumes, respectively, representative of the peak arrival and departure hours for Saturday games. A comparison of these weekend peak hour traffic volumes to their weekday counterparts confirms that the weekend volumes are meaningfully to substantially less impactful on the surrounding street network due to the overall lower background traffic volume.

Figures 5.14 and **5.15** graphically illustrate the comparison between Weekday and Weekend intersection peak hour levels of service, during the analyzed AM, mid-day and PM peak hours.

Delay/LOS values indicate unacceptable service levels based on LOS Criteria identified in this report.

A review of Table 5.4 indicates that Study Intersection #4: Base Line Road at the I-210 On/Off-Ramps is forecast to operate at unacceptable level of service during AM peak hour.

Appendix C contains the Opening Year Without Project Traffic Conditions delay and LOS calculation worksheets for each study intersection.

5.3.2 Opening Year 2027 With Project Conditions

Table 5.5 summarizes the intersection levels of service with the addition of the Project. Review of Table 5.5 indicates that the intersection of Base Line Road at the I-210 On/Off-Ramps is forecast to continue operating at an unacceptable level of service with the addition of Project traffic, for each of the sub-analysis scenarios, i.e., Weekday: Practice Day; Weekday: Game Day; Weekend: Game Day – Fall; and Weekend: Game day – Spring. The remaining key study intersections are forecast to operate at an acceptable level of service during Practice and Game Days during the AM and PM peak hours with the addition of Project traffic.

TABLE 5.5 OPENING YEAR 2027 WITH PROJECT LOS SUMMARY

Bold Delay/LOS values indicate unacceptable service levels based on LOS Criteria identified in this report.

5.3.2a Opening Year 2027 Cumulative Plus Project (Weekday: Practice Day) Traffic

Project trip estimates for the Weekday: Practice Day scenario, as shown on Table 5.3, were added to the Opening Year 2027 Cumulative Without Project conditions to develop traffic projections for the Year 2027 Cumulative Plus Project (Weekday: Practice Day) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.16** and **5.17**, respectively. **Figure 5.18** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

5.3.2b Opening Year 2027 Cumulative Plus Project (Weekday: Game Day) Traffic

Project trip estimates for the Weekday: Game Day scenario, as shown on Table 5.3, were added to the Opening Year 2027 Cumulative Without Project conditions to develop traffic projections for the Year 2027 Cumulative Plus Project (Weekday: Game Day) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.19** and **5.20**, respectively. **Figure 5.21** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

5.3.2c Opening Year 2027 Cumulative Plus Project (Weekend: Game Day – Fall) Traffic

Project trip estimates for the Weekend: Game Day (Fall) scenario, as shown on Table 5.3, were added to the Opening Year 2027 Cumulative Without Project conditions to develop traffic projections for the Year 2027 Cumulative Plus Project (Weekend: Game Day – Fall) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.22** and **5.23**, respectively. **Figure 5.24** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

5.3.2d Opening Year 2027 Cumulative Plus Project (Weekend: Game Day – Spring) Traffic

Project trip estimates for the Weekend: Game Day (Spring) scenario, as shown on Table 5.3, were added to the Opening Year 2027 Cumulative Without Project conditions to develop traffic projections for the Year 2027 Cumulative Plus Project (Weekend: Game Day – Spring) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.25** and **5.26**, respectively. **Figure 5.27** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

Appendix D contains the Opening Year with Project Traffic Conditions Delay/LOS calculation worksheets for the key study intersections.

5.4 HORIZON YEAR 2045

The long-range impacts of the Project's traffic volumes on the surrounding street network were evaluated under the context of intersection peak hour operating conditions in the Horizon Year 2045. The previously discussed capacity analysis procedures were utilized to investigate the effect of added project trips in the Year 2045, based on the incremental increases to intersection delay and level of service. The Project's potential "Non-CEQA impacts" at each key intersection was then determined using City traffic impact criteria previously described in this report.

