A NOP/IS, SCOPING MEETING MATERIALS, AND COMMENT LETTERS RECEIVED

NOTICE OF PREPARATION (NOP)
OF AN ENVIRONMENTAL IMPACT REPORT AND
NOTICE OF PUBLIC SCOPING MEETING
NEW HIGH SCHOOL NO. 8 PROJECT

Notice Is Hereby Given that Oxnard Union High School District (OUHSD) will be the lead agency and will prepare an environmental impact report (EIR) for the proposed New High School No. 8 Project. We need any applicable response of your agency as to the scope and content of the EIR, which is germane to your agency's statutory responsibilities as related to the proposed project. Your agency will need to use the EIR prepared by OUHSD when considering your permit or other approval for the project.

The scoping process is intended to provide OUHSD with the information the public feels is necessary to establish the appropriate scope for preparing the EIR. Please submit your comments, input, suggestions for project alternatives, and any other pertinent information that may enable us to prepare a comprehensive EIR for the proposed project. The Notice of Preparation (NOP) comment period begins on **February 19, 2019 and ends on March 20, 2019**. Due to the time limits mandated by State Law, your response must be sent at the earliest possible date but not later than 30 days after receipt of the notice.

Please submit written comments to:
Mr. Jeffrey Weinstein
Assistant Superintendent, Business Services
Oxnard Union High School District
309 South K Street,
Oxnard, CA 93030

Project Title: New OUHSD High School No. 8 Project

Project Location: The project site includes approximately 46.8-acres of the Maulhardt Ranch, a 107.25-acre property (APN 214-002-059) located in the City of Oxnard, California. The geographic coordinates of the site are approximately Latitude 34° 12' 29.47" North, Longitude 119° 09' 19.07" West.

The project site is currently used for agriculture. Surface elevations are approximately 54-60 feet above mean sea level (msl). The site is adjacent to agricultural land to the north; single family residential land and Rio Rosales Elementary School to the east; single and multi-family residential and commercial land to the south; and single-family residential land to the west. Access to the project site is provided from Camino Del Sol and Rose Avenue.

Project Description: The OUHSD proposes to construct and operate a new state of the art neighborhood High School to accommodate existing and anticipated future enrollment in the District. The project site includes approximately 46.8-acres of the Maulhardt Ranch, a 107.25-acre property (APN 214-002-059) located in the City of Oxnard, California. Access to the project site is provided from Camino Del Sol and Rose Avenue. The geographic coordinates of the site are approximately Latitude 34 degrees 12' 29.47" North, Longitude 119 degrees 09' 19.07" West. The new school facilities are designed to meet the educational and recreational needs of up 2,500 students in grades 9-12 onsite. The proposed project would comprise approximately 211,115 square feet (sq. ft.) of building and structures and provide 806 parking spaces on the project site. In addition, the proposed project includes a variety of recreational areas to accommodate the recreational needs of the students and community. This proposed project includes a

variety of play fields, hard courts, and a pool. Of these, approximately 14.2 – 17 acres of play fields are proposed for joint-use with the City to provide additional recreation opportunities to the community as well as consideration for civic center use of other school facilities on site. The District would process a General Plan Amendment (GPA) and Specific Plan Amendment (SPA) through the City of Oxnard. OUHSD proposes to change the NECSP designations for the project site to Public Education and Civic Center Use.

Topics Identified for Study in an EIR. OUHSD prepared an Initial Study (IS). Based on the environmental review contained in the IS, OUHSD determined that implementation of the proposed project may have a significant effect on the environment and an EIR is required. The EIR will be prepared to evaluate potentially significant impacts related to the following issues:

- Aesthetics
- Biological Resources
- Geology/Soils
- Hydrology/Water Quality
- Noise
- Recreation
- Utilities/Service Systems
- Agriculture and Forestry Resources
- Cultural Resources
- Greenhouse Gas Emissions
- Land Use/Planning
- Transportation
- Air Quality
- Energy
- Hazards and Hazardous Materials
- Public Services
- Tribal Cultural Resources

Based on the analysis contained within the IS, impacts related to Population/Housing, Wildfire, and Mineral Resources are anticipated to be less than significant. Therefore, these topics will not be studied in detail in the EIR.

Scoping Meeting: OUHSD will conduct a public scoping meeting for the proposed project. The purpose of the scoping meeting is to solicit and receive public comment and input regarding the appropriate scope and content in the preparation of the EIR. Participation in the public meeting by agencies, organizations, and persons is encouraged. The Scoping Meeting for the EIR for the New High School No. 8 Project is scheduled for **March 6, 2019, at 6 p.m.** at the District Office Board Room, 220 South K Street, Oxnard, CA 93030.

In addition to the public scoping meeting, comments can also be submitted in writing, attention: Mr. Jeffrey Weinstein, at the address provided above.

Document Availability: The NOP and IS are available for public review at the Oxnard Union High School District, 309 South K Street, Oxnard, CA 93030 and at the Downtown Main Library, 251 South A Street, Oxnard, CA 93030 during normal business hours. They are also posted online on the District's website at: https://www.oxnardunion.org.

1.0 PROJECT INFORMATION

Project title:	New High School No. 8
Lead agency name and address:	Oxnard Union High School District 309 South K Street Oxnard, CA 93030
Contact person and phone number:	Jeffrey Weinstein, Asst. Sup. Business Services (805) 834-1461
Project location:	Northeast of Camino Del Sol and Rose Avenue
Assessor Parcel Number (APN):	APN 214-002-059
Project sponsor's name and address:	Oxnard Union High School District 309 South K Street Oxnard, CA 93030
General Plan Designation:	Residential Low Medium (RLD) and Open Space (OS) - Urban Village
Specific Plan	Northeast Community Specific Plan (NECSP)
Zoning Designation:	Single Family Residential Planned Development (R1PD) and Community Reserve (C-R)
Surrounding land uses:	North: Agricultural land East: Single family residential land and Rio Rosales Elementary School to the east South: Single and multi-family residential and commercial land West: Single family residential

1.1 PROJECT LOCATION

The project site includes approximately 46.8-acres of the Maulhardt Ranch, a 107.25-acre property (APN 214-002-059) located in the City of Oxnard, California. Access to the project site is provided from Camino Del Sol and Rose Avenue. The geographic coordinates of the site are approximately Latitude 34° 12' 29.47" North, Longitude 119° 09' 19.07" West. A Project Location and Vicinity Map is provided as Figure 1-1.

Surface elevations at the site are approximately 54-60 feet above mean sea level (msl) (Google Earth 2018). The project site is located in the southern area of the Santa Clara River flood plain. As of March 2017, the Santa Clara River Levee in Oxnard was in the process of rehabilitation construction and undergoing design/engineering/CEQA work (City of Oxnard 2017). The Santa Clara River is located approximately 2.8 miles northwest of the project site. The site topography is relatively flat with surface elevations ranging from approximately 54 feet above msl in the south to 60 feet above msl in the north (Google Earth 2018).

The project site has a General Plan Land Use designation of Residential Low Medium (RLD), Urban Village. The project site is located in the Northeast Community Specific Plan (NECSP) area of Oxnard, Ventura County,

California. The zoning designations are Single Family Residential Planned Development (R1PD) and Community Reserve (C-R).

The project site is currently used for agriculture and the cultivation of strawberries was observed during our January 29, 2019 field visit. Historical aerial photographs, Google Earth images, and information from the project Site owners indicate that the site has been used for cultivation of row crops from as early as 1869 to the present. The site is adjacent to agricultural land to the north; single family residential land and Rio Rosales Elementary School to the east; single and multi-family residential and commercial land to the south; and single-family residential land to the west. There are three public parks within 0.5-mile of the site: Del Sol Park to the southwest, Thompson Park to the south, and West Village Park to the northwest.

1.2 PROJECT OBJECTIVES

The objectives of the proposed project include the following:

- Accommodate existing and projected future student enrollment within the District;
- Provide new facilities that meet the District's educational specifications;
- Provide a new neighborhood High School to accommodate 2,500 students in permanent classroom facilities;
- Build and maintain school facilities that reflect the wise and efficient use of limited land resources; and
- Provide for new community appropriate recreational facilities.

1.3 PROJECT DESCRIPTION

The OUHSD proposes to construct and operate a new state of the art neighborhood High School to accommodate existing and anticipated future enrollment in the District. The new school facilities are designed to meet the educational and recreational needs of up 2,500 students in grades 9-12 onsite.

General Plan and Specific Plan Amendments

The District would process a General Plan Amendment (GPA) and Specific Plan Amendment (SPA) through the City of Oxnard. OUHSD proposes to change the General Plan designation for the project site to School (SCH), the zoning designation to Community Reserve (C-R), and the NECSP designation to School.

School Facilities

The proposed project would comprise approximately 211,115 square feet (sq. ft.) of building and structures and provide approximately 806 parking spaces on the project site. In addition, the proposed project includes a variety of recreational areas to accommodate the recreational needs of the student's onsite. These facilities include a variety of play fields, hard courts, and a pool. The proposed buildings would be of wood or metal frame construction or cast in place concrete tilt up construction with concrete slab-on-grade foundations. Access to the school would be provided from Camino Del Sol and half width of a proposed new "Central Road" to the north of the project site that would connect to the existing Camino De La Luna and Jacinto Drive. The proposed circulation is being planned in cooperation with City Planning, Public Works, and Traffic staff. A conceptual site plan is included as Figure 1-2 and a summary of anticipated development is provided in Table 1-1.

Table 1-1
Conceptual Site Plan Summary

Building	Building Footprint ft^2	Notes
Lockers/Gymnasium	45,730	Two-Story

Notes: ft^2 = Square Foot. All square footage estimates are approximate

Recreational/ Community Use/ Civic Center

This proposed project includes a variety of play fields, hard courts, and a pool. Of these, approximately 14.2 – 17 acres of playfields are proposed for joint-use with the City to provide additional recreation opportunities to the community as well as consideration for civic center use of other school facilities on site.

Project Design Features

Landscaping

The landscape concept for the proposed project includes the surfacing and planting of the soft-top sports facilities, site irrigation, and ornamental plantings of trees, shrubs, and groundcover. The proposed irrigation system includes drip, smart clock, flow sensor, rotor, bubbler, and pop up spray components that would result in the system meeting California Assembly Bill (AB) 1881, Cal Green, and Title 23 (Chapter 2) requirements. Plant species selected would add to the aesthetic appeal of the campus.

Lighting

The proposed project will include necessary lighting for adequate nighttime safety and security. Campus lights will be shielded and directed downward to the extent feasible. Lighted playfields are proposed for the stadium and varsity baseball and softball fields.

Energy

The proposed project is designed to include energy saving features such as ultra-high efficiency rooftop packaged units, demand control ventilation, solar panels, and an energy management system that will provide scheduled times of operation as well as temperature-setback when the classroom is unoccupied. The electrical systems will include energy-efficient light-emitting diode (LED) lighting fixtures in the interior and exterior of the buildings with low voltage controls to include dimming, daylight sensors and automatic occupancy sensing devices. The site parking lot and pathway pole-mounted lighting and sports field lighting will have energy-efficient LED lamps and drivers with low voltage controls. The electrical power transformer specified for the project will be an energy-efficient type complying with the most recent energy code.

Water Saving Features

The proposed project will incorporate a state-of-the-art drip irrigation system and a smart clock which automatically adjusts daily based on evapotranspiration (ET). All trees will have a separate valve allowing for water to be provided only as needed. Large turf areas will be irrigated by rotors and small turf areas will be irrigated by spray heads. The irrigation system will incorporate a master valve and flow sensor to shut down the system in case of line breakage.

Offsite Infrastructure Improvements and Connections

Stormwater Drainage

A high-density polyethylene (HPDE) storm drain system will be provided throughout the project site. Two points of pre-treatment (CDS Unit), infiltration, and detention (underground corrugated metal pipe (CMP)). Infiltration is proposed as above ground basins: one behind the tennis courts and one in the landscape frontage along Camino del Sol. Underground detention will be 66" CMP's under the outdoor basketball courts and 36" CMP's under the SW parking area. The proposed site will join the existing storm drain (SD) in Camino del Sol at an existing lateral. A public SD line is proposed from the connection point, through the campus and up to Central Street. This public SD line will carry flow from the residential development and the High School. A second public SD line will run along the east property line in

the currently designated public street. This line will serve only the undeveloped land to the north and not benefit the High School. This line will have to be constructed with the easterly street. This is the current design concept that would require review and approval by the City.

Transportation/Circulation

While the educational facilities would be contained within the project site; the City may require additional street and sidewalk improvements required to service the proposed project. Anticipated roadway improvements include the widening of Rose Avenue that would require removal of the existing windrow trees. A new half width access road is proposed to the north of the project site as shown on the conceptual site plan (Figure 2-2.) The City will dictate the final route for the access road. Anticipated sidewalk improvements and other circulation improvements required to adequately accommodate the project site will be identified based on coordination with the City's Planning and Public Works Departments.

Utility Connections

The project site is currently undeveloped and used for agriculture. Utility connections will need to connect to the project site including water, sewer, gas, electric, data/telecommunications, and storm water connection.

Project Construction

Phased construction is anticipated to begin in 2019 and would take approximately 31 months to construct. The number of construction workers at the proposed site during the construction phases would range from 20 to 100.

Operation and Staffing

Operation of the new school is anticipated for the 2022-2023 school year. The approximate number of employees for the high school opening was estimated to be 150 based on the educational specifications approved by the Board. This includes administrative staff, teachers, aides, librarians, technology teachers, cafeteria workers, janitors and groundskeeping staff.

1.4 OTHER PUBLIC AGENCIES WHOSE APPROVAL IS REQUIRED

The EIR will be used by OUHSD and responsible and trustee agencies with jurisdiction over portions of the project prior to deciding whether to approve or permit project components. A public agency, other than the lead agency, that has discretionary approval power over a project is known as a "responsible agency" as defined by CEQA Guidelines Section 15381. Anticipated permits and approvals for the proposed project are identified in **Error! R eference source not found.**.

Table 1-2
Anticipated Permits and Approvals

Agency	Permit/Approval
Oxnard Union High School District	Approve Project (Educational Specifications, Design/Construction Funding and Associated Contract Approvals)/ EIR/ Parks Designation
City of Oxnard	General Plan Amendment, Specific Plan Amendment, and Building Permits

California Department of General Services, Division of State Architect.	Approval of construction plans
California Department of Toxic Substance Control	Approval of Preliminary Environmental Assessment (PEA) and Supplemental Site Investigation (SSI)
Los Angeles Regional Water Quality Control Board	Storm Water Pollution Prevention Plan.

1.5 CALIFORNIA NATIVE AMERICAN TRIBE CONSULTATION

Have California Native American tribes traditionally and culturally affiliated with the project area requested consultation pursuant to Public Resources Code section 21080.3.1? If so, is there a plan for consultation that includes, for example the determination of significance of impacts to tribal cultural resources, procedures regarding confidentiality, etc.?

OUHSD has not received written notification from California Native American tribes traditionally and culturally affiliated with the project area.

2.0 ENVIRONMENTAL CHECKLIST

2.1 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

☒ Aesthetics	☒ Agriculture and Forestry Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Energy
☒ Geology/Soils	☒ Greenhouse Gas Emissions	☒ Hazards & Hazardous Materials
☒ Hydrology/Water Quality	☒ Land Use/Planning	☐ Mineral Resources
☒ Noise	☐ Population/Housing	☒ Public Services
☒ Recreation	☒ Transportation	☒ Tribal Cultural Resources
☒ Utilities/Service Systems	☐ Wildfire	☒ Mandatory Findings of Significance

2.2 DETERMINATION: (TO BE COMPLETED BY THE LEAD AGENCY)

On the basis of this initial evaluation:

- ☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- ☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- ☒ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- ☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Signature	Date	Signature	Date
Print Name		Print Name	

2.3 EVALUATION OF ENVIRONMENTAL IMPACTS

(1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained if it is based on project-specific factors as well as general standards (e.g., the project would not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

(2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

(3) Once the lead agency has determined that a particular physical impact may occur, the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

(4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies when the incorporation of mitigation measures has reduced an effect from a "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analyses," as described in (5) below, may be cross-referenced).

(5) Earlier analyses may be used if, pursuant to tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration (Section 15063[c][3][D]). In this case, a brief discussion should identify the following:

a. Earlier Analysis Used. Identify and state where earlier analyses are available for review.

b. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards and state whether such effects were addressed by mitigation measures based on the earlier analysis.

c. Mitigation Measures. For effects that are "Less Than Significant with Mitigation Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

(6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, when appropriate, include a reference to the page or pages where the statement is substantiated.

(7) Supporting Information Sources. A source list should be attached and other sources used or individuals contacted should be cited in the discussion.

(8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.

(9) The explanation of each issue should identify:

a. The significance criteria or threshold, if any, used to evaluate each question; and

b. The mitigation measure identified, if any, to reduce the impact to less than significant.

2.4 ENVIRONMENTAL IMPACT ANALYSIS

2.4.1 AESTHETICS

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Except as provided in Public Resources Code Section 21099, would the project:					
a.	Have a substantial adverse effect on a scenic vista?	X			
b.	Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings along a scenic highway?				X
c.	In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	X			
d.	Create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?	X			

Discussion:

a. Would the project have a substantial adverse effect on a scenic vista?

Potentially Significant Impact. In the City of Oxnard, key view corridors include local waterways, agricultural open space, beaches, mountains, and a variety of urban landscapes (Oxnard 2011). According to the East Village Phase III Annexation EIR, Rose Avenue is a designated City-image corridor characterized by expansive northerly views of distant mountain ranges. The proposed project includes roadway improvements to Rose Avenue that would require removing mature windrow trees. Therefore, this topic will be discussed further in the EIR.

b. Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

No Impact. The project site is relatively flat and currently used for agriculture. The project site is not located adjacent to a designated State scenic highway or eligible State scenic highway, as identified on the California Scenic Highway Mapping System (Caltrans 2018). Therefore, the proposed project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway and this issue will not be discussed further in the EIR.

c. Would the project substantially degrade the existing visual character or quality of the site and its surroundings?

Potentially Significant Impact. The project site is relatively flat and currently used for agriculture. Development of the proposed project will result in a visual change from construction and operation of the new educational facilities in comparison to existing conditions. Therefore, potential impacts to the visual character or quality of the site and its surroundings will be analyzed further in the EIR.

d. Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Potentially Significant Impact. The project site is currently used for agriculture within a developed urban environment. The proposed project would include exterior lighting around buildings, walkways, and parking lots as needed for adequate safety and security at night. The proposed new stadium would include lighted playfields and the varsity baseball and softball fields would also be lighted. In addition, it is anticipated that the school would be used in the evening for community meetings and periodic school activities. As such, the proposed project could represent a new source of light or glare which could potentially impact nighttime views in the area. Therefore, this topic will be discussed further in the EIR.

2.4.2 AGRICULTURE AND FOREST RESOURCES

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:					
a.	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	X			
b.	Conflict with existing zoning for agricultural use or conflict with a Williamson Act contract?			X	
c.	Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined in Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?				X
d.	Result in the loss of forest land or conversion of forest land to non-forest use?				X
e.	Involve other changes in the existing environment that, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?			X	

Discussion:

a. Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

Potentially Significant Impact. The City of Oxnard 2030 General Plan Program EIR (Oxnard 2009) accounted for the conversion of up to 2,215 acres of important farmland (defined as Prime Farmland and Farmland of Statewide Importance) including the project site to non-agricultural use and determined the impact to be significant and unavoidable. The entire Maulhardt Ranch site was identified as either Prime Farmland or Farmland of Statewide Importance in PEIR Figure 5-1, Important farmland Impacts. No feasible mitigation measures were available to reduce the impact to a less than significant level (Oxnard 2009).

The City certified the 2030 General Plan Program EIR on October 11, 2011 that considered the possible environmental impacts of buildout to 2030: adding approximately 40,000 people to the City's population, development of all remaining vacant land within the Oxnard CURB Line including the project site. The conversion of the project site to a developed use was addressed by the 2030 General Plan Final EIR and found to be a significant citywide adverse impact for which an overriding consideration was made. (Oxnard 2012). According to the East Village Phase III Annexation EIR, the City has also determined that conversion of agricultural land is a project-level impact and required a mitigation measure (AG1) to offer the topsoil for removal to another farm operation, if feasible, as a partial mitigation for the loss of prime farmland impact (Oxnard 2012).

As part of the proposed project, the OUHSD would process a General Plan Amendment (GPA) and Specific Plan Amendment (SPA) through the City of Oxnard. OUHSD proposes to change the NECSP designations for the project site to School use. The buildout of the site with a non-agricultural use was previously accounted for in the 2030 General Plan and identified in the East Village Phase III Annexation EIR. While the proposed project would be a different development scenario than previously evaluated it would nonetheless also convert the site to non-agricultural use. No new or increased impact related to conversion of important farmland would result given the location of the project site within a developed urban environment. A review of mitigation measure AG1 should be conducted to determine if this measure is still feasible for the project site and/or if there are other partial mitigation measures available for the loss of important farmland. Nonetheless, conversion of agricultural land at the project level would remain a significant and unavoidable impact.

b. Would the project conflict with existing zoning for agricultural use or a Williamson Act contract?

Less Than Significant Impact. While the project site is currently used for agriculture, it is located within the NECSP and is not designated for agricultural use. According to the East Village Phase III EIR, a Declaration of Notice of Nonrenewal was filed for the Maulhardt Ranch property (a portion of which includes the project site) on December 13, 2002 and the termination date was identified as February 29, 2012.Therefore, the proposed project would not conflict with zoning for agricultural use or a Williamson Act contract. Project impact would be less than significant and this issue will not be further analyzed in the EIR

c. Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Public Resources Code section 12220(g)), timberland (as defined in Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. There is no forest timberland located on the project site. Nor, is the project site zoned for timberland use as identified above. Therefore, the proposed project would not conflict with zoning for, or cause rezoning of, forest land or timberland and this issue will not be further analyzed in the EIR.

d. Would the project result in the loss of forest land or conversion of forest land to non-forest use?

No Impact. There is no forest land located on the project site. Therefore, the proposed project would not result in the loss of forest land or conversion of forest land to a non-forest use and this issue will not be further analyzed in the EIR.

e. Would the project involve other changes in the existing environment that, due to their location or nature, could individually or cumulatively result in loss of Farmland to non-agricultural use or conversion of forest land to non-forest use?

Less Than Significant Impact. There is no forest land located on or adjust to the project site. Therefore, the proposed project would not individually or cumulatively result in the loss of forestland to non-forest use and this issue will not be further analyzed in the EIR. The project site is currently used for agriculture and implementation of the proposed project would convert the site to a non-agricultural use. However, the project site and the adjacent agricultural land to the north, are located within a developed urban environment and the conversion of the project site and the adjacent land to the north was previously accounted for in the 2030 General Plan EIR. No new or increased impacts related to the conversion of farmland are anticipated as a result of implementation of the proposed project given the location of the project site within a developed urban environment. Therefore, project impact would be less than significant and this issue will not be further analyzed in the EIR.

2.4.3 AIR QUALITY

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:					
a.	Conflict with or obstruct implementation of the applicable air quality plan?	X			
b.	Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is a non-attainment area for an applicable federal or state ambient air quality standard?	X			
c.	Expose sensitive receptors to substantial pollutant concentrations?	X			
d.	Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	X			

Discussion:

a. Would the project conflict with or obstruct implementation of the applicable air quality plan?

Potentially Significant Impact. The project site is located within the City of Oxnard. To pursue improvement of air quality in Ventura County, the Ventura County Air Pollution Control Board has adopted the 2016 Ventura County Air Quality Management Plan (AQMP), which presents a comprehensive list of pollution control strategies aimed at attaining Ventura County's federal 8-hour ozone standard by 2020 as required by the Clean Air Act Amendments of 1990. These strategies are developed, in part, based on regional population, housing, and employment projections prepared by the Southern California Association of Governments and reflected in local general plans. An air quality study will be conducted for the proposed project and this issue will be analyzed in the EIR.

b. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is a non-attainment area for an applicable federal or state ambient air quality standard?

Potentially Significant Impact. The proposed project would result in significant cumulative impacts if it exceeds daily thresholds of significance established by VCAPCD or if it incurs an increase of emissions beyond what is planned in the General Plan. An air quality study will be prepared for the proposed project and this issue will be analyzed further in the EIR.

c. Would the project expose sensitive receptors to substantial pollutant concentrations?

Potentially Significant Impact. The proposed project includes a new high school to help meet the educational needs of District students. The proposed project is anticipated to have a less than significant impact on sensitive receptors. Nonetheless, an air quality study will be prepared for the proposed project and this issue will be analyzed further in the EIR.

d. Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Potentially Significant Impact. The proposed project includes a new high school to help meet the educational needs of District students. The proposed project is currently adjacent to agricultural fields. Should those fields remain active, the cultivation process could create objectionable odors. An air quality study will be prepared for the proposed project and this issue will be analyzed further in the EIR.

2.4.4 BIOLOGICAL RESOURCES

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	X			
b.	Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?				X
c.	Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?				X
d.	Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	X			
e.	Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	X			
f.	Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?				X

Discussion:

a. Would the project have a substantial adverse impact, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service?

Potentially Significant Impact. The project site is located within an urban area of the City of Oxnard. Accordingly, the potential for candidate, sensitive, or special-status species or habitats is low within City limits. The project site is currently used for the cultivation of strawberries.

A query of the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDB) was conducted to determine the known locations of any special-status species or habitats (sensitive, threatened, endangered, rare, or candidate species) within and surrounding the project site. The special-status species presented in Table 2-1 are those with any chance of potentially occurring within or adjacent to the project site based on regional occurrence and habitat present on the project site (CDFW 2019).

Table 2-1
Special-Status Wildlife Species with Potential to Occur

Common Name	Scientific Name	Federal Status / State Status	Other Status
Birds			
burrowing owl	*Athene cunicularia*	- / -	S, SSC
ferruginous hawk	*Buteo regalis*	- / -	WL
white-tailed kite	*Elanus leucurus*	- / -	S, FP
California horned lark	*Eremophila alpestris actia*	- / -	WL
American peregrine falcon	*Falco peregrinus anatum*	FD / SD	FP
Mammals			
pallid bat	*Antrozous pallidus*	- / -	S, SSC
western mastiff bat	*Eumops perotis californicus*	- / -	S, SSC

Notes: Results based on CNDDB query for six regional quadrangles (Oxnard, Ventura, Saticoy, Santa Paula, Camarillo, Point Mugu).
FD = Federally Delisted
FP = CDFW Fully Protected
S = BLM Sensitive Species
SD = State Delisted
SSC = CDFW Species of Special Concern
WL = CDFW Watch List

A general biological survey conducted on January 29, 2019 verified that no native vegetation communities occur within the site boundary. Due to the active agricultural use of the site and plant list established during the general biological survey, there is no potential for special-status plants to occur on the project site.

Due to the active agricultural use of the project site, it is unlikely that any special-status species would occur. However, the proposed project includes roadway improvements that would likely require removal of the existing windrow trees along Rose Avenue. Eucalyptus trees have the highest potential to support nesting activity; additionally, other vegetation and structures within and adjacent to the site have the potential to serve as habitat. Therefore, direct removal of trees, use of heavy machinery, and/or significant ground disturbance during construction activities has the potential to disturb nesting birds if present and this issue will be further evaluated in the EIR.

b. Would the project have a substantial adverse impact on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service?

No Impact. The CNDDB query identified nine sensitive habitat types within a six quadrangle search around the project site including:

- Southern California Coastal Lagoon
- Southern California Steelhead Stream
- Valley Needlegrass Grassland
- Southern Coastal Salt Marsh

- Coastal and Valley Freshwater Marsh
- Southern Coast Live Oak Riparian Forest
- Southern Sycamore Alder Riparian Woodland
- Southern Riparian Scrub
- California Walnut Woodland

None of the sensitive habitats listed above occur on or within the vicinity of the project site. The project site is located within an urban environment and is currently used for agriculture. No native vegetation communities were documented on the project site during the general biological survey conducted on January 29, 2019. Cultivated strawberries (*Fragaria* sp.) were the dominant plant on the project site along with other plant species that were primarily non-native and occurred mostly on the fringe of the cultivated rows. Therefore, the proposed project would have no impact on any riparian habitat or other sensitive natural community and this issue will not be discussed further in the EIR.

c. Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marshes, vernal pools, coastal wetlands, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact. During the general biological survey conducted on January 29, 2019, no jurisdictional wetlands or potential wetlands were identified on, or directly adjacent to the project site. The U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory identifies the nearest wetland waters occurring approximately 1.0 mile to the east of the project site. These wetland waters include a small area characterized as a freshwater pond. The proposed project would not impact any areas outside of the defined impact area; as such, no impacts to protected wetlands would occur and this issue will not be discussed further in the EIR.

d. Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of wildlife nursery sites?

Potentially Significant Impact. The project site is located within a developed urban environment. The project site is not located within, or directly adjacent to, any known or mapped wildlife corridors or nursery sites. Vegetation currently on site, particularly the Eucalyptus windrow trees at the western site border may serve as potential nesting areas. The proposed project includes roadway improvements that would likely require removal of the existing windrow trees along Rose Avenue. Therefore, this issue will be further evaluated in the EIR.

e. Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Potentially Significant Impact. Eucalyptus windrow trees are located at the western project site border, adjacent to Rose Avenue. The infrastructure improvements proposed for Rose Avenue would require the removal of these windrow trees. As such, this issue will be further evaluated in the EIR.

f. Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. The project site is not included in any state, regional, or local habitat conservation plans (CDFW 2017), nor are any Habitat Conservation Plans or Natural Communities Conservation Plans directly referenced within the Planning Area of the 2030 General Plan (City of Oxnard 2011). Therefore, no project impacts would occur, and this issue will not be discussed further in the EIR.

2.4.5 CULTURAL RESOURCES

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?	X			
b.	Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?	X			
c.	Disturb any human remains, including those interred outside of dedicated cemeteries?			X	

Discussion:

a. Would the project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?

Potentially Significant Impact. CEQA defines a "historical resource" as any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California, provided the determination is supported by substantial evidence in light of the whole record. Generally, a resource is considered "historically significant" if it meets the criteria for listing on the California Register of Historical Resources (CRHR). A historical resource must be significant at the local, state, or national level under one or more of four criteria defined in the California CCR Title 14, Chapter 11.5, §4850. In addition, buildings, sites, structures, objects, and districts representative of California and United States history, architecture, archaeology, engineering, and culture convey significance when they also possess integrity of location, design, setting, materials, workmanship, feeling, and association. A resource has integrity if it retains the characteristics that were present during the resource's period of significance. Enough of these characteristics must remain to convey the reasons for its significance.

The proposed project includes a portion of Maulhardt Ranch, a 107-acre parcel in the City of Oxnard, California. Maulhardt Ranch has been owned and operated by the Maulhardt family since 1869 and is still being used as a residence by the Maulhardts (the existing residential area is not included in the proposed project) and for strawberry cultivation. A Phase I Archaeological Survey will be conducted for the project site to determine if prehistoric or historic archaeological deposits are present. Therefore, this issue will be evaluated further in the EIR.

b. Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Potentially Significant Impact. As noted above, a Phase I Archaeological Survey will be conducted to determine if prehistoric or historic archaeological deposits are present. Therefore, this issue will be evaluated further in the EIR.

c. Disturb any human remains, including those interred outside of dedicated cemeteries?

Less Than Significant Impact. The project site is currently used for agriculture. Existing regulations require that if human remains and/or cultural items defined by the Health and Safety Code, Section 7050.5, are inadvertently discovered, all work in the vicinity of the find would cease and the Ventura County Coroner would be contacted immediately. If the remains are found to be Native American as defined by Health and Safety Code, Section 7050.5,

the coroner will contact the NAHC by telephone within 24 hours. The NAHC shall immediately notify the person it believes to be the Most Likely Descendant (MLD) as stipulated by California PRC, Section 5097.98. The MLD(s), with the permission of the landowner and/or authorized representative, shall inspect the site of the discovered remains and recommend treatment regarding the remains and any associated grave goods. The MLD shall complete their inspection and make their recommendations within 48 hours of notification by the NAHC. Any discovery of human remains would be treated in accordance with Section 5097.98 of the Public Resources Code (PRC) and Section 7050.5 of the Health and Safety Code. SCCIC record search results and Tribal consultation. Therefore, with compliance with existing regulations, project impact would be less than significant.

2.4.6 ENERGY

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	X			
b.	Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	X			

Discussion:

a. Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Potentially Significant Impact. The proposed project would be designed and constructed to required green building code standards and thereby the inefficient or unnecessary consumption of energy is not anticipated. According to CEQA Guidelines Appendix F, the goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include: 1) decreasing overall per capita energy consumption; 2) decreasing reliance on natural gas and oil; and 3) increasing reliance on renewable energy resources. While significant adverse impacts related to energy consumption are not anticipated, a clear determination cannot be made at this time. Therefore, this issue will be evaluated further in the EIR.

b. Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Potentially Significant Impact. The proposed project would be designed and constructed to required green building code standards and thereby the inefficient or unnecessary consumption of energy is not anticipated. While significant adverse impacts related to energy consumption that could conflict or obstruct a state or local plan for renewable energy or energy efficiency are not anticipated, a clear determination cannot be made at this time. Therefore, this issue will be evaluated further in the EIR.

2.4.7 GEOLOGY AND SOILS

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:				
	i.) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.			X	
	ii.) Strong seismic ground shaking?	X			
	iii.) Seismic-related ground failure, including liquefaction?			X	
	iv.) Landslides?			X	
b.	Result in substantial soil erosion or the loss of topsoil?	X			
c.	Be located on a geologic unit or soil that is unstable or that would become unstable as a result of the project and potentially result in an on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?			X	
d.	Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?			X	
e.	Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems in areas where sewers are not available for the disposal of waste water?				X
f.	Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	X			

Discussion:

a. Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

I. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other

substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

Less Than Significant Impact. The project site is not located within a designated Alquist-Priolo Earthquake Hazard Zone (CGS 2018). There are no known active faults beneath or trending toward the site, the probability of surface rupture due to faulting at the site is considered low. Therefore, this issue will not be discussed further in the EIR.

II. Strong seismic ground shaking?

Potentially Significant Impact. The *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006) indicates that even though the historic record indicates that no strong earthquakes or surface displacement have occurred along the faults in southern Ventura County in the site area, the likelihood of the occurrence of one or more of such events within the next 50 to 100 years is not remote. Therefore, this issue will be discussed further in the EIR.

III. Seismic-related ground failure, including liquefaction?

Less Than Significant Impact. Generally, there is a potential for liquefaction when the following three conditions are met: (1) a site is located on Holocene age, unconsolidated, coarse-grained sediments; (2) the site is in area of potentially strong ground motion; and (3) groundwater is less than 50 below ground surface (bgs). The *Seismic Hazards* Zone *Report for the Oxnard 7.5-Minute Quadrangle, Ventura County California* (CGS 2002), *State of California Seismic Hazard Zones Oxnard Quadrangle, Revised Official Map* (CGS 2002), and Figure 6-1 of the *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006) indicates that the site is located in a recognized geological hazard zone for earthquake induced liquefaction. This findings in these data are based on the assumptions that the site area is underlain by coarse grained Holocene age sediments, which are generally considered have a significant liquefaction potential, and because the depth to groundwater for the site area is estimated to be less than 50 feet bgs. Groundwater was encountered at the site at depths ranging from approximately 20 to 25 feet bgs in the geotechnical borings completed during April and July 2018 (ESP 2018), which is much shallower than the 50 feet bgs depth used as the maximum depth criterion for potentially liquefiable conditions.

ESP evaluated the liquefaction potential at the site in accordance with the 2016 CBC (ICC 2017) and the methods in the *Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication 117A* (Special Publication 117A) (CGS 2008). ESP has analyzed the boring data for this project and utilized methods suggested in Special Publication 117A (CGS 2008), and based on this analysis, concluded that due to the presence of groundwater in the upper 50 feet of soil (measured at 20 to 25 feet bgs) and the density of sand and silt soils, there appears to be a potential for both liquefaction and seismically induced settlement of dry sand to occur at the site (ESP 2018).

ESP evaluated the potential effects of liquefaction by performing analysis of the cone penetrometer (CPT) data using the site-specific peak ground acceleration (PGA) of 0.969 g from the site specific ground motion analysis, an earthquake modal magnitude of 7.01g (USGS 2018c), an assumed historical high groundwater depth of 8 feet bgs (CGS 2002a), and the approximate existing groundwater depth of approximately 20 feet bgs. ESP concluded that it appears liquefaction occurs in relatively thin discontinuous soil layers. Total liquefaction induced dynamic settlement assuming a groundwater depth of 8 feet ranged between 0.2 to 1.2 inches, and 0.1 to 0.6 inches for a groundwater depth of 20 feet (ESP 2018b).

Seismically induced settlement of dry sand is also caused by a significant seismic event, and may occur in lower density and sand and silt soils that are not saturated by groundwater. During a major earthquake, the void spaces between the unsaturated soil particles that are filled with air tend to compress which translates to a decrease in volume or settlement (ESP 2018).

ESP evaluated seismically induced settlement of dry sand as part of the liquefaction evaluation using a reduced or modified PGA value of 2/3 (0.969 g) = 0.646 g. Additionally, the upper 30 inches of soil were neglected in the

analyses because the upper 2 to 3 feet of the surface soils had been recently ripped and plowed as part of the on-going agriculture operations at the site, and these soils will ultimately be removed and replaced as moisture conditioned compacted fill as part of future site development as recommended later in the "Grading" section ESP's 2018 report. Total seismically induced settlement of dry sand assuming a groundwater depth of 8 feet ranged between 0 to 0.2 inches, and 0.1 to 0.2 inches for a groundwater depth of 20 feet (ESP 2018).

Based on the information presented above, ESP concluded that no special measures will be needed to protect the structures and improvements from either liquefaction or seismically induced settlement of dry sand (ESP 2018). Therefore, project impact would be less than significant and this issue will not be discussed further in the EIR.

IV. Landslides?

Less Than Significant Impact. On the basis of the July 2, 2018 Site reconnaissance performed for the Geohazard Assessment/Geotechnical Investigation (Tetra Tech 2018b), a review of the CGS Seismic Hazards Map for the 7.5 Minute Series Oxnard Quadrangle (CGS 2002b) and Section 6.2.2 of the *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006) indicates that the project site is not in an area prone to landslides and slope instability. Therefore, project impact is less than significant, and this issue will not be discussed further in the EIR.

b. Would the project result in substantial soil erosion or the loss of topsoil?

Potentially Significant Impact. The project site is currently used for agriculture. Soil erosion would potentially occur during construction activities, including site grading, structure assembly, and utility extension. Therefore, this issue will be addressed in the EIR.

c. Is the project located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslides, lateral spreading, subsidence, liquefaction, or collapse?

Less Than Significant Impact. As documented above in response 3.4.7 a IV), the project site is not in an area prone to landslides or slope instability. Therefore, project impact is less than significant, and this issue will not be discussed further in the EIR.

Based on the results of the liquefaction analysis performed by ESP for their Geotechnical Report, the potential for loss of soil bearing strength and lateral spreading at the site was determined to be very low. The assessment for loss of soil bearing strength was developed by comparing the thickness of the overlying non-liquefiable soils with respect to the depth, the relatively thin thickness, and the discontinuous nature of the underlying liquefiable soils. Lateral spreading can occur when a soil mass either slides laterally on liquefied soil layers towards a free slope face, or when a soil mass moves downslope on sloping ground. Since a free slope face does not exist within or near the site, we focused on the sloping ground aspect of lateral spreading. Based on the Google Earth website (Google, 2018), the site slopes at approximately 0.35 percent from the north to the south. The assessment for lateral spreading was developed by considering the relatively flat to very gently sloping ground surface with respect to the discontinuous nature of the underlying liquefiable soils. The conditions needed for lateral spreading to occur do not appear to exist at the Site (ESP 2018; Tetra Tech 2018b). Therefore, project impact is less than significant, and this issue will not be discussed further in the EIR.