5.4.1 Horizon Year 2045 Without Project Conditions

Horizon Year (HY) 2045 Without Project conditions reflect the long-range modeled regional traffic growth in the area, including all known additional cumulative developments assumed to be completed under the HY-2045 timeframe. From the list of cumulative projects shown on Table 5.1, project numbers 3, 4, 7, 8, 12-14, 26-30, and 32 were added to the previous OY-2027 cumulative project baseline trip forecast. The Future Year 2045 traffic volume forecasts were developed using the Southern California Association of Governments' (SCAG) Year 2040 model data as the basis. It should be noted that at the time of this study's preparation, SCAG's model is not generating link volume data for Year 2045, and therefore as a result the Year 2040 volumes were refined further to reflect Year 2045 projections and intersection turning movements at each study intersection.

The future land use assumptions in the SCAG model were then reviewed and compared to the estimated assumptions of household and employment growth for each related project to determine whether the growth from these related projects was already included within the model assumptions. If a proposed related project was estimated to exceed the growth associated with its Transportation Analysis Zone (TAZ), then it was determined that the SCAG does not include the related project in its future assumptions, and therefore the related project's trips were incorporated into the traffic forecast for the Without Project condition. If a proposed related project was estimated to not exceed the growth associated with its TAZ, then it was assumed that the related project's growth is already accounted for in the SCAG.

The HY-2045 weekday traffic volume conditions, without the Project's AM and PM peak hour trips, are illustrated in **Figures 5.28 and 5.29**.

HY-2045 Without Project traffic volume conditions were developed for the weekend MD and PM peak-hours as well, to reflect the potential effects of Saturday Game Day traffic on local traffic conditions in the Year 2045. **Figures 5.30 and 5.31** illustrate the HY-2045 weekend traffic volume conditions, without the Project's MD and PM peak hour trips.

Figures 5.32 and 5.33 graphically illustrate the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

Table 5.6 represents the level of service during the weekday and weekend AM and PM under the Horizon Year 2045 cumulative traffic conditions.

TABLE 5.6 HORIZON YEAR 2045 WITHOUT PROJECT LOS SUMMARY

Study Intersection		Minimum Acceptable LOS	Peak Hour	Weekday		Weekend	
No.	Intersection			LOS	Delay	LOS	Delay
1	Base Line Rd & Indian Hill Blvd	E	AM	C	26.9	C	24.1

Bold Delay/LOS values indicate unacceptable service levels based on LOS Criteria identified in this report.

Review of column LOS and Delay of Table 5.6 shows that four of the key study intersections are forecast to operate at unacceptable levels of service during the AM and/or PM peak hours under the Year 2045 Cumulative Weekday and Weekend traffic conditions. The remaining key study intersections are forecast to operate at acceptable levels of service during the AM and PM peak hours under the Year 2045 Cumulative traffic conditions. The intersections forecast to have unacceptable levels of service are as follows:

Intersection Name	Jurisdiction	Peak Hour	Weekday		Weekend	
			LOS	Delay	LOS	Delay
13. 6 th St & Indian Hill Blvd	Claremont	AM	F	54.9	F	71.3
		PM	F	68.0	F	99.3
14. 6 th St & College Ave	Claremont	PM	E	40.1	E	37.2
20. 1 st St & College Ave	Claremont	PM	F	79.5	E	42.5

Appendix E contains the Horizon Year without Project Traffic Conditions Delay/LOS calculation worksheets for the key study intersections.

5.4.2 Horizon Year 2045 With Project Conditions

A review of **Table 5.7** shows that under the Horizon Year 2045 scenario, the four (4) study intersections listed below are forecast to continue operating at unacceptable levels of service with the addition of Project traffic, based on the applicable (non-CEQA) LOS impact criteria:

- Intersection #4 - Base Line Road & I-210 On/Off-Ramps
 - Weekend Game Day (Fall and Spring) – AM Peak Hour
- Intersection #13 – 6th Street at Indian Hill Boulevard
 - Weekday Practice Day – AM and PM Peak Hours
 - Weekday Game Day – AM and PM Peak Hours
 - Weekend Game Day (Fall and Spring) – AM and PM Peak Hours
- Intersection #14 – 6th Street at College Avenue
 - Weekday Practice Day – PM Peak Hour
 - Weekday Game Day – PM Peak Hours
 - Weekend Game Day (Fall and Spring) – PM Peak Hour
- Intersection #20 – 1st Street at College Avenue
 - Weekday Practice Day – PM Peak Hour
 - Weekday Game Day – PM Peak Hours
 - Weekend Game Day (Fall and Spring) – PM Peak Hour

The remaining key study intersections are forecast to operate at an acceptable level of service during all Practice and Game Days under the Horizon Year 2045 conditions.

TABLE 5.7 HORIZON YEAR 2045 WITH PROJECT LOS SUMMARY

Bold Delay/LOS values indicate unacceptable service levels based on LOS Criteria identified in this report.

5.4.2a Horizon Year 2045 Cumulative Plus Project (Weekday: Practice Day) Traffic

Project trip estimates for the Weekday: Practice Day scenario, as shown on Table 5.3, were added to the Horizon Year 2045 Cumulative Without Project conditions to develop traffic projections for the Year 2045 Cumulative Plus Project (Weekday: Practice Day) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.34** and **5.35**, respectively. **Figure 5.36** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

5.4.2b Horizon Year 2045 Cumulative Plus Project (Weekday: Game Day) Traffic

Project trip estimates for the Weekday: Game Day scenario, as shown on Table 5.3, were added to the Horizon Year 2045 Cumulative Without Project conditions to develop traffic projections for the Year 2045 Cumulative Plus Project (Weekday: Game Day) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.37** and **5.38**, respectively. **Figure 5.39** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

5.4.2c Horizon Year 2027 Cumulative Plus Project (Weekend: Game Day [Fall]) Traffic

Project trip estimates for the Weekend: Game Day (Fall) scenario, as shown on Table 5.3, were added to the Horizon Year 2045 Cumulative Without Project conditions to develop traffic projections for the Year 2045 Cumulative Plus Project (Weekend: Game Day – Fall) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.40** and **5.41**, respectively. **Figure 5.42** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

5.4.2d Horizon Year 2045 Cumulative Plus Project (Weekend: Game Day [Spring]) Traffic

Project trip estimates for the Weekend: Game Day (Spring) scenario, as shown on Table 5.3, were added to the Horizon Year 2045 Cumulative Without Project conditions to develop traffic projections for the Year 2045 Cumulative Plus Project (Weekend: Game Day – Spring) traffic conditions. The resulting traffic volumes during the AM and PM peak hours at the key study intersections are illustrated in **Figures 5.43** and **5.44**, respectively. **Figure 5.45** graphically illustrates the comparison between Weekday and Weekend level of service results for the AM and PM peak hours.

Appendix F contains the Horizon Year with Project Traffic Conditions Delay/LOS calculation worksheets for the key study intersections.

FIGURE 5.45 HORIZON YEAR 2045 WITH PROJECT WEEKDAY: GAME DAY[SPRING] LOS

6.0 PARKING, ACCESS, AND CIRCULATION

6.1 PARKING PROVISIONS

The Project proposes various on-site parking facilities that will serve existing CMC campus uses including organized athletics activities occurring on the following eight sports fields to be located on the Project site:

- 1 Baseball Field
- 1 Softball Field
- 1 Soccer/Rugby Field
- 3 Multi-Purpose Fields
- 1 Track & Field / Football Field
- 1 Golf Practice Facility

The Project will include a total of 790 on-site parking spaces, as indicated in the Parking Plan exhibit below. A portion of the Project parking will replace an existing faculty and staff parking lot on the CMC campus west of Claremont Boulevard. Approximately 600 of these spaces will be situated in surface and structured parking along the westerly side of the site on Claremont Boulevard, spanning to the south of the Ninth Street entrance. The proposed parking structure will contain approximately 470 of the 600 parking spaces on the west side of the site. The remaining 130 westerly spaces will be located in a surface-level parking lot located to the north of the Ninth Street entrance.

A total of 80 surface-level parking spaces are proposed to be situated along the northerly perimeter of the site, along Foothill Boulevard, near the intersection at Monte Vista Avenue. 110 additional surface-level parking spaces are proposed at the southeast corner of the site along Monte Vista Avenue, just north of Arrow Route.

6.2 DRIVEWAY ACCESS

The primary access point for the Project Site is located at the intersection of Claremont Boulevard and 9th Street, currently a three-way unsignalized "T" intersection. A new four-way traffic signal is proposed at this intersection, including direct entry/exit access into the proposed parking structure. An additional Project driveway along Claremont Boulevard is proposed approximately 800 feet south of 9th Street. This southwesterly driveway will be designated for outbound traffic (i.e., right-turn exit only) departing from the site, and will remain as unsignalized. Inbound traffic movements into the southwesterly driveway may be permitted by emergency vehicles only.