Section 6.2.2 of the *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006) indicates that the Site is located in an area susceptible to subsidence. The subsidence has been caused by overdraft of the groundwater aquifers that underlie the Oxnard Plain. Although it could occur, it is considered to be an insignificant risk due to the absence of reported problems. Therefore, project impact is less than significant, and this issue will not be discussed further in the EIR.

As documented above in response 3.4.7 a III), the project site is not in an area prone to liquefaction, or collapse. Therefore, impact is less than significant, and this issue will not be discussed further in the EIR.

d. Is the project located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?

Less Than Significant Impact. The ESP Geotechnical Engineering Report concluded that the upper Site soils were judged to be generally non-expansive. Therefore, no special measures with respect to expansive soils are considered necessary (ESP 2018; Tetra Tech 2018b). Project impact would be less than significant, and this issue will not be discussed further in the EIR.

e. Would the project have soils that are incapable of supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of waste water?

No Impact. The proposed project would not use septic tanks or alternative wastewater disposal systems and no project impact would result. Therefore, this issue will not be discussed further in the EIR.

f. Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Potentially Significant Impact. Based on the geotechnical studies prepared for the project site (Tetra Tech 2018b), the project site is underlain at the ground surface by Holocene deltaic alluvium and wash fan deposits to approximately 70 feet bgs. These are conformably underlain by upper Pleistocene alluvial sand and gravel deposits to approximately 400 feet bgs, and the marine – non-marine clays and gravels of the Lower Pleistocene San Pedro formation to approximately 2,000 feet bgs. Older alluvial deposits, upper Pleistocene and older deposits would have the potential to contain paleontological resources. Therefore, this issue will be discussed further in the EIR.

2.4.8 GREENHOUSE GAS EMISSIONS

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	X			
b.	Conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?	X			

Discussion:

a. Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Potentially Significant Impact. The proposed project would generate GHGs during construction and operation activities. Pursuant to state law (CEQA Guidelines 15064.7), VCAPCD is authorized to adopt thresholds of significance for GHG emissions. To date, VCAPCD has evaluated multiple options, but has not made a decision to adopt any of these options. VCAPCD is leaning toward the adoption of thresholds of significance for land use development consistent with those adopted by the South Coast Air Quality Management District (SCAQMD). On December 5, 2008, SCAQMD Governing Board adopted a proposal for an interim GHG threshold of significance for projects where the SCAQMD is lead agency. The threshold of significance is applicable for stationary sources and can be used for determining significant impacts for proposed projects (SCAQMD 2008). Under the interim thresholds of significance, projects can emit up to 10,000 MT per year of CO_2e before being deemed as having significant impacts. Therefore, GHGs resulting from the Proposed Project will be calculated using CalEEMod and this issue will be further analyzed in the EIR.

b. Would the project conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?

Potentially Significant Impact. As noted above, GHGs resulting from the proposed project will be calculated using CalEEMod and included in the EIR. Based on these results, the proposed project will be evaluated further in the EIR for potential conflict(s) with applicable plans, policies or regulations of an agency adopted for the purpose of reducing the emissions of GHGs.

2.4.9 HAZARDS AND HAZARDOUS MATERIALS

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?			X	
b.	Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			X	
c.	Emit hazardous emissions or involve handling hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school?			X	
d.	Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	X			
e.	For a project located within an airport land use plan area or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?			X	
f.	Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			X	
g.	Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?			X	

Discussion:

a. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Less Than Significant Impact. The proposed project would not handle or generate large quantities of hazards materials. Potential hazardous materials used onsite include those needed during short term temporary construction activities such as architectural coatings and sealants. During long term operations, potential hazardous materials stored at the school would include cleaners (e.g., disinfectants, bleach) and office supplies (e.g., toner). As is standard for schools, these materials would be kept in cabinets or supply rooms and therefore, would not be

considered a hazard to students, staff, or the public. Therefore, project impact would be less than significant, and this issue will not be discussed further in the EIR.

b. Would the project create a significant hazard to the public or the environment through the reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment?

Less Than Significant Impact. The proposed project would not create a significant hazard to the public or the environment involving the likely release of hazardous materials. As noted in response 3.4.9 a) above; the proposed project would be a public school that would not handle or generate large quantities of hazardous materials. Common hazardous materials needed for routine maintenance and operations would be stored in small quantities in cabinets and supply rooms. Hazardous materials on campus would be limited and stored away from students and the public. Therefore, project impact would be less than significant, and this issue will not be discussed further in the EIR.

c. Would the project emit hazardous emissions or handle hazardous materials or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school?

Less Than Significant Impact. The proposed project is a public school that would not generate hazardous emissions or use materials in hazardous quantities. Therefore, project impact would be less than significant.

Radon is a naturally occurring, odorless, colorless gas produced by certain geologic materials. It is known to be a human carcinogen and can pose a cancer risk greater than one in one million in humans at concentrations equal to or greater than 4 picoCuries per liter (pCi/L).

The EDR environmental database search indicated that Ventura County is in a Radon Zone 1 area. Zone 1 areas have a predicted average indoor screening level greater than 4 pCi/L. The EDR database search reported that of 38 sites listed in the California Radon database that have been tested for the zip code of 93030, one had radon at levels greater than 4 pCi/L. The Federal Area Radon Information database reported 9 sites tested for radon in the 93454 zip code. The average concentration of tested sites was 0.478 pCi/L in first floor living areas (EDR 2017).

The EDR report gives a passing result for the project site with no further action required. These findings suggest there are no health concerns related to radon at the site. Therefore, project impact would be less than significant, and this issue will not be discussed further in the EIR.

d. Is the project located on a site which is included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Potentially Significant Impact. Based on information provided in the 2018 Phase I ESA (Tetra Tech 2019a) and Draft PEA (Tetra Tech 2018c), the proposed school project would not be located on a site included on a list of hazardous material sites. However, the PEA field investigation results indicated that approximately 28 acres of the site surface soils are impacted by OCPs at concentrations exceeding the PEA Screening Levels (Tetra Tech 2018c). Based on the results of the PEA, including the human health screening evaluation and the ecological screening evaluation, OCPs detected at the site (primarily toxaphene) appear to be present at significant concentrations that pose a threat to likely human receptors, including residential/unrestricted land use. Assumed exposures at the project ste result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors (Tetra Tech 2018c). The Draft PEA concluded that the surface soil sampling performed for PEA has adequately defined the lateral extent of OCP-impacted soil at the project site at concentrations exceeding DTSC Screening Levels. Tetra Tech is currently conducting a SSI of the under DTSC oversight to assess the depth of OCP-impacted soil at the site at concentrations exceeding PEA Screening Levels. A remedy for the OCP-impacted soil at the site will be developed following completion of the SSI. Therefore, this issue will be evaluated further in the EIR.

e. For a project located within an airport land use plan area or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?

Less Than Significant Impact. California Code of Regulations Title 21 requires the State Department of Transportation to review any proposed school site that is located within 2 nautical miles of a runway. There are no airports within two nautical miles of the Site. Based on review of a Google Earth Image date January 5, 2015, and AirNav.com (AirNav.com 2017) (Appendix E), no airports are located within two nautical miles of the site. The closest airport to the Site is the Oxnard Airport, which is approximately 2.4 nautical miles west of the site. In addition, the Camarillo Airport is located approximately 3.2 nautical miles east of the site. Therefore, project impact is less than significant, and this issue will not be discussed further in the EIR.

Based on review of data from AirNav.com, the site is located within two nautical miles of a heliport. The St John's Regional Medical Center Heliport is located approximately 0.6 nautical miles north of the site (AirNav.com 2017). This heliport is not identified as a primary noise source in the City of Oxnard's Noise Element. Therefore, this heliport would not result in a safety hazard or excessive noise for people residing or working in the project area. Therefore, project impact is less than significant, and this issue will not be discussed further in the EIR.

f. Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Less Than Significant Impact. The project site is not located in or near a state responsibility area, nor is it within lands classified as very high fire hazard severity zones. Therefore, project impact is less than significant, and this issue will not be discussed further in the EIR.

g. Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?

Less Than Significant Impact. The *Ventura County Community Wildfire Protection Plan* (Ojai Valley Fire Safe Council 2010) (VCCWFPP) was created in accordance with Healthy Forest Restoration Act (HFRA) (enacted by the U.S. Congress in 2003) to serve as a Community Wildfire Protection Plan (CWPP) to protect communities at risk from wildland fires in Ventura County. The VCCWFPP defines an "at risk community" for wildland fires as:

- One that is listed in the notice entitled "Wildland Urban Interface Communities Within the Vicinity of Federal Lands That Are at High Risk From Wildfire";
- A community in which conditions are conducive to a large-scale wildland fire disturbance event; and
- A community for which a significant threat to human life or property exists as a result of a wildland fire disturbance event.

The VCCWFPP does not identify the City of Oxnard as a "at risk community" for wildland fires. Therefore, project impact would be less than significant and this issue will not be discussed further in the EIR.

2.4.10 HYDROLOGY AND WATER QUALITY

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?	X			
b.	Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	X			
c.	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:	X			
	i.) result in substantial erosion or siltation on- or off-site;	X			
	ii.) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;	X			
	(iii.) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or	X			
	(iv.) impede or redirect flood flows?	X			
d.	In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	X			
e.	Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	X			

Discussion:

a. Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?

Potentially Significant Impact. The project would need to connect to a sanitary sewer main which conveys domestic wastewater to the Oxnard Wastewater Treatment Plant (OWTP). The OWTP, owned and operated by the City of Oxnard, is a secondary treatment facility located at 6001 South Perkins Road, Oxnard, California (Oxnard Public Works 2015). The OWTP treats and discharges wastewater pursuant to National Pollutant Discharge Elimination System Order No. R4-2013-0094, adopted by the Los Angeles Regional Water Quality Board on June 6, 2013. The project would generate domestic wastewater from restroom facilities, which would be treated by the OWTP. The construction and operational impacts of the project will be in accordance with a Construction General

Permit Storm Water Pollution Prevention Plan (SWPPP). Studies including sewer calculations, a Preliminary Drainage Report, and a Preliminary Water Demand Analysis are being prepared. Therefore, this issue will be discussed further in the EIR.

b. Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?

Potentially Significant Impact. The proposed project is designed to meet the educational and recreational needs of students onsite. Stormwater improvements are proposed as part of the project, such as a High Density Polyethylene (HPDE) storm drain system and two points of stormwater pre-treatment, infiltration, and detention. Studies including sewer calculations, a Preliminary Drainage Report, and a Preliminary Water Demand Analysis are being prepared. Therefore, this issue will be discussed further in the EIR.

c. Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or through the addition of impervious surfaces in a manner that would:

(i) result in substantial erosion or siltation on- or off-site;

Potentially Significant Impact. The project site is not located near the Santa Clara River or perennial surface streams. Therefore, the proposed project would not alter the course of a stream or river. However, the project would result in a change in the runoff patterns in the local area because the site would be converted from agricultural uses to educational uses, thereby increasing the amount of hardscape on the site and potentially increasing runoff in the area. Therefore, the projects long-term effects on erosion or siltation will be discussed further in the EIR.

(ii) substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;

Potentially Significant Impact. The project is not located near the Santa Clara River or perennial surface streams. Therefore, the proposed project would not alter the course of a stream or river. However, the project would result in a change in the runoff patterns in the local area because the site would be converted from agricultural uses to educational facilities, thereby increasing the amount of hardscape on the site and potentially increasing runoff in the area. The proposed project includes stormwater improvements such as a High Density Polyethylene (HPDE) storm drain system and two points of stormwater pre-treatment, infiltration, and detention. A Preliminary Drainage Report is being prepared and this issue will be discussed further in the EIR.

(iii) create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;

Potentially Significant Impact. The project site is not located near the Santa Clara River or perennial surface streams. Therefore, the proposed project would not alter the course of a stream or river. However, the project would result in a change in the runoff patterns in the local area because the site would be converted from agricultural uses to educational facilities, thereby increasing the amount of hardscape on the site and potentially increasing runoff in the area. While multiple stormwater improvements are proposed as part of the project, analysis of potential impacts on downstream drainage system capacity is necessary. A Preliminary Drainage Report is being prepared and this issue will be discussed further in the EIR.

(iv) impede or redirect flood flows?

Potentially Significant Impact. The project site is located in the southern area of the Santa Clara River flood plain. According to the FEMA Flood Insurance Rate Map No. 06111C0910E the Western half of the project site is located in Zone X (Other Areas) and is defined as areas determined to be outside the 0.2% (500-yr) annual chance floodplain, while the eastern portion of the site is located in Zone X (Other Flood Areas) and is defined as areas of 0.2% (500-yr) annual chance of flood; areas of 1%(100-yr) annual chance flood with average depths of less than

one foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% (100-yr) annual chance flood (FEMA 2010). The drainage path of the site post-construction, including potential flood flows, requires further analysis. A Preliminary Drainage Report is being prepared and this issue will be discussed further in the EIR.

d. Would the project, in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?

Potentially Significant Impact. The project site is located in the southern area of the Santa Clara River flood plain. According to the FEMA Flood Insurance Rate Map No. 06111C0910E the Western half of the project site is located in Zone X (Other Areas) and is defined as areas determined to be outside the 0.2% (500-yr) annual chance floodplain, while the eastern portion of the site is located in Zone X (Other Flood Areas) and is defined as areas of 0.2% (500-yr) annual chance of flood; areas of 1%(100-yr) annual chance flood with average depths of less than one foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% (100-yr) annual chance flood (FEMA 2010). Figure 2.6 of the *Ventura County General Plan Hazards Appendix* indicates the project site is not located in an area subject to inundation by tsunami or seiche (Ventura County 2013). Figure 2.11.2 of the *Ventura County General Plan Hazards Appendix* indicates there are four major reservoirs in the Santa Clara River watershed upstream of the project site that are FEMA high hazard dams that would inundate the project area in the event of a reservoir failure (Ventura County 2013). During an inundation event, all pollutants stored at the project site are at risk of release to all areas downstream of the project site. Further analysis of potential pollutants on site and potential flood flows is necessary. Therefore, this issue will be discussed further in the EIR.

e. Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Potentially Significant Impact. The water supply needed for the long-term function of the project requires further evaluation. Therefore, the projects effect on the current water quality control plan or sustainable groundwater management plan will be discussed further in the EIR.

.

2.4.11 LAND USE AND PLANNING

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Physically divide an established community?			X	
b.	Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	X			

Discussion:

a. Would the project physically divide an established community?

Less Than Significant Impact. With implementation of the proposed project, access to the surrounding community would still be available via the existing roadway network including Camino Del Sol and Rose Avenue. In addition, the proposed new Central Road would improve community roadway circulation by providing a new road to the north of the school campus that would connect the existing Camino De La Luna to Jacinto Drive. Therefore, the proposed project would not physically divide an established community and project impact would be less than significant. This issue will not be discussed further in the EIR.

b. Would the project cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?

Potentially Significant Impact. OUHSD proposes to change the NECSP designations for the project site to Public Education and as needed Civic Center Use. The District would process a General Plan Amendment and Specific Plan Amendment through the City of Oxnard. Therefore, this issue will be evaluated further in the EIR.

2.4.12 MINERAL RESOURCES

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X
b.	Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?				X

Discussion:

a. Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

No Impact. Minerals are defined as any naturally occurring chemical elements or compounds formed from inorganic processes and organic substances. The California Surface Mining and Reclamation Act of 1975 (SMARA) requires that all cities address significant mineral resources, classified by the State Geologist and designated by the State Mining and Geology Board, in their General Plans.

According to the Oxnard 2030 General Plan, the project site is not within a known mineral resource area; important mineral / sand / gravel deposits are primarily located along the Santa Clara River channel, along Route 101 (Ventura Freeway) corridor, and along the eastern edge of the City extending as far west as Oxnard Boulevard in several areas (City of Oxnard 2011).

According to the California Department of Conservation, the project site is in a Mineral Resource Zone (MRZ) MRZ-3 and MRZ-4. MRZ-3 zones are defined as areas containing known or inferred aggregate resources of undetermined significance and MRZ-4 zones are defined as areas were available information is inadequate for assignment to any other MRZ zone (California Department of Conservation 2011).The State Mining and Geology Board designates Mineral Resource Zones (MRZ) and areas in which minerals have been found in substantial quantities. MRZ-2 areas are defined as areas where there are, or there is likely to be, mineral deposits. The project site is within an MRZ-3 and MRZ-4 area. There are no MRZ-2 areas within the project boundary; additionally, mining operations are generally not considered a compatible use with residential and school land uses. Therefore, no project impacts to mineral resources would occur, and this issue will not be discussed further in the EIR.

b. Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

No Impact. The Mineral Resources land use designation previously included in the Oxnard 2020 General Plan has been discontinued in the Oxnard 2030 General Plan; there are no mineral resource recovery sites delineated within the Oxnard 2030 General Plan or the Northeast Community Specific Plan (City of Oxnard 2011, City of Oxnard 1993). Therefore, no project impacts would occur, and this issue will not be discussed further in the EIR.

2.4.13 NOISE

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project result in:					
a.	Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	X			
b.	Generation of excessive groundborne vibration or groundborne noise levels?	X			
c.	For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			X	

Discussion:

a. Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Potentially Significant Impact. The existing noise environment consists of vehicle noise from local street traffic on Camino Del Sol, Rose Avenue, and Cesar Chavez Drive, nature sounds, and community sounds. Other noise sources include the Union Pacific Railroad line that is located 0.6 miles south of the project site. Agriculture land use is located north of the project site and residential land use is located to the east, south, and west of the project site. Rio Rosales Elementary School is also located to the east. No ambient noise monitoring data have been identified for the Project vicinity, but existing land use patterns and street patterns as well as the existing noise contours published in the City of Oxnard's Noise Element indicate that the existing ambient noise levels at the proposed project site should be at or below 60 A-weighted decibels (dBA) Community Noise Equivalent Level (CNEL).

A technical noise analysis will be prepared to evaluate the potential impacts from the construction and operation of the proposed project related to applicable noise standards. The results will be documented in the noise section of the EIR. The analysis will also evaluate the potential construction noise impacts to Rio Rosales Elementary School since construction of the proposed project could occur during school hours. Therefore, this issue will be discussed further in the EIR.

b. Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Potentially Significant Impact. Operation of the school would not generate perceivable vibration levels; however, construction of the classroom buildings and site grading would require the use of equipment that could generate significate vibration levels. Possible sources of vibration may include bulldozers, dump trucks, backhoes, rollers, and other construction equipment that produces vibration. Therefore, this issue will be discussed further in the EIR.

c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Less Than Significant Impact. California Code of Regulations Title 21 requires the State Department of Transportation to review any proposed school site that is located within 2 nautical miles of a runway. There are no airports within two nautical miles of the site. Based on review of a Google Earth Image date January 5, 2015, and AirNav.com (AirNav.com 2017) (Appendix E), no airports are located within two nautical miles of the site. The closest airport to the site is the Oxnard Airport, which is approximately 2.4 nautical miles west of the site. In addition, the Camarillo Airport is located approximately 3.2 nautical miles east of the site. This issue will not be discussed further in the EIR.

Based on review of data from AirNav.com, the site is located within two nautical miles of a heliport. The St John's Regional Medical Center Heliport is located approximately 0.6 nautical miles north of the Site (AirNav.com 2017). This heliport is not identified as a primary noise source in the City of Oxnard's Noise Element. Therefore, this heliport would not result in a safety hazard or excessive noise for people residing or working in the project area. This issue will not be discussed further in the EIR.

2.4.14 POPULATION AND HOUSING

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?			X	
b.	Displace a substantial number of existing people or housing units, necessitating the construction of replacement housing elsewhere?				X

Discussion:

a. Would the project induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)?

Less Than Significant Impact. The proposed project is needed to accommodate existing and anticipated future enrollment in OUHSD. The project site is located within a developed urban environment. Access to the school would be provided from Rose Avenue, Camino Del Sol, and a proposed new "Central Road" to the north of the project site that would connect to the existing Camino De La Luna and Jacinto Drive. While the educational facilities would be contained within the project site; the City may require additional street and sidewalk improvements to service the proposed project. As noted below in section 3.4.17, a traffic study is being prepared for the proposed project and potential impacts related to traffic evaluated in the EIR. However, given the location of the project site within an existing developed urban environment these roadway improvements are not anticipated to be growth inducing.

Increased demand for school services is generally linked to changes in local land use patterns such as the construction of new dwelling units and the generation of new jobs that encourages new people to move into the area. No housing is proposed as a part of the project. The proposed project would generate some new jobs. Additional staff would include teachers, administrative, and support staff. Most or all of the additional staff could be hired from the existing qualified applicant pool already residing within or near the District. However, if teachers or other staff are hired outside the District area to fill a specific role(s), it may result in a few new people and their families moving into surrounding neighborhoods, thus creating a slight increase in the local population. Therefore, project impact would be less than significant and this issue will not be discussed further in the EIR.

b. Would the project displace a substantial number of existing people or housing units, necessitating the construction of replacement housing elsewhere?

No Impact. The project site is vacant undeveloped land that does not contain any housing. No people would be displaced requiring replacement housing. Therefore, no project impacts would occur, and this issue will not be discussed further in the EIR.

2.4.15 PUBLIC SERVICES

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities or a need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the following public services:				
	i.) Fire protection?	X			
	ii.) Police protection?	X			
	iii.) Schools?				X
	iv.) Parks?	X			
	v.) Other public facilities?			X	

Discussion:

a. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities or a need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:

I. Fire Protection

Potentially Significant Impact. The proposed project would be designed and constructed to meet required fire protection standards including adequate emergency access. As a public school, the proposed project would be anticipated to generate similar types of calls as the residential uses located nearby. Nonetheless, the EIR will evaluate the potential physical impacts on the environment for fire protection services and this issue will be analyzed further in the EIR.

II. Police Protection

Potentially Significant Impact. The proposed project would be designed and constructed to meet required fire protection standards including adequate emergency access. As a public school, the proposed project would be anticipated to generate similar types of calls as the residential uses located nearby. Nonetheless, the EIR will evaluate the potential physical impacts on the environment for police protection services and this issue will be analyzed further in the EIR.

III. Schools

No Impact. The proposed project includes educational facilities for a new High School that is needed to accommodate existing and anticipated future enrollment in the OUHSD. The increased school capacity with the proposed project would have a beneficial impact on public school facilities. Therefore, no adverse project impact on public school facilities would result and this issue will not be further analyzed in the EIR.

IV. Parks

Potentially Significant Impact. The proposed project includes educational facilities designed to meet the educational and recreational needs of grades 9-12 students' onsite. Recreational facilities to be provided on campus include a stadium, a variety of play fields, hard courts, and a pool. Of these, approximately 14.2-17 acres of playfields are proposed for joint-use with the City to provide additional recreation opportunities to the community as well as consideration for civic center use of other facilities on site. This issue will be evaluated further in the EIR.

V. Other Public Facilities

Less Than Significant Impact. The proposed project would not result in substantial increased demand for other public facilities such as libraries. The proposed project is designed to meet the educational and recreational needs of grades 9-12 students' onsite. Therefore, project impact is less than significant, and this issue will not be further analyzed in the EIR.

2.4.16 RECREATION

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?			X	
b.	Include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?	X			

Discussion:

a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?

Less Than Significant Impact. The City of Oxnard Recreation & Community Services Department provides park and recreation services in the City. The proposed project is not dependent upon City parks for student recreational needs. The proposed project is designed to meet the educational and recreational needs of grades 9-12 students' onsite. Recreational facilities to be provided on campus include a stadium, a variety of play fields, hard courts, and a pool. Therefore, project impact would be less than significant, and this issue will not be further analyzed in the EIR.

b. Does the project include recreational facilities or require the construction or expansion of recreational facilities that might have an adverse physical effect on the environment?

Potentially Significant Impact. The proposed project includes educational facilities designed to meet the educational and recreational needs of grades 9-12 students' onsite. Recreational facilities to be provided on campus include a stadium, a variety of play fields, hard courts, and a pool. Of these, approximately 14.2 – 17 acres of playfields are proposed for joint-use with the City to provide additional recreation opportunities to the community as well as consideration for civic center use of other facilities on site. Potential environmental impacts associated with the proposed project, including recreational areas, are discussed by environmental resources topic throughout this Initial Study (IS). Per CEQA Guidelines Section 15378, a "project" means the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment. Therefore, issues identified for further analysis in the EIR will include analysis for the whole project including potential impacts related to new recreational facilities.

2.4.17 TRANSPORTATION

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	X			
b.	Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	X			
c.	Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	X			
d.	Result in inadequate emergency access?	X			

Discussion:

a. Would the project conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Potentially Significant Impact. A traffic study will be conducted for the proposed project. As part of this study, traffic counts at study area intersections will be collected for AM and PM peak hours. Trip generation estimates will be determined for the project site based on anticipated enrollment and standard trip generation rates and other sources. The trip generation will be coordinated with City staff. Trips will be distributed based on school routes and student zip code information. The traffic study will calculate intersection levels of service for existing conditions, cumulative conditions and 2030 General Plan conditions with and without the proposed project. The traffic study will identify feasible mitigation measures where applicable. The potential for the proposed project to conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system will be evaluated further in the EIR based on the results of the traffic study.

b. Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Potentially Significant Impact. As noted above, a traffic study is being conducted for the proposed project. Therefore, this issue will be evaluated further in the EIR based on the results of the traffic study.

c. Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Potentially Significant Impact. The proposed project would be designed and constructed to meet required standards including adequate emergency access. A review of project site access and circulation plan, including bicyclist and pedestrian access and safety will be conducted as part of the traffic study. Therefore, this issue will be evaluated further in the EIR.

d. Would the project result in inadequate emergency access?

Potentially Significant Impact. The proposed project would be designed and constructed to meet required standards including adequate emergency access. While no impacts to emergency access are anticipated, a review of project site access will be conducted as part of the traffic study and the results documented in the EIR.

2.4.18 TRIBAL AND CULTURAL RESOURCES

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
	i.) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	X			
	ii.) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	X			

Discussion:

a. Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

I. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or

Potentially Significant Impact. The project site is currently used for agriculture. A Phase I Archaeological Survey will be conducted for the project site to determine if prehistoric or historic archaeological deposits are present. Therefore, this issue will be evaluated further in the EIR.

II. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Potentially Significant Impact. A Phase I Archaeological Survey will be conducted for the project site to determine if prehistoric or historic archaeological deposits are present. Therefore, this issue will be evaluated further in the EIR.

2.4.19 UTILITIES AND SERVICE SYSTEMS

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	X			
b.	Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	X			
c.	Result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	X			
d.	Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?			X	
e.	Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?			X	

Discussion:

a. Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Potentially Significant Impact. Implementation of the proposed project would require water and wastewater treatment services and other public utility connections. A preliminary water demand memo, hydrology report and sewer report are being prepared for the Maulhardt Ranch property. Therefore, this issue will be evaluated further in the EIR.

b. Would the project have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Potentially Significant Impact. Implementation of the proposed project would require water service. A preliminary water demand memo is being prepared for the Maulhardt Ranch property. Therefore, potential impacts to water supply will be evaluated further in the EIR.

c. Would the project result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Potentially Significant Impact. Implementation of the proposed project would require wastewater treatment services. A sewer report is being prepared for the Maulhardt Ranch property. Therefore, potential impacts to wastewater treatment capacity will be evaluated further in the EIR.

d. Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

Less Than Significant Impact. The proposed project would submit the City of Oxnard Construction and Demolition (C and D) Management Worksheets in compliance with AB 939 for diverting solid wastes during the Construction, Demolition, and Occupancy phases of the project (City of Oxnard 2015). The City of Oxnard is in the process of developing a Zero Waste strategic plan and is currently meeting or exceeding state diversion goals for solid waste. The City operates the Del Norte Regional Recycling and Transfer Station, which serves as the central hub of the City's overall solid waste management system and as a regional resource. Waste that is not recycled is disposed of at local landfills, most commonly Toland Road Landfill (City of Oxnard 2017). The Ventura Regional Sanitation District expanded Toland Road Landfill from 135-tons per day to 1,500-tons per day in 1997 to provide Ventura County with approximately 30 years of landfill capacity as of that date (Ventura Regional Sanitation District 2016). Therefore, the proposed project would not generate solid waste in excess of State or local standards, in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals, and project impact would be less than significant. This topic will not be discussed further in the EIR.

e. Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

Less Than Significant Impact. The proposed project would not generate substantial amounts of solid waste and the project would comply with applicable federal, state, and local statutes and regulations related to solid waste. The proposed project would submit the City of Oxnard Construction and Demolition (C and D) Management Worksheets in compliance with AB 939 for diverting solid wastes during the Construction, Demolition, and Occupancy phases (City of Oxnard 2015). Therefore, project impact would be less than significant, and this issue will not be discussed further in the EIR.

2.4.20 WILDFIRE

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:					
a.	Substantially impair an adopted emergency response plan or emergency evacuation plan?				X
b.	Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?				X
c.	Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?				X
d.	Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?				X

Discussion:

a. Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?

No Impact. The project site is not located in or near a state responsibility area; the site is within the incorporated Oxnard local responsibility area (CalFire 2007). The project site is within a Moderate Fire Hazard Severity Zone and is not within a determined "Community at Risk." Within Ventura County, a "Community at Risk" is defined as a community within close proximity to chaparral vegetation, that if ignited, would present a high or very high hazard to nearby homes, infrastructure, and/or assets (Ojai Valley Fire Safe Council 2010). The project site is not located in or near a state responsibility area, nor is it within lands classified as very high fire hazard severity zones; therefore, no project impacts would occur, and this issue will not be discussed further in the EIR.

b. Would the project due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?

No Impact. The project site is not located in or near a state responsibility area, nor is it within lands classified as very high fire hazard severity zones. There are no factors that would exacerbate wildfire risks, therefore no project impacts would occur, and this issue will not be discussed further in the EIR.

c. Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?

No Impact. The project site is not located in or near a state responsibility area, nor is it within lands classified as very high fire hazard severity zones. The urban infrastructure installation/expansion associated with the proposed project would not exacerbate fire risk or result in temporary or ongoing impacts to the environment. Therefore, no project impacts would occur, and this issue will not be discussed further in the EIR.

d. Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?

No Impact. The project site is not located in or near a state responsibility area, nor is it within lands classified as very high fire hazard severity zones. Surface elevations at the project site are approximately 54-60 feet above MSL, and the proposed project would not expose people or structures to significant risks such as downstream flooding or landslides. Therefore, no project impacts would occur, and this issue will not be discussed further in the EIR.

2.4.21 MANDATORY FINDINGS OF SIGNIFICANCE

		Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
Would the project:					
a.	Have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	X			
b.	Have impacts that are individually limited but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects).	X			
c.	Have environmental effects that will cause substantial adverse effects on human beings, either directly or indirectly?	X			

Discussion:

a. Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

Potentially Significant Impact. As noted in this Initial Study analysis, several resource issues will be analyzed further in the EIR. While it is unlikely that the proposed project would substantially degrade the environment for biological or cultural resources, a clear determination cannot be made at this time and this issue will be analyzed further in the EIR.

b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects).

Potentially Significant Impact. As noted in this Initial Study analysis, several resource issues will be analyzed further in the EIR. The potential for the proposed project, when combined with other foreseeable projects in the area, to result in cumulative impacts will be evaluated further in the EIR.

c. Does the project have environmental effects that would cause substantial adverse effects on human beings, either directly or indirectly?

Potentially Significant Impact. The proposed project would be designed and constructed to meet required safety standards. As identified in this Initial Study, several resource issues will be analyzed further in the EIR. Therefore, a clear determination cannot be made at this time and this issue will be analyzed further in the EIR.

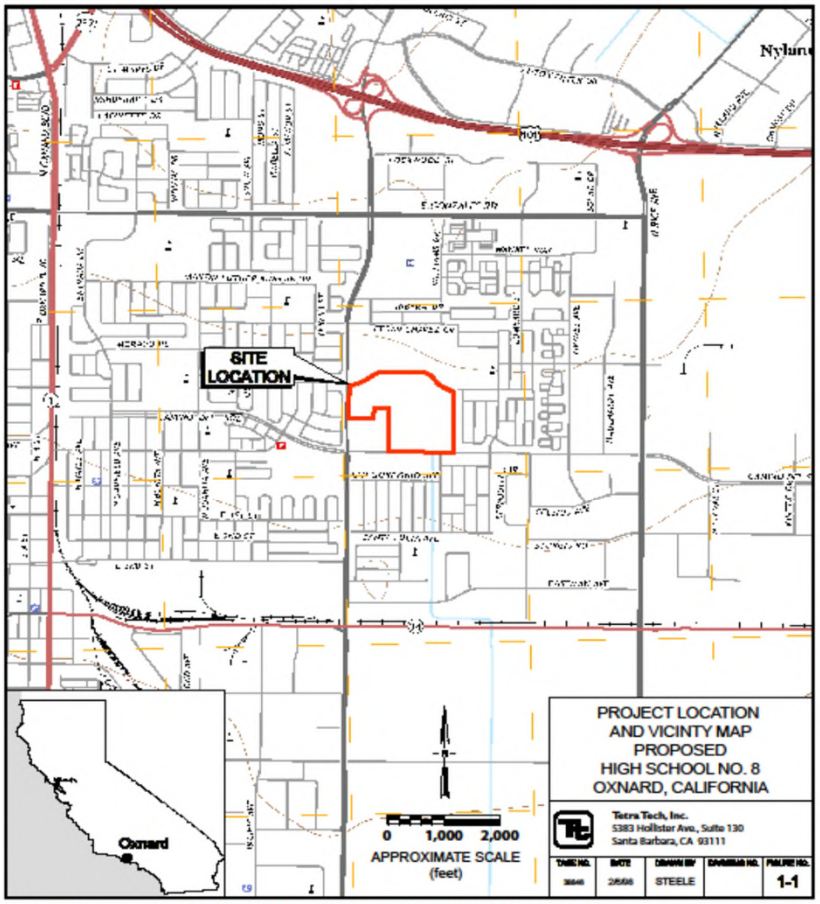
OXNARD UNION HIGH SCHOOL DISTRICT

Public Scoping Meeting for the New OUHSD High School No. 8 Project Environmental Impact Report

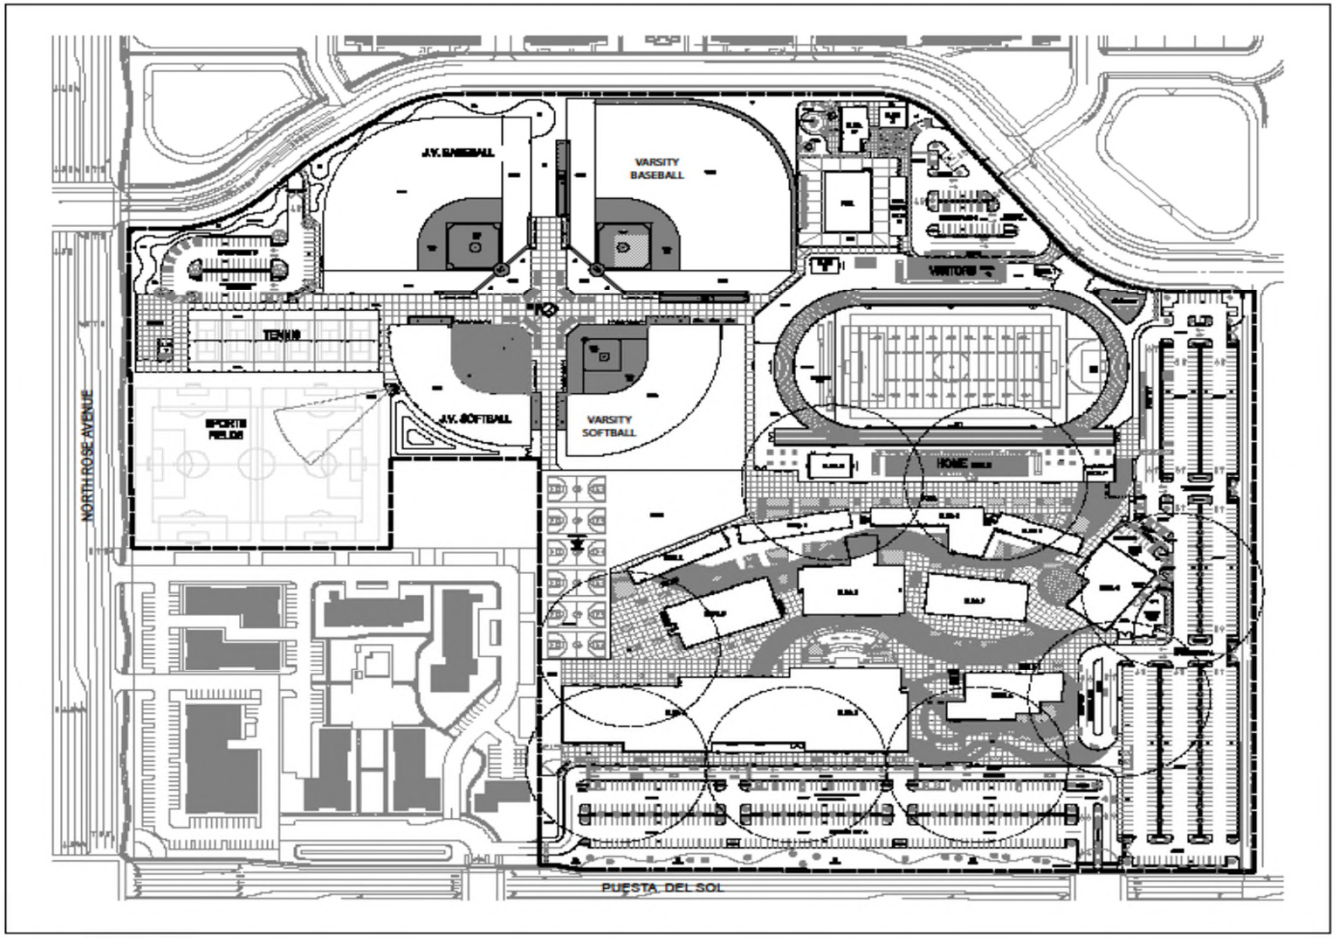


MARCH 6, 2019 6:00 PM

Scoping Meeting Agenda:

- Introductions
- Description of Proposed Project
- Summary of the Environmental Review Process
- Public comments

Project Location



- Located northeast of Camino Del Sol and Rose Avenue, Oxnard, CA.
- The project site includes approximately 46.8-acres of the Maulhardt Ranch which is a 107.25-acre property.
- The project site has been used for cultivation of row crops from as early as 1869 to the present. Currently used for cultivation of strawberries.

Notes: 1) Base Map Oxnard Quadrangle 7.5 Minutes Series, U. S. Geological Survey (2015).
2) Site Boundary Extropolated from *Site Plan* (WLC Associates 2018)

Proposed Project

- OUHSD proposes to construct and operate a new state of the art High School to accommodate 2,500 school students in grades 9-12.
- The school facilities are designed to meet the educational and recreational needs of students in grades 9-12 onsite.
- In total, the proposed project would comprise approximately 211,115 square feet (sq. ft.) of building and structures and provide 806 parking spaces onsite.
- The proposed project includes utility connections including water, sewer, gas, electric, data/telecommunications, and storm water collection.

Proposed Project

- The project includes a variety of play fields, hard courts, and a pool. Approximately 14.2 -17 acres of play fields are proposed for joint-use with the City to provide additional recreational opportunities as well as consideration for civic center use of other school facilities on site.
- OUHSD would process a General Plan Amendment (GPA) and Specific Plan Amendment (SPA) through the City of Oxnard.
- OUHSD proposes to change the Northeast Community Specific Plan (NECSP) designations for the project site to Public Education and Civic Center Use.

Environmental Review Process

Initial Study

- OUHSD has prepared an Initial Study and determined that an Environmental Impact Report (EIR) is required.
- The EIR will be prepared to evaluate potentially significant impacts related to the following issues:
  - Aesthetics
  - Agriculture and Forestry Resources
  - Air Quality
  - Biological Resources
  - Cultural Resources
  - Energy
  - Geology/Soils
  - Greenhouse Gas Emissions
  - Hazards/Hazardous Materials
  - Hydrology/Water Quality
  - Land Use Planning
  - Noise
  - Public Services
  - Recreation
  - Transportation/Traffic
  - Tribal Cultural Resources
  - Utilities/Service Systems

Public Scoping

- The Notice of Preparation (NOP) comment period began on February 19, 2019 and ends on March 20, 2019.
- The public scoping process is intended to provide OUHSD (as the Lead Agency for CEQA) with the information the public feels is necessary to establish the appropriate scope for preparing the Environmental Impact Report (EIR).
- Please provide your comments, input, suggestions for project alternatives, and any other pertinent information that may enable us to prepare a comprehensive EIR for the proposed project.

Public Comments

- In addition to speaking at today's meeting; comments can also be submitted in writing:

Mr. Jeffrey Weinstein
Assistant Superintendent, Business Services
Oxnard Union High School District
309 South K Street,
Oxnard, CA 93030

Copy to: Mr. Joel Kirschenstein
President
Sage Realty Group, Inc.
2945 Townsgate Road, Suite 200
Westlake Village, CA 91361

- Please submit written comments by **March 20, 2019**. Due to the time limits mandated by State Law, your response must be sent at the earliest possible date but not later than 30 days after receipt of the Notice of Preparation (NOP).
- Please call Randy Westhaus, Tetra Tech at (805) 681-3101 or (805) 455-0603 (cell) if you have any questions.

RE: New High School No. 8 – Notice of Preparation (NOP)
SCH# 2019029101
GTS # 07-VEN-2019-00241
Vic. VEN-101/PM:20.734

Dear Mr. Jeffrey Weinstein:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced project's NOP. The Oxnard Union High School District (OUHSD) proposes to construct and operate a new state of the art neighborhood High School to accommodate existing and anticipated future enrollment in the District. The new school facilities are designed to meet the educational and recreational needs of up to 2,500 students in grades 9-12. The proposed project would comprise approximately 211, 115 sq. ft of building and structures and provide 806 parking spaces. In addition, the proposed project includes a variety of recreational areas to accommodate the recreational needs of the students and community. This proposed project includes a variety of play fields, hard courts, and a pool. Of these, approximately 14.2-17 acres of play fields are proposed for joint-use with the City to provide additional recreation opportunities to the community, as well as consideration of civic center used of other facilities onsite.

Caltrans has reviewed the NOP and we are looking forward to reviewing this project's Environmental Impact Report and Traffic Study in the future.

Caltrans is moving towards replacing Level of Service (LOS) with Vehicle Miles Traveled (VMT) when evaluating traffic impact. For any future project, like the proposed EIR, we encourage the Lead Agency to integrate transportation and land use in a way that reduces VMT and Greenhouse Gas (GHG) emissions by facilitating the provision of more proximate goods and services to shorten trip lengths and achieve a high level of non-motorized travel and transit use.

Caltrans seeks to promote safe, accessible multimodal transportation. Methods to reduce pedestrian and bicyclist exposure to vehicles improve safety by lessening the time that the user is in the likely path of a motor vehicle. These methods include the construction of physically separated facilities such as sidewalks, raised medians, refuge islands, and off-road paths and trails, or a reduction in crossing distances through roadway narrowing.

Caltrans recommends the project to consider the use of methods such as, but not limited to, pedestrian and bicyclist warning signage, flashing beacons, crosswalks, signage and striping, be used to indicate to motorists that they should expect to see and yield to pedestrians and bicyclists. Visual indication from

signage can be reinforced by road design features such as lane widths, landscaping, street furniture, and other design elements.

Storm water run-off is a sensitive issue for Los Angeles County. Please be mindful that projects should be designed to discharge clean run-off water. Discharge of storm water run-off is not permitted onto State Highway facilities without a storm water management plan.

As a reminder, any transportation of heavy construction equipment and/or materials which requires use of oversized-transport vehicles on State highways will need a Caltrans transportation permit. We recommend large size truck trips be limited to off-peak commute periods.

If you have any questions regarding these comments, please contact project coordinator Reece Allen, at reece.allen@dot.ca.gov and refer to GTS# 07-VEN-2019-00241.

Sincerely,

MIYA EDMONSON
IGR/CEQA Branch Chief

CITY OF OXNARD CALIFORNIA

March 20, 2019

BY E-MAIL AND FIRST-CLASS MAIL

Oxnard Union High School District
Mr. Jeffrey Weinstein
Assistant Superintendent, Business Services
309 South K Street
Oxnard, CA 93030

RE: New Oxnard Union High School District High School Number 8 Project

The City of Oxnard (City) has received and reviewed the Notice of Preparation (NOP) and Initial Study (IS) of an Environmental Impact Report (EIR) for the proposed new Oxnard Unified High School District (OUHSD) High School No. 8 Project (OUHSD project). This letter provides the City's comments on the NOP and IS.

City of Oxnard NOP Comments

According to the NOP, the OUHSD proposes to construct and operate a new state of the art neighborhood high school to accommodate existing and anticipated future enrollment in the OUHSD. The project site includes approximately 46.8-acres of the Maulhardt Ranch, a 107.25-acre property (APN 214-002-059) located in the City. Access to the project site is provided from Camino Del Sol and Rose Avenue. The new school facilities are designed to meet the educational and recreational needs of up 2,500 students in grades 9-12 onsite. The proposed project would comprise approximately 211,115 square feet (sq.ft.) of building and structures and provide 806 parking spaces on the project site. In addition, the proposed project includes a variety of recreational areas to accommodate the recreational needs of the students and community. This proposed project includes a variety of play fields, hard courts, and a pool. Of these, approximately 14.2 to 17 acres of play fields are proposed for joint-use with the City to provide additional recreation opportunities to the community as well as consideration for civic center use of other school facilities on site. The OUHSD would process a General Plan Amendment (GPA) and Specific Plan Amendment (SPA) through the City of Oxnard. OUHSD proposes to change the Northeast Community Specific Plan (NECSP) designations for the project site to Public Education and Civic Center Use.

The City is currently processing a Pre-Application that includes the following development:

PLANNING AREA	ACREAGE	PROPOSED DEVELOPMENT
A: Urban	43.7	750 to 900 multifamily residential units (apartments, condominiums,

Village		townhomes, and/or tri/quad-plex), a 2-acre neighborhood commercial center, 5.4-acre expansion of East Village Park and 3.1 acres of expanded street frontage paseos and interior paseos, roadways and associated improvements
B: High School	49.75	A 2,300 student high school campus and associated sports and recreation facilities (20.3 acres proposed for scheduled use by community groups and athletic organizations outside of regular school hours pursuant to the Civic Center Act Agreement), retention and/or adaptive reuse of the Maulhardt Barn, and .4 acres of expanded street frontage designed as a paseo, roadways and associated site improvements.
C: Urban Village	10.65	150 to 200 affordable multifamily residential units (apartments and townhomes), a 1-acre park designed around the Maulhardt Farmhouse (cultural resource), 2.1 acres of expanded street frontage designed as paseos and interior paseos.
Total	107 (gross)	900 to 1,100 multifamily residential units, 6.4 acres of public parks, 6.3 acres of paseos, 20.3 acres of recreational facilities and parking areas for scheduled use by community groups and athletic organizations outside of regular school hours pursuant to the Civic Center Act Agreement, a 2,300 student high school, a 2-acre neighborhood commercial shopping center, plus associated streets, sidewalks, etc.

The Pre-Application project will require filing of a General Plan Amendment, Specific Plan Amendment, Zone Change, Tentative Subdivision Map, and respective development entitlement permit(s). Additionally, the Pre-Application project is located within a designated Urban Village identified in the City's 2030 General Plan as 'East Village Phase III' and the project shall be designed to meet the requirements of an Urban Village.

As indicated in the project description submitted to the City, the high school component of the proposed Pre-Application development of the 107.25-acre Maulhardt Ranch property is identified as totaling 49.75 acres; however, the NOP's project description identifies the project site to include 46.8 acres of the Maulhardt Ranch property. Please clarify what the exact size of the proposed high school component is in relation to the Maulhardt Ranch property.

California Environmental Quality Act (CEQA) Statute & Guidelines/California Public Resources Code

CEQA Guidelines Section 15130(a) requires that an EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable, as defined in section 15065 (a)(3). Where a lead agency is examining a project with an incremental effect that is not "cumulatively considerable," a lead agency need not consider that effect significant, but shall briefly describe its basis for concluding that the incremental effect is not cumulatively considerable. CEQA Guidelines Section 15065 (a)(3) provides that a project has possible environmental effects that are individually limited but cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and

the effects of probable future projects.

The OUHSD project lies within the previously mentioned Pre-Application project site. The OUHSD's NOP and Initial Study do not disclose the relationship between the OUSHD project and the Pre-Application project. In order for an accurate assessment of the potential cumulative impacts, it would be necessary to disclose the relationship between the proposed OUSHD project and the Pre-Application project. Based on the analysis made by the City through the Pre-application process, the cumulative impact of the proposed OUSHD project is significant. Therefore, the DEIR is required to analyze the entire development of the 107.25-acre Maulhardt Ranch property.

Pursuant to Public Resources Code Section 21166, when an environmental impact report has been prepared for a project pursuant to this division, no subsequent or supplemental environmental impact report shall be required by the lead agency or by any responsible agency, unless one or more of the following events occurs:
(a) Substantial changes are proposed in the project which will require major revisions of the environmental impact report.
(b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report.
(c) New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, or becomes available.

As previously mentioned, the IS fails to identify the relationship between the OUHSD project and the Pre-Application project, inclusive of the Urban Village component. The IS makes assumptions pertaining to the OUHSD project based on the City's 2030 General Plan PEIR, East Village Phase III Annexation EIR and the NECSP EIR. However, the OUHSD project was not contemplated in all of the environmental reviews adopted by the City and referenced in the IS. As such, pursuant to Public Resources Code Section 21166 (Subsequent or Supplemental Impact Report; Conditions) the impacts of the entire Pre-Application project shall be analyzed in the DEIR for the OUHSD project in order to accurately assess the cumulative impacts.

City of Oxnard Initial Study Comments
City comments follow Initial Study Sections as follows:

1.3 Project Description
General Plan and Specific Plan Amendments
General Plan and Specific Plan Amendments
The OUHSD project site is located within the project area included in the Pre-Application submitted to the City for the development of the 107.25-acre Maulhardt Ranch property. The IS fails to identify the relationship between the OUHSD project and the Pre-Application project. In order for an accurate assessment of the potential impacts, it would necessary to disclose the relationship between the proposed OUHSD Project and the Pre-Application project.

Additionally, the project description fails to mention that the project will require approval of a Tentative Subdivision Map.

1.5 California Native American Tribe Consultation

Please identify the Tribal groups that the OUHSD contacted for Tribal Consultation pursuant to Public Resources Code Section 21080.1.1. Additionally, please disclose the date and method of contact.

2.4.1 Aesthetics

Would the project have a substantial adverse effect on a scenic vista? Potentially Significant Impact.

The IS correctly identifies Rose Avenue as a designated City-image corridor characterized by expansive northerly views of distant mountain ranges as described in the East Village Phase III Annexation EIR. Additionally, the City's 2030 General Plan designates Rose Avenue between U.S. Route 101 and State Route 1 as a Scenic Route as well. The draft Environmental Impact Report (DEIR) should include an analysis of potential Aesthetic impacts from Rose Avenue. Please visit the City of Oxnard Planning website to review the designated Scenic Highways and Roadway Map in its entirety: https://www.oxnard.org/wp-content/uploads/2017/05/Scenic-Routes-11x17-4.17.pdf. Additionally, the DEIR should include photo simulations of the proposed OUHSD project from all the vantage points of all surrounding scenic resource roadways in order to assist in determining the potential impact the project might have on visual resources and the project should be designed pursuant to the Scenic Highway Landscape Requirements.

The DEIR should include discussion of the effect of the proposed project on scenic resources, and evaluation to determine whether the effect would be significant. The DEIR should include, but not limit discussion to the following:

1. **The nature and quality of the visual resource**
   Any of the significant visual resources, as identified in the 2030 General Plan Goals and Policies or in the General Plan Background Report, that may be affected by the proposed project should be noted and described. This would include local waterways, agricultural greenbelts, beaches and coast lines, scenic roadways, and well preserved urban landscapes associated with historic neighborhoods and parks and open plazas.
2. **The viewpoint and the identity of the viewers and their sensitivity to changes in the view**
   Viewers who would be the most sensitive to alterations in the landscape or existing views would be residents or visitors enjoying the recreational uses in open spaces, beaches, coastal areas, or scenic roadways viewing these areas. People using smaller parks, open spaces, or plazas within urban areas would also be sensitive to the views of urban landscapes in the area.

3. **The effect of the proposed project in altering the nature of the view**
   A project component that introduces a manmade feature that contrasts strongly with the existing natural or cultural landscape affecting sensitive viewers would normally have a significant impact. The impact may be project-specific if the project is inharmonious or discordant with the existing landscape, or if it would introduce a feature that blocks views of important resources, even if the view is already partially blocked. The effect may also be part of a cumulative impact if it occurs in combination with similar projects or man-made features that adversely affect the same visual resource.

Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area? Potentially Significant Impact.
A glare analysis and lighting plan should be included in the DEIR in order to make an assessment if the project might adversely affect daytime or nighttime views in the area. Additional concern is warranted based on the IS stating that the OUHSD proposed new stadium would include lighted playfields and the varsity baseball and softball fields would also be lighted. In addition, it is anticipated that the school would be used in the evening for community meetings and periodic school activities. As such, the proposed project could represent a new source of light or glare which could potentially impact nighttime views in the area.

Section 2.4.2 – Agriculture
The IS identifies the OUHSD project as having a potentially significant impact on Agriculture. However, the IS does not include the Urban Village component of the Pre-Application project, which includes up to 1,100 residential units and commercial opportunities. The City's 2030 General Plan PEIR, NECSP EIR and Village Phase III Annexation EIR did not include an analysis of a high school or any other school as part of the environmental impact analysis. The development of the OUHSD project could potentially have a significant impact to mitigation measures required under the NECSP and the City's 2030 General Plan concerning Agriculture. The IS references mitigation measure AG1 of the East Village Phase III Annexation EIR, which requires to offer the topsoil for removal to another farm operation, if feasible, as a partial mitigation for the loss of prime farmland impact (Oxnard 2012). Based on CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the Agriculture impact of the entire 107.25-acre Maulhardt Ranch development.

Section 2.4.3 Air Quality
The IS identifies the OUHSD project as having a potentially significant impact on Air Quality. However, the analysis is based solely on the OUHSD project. As previously stated, the Project does not clarify the relationship between the OUHSD project and Pre-Application project. In order for an accurate assessment of the potential impacts, it would necessary to disclose the relationship between the proposed OUHSD Project and the Pre-Application project. Additionally, in accordance with CEQA Guidelines Section 15130(a) and Public Resources Code Section 21166, the air quality project impact analysis should include the entire development of the 107.25-acre Maulhardt Ranch property, inclusive of the Urban Village development.

2.4.4 Biological Resources

As previously stated, the Project does not clarify the relationship between the OUSHD project and Pre-Application project. In order for an accurate assessment of the potential impacts, it would necessary to disclose the relationship between the proposed OUHSD Project and the Pre-Application project. In accordance to CEQA Guidelines Section 15130(a) and Public Resources Code Section 21166, all biological studies and surveys included in the DEIR should be inclusive of the entire development of the 107.25-acre Maulhardt Ranch property, inclusive of the Urban Village and commercial development.

2.4.5- Cultural resources

The recent Pre-Application project site plan identifies the Maulhardt family residence as being preserved and sited within a one-acre park at the southwest corner of the 107-acre Maulhardt property. The DEIR should analyze the potential future use/reuse of the Maulhardt family residence and all other historic structures. The IS states that a Phase 1 Archaeological Survey will be conducted to determine if prehistoric or historic archaeological deposits are present on the OUHSD project site. The 107.25-acre Maulhardt Ranch property has an important historical value to the City and County of Ventura. The barn was found to be historically significant there is a presence of mature vegetation and wind row. The NECSP EIR and the East Village Phase III Annexation EIR did not contemplate the impact of the development of the OUHSD project on the 107.25-acre Maulhardt Ranch property. In accordance to Public Resources Code Section 21166, the DEIR should conduct a Phase 1 Archaeological Survey on the entire 107.25-acre Maulhardt Ranch property.

2.4.6 Energy

The IS identifies the OUHSD project as having a potential significant impact on the environment. The IS analysis only accounted for the OUHSD project and failed to account for the Urban Village component of the previously mentioned Pre-Application of the 107.25-acre Maulhardt Ranch property. Based on CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the energy impact of the entire development of the 107.25-acre Maulhardt Ranch property.

2.4.7 Geology and Soils

As previously stated, the NOP does not clarify the relationship between the OUHSD project and Pre-Application project. In order for an accurate assessment of the potential impacts, it would be necessary to disclose the relationship between the proposed OUHSD project and the Pre-Application project. All geological and soils studies analyzed in the DEIR shall be inclusive of the Pre-Application development of the 107.25-acre Maulhardt Ranch property.

2.4.8 Greenhouse Gas Emissions

The IS identifies the OUHSD project as having a potentially significant impact on Green Gas Emissions. However, the IS does not include the Urban Village component of the Pre-Application project. Based on CEQA Guidelines Section 15130(a) and Public Resource Code

Section 21166, the DEIR shall analyze the greenhouse gas emissions impact of the entire 107.25-acre Maulhardt Ranch development.

2.4.9 Hazards and Hazardous Materials

Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials? Less Than Significant Impact.

As previously stated, the OUHSD project does not clarify the relationship between the OUHSD project and Pre-Application project. However, the Pre-Application project identifies residential and commercial opportunities as part of the Urban Village land use component. Pursuant to CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the potential impact of the Pre-Application build out proposal creating a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials to the entire 107.25-acre Maulhardt Ranch development.

Would the project create a significant hazard to the public or the environment through the reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment? Less Than Significant Impact.

As stated above, the IS does not clarify the relationship between the OUSHD project and Pre-Application project. However, the Pre-Application project identifies residential and commercial opportunities as part of the Urban Village land use component. Pursuant to CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the potential impact of the Pre-Application build out proposal to creating a significant hazard to the public or the environment through the reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment.

Would the project emit hazardous emissions or handle hazardous materials or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school?

Less Than Significant Impact.

The IS does not clarify the relationship between the OUHSD project and Pre-Application project. However, the Pre-Application project identifies residential and commercial opportunities as part of the Urban Village land use component. Pursuant to CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the potential impact of the commercial opportunities included within the Pre-Application project that have the potential to emit hazardous emissions or handle hazardous materials or acutely hazardous materials, substances, or waste within 0.25 mile of an existing or proposed school- in this case the OUHSD project itself.

2.4.10 Hydrology and Water Quality

The IS identifies the OUHSD project as having a potentially significant impact on Hydrology and Water Quality. However, the IS does not include the Urban Village component of the Pre-Application project. The City's 2030 General Plan PEIR, NECSP EIR and Village Phase III Annexation EIR did not include an analysis of a high school or any other school as part of the environmental impact analysis. The development of the OUHSD project could potentially have a

significant impact to infrastructure required under the NECSP concerning Hydrology and Water Quality. Based on CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the Hydrology and Water Quality impact of the entire 107.25-acre Maulhardt Ranch development.

2.4.11 Land Use and Planning

The City reaffirms that the current 2030 General Plan land use designation for the site does not permit the development of a school and that a General Plan Amendment, Pre-zone, Specific Plan Amendment, Tentative Subdivision Map and respective development entitlement permit(s) will be required. Additionally, the OUHSD project lies within the project site of a Pre-Application for the development of the 107.25-acre Maulhardt Ranch property the City is currently processing, which includes an Urban Village component. The Initial Study is not clear as to how both of these proposals relate to each other. Please clarify the relationship between the OUHSD project and the Pre-Application project so that the general public and decision makers have a clear understanding of the future development and impacts of the project area.

The Pre-Application project has been reviewed by the Development Advisory Committee (DAC). To assist the OUHSD in understanding comments which may be applicable, relevant DAC comments are provided below. Comments generated by DAC were made based on the previously adopted environmental project and are provided as a baseline to determine the deficiencies and requirements which should be addressed as part of the OUHSD environmental document and studies:

1. Consistency with General Plan policies related to Urban Village and School Siting
2. Windrow tree removal mitigation
3. Siting consideration related to roadway noise, visibility, etc.
4. Continue existing landscaped treatment for Caesar Chavez features west of the project site across the property and south to the existing park
5. Large drainage basins/open space at either end of Central Street should be designed to function as parks and not so deep as to require fencing
6. The "drainage basin/open space" areas should be designed to a depth that will not require fencing so that they can be used by the community when dry
7. Provide improved pedestrian connections within the project

As previously mentioned, the City's 2030 General Plan PEIR, NECSP EIR and East Village Phase III Annexation EIR did not include an analysis of a high school or any other school as part of the environmental impact analysis. The development of the OUHSD project could potentially have a significant impact to land use and planning requirements and goals adopted under the NECSP. Additionally, the development of the OUHSD project could potentially have a significant impact to infrastructure required to address land use and planning issues identified under the NECSP. Based on CEQA Guidelines Section 15130(a) and Public Resource Code

Section 21166, the DEIR shall analyze the Land Use and Planning impact of the entire 107.25-acre Maulhardt Ranch development.

2.4.12 Mineral Resources

The IS identifies the OUHSD project as having no impact on mineral resources. However, the IS does not include the Urban Village component of the Pre-Application project. Based on CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the potential impact of the entire 107.25-acre Maulhardt Ranch development on mineral resources.

2.4.13 Noise

The IS identifies the OUHSD project as having a potentially significant impact on Noise. However, the IS does not include the Urban Village component of the Pre-Application project. The City's 2030 General Plan PEIR, NECSP EIR and Village Phase III Annexation EIR did not include an analysis of a high school or any other school as part of the environmental impact analysis. The development of the OUHSD project could potentially have a significant impact to the residential component of the NECSP. Additionally, the OUHSD project will host school games, school functions and community events which were not contemplated or addressed in the NECSP EIR. Based on CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the Noise impact of the entire 107.25-acre Maulhardt Ranch development.

2.4.14 Population and Housing

Would the project induce substantial unplanned population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extension of roads or other infrastructure)? Less Than Significant Impact.

The IS only examines the development of the OUHSD project and it fails to include an analysis of the proposed Urban Village component of the Pre-Application project, which proposes up to 1,100 residential units. Pursuant to CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the Population and Housing impact of the entire 107.25-acre Maulhardt Ranch development.

2.4.15 Public Services

The IS identifies the OUHSD project as having a potentially significant impact on Public Services. However, the IS does not include the Urban Village component of the Pre-Application project in any future environmental analysis. The City's 2030 General Plan PEIR, NECSP EIR and Village Phase III Annexation EIR did not include an analysis of a high school or any other school as part of the environmental impact analysis. The development of the OUHSD project and the Urban Village component could potentially have a greater impact to public services than previously analyzed and/or under the OUHSD scenario by itself. Additionally, the OUHSD project will host school games, school functions and community events which were not contemplated or addressed in the NECSP EIR. Based on CEQA Guidelines Section 15130(a) and

Public Resource Code Section 21166, the DEIR shall analyze the Public Services impact of the entire 107.25-acre Maulhardt Ranch development.

To assist the OUHSD in understanding comments which may be applicable, relevant DAC comments are provided below. Comments generated by DAC were made based on the previously adopted environmental project and are provided as a baseline to determine the deficiencies and requirements which should be addressed as part of the OUHSD environmental document and studies:

1. Police and Fire
    a. Environmental review will need to identify and mitigate the impacts proposed to Fire and Police services by the project.
    b. Plan includes numerous dead-end driveways. Revise circulation plan to provide hammerhead turnouts where required.

2.4.16 Recreation

Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated? Less Than Significant Impact.

The IS only examines the development of the OUSHD project and it fails to include an analysis of the proposed Urban Village component of the Pre-Application project which proposes up to 1,100 residential units. Pursuant to CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the Recreation impact of the entire 107.25-acre Maulhardt Ranch development.

2.4.17 Transportation

The IS identifies the OUHSD project as having a potentially significant impact on Transportation. However, the IS does not include the Urban Village component of the Pre-Application project, which proposes up to 1,100 residential units and commercial opportunities. The City's 2030 General Plan PEIR, NECSP EIR and Village Phase III Annexation EIR did not include an analysis of a high school or any other school as part of the environmental impact analysis. The development of the OUHSD project could potentially have a significant impact to infrastructure required under the NECSP concerning transportation and circulation. Based on CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall analyze the Transportation impact of the entire 107.25-acre Maulhardt Ranch development.

The Pre-Application project has been reviewed by the Development Advisory Committee (DAC). To assist the OUHSD in understanding comments which may be applicable, relevant DAC comments are provided below. Comments generated by DAC were made based on the previously adopted environmental project and are provided as a baseline to determine the deficiencies and requirements which should be addressed as part of the OUHSD environmental document and studies:

1. A traffic study will be required.

2. Street designs are not consistent with the approved street sections in the Northeast Community Specific Plan.
3. Project will be required to comply with the City's Bicycle and Pedestrian Master Plan, including provision of a Class III "Bicycle Boulevard" along Cesar Chavez that connects to the existing park site. See Map 5-1, A-30, and page 95 of the BPFMP
4. Provide a north/south connecting road along the easterly property line of the school for improved internal circulation and to reduce the school queueing anticipated along Camino Del Sol.

GOLD COAST Transit- consult and work with Gold Coast Transit to address questions, comments, and concerns:

1. Identify direct pedestrian travel path from residential units to high school
2. Identify Pedestrian lighting throughout development site
3. Identify existing bus stops on Rose Ave at Socorro Way & Camino Del Sol in both directions
4. Clarify bike rack placement
5. Identify quantity of bike racks
6. Consider incorporating wayfinding signage to historically significant site

2.4.18 Tribal and Cultural resources

The IS identifies the OUHSD project as having a potentially significant impact on Tribal and Cultural Resources. However, the IS does not include the Urban Village component of the Pre-Application project, which proposes up to 1,100 residential units and commercial opportunities. The IS states that a Phase 1 Archaeological Survey will be conducted to determine if prehistoric or historic archaeological deposits are present on the OUHSD project site. The 107.25-acre Maulhardt Ranch property has an important historical value to the City and County of Ventura. The barn was found to be historically significant and there is a presence of mature vegetation/wind row. The NECSP EIR and the East Village Phase III Annexation EIR did not contemplate the impact of the development of the OUHSD project on the 107.25-acre Maulhardt Ranch property. In accordance to Public Resources Code Section 21166, the DEIR should conduct a Phase 1 Archaeological Survey on the entire 107.25-acre Maulhardt Ranch property.

2.4.19 Utilities and Service Systems

The IS identifies the OUHSD project as having a potentially significant impact on Utilities and Service Systems. However, the IS does not include the Urban Village component of the Pre-Application project, which proposes up to 1,100 residential units and commercial opportunities. The City's 2030 General Plan PEIR, NECSP EIR and Village Phase III Annexation EIR did not include an analysis of a high school or any other school as part of the environmental impact analysis. The development of the OUHSD project could potentially have a significant impact to infrastructure required under the NECSP concerning utilities and service systems. Based on CEQA Guidelines Section 15130(a) and Public Resource Code Section 21166, the DEIR shall

analyze the Utilities and Service Systems impact of the entire 107.25-acre Maulhardt Ranch development.

The Pre-Application project has been reviewed by the Development Advisory Committee (DAC). To assist the OUHSD in understanding comments which may be applicable, relevant DAC comments are provided below. Comments generated by DAC were made based on the previously adopted environmental project and are provided as a baseline to determine the deficiencies and requirements which should be addressed as part of the OUHSD environmental document and studies:

1. Public Works:
    a. Water demand estimates versus transferred allocation rates
    b. Utility capacity and connections required
    c. Potential use of recycled irrigation
    d. Capping of on-site wells and septic
    e. Proposed reduction of the 30 acres of park space anticipated.
    f. Parks provide on private development portion include small corners, detention areas, and residential common space
    g. Location of proposed stadium presents conflicts with adjacent residential uses. Recommend relocate and mitigate noise, parking and lighting impacts.
    h. Drainage report needs to provide an evaluation of a mid-level (Q10) storm and the depths that the water will reach. Report should address how long it takes the detention facility to empty
    i. Why are detention/infiltration facilities only proposed for the Shared Use fields.

Thank you for the opportunity to comment on the NOP and IS. Please feel free to contact Doug Spondello at (805) 385-3919 if you have questions or you can e-mail at doug.spondello@oxnard.org.

Sincerely,

Jeffrey Lambert, AICP

Oxnard, CA 93030

Dear Mr. Weinstein:

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT FOR THE NEW HIGH SCHOOL NO. 8 PROJECT, SCH# 2019029101

The Department of Conservation's (Department) Division of Land Resource Protection (Division) has reviewed the Notice of Preparation for the New High School No. 8 project. The Division monitors farmland conversion on a statewide basis and administers the California Land Conservation (Williamson) Act and other agricultural land conservation programs. We offer the following comments and recommendations with respect to the proposed project's potential impacts on agricultural land and resources.

Project Description

The Oxnard Union High School District proposes to construct and operate a new state of the art neighborhood High School to accommodate existing and anticipated future enrollment in the District. The new school facilities are designed to meet the educational and recreational needs of up 2,500 students in grades 9-12. The proposed project would comprise approximately 211,115 square feet (sq. ft.) of building and structures and provide approximately 806 parking spaces on the project site. In addition, the proposed project includes a variety of recreational areas including a variety of play fields, hard courts, and a pool. The project site is currently classified as Prime Farmland and/or Farmland of Statewide Importance by the Department of Conservation's Farmland Mapping and Monitoring Program.[1]

Department Comments

Although direct conversion of agricultural land is often an unavoidable impact under CEQA analysis, mitigation measures must be considered. In some cases, the argument is made that mitigation cannot reduce impacts to below the level of significance because agricultural land will still be converted by the project, and therefore,

[1] California Department of Conservation, Division of Land Resource Protection, Farmland Mapping and Monitoring Program, https://maps.conservation.ca.gov/DLRP/CIFF/

mitigation is not required. However, reduction to a level below significance is not a criterion for mitigation under CEQA. Rather, the criterion is feasible mitigation that lessens a project's impacts.

All mitigation measures that are potentially feasible should be considered. A measure brought to the attention of the Lead Agency should not be left out unless it is infeasible based on its elements. The Department suggests that the County consider any and all mitigation measures that will effectively mitigate the conversion of agricultural land.

Agricultural conservation easements are an available mitigation tool that the City should consider. The Department highlights easements as a mitigation tool because of their acceptance and use by lead agencies as an appropriate mitigation measure under CEQA and because they follow an established rationale similar to that of wildlife habitat mitigation.

Mitigation via agricultural conservation easements can be implemented by at least two alternative approaches: the outright purchase of easements or the donation of mitigation fees to a local, regional, or statewide organization or agency whose purpose includes the acquisition and stewardship of agricultural conservation easements. The conversion of agricultural land should be deemed an impact of at least regional significance. Hence, the search for replacement lands should not be limited strictly to lands within the project's surrounding area.

Conclusion

Thank you for giving us the opportunity to comment on the Notice of Preparation for the New High School No. 8 project. Please provide this Department with notices of any future hearing dates as well as any staff reports pertaining to this project. If you have any questions regarding our comments, please contact Farl Grundy, Environmental Planner at (916) 324-7347 or via email at Farl.Grundy@conservation.ca.gov.

Sincerely,

Monique Wilber
Conservation Program Support Supervisor

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the New OUHSD High School No. 8 Project [SCAG NO. IGR9833]

Dear Mr. Weinstein,

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the New OUHSD High School No. 8 Project ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

SCAG is also the designated Regional Transportation Planning Agency under state law, and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS) pursuant to Senate Bill (SB) 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.[1] SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Community Strategies (RTP/SCS) goals and align with RTP/SCS policies.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the New OUHSD High School No. 8 Project in Ventura County. The proposed project includes the construction of a new 211,115 square foot high school on a 46.8 acre site.

When available, please send environmental documentation to *SCAG's Los Angeles office in Los Angeles (900 Wilshire Boulevard, Ste. 1700, Los Angeles, California 90017) or by email to au@scag.ca.gov* providing, at a minimum, the full public comment period for review.

If you have any questions regarding the attached comments, please contact the Inter-Governmental Review (IGR) Program, attn.: Anita Au, Associate Regional Planner, at (213) 236-1874 or au@scag.ca.gov. Thank you.

Sincerely,

Ping Chang
Manager, Compliance and Performance Monitoring

[1] Lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS for the purpose of determining consistency for CEQA. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a determination of consistency with the 2016 RTP/SCS for CEQA.

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE NEW OUHSD HIGH SCHOOL NO. 8 PROJECT [SCAG NO. IGR9833]

CONSISTENCY WITH RTP/SCS

SCAG reviews environmental documents for regionally significant projects for their consistency with the adopted RTP/SCS. For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the RTP/SCS.

2016 RTP/SCS GOALS

The SCAG Regional Council adopted the 2016 RTP/SCS in April 2016. The 2016 RTP/SCS seeks to improve mobility, promote sustainability, facilitate economic development and preserve the quality of life for the residents in the region. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health (see http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx). The goals included in the 2016 RTP/SCS may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project within the context of regional goals and policies. Among the relevant goals of the 2016 RTP/SCS are the following:

SCAG 2016 RTP/SCS GOALS	
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*
RTP/SCS G3:	*Ensure travel safety and reliability for all people and goods in the region*
RTP/SCS G4:	*Preserve and ensure a sustainable regional transportation system*
RTP/SCS G5:	*Maximize the productivity of our transportation system*
RTP/SCS G6:	*Protect the environment and health for our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking)*
RTP/SCS G7:	*Actively encourage and create incentives for energy efficiency, where possible*
RTP/SCS G8:	*Encourage land use and growth patterns that facilitate transit and active transportation*
RTP/SCS G9:	*Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies**
	**SCAG does not yet have an agreed-upon security performance measure.*

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

SCAG 2016 RTP/SCS GOALS		
	Goal	Analysis
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
etc.		etc.

2016 RTP/SCS STRATEGIES

To achieve the goals of the 2016 RTP/SCS, a wide range of land use and transportation strategies are included in the 2016 RTP/SCS. Technical appendances of the 2016 RTP/SCS provide additional supporting information in detail. To view the 2016 RTP/SCS, please visit: http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx. The 2016 RTP/SCS builds upon the progress from the 2012 RTP/SCS and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that the SCAG region strives toward a more sustainable region, while the region meets and exceeds in meeting all of applicable statutory requirements pertinent to the 2016 RTP/SCS. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

The 2016 RTP/SCS also identifies open space resources in the SCAG region and develops strategies to address open space, biodiversity habitat and agriculture conservation in the SCAG region. For further information on open space strategies, please review the Natural and Farmlands Appendix of the 2016 RTP/SCS (http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS_NaturalFarmLands.pdf).

DEMOGRAPHICS AND GROWTH FORECASTS

Local input plays an important role in developing a reasonable growth forecast for the 2016 RTP/SCS. SCAG used a bottom-up local review and input process and engaged local jurisdictions in establishing the base geographic and socioeconomic projections including population, household and employment. At the time of this letter, the most recently adopted SCAG jurisdictional-level growth forecasts that were developed in accordance with the bottom-up local review and input process consist of the 2020, 2035, and 2040 population, households and employment forecasts. To view them, please visit http://www.scag.ca.gov/Documents/2016GrowthForecastByJurisdiction.pdf. The growth forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts			Adopted City of Oxnard Forecasts		
	Year 2020	Year 2035	Year 2040	Year 2020	Year 2035	Year 2040
Population	19,663,000	22,091,000	22,138,800	220,200	236,300	237,300
Households	6,458,000	7,325,000	7,412,300	55,100	59,800	60,100
Employment	8,414,000	9,441,000	9,871,500	68,000	78,200	79,200

MITIGATION MEASURES

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for the 2016 RTP/SCS for guidance, as appropriate. SCAG's Regional Council certified the Final PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on April 7, 2016 (please see: http://scagrtpscs.net/Pages/FINAL2016PEIR.aspx). The Final PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and

implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

SCAG staff recommends that you review the agriculture and bio habitat-related example mitigation measures listed below:

Mitigation Measure-AF-1(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses that are within the jurisdiction and responsibility of the Natural Resources Conservation Service, the California Resources Agency, other public agencies, and/or Lead Agencies. Where the Lead Agency has identified that a project has the potential for significant effects, the Lead Agency can and should consider mitigation measures to ensure compliance with the Farmland Protection Act and implementing regulations, and the goals and policies established within the applicable adopted county and city general plans to protect agricultural resources consistent with the Farmland Mapping and Monitoring Program of the California Resources Agency. Such measures may include the following, or other comparable measures identified by the Lead Agency taking into account project and site-specific considerations as applicable and feasible:

- For projects that require approval or funding by the USDOT, comply with Section 4(f) U.S. Department of Transportation Act of 1966 (USDOT Act).
- Project relocation or corridor realignment to avoid Prime Farmland, Unique Farmland, or Farmland of Local or Statewide Importance.
- Maintain and expand agricultural land protections such as urban growth boundaries.

Support the acquisition or voluntary dedication of agriculture conservation easements and other programs that preserve agricultural lands, including the creation of farmland mitigation banks. Local governments would be responsible for encouraging the development of agriculture conservation easements or farmland mitigation banks, purchasing conservation agreements or farmland for mitigation, and ensuring that the terms of the conservation easement agreements are upheld. The California Department of Fish and Wildlife provides a definition for conservation or mitigation banks on their website (please see https://www.wildlife.ca.gov/Conservation/Planning/Banking)

"A conservation or mitigation bank is privately or publicly owned land managed for its natural resource values. In exchange for permanently protecting, managing, and monitoring the land, the bank sponsor is allowed to sell or transfer habitat credits to permitees who need to satisfy legal requirements and compensate for the environmental impacts of developmental projects.

A privately owned conservation or mitigation bank is a free-market enterprise that:

- Offers landowners economic incentives to protect natural resources;
- Saves permitees time and money by providing them with the certainty of pre-approved compensation lands;
- Consolidates small, fragmented wetland mitigation projects into large contiguous sites that have much higher wildlife habitat values;
- Provides for long-term protection and management of habitat.

A publicly owned conservation or mitigation bank:

- Offers the sponsoring public agency advance mitigation for large projects or multiple years of operations and maintenance."

In 2013, the University of California published an article entitled "Reforms could boost conservation banking by landowners" that speaks specifically to the use of agricultural lands for in conjunction with conservation banking programs.

- Provide for mitigation fees to support a mitigation bank that invests in farmer education, agricultural infrastructure, water supply, marketing, etc. that enhance the commercial viability of retained agricultural lands.
- Include underpasses and overpasses at reasonable intervals to maintain property access.
- Use berms, buffer zones, setbacks, and fencing to reduce conflicts between new development and farming uses and protect the functions of farmland.
- Ensure individual projects are consistent with federal, state, and local policies that preserve agricultural lands and support the economic viability of agricultural activities, as well as policies that provide compensation for property owners if preservation is not feasible.
- Contact the California Department of Conservation and each county's Agricultural Commissioner's office to identify the location of prime farmlands and lands that support crops considered valuable to the local or regional economy and evaluate potential impacts to such lands using the land evaluation and site assessment (LESA) analysis method (CEQA Guidelines §21095), as appropriate. Use conservation easements or the payment of in-lieu fees to offset impacts.