A second unsignalized access driveway is proposed at midblock along the northerly perimeter of the site, along Foothill Boulevard, where entry and exit maneuvers are restricted to right turning movements only (i.e., no median curb cuts are proposed). At the southeast corner of the site along Monte Vista Avenue, approximately 375 feet north of Arrow Route, a third unsignalized driveway will be provided and similarly accommodate right-in/right-out maneuvers only.

6.3 INTERNAL ACCESS AND CIRCULATION

Figure 6.1 presents the circulation diagram for the proposed Project, and illustrates vehicular access as well as pedestrian access to the site from the public streets bordering the proposed Project. A review of the proposed site access and circulation patterns confirms that pedestrian connectivity along Claremont Boulevard between the Project site and the CMC/Pitzer Colleges to the west will be provided at the intersections of Claremont Boulevard and Foothill Boulevard, Ninth Street and Sixth Street/Arrow Route. These intersections are currently (and/or will be) signalized with traffic signal-controlled crosswalks.

The signalization of the Claremont Boulevard and Ninth Street intersection, proposed in conjunction with the development of the Project (and required by prior CMC Master Plan approvals), will provide pedestrians with a street-level means of accessing the facilities and venues of the proposed sports complex. In addition, a pedestrian tunnel, crossing under Claremont Boulevard, is proposed to provide visitor access between the adjacent CMC campus (just south of the new Science Building near Ninth Street) and the internal walkway west of the Football/Track field. It is expected that this pedestrian tunnel will offer pedestrians on campus with primary access to the Project site, and will reduce the pedestrian crossing demand at the signalized crossing at Ninth Street.

Transit service to the Project site is provided by Foothill Transit, with existing bus stops located on Claremont Boulevard at Foothill Boulevard, Ninth Street, and Sixth Street. It is noted from Figure 6.1 that the site will not take any direct northbound access across Monte Vista Avenue. All site traffic along Monte Vista Avenue will occur in the southbound direction only, at the southeasterly driveway, and no inbound/outbound movements crossing the median are proposed. Similarly, along Foothill Boulevard, the site will not generate any median crossing maneuvers on Foothill Boulevard. All inbound and outbound site traffic along Foothill Boulevard will occur in the eastbound direction only, at the northerly driveway.

FIGURE 6.1 CIRCULATION DIAGRAM

7.0 ACTIVE TRANSPORTATION AND TRANSIT

This section addresses the potential impacts to public transit, pedestrian facilities and travel, and bicycle facilities and travel associated with the development of Project site. Claremont McKenna College is a private university in Claremont, California, with an enrollment of approximately 1,300 students. It is a part of the Claremont Colleges consortium, a group of seven colleges and graduate schools located on adjacent campuses within walking distance. The area is served by Foothill Boulevard, California State Route 210, Interstate 10, E. Arrow Highway, and two nearby Metrolink stations. Approximately 94 percent of Claremont McKenna College students live on campus.

The Project site is approximately 74.44 acres of land that is generally located south of Foothill Boulevard and east of Claremont Boulevard in the Cities of Claremont and Upland, California. Elements of the plan are collegiate sports venues (including football/track/lacrosse, baseball, softball, soccer) with spectator seating), golf practice and multi-purpose fields, related support facilities, and parking. These elements are generally upgraded and replacement facilities for existing sports venues and parking that have or will be removed on the Claremont McKenna College (CMC) campus, and also add some additional parking for the campus. The Project site vicinity and location map are shown in Figure 1.1.

The City of Claremont-City of Upland boundary extends diagonally through the proposed Project site from approximately 220 feet (measured along Foothill Boulevard) west of Monte Vista Avenue. This boundary also forms the Los Angeles County-San Bernardino County line, with Los Angeles County and the City of Claremont (29.14 acres) lying to the west, and San Bernardino County and the City of Upland (45.30 acres) lying to the east.

7.1 ACTIVE TRANSPORTATION AND PUBLIC TRANSIT