Mitigation Measure-AF-2(b): Consistent with the provisions of Section 15091 of the State CEQA Guidelines, SCAG has identified mitigation measures capable of avoiding or reducing the significant effects from conflict with existing zoning for agricultural use or a Williamson Act contract that are within the jurisdiction and responsibility of the California Department of Conservation, other public agencies, and Lead Agencies. Where the Lead Agency has identified that a project has potential for significant effects, the Lead Agency can and should consider mitigation measures to mitigate the significant effects of agriculture and forestry resources to ensure compliance with the goals and policies established within the applicable adopted county and city general plans to protect agricultural resources consistent with the California Land Conservation Act of 1965, the Farmland Security Zone Act, and county and city zoning codes, as applicable and feasible. Such measures may include the following, or other comparable measures identified by the Lead Agency, taking into account project and site-specific considerations as applicable and feasible:

- Project relocation or corridor realignment to avoid lands in Williamson Act contracts.
- Establish conservation easements consistent with the recommendations of the Department of Conservation, or 20-year Farmland Security Zone contracts (Government Code Section 51296 et seq.), 10-year Williamson Act contracts (Government Code Section 51200 et seq.), or use of other conservation tools available from the California Department of Conservation Division of Land Resource Protection.
- Prior to final approval of each project, encourage enrollments of agricultural lands for counties that have Williamson Act programs, where applicable.

Ventura County Transportation Commission

MAR 2019
Oxnard Union
High School Dist.
Business Services

March 15, 2019

Mr. Jeffrey Weinstein
Assistant Superintendent, Business Services
Oxnard Union High School District
309 South K Street,
Oxnard, CA 93030

Subject: Oxnard Union High School District (OUHSD) New High School No. 8 Project Comments

Dear Mr. Weinstein,

The Ventura County Transportation Commission (VCTC) has reviewed the Notice of Preparation and Initial Study for the proposed New High School No. 8 Project. After a review of the subject documents, VCTC recommends that OUHSD consider the following areas as the Environmental Impact Report is prepared:

1. Ensure that transit operations are included/evaluated as part of the proposed traffic study analysis.
2. Ensure that the traffic study area incorporates AM peak hour traffic counts for all major intersections within the proposed Project's commute shed/student shed.
3. Consult with Gold Coast Transit to ensure adequate service can be provided to meet forecasted transit trip generation needs, thereby reducing individual trips and greenhouse gas emissions.
4. As part of the construction impacts discussion, identify all local/municipal transportation agencies that will be impacted by roadway improvements and include adequate notification as part of the Project's mitigation measures.
5. Consider including a VMT (Vehicle Miles Traveled) analysis in addition to the proposed Level of Service (LOS) analysis as part of the proposed traffic study.
6. The EIR should include a discussion of a full range of Transportation Demand Management (TDM) strategies to reduce the number of individual trips by students and faculty alike.

Thank you for the opportunity to provide comments on this Project. Please feel free to contact me if you have questions or would like clarification on the comments above.

Respectfully,

Steve DeGeorge
Planning Director

TLC-LED-1500	>81,000	>81,000	>81,000
TLC-LED-1200	>81,000	>81,000	>81,000
TLC-BT-575	>81,000	>81,000	>81,000
TLC-LED-600	>81,000	>81,000	>81,000

Reported per TM-21-11. See luminaire datasheet for details.

Guaranteed Performance: The ILLUMINATION described above is guaranteed per your Musco Warranty document and includes a 0.95 dirt depreciation factor.

Field Measurements: Individual field measurements may vary from computer-calculated predictions and should be taken in accordance with IESNA RP-6-15.

Electrical System Requirements: Refer to Amperage Draw Chart and/or the **"Musco Control System Summary"** for electrical sizing.

Installation Requirements: Results assume ± 3% nominal voltage at line side of the driver and structures located within 3 feet (1m) of design locations.

Luminaire Output:	132,300 / 136,000 / 52,000 / 65,600 lumens
No. of Luminaires:	**22**
Total Load:	22.42 kW

Lumen Maintenance

Luminaire Type	L90 hrs	L80 hrs	L70 hrs
TLC-LED-1200	>81,000	>81,000	>81,000
TLC-BT-575	>81,000	>81,000	>81,000
TLC-LED-600	>81,000	>81,000	>81,000

Reported per TM-21-11. See luminaire datasheet for details.

Guaranteed Performance: The ILLUMINATION described above is guaranteed per your Musco Warranty document and includes a 0.95 dirt depreciation factor.

Field Measurements: Individual field measurements may vary from computer-calculated predictions and should be taken in accordance with IESNA RP-6-15.

Electrical System Requirements: Refer to Amperage Draw Chart and/or the **"Musco Control System Summary"** for electrical sizing.

Installation Requirements: Results assume ± 3% nominal voltage at line side of the driver and structures located within 3 feet (1m) of design locations.

Pole location(s) ⊕ dimensions are relative to 0,0 reference point(s) ⊗

Guaranteed Performance: The ILLUMINATION described above is guaranteed per your Musco Warranty document.

Field Measurements: Individual field measurements may vary from computer-calculated predictions and should be taken in accordance with IESNA RP-6-15.

Electrical System Requirements: Refer to Amperage Draw Chart and/or the **"Musco Control System Summary"** for electrical sizing.

Installation Requirements: Results assume ± 3% nominal voltage at line side of the driver and structures located within 3 feet (1m) of design locations.

High School No. 8

Ventura County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
High School	2,500.00	Student	7.61	281,311.00	0
Other Non-Asphalt Surfaces	699.20	1000sqft	16.05	699,197.00	0
Parking Lot	339.73	1000sqft	7.80	0.00	0
Racquet Club	43.59	1000sqft	1.00	0.00	0
Recreational Swimming Pool	7.24	1000sqft	0.17	0.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	31
Climate Zone	8			**Operational Year**	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Non asphalt surfaces-soccer and ball fields

Construction Phase - Working days

Off-road Equipment - Equipment estimated from provided information

Off-road Equipment - Equipment based on provided information

Off-road Equipment - Equipment information provided

Trips and VMT - Trips=two one way trips per worker per day

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - Averate Tier 3 for all off-road equipment

Mobile Land Use Mitigation -

Mobile Commute Mitigation - Estimate 55 percent of families will use the bus system based on https://nces.ed.gov data

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation - Recyclyng is based on statistic provided by https://lbre.stanford.edu

Off-road Equipment - Schedule provided

Off-road Equipment -

Vehicle Trips - No significant additional trips generated by tennis and pool

Energy Use - No significant energy used by tennis courts

Water And Wastewater - No water use by tennis courts

Solid Waste - No significant solid waste generated by tennis and pool

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Non asphalt surfaces-soccer and ball fields

Construction Phase - Working days

Off-road Equipment - Equipment estimated from provided information

Off-road Equipment - Equipment based on provided information

Off-road Equipment - Equipment information provided

Trips and VMT - Trips=two one way trips per worker per day

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - Averate Tier 3 for all off-road equipment

Mobile Land Use Mitigation -

Mobile Commute Mitigation - Estimate 55 percent of families will use the bus system based on https://nces.ed.gov data

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation - Recyclyng is based on statistic provided by https://lbre.stanford.edu

Off-road Equipment - Schedule provided

Off-road Equipment -

Vehicle Trips - No significant additional trips generated by tennis and pool

Energy Use - No significant energy used by tennis courts

Water And Wastewater - No water use by tennis courts

Solid Waste - No significant solid waste generated by tennis and pool

Recreational Swimming Pool	7.24	1000sqft	0.17	0.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	31
Climate Zone	8			**Operational Year**	2022
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	702.44	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Non asphalt surfaces-soccer and ball fields

Construction Phase - Working days

Off-road Equipment - Equipment estimated from provided information

Off-road Equipment - Equipment based on provided information

Off-road Equipment - Equipment information provided

Trips and VMT - Trips=two one way trips per worker per day

Land Use Change -

Sequestration -

Construction Off-road Equipment Mitigation - Averate Tier 3 for all off-road equipment

Mobile Land Use Mitigation -

Mobile Commute Mitigation - Estimate 55 percent of families will use the bus system based on https://nces.ed.gov data

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Waste Mitigation - Recyclyng is based on statistic provided by https://lbre.stanford.edu

Off-road Equipment - Schedule provided

Off-road Equipment -

Vehicle Trips - No significant additional trips generated by tennis and pool

Energy Use - No significant energy used by tennis courts

Water And Wastewater - No water use by tennis courts

Solid Waste - No significant solid waste generated by tennis and pool

Contract No:	100-SBA-T38846/1163664
U.S.G.S. Quad:	Oxnard, California
Acreage:	Approximately 46.8 acres
Key words:	Ventura County, Oxnard, APN 214-002-059, Maulhardt Ranch, Chumash

MANAGEMENT SUMMARY

At the request of Tetra Tech, Inc., Provenience Group, Inc. (PGI) performed a Phase I archaeological pedestrian survey of a 46.8 acre property northeast of Camino Del Sol and Rose Avenue in Oxnard, Ventura County, California. The objective of the Phase I survey was to record any prehistoric and historic archaeological resources within the 46.8 acre survey area, defined as the project area. This report summarizes the results of the study.

The record search, completed by PGI staff archaeologist Roderic McLean, M.A. on March 12, 2019, did not identify any previously identified archaeological resources within 0.5-mile of the project area. On March 21, 2019, PGI archaeologist Debra Hargett completed a Phase I archaeological pedestrian survey of the project area to detect prehistoric and historic archaeological resources. There were no major constraints during the pedestrian survey; however, the ground surface was very muddy due to recent rains and ground visibility in much of the survey area ranged from 0 to 20 percent, largely due to the placement of black plastic on the planted strawberry mounds, which extended into the rows between mounds.

The proposed project is located on the east and north sides of the historic Maulhardt Ranch property, which was previously recommended eligible for the National Register of Historic Places (National Register), California Register of Historical Resources (California Register) and as a Ventura County Landmark by San Buenaventura Research Associates in 2014. Indirect visual impacts of the project, which have the potential to visually alter the characteristics of the ranch and diminish its integrity, will require mitigation. PGI recommends mitigation that will entail planting a thick windrow of tall trees and bushes along the east and north sides of the Maulhardt Ranch property to visually obscure the school complex from the ranch.

[redacted]

[redacted]

PGI recommends limited Extended Phase 1 testing in the two areas [redacted]

1.0 INTRODUCTION

At the request of Tetra Tech, Inc., Provenience Group, Inc. (PGI) completed a records search and performed a Phase I archaeological resources pedestrian survey in support of the proposed Oxnard Union High School District High School No. 8 Site in Oxnard, Ventura County, California. The project area encompasses Township 2 North, Range 22 West, as shown on the U.S. Geological Survey (USGS) *Oxnard, California* 7.5-minute series topographic quadrangle map (Figure 1). This report summarizes the results of the study.

PGI completed the Phase I cultural resources study pursuant to the California Environmental Quality Act (CEQA) and Ventura County guidelines. CEQA requires lead agencies to evaluate proposed projects for their potential to impact archaeological resources (Public Resources Code Section 21082, 21083.2, and 21084.1, and California Code of Regulations 15064.5).

According to the CEQA Guidelines, "historical resources" include buildings, structures, objects, districts, or sites that may possess prehistoric or historical archaeological, architectural, cultural, or scientific importance. CEQA states that if a project will have a significant effect on important cultural resources, then alternative plans or mitigation measures need to be developed. However, only important cultural resources need to be considered in the mitigation plans.

Prior to completing an archaeological pedestrian survey of the project area, PGI staff conducted a record search and completed historic background research. On March 21, 2019, archaeologist Debra Hargett surveyed approximately 46.8 acres, defined as the project area, to identify prehistoric and historic archaeological resources.

Carole Denardo, M.A., RPA, who exceeds the U.S. Secretary of the Interior's Historic Preservation Professional Qualification Standards as outlined in 36 CFR 61, served as PGI's principal investigator and project manager. Staff archaeologist Debra Hargett, M.St. performed the Phase I archaeological survey.

PGI initiated consultation with the California Native American Heritage Commission (NAHC) on March 10, 2019 to inquire if known sacred sites are present in the project area; the result was negative. The NAHC provided a list of ten Native American groups and individuals. Letters and/or emails were provided to each of the contacts on March 18, 2019. Follow-up phone calls were made on March 22, 28, and 29, 2019.

The remainder of this section provides the project description and location; Section 2.0 discusses the regulatory framework; Section 3.0 summarizes environmental, ethnographic, and archaeological overviews for the region; Section 4.0 describes the records search results; Section 5.0 presents the field methodology; Section 6.0 discusses the survey results; Section 7.0 provides a summary and recommendation; and references are listed in Section 8.0.

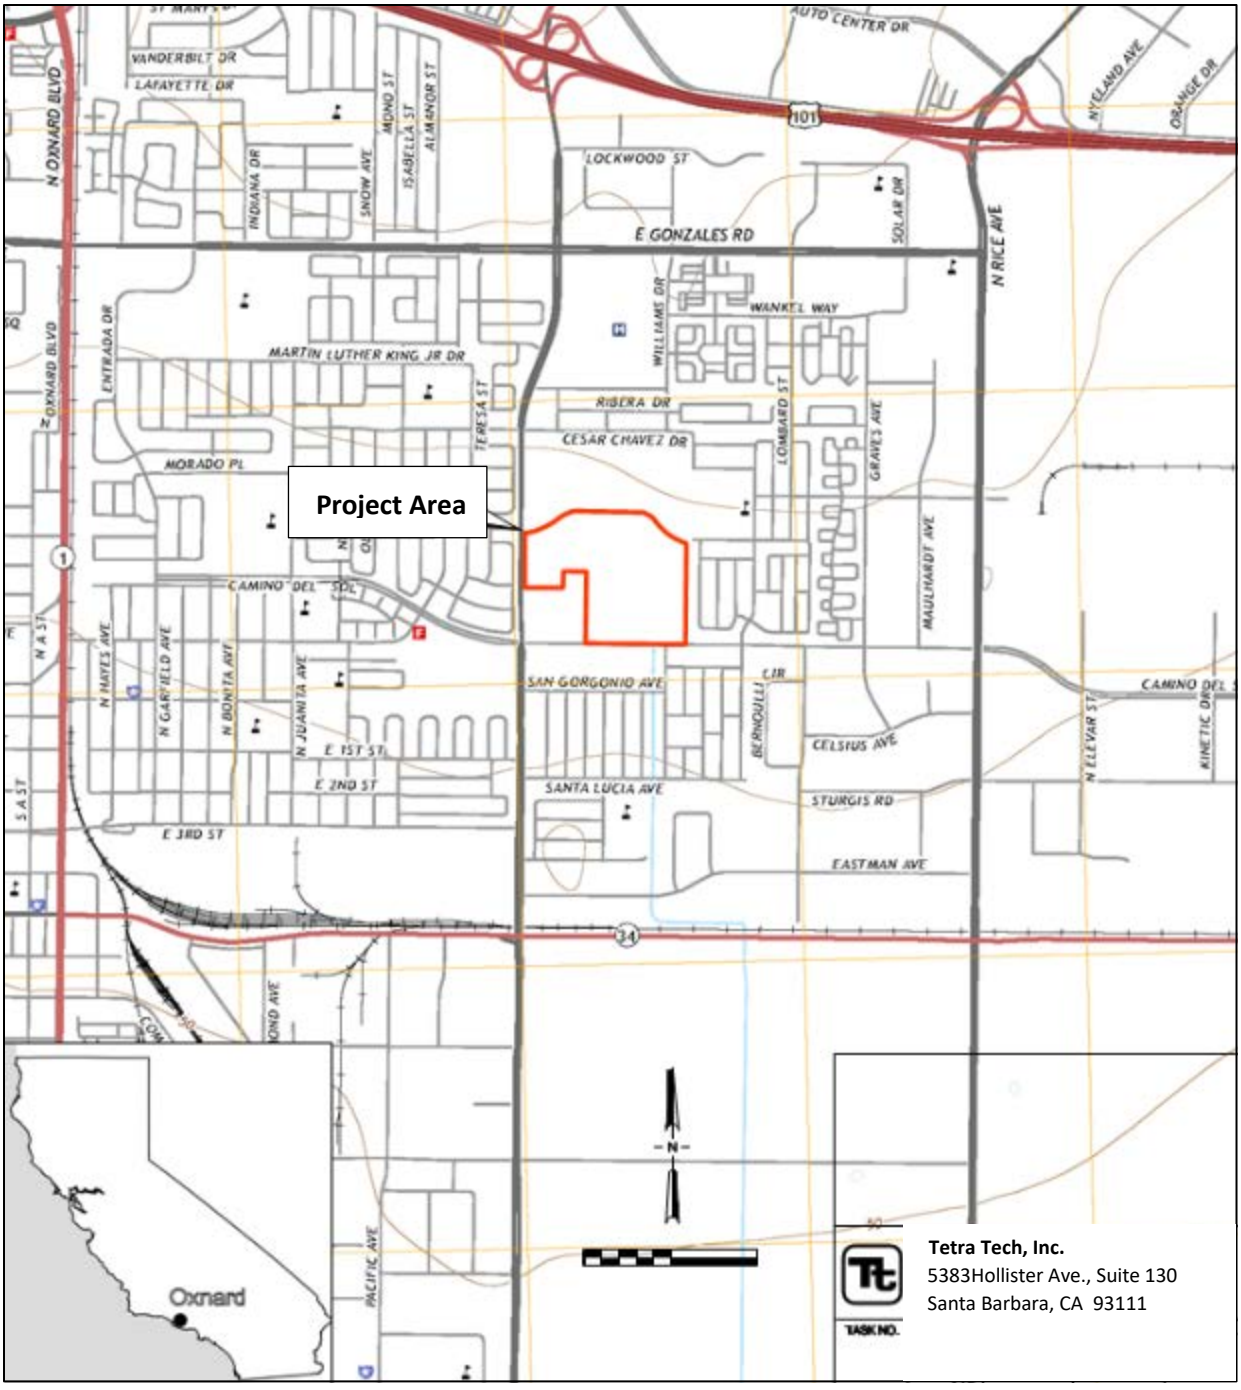

Figure 1. Project Location Map.

1.1 Project Description and Location

The 46.8 acre property is located northeast of Camino Del Sol and Rose Avenue in Oxnard, Ventura County, California (Figure 1). Presently, the parcel (Assessor's Parcel Number 214-002-059) (Figure 2), within the historic Maulhardt Ranch, is planted with strawberries. The purpose of the Phase I survey was to identify prehistoric and historic archaeological resources that have the potential to be adversely affected by development in the project area.

The project area is within the southern expanse of the Santa Clara River flood plain. The parcel is surrounded by residential properties on each side, and the Rio Rosales Elementary School and Park are located to the east-northeast and Del Sol Park is present to the southwest. The topography of the agricultural field is mostly flat (Figure 3). The elevation ranges between approximately 54 and 60 feet above mean average sea level (amsl) (Google Earth 2019).

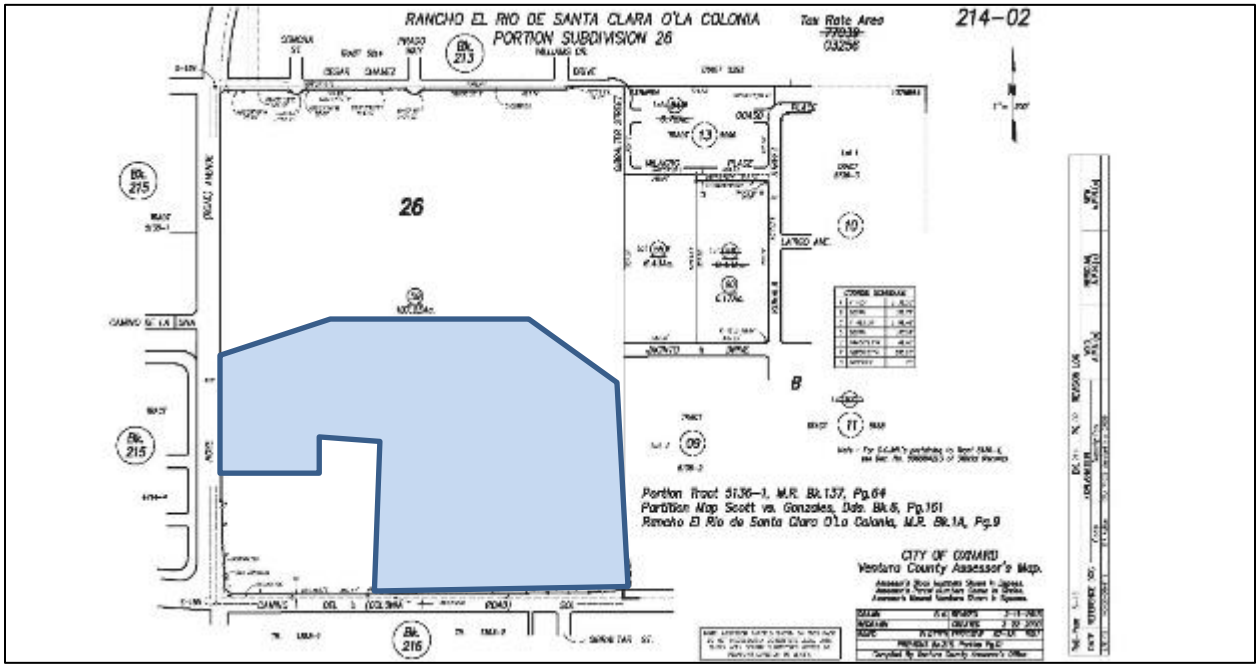

Figure 2. Assessor Parcel Map of Project Area (APN 214-002-059), shaded blue.

Figure 3. Aerial photograph indicating the surveyed Project Area. (Google Map 2019).

2.0 REGULATORY FRAMEWORK

The following regulatory framework describes the applicable state and local statutes, ordinances, and policies pertaining to the protection of cultural resources. These laws must be considered during the planning process for projects that have the potential to affect cultural resources in Ventura County.

2.1 State Regulations

2.1.1 California Environment Quality Act (CEQA)

The California Environmental Quality Act (CEQA) statute and guidelines include procedures for identifying, analyzing, and disclosing potential adverse impacts to historical resources, which include all resources listed in or formally determined eligible for the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), or local registers. CEQA further defines a "historical resource" as a resource that meets any of the following criteria:

- A resource listed in, or determined to be eligible for listing in, the NRHP or CRHR;

- A resource included in a local register of historical resources, as defined in Section 5020.1(k) of the Public Resources Code, unless the preponderance of evidence demonstrates that it is not historically or culturally significant;

- A resource identified as significant (i.e., rated 1-5) in a historical resource survey meeting the requirements of Public Resource Code Section 5024.1(g) (Department of Parks and Recreation Form 523), unless the preponderance of evidence demonstrates that it is not historically or culturally significant; or

- Any object, building, structure, site, area, place, record or manuscript, which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military or cultural annals of California, provided the determination is supported by substantial evidence in light of the whole record. Generally, a resource is considered "historically significant" if it meets the criteria for listing on the CRHR (CEQA Guidelines Section 15064.5).

2.1.2 California Register of Historical Resources

CRHR Criteria of Evaluation

All resources listed in or formally determined eligible for the NRHP are eligible for the CRHR. The CRHR is a listing of California resources that are significant within the context of California's history. The CRHR is a state-wide program of similar scope to the NRHP. In addition, properties designated under municipal or county ordinances are eligible for listing in the CRHR. A historic resource must be significant at the local, state, or national level under one or more of the following criteria that are defined in the California Code of Regulations Title 14, Chapter 11.5, Section 4850:

1. It is associated with events or patterns of events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or

2. It is associated with the lives of persons important to local, California, or national history; or

3. It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values; or

4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

The CRHR criteria are similar to NRHP criteria, and are tied to CEQA, as any resource that meets the above criteria is considered an historical resource under CEQA.

2.2 Local Ordinances and Guidelines

2.2.1 Ventura County Guidelines

Ventura County maintains a Cultural Heritage Ordinance. Its purpose is to "promote the economic and general welfare of the County by preserving and protecting public and private historic, cultural and natural resources which are of special historical or aesthetic character or interest, or relocating or recreating such resources where necessary for their preservation and for their use, education, and view by the general public" (Ventura County Zoning Ordinance 2019).

2.2.2 Ventura County Cultural Heritage Board

The purpose of the Ventura County Cultural Heritage Board is to "research and record County history and to make historic landmark designations" (County Ordinance Nos. 2026, 2737, and 3568). According to The Cultural Heritage Board is responsible for reviewing plans that entail alterations or demolition to any site designated as an official County Landmark. They have the authority to assess and make determinations of eligibility for landmarking using the following Criteria for Landmark Status:

1. Character, interest or value, regardless of age, is significant to the heritage of the community.
2. A significant historical event occurred at the site.
3. It is reminiscent of an early state of development.
4. It is identified with a person who significantly contributed to the culture or development of the County, State or the Nation.
5. It exemplifies a particular architectural style or way of life.
6. It is the design or work of a person whose efforts have significantly influenced the heritage of the County.
7. It demonstrates outstanding architectural design, detail, materials, or craftsmanship.
8. Its preservation is essential to the integrity of another landmark.
9. Its location or physical characteristics represent an established visual feature of a neighborhood.
10. It has potential of yielding significant information of archaeological interest.
11. It is a natural environment that strongly contributes to the well-being of the community.

2.2.3 City of Oxnard

The City of Oxnard largely defers to CEQA for guidance with cultural resources projects. Among the City of Oxnard's 2030 General Plan Goals and Policies Related to Cultural and Tribal Cultural Resources, are the following:

Chapter 3 Community Development - Goal CD-11: Protected historic and authentic qualities of Oxnard's traditional neighborhoods and historic districts;

Chapter 5 Environmental Resources - Goal ER-1: Protection of natural and cultural resources, agriculture, and open spaces is well integrated with the built environment and human activities and achieves a symbiotic, mutually beneficial, sustainable relationship.

2.3 Regulations Concerning Discovery of Human Remains

California Public Resources Code §5097.98 (Notification of Native American human remains, descendants; disposition of human remains and associated grave goods) mandates that the lead agency adhere to the following regulations when a project results in the identification or disturbance of Native American human remains:

(a) Whenever the commission receives notification of a discovery of Native American human remains from a county coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code, it shall immediately notify those persons it believes to be most likely descended from the deceased Native American. The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The descendants shall complete their inspection and make their recommendation within 48 hours of their notification by the Native American Heritage Commission. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials.

(b) Whenever the commission is unable to identify a descendant, or the descendant identified fails to make a recommendation, or the landowner or his or her authorized representative rejects the recommendation of the descendant, and the mediation provided for in subdivision (k) of Section 5097.94 fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall reinter the human remains and items associated with Native American burials with appropriate dignity on the property in a location not subject to further subsurface disturbance.

(c) Notwithstanding the provisions of Section 5097.9, the provisions of this section (including those actions taken by the landowner or his or her authorized representative to implement this section), and any action taken to implement an agreement developed pursuant to subdivision (l) of Section 5097.94, shall be exempt from the requirements of the California Environmental Quality Act (Division 13, commencing with Section 21000).

(d) Notwithstanding the provisions of Section 30244, the provisions of this section (including those actions taken by the landowner or his or her authorized representative to implement this section), and any action taken to implement an agreement developed pursuant to subdivision (1) of Section 5097.94 shall be exempt from the requirements of the California Coastal Act of 1976 (Division 20, commencing with Section 30000).

3.0 NATURAL AND CULTURAL OVERVIEW

3.1 Environmental Setting

The 46.8-acre project area is in the western portion of the Transverse Ranges Geomorphic Province. It is within the Oxnard Plain, a large alluvial basin bounded on the north by the Santa Clara River and on the south by Calleguas Creek and the Santa Monica Mountains. Alluvial sediments, including poorly consolidated silt, sand, and gravel deposits along modern drainages and alluvial fans and floodplains appear in lower elevations (Conkling 2012). Elevations in the project area range from 60 to 65 feet above mean sea level (amsl), and soils consist of Holocene wash deposits composed of unconsolidated sand, silt, and gravel (Clahan 2003).

3.1.1 Paleoenvironment

An understanding of the late Pleistocene and Holocene environments is crucial to the understanding of prehistoric California (West et al. 2007). The archaeological/geologic time scale of California can be divided into four broad periods: Terminal Pleistocene (before 10,000 years BP), early Holocene (10,000 - 7,000 years BP), middle Holocene (7,000 - 3,350 years BP), and late Holocene (3,350 - 200 years BP) (Erlandson and Colten 1991). The period between 11,000 and 8,000 years ago is marked by the Pleistocene/Holocene transition. This was a time of dramatic change in vegetation and a warming period following the Late Glacial Maximum.

Initial development of Holocene plant communities (oak woodland, chaparral and coastal sage scrub) began during the Pleistocene-Holocene transition (11,000 to 8,000 years ago). The rapid increase in oaks, herbs and chaparral taxa corresponded with a decrease in conifers. During the Holocene, there were brief shifts in the pine to oak transition occurring at approximate one thousand-year intervals between 11,000 and 3,000 years ago (West et al. 2007). This indicates vegetation changes came in pulses, with a brief change event followed by a stabilization period with slower, more gradual changes, until the next change event or pulse. Vegetation changes were associated with similar climatic changes as conditions shifted from cool and wet to warm and dry (Brandoff-Kerr 2010).

Climatic data from the middle Holocene show a distinct drying period with decreases in the woodland environments. The late Holocene was marked by a moist and cool climate up until about 1,000 years ago when the climate shifted to present norms.

Fire may have begun to be a factor in shaping the landscape as early as the middle Holocene. The changing plant species compositions and lower rainfall, particularly when fuel/vegetation moisture was low during prolonged dry periods, would have created conditions for wildfire. Fire ecology studies in California have demonstrated regular intervals of large fires in 20 to 50-year cycles (Mensing et al. 1999; Lightfoot 2005) during the late Holocene, in addition to evidence of anthropogenic-caused fires. In evaluating column samples from the Santa Barbara basin, “Firestorms erupted occasionally especially at the end of wet periods and at the beginning of significant droughts” (Mensing et al. 1999). Geomorphic changes are commensurate with fires of this magnitude: slope failures, mudflows, and debris flows that changed water courses (Brandoff-Kerr 2010).

3.1.2 Climate and Precipitation

The area is characterized by a Mediterranean climate with hot dry summers and cool wet winters. The rainy season occurs from October through April with precipitation averaging at about 16 inches annually.

Where coastal influences meet interior high temperatures, summer temperatures range from the 68 to 74 degrees. Cool humid marine air causes frequent fog and low clouds on the coast, generally at night and early morning in the late spring and early summer. The area experiences a diurnal cycle of onshore winds from the west and northwest that are replaced by mild offshore breezes flowing from warm inland valleys during the night and early morning. Winters are relatively mild annually and nighttime temperatures only rarely drop below freezing.

3.2 Archaeological Context

The history of human habitation in Ventura County extends back at least 12,000 years on the Channel Islands, and 6,900 years in the mountainous interior. Permanent villages or base camps would have been at lower elevations, along creeks and river drainages. Prehistoric archaeological sites within Ventura County range from chipped stone debitage and fire-affected rock at higher elevations, which indicates specialized activities and short-term occupation akin to camping, to multi-component sites representing base or seasonal settlements along the coast and closer to creeks and drainage bottoms.

3.2.1 Paleo-Indian Period (12,000 to 8,000 cal B.C.)

The Paleo-Indian Period is the earliest known human occupation of the Ventura County area, with evidence of a developing maritime culture found mostly on the Channel Islands. Recent work by scholars has pressed these earliest dates back further. People used relatively simple technology to procure plant foods, shellfish, and a limited variety of vertebrate species (Greenwood 1972; Jones and Waugh 1995; King 1982, 1990; Glassow 1996). There are at least 50 sites reported on the Channel Islands of San Miguel and Santa Rosa dating between 13,000 and 7,500 cal B.C. (Davis et al. 2010; Erlandson and Braje 2008). Mainland coastal sites occupied during this time would later become submerged by rising sea levels. Presently, there is a lack of archaeological evidence that demonstrates Paleo-Indian occupation in Ventura County.

3.2.2 Early Period (7,000 to 2,000 cal B.C.)

The Early Period reveals the earliest evidence of established occupation, with the Millingstone Horizon ending around 5,000 B.C. Most of the archaeological sites from this period are recorded at or near the coast, or on the Channel Islands. It was a time of rising sea levels that created an abundance of lagoons and estuaries (Glassow et al. 2007). This period is characterized by a subsistence shift to small seeds found in the chaparral plant community, as demonstrated by the abundance of multi-facial manos. Other common artifacts include metates, and a variety of flaked stone; plano-convex cores and core tools of quartzite, basalt and other volcanic stones. Larger populations were supported by a more diversified subsistence base that included not only seeds and other plant resources, but terrestrial and marine mammals, fish, and shellfish (Erlandson 1994; Glassow et al. 1988). Although deer are represented in the archaeological record, hunting and fishing contributed little to the diet, with the faunal diet relying heavily on mussels and Pismo clams. Residential bases are presumed to have been comprised of extended families during this period. Although quantities of animal bones do not appear to increase much in the archaeological record, hunting gained more prominence, as indicated by the variety of flaked stone artifacts and tools. A semi-sedentary lifestyle seems to have evolved. Occurrences of digging stick weights suggest harvest of tuberous plants.

3.2.3 Middle Period (1,400 B.C. to A.D. 1,150)

The Middle Period is marked by continued subsistence intensification and increased technological and economic complexity. Several technological developments include the inception of the mortar and pestle

for processing acorns and other foods, use of the bow and arrow to replace the *atlatl* for hunting, and the introduction of the plank canoe (*tomol*), to more effectively exploit marine resources. Coastal settlement increases significantly between 2,000 and 1,000 B.C. Sedentism is apparent, along with formal architecture, ceremonial structures and traditional cemeteries.

3.2.4 Middle to Late Transition Period (A.D. 1,150 - 1,300)

The Middle to Late Transition Period is characterized by the beginnings of political and social complexity and development of social hierarchy (Arnold 1992). Inland settlement became more pronounced as a result of climatic shifts and elevated sea temperatures (Jones et al. 1994). Population densities expanded, along with more sophisticated technology and craft specialization. By the end of this period, *Olivella* callus beads were used as currency throughout the region, and trade networks intensified between villages. There was an increase in the manufacture of elaborate shell ornaments and beads for trade between the Santa Barbara Channel groups, their neighbors, and the interior (Erlandson 1994). By the Late Transition Period, climatic fluctuations that increased ocean temperatures prompted a decrease in maritime activities and augmented a shift in settlement away from the coast as populations moved inland (Jones and Waugh 1995).

3.2.5 Late Period (1,000 cal A.D. to Missionization)

Around 1,000 A.D., the Medieval Climatic Anomaly, a 300-year period of warmer temperatures and drier climate, caused consequential, adverse environmental conditions, particularly intermittent droughts (Rabb and Larson 1997). During the Late Period, terrestrial resource production is thought to have decreased significantly, while socioeconomic complexity evolved. A conversion to concave based projectile points led to the abandonment of asphaltum, which had been used for hafting. Shellfish remained the principal protein food. A ranked society with hereditary elite was established, and population growth and socioeconomic complexity transpired, along with environmental change (Glassow et al. 2007). Several new artifact styles became popular after A.D. 1300, including leaf-shaped and triangular concave-based arrow points, “flowerpot” mortars, and circular shell fishhooks (Glassow 1996). It is likely that the aboriginal society was akin to the Chumash culture first encountered by Europeans (King 1990).

3.3 Ethnographic Context

Prior to Euro-American contact, the central California coastal region, including the northern Channel Islands and inland areas, was occupied by Chumash-speaking people. Their territory extended from San Luis Obispo to Malibu, and inland as far as the San Joaquin Valley. The Chumash have been divided into several geographic groups with strong Hokan language dialect associations, comprised of the Barbareño, Purisimeño, Inezeño, and Ventureño (Grant 1978). The project is within the ethnographic and historic territory inhabited by the Ventureño Chumash dialect group (Kroeber 1925). The Chumash occupied the area from Topanga Canyon to the Ventura River Valley, Oxnard Plain, Santa Clara Valley, Ojai, and Castaic (Van Valkenburgh 1935).

The Chumash were a non-agrarian culture known for having one of the most populous thriving, advanced societies of hunting-gathering California Native American groups. They practiced a regular seasonal round of population dispersal and aggregation in response to the location and seasonal availability of different food resources (Landberg 1965). In this way, large coastal villages would have been fully populated only in the late summer when pelagic fishing was at its peak. Shellfish were also exploited, including mussel and abalone from rocky shores and cockle and clams from sandy beaches. Acorns were a food staple;

they were ground into flour using stone mortars and pestles and then leached to remove tannic acid. In addition, a wide variety of seeds, including *chia* from various species of sage, were utilized. Through the winter months, the Chumash depended largely on stored food resources.

In this area, as elsewhere in California, basketry served many of the functions that pottery did in other places. Baskets were used for cooking, serving, storage, and transporting burdens. Some basket makers wove baskets so tightly that they could hold water, while others waterproofed their baskets by lining them with pitch or asphaltum (Chartkoff and Chartkoff 1984:130).

The Chumash lived in large, hemispherical houses constructed by planting willows or other poles in a circle and bending and tying them together at the top. These structures were then covered with tule mats or thatch. Structures such as this housed 40 to 50 individuals, or three-to-four-member family groups. Dance houses and sweathouses are also reported for the Chumash (Kroeber 1925:557).

Political organization was typified by small-scale chiefdoms. Chiefs were associated with villages or segments of larger villages. Higher status chiefs controlled entire regions containing several villages. The chiefly offices were normally inherited through the male line with a primogeniture rule in effect. Chiefs had several bureaucratic assistants to help in political affairs and serve as messengers, orators, and ceremonial assistants. A number of status positions were associated with specialized knowledge and rituals, such as a weather prophet, ritual poisoner, or herbalist (Bean 1974).

The protohistoric culture of the Chumash, defined as the time when intermittent trade and contact was experienced between Native Americans and Spanish trading vessels in route to the Orient, was disrupted by the arrival of the Spanish expedition led by Gaspar de Portolá in 1769. The establishment of the San Buenaventura Mission in 1782 further disrupted Chumash culture in Ventura County. Archaeological evidence verifies not only that the native population was rapidly decimated by missionization, but also that the culture itself disintegrated rapidly. Chartkoff and Chartkoff (1984:264) note that Spanish settlement barred many Native Americans from traditionally important resources including shellfish, clam shell beads, steatite, and asphaltum. Disease and forced relocation to Mission San Buenaventura disrupted traditional subsistence systems and, by 1810, most of the Chumash villages had been abandoned.

3.4 Historic Period Context

3.4.1 Mission Period (1760-1821)

In 1542, Juan Sebastían Cabrillo was the first of the exploring Europeans to sail along the California coast. The aftermath of Spanish exploration in Alta California led to immigrations and settlement. In 1769, Gaspar de Portolá led the first land expeditions from Baja California to the San Francisco Bay. Coined the Sacred Expedition, Fray Junípero Serra joined the journey with the intent to establish California missions and colonize the region. During the expedition the site was selected for the future San Buenaventura Mission, which would be established in 1782 as the ninth of 21 missions established in Alta California (Triem 1985). Newly baptized Chumash provided nearly all the labor to construct and maintains the missions, which soon produced surplus amounts of wheat, beans, corn, cattle, and sheep for trade.

By 1804, five missions had been established in Chumash territory. Of sad note during this period was the perish of large populations of Native American tribes and mission neophytes, largely triggered from exposure to European diseases and the sudden introduction to subsistence and cultural changes, which contributed to low fertility rates and high infant mortality (Tompkins 1975).

To some extent, the San Buenaventura Mission and other missions along the central coast were somewhat geographically disconnected from the Alta California headquarters in Monterey and Los Angeles, largely due to a lack of accessible seaports and the shortcomings of travel along El Camino Real. The geographic divide continued during Mexican revolution from 1810 to 1821 (Hildebrandt and Darcangelo 2009:48).

3.4.2 Rancho Period (1821-1845)

California officially became a Mexican Territory after the Treaty of Cordoba was signed in 1821. The transfer of sovereignty from Spain to Mexico altered Mission San Buenaventura irrevocably. After secularization of the missions in 1834, approximately ten million acres were gradually transferred to private ownership via a system of land grants. Mexican officials dispersed large land grants to former Mexican military soldiers and their descendants as compensation for their service. In 1837, Governor Juan B. Alvarado ceded Rancho El Rio de Santa Clara o La Colonia, consisting of 44.883-acres of fertile soil in the plain south of the Santa Clara River, to a group of former soldiers who had served at the Santa Barbara Presidio The soldiers included Valentine Cota, Salvador Valenzuela, Vicente Pico, Rafael Valdez, Vincent Feliz, Leandro Gonzalez, Rafael Gonzalez, and Jose Maria Valenzuela (Maulhardt 2004, 2016).

The Mexican government also sold some of their holdings as a tactic to thwart Spain's control of California. California also opened to international trade, which caused "great and rapid economic transportation" as foreign companies competed for access to the developing hide-and-tallow industry (Hackel 1997). Native people who suffered from the mission's reduced economic circumstances were hired as vaqueros at the ranches.

3.4.3 Anglo-Mexican Period (1845-1880)

The Mexican-American War in 1846 weakened Mexico's hold on Alta California, and American influence steadily increased. In 1848, hostilities between the Mexican Californios and the Americans ceased and the two-year war ended with the Treaty of Guadalupe Hidalgo. As a result, California was declared a United States territory, and in 1850 it became the nation's thirty-first state (Chartkoff and Chartkoff 1984). Following statehood, passage of the Land Act of 1851 created the California State Lands Commission to adjudicate disputes regarding Mexican citizens' land claims, to determine their validity, and redistribute land where ownership was in question (Gates 1971). Often land grants were denied to the original grantee when formal legal documents were lacking, and the property fell into the hands of new owners, generally the recent American arrivals. This process also allowed settlers to homestead on unclaimed government lands. Proper documentation was filed for Rancho El Rio de Santa Clara o La Colonia in 1852, and twenty years later it was legally patented (Willey 1886).

During the Gold Rush, a rapid population increase caused the demand (and price) for California livestock to soar. However, a long drought from 1860 to 1864, which coincided with the Civil War, was devastating for the cattle industry throughout California. It decimated large numbers of cattle within Ventura County. As a result, most of the ranchos were divvied up and sold, with large acreages purchased by investors from the east, some who hoped to profit amid reports of oil discoveries in the area. Over the next twenty years, American settlers continued their influx into the state of California, with many marrying into the families of wealthy Californios and gradually outnumbering the Mexican citizens.

In 1865, Rafael Gonzalez sold 4,000 acres of La Colonia to Juan Camarillo. By 1866, German immigrant Johannes Christian Borchard arrived in the area and sought arable land for crop production and sheep grazing, and in 1866, he purchased the Gonzalez home and 1,000 acres of Rancho El Rio de Santa Clara o La Colonia, which had belonged to Leandro and Rafael Gonzalez. In the following year, German settlers

Gottfried and Sophie Maulhardt and brothers Jacob and Anton Maulhardt arrived. In 1871, other portions of the land grant were bought by Thomas Bard who subdivided much of the rancho into farm plots and sought to establish a wharf so crops could be loaded on ships locally for transport to market (Maulhardt 2004).

In 1872, after Christian Borchard found that barley crops thrived in alkali soils, brothers Jacob Maulhardt and Gottfried Maulhardt and Johannes Borchard got together to purchase 1,230 acres of prime farm land from Juan Camarillo who had earlier obtained a portion of the land grant from Leandro and Rafael Gonzalez. The Maulhardt brothers and Johannes Borchard later split the property three ways, so each would own 410 acres. In 1878, Jacob Maulhardt built his home, not far from the present Maulhardt residence next to the project site (Figure 4). It was there that he and his wife Dorothea Kohler raised their family (Maulhardt 2004; San Buenaventura Research Associates 2014).

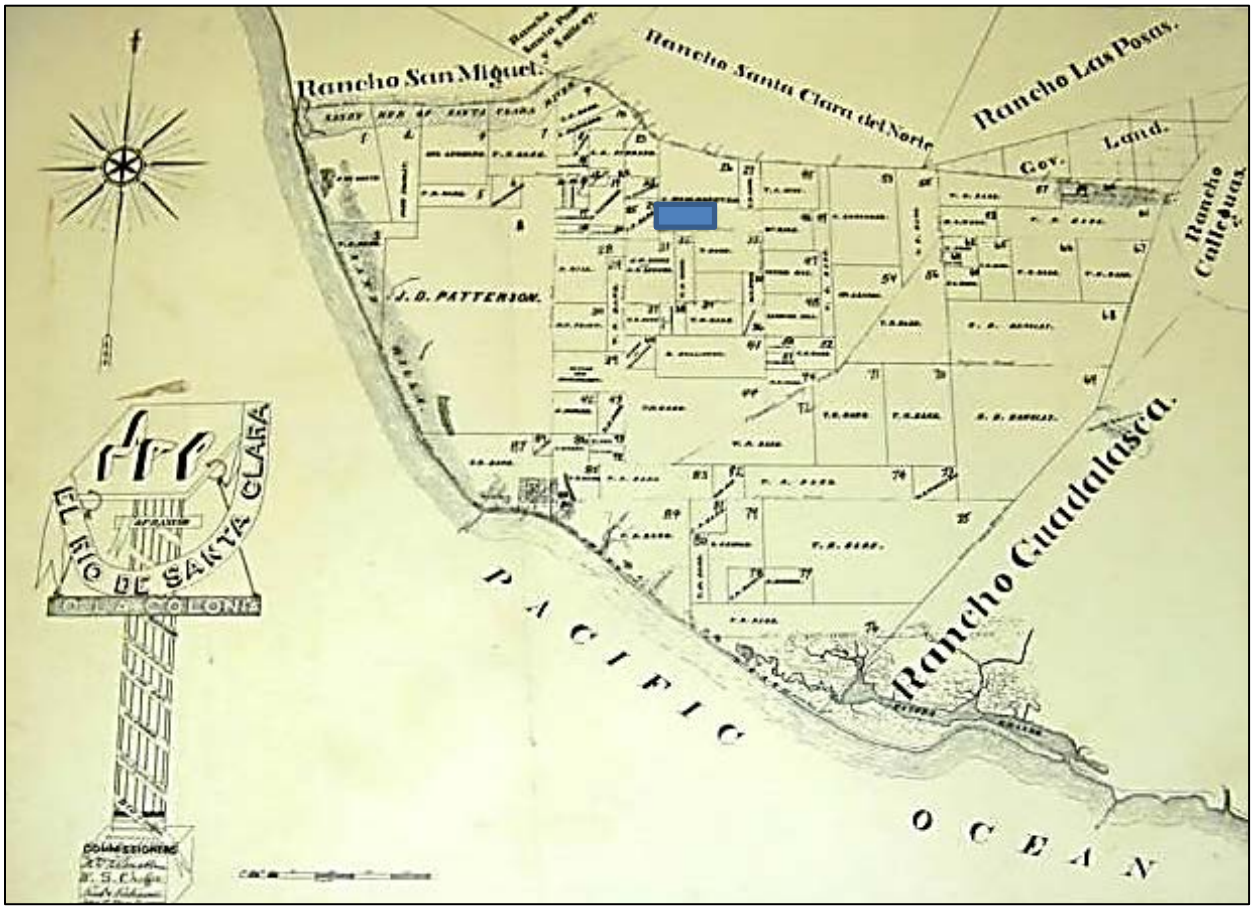

Figure 4. 1877 Map of Rancho el Rio de Santa Clara O La Colonia: partitioned by order Dist. Court 1st Jud. Dist. California. Hon. Eugene Fawcett; / John T. Storr, Surveyor. (Huntington Library archives). Blue-shaded area depicts project area within the Maulhardt Ranch property.

Along with agriculture, homes and businesses sprang up and towns emerged in the area that would later become Ventura County. In 1866, the community of San Buenaventura incorporated, and at that time the fledging city boasted a wharf, courthouse, bank, and library (City of Ventura 2019). Ventura County then seceded from Santa Barbara County in 1873.

3.4.4 Americanization Period (1880-1915)

During the early American Period, the ranchos continued to raise cattle and sheep, but the industry shifted from hides and tallow to dairy, meat, and agricultural products such as lima beans and sugar beets.

In 1887, the Southern Pacific Railroad constructed a spur from the Newhall Pass to San Buenaventura and a depot to expedite shipments of agricultural products produced in the Santa Clara River Valley and Oxnard Plain (Triem 2002). In 1897, the railroad established the Oxnard Depot in advance of the American Beet Sugar Factory, which opened on the north side of Wooley Road, east of Oxnard Boulevard in 1898 (Figure 5). The sugar beet factory, launched by entrepreneur Henry T. Oxnard, offered prosperity for the farming community that would later be named Oxnard. Mr. Oxnard was a well-known 'sugar baron' who had established the American Crystal Sugar Company. He was persuaded to invest in the superior quality sugar beets grown by farmers Albert Maulhardt, John Borchard, and others. The profitable $2 million sugar facility had the capacity to process 2,000 tons of sugar beets daily, which eliminated the need for shipping the product elsewhere, plus the factory provided plenty of jobs for the community. For a time, it was considered the world's largest sugar beet factory (Maulhardt 2016).

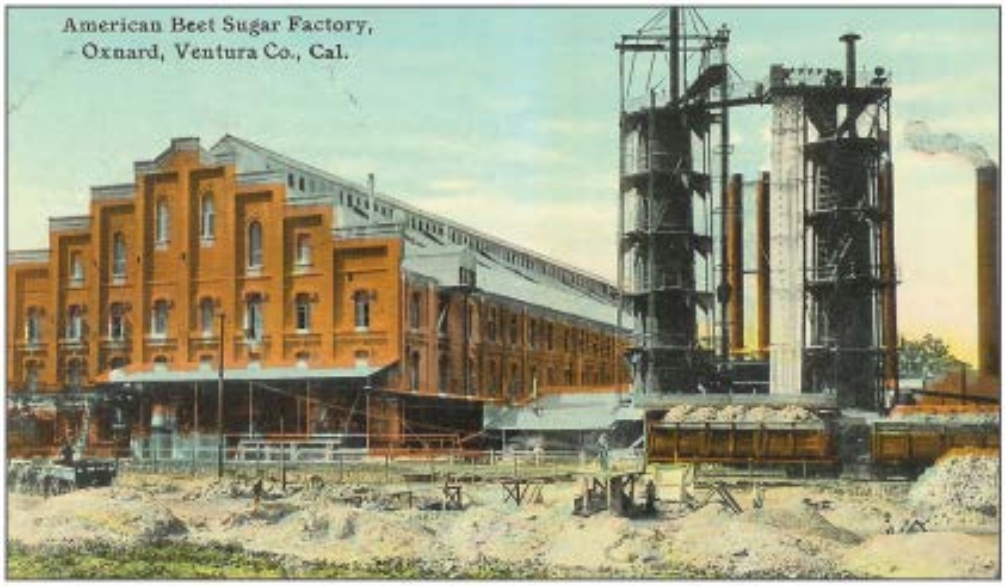

Figure 5. Postcard depicting the American Beet Sugar Factory in Oxnard.

In 1898, the townsite of Oxnard was platted by James A. Driffilll of the Colonia Improvement Company, who also managed construction of the sugar mill. The sugar beet industry created a population surge that brought many foreign workers, especially Japanese immigrants. In 1903, Oxnard became incorporated (Maulhardt 2014).

Louis G. Maulhardt inherited 100 acres of the Maulhardt Ranch after his father's death in 1899. He later accumulated additional acreage, where he and his wife Theresa Borchard raised a family, and successfully expanded the farming operation (Maulhardt 2004; San Buenaventura Research Associates 2014).

3.4.5 Twentieth Century Development (1915-Present)

In 1915/1916 the original Maulhardt Ranch farm house was demolished and replaced with a new residence. Other extant buildings on the ranch include a large two-story wooden barn constructed in 1906, and other ancillary buildings constructed ca. 1915. The oldest building on the property, the wood

carriage house, dates to ca. 1880 (San Buenaventura Research Associates 2014). The proposed project is located on the north and east sides of the Maulhardt Ranch.

The Great Depression of the 1930s were a difficult time in Oxnard, as it was throughout the United States. However, Oxnard felt an economic upswing during the 1940s, as it experienced significant growth due to increased populations and business interests subsequent to World War II. People were attracted to Oxnard and the overall Ventura County area by jobs in the petroleum industry at the Oxnard Oil Fields, the aerospace and technology, and other industry and retail business opportunities. In 1947, the Wagon Wheel Junction, conceived by developer Martin V. Smith, was a central automobile stop on the 101 Freeway between Los Angeles and Santa Barbara County, offering shopping, dining, and lodging accommodations for travelers. Between 1940 and 1950, the population more than doubled, from approximately 8,500 to over 21,500 residents. By 1960, there were more than 40,000 people living in Oxnard. Agriculture remained strong in Oxnard with sugar beet industry leading, with an estimate of 40 million bags of 100 pound sugar produced from local sugar beets for a duration of 60 years. Oxnard's sugar beet factory closed in 1958, due to the increased cost for crop production in California, as well as competition abroad and in the Southern states (CNU California 2017).

Oxnard continues to be a producer of agricultural crops, such as celery, strawberries, beans, chili peppers, onions, and bell peppers, but much of the former farm land has been replaced by commercial and retail development, as well as recreation and tourist attractions at the Channel Islands Harbor, Fisherman's Wharf, and the Maritime Museum.

4.0 RECORDS SEARCH

4.1 Records Search Results

Provenience Group, Inc. conducted a record search at the South-Central Coast Information Center of the California Historic Resources Information System (SCCIC-CHRIS), housed at the California State University, Fullerton on March 12, 2019. The SCCIC, an affiliate of the State of California Office of Historic Preservation, is the official state repository of archaeological and historical records and reports for Ventura, Los Angeles, Orange, and San Bernardino counties. The records search comprised a review of all recorded historic and prehistoric archaeological sites within a 0.5-mile radius of the project, as well as a review of known cultural resource studies.

The objective of the records search and literature review for this project was: (1) to determine whether previously recorded cultural resources are present within or adjacent to the project area; (2) to assess the likelihood of unrecorded cultural resources, based on archaeological, ethnographic, and historical documents and literature; (3) to make preliminary evaluations based on the significance such resources, according to CRHR criteria; and (4) to recommend procedures for avoidance or mitigation of adverse effects to potentially significant resources.

The following resources were consulted as a part of this records search:

- National Register of Historic Places (NRHP), Index of Listed Properties;
- Office of Historic Preservation Historic Property Data File for Santa Barbara County; and
- California Historical Landmarks (California OHP 2019).

4.1.1 Previous Cultural Resources Studies

The records search identified fourteen (14) previous studies within 0.5-mile of the project area. Each of the previous studies are listed in Table 1.

Table 1. Cultural Resources Studies within 0.5-mile of the Project Area.

VN-1959	Maki 2001	*Phase I Archaeological Survey of Approximately 11.5 Acres for Shea Homes Tentative Tract No. 5293, Oxnard, Ventura County, California.*

4.1.2 Previously Recorded Cultural Resources

The records search did not identify any previously recorded prehistoric or historic cultural resources within 0.5-mile of the project area, which suggests the area has a low archaeological sensitivity.

4.1.3 Native American Consultation

The California Native American Heritage Commission (NAHC) was consulted to inquire if known sacred sites are present in the project area; the results were negative. On March 15, 2019, the NAHC indicated an absence of Native American traditional cultural places and sacred sites in or around the project area. The NAHC provided a list of ten (10) Native American groups and individuals. Letters and/or emails were provided to each contact on March 18, 2019 (Appendix A). Follow-up phone calls were made on March 22, 28, and 29, 2019. Voicemail messages were left for 4 of the 10 contacts; thus far, there have been no

return calls. Native Americans located outside Ventura County generally supported the recommendations of local Barbareño/Ventureño Chumash tribal members.

[redacted]

Patrick Tumamait wanted to make sure a records search was completed, in addition to the NAHC consultation.

5.0 METHODOLOGY

5.1 Archaeological Field Methods

5.1.1 Phase I Cultural Resources Survey

On March 21, 2019, PGI staff archaeologist Debra Hargett surveyed the approximately 46.8 acre project area to identify cultural resources. Most of the project area, with the exception of unimproved access roads, is within an active strawberry field. The area was surveyed using transect intervals that varied between three and ten meters. All transects were surveyed within the pathways between strawberry rows, which were oriented in a north-south direction.

The focus of the survey was the level strawberry fields, unimproved access roads, and slopes between the roads and strawberry rows in the central and southern parts of the property (Figures 6-8). The southwest portion of the parcel surrounding the residence and associated buildings, was excluded from archaeological survey. Ground visibility ranged from zero to 20 percent at best throughout the strawberry fields and 90 to 100 percent on the maintained unimproved access roads throughout the property. Strawberry plasticulture is practiced in the fields with raised beds; they measure approximately 8 to 12 inches high, 32 inches at the base, 30 inches at the top, and with a slightly crowned top to allow for water runoff. The raised beds are covered in plastic and consist of four offset rows of strawberries and three drip lines per bed. Narrow passageways, about 6 inches wide, are located between each bed. The tops of the beds are level with the roads and surrounding ground surface. Bare swatches of ground, especially the exposed road slopes, were carefully inspected for the presence of cultural materials. The sidewalls of unimproved access roads along the perimeter and between sections of the planted strawberry field offered the best visibility. [redacted]

Photographs were taken with a digital camera. No cultural materials were collected or removed.

Figure 6. Project area overview, facing north from the south end of the field.

Figure 7. [redacted]

Figure 8. Road through center of southeast project area, facing south.

5.1.2 Project Personnel

Carole Denardo, M.A., RPA served as principal investigator and project manager. Ms. Denardo exceeds the U.S. Secretary of the Interior's Historic Preservation Professional Qualification Standards as outlined in 36 CFR 61. Staff archaeologist Debra Hargett, M.St. performed the pedestrian field survey.

6.0 FIELD SURVEY RESULTS

The results of the Phase I cultural resources pedestrian survey of the project area was positive for archaeological resources (Figure 9).

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

PGI archaeologists reviewed historical aerial photographs obtained from EDR, and provided by Tetra Tech Inc., included photographs dated 1927, 1938, 1947, 1959, 1967, 1978, 1985, 1994, 2005, 2009, 2010, and 2012 (EDR 2017).

[redacted]

The northernmost area [redacted] was undeveloped in 1927 and 1938, but by 1947 row crops were planted in that location. By 1985, a road cut through diagonally and then turned north from the artifact location, which depicts either a small building or an unidentified activity area. In 1994, this location is within row crops. Subsequent aerial photographs that date to 2005, 2009, 2010, and 2012, depict this area as the juncture of north-south and east oriented access roads. The closest extant buildings are a tin shed and a small storage shed to the southeast.

[redacted] farm buildings are present southeast of the extant tin shed, east of the garage, and northeast of the horse barn. There appears to be access from the farm buildings to the north-south oriented unimproved access road [redacted] In 1927, this area was part of the farmyard, and appears to have been graded and although the image is blurred, small sheds, possibly chicken coops or pig pens, are present [redacted]. By 1938, no buildings are present in this area, but the horse barn has an addition on the east side, and it appears that this area is dedicated to row crops. Later aerial photographs dated 1947, 1959, 1967, 1978, 1985, 1994, 2005, 2009, 2010, and 2012 do not show any development other that row crops and unimproved access roads [redacted]

[redacted]

[redacted]

An examination of historic and modern aerial imagery dated 1927, 1938, 1947, 1959, 1967, 1978, 1985, 1994, 2005, 2009, 2010, and 2012, revealed that other than crop production, no development has occurred [redacted]

7.0 CONCLUSIONS AND RECOMMENDATIONS

At the request of Tetra Tech, Inc., PGI completed a records search, Native American consultation, and a Phase I archaeological pedestrian survey of the project area parcel northeast of Camino Del Sol and Rose Avenue in Oxnard, Ventura County, California. The proposed project is located on the east and north sides of the historic Maulhardt Ranch property, which was previously recommended eligible for the National Register of Historic Places (National Register), California Register of Historical Resources (California Register) and as a Ventura County Landmark by San Buenaventura Research Associates in 2014.

Despite 14 prior studies, no previously identified prehistoric or historic archaeological resources have been recorded within 0.5-mile of the project area. There was poor ground visibility throughout much of the project area [redacted]

[redacted]

7.1 Recommendations

Indirect visual impacts of the project, which have the potential to visually alter the characteristics of the ranch and diminish its integrity, will require mitigation. PGI recommends mitigation that will entail planting a thick windrow of tall trees and bushes along the east and north sides of the Maulhardt Ranch property to visually obscure the school complex from the ranch.

PGI also recommends [redacted]

Depending on the results of the Extended Phase 1 study, additional mitigation may be required if avoidance is not feasible.

In addition, given the poor visibility throughout most of the project area, archaeological monitoring during initial grading for the project is recommended.

7.2 Procedure for Unanticipated Discoveries

If previously unidentified cultural resources are encountered during construction within the project area, then the archaeologist will have the authority to halt work within 50 feet of the area until the project archaeologist can assess the find; determine its potential for significance; and develop measures to eliminate adverse impacts. Such measures may include avoidance through project redesign, or Phase 2 testing (excavation) to evaluate the significance of the find.

CEQA provides a measure of protection for human remains (Guidelines section 15064.5[d]), and for the accidental discovery of cultural resources (Guidelines section 15064.5[e]). These guidelines are particularly important as they consider the possibility that significant archaeological resources not noted as a result of previous research efforts may be present within a project area and need to be treated in a way commensurate with CEQA standards.

7.2.1 Regulations Concerning Discovery of Human Remains

There is a possibility of encountering human remains either in association with prehistoric occupation sites or as separate finds. Section 7050.5 of the California Health and Safety Code states that it is a misdemeanor to knowingly disturb a human burial, and Section 5097.99 of the Public Resources Code defines the obtaining or possession of Native American remains or grave goods to be a felony. If human remains are encountered during construction activities, any work in the vicinity should stop and the County Coroner contacted immediately. At the same time, a qualified archaeologist should be contacted to evaluate the situation. If the human remains are Native American in origin, then the Coroner must notify the Native American Heritage Commission within 24 hours of this identification.

California Public Resources Code §5097.98 (Notification of Native American human remains, descendants; disposition of human remains and associated grave goods) mandates that the lead agency adhere to the following regulations when a project results in the identification or disturbance of Native American human remains:

> (a) Whenever the commission receives notification of a discovery of Native American human remains from a county coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code, it shall immediately notify those persons it believes to be most likely descended from the deceased Native American. The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The descendants shall complete their inspection and make their recommendation within 48 hours of their notification by the Native American Heritage Commission. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials.
>
> (b) Whenever the commission is unable to identify a descendant, or the descendant identified fails to make a recommendation, or the landowner or his or her authorized representative rejects the recommendation of the descendant and the mediation provided for in subdivision (k) of Section 5097.94 fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall reinter the human remains and items associated with Native American burials with appropriate dignity on the property in a location not subject to further subsurface disturbance.
>
> (c) Notwithstanding the provisions of Section 5097.9, the provisions of this section, including those actions taken by the landowner or his or her authorized representative to implement this section and any action taken to implement an agreement developed pursuant to subdivision (l) of Section 5097.94, shall be exempt from the requirements of the California Environmental Quality Act (Division 13 (commencing with Section 21000)).

(d) Notwithstanding the provisions of Section 30244, the provisions of this section, including those actions taken by the landowner or his or her authorized representative to implement this section, and any action taken to implement an agreement developed pursuant to subdivision (1) of Section 5097.94 shall be exempt from the requirements of the California Coastal Act of 1976 (Division 20 (commencing with Section 30000)).

MANAGEMENT SUMMARY

At the request of the Oxnard Union High School District, under contract with Tetra Tech, Inc., Provenience Group, Inc. completed Extended Phase 1 (XP1) archaeological subsurface testing for the Oxnard Union High School No. 8 Site in the City of Oxnard, Ventura County, California.

On June 19 and 20, 2019, Provenience Group archaeologists excavated eight (8) shovel test probes (STPs). T

As a result, Provenience Group, Inc. recommends archaeological monitoring during trenching, grading, excavation, or other ground-disturbing activities to identify and protect any intact midden or possible archaeological features that may be uncovered by earth-moving activities. it is also recommended that a local Chumash Native American representative be retained to monitor during construction.

In the event human remains are encountered, the monitoring archaeologist or construction crew should adhere to the provisions of sections 7052 and 7050.5 of the California Health and Safety Code. Section 7052 states that disturbance of Indian cemeteries is a felony. Section 7050.5 requires that construction or excavation be stopped near discovered human remains until the coroner can determine whether the remains are those of a Native American. If the remains are Native American, Section 7052 states that the coroner must contact the California Native American Heritage Commission.

[redacted]

1.0 INTRODUCTION

At the request of the Oxnard Union High School District, under contract with Tetra Tech, Inc., Provenience Group, Inc. has completed Extended Phase 1 (XP1) archaeological subsurface testing for the Oxnard Union High School No. 8 Site in the City of Oxnard, Ventura County, California (Figure 1).

[redacted]

[redacted]

Because much of the ground surface in the Direct APE where the new high school is proposed was obscured by ripening strawberry fields, it was determined that XP1 testing was warranted. [redacted]

On June 19 and 20, 2019, under the direction of Provenience Group, Inc. principal archaeologist Carole Denardo, M.A., archaeologists Gina Zavala, M.A., and Caitlin Paulson, B.A. excavated eight (8) STPs. Field methods included excavation of STPs, photographic documentation, and mapping. In total, Provenience Group, Inc. excavated approximately 2.03 $m^3$of soil.

The remainder of this section describes the project and its location and outlines the regulations that guided the excavation; Section 2.0 outlines the research design and contextual framework; Section 3.0 provides environmental, ethnographic, and archaeological overviews for the region; Section 4.0 provides the records search results and Native American consultations; Section 5.0 provides the field methodology and survey results; Section 6.0 provides recommendations; and references are listed in Section 7.0.

1.1 PROJECT LOCATION AND DESCRIPTION

The project entails the construction of a new high school by Oxnard Union High School District within a 46.8 acre property northeast of Camino Del Sol and Rose Avenue in Oxnard, Ventura County, California. The project area is within the Oxnard, California USGS 7.5-Minute Series topographic quadrangle map. Specifically, the project area is unsectioned, in T 2 North, R 22 West in the City of Oxnard, Ventura County, California (Figure 1).

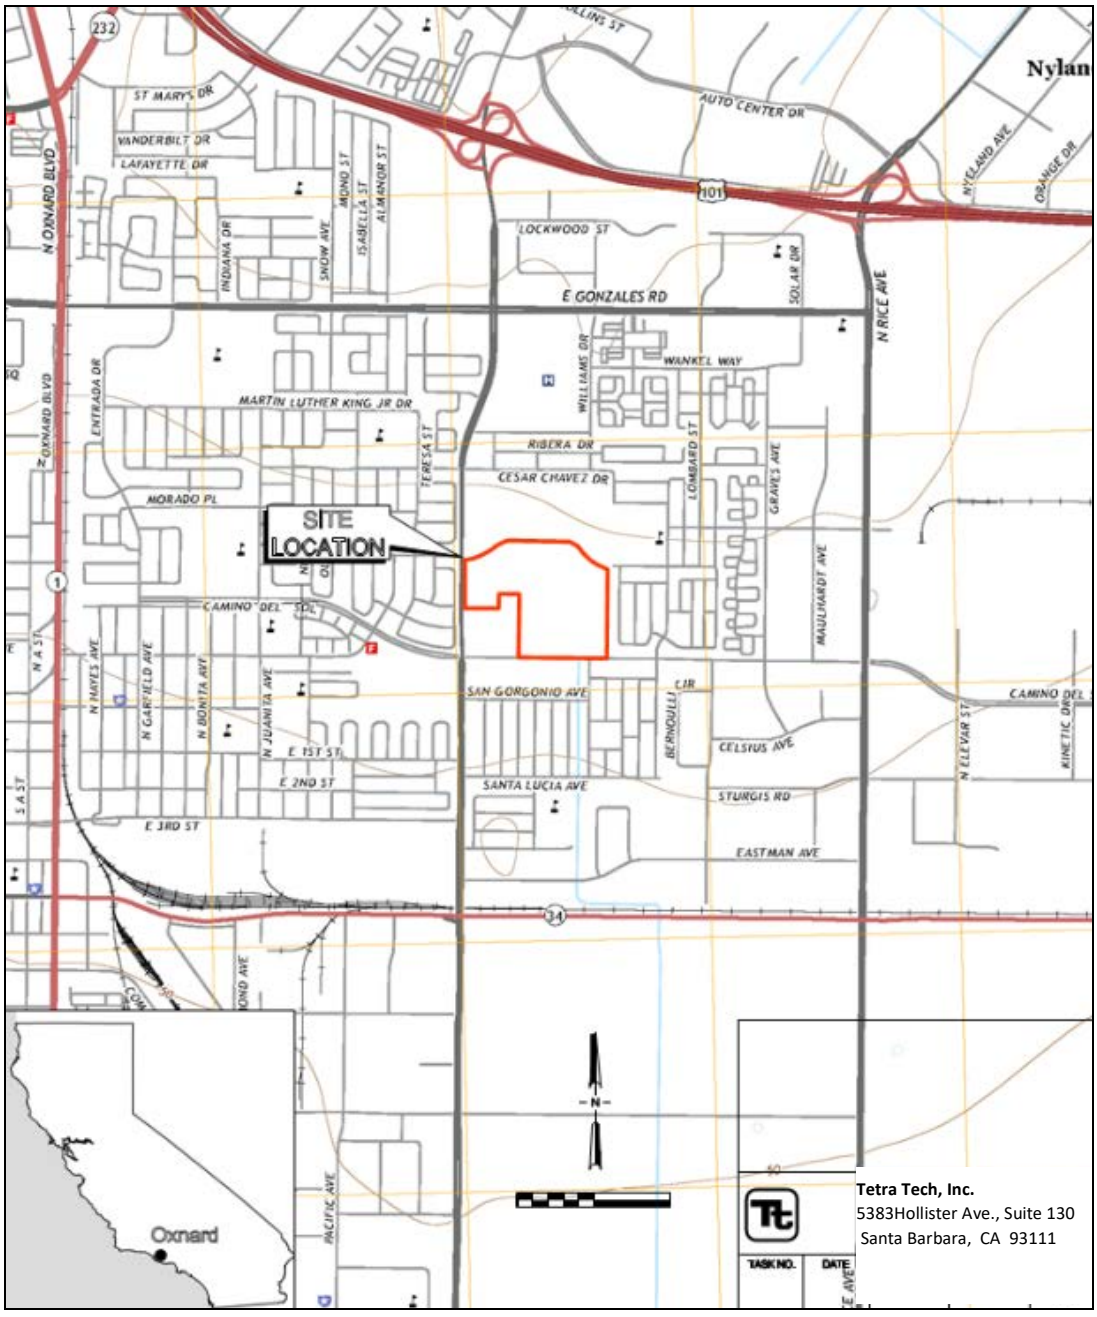

Figure 1. Project Location Map—Oxnard, California topographic quadrangle map.

The Oxnard High School No. 8 Site envelops the historic Maulhardt Ranch buildings on the north and east sides. Presently, the parcel (Assessor's Parcel Number 214-002-059) (Figure 2), within the historic Maulhardt Ranch, is cultivated with strawberries. The project area is surrounded by residential properties on each side, and the Rio Rosales Elementary School and Park are located to the east-northeast and Del Sol Park is present to the southwest. The topography of the agricultural field is mostly flat. The approximate elevation of the project area ranges between 45 and 60 feet above mean sea level.

Figure 2. Aerial photograph indicating the surveyed Project Area. (Google Map 2019).

1.2 REGULATORY AUTHORITY

Provenience Group, Inc. conducted the project in accordance with state (CEQA guidelines) and local regulations (California Resources Agency 1996). CEQA equates a substantial adverse change in the significance of a cultural resource with a significant effect on the environment (Public Resources Code, Section 21084.1). "Substantial adverse change" is defined as demolition, destruction, relocation, or alteration activities that would impair significance (Public Resources Code, Section 5020.1).

Under the provisions of CEQA, where a project has the potential to affect an archaeological resource, it must be determined whether the resource at hand is "significant," as defined by CEQA, and therefore eligible for certain protections under the law (Public Resources Code, Sections 4852, 21083.2, and 21084.1). Provenience Group, Inc. conducted the XP1 study described in this report in fulfillment of these requirements. Research focused on prehistoric and historic land use.

1.3 CEQA CONSIDERATIONS

This study was carried out in compliance with the requirements of CEQA. The purpose of this study was to locate, record, and evaluate the significance of archaeological resources located within the area that would be impacted by the construction of the new Oxnard Union High School No. 8.

The California Register of Historical Resources (California Register) is the authoritative guide to the state's significant historical and archaeological resources (Public Resources Code, Section 4852). According to criteria established by the California Register, a resource is considered "historically significant" if it:

(A) is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;

(B) is associated with the lives of persons important to local, California, or National history;

(C) embodies the distinctive characteristics of a type, period, region, or method of construction or represents the work of a master or possesses high artistic values; or

(D) has yielded, or has the potential to yield, information important to prehistory or history of the local area, California, or the United States.

Resources meeting one or more of these criteria may be eligible for listing on the CRHR, and, therefore, for certain protections under CEQA. Additionally, CEQA Guidelines specify that an archaeological resource is "unique" and significant if it:

- is associated with an event or person of recognized significance in California or American history, or recognized scientific importance in prehistory;
- can provide information, which is both of demonstrable public interest and useful in addressing scientifically consequential and reasonable or archaeological research questions;
- has a special or particular quality such as oldest, best example, largest, or last surviving example of its kind;
- is at least 100 years old and possesses substantial stratigraphic integrity; or
- involves important research questions that historical research has shown can be answered only with archaeological methods (California Public Resources Code Section 21083.2).

2.0 PROJECT DESIGN

2.1 RESEARCH FOCUS

This research design follows the California Office of Historic Preservation's guidelines for *Archaeological Resource Management Reports (ARMR) Recommended Contents and Format*, the California Office of Historic Preservation's *Preservation Planning Bulletin - Guidelines for Archaeological Research Designs* (1991). Its purpose is to describe research themes and address the types of anticipated artifacts, locales of increased archaeological sensitivity, probable depth of cultural deposits, previous disturbances, and California Register-eligibility.

To create an accurate reconstruction of site history and function, and to understand the processes of development and change occurring within the project area, information from published sources, historic maps, aerial photographs, archival documents, and archaeological materials is required.

Scientific or scholarly research values are judged within the context of a research design that provides the framework for examining variability and change in the archaeological record. A research design outlines the topics or questions that could be asked, given the kinds of data that a particular property type is likely to contain, and evaluates whether that information can be gained from other sources (Maniery and Brown 1995).

This research design is based on a contextual approach, which emphasizes the specific historical, social, and cultural behaviors contributing to the creation of archaeological remains (Hodder 1986:118-146; 1982:215-218). Through this approach, an archaeologist can examine cultural processes on a small scale, at the level of the mundane and day-to-day activities and experiences that together form a society's broader patterns of development. Use of a contextual approach requires the development of an historic context within which to place the activities that have led to the creation of an archaeological site. An historic context for an archaeological deposit might include information about specific characteristics of an individual or group, such as ethnicity and profession, as well as information about the political, social, and economic climate of the larger society, and may address technological trends relating to site formation processes and site components.

2.2 RESEARCH OBJECTIVE AND CONTEXT OF EVALUATION

Scientific or scholarly research values are judged within the context of a research design that provides the framework for examining variability and change in the archaeological record. A research design outlines the topics or questions that could be asked, given the kinds of data that a particular property type is likely to contain, and evaluates whether that information can be gained from other sources (Maniery and Brown 1995). Archaeological research requires a broad theoretical perspective and framework for asking questions about the historical and archaeological record, as well as the appropriate middle-range theory linking general research questions to archaeological data. While most historical archaeological sites in California contain some information, the key to productive archaeology is to assess whether a property is likely to contain important new information not available from traditional historical sources.

The objectives of the XP1 study for this project was to establish the presence or absence of cultural materials within the proposed project location. The primary criteria used for assessing archaeological sites are a resource's ability to provide information of importance to the prehistory or history of an area and to illustrate the culture and lifeways of past inhabitants in the Central Coast region. Archaeological sites in Ventura County have the potential to contain important data that can increase our knowledge of past lives of people in the prehistoric and historic past. These data potentials must be evaluated in the context of regional research interests.

Based on previous work in Ventura County and current academic research Southern California, three general research domains are applicable for the study of regional prehistory for this project, including 1) Cultural Chronology, 2) Site Formation, and 3) Prehistoric Settlement and Subsistence. Research domains for the regional history relate to area settlement and agricultural-based occupation. Given the sparse density of prehistoric archaeological materials, the research topics are designed to be flexible enough to be used for the current Project.

2.3 CULTURAL CHRONOLOGY

Cultural chronology is germane to achieve research objectives and requires temporal controls in order to place a site within a specific context. Chronological data provides a framework for comparing sites that date to the same period within the established cultural sequence for the Central Coast. Identification of temporally sensitive artifacts and ecofacts and precision in defining their periods of use is pertinent to research goals.

Data Requirements

- Radiocarbon dating using suitable organic material (e.g., charcoal, marine shell, and/or bone)
- Obsidian for source and hydration analyses
- Time sensitive diagnostic artifacts
- Artifacts obtained from distinct, dated contexts

2.4 SITE FORMATION PROCESSES

To attain a clear understanding of past lifeways, it is crucial for researchers to understand the processes by which cultural and natural strata are formed in order to interpret cultural resource data and to evaluate their importance. The formation of layers and the creation of new feature interfaces create archaeological strata that represent the sequence of events that have occurred at a particular site. Cultural resource deposits reflect periods of continuous use, as well as intervals of transition in site occupation and use. Continuous use of a site creates a gradually accumulated layer of deposition, such as sheet refuse or an ash layer, over a period of months, years, or thousands of years. It entails perception of how the resources in archaeological sites were acquired, as well as consideration for potential changes that occurred after formation of the site. Deposits of these types allow archaeologists to examine research questions including those that relate to change over time. In contrast, other cultural resource deposits are created during events of transition. Natural forces, such as floods fires, or erosional episodes, and human activity, agricultural activities, or mechanical grading can transform the character of a site. Recognizing this enables us to evaluate a site's integrity. If a site's integrity has become impaired and its constituents jumbled or disturbed, then it reduces the likelihood of a site

producing meaningful interpretive value because archaeological analyses depend upon on associations between a site's intact constituents and its depositional context. However, it should be noted that despite extensive disturbance, single component sites can be determined significant.

Data Requirements

- Chronological analysis
- Lithic technology
- Tool stone procurement
- Faunal, and archaeobotanical remains from distinct, well-dated components
- Cultural features

2.5 PREHISTORIC SETTLEMENT AND SUBSISTENCE

Settlement patterns refer to the spatial distribution of sites, and in part, reflect the choices people make in stationing themselves to best exploit available resources. Prehistoric settlement and land use data, consisting of compilations of major village site locations, are also derived from ethnographic and historic literature, site survey, and archaeological syntheses. Studies based upon the forager-collector model (Binford 1980) can be helpful in addressing questions about sedentism and resource exploitation. Foraging requires residential mobility to increase a group's ability to exploit different resources as they become seasonally available. However, people who collect rather than forage may remain more sedentary and exploit resources by being logistically flexible (e.g., place their settlements between varied environments). Whether people forage or collect is in part determined by the availability of resources and the return on the costs of their collection. Faunal data directly reflects subsistence practices. Numbers of identified species represented per assemblage provide a qualitative measure of animal selection, which, when compared with other sites/components, can indicate spatio-temporal changes in resource selection.

Material that would need to be recovered to address settlement pattern questions includes lithics, shell, bone, and/or charcoal for radiometric dating; protein residue, pollen, and phytolith material to determine what plants and animals were used; and fish otoliths to determine season of occupation. Recovery and analysis of artifacts and cultural material will be necessary to determine site function. Also important, would be identification of single occupation sites or site components; stratigraphy that exhibits cultural integrity and/or identifiable patterns in formation; and discrete features, including hearths, living surfaces, structures, or other architectural remains.

Data Requirements

- Lithic material
- Faunal remains and/or archaeobotanical dietary materials from distinct, well-dated components
- Protein residue, pollen, and phytolith material
- Fish otoliths
- Hearths and other features

3.0 METHODS AND RESULTS

3.1 ARCHAEOLOGICAL FIELD METHODS

On June 19 and 20, 2019, under the direction of Provenience Group, Inc. principal archaeologist Carole Denardo, M.A., archaeologists Gina Zavala, M.A. and Kate Paulson, B.A. excavated eight (8) STPs within the project area, which is currently a cultivated strawberry field (Figures 3), and presented as an overlay of the proposed plans on an aerial photograph (Figure 4).

[redacted]

STP levels were excavated in arbitrary 20-cm layers, and sediments were dry-screened in the field through 3.0-millimeter (mil) (1/8-inch) hardware cloth. A Munsell soil color chart was used to describe soil color and texture for each 10-cm level. Color digital photographs were taken to document the fieldwork. A Global Positioning System (GPS) unit was used to record the locations of the STPs and a map was created. Each of the STPs were backfilled upon completion of the excavation and the area restored as nearly as possible to its original appearance.

[redacted]

Figure 3. Overview of cultivated strawberry field.

3.2 EXTENDED PHASE 1 RESULTS

On June 19 and 20, 2019 Provenience Group, Inc. archaeologists Gina Zavala, M.A. and Kate Paulson, B.A. excavated eight (8) STPs measuring 30-cm in diameter, to determine the presence or absence of cultural materials (Table 1).

4.0 SUMMARY AND RECOMMENDATIONS

The XP1 archaeological study at the proposed Oxnard Union High School No. 8 Site was completed pursuant to the California Environmental Quality Act (CEQA), which requires a review of projects sponsored by public agencies to determine the effects of the project on historical resources. According to CEQA, "historical resources" comprise buildings, structures, objects, districts, or sites that may possess prehistoric or historical archaeological, architectural, cultural, or scientific importance.

[redacted]

[redacted]

[redacted]

[redacted] If intact soils containing prehistoric cultural materials are found during construction, they have the potential to address important research questions and yield important information about prehistoric people in this area of California.

As a result, Provenience Group, Inc. recommends archaeological monitoring during trenching, grading, excavation, or other ground-disturbing activities. to identify and protect any intact midden or possible archaeological features that may be uncovered by earth-moving activities. Given the prehistoric context, it is also recommended that a local Chumash Native American representative be retained to monitor during construction.

4.1 PROCEDURES FOR UNANTICIPATED DISCOVERIES

CEQA provides a measure of protection for the accidental discovery of cultural resources (Guidelines section 15064.5[e]). These guidelines are particularly important as they consider the possibility that significant archaeological resources not noted as a result of previous research efforts may be present within a project area and need to be treated in a way commensurate with CEQA standards.

If previously unidentified cultural resources or intact archaeological deposits are encountered during construction within the project area, then the archaeologist will have the authority to halt work within 50 feet of the area until the project archaeologist can assess the find; determine its potential for significance; and develop measures to eliminate adverse impacts. Such measures may include avoidance through project redesign, or Phase 2 archaeological testing (excavation) to evaluate the significance of the find.

4.2 REGULATIONS CONCERNING DISCOVERY OF HUMAN REMAINS

In the event human remains are encountered, the monitoring archaeologist or construction crew should adhere to the provisions of sections 7052 and 7050.5 of the California Health and Safety Code. Section 7052 states that disturbance of Indian cemeteries is a felony. Section 7050.5 of the California Health and Safety Code states that it is a misdemeanor to knowingly disturb a human burial, and Section 5097.99 of the Public Resources Code defines the obtaining or possession of Native American remains or grave goods to be a felony. If human remains are encountered during construction activities, any work in the vicinity should stop and the County Coroner contacted immediately. At the same time, a qualified archaeologist should be contacted to evaluate the situation. If the human remains are Native American in origin, then the Coroner must notify the Native American Heritage Commission within 24 hours of this identification.

California Public Resources Code §5097.98 (Notification of Native American human remains, descendants; disposition of human remains and associated grave goods) mandates that the lead agency adhere to the following regulations when a project results in the identification or disturbance of Native American human remains:

> (a) Whenever the commission receives notification of a discovery of Native American human remains from a county coroner pursuant to subdivision (c) of Section 7050.5 of the Health and Safety Code, it shall immediately notify those persons it believes to be most likely descended from the deceased Native American. The descendants may, with the permission of the owner of the land, or his or her authorized representative, inspect the site of the discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The descendants shall complete their inspection and make their recommendation within 48 hours of their notification by the Native American Heritage Commission. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials.
>
> (b) Whenever the commission is unable to identify a descendant, or the descendant identified fails to make a recommendation, or the landowner or his or her authorized representative rejects the recommendation of the descendant and the mediation provided for in subdivision (k) of Section 5097.94 fails to provide measures acceptable to the landowner, the landowner or his or her

authorized representative shall reinter the human remains and items associated with Native American burials with appropriate dignity on the property in a location not subject to further subsurface disturbance.

(c) Notwithstanding the provisions of Section 5097.9, the provisions of this section, including those actions taken by the landowner or his or her authorized representative to implement this section and any action taken to implement an agreement developed pursuant to subdivision (l) of Section 5097.94, shall be exempt from the requirements of the California Environmental Quality Act (Division 13 (commencing with Section 21000)).

(d) Notwithstanding the provisions of Section 30244, the provisions of this section, including those actions taken by the landowner or his or her authorized representative to implement this section, and any action taken to implement an agreement developed pursuant to subdivision (1) of Section 5097.94 shall be exempt from the requirements of the California Coastal Act of 1976 (Division 20 (commencing with Section 30000)).

1.0 INTRODUCTION

Tetra Tech, Inc. (Tetra Tech) has prepared this Geohazard Assessment/Geotechnical Soil Investigation for the Oxnard Union High School District (OUHSD) for the proposed High School No. 8 located in the City of Oxnard in Ventura County, California (Figures 1 and 2). The proposed High School No. 8 is hereinafter referred to as the "Site." The project will include the construction of new parking areas, driveways, buildings, playgrounds, and athletic fields on properties currently owned by Maulhardt family.

This Geohazard Assessment/Geotechnical Soil Investigation was performed in accordance with requirements of Sections 17212 and 17212.5 of the California Education Code (CEC), the 2016 California Building Code (CBC) (International Code Council 2016 [ICC] 2017) as described in California Code of Regulations (CCR) Title 24, and California Department of Conservation, California Geological Survey (CGS) Note 48 (*Checklist for the Review of Engineering Geology and Seismology Reports for California Public Schools, Hospitals, and Essential Services Buildings* (CGS 2014). Earth Systems Pacific (ESP) prepared the Geotechnical Engineering Report (ESP 2018b) that is included in Appendix A under subcontract to Tetra Tech.

2.0 PURPOSE AND SCOPE

This assessment evaluates potential geologic hazards for the Site and provides input for the design recommendations relative to mitigation of potential geologic hazards. The work performed by Tetra Tech included:

- Reviewing selected published geologic documents, groundwater elevation records, historical aerial photographs, project plans, and in-house files;
- Performing a Site reconnaissance on July 2, 2018;
- Evaluation of the potential for geologic hazards at the Site, including surface fault rupture, ground shaking, liquefaction, seismically induced settlement, subsidence, landslides, and flooding; and
- Preparing this report summarizing the data reviewed, the results of our assessment, and our recommendations to reduce the potential for the Site to be impacted by geologic hazards.

The scope of work for ESP's Geotechnical Engineering Report (ESP 2018) includes the following tasks:

- Drilling borings B-1, B-2, B-22, and B-51 to 51.5 to feet below ground surface (bgs), borings B-35 and B-43 to 50 feet bgs, B-16 to 46 feet bgs, B-9, B-14, B-20, B-24, B-27, B-34, B-41, B-45, and B-50 to 26.5 feet bgs, borings B-7, B-8, B-10, B-13, B-15, B-17 through B-19, B-21, B-23, B-25, B-28 through B-33, B-36 through B-42, B-46 through B-49, and B-52 to 16.5 feet bgs, borings B-3 and B-11 to 11.5 feet bgs, and B-4, B-5, B-6, B-12, B-26, B-44, and B-53 to 10 feet bgs. The boring locations are shown on Figure 2. The borings were completed on April 10, 2018 and from July 16 through 26, 2018 using a hollow stem auger (HSA) Mobile Drill Rig, Model B-53 equipped with a 6-inch diameter hollow stem auger and an automatic trip hammer for soil sampling. Copies of the boring logs are included in Appendix A of ESP's Geotechnical Engineering Report (ESP 2018b) (Appendix A).
- Ten cone penetrometer test (CPT) soundings were completed at the Site on April 20, 2018 and July 16, 2018 in general accordance with ASTM D5778-12 and D3441-16 using an electric cone penetrometer. The CPT soundings were advanced to depths ranging from approximately 11 to 60 feet bgs. Three of the CPT soundings met refusal at relatively shallow depths; therefore, those soundings are not included in ESP's Geotechnical Engineering Report (ESP 2018b). The logs for the seven CPT soundings that extend to depths of approximately 45 feet bgs or greater are included in Appendix A of ESP's Geotechnical Engineering Report (ESP 2018b) (Appendix A).
- Soils encountered in the borings were categorized and logged in general accordance with the Unified Soil Classification System (USCS) and ASTM D2488-17 (Appendix A).
- Soil samples from the borings were taken using a ring-lined barrel sampler (ASTM D3550-17, with shoe similar to D2937-17) and Standard Penetration

Tests (SPT) were conducted at selected depths within the borings (ASTM D1586-11). Bulk soil samples were also obtained from the auger cuttings

- Ring samples were tested for bulk density (ASTM D2937-17 as modified for ring samplers). Four bulk samples were tested for maximum density and optimum moisture content (ASTM 1557-12). Direct shear tests (ASTM D3080/D3080M-11) were conducted on the same four bulk samples after they were remolded to approximately 90 percent of maximum dry density. Six one-dimensional consolidation tests (ASTM D2435/D2435M-11) were performed on ring samples. Particle size tests (ASTM D422-63/07 and D1140-17) were conducted on fourteen bulk and ring samples. The expansion index (ASTM D4829-11) was determined for one bulk sample. For use in the development of pavement design criteria, two bulk samples were tested for R-value (ASTM D2844/D2844M-13). Four bulk samples were also sent to Cerco Analytical of Concord, California for use in preparing a corrosion evaluation report. The evaluation and associated test results are for use by the architect/engineer in determining appropriate corrosion mitigation measures. The laboratory test results are presented in Appendix B of ESP's Geotechnical Engineering Report and the corrosion evaluation report prepared by Cerco Analytical are presented in Appendix C of ESP's Geotechnical Engineering Report (ESP 2018b) (Appendix A).

- The field and laboratory data were reviewed by a State of California Registered Geotechnical Engineer and evaluated with respect to development of geotechnical criteria for site development. The following items were addressed:

    - Soil and groundwater conditions encountered;
    - Settlement potential;
    - Excavation characteristics;
    - Suitability of the site soils for fill/backfill;
    - Stability of soils during grading;
    - Corrosive soils;
    - Erodible nature of the soils;
    - Liquefaction and seismically induced settlement of dry sand;
    - CBC seismic design criteria;
    - Preparation of improvement areas prior to construction;
    - Grading;
    - Utility trenches;
    - Types and depths of foundation systems;
    - Maximum allowable bearing capacities;
    - Slabs-on-grade and exterior flatwork;
    - Pavement sections;
    - Drainage and maintenance; and
    - Construction observation and testing.

- Preparing the Geotechnical Engineering Report (ESP 2018b) which contains a more detailed description of the methods, conclusions, and recommendations from the geotechnical

investigation. The ESP Geotechnical Engineering Report is being submitted concurrently with this report in Appendix A.

3.0 SITE DESCRIPTION

3.1 PHYSICAL SETTING

The Site located within the Maulhardt Ranch at 1853 Camino Del Sol in the City of Oxnard, California in the 93030-zip code area (Figure 1). The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California (Figures 1 and 2). Book 214 page 2 of the County of Ventura's Assessor Map indicates that the Site comprises approximately the southernmost 48 Acres of Parcel 59, within the Rancho El Rio Santa Clara O'La Colonia Portion A of Subdivision 26 in the city of Oxnard. The geographic coordinates of the Site are approximately Latitude 34° 12' 27.76" North, Longitude 119° 9' 19.44" West. Surface elevations at the Site are approximately 63 feet above mean sea level (EDR 2017).

Currently, the Site is used for the cultivation of strawberries. Historical aerial photographs, Google Earth images, and information from the Site owners indicate that the Site has been used for cultivation of row crops from as early as 1869 to the present.

3.2 PROPOSED SCHOOL DEVELOPMENT

Tetra Tech's knowledge of the proposed project improvements is limited as of this time and is based on the Overall Site Plan Oxnard High School District High School No. 8 prepared by WLC Architects (WLC Architects 2018). The Site Plan is summarized in Table 1.

Table 1
Conceptual Site Plan Summary

Building	Building Footprint ft^2	Notes
Lockers/Gymnasium	45,730	Two-Story
Performing Arts	26,500	Two-Story
Media/Administration	14,575	One-Story

Note:
ft^2 - Square Foot. All square footage estimates are approximate.

The proposed buildings will be of wood or metal frame construction, or cast in place concrete tilt up construction with concrete slab-on-grade foundations. No other structures are planned. The proposed grading plan for the project and finish floor elevations were not provided to Tetra Tech for the preparation of this report. It is anticipated that the final grade will be similar to the existing grade and that the grading required to achieve the building pad subgrade will be minor and necessary only to provide adequate foundation and slab support and positive drainage away from the structures.

It is assumed that surface and subsurface improvements will also be constructed. Surface improvements will include concrete flat work for pedestrian use. Subsurface improvements will include underground utility conduits.

3.3 SITE VICINITY CHARACTERISTICS

3.3.1 Previous Development

The review of historical aerial photographs dated 1927, 1938, 1947, 1959, 1967, 1978, 1985, 1994, 2005, 2009, 2010, and 2012 (EDR 2017) and interviews with representatives of the Site owner, the Maulhardt family, indicates that the Site and surrounding area were used for agricultural (row crop production) land use as part of the historic Maulhardt Ranch from at least 1869 to the present. The Site is located within the Oxnard Oil Field, however no oil production activities are known to have occurred on the Site property.

3.3.2 Current Area Development

The Site is currently being used for strawberry cultivation. The Site is located in an area that is developed for commercial, residential, park, and agricultural land use. The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas (Figure 2). The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. The entire Maulhardt Ranch (APN 214-002-059) is bound by Camino Del Sol on the South, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential

neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site.

3.4 CLIMATE

The City of Oxnard is situated in a Mediterranean (dry subtropical) climate zone, experiencing mild and relatively wet winters, and warm, dry summers, in a climate called the warm-summer Mediterranean climate. Onshore breezes keep the communities of Oxnard cooler in summer and warmer in winter than those further inland. The average mean temperature is 61 degrees Fahrenheit (F). The average minimum temperature is 52 F and the average maximum temperature is 69 F. Generally, the weather is mild and dry, with 354 days of sunshine annually. The average annual precipitation is 15.62 inches (Wikipedia 2018).

4.0 GEOLOGIC/HYDROGEOLOGIC SETTING

4.1 REGIONAL GEOLOGY

The Site is located on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. The Transverse Ranges Province is a series of ranges and intervening valleys that extends for 325 miles "directly across the structural grain of California" (Oakeshott 1978). The province extends from Point Arguello and San Miguel Island eastward to the Pinto and Eagle Mountains which end in the Mojave and Colorado Deserts respectively. The province ranges in width from 10 to 50 miles. The narrowest points are at the western extreme in the Santa Ynez Mountains and at the Cajon Pass which separates the San Gabriel and San Bernardino Mountains. The province's broadest point is the distance from the Santa Monica coast, across the Santa Monica, Topatopa and Pine Mountains, to the Tehachapi Mountains.

The Ventura Basin is large synclinal structure situated between the Santa Ynez Range and Topatopa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (CGS 2002a).

4.2 SITE GEOLOGY

The geology of the Site area is shown on Figures 3A and 3B (Gutierrez, et al. 2008). The Site is located in the Oxnard Plain of the Ventura Basin. The Ventura Basin, including its offshore continuation into the Santa Barbara Channel, is filled with a thick sequence of Cenozoic sedimentary rocks estimated to be more than 20,000 feet in total thickness. Major east trending folds and reverse faults reflect regional north-south compression and are characteristic of the basin (Norris and Webb 1990). The Oxnard Plain is underlain by several thousand feet of Pleistocene-age sediments of the San Pedro Formation. The San Pedro Formation consists of marine and continental deposits of clay, silt, and gravel (Turner, et al 1975). The predominant surface materials in this region include Pleistocene to Recent age alluvial, floodplain, and near-shore deposits, some of which have been uplifted, folded, and faulted.

4.3 EARTH MATERIALS

4.3.1 Stratigraphy

The geology of the Site surface is shown on Figure 2. The geology of the Site subsurface was constructed from the geotechnical soil boring logs in ESP's 2018 Geotechnical Engineering Report (ESP 2018b) (Appendix A) and is depicted on Figure 4A (Cross Section A – A') and Figure 4B (Cross Section B – B'). Based on the geologic map in Figure 2 (Gutierrez, et al. 2008) and information in *Ventura County Water Resources Management Study, Geologic Formations, Structure and History in the Santa Clara-Calleguas Area* (Turner, et al 1975), the Site is underlain at the ground surface by Holocene deltaic alluvium and wash fan deposits to approximately 70 feet bgs. These are conformably underlain by upper Pleistocene alluvial sand and gravel deposits to approximately 400 feet bgs, and the marine – non marine clays and gravels of the Lower Pleistocene San Pedro formation to approximately 2,000 feet bgs.

4.3.2 U.S. Department of Agriculture, Soil Conservation Service Data

The U.S. Department of Agriculture, Soil Conservation Service (USDA) data identifies the native soil types at the Site to be Mocho loam, Pico sandy loam and sandy loam substratum, Hueneme sandy loam, and Camarillo sandy loam. These soils are nearly level and occur on alluvial fans and flood plains. Permeability is rapid and surface runoff is very slow, such that there is no hazard of erosion by water (USDA 1970).

4.3.3 Earth Systems Pacific April and July 2018 Soil Boring Data

ESP completed 53 geotechnical soil borings to depths ranging from 10 feet bgs to 51.5 feet bgs during April and July 2018 for the OUHSD to collect soil samples and soil blow-count density data for use in development of the High School No. 8 (Figures 2, 4A, and 4B). The general subsurface profile observed in the borings consisted of silty sand at the ground surface extending to approximately 3 to 8 feet bgs, underlain by interbedded poorly to well graded sand and occasional gravel with clay and silt layers that are exposed in the borings completed for this project to 51.5 feet bgs. These alluvium and wash deposits were deposited by the Santa Clara River. Groundwater was encountered at depths ranging from approximately 20 to 25 feet bgs in the deeper borings completed for this project. The soils were in a slightly moist to moist condition above the water table and wet below the water table. The sandy soils have a loose to very dense consistency while the silt and clay soils were medium stiff to stiff. Several of these soil layers also had varying amounts of fine to coarse gravel and cobbles. Based on the subsurface profile described above, the Site Class per Chapter 20 Table 20.3-1 (ASCE 2013) is "D", a "Stiff Soil Profile" (ESP 2018b). Please refer to the boring logs and CPT data included in Appendix A of ESP's Geotechnical Engineering Report (ESP 2018b) (Appendix A).

4.4 GROUNDWATER

4.4.1 Hydrogeology

The Site is located in the northern portion of the Oxnard Plain Pressure Basin within the Santa Clara River Hydrologic Unit (Turner, et al 1975; Ventura County Public Works Department [VCPWA] 1975). The Oxnard Plain Basin is a relatively flat alluviated area, which ranges in elevation from sea level to approximately 100 feet. The water bearing zones of the Oxnard Plain Basin are grouped into three major units; 1) the semi-perched aquifer and clay cap, 2) the Upper Aquifer System (UAS), and 3) the Lower Aquifer System (LAS).

The semi-perched aquifer and clay cap consists of all of the alluvial materials above the Oxnard aquifer. In the Site area, the semi-perched aquifer extends to depths of approximately 75 feet bgs and the clay cap from approximately 75 feet bgs to 150 feet bgs (Turner, et al 1975). The semi-perched aquifer consists primarily of geologically Recent-aged stream deposited sands and gravels with minor silt and clay interbeds. Sand and gravel deposits are generally parallel to the deltaic channel complex of the ancestral Santa Clara River and form lenses perpendicular to the channels of the ancestral Santa Clara River (Figure 3). The depth to the historically highest groundwater elevation for the Site area shown on Plate 1.2 of the *Seismic Hazard Zone Report for the Oxnard 7.5-Minute Quadrangle. Ventura County, California* (CGS 2002a) is approximately 8 feet bgs. The "clay cap" underlies the semi-perched groundwater zone separating it from the underlying Oxnard aquifer of the UAS. This clay cap acts as an aquitard. Based on topographic controls, groundwater in the site vicinity is expected to flow toward the south to south-southwest.

The UAS system consists of the Oxnard and underlying Mugu aquifer zones. These two water bearing units were combined due to their similar, planar structure. Both the Oxnard and Mugu aquifers are composed of sediments deposited largely by the ancestral Santa Clara River during the Upper Pleistocene. The Oxnard aquifer zone extends from approximately 150 to 200 feet bgs in the Site area and is a laterally continuous layer gravel and cobbles and coarse to fine sand, with local fine grained lenses deposited in non-marine environment. The underlying Mugu aquifer zone extends from approximately 200 to 400 feet bgs in the Site area and consists of laterally continuous sand and gravel deposited in a shallow marine embayment on an erosional unconformity on top of the San Pedro formation that forms the top of the LAS.

The LAS system in the Site area, in descending order, consists of the Hueneme and Fox Canyon aquifer zones. The sediments in the LAS are more structurally complex than the UAS resulting from folding and faulting. Both the Hueneme and Fox Canyon aquifer zones are composed of lower Pleistocene age San Pedro Formation.

4.4.2 Groundwater Levels Recorded by ESP During April and July 2018

Groundwater was encountered at depths ranging from approximately 20 to 25 feet bgs in the deeper borings completed for this project during April and July 2018 (ESP 2018b).

4.4.3 Groundwater Quality

Groundwater in the borings completed for this project in the semi-perched zone is generally considered to be of poorer quality and of limited beneficial use (Turner, et al 1975). The groundwater in the underlying UAS system, the Oxnard and underlying Mugu aquifer zones is generally of good quality and serves as a major source of water for agriculture, municipal, and industrial use in the Oxnard area.

4.4.4 Aquifers Impacted by Site Releases

Tetra Tech is currently performing a Preliminary Environmental Assessment (PEA) for the Site and identified a potential for impacts to the groundwater of the semi-perched zone from fuel formerly stored in underground storage tanks in the Maulhardt Ranch farmyard area. Soil and groundwater samples were collected from the area of the Site adjacent to farmyard area and tested for fuel related volatile organic compound (VOCs) and total petroleum hydrocarbons (TPH). The PEA groundwater assessment did not identify any evidence of a release fuel release from the Site to groundwater.

4.5 SURFACE WATER

No surface water was observed at the Site during the reconnaissance performed on July 2, 2018. It is likely that during periods of moderate rainfall, free surface water that accumulates on the Site may flow south and southwest and possibly into gutters along Camino Del Sol and North Rose Avenue (Figures 1 and 2). However, the U.S. Department of Agriculture, Soil Conservation Service report indicates that soil permeability at the Site is moderate to rapidly moderate and surface runoff is very slow, such that there is a low hazard of erosion by water (U.S. Department of Agriculture, Soil Conservation Service 1970).

4.6 SEISMICITY

4.6.1 Regional Earthquake Fault Analysis

The high rate of seismic activity in California and the Site area is the result of large-scale earth processes in which the Pacific plate slides northwestward relative to the North American plate at about 2 inches/year. This plate motion results in horizontal slip (primarily on the San Andreas "strike-slip" fault) and crustal block rotation and compression within a restraining bend of the San Andreas Fault, that has created the series of the prominent mountain ranges and intervening valleys situated between Santa Monica and Santa Barbara and associated thrust and reverse faults (CGS 2002a). Although slower moving than the strike-slip faults of the San Andreas system, these numerous thrust and reverse faults account for over half of the significant earthquakes that have occurred in southern California during the past century, including the damaging 1971 M 6.6 San Fernando, 1994 M 6.7 Northridge, and 2003 M 6.5 San Simeon earthquakes (Ross *et al.* 2004).

Active and potentially active faults in the Site area were evaluated by reviewing the *Fault Activity Map of California and Adjacent Areas* (Jennings 1994), *Map No. 0-6 California Geological Survey 150th Anniversary Fault Activity Map of California* (Jennings, *et* al. 2010), *Draft Background Report, City of Oxnard General Plan* (City of Oxnard 2006), Figures 2.2.1b, 2.2.2 and 2.2.3b of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013), and Earthquake Zones of Required Investigation Maps for the Saticoy Quadrangle (CDMG 1978), Camarillo Quadrangle (CDMG 1998b; CGS 2002a), and Santa Paula Quadrangle (CDMG 1998a; CGS 2002a). Active faults are defined as those faults with evidence of displacement within the last 11,000 years and potentially active faults are defined as those with evidence of displacement within the last 1.6 million years (CGS 2007). The faults shown on Figures 5A through D are from the *Fault Activity Map of California and Adjacent Areas* (Jennings 2010). The terms active and inactive faults have been interpreted differently by geologists, seismologists, and agencies. For this report, active faults are defined as having evidence of surface displacement within the last 11,000 years and potentially active faults are defined as having evidence of surface displacement in the last 1.6 million years (CGS 2007). The fault classification terms shown on Figures 5A through 5D are specific to 2010 Fault Activity Map and will not be considered for design purposes.

Table 2 contains a summary of earthquake faults within approximately 100 kilometers (62.1 miles) listed in *Appendix A: California Fault Parameters for the National Seismic Hazards Map and Working Group on California Earthquake Probabilities* (U.S. Geological Survey [USGS] and CGS 2007). Most of these faults are shown on the 2010 Fault Activity Map.

The earthquake faults located nearest to the Site are the Springville Fault, located approximately 5.4 km (3.3 miles) east of the Site, the Wright Road Fault, located approximately 6.1 km (3.7 miles) north of the Site, the Oak Ridge Fault, located approximately 7.3 km (4.5 miles) north of the Site, the Camarillo Fault located approximately 8.3 km (5.1 miles) east of the Site, and the Ventura-Pitas Point Fault, located approximately 8.9 km (5.5 miles) north of the Site.

The Oak Ridge Fault System (Reference Number 335 on the 2010 Fault Activity Map 2010 in Figure 4) is a Late Quaternary dip slip fault dipping at approximately 65 degrees to the south that extends from the Santa Susana Mountains where it has been overridden by the north-dipping Santa Susana Thrust Fault, westward along the southerly side of the Santa Clara River Valley and thence into the Oxnard Plain. The Oak Ridge Fault System is an active reverse fault with a slip rate of 3.0 mm/year, a maximum moment magnitude of 6.9 and a recurrence interval of 299 years. It does not have a surface expression nor have any been shown to cut near-surface sediments (alluvium). It is conceivable that past movement of this

fault system in the Oxnard Plain area has not resulted in surface displacements but, instead, has resulted in only broad warping or tilting of the near-surface alluvial sediments. The lack of surface evidence of fault displacement in the Oxnard Plain is not necessarily indicative of activity in the recent geologic past as surface features could easily have been obscured by fluvial processes (erosion or deposition of alluvium). Several recorded earthquake epicenters in the offshore as well as mainland area during historic time may have been associated with the Oak Ridge Fault System or within close proximity and associated with it (County of Ventura 2013).

The Ventura-Pitas Point Fault (Reference Number 336 on the 2010 Fault Activity Map 2010 in Figure 4) is a Holocene, oblique left lateral reverse fault, dipping at approximately 64 degrees to the north that extends along the base of the foothills on the north side of the Santa Clara River from Santa Paula westerly to the mouth of the Ventura River, thence westerly into the Santa Barbara Channel area. Evidence for the existence of the Ventura-Pitas Point Fault is based mainly upon minor faulting of terrace deposits north of San Buenaventura and evidence of faulting from the Tidewater Oil Company corehole #5. It has slip rate of 1.0 mm/yr, a maximum moment magnitude of 6.8 and a recurrence interval of 1,112 years (County of Ventura 2013).

The Wright Road Fault (Reference Number 536 on the 2010 Fault Activity Map 2010 in Figure 4) is considered to be an active "tear" fault, terminating the west end of the Camarillo and Springville anticlines. It may be interpreted as a structural boundary between the Ventura Anticline on the west and South Mountain to the east (Treiman 1997). This fault was not included in the Appendix A CFP (or included in Table 1), or discussed in the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013), so characteristics such as the configuration, slip rate, and maximum moment magnitude were not reviewed for this report.

The Springville Fault Zone (Reference Number 348 on the 2010 Fault Activity Map 2010 in Figure 4) marks the southern edge of the Camarillo Hills, which are largely the expression of the Camarillo Anticline. This fold is relatively young, having developed within the last few hundred thousand years above young, concealed thrust faults of the Springville Fault Zone, which may be a back thrust off of the Oakridge Fault Zone. The Springville Fault Zone is approximately 5.5 miles long. The southern trace is largely concealed, extends approximately 2.5 miles east from the west end of the Camarillo Hills, and it is considered to be an active, Holocene fault, with an estimated an average earthquake recurrence interval of 900 years with a displacement of 0.6 to 11 meters per event. The northern trace lies along the main body of the Camarillo Hills extending approximately 5.5 miles east from the west end of the Camarillo Hills, is considered to be an active fault, and marks the southern margin of the Camarillo Anticline (Treiman 1997). This fault was not included in the Appendix A CFP (or included in Table 1), so characteristics such as the configuration, slip rate, and maximum moment magnitude were not reviewed for this report.

The Camarillo Fault (Reference Number 349 on the 2010 Fault Activity Map 2010 in Figure 4) is expressed by an east-west anticlinal ridge approximately 5.5 miles long located southwest of Camarillo. This fault extends in an east-west direction immediately south of Camarillo from Calleguas Creek to Camarillo Airport. The present of the fault is based primarily upon the abrupt uplifted sediments along the north side of the fault that resulted in the long linear hill of the southern portion of Camarillo just south of the 101 Freeway (County of Ventura 2013). Limited trenching has not revealed a surface trace for this fault, however the straight planar nature of most of the escarpment and the steepening of bedding near the base of the slope strongly suggests a surface fault. Although there is no hard evidence for Holocene activity on this fault, the step in the Calleguas Creek flood plain across the fault trace appears to be Holocene. Therefore, this fault is considered to be active (Treiman 1997). This fault was not included in the Appendix A CFP (or included in Table 1), so characteristics such as the configuration slip rate, and maximum moment magnitude were not reviewed for this report.

4.6.2 Analysis of Historical Earthquakes

The rate of seismic activity for the Site areas summarized in Table 3 was estimated from the USGS Earthquake Hazards Program Search Earthquake Catalogue website for the Site area from 1900 through 2018 (USGS 2018b).

According to the USGS database, 119 earthquakes with magnitudes exceeding 4.5 have occurred within 63 miles (100 kilometers) of the Site since 1900 (Table 2). Significant historical earthquakes of the Oxnard region include the 1812 earthquake that effected most of southern California (Richter Magnitude [M_L] 7.0), the 1827 Ventura Earthquake (M_L 7.0), the 1857 Fort Tejon Earthquake (M_L 7.1), the 1952 Tehachpi Earthquake (M_L 7.7), and the 2004 Northridge Earthquake (M_L 6.7). While all of these earthquakes were felt in the Site area, no historical earthquakes have caused a great amount of property damage or loss of human life in the Site area. However, the historical earthquake record of California spans a little over 200 years and provides only a partial indication of seismic hazards. The absence of earthquakes on many recognized active faults and fault-related folds in California probably reflects recurrence intervals greater than the historical record.

5.0 PREVIOUS REPORTS

5.1 2018 ESP PRELIMINARY FOUNDATION DESIGN PARAMETERS AND INFILTRATION TESTING REPORT

In May 2018, ESP prepared the *Preliminary Foundation Design Parameters and Infiltration Testing Report* for the OUHSD to provide preliminary foundation design parameters and preliminary infiltration rates for use by the architect/engineer in starting their work in the preparation of plans and specifications for the project (ESP 2018a). On April 10, 2018, ESP completed four borings at the site to depths ranging from approximately 3 to 51.5 feet below the existing ground surface. Two of the borings (borings B-1 and B-2) were drilled for exploration and soil sample acquisition purposes, and the other two borings (Infiltration Tests A and B) were drilled for the infiltration testing. All of the borings were drilled with a Mobile Drill Model B-53 drill rig, equipped with 6-inch outside diameter hollow stem auger and an automatic trip hammer for sampling. On April 20, 2018, four cone penetrometer test (CPT) soundings were also performed at the Site. The CPT soundings were advanced to a depth of approximately 18 to 60 feet bgs.

The *Preliminary Foundation Design Parameters and Infiltration Testing Report* (ESP 2018a) contained the following conclusions:

Infiltration Test Results

"The 30-minute constant head portion of the infiltration testing resulted in introducing an approximate volume of water of 0.5 to 3 gallons (0.07 to 0.4 cubic ft.) into the infiltration test borings. The infiltration rates varied between 0.5 and 73 inches/hour over the testing period depending on the water's head or elevation, and the soil's hydraulic conductivity that existed in the infiltration test borings."

Liquefaction and Seismically Induced Settlement of Dry Sand

"Total and differential settlement due to liquefaction and seismically induced settlement of dry sand may approach approximately 3 inches and 1.5 inches, respectively."

Foundation Type

"Pending the completion and the results of the additional geotechnical work needed at the site, it is our opinion at this time that the buildings and other ancillary structures can be supported by either shallow or deep foundation systems.

Shallow foundations may consist of conventional continuous and spread footings or rigid mat foundations. If conventional shallow foundations are used, the spread footings should be interconnected with grade beams on at least two sides. Additionally, the entire conventional foundation system will need to be underlain with a series of two geogrids, both covered with Class 2 Aggregate Base (Caltrans, 2015). If rigid mat foundations are used, they can be supported by compacted native soils. The purpose of underlaying shallow conventional foundations with the geogrid and aggregate base or utilizing shallow rigid mat foundations is to reduce seismic differential settlement to approximately 1-inch."

More heavily loaded structures (such as stadium grandstands, scoreboards, light poles, etc.) can be supported by deeper reinforced concrete cast-in-drilled hole piles (CIDH).

5.2 2018 PHASE I ENVIRONMENTAL ASSESSMENT

A Phase I Environmental Site Assessment (ESA) was performed for the Site by Tetra Tech for the OUSHD in 2017 and 2018 (Tetra Tech 2018). The Phase I ESA was performed under regulatory oversight by the California Department of Toxic Substances Control (DTSC). Based on Tetra Tech's background research for the Site in the High School No. 8 Phase I ESA (Tetra Tech 2018), the following six Recognized Environmental Concerns (RECs) were identified at the Site:

1. Potential toxic soil gas from potential formation leakage from the Oxnard Oil Field;

2. Potential residual organochlorine pesticides (OCPs), arsenic, semivolatile organic compounds (SVOCs), polyaromatic hydrocarbons (PAHs), and diesel to heavy end total petroleum hydrocarbons (TPHde) in soil from agricultural production;

3. Potential impacts to shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch residential and farmyard areas from former above ground storage tanks (ASTs) and underground storage tanks (USTs) formerly used for the storage of motor fuel and herbicides;

4. Potentially hazardous substances and petroleum products (volatile organic compounds [VOCs] and gasoline range total petroleum hydrocarbons [TPHg]) have been used and stored in the Tin Shed, Horse Barn, Garage, and Storage Shed on the Maulhardt Ranch that may have impacted shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch farmyard area;

5. Potential polychlorinated biphenyl (PCB) soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol; and

6. The following hazardous pipelines identified within 1,500 feet of the Site:

    - The City of Oxnard maintains a 12-inch diameter PVC water pipeline routed north-south beneath North Rose Avenue immediately west of the Site;

    - The City of Oxnard maintains a 12-inch diameter ACP water pipeline routed east-west beneath Camino Del Sol immediately south of the Site;

    - The United Water Conservation District (UWCD) maintains a 42-inch water pipeline beneath North Rose Avenue immediately west of the Site; and

    - The Maulhardt Ranch maintains a 12-inch diameter PVC water pipeline routed east to west underlying the dirt access road just south of the northern boundary of the Maulhardt Ranch, approximately 920 feet north of the Site. This pipeline is connected to two buried 12-inch diameter PVC water pipelines that are routed north-south beneath and just west of the main north-south road approximately 450 to 460 feet east of Rose Avenue through the Site to the farmyard/residential area of the Maulhardt Ranch.

5.3 2018 PRELIMINARY ENVIRONMENTAL ASSESSMENT REPORT

The six RECs identified in the Phase I ESAs are currently being evaluated in a Preliminary Environmental Assessment (PEA) being performed by Tetra Tech under DTSC oversight. The hazardous pipelines identified as REC 6 are being assessed in a separate task in accordance with the *Guidance*

Protocol for School Site Pipeline Risk Analysis (CDE 2007). The methods, findings, and recommendations of the hazardous pipeline risk analysis will be presented in a High School No. 8 Pipeline Risk Analysis Report that will be summarized as an addendum to the PEA report.

6.0 GEOLOGIC HAZARDS

The following geologic hazard assessment was performed in general accordance with the guidelines contained in the CGS Note 48 (CGS 2013), *Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication 117A* (CGS 2008), and the 2016 California Building Code (CBC) (ICC 2017). It is based on published information on the regional and local geologic conditions along with data from the geotechnical assessments of the Site performed by ESP (ESP 2018b).

6.1 SURFACE FAULT RUPTURE

6.1.1 Alquist-Priolo Earthquake Fault Zones

The Site is not located within a designated Alquist-Priolo Earthquake Fault Zone (AP Zone) (CGS 2007). Because the Site is not located within an AP Zone and there are no known active faults with the potential for surface rupture beneath or trending toward the Site, the probability of surface rupture due to faulting at the Site is considered low. Based on review of the Earthquake Fault Zone Maps for the Saticoy (CDMG 1978), Camarillo (CDMG 1998a), and Santa Paula (CDMG 1998b) Quadrangles, and Figure 2.2.3b of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013), the nearest AP Zones are located at the Springville Fault, located approximately 5.4 km (3.3 miles) east of the Site, the Wright Road Fault, located approximately 6.1 km (3.7 miles) north of the Site, the Camarillo Fault located approximately 8.3 km (5.1 miles) east of the Site, and the Ventura-Pitas Point Fault, located approximately 8.9 km (5.5 miles) north of the Site.

6.1.2 Site Reconnaissance/Aerial Photograph Review

The potential for surface fault rupture at the Site was also evaluated through review of historical aerial photographs available in Tetra Tech files and EDR (EDR 2017) (Appendix C), and visual evaluation of the Site geomorphology during the July 2, 2018 reconnaissance. No evidence for surface fault rupture at the Site (such as scarps, lineations, or other geomorphic features) was observed during the July 2, 2018 Site reconnaissance or in historical aerial photographs dating from 1927, 1938, 1947, 1959, 1967, 1978, 1985, 1994, 2005, 2009, 2010, and 2012 (EDR 2017) (Appendix B). The Site is generally flat. It is shown as being used for various types of row crop agricultural development in all of the aerial photographs reviewed. Relict lineations of braided stream channel morphology from former flood events of the ancestral Santa Clara River are visible on the Site and surrounding areas in the aerial photographs dating from 1927, 1938, 1947, and 1959.

6.2 SITE SPECIFIC EARTHQUAKE GROUND MOTION ANALYSIS

The site is in a region of generally high seismicity and has the potential to experience strong ground shaking from earthquakes on regional or local causative faults. According to the 2016 California Building Code (CBC) Section 1616A.1.3 (International Code Council [ICC] 2017), the site should be assigned to Seismic Design Category E or F, as the site's mapped spectral response acceleration parameter at a 1-second period (S_1) is 0.938 g, which is greater than 0.75 g (see Table 1 ASCE 7-10 Standard Acceleration Parameters later in this section). Based on this S_1 parameter, a site-specific response analysis is warranted to analyze the ground motion hazard at the site. The site-specific response analysis is intended to be in general conformance with ASCE Standard 7-10, Chapter 21, Site Specific Ground Motion Procedures for Seismic Design, Sections 21.1.1 through 21.5.3 (ASCE 2013).

ASCE 7-10 (ASCE 2013) requires that the following site-specific seismic information be developed: 1) Risk-Targeted Maximum Considered Earthquake (MCE_R) Probabilistic and Deterministic response

curves; 2) Site-Specific MCE_R spectral response curve; 3) Site Design Response Curve (2/3 Site-Specific MCE); and 4) Site Design Acceleration Parameters.

The MCE_R is defined as an event having a 2 percent chance of exceedance in 50 years, with a return period of approximately 2,475 years, which is expected to achieve a 1 percent probability of partial or total structure collapse within a 50-year period. The deterministic and probabilistic ground motions were calculated using the USGS 2008 Lower 48 California outside of Cascadia seismic source database and Next Generation Attenuations (NGA) from the EZ-FRISK Version 7.65 by Fugro (Fugro 2018). The NGAs used for this ground motion analysis were as follows: 1) Boore & Atkinson, 2008; 2) Campbell & Bozorgnia, 2008; and 3) Chiou & Young, 2007, all of which are applicable to shallow crustal earthquakes in the western United States. The geometric mean spectral curve of these three NGAs was used as the Probabilistic MCE_R and Deterministic MCE_R.

6.2.1 Probabilistic (MCE_R) Ground Motions

To develop the probabilistic MCE_R spectrum for the site, EZ-FRISK was used. Mapped faults within a 105-kilometer radius (65 miles) were selected from the program database. The peak horizontal ground acceleration (PGA) and spectral accelerations, at 5 percent damped for a Site Class "D" (ASCE, 2013), were estimated using the NGAs mentioned above. The geometric mean of these three generated curves was used as the probabilistic MCE_R response spectrum. The ordinates of the probabilistic ground motions were then computed using Method 1 of ASCE 7-10 Section 21.2.1.1 (ASCE, 2013). To obtain the probabilistic MCE_R spectrum using this method, at each spectral response period for which the acceleration is computed, the ordinates of the probabilistic ground motion are determined as the product of the risk coefficient C_R, and the spectral response acceleration from a 5 percent damped acceleration response spectrum having a two percent probability of exceedance within a 50-year period. The value of the risk coefficient C_R, is determined using the values of C_{RS} (0.910) and C_{R1} (0.909) from Figures 22-17 and 22-18 of ASCE 7-10 (ASCE, 2013) that were obtained from the USGS Earthquake Hazards Program website (USGS, 2018a) (Appendix C). The ground motions were multiplied by the mapped risk coefficient C_{RS} (0.910) at periods up to 0.2 seconds, and C_{R1} the mapped risk coefficient (0.909) at periods greater than or equal to 1 second. At response spectral periods greater than 0.2 seconds and less than 1.0 seconds, C_R was based on linear interpolation of C_{RS} and C_{R1}. The Probabilistic Response Spectra (MCE_R) are included in a single graph presented in Figure 6. The probabilistic geometric mean PGA (MCE_G) is 0.969g (includes risk factor), which is the PGA with a 2 percent probability of exceedance within a 50-year period.

6.2.2 Deterministic (MCE_R) Ground Motions

A deterministic analysis using the NGAs was performed in accordance with ASCE 7-10 (ASCE, 2013). The parameters used in this analysis included the stiff soil classification (Site Class "D"), and the controlling seismic source being the late Quaternary Oak Ridge—Connected-Fault with a maximum magnitude of 7.40 and 5.04 kilometers from the Site and the Oak Ridge (Onshore)-Fault with a maximum magnitude of 7.20 and 5.72 kilometers from the site. Values for the three spectral NGA curves were calculated using EZ-FRISK. The geometric mean of the obtained values was used as the basis for calculating the Deterministic Response Spectrum (MCE_R) presented on the graph in Figure 7. The Deterministic (MCE_R) Lower Limit was calculated using F_a = 1.00 and F_v = 1.50, obtained from the USGS Earthquake Hazards Program website (USGS 2018a) (Appendix C). The Deterministic Response Spectra (MCE_R) are included in a single graph presented in Figure 7.

ASCE 7-10 Section 21.2.2 (ASCE, 2013) requires that the ordinates of the deterministic ground motion response spectrum shall not be less than the corresponding ordinates of the Deterministic Lower Limit

determined in accordance with Figure 21.2.1. The ordinates of the Deterministic Geometric Mean (MCE_R) spectrum are higher than the corresponding ordinates of the Deterministic Lower Limit response spectrum at spectral periods less than 1.6 seconds, and less than the corresponding ordinates of the Deterministic Lower Limit at spectral periods greater than 1.6 seconds. Therefore, it is our opinion that the deterministic ground motion response spectrum should comprise the Deterministic Geometric Mean (MCE_R) curve at spectral periods less than 1.6 seconds and the Deterministic Lower Limit response spectrum curve at spectral periods greater than 1.6 seconds. This Deterministic Site-Specific (MCE_R) is indicated by the red dashed line on the Deterministic Response Spectra graph presented in Figure 7.

The Deterministic Geometric Mean (MCE_R) PGA is 1.222 g, which was calculated from the largest source earthquake from the Oak Ridge-Connected-Fault.

6.2.3 Site-Specific (MCE_R)

The Site-Specific (MCE_R) is defined by ASCE 7-10, Section 21.2.3 (ASCE, 2013) as the lesser of the Probabilistic (MCE_R) and the Deterministic (MCE_R). A review of the Probabilistic and Deterministic Geometric Mean Response Spectra graphs presented in Figure 8 indicates that the Probabilistic (MCE_R) spectral response accelerations is the lesser curve. Therefore, the Site-Specific (MCE_R) should consist of the Probabilistic Geometric Mean with Risk Coefficient spectral response curve. The Probabilistic Geometric Mean with Risk Coefficient curve is shown on the Probabilistic Response Spectra and Probabilistic and Deterministic Response Spectra graphs presented in Figure 8.

6.2.4 ASCE 7-10 Standard Acceleration Parameters

The site coefficients, mapped and design seismic ground motions that could occur at the site were analyzed based on the CBC (ICC 2017) and ASCE 7-10 Standard method (ASCE, 2013). The site coordinates used in this analysis were latitude 34.2077 north and longitude 119.1554 west (Google Earth 2018), with a Site Classification of "D". The ASCE 7-10 Standard method available on the USGS Earthquake Hazards Program website (USGS 2018a) was used (Appendix C). The results of the seismic ground motion analysis are presented in Table 4.

Table 4
ASCE 7-10 Standard Acceleration Parameters

Mapped Acceleration Values for Site Class "B"		**Site Coefficients and Adjusted MCE_R Design Response Spectrum Acceleration Parameters For Site C ass "D"**					
Seismic Parameters	**Values (g)**	**Site Coefficients**	**Values**	**Seismic Parameters**	**Values (g)**	**Seismic Parameters**	**Values (g)**
S_S	2.596	F_a	1.000	S_{MS}	2.596	S_{DS}	1.731
S_1	0.938	F_v	1.500	S_{M1}	1.407	S_{D1}	0.938

6.2.5 Design Response Spectrum

Per ASCE 7-10 Section 21.3 (ASCE, 2013), the Site Design Response Spectra is obtained by taking 2/3 of the Site-Specific (MCE_R), except that the ordinates shall not be less than those obtained from 80% of the ASCE 7-10 Standard adjusted Design Response Spectra values per ASCE 7-10 Section 11.4.5 (ASCE, 2013). The Site Design Response Spectra accelerations for 2/3 of the Site-Specific (MCE_R) were higher

from periods 0.0 to 0.29 seconds, and lower from periods 0.29 to 4.0 seconds than the accelerations from the 80% of the ASCE 7-10 Standard adjusted Design Response Spectrum ground accelerations per ASCE 7-10 Section 11.4.5 (ASCE, 2013), as shown on the Site Design Response Spectra graph presented in Figure 9. Therefore, the ground accelerations for 2/3 of the Site-Specific (MCE_R) from periods 0.0 to 0.29 seconds should be used, and for periods greater than 0.29 seconds to 4 seconds 80 percent of the ASCE 7-10 Standard adjusted Design Response Spectra values should be used. This Governing Site Design Response Spectrum combination is indicated by the red dashed line on the Site Design Response Spectra graph presented in Figure 9.

Note that ASCE 7-10, Section 21.4 (ASCE, 2013), requires that the parameter S_{DS} shall be obtained from site-specific spectra as the spectral acceleration S_a, determined in accordance with ASCE 7-10, Section 21.3, at a period of 0.2 second (1.64g), except it shall not be taken as less than 90 percent of the peak acceleration, S_a, at any period larger than 0.2 seconds. In this case, S_a is greater than 90 percent of the peak acceleration spectral acceleration at any period larger than 0.2 seconds. The parameter S_{D1} shall be taken as the greater of the spectral acceleration, S_a, at a period of 1 second (0.750 g) or two times the spectral acceleration, S_a, at 2 seconds (0.375 g). In this case, the value at two times the spectral acceleration, S_a, at a period of 2 seconds (2 x 0.3752 g = 0.7504 g) is equal to the spectral acceleration, S_a, at a period of 2 of 0.750 g. Therefore 0.750 g shall be used as the value for S_{D1}. The parameters S_{MS} and S_{M1} were taken as 1.5 times S_{DS} and S_{D1}, respectively. The Site Design Response Parameters are provided in Table 5.

Table 5
Site Design Response Parameters

80% of the ASCE 7-10 Design Response Spectrum Acceleration Values for Site Class "D"				**Site Design Response Spectrum Acceleration Values for Site Class "D"**			
Seismic Parameters	**Values (g)**	**Seismic Parameters**	**Values (g)**	**Seismic Parameters**	**Values (g)**	**Seismic Parameters**	**Values (g)**
S_{MS}	2.466	S_{DS}	1.644	S_{MS}	2.466	S_{DS}	1.644
S_{M1}	1.1256	S_{D1}	0.7504	S_{M1}	1.1256	S_{D1}	0.7504

6.2.6 Maximum Considered Earthquake Geometric Mean (MCE_G) Peak Ground Acceleration

6.2.6.1 Probabilistic (MCE_G) Peak Ground Acceleration

The Probabilistic geometric mean PGA (MCE_G) is 0.969 g (includes risk factor), taken as the geometric mean PGA with a 2% probability of exceedance over a 50-year period.

6.2.6.2 Deterministic (MCE_G) Peak Ground Acceleration

The Deterministic MCE_G geometric mean PGA is 1.222 g, taken as the geometric mean peak ground acceleration of the largest 84th percentile earthquake, which was the late Quaternary Age Oak Ridge—Connected-Fault located approximately 5.04 kilometers north of the site and the Oak Ridge (Onshore)-Fault located approximately 5.72 kilometers north the site.

ASCE 7-10, Section 11.8.3 (ASCE, 2013) indicates that the Site PGA for evaluation of potential liquefaction and soil strength loss shall be determined based on the peak ground acceleration adjusted for site class effects (PGA_M) from equation 11.8-1 ($PGA_M = F_{PGA}$ PGA) using the coefficient F_{PGA} from Table

11.8-1. The PGA value is based on the mapped Maximum Considered Earthquake (MCE) ground motion peak ground acceleration shown on Figure 22-7 of ASCE 7-10 (1.020 g) that was obtained from the USGS Earthquake Hazards Program website (USGS 2018a) (Appendix C). For Site Class = D, PGA = 1.020 g, and F_{PGA} = 1.0. Therefore, PGA_M = 1.02 g and should be used as the Deterministic MCE_G geometric mean peak ground acceleration.

6.2.6.3 Site Specific (MCE_G) Peak Ground Acceleration

The site-specific MCE_G PGA is the lesser of the Probabilistic (MCE_G) and the Deterministic (MCE_G). In this case, the Probabilistic (MCE_R) geometric mean PGA of 0.969 g is the lesser PGA. The Probabilistic (MCE_R) geometric mean PGA of 0.969 g is not less than 80 percent of the PGA_M = 1.02 g determined from ASCE 7-10 Eq. 11.8-1 (ASCE, 2013). Therefore, the site-specific MCE_G PGA should be Probabilistic (MCE_R) geometric mean PGA of 0.969 g.

6.2.7 Deaggregated Seismic Parameters

A seismic hazards analysis procedure was used to estimate the probabilistic modal magnitude at the Site using the USGS Unified Hazard Tool available at the USGS Earthquake Hazards Program Website (USGS 2018c) (See the Unified Hazard Tool output presented in Appendix C). The Probabilistic Maximum Considered Earthquake (MCE) was used in the analysis. The MCE is defined as having a 2 percent chance of exceedance in 50 years, with a return period of approximately 2,475 years. The results of this analysis indicate that the Site could experience a probabilistic mean magnitude of 7.01g at a distance of 10.79 km.

6.2.8 Seismic Design Category

The S_1 calculated for the Site is 0.938 g. CBC Section 1613A.3.5 (CBSC, 2013) states that structures assigned to Risk Category I, II, or III where the $S_1 \geq 0.75$g should be assigned to Seismic Design Category E. If structures are assigned to Risk category IV, they should be assigned to Seismic Design Category F.

6.3 LIQUEFACTION

Liquefaction is the significant loss of soil strength due to pore pressure increase (CGS 2008). Ground shaking reorients the unconsolidated sediment grains into a more compact arrangement. If the water table is close to the surface during this reorientation, the grain-to-grain contacts are reduced and the load is temporarily transferred to the pore water. This increases pore pressure and decreases the soil strength, and the deposit then behaves like a liquid (Costa and Baker 1981). Liquefaction may occur when groundwater is present within the potentially liquefiable material (granular soils within a specific range of grain sizes in a relatively loose state of low relative density). If these conditions are present and strong ground motion occurs, portions of the soil column could liquefy, depending on the intensity and duration of the strong ground motion. Soils most susceptible to liquefaction are saturated, very loose to loose, fine grained sandy and silty soils. Liquefaction may manifest itself at the surface as lateral spreading, sand boils, lurching and ground fissuring, loss of bearing strength, and settlement. Any structures founded on or above potentially liquefiable soils may experience settling (both total and differential) and loss of foundation support during ground shaking.

6.3.1 Regional Conditions

Generally, there is a potential for liquefaction when the following three conditions are met: (1) a site is located on Holocene age, unconsolidated, coarse-grained sediments; (2) the site is in area of potentially strong ground motion; and (3) groundwater is less than 50 bgs. The *Seismic Hazards Zone Report for the Oxnard 7.5-Minute Quadrangle, Ventura County California* (CGS 2002a), *State of California Seismic Hazard Zones Oxnard Quadrangle, Revised Official Map* (CGS 2002b), and Figure 2.4b of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013) indicates that the Site is located in a recognized geological hazard zone for earthquake induced liquefaction. The findings in these data are based on the assumptions that the Site area is underlain by coarse grained Holocene age sediments, which are generally considered have a significant liquefaction potential, because the depth to groundwater for the Site area is less than 50 feet bgs with a historic high groundwater elevation of approximately 8 feet bgs (CGS 2002a). Groundwater was encountered in exploratory soil borings drilled at the Site by ESP in April and July 2018 at depths ranging from approximately 20 to 25 feet bgs, which is much shallower than the 50 feet bgs depth used as the maximum depth criterion for potentially liquefiable conditions.

6.3.2 2018 Earth Systems Pacific Liquefaction Analysis

ESP evaluated the liquefaction potential at the Site in accordance with the 2016 CBC (ICC 2017) and the methods in the *Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication 117A* (Special Publication 117A) (CGS 2008). ESP has analyzed the boring data for this project and utilized methods suggested in Special Publication 117A (CDMG 2008), and based on this analysis, concluded that due to the presence of groundwater in the upper 50 feet of soil (measured at 20 to 25 feet bgs) and the density of sand and silt soils, there appears to be a potential for both liquefaction and seismically induced settlement of dry sand to occur at the site (ESP 2018b). Tetra Tech concurs with this finding.

ESP evaluated the potential effects of liquefaction by performing analysis of the CPT data using the site-specific PGA of 0.969 g from the site specific ground motion analysis (Section 6.2.6.3), an earthquake modal magnitude of 7.01 g (USGS 2018c), an assumed historical high groundwater depth of 8 feet bgs (CGS 2002a), and the approximate existing groundwater depth of approximately 20 feet bgs. Based on the analyses presented in Appendix D of ESP's 2018 report (Appendix A), it appears liquefaction occurs in relatively thin discontinuous soil layers as shown on in the cross sections on Figures 4a and 4b. Total liquefaction induced dynamic settlement assuming a groundwater depth of 8 feet ranged between 0.2 to 1.2 inches, and 0.1 to 0.6 inches for a groundwater depth of 20 feet (ESP 2018b).

6.4 SEISMICALLY INDUCED SETTLEMENT OF DRY SAND

Seismically induced settlement of dry sand is also caused by a significant seismic event, and may occur in lower density and sand and silt soils that are not saturated by groundwater. During a major earthquake, the void spaces between the unsaturated soil particles that are filled with air tend to compress which translates to a decrease in volume or settlement (ESP 2018b).

ESP evaluated seismically induced settlement of dry sand as part of the liquefaction evaluation using a reduced or modified PGA value of 2/3 (0.969 g) = 0.646 g. Additionally, the upper 30 inches of soil were neglected in the analyses because the upper 2 to 3 feet of the surface soils had been recently ripped and plowed as part of the on-going agriculture operations at the Site, and these soils will ultimately be removed and replaced as moisture conditioned compacted fill as part of future Site development as recommended later in the "Grading" section ESP's 2018 report. Total seismically induced settlement of dry sand assuming

a groundwater depth of 8 feet ranged between 0 to 0.2 inches, and 0.1 to 0.2 inches for a groundwater depth of 20 feet (ESP 2018b).

6.5 LANDSLIDES/SLOPE INSTABILITY

The Site is relatively flat and is surrounded by flat terrain away from slopes on all sides. On the basis of the July 2, 2018 Site reconnaissance and review of the CGS Seismic Hazards Map for the 7.5 Minute Series Oxnard Quadrangle (CGS 2002b), Figure 2.7.1b of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013), and Section 6.2.2 of the *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006), the Site is not in an area prone to landslides and slope instability.

6.6 LATERAL SPREADING

Lateral spreading can occur when a soil mass either slides laterally on liquefied soil layers towards a free slope face, or when a soil mass moves downslope on gently sloping ground. Based on the results ESP's liquefaction analysis, the potential for loss of soil bearing strength and lateral spreading was determined to be very low. ESP developed the assessment for loss of soil bearing strength by comparing the thickness of the overlying non-liquefiable soils with respect to the depth, the relatively thin thickness, and the discontinuous nature of the underlying liquefiable soils. Lateral spreading can occur when a soil mass either slides laterally on liquefied soil layers towards a free slope face, or when a soil mass moves downslope on sloping ground. ESP stated that since a free slope face does not exist within or near the Site, they focused on the sloping ground aspect of lateral spreading. ESP deduced from the Google Earth website that the Site slopes at approximately 0.35 percent from the north to the south. The assessment for lateral spreading was developed by considering the relatively flat to very gently sloping ground surface with respect to the discontinuous nature of the underlying liquefiable soils. ESP concluded that the conditions needed for lateral spreading to occur do not appear to exist at the Site. Tetra Tech concurs with this finding.

6.7 SUBSIDENCE

Subsidence is any settling or sinking of the ground surface over a regional area arising from surface or subsurface causes, such as earthquakes or groundwater and/or oil extraction. Figure 2.8 of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013) and Section 6.2.2 of the *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006) indicates that the Site is located in an area susceptible to subsidence. The subsidence has been caused by overdraft of the groundwater aquifers that underlie the Oxnard Plain. Although it could occur, it is considered to be an insignificant risk due to the absence of reported problems.

6.8 GROUND LURCHING

Ground lurching occurs when the ground is accelerated during a seismic event. Ground lurching occurs due to detachment of underlying stratigraphic units, allowing near-surface soil to move differentially from underlying soil. Because the Site is within a seismically active area, there is a potential for ground lurching to occur.

6.9 FLOODING

6.9.1 FEMA Map Data

According to the FEMA Flood Insurance Rate Map No. 06111C0910E the Western half of the Site is located in Zone X (Other Areas) and is defined as areas determined to be outside the 0.2% (500-yr) annual chance floodplain , while the eastern portion of the site is located in Zone X (Other Flood Areas) and is defined as areas of 0.2% (500-yr) annual chance of flood; areas of 1%(100-yr) annual chance flood with average depths of less than one foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% (100-yr) annual chance flood (FEMA, 2010).

6.10 RESERVOIR FAILURE INUNDATION

A dam that stores more than 1,000 acre-feet of water, is higher than 150 feet, and has the potential to cause downstream property damage is classified as a high hazard dam by FEMA. A review of Section 2.11 and Figures 2.11.1 and 2.11.2 of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013) and Section 4.3.3.1 and Tables 4-5, 4-6, and, 4-7, and Figure 4-3 of the *Multi-Jurisdictional Hazard Mitigation Plan for Ventura County, California* (County of Ventura 2005) indicates that there are four major reservoirs in the Santa Clara River watershed upstream of the Site that are FEMA high hazard dams that would inundate the Site area in the event of a reservoir failure. Information for each of these four dams is summarized below.

Santa Felicia Dam: The Santa Felicia Dam (Lake Piru) is operated by the United Water Conservation District (UWCD), can hold up to 100,000 acre-feet of water, and is located on Piru Creek approximately 32 miles upstream of the Site (Figure 10). Data provided by the UWCD indicates that the Site would be inundated by flood waters approximately 4 hours after the dam failure (UWCD 1974).

Castaic Dam. The Castaic Dam is operated by the California Department of Water Resources (CDWR), can hold up to 325,000 acre-feet of water, and is located on Castaic Creek approximately 42 miles upstream of the Site (Figure 10). Data provided by the CDWR indicates that the Site would be inundated by flood waters approximately 4 hours after a failure of the Castaic Dam (CDWR 1975).

Pyramid Dam. The Pyramid Dam is operated by the CDWR, can hold up to 179,000 acre-feet of water, and is located on Piru Creek approximately 20 miles upstream of the Santa Felicia Dam and 52 miles upstream of the Site (Figure 10). Data provided by the CDWR indicates that the Site would be inundated by flood waters to depths of 10 to 20 feet approximately 4 hours after a failure of the Pyramid Dam (CDWR 1975).

Bouquet Canyon Dam. The Bouquet Canyon Dam is operated by the Los Angeles Department of Water and Power (LADWP), can hold up to 36,500 acre-feet of water, and is located approximately 57 miles upstream of the Site (Figure 10). Data provided by the LADWP indicates that the Site would be inundated by flood waters approximately 4.5 hours after a failure of the Bouquet Canyon Dam (LADWP 2015).

The need for dam failure disaster planning was demonstrated by the midnight collapse in March 1928 of the St. Francis Dam in Los Angeles County, which occurred after the newly constructed cement arched dam was completely filled for the first time. The ensuing flooding from the dam's total collapse resulted in the loss of over 400 lives in Ventura County as floodwaters washed out homes and structures along the banks of the Santa Clara River. The communities of Piru, Fillmore, Santa Paula, Bardsdale, Saticoy, Montalvo and El Rio sustained extensive life and property loss from the flood (County of Ventura 2013).

More recently, the San Fernando Earthquake in 1971 resulted in ground shaking in the vicinity of the Van Norman Dam in Los Angeles County. As a result of the earthquake, structural damage threatened the dam's immediate collapse. Approximately 80,000 residents in the San Fernando Valley had to be evacuated to areas of safety in the midst of many other earthquake-related emergencies (County of Ventura 2013).

The California's Dam Safety Act (Section 8589.5 California Emergency Services Act) requires the preparation of dam inundation maps showing areas of potential flooding in the event of sudden or total dam failure as well as emergency procedures for notification and evacuation of nearby residents (County of Ventura 2013).

In Ventura County, disaster coordination and planning is the responsibility of the Sheriff's Department through its Office of Emergency Services (OES). Within California's emergency management organizational structure, each county serves as an Operational Area. In this role, Sheriff's OES acts as an agent between Cal OES and the cities (including the City of Oxnard), special districts and unincorporated areas of Ventura County. OES is responsible for countywide disaster planning, mitigation, response and recovery activities. The OES serves as the depository for the County's Dam Inundation Maps and is charged with ongoing maintenance of the County's Dam Failure Response Plan which was adopted by the Board of Supervisors on September 13, 1983. The Dam Failure Response Plan was currently updated by the OES during 2013 (County of Ventura 2013).

6.11 TSUNAMIS

The Site is not likely to be inundated by tsunamis because it is located at an elevation higher than approximately 60 to 65 feet above msl and over 12 miles from the ocean, therefore, tsunamis are not a concern. This finding is supported by information on Figure 2.6 of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013).

6.12 SEICHE INUNDATION

As there are no large bodies of water near the Site, seiche is not a concern.

6.13 EXPANSIVE SOILS

6.13.1 USDA Soil Survey

The *Soil Survey, Ventura Area, California* (USDA 1970) indicates that the Huenme sandy loam, and Camarillo sandy loam are non-plastic, have no coefficient of linear extensibility, and no percent expansion rating. Mocho loam, Pico sandy loam and sandy loam substratum have a liquid limit of 25 to 35 percent and a plasticity index of 5 to 10.

6.13.2 2018 ESP Report

The 2018 ESP geotechnical report concluded the upper site soils were judged to be generally nonexpansive; therefore, no special measures with respect to expansive soils are considered necessary (ESP 2018b).

6.14 CORROSIVE SOILS

ESP retained Cerco Analytical to perform laboratory testing for resistivity, chloride, and sulfate soil content. Based on the testing performed by Cerco Analytical, the upper site soils were classified as "corrosive" to certain construction materials that will be in contact with the soils. The ESP report recommended that the architect/engineer should refer to the Cerco Analytical report presented in Appendix C of the 2018 ESP report for use in determining appropriate mitigation measures for the soil's corrosivity (Appendix A) (ESP 2018b).

6.15 ASBESTOS-CONTAINING ROCKS

Tetra Tech has reviewed available topographic and geologic maps for the Site area and *A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos* (CDMG 2000) for potential sources of naturally occurring asbestos (NOA) and believes the risk for NOA at the proposed High School No. 8 site is low. The nearest sources of NOA are in the Santa Ynez River watershed in the Santa Ynez Mountains, approximately 30 miles northwest of the Site. NOA sources are not known to exist in the Santa Clara River watershed.

7.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the work performed for this geohazard assessment, Tetra Tech makes the following conclusions and recommendations regarding potential geohazards at the Site.

7.1 SITE SUITABILITY

The results of the geohazard assessment and the ESP geotechnical investigation indicate the Site is suitable for the proposed High School No. 8 project. Tetra Tech recommends that the ESP conclusions and recommendations for design and construction at the Site be implemented (ESP 2018b).

7.2 SITE PREPARATION AND GRADING

Tetra Tech recommends that the conclusions and recommendations in the 2018 ESP Report (ESP 2018b) (Appendix A) for Site Preparation and Grading be implemented.

7.3 SEISMIC DESIGN CONSIDERATIONS

It is our understanding that the proposed school will be designed in accordance with the current standards of the 2016 CBC (ICC 2017). Seismic data that can be used with the 2016 CBC are included in this report.

7.4 GEOLOGIC HAZARDS

7.4.1 Surface Fault Rupture

Data reviewed for this report do not indicate that the Site is located in an AP Fault Zone nearest the Site is along the Los Alamos-Baseline fault approximately 13.2 miles to the south. The closest known active fault to the Site and AP Fault Zone is the Springville Fault, located approximately 5.4 km (3.3 miles) east of the Site. Based on these data, there is a low potential for surface fault rupture to occur at the Site.

No geomorphic evidence for surface fault rupture at the Site was noted in reviews of historical aerial photographs or during the July 2, 2018 Site reconnaissance.

7.4.2 Liquefaction and Seismic Settlement

ESP evaluated the liquefaction potential at the Site in accordance with the 2016 CBC (ICC 2017) and the methods in the *Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication 117A* (Special Publication 117A) (CGS 2008). Based on the analyses presented in Appendix D of ESP's 2018 report (Appendix A), it appears liquefaction occurs in relatively thin discontinuous soil layers as shown on in the cross sections on Figures 4a and 4b. Total liquefaction induced dynamic settlement assuming a groundwater depth of 8 feet ranged between 0.2 to 1.2 inches, and 0.1 to 0.6 inches for a groundwater depth of 20 feet (ESP 2018b).

7.4.3 Seismically Induced Settlement of Dry Sand

ESP's analysis of the seismically induced settlement of dry sand is presented in Appendix D of their 2018 Geotechnical Engineering Report (ESP 2018b) (Appendix A). Total seismically induced settlement of dry sand assuming a groundwater depth of 8 feet ranged between 0 to 0.2 inches, and 0.1 to 0.2 inches for a groundwater depth of 20 feet (ESP 2018b).

7.4.4 Landslides/Slope Instability

On the basis of the July 2, 2018 Site reconnaissance and review of the CGS Seismic Hazards Map for the 7.5 Minute Series Oxnard Quadrangle (CGS 2002b), Figure 2.7.1b of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013), and Section 6.2.2 of the *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006), the Site is not in an area prone to landslides and slope instability.

7.4.5 Lateral Spreading

ESP's evaluated the potential for lateral spreading to occur at the Site and based on the liquefaction analysis found that the potential for loss of soil bearing strength and lateral spreading was determined to be very low. ESP stated that since a free slope face does not exist within or near the site, they focused on the sloping ground aspect of lateral spreading. ESP concluded that the conditions needed for lateral spreading to occur do not appear to exist at the site. Tetra Tech concurs with this finding.

7.4.6 Subsidence

Figure 2.8 of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013) and Section 6.2.2 of the *City of Oxnard General Plan Draft Background Report* (City of Oxnard 2006) indicates that the Site is located in an area susceptible to subsidence. The subsidence has been caused by overdraft of the groundwater aquifers that underlie the Oxnard Plain. Although it could occur, it is considered to be an insignificant risk due to the absence of reported problems.

7.4.7 Flooding

FEMA Flood Insurance Rate Map No. 06111C0910E indicates that the Western half of the Site is located in Zone X (Other Areas) and is defined as areas determined to be outside the 0.2% (500-yr) annual chance floodplain , while the eastern portion of the site is located in Zone X (Other Flood Areas) and is defined as areas of 0.2% (500-yr) annual chance of flood; areas of 1%(100-yr) annual chance flood with average depths of less than one foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% (100-yr) annual chance flood (FEMA, 2010).

7.4.8 Reservoir Failure Inundation

A review of Section 2.11 and Figures 2.11.1 and 2.11.2 of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013) and Section 4.3.3.1 and Tables 4-5, 4-6, and, 4-7, and Figure 4-3 of the *Multi-Jurisdictional Hazard Mitigation Plan for Ventura County, California* (County of Ventura 2005) indicates that there are four major reservoirs in the Santa Clara River watershed upstream of the Site that are FEMA high hazard dams that would inundate the Site area in the event of a reservoir failure. Tetra Tech recommends that the OUHSD develop and implement a Site specific flooding evacuation plan to be implemented in conjunction with the County of Ventura OES Dam Failure Response Plan.

7.4.9 Tsunamis

The Site is not likely to be inundated by tsunamis because it is located at an elevation higher than approximately 60 to 65 feet above msl and over 12 miles from the ocean, therefore, tsunamis are not a concern. This finding is supported by information on Figure 2.6 of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013).

7.4.10 Seiche Inundation

As there are no large bodies of water near the Site, seiche is not a concern.

7.4.11 Expansive Soils

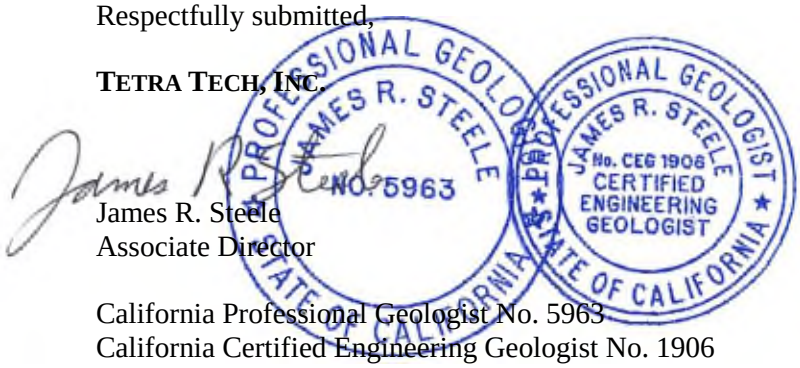
The 2018 ESP geotechnical report concluded the upper site soils were judged to be generally nonexpansive; therefore, no special measures with respect to expansive soils are considered necessary (ESP 2018b).

7.4.12 Corrosive Soils

The 2018 Cerco Analytical report in Appendix C of the 2018 ESP report (Appendix A) indicated that the upper site soils were classified as "corrosive" to certain construction materials that will be in contact with the soils. The ESP report recommended that the architect/engineer should refer to the Cerco Analytical report presented in Appendix C of the 2018 ESP report for use in determining appropriate mitigation measures for the soil's corrosivity (Appendix A) (ESP 2018b).

7.4.13 Asbestos Containing Rocks

Based on review of available topographic and geologic maps for the Site area and *A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos* (CDMG 2000) the risk for NOA in the soils of the proposed High School No. 8 site is low.



8.0 DISCLAIMER

This report was compiled based partially on information supplied to Tetra Tech from outside sources and other information, which is in the public domain. The conclusions and recommendations herein are based solely on the information Tetra Tech obtained in compiling the report. Documentation for the statements made in the report is on file at Tetra Tech's offices in Santa Barbara, California. Tetra Tech makes no warranty as to the accuracy of statements made by others which may be contained in the report, nor are any other warranties or guarantees, expressed or implied, included or intended by the report, except that it has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professional consultants or firms performing the same or similar services. Since the facts forming the basis for the report are subject to professional interpretation, differing conclusions could be reached. Tetra Tech does not assume responsibility for the discovery and elimination of hazards that could possibly cause accidents, injuries, or damage. Compliance with submitted recommendations or suggestions does not assure elimination of hazards or the fulfillment of client's obligation under local, state, or federal laws or any modifications or changes to such laws.

None of the work performed hereunder shall constitute or be represented as a legal opinion of any kind or nature, but shall be a representation of findings of fact from records examined.

Respectfully submitted,

TETRA TECH, INC.

ABBREVIATED EXPLANATION

Approximate stratigraphic relationships only;
see pamphlet for more detailed information

Holocene

- af — Artificial fill (Holocene)
- alf — Artifical levee fill (Holocene)
- Qb — Active beach deposits (Holocene)
- Qe — Active coastal eolian (sand dune) deposits (Holocene)
- Qes — Active coastal estuarine deposits (Holocene)
- Qw — Active wash deposits within major river channels (Holocene)
- Qw_1 — Historically active wash deposits adjacent to active channel (Holocene)
- Qhw_3 — Wash deposits Unit 3 (Holocene), associated with units Qht_3 and Qha_3
- Qhw_2 — Wash deposits Unit 2 (Holocene), associated with unit Qha_2
- Qhw_1 — Wash deposits Unit 1 (Holocene), associated with units Qht_1 and Qha_1
- Qhfy — Alluvial fan deposits (latest holocene)
- Qhf — Alluvial fan deposits (Holocene)
- Qhff — Alluvial fan deposits, fine facies (Holocene)
- Ql — Lacustrine deposits (Holocene)
- Qls — Landslide deposits (Holocene to Pleistocene)
- Qha — Alluvial deposits and colluvial deposits, associated with Qw (Holocene)
- Qha_3 — Unit 3, associated with unit Qhw_3
- Qha_2 — Unit 2, associated with unit Qhw_2
- Qha_1 — Unit 1, associated with unit Qhw_1
- Qht — Stream terrace deposits, associated with unit Qw (latest Holocene)
- Qht_3 — Unit 3, associated with unit Qhw_3
- Qht_1 — Unit 1, associated with unit Qhw_1
- Qhps — Paralic deposits of the Sea Cliff marine terrace (Holocene)

Pleistocene

- Qf — Alluvial fan deposits (late Pleistocene)
- Qppp — Paralic deposits of Punta Gorda marine terrrace (Pleistocene)
- Qpmw — Undivided mass-wasting deposits (Pleistocene)
- Qpa — Alluvial deposits, undivided (late Pleistocene)
- Qpa_2 — Unit 2
- Qpa_1 — Unit 1
- Qpf — Alluvial fan deposits (late to middle Pleistocene)
- Qpf_2 — Unit 2
- Qpf_1 — Unit 1
- Qoa — Alluvial deposits (early to middle Pleistocene)
- Qca — Casitas Formation (Pleistocene)
- Qs — Saugus Formation (Pleistocene)
- Qlp — Las Posas Formation (Pleistocene)
- Qsb / Qsbc — Santa Barbara Formation (Pleistocene)
  - Qsbc - conglomerate

Pliocene

- Tps / Tpsc — Pico Formation (Pliocene) (Tp)
  - Tp - undivided
  - Tps -sandstone
  - Tpsc - sandstone and conglomerate
- Tsq — Sisquoc Formation (Pliocene-Miocene)

Miocene

- Ta — Andesite sill (Miocene)
- Tcvai — Conejo Volcanics, andesitic (middle Miocene)
- Tcvdi — Conejo Volcanics, dacitic (middle Miocene)
- Tcvb — Conejo Volcanics, basaltic (middle Miocene)
- Tcvbs — Conejo Volcanics, interbedded with sandstone and siltstone (middle Miocene)
- Tcvbb — Conejo Volcanics, basaltic flow breccias (middle Miocene)
- Tcvab — Conejo Volcanics, andesitic flow breccias (middle Miocene)
- Tcvdb — Conejo Volcanics, dacitic flow breccias (middle Miocene)
- Tcvadb — Conejo Volcanics, mix of andesitic and dacitic flow breccias (middle Miocene)
- Tdb — Undivided diabase and mafic hypabyssal intrusive rocks (Miocene)
- Tmyu / Tmyl (Tmy) — Monterey Formation (middle and late Miocene)
  - Tmy - undivided
  - Tmyu - upper
  - Tmyl - lower
- Tm / Tmb — Modelo Formation (Miocene)
  - Tmb - burnt rock
- Tr — Rincon Shale (Miocene)
- Tt / Tts — Topanga Formation (middle to early Miocene)
  - Tts - dominantly sandstone
- Tv / Tvs — Vaqueros Sandstone (early Miocene)
  - Tvs - dominantly sandstone

Oligocene

- Ts — Sespe Formation (Oligocene)

Eocene

- Tcw / Tcwsh — Coldwater Sandstone (late Eocene)
  - Tcwsh - dominantly shale
- Tcd — Cozy Dell Shale (late Eocene)
- Tma / Tmash — Matilija Sandstone (middle to late Eocene)
  - Tmash - micaceous shale
- Tj / Tjs — Juncal Formation (early to middle Eocene)
  - Tjs - dominantly arkosic sandstone

Cretaceous

- Ku — Unnamed conglomerate (late Cretaceous)

SYMBOL EXPLANATION

- Contact between map units - Solid where accurately located, dashed where approximately located; dotted where concealed; queried where uncertain.
- Fault - Solid where accurately located, dashed where approximately located; short dash where inferred; dotted where concealed, queried where uncertain. Ball and bar on downthrown block. Arrow and number indicate direction and angle of dip of fault plane.
- Contact between similar map units; approximately located.
- Inferred shoreline angle of marine terraces.
- Erosional scarps in terraced alluvial units; hatchures point towards topograhically lower surfaces
- Anticline - Solid where accurately located, dashed where approximately located, dotted where concealed, queried where uncertain, arrow indicates direction of plunge.
- Overturned Anticline - Solid where accurately located, dotted where concealed, queried where uncertain.
- Syncline - Solid where accurately located, dotted where concealed, queried where uncertain arrow indicates direction of plunge.
- Overturned Syncline - Solid where accurately located, dotted where concealed, queried where uncertain.

Strike and dip of sedimentary beds:

- Inclined bedding
- Vertical bedding
- Overturned bedding
- Landslide - arrow indicates principal direction of movement; hachured where headscarp is mappable. The existence of some landslides may be questionable; .

Prepared in cooperation with the U.S. Geological Survey, Southern California Areal Mapping Project.

* Quaternary now recognized as extending to 2.6 Ma (Walker and Geissman, 2009). Quaternary faults in this map were established using the previous 1.6 Ma criterion.

EXPLANATION

Fault traces on land are indicated by solid lines where well located, by dashed lines where approximately located or inferred, and by dotted lines where concealed by younger rocks or by lakes or bays. Fault traces are queried where continuation or existence is uncertain. Concealed faults in the Great Valley are based on maps of selected subsurface horizons, so locations shown are approximate and may indicate structural trend only. All offshore faults based on seismic reflection profile records are shown as solid lines where well defined, dashed where inferred, queried where uncertain.

FAULT CLASSIFICATION COLOR CODE
(Indicating Recency of Movement)

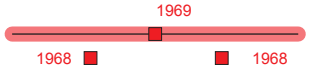
Fault along which historic (last 200 years) displacement has occurred and is associated with one or more of the following:

(a) a recorded earthquake with surface rupture. (Also included are some well-defined surface breaks caused by ground shaking during earthquakes, e.g. extensive ground breakage, not on the White Wolf fault, caused by the Arvin-Tehachapi earthquake of 1952). The date of the associated earthquake is indicated. Where repeated surface ruptures on the same fault have occurred, only the date of the latest movement may be indicated, especially if earlier reports are not well documented as to location of ground breaks.

(b) fault creep slippage - slow ground displacement usually without accompanying earthquakes.

(c) displaced survey lines.

A triangle to the right or left of the date indicates termination point of observed surface displacement. Solid red triangle indicates known location of rupture termination point. Open black triangle indicates uncertain or estimated location of rupture termination point.



Date bracketed by triangles indicates local fault break.

No triangle by date indicates an intermediate point along fault break.

Fault that exhibits fault creep slippage. Hachures indicate linear extent of fault creep. Annotation (creep with leader) indicates representative locations where fault creep has been observed and recorded.

Square on fault indicates where fault creep slippage has occured that has been triggered by an earthquake on some other fault. Date of causative earthquake indicated. Squares to right and left of date indicate terminal points between which triggered creep slippage has occurred (creep either continuous or intermittent between these end points).

Holocene fault displacement (during past 11,700 years) without historic record. Geomorphic evidence for Holocene faulting includes sag ponds, scarps showing little erosion, or the following features in Holocene age deposits: offset stream courses, linear scarps, shutter ridges, and triangular faceted spurs. Recency of faulting offshore is based on the interpreted age of the youngest strata displaced by faulting.

Late Quaternary fault displacement (during past 700,000 years). Geomorphic evidence similar to that described for Holocene faults except features are less distinct. Faulting may be younger, but lack of younger overlying deposits precludes more accurate age classification.

Quaternary fault (age undifferentiated). Most faults of this category show evidence of displacement sometime during the past 1.6 million years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age. Unnumbered Quaternary faults were based on Fault Map of California, 1975. See Bulletin 201, Appendix D for source data.

Pre-Quaternary fault (older that 1.6 million years) or fault without recognized Quaternary displacement. Some faults are shown in this category because the source of mapping used was of reconnaissnce nature, or was not done with the object of dating fault displacements. Faults in this category are not necessarily inactive.

ADDITIONAL FAULT SYMBOLS

Bar and ball on downthrown side (relative or apparent).

Arrows along fault indicate relative or apparent direction of lateral movement.

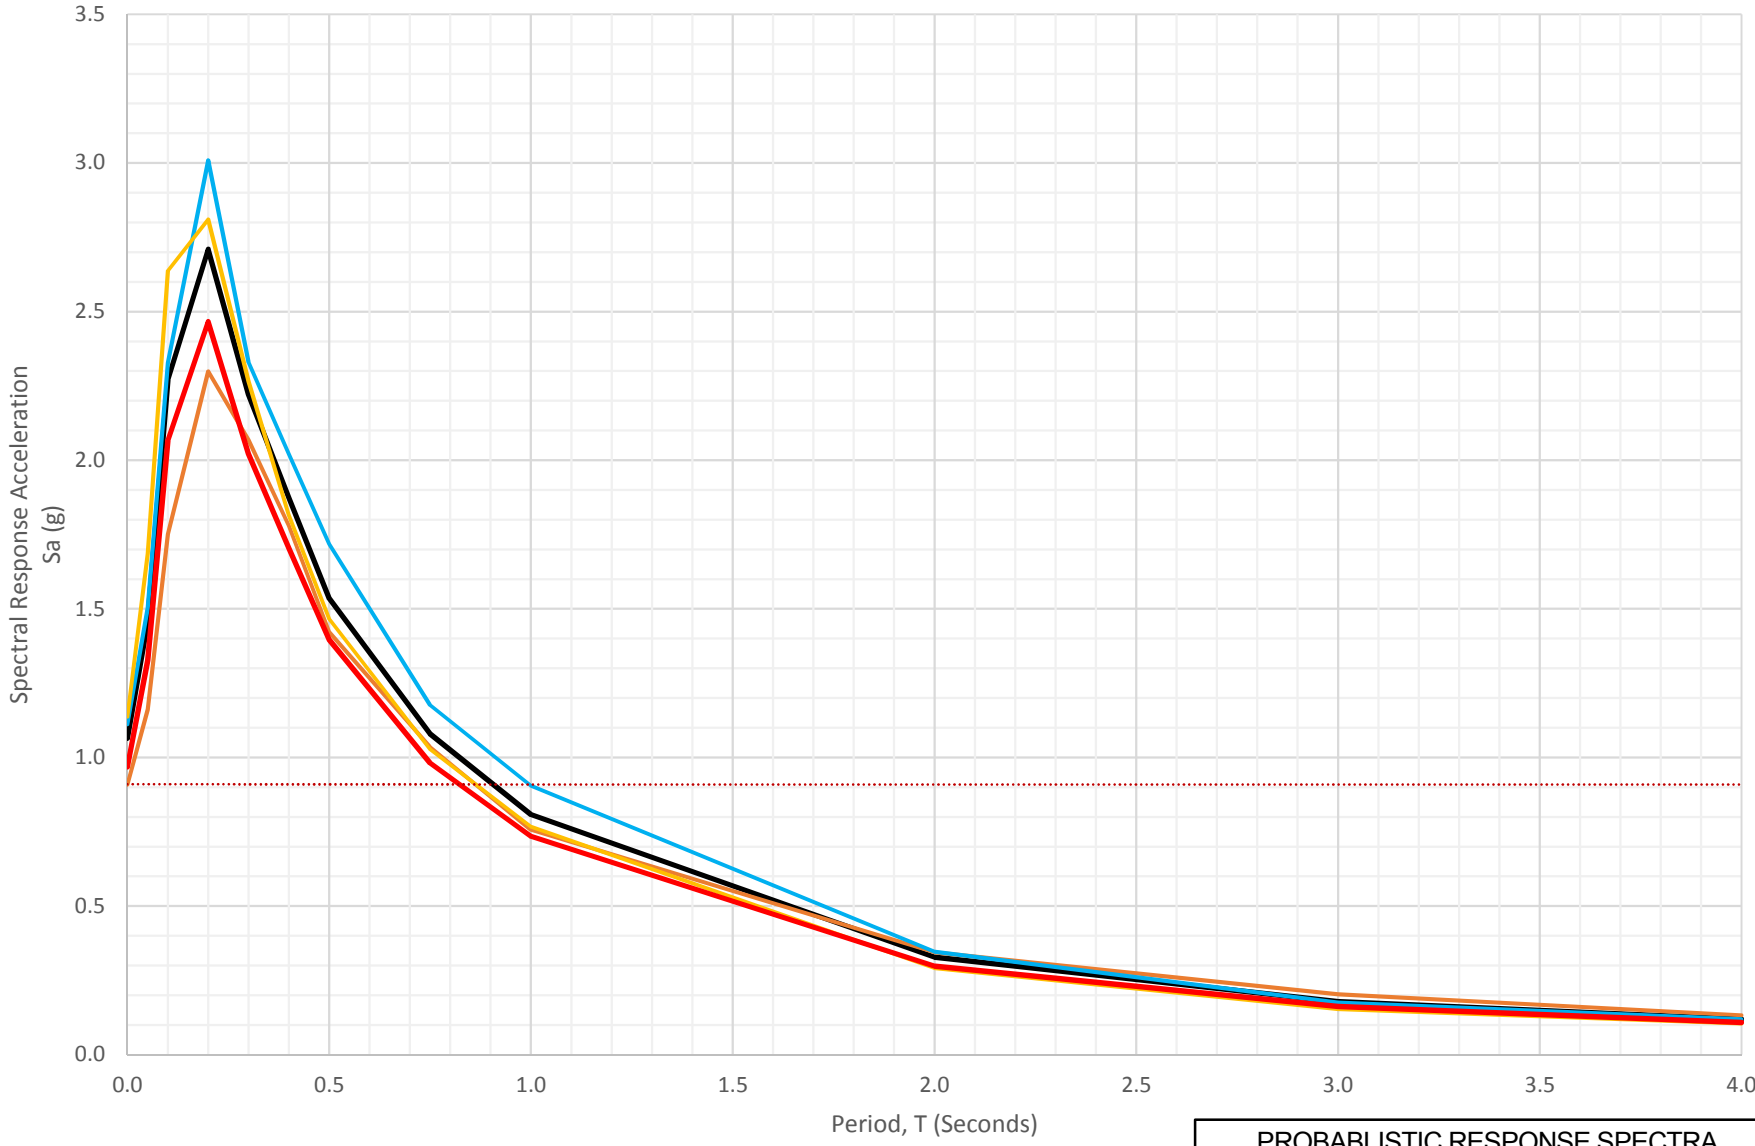
Arrow on fault indicates direction of dip.

Low angle fault (barbs on upper plate). Fault surface generally dips less than 45° but locally may have been subsequently steepened. On offshore faults, barbs simply indicate a reverse fault regardless of steepness of dip.

OTHER SYMBOLS

Numbers refer to annotations listed in the appendices of the accompanying report. Annotations include fault name, age of fault displacement, and pertinent references including Earthquake Fault Zone maps where a fault has been zoned by the Alquist-Priolo Earthquake Fault Zoning Act. This Act requires the State Geologist to delineate zones to encompass faults with Holocene displacement.

Structural discontinuity (offshore) separating differing Neogene structural domains. May indicate discontinuities between basement rocks.



Brawley Seismic Zone, a linear zone of seismicity locally up to 10 km wide associated with the releasing step between the Imperial and San Andreas faults.

RAYMOND	84.5	B	6.5	0.5	DS

Notes: - The data presented in this table are from *The Uniform California Earthquake Rupture Forecast, Version 2 (UCEFR 2)* (U. S. Geologial Survey and California Geological Survey 2008), Appendix A and the Supplimentary Excel Spreadsheet.

A - Faults with a MwMax ≥ 7 and a slip rate ≥ 5 mm/yr.

B - Faults with a MwMax ≥ 7 and a slip rate < 5 mm/yr, MwMax < 7 and a slip rate > 2, or MwMax ≥ 6.5 and a slip rate < 2mm/yr.

BT - blind thrust fault

DS - dip slip fault

mm/yr - millimeters per year

Mmax - Maximum earthquake moment magnitued (Mw) where Mw is equal to the rigidity of the earth times the average amount of

SS - strike slip fault

Table 3
Historic Earthquake Catalogue Data Summary

Notes: - **Red Bold** text indicates the maximum magnitude (7.5 mw from the 1952 White Wolf Earthquake).
a - All times use ISO8601 Date/Time format. Unless a timezone is specified, UTC is assumed.
- The data presented in this table are from the U.S. Geological Survey Earthquake Hazards Program Search Earthquake Catalogue website at https://earthquake.usgs.gov/earthquakes/search/. The ATLAS, CI, DUPTRL, GCMT, ISCGEM, LD, NM, SE, US, and UW catalogues were searched.
g - Standard acceleration of gravity where g = 9.81 meters/second as estimated using a deterministic method.
km - kilometer

Magnitude Type	Magnitude Range	Distance Range	Equation	Comments
Mww (Moment W-phase) (generic notation Mw)	~5.0 and larger	1 - 90 degrees	MW = 2/3 * (log10(MO) - 16.1), where MO is the seismic moment. Note this is also unit-dependent; the formula above is for moment in dyne-cm. If using metric units (N.m), the constant is 9.1.	Derived from a centroid moment tensor inversion of the W-phase (~50-2000 s; pass band based on size of EQ). Computed for all M5.0 or larger earthquakes worldwide, but generally robust for all M5.5 worldwide. Provides consistent results to M~4.5 within a regional network of high-quality broadband stations. Authoritative USGS magnitude if computed.
Mwc (centroid)	~5.5 and larger	20 - 180 degrees	MW = 2/3 * (log10(MO) - 16.1), where MO is the seismic moment.	Derived from a centroid moment tensor inversion of the long-period surface waves (~100-2000 s; pass band based on size of EQ). Generally computable for all M6.0 worldwide using primarily the Global Seismograph Network. Only authoritative if Mww is not computed, not published otherwise.
Mwb (body wave)	~5.5 to ~7.0	30 - 90 degrees	M_W = 2/3 * ($\log_{10}(M_O)$ - 16.1), where MO is the seismic moment.	Derived from moment tensor inversion of long-period (~20-200 s; pass band based on size of EQ) body-waves (P- and SH). Generally computable for all M5.5 or larger events worldwide. Source complexity at larger magnitudes (~M7.5 or greater) generally limits applicability. Only authoritative if Mww and Mwc are not computed.
Mwr (regional)	~4.0 to ~6.5	0 - 10 degrees	M_W = 2/3 * ($\log_{10}(M_O)$ - 16.1), where MO is the seismic moment.	Based on the scalar seismic-moment of the earthquake, derived from moment tensor inversion of the whole seismogram at regional distances (~10-100 s; pass band based on size of EQ). Source complexity and dimensions at larger magnitudes (~M7.0 or greater) generally limits applicability. Authoritative for <M5.0. Within the continental US and south-central Alaska where we have a large number of high quality broadband stations we expect we can compute an Mwr consistently for events as small as M4.0. In some areas of the country, with relatively dense broadband coverage, we can compute Mwr consistently to as small as M3.5.
Ms20 or Ms (20sec surface wave)	~5.0 to ~8.5	20 - 160 degree	MS = log10 (A/T) + 1.66 log10 (D) + 3.30 .	A magnitude based on the amplitude of Rayleigh surface waves measured at a period near 20 sec. Waveforms are shaped to the WWSSN LP response. Reported by NEIC, but rarely used as authoritative, since at these magnitudes there is almost always an Mw available. Ms is primarily valuable for large (>6), shallow events, providing secondary confirmation on their size. Ms_20 tends to saturate at about M8.3 or larger.
mb (short-period body wave)	~4.0 to ~6.5	15 - 100 degrees	mb = log10(A/T) + Q(D,h), where A is the amplitude of ground motion (in microns); T is the corresponding period (in seconds); and Q(D,h) is a correction factor that is a function of distance, D (degrees), between epicenter and station and focal depth, h (in kilometers), of the earthquake.	Based on the amplitude of 1st arriving P-waves at periods of about 1 s. Waveforms are shaped to the WWSSN SP response. Reported for most M4.0-4.5 to 6.5 EQs that are observed teleseismically. Only authoritative for global seismicity for which there is no Mww, Mwc, Mwb or Mwr, typically 4.0-5.5 range. Mb tends to saturate at about M 6.5 or larger.
ML Ml, or ml (local)	~2.0 to ~6.5	0 - 600 km		The original magnitude relationship defined by Richter and Gutenberg in 1935 for local earthquakes. It is based on the maximum amplitude of a seismogram recorded on a Wood-Anderson torsion seismograph. Although these instruments are no longer widely in use, ML values are calculated using modern instrumentation with appropriate adjustments. Reported by NEIC for all earthquakes in the US and Canada. Only authoritative for smaller events, typically M<4.0 for which there is no mb or moment magnitude. In the central and eastern United States, NEIC also computes ML, but restricts the distance range to 0-150 km. In that area it is only authoritative if there is no mb_Lg as well as no mb or moment magnitude.
mb_Lg, mb_lg, or MLg (hort-period surface wave)	~3.5 to ~7.0	150 – 1110 km (10 degres)		A magnitude for regional earthquakes based on the amplitude of the Lg surface waves as recorded on short-period instruments. Only authoritative for smaller events in the central and eastern United States, typically <4.0 for which there is no mb or moment magnitude.
Md or md (duration)	~4 or smaller	0 - 400 km		Based on the duration of shaking as measured by the time decay of the amplitude of the seismogram. Sometimes the only magnitude available for very small events, but often used (especially in the past) to compute magnitude from seismograms with "clipped" waveforms due to limited dynamic recording range of analog instrumentation, which makes it impossible to measure peak amplitudes. Computed by NEIC but only published when there is no other magnitude available.

Magnitude Type	Magnitude Range	Distance Range	Equation	Comments
Mi or Mwp (integrated p-wave)	~5.0 to ~8.0	all		Based on an estimate of moment calculated from the integral of the displacement of the P wave recorded on broadband instruments.
Me (energy)	~3.5 and larger		Me = 2/3 log10E - 2.9, where E is the energy calculated by log10E = 11.8 + 1.5MS where energy, E, is expressed in ergs.	Based on the seismic energy radiated by the earthquake as estimated by integration of digital waveforms.
Finite Fault Modeling	~7.0 and larger	30 - 90 degrees		FFM modeling provides a kinematic description of faulting including estimates of maximum slip, area of rupture and moment release as a function of time. Results are used to provide constraints on fault dimensions and slip used in damage assessment modeling (ShakeMap, PAGER) and to model stress changes (Coulomb stress modeling) on the active fault and/or adjacent faults.

A 2018 EARTH SYSTEMS PACIFIC GEOTECHNICAL ENGINEERING REPORT

GEOTECHNICAL ENGINEERING REPORT
OXNARD HIGH SCHOOL NO. 8

PROJECT: OXNARD HIGH SCHOOL NO. 8
NORTHEAST OF CAMINO DEL SOL AND NORTH ROSE AVENUE
OXNARD, CALIFORNIA

SUBJECT: Geotechnical Engineering Report

REF: Proposal to Provide a Geotechnical Engineering Report, Oxnard High School No. 8, Northeast of Camino Del Sol and North Rose Avenue, Oxnard, California by Earth Systems Pacific, dated June 27, 2018, Doc. No. 1806-063.PRP

Dear Mr. Steele:

In accordance with the authorization of the above-referenced proposal, this geotechnical engineering report has been prepared for use in the development of plans and specifications for the Oxnard High School No. 8 project. The school campus is located northeast of Camino Del Sol and North Rose Avenue in the City of Oxnard, California. Preliminary geotechnical recommendations for site preparation, grading, utility trenches, foundations, retaining walls, slabs-on-grade and exterior flatwork, pavement sections, drainage and maintenance, and construction observation and testing are presented herein. Two bound copies and an electronic copy of this report are being furnished for your use.

We appreciate the opportunity to have provided services for this project and look forward to working with you again in the future. If there are any questions concerning this report, please do not hesitate to contact the undersigned.

Sincerely,

Earth Systems Pacific

Doug Dunham

Doug Dunham, GE
Associate Engineer

1.0 INTRODUCTION

Oxnard High School No. 8 is planned northeast of Camino Del Sol and North Rose Avenue in the City of Oxnard, California. The school campus is referred to herein as "the site." The site is shown on the Exploration Location Map presented in Appendix A.

We understand it is planned to construct the following buildings/structures, athletic facilities, and surface improvements.

Buildings/Structures

Buildings/Structures	Building/Structure Footprint (feet^2)	Number of Stories
Locker Room/Gymnasium	45,730	2
Performing Arts	26,500	2
Media/Administration	14,575	1
Shops 1	14,025	2
Shops 2	11,160	1
Academic Labs	17,400	2
Kitchen/Multipurpose Room	17,770	1
Academic Classroom 1	5,380	2
Academic Classroom 2	5,690	2
Academic Classroom 3	14,470	2
Daycare	2,900	1
Stadium Restroom 1	1,600	1
Stadium Restroom 2	1,600	1
Home Bleachers	15,175	n/a
Visitor Bleachers	7,500	n/a

Athletic Facilities

Sports Facilities	Facility Footprint (feet^2)	Surface Covering
Track/Football Field	159,031	Turf
Varsity Baseball Field	135,347	Turf
Junior Varsity Baseball Field	113,034	Turf
Varsity Softball Field	55,259	Turf
Junior Varsity Softball Field	53,695	Turf
Soccer Field	182,831	Turf
Basketball Courts	52,960	Paved
Tennis Courts	43,590	Paved

Surface Improvements

Parking Lots	Parking Lot Footprint (feet^2)	Number of Parking Spaces
Staff	180,088	318
Student	123,300	305
Visitor	3,230	18
Northeast Joint Use	33,115	89
Northwest Joint Use	46,810	76

As the project is in its preliminary design stages, we have assumed that: 1) the buildings/structures depending on size and usage will be of wood-frame, of steel-frame, of masonry, of Portland cement concrete (PCC) construction materials, or combinations thereof; 2) the buildings/structures will utilize PCC slabs-on-grade; 3) masonry or PCC retaining walls for site work but not forming part of a building and less than 6 feet in height may also be constructed; and 4) maximum line and point loads will be on the order of 4 kips/foot and 60 kips, respectively.

We have assumed surface improvements will consist of hot mix asphalt (HMA) and/or PCC pavement placed on aggregate base (AB) for vehicle use, and PCC flatwork placed on AB or compacted soils for pedestrian use. Subsurface improvements are assumed to be the underground municipal sewer, water, storm drain, power, and communication conduits that will provide utility service to the project. No on-site effluent disposal systems for sewage or Low Impact Development (LID) drainage improvements for runoff infiltration and/or filtering have been identified as part of the project; therefore, these items are not addressed within this report.

We have assumed the site will be mass graded to develop the building and surface improvement areas, to improve access, and to improve drainage. Due to the relatively level to very gently sloping topography at the site, grading cuts and fills are anticipated to be minimal to develop final grades; no slopes are anticipated.

2.0 SCOPE OF SERVICES

The scope of work for the geotechnical engineering report included a general site reconnaissance, subsurface exploration, laboratory testing of selected soil samples, geotechnical analysis of data, and preparation of this report. The analysis and subsequent recommendations were based, in part, upon information provided by the client.

This report and preliminary geotechnical recommendations are intended to comply with the considerations of the California Building Code (CBC) Sections 1803A.1 through 1803A.6, J104.3 and J104.4 (CBSCa, 2016), as applicable; the California Geological Survey (CGS) Note 48 (CGS, 2013); the California Code of Regulations Title 24 (CBSCb, 2016); and common geotechnical engineering practice in this area under similar conditions at this time. The test procedures were accomplished in general conformance with the standards noted, as modified by common geotechnical engineering practice in this area under similar conditions at this time.

Preliminary geotechnical recommendations for site preparation, grading, utility trenches, foundations, retaining walls, slabs-on-grade and exterior flatwork, pavement sections, drainage and maintenance, and construction observation and testing are presented to guide the development of project plans and specifications. It is our intent that this report be used exclusively by the client to form the geotechnical basis of the design of the project and in the preparation of plans and specifications. Application beyond this intent is strictly at the user's risk. If future parties wish to use this report, such use may be allowed to the extent the report is applicable, only if the user agrees to be bound by the same contractual conditions as the original client, or contractual conditions that may be applicable at the time of the report use.

This report does not address issues in the domain of contractors such as, but not limited to, site safety, loss of volume due to stripping of the site, shrinkage of soils during compaction, dewatering, temporary slope angles, construction means and methods, etc. Analyses of the

soil for asbestos (either man-made or naturally occurring), radioisotopes, mold or other microbial content, hydrocarbons, lead, and/or other chemical properties (except for geotechnical corrosivity) are beyond the scope of this report. Ancillary features such as temporary access roads, fencing, flag and light poles, signage, LID drainage improvements, effluent disposal systems; and nonstructural fills and slopes are not within our scope and are also not addressed.

As there may be unresolved geotechnical issues with respect to this project, the geotechnical engineer should be retained to provide consultation as the design progresses, and to review project plans as they near completion to assist in verifying that pertinent geotechnical issues have been addressed and to aid in conformance with the intent of this report. In the event that there are any changes in the nature, design, or location of improvements, or if any assumptions used in the preparation of this report prove to be incorrect, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and the conclusions of this report are verified or modified by the geotechnical engineer in writing. The criteria presented in this report are considered preliminary until such time as any peer review or review by any jurisdiction has been completed, conditions are observed by the geotechnical engineer in the field during construction, and the recommendations have been verified as appropriate or are modified by the geotechnical engineer in writing.

3.0 SITE SETTING

The site is located northeast of the intersection of Camino Del Sol and North Rose Avenue within the northeast sector of the City of Oxnard, California. The site is currently accessed off of Camino Del Sol. The approximate central coordinates and elevation from the Google Earth website (Google, 2018) where a majority of the campus buildings are currently planned are latitude 34.2077 degrees north, longitude 119.1554 degrees west, and 56 feet.

At the writing of this report, the site is being utilized for agriculture purposes; however, it was temporarily devoid of vegetation during our subsurface exploration program due to the crop rotation process. Surface and subsurface improvements associated with the agriculture operations exist within the site. Topographically, the site is relatively level to very gently sloping. Drainage is by sheet flow to south-southwest.

4.0 FIELD INVESTIGATION AND LABORATORY ANALYSIS

On April 10, 2018 and between July 16 to 26, 2018, fifty-three exploratory borings were drilled at the site to depths ranging from approximately 10 to 51.5 feet below the existing ground surface. The borings were drilled with a Mobile Drill Model B-53 drill rig, equipped with 6-inch outside diameter hollow stem auger and an automatic trip hammer for sampling. On April 20, 2018 and July 16, 2018, ten cone penetrometer test (CPT) soundings were also performed at the site. The CPT soundings were advanced to depths ranging from approximately 11 to 60 feet below the existing ground surface. Three of the CPT soundings met refusal at relatively shallow depths; therefore, those soundings are not included within this report. We have only included and analyzed the CPT soundings that extend to depths of approximately 45 feet or deeper below the existing ground surface. The approximate locations of the borings and CPT soundings are shown on the Exploration Location Map presented in Appendix A.

Soils encountered in the exploratory borings were categorized and logged in general accordance with the Unified Soil Classification System and ASTM D2488-17. Copies of the boring logs and a Boring Log Legend are included in Appendix A. In reviewing the boring logs and legend, the reader should recognize that the legend is intended as a guideline only, and there are a number of conditions that may influence the soil characteristics as observed during drilling. These include, but are not limited to, the presence of cobbles or boulders, cementation, variations in soil moisture, presence of groundwater, and other factors.

Consequently, the logger must exercise judgment in interpreting the subsurface characteristics, possibly resulting in descriptions that vary somewhat from the legend.

The CPT soundings were conducted in general accordance with ASTM D5778-12 and D3441-16 using an electric cone penetrometer. Copies of the graphical CPT data can also be found in Appendix A.

As the exploratory borings were drilled, soil samples were obtained using a ring-lined barrel sampler (ASTM D3550-17, with shoe similar to D2937-17) and Standard Penetration Tests (SPT) were conducted at selected depths within the borings (ASTM D1586-11). Bulk soil samples were also obtained from the auger cuttings.

Ring samples were tested for bulk density per ASTM D2937-17 (modified for ring liners). Four bulk samples were tested for maximum density and optimum moisture content (ASTM D1557-12). Direct shear tests (ASTM D3080/D3080M-11) were conducted on the same four bulk samples after they were remolded to approximately 90 percent of maximum dry density. Six one-dimensional consolidation tests (ASTM D2435/D2435M-11) were performed on ring samples. Particle size tests (ASTM D422-63/07 and D1140-17) were conducted on fourteen bulk and ring samples. The expansion index (ASTM D4829-11) was determined for one bulk sample. For use in the development of pavement design criteria, two bulk samples were tested for R-value (ASTM D2844/D2844M-13). Four bulk samples were also sent to Cerco Analytical of Concord, California for use in preparing a corrosion evaluation report. The evaluation and associated test results are for use by the architect/engineer in determining appropriate corrosion mitigation measures. The laboratory test results and the corrosion evaluation report prepared by Cerco Analytical are presented in Appendices B and C, respectively.

Sampler Blow Counts in Granular Alluvial Soils

The majority of the alluvial soils observed in the borings were generally classified as sands, and some of the sand layers had variable amounts of rocks (from 0 to approximately 17 percent) that ranged from fine gravel to cobble in size. Where these sand soils were below the existing groundwater elevations, flow sands were encountered at isolated depths in some of the deeper borings. These conditions can have an influence on the sampler blow counts.

Using our knowledge of the subsurface conditions in Oxnard, we implemented a drilling and sample acquisition monitoring program with respect to addressing the influence that rocks and flow sands could have on the sampler blow counts. All drilling and sampling operations were closely monitored. We further utilized drilling fluid in the deeper borings below the groundwater surface to reduce the potential for flow sands to intrude into the bottom of the hollow stem drill auger. The specific depths where the sampler blow counts appeared to be comprised by rocks or by flow sands are noted within the boring logs. Because of the potential uncertainties of some of the sampler blow counts, we exclusively used the CPT data for estimating the magnitude of liquefaction and seismically induced settlement of dry sand presented later in this report.

5.0 GENERAL SUBSURFACE PROFILE

The general subsurface profile observed in the borings consisted of layered alluvial sand soils with varying amounts of silt and clay. The only exceptions were relatively thin isolated silt and clay soil layers encountered at various elevations within several of the borings. The sand soils were in a slightly moist to wet condition with a loose to dense consistency. The silt and clay soils were moist to wet and very soft to very stiff. Several of the sand soil layers also had varying amounts of fine to coarse gravel and cobbles. Subsurface water was encountered between the depths of approximately 20 to 25 feet below the existing ground surface in the deeper borings. Please refer to the boring logs and graphical CPT data for a more complete description of the subsurface conditions. It should be noted that the CPT soil behavior data

correlated fairly well to the soil conditions observed in the deeper borings drilled in close proximity to each of the CPT Soundings. Based on the subsurface soil profile described above, the Site Class per Chapter 20 Table 20.3-1 (ASCE, 2013) is "D", a "Stiff Soil Profile".

6.0 CONCLUSIONS

In our opinion, the site is suitable, from a geotechnical engineering standpoint, for the planned buildings/structures and improvements as described in the "Introduction" section of this report, provided the recommendations contained herein are implemented in the design and construction. The upper site soils were tested and found to be generally nonexpansive; therefore, no special measures with respect to expansive soils are considered necessary. Assuming the site is designed and prepared in accordance with the "Preliminary Geotechnical Recommendations" section of this report, the buildings and other ancillary structures may be supported by shallow conventional continuous and spread (pad) footings, and structures such as stadium light standards, scoreboards, etc. may alternatively be supported by deeper cast-in-drilled-hole (CIDH) piles.

The primary geotechnical engineering concerns at the site are the potential for settlement, the excavation characteristics of the soils, the suitability of the soils for use as fill and backfill, the stability of the soils during grading, the corrosive nature of the soils, the erodible nature of the soils, and the potential for liquefaction and seismically induced settlement of dry sand.

Settlement Potential

Settlement (total and differential) can occur when foundations and surface improvements span soil materials having variable moisture and density characteristics. Such a situation could stress and possibly damage foundations and surface improvements, often resulting in severe cracks and displacement. To reduce this settlement potential, it is necessary for all foundations and surface improvements to bear on material that is as uniform as practicable. A program of overexcavation, scarification, moisture conditioning, and compaction of the

upper soils in the building and the surface improvement areas is recommended to provide more uniform soil moisture and density, and appropriate support.

Excavation Characteristics

The site soils are anticipated to be readily excavatable with conventional earthmoving equipment; however, the stability of excavations is a concern. Additionally, various size rocks were noted within some of the soil layers. Based on our preliminary testing, the soils are considered to be "Type C" per the 2007 Cal/OSHA classification system. This classification should be verified by the contractor's "Competent Person" at the time of construction. Excavation sloping and shoring will be needed to safely work in and to restrict the size of the excavations, and to reduce the potential for falling rock hazards. As with all construction safety issues, the methods of excavation stabilization, sloping, and/or shoring are ultimately the responsibility of the contractor.

Suitability of the Soils for Use as Fill and Backfill

We anticipate that the majority, if not all, of the soils excavated at the site will be acceptable from a geotechnical viewpoint for reuse as compacted fill and backfill. However, special requirements for utility trench bedding and shading per the specifications of the City of Oxnard, the conduit manufacturer, and the utility companies should be anticipated.

Stability of the Soils During Grading

The site soils may be susceptible to temporary high soil moisture contents, especially during or soon after the rainy season. Attempting to compact the soils in an overly moist condition may create unstable conditions in the form of pumping, yielding, shearing, and/or rutting. These conditions will not allow proper compaction and are inappropriate for continued fill placement. Therefore, the construction schedule should allow adequate time during grading for aerating and drying the soils to near optimum moisture content prior to compaction. If

unstable conditions occur, the geotechnical engineer should be consulted to provide recommendations for correction of the conditions.

Corrosive Soils

Based on the testing performed by Cerco Analytical, the upper site soils were classified as "corrosive" to certain construction materials that will be in contact with the soils. The architect/engineer should refer to the Cerco Analytical report presented in Appendix C for use in determining appropriate mitigation measures for the soil's corrosivity.

Soil Erosion

The site soils are considered to be highly erodible. Stabilization of surface soils, particularly those disturbed during construction, by vegetation or other means *during* and *following* construction is essential to reduce the potential of erosion damage. Care should be taken to establish and maintain proper drainage around the structures and improvements.

Liquefaction and Seismically Induced Settlement of Dry Sand

Liquefaction is the loss of soil strength caused by a significant seismic event. It occurs primarily in loose, fine to medium-grained sands, and in very soft to medium stiff silts that are saturated by groundwater. During a major earthquake, the saturated sands and silts tend to compress and the void spaces between the soil particles that are filled with water decrease in volume. This causes the pore water pressure to build up in the soils. Then if the water does drain away rapidly, the soils may lose their strength and transition into a liquefied state.

Seismically induced settlement of dry sand is also caused by a significant seismic event which could occur in lower density sand and silt soils that are not saturated by groundwater. During a major earthquake, the air void spaces between the unsaturated soil particles tend to compress which translates to a decrease in volume or settlement.

In order to assess the potential for liquefaction and seismically induced settlement of dry sand to occur at the site, we reviewed the boring data and utilized methods suggested by the Guidelines for Evaluating and Mitigating Seismic Hazards in California, Special Publication 117a (CDMG, 2008). Considering the presence of groundwater in the upper 50 feet of soil (measured at 20 to 25 feet below the existing ground surface) and the density of sand and silt soils, there appears to be a potential for both liquefaction and seismically induced settlement of dry sand to occur at the site.

To further understand the effects of liquefaction, we performed analyses of the CPT data using the site-specific PGA of 0.969g (provided by the client from their site specific ground motion analysis), an earthquake modal magnitude of 6.77 (USGS, 2018), an assumed historical high groundwater depth of 8 feet below the existing ground surface (provided by the client), and the approximate existing groundwater depth of approximately 20 feet below the existing ground surface. Based on the analyses presented in Appendix D, it appears liquefaction occurs in relatively thin discontinuous soil layers. Total liquefaction induced dynamic settlement assuming a groundwater depth of 8 feet ranged between 0.2 to 1.2 inches, and 0.1 to 0.6 inches for a groundwater depth of 20 feet. The summary of the liquefaction induced dynamic settlement is shown on the Tables below.

As part of the liquefaction evaluation, seismically induced settlement of dry sand was also analyzed. To perform those analyses, we utilized a reduced or modified PGA value of 2/3 (0.969g) = 0.646g. Additionally, the upper 30 inches of soil were neglected in the analyses. The reasoning being that the upper 2 to 3 feet of the surface soils had been recently ripped and plowed as part of the on-going agriculture operations at the site, and these soils will ultimately be removed and replaced as moisture conditioned compacted fill as part of future site development as recommended later in the “Grading” section of this report. Total seismically induced settlement of dry sand assuming a groundwater depth of 8 feet ranged between 0 to 0.2 inches, and 0.1 to 0.2 inches for a groundwater depth of 20 feet. The

summary of seismically induced settlement of dry sand calculated is shown on the Tables below.

Groundwater at 8 feet

CPT Number	Total Liquefiable Thickness (feet)	Dynamic Settlement (inches)	Dry Sand Settlement (inches)	Total Seismic Settlement (inches)
1	1.6	0.2	0.1	0.3
2A	3.8	0.6	0.1	0.7
3	2.3	0.3	0	0.3
4	7.2	1.2	0	1.2
5	5.7	0.8	0.1	0.9
6A	2.1	0.3	0.1	0.4
7	3.1	0.4	0.2	0.6

Groundwater at 20 feet

CPT Number	Total Liquefiable Thickness (feet)	Dynamic Settlement (inches)	Dry Sand Settlement (inches)	Total Seismic Settlement (inches)
1	1.1	0.1	0.1	0.2
2A	3.8	0.6	0.2	0.8
3	2.3	0.3	0.1	0.4
4	3.8	0.5	0.2	0.7
5	1.8	0.2	0.2	0.4
6A	2.1	0.3	0.1	0.4
7	1.3	0.1	0.2	0.3

In summary, total and differential settlement attributed to liquefaction induced dynamic settlement in conjunction with seismically induced settlement of dry sand is not anticipated to exceed 1.5 inches and 0.75 inches, respectively.

Based on the results of the liquefaction analysis, the potential for loss of soil bearing strength and lateral spreading was determined to be very low. The assessment for loss of soil bearing strength was developed by comparing the thickness of the overlying non-liquefiable soils with respect to the depth, the relatively thin thickness, and the discontinuous nature of the

underlying liquefiable soils. Lateral spreading can occur when a soil mass either slides laterally on liquefied soil layers towards a free slope face, or when a soil mass moves downslope on sloping ground. Since a free slope face does not exist within or near the site, we focused on the sloping ground aspect of lateral spreading. Based on the Google Earth website (Google, 2018), the site slopes at approximately 0.35 percent from the north to the south. The assessment for lateral spreading was developed by considering the relatively flat to very gently sloping ground surface with respect to the discontinuous nature of the underlying liquefiable soils. The conditions needed for lateral spreading to occur do not appear to exist at the site.

Based on the information presented above, it is our opinion that no special measures will be needed to protect the structures and improvements from either liquefaction or seismically induced settlement of dry sand.

7.0 PRELIMINARY GEOTECHNICAL RECOMMENDATIONS

The following preliminary geotechnical recommendations are applicable to the planned buildings/structures and improvements as described in the "Introduction" section of this report and assume that all floors will be above grade. If taller buildings, basements, or other features are incorporated into site development, this firm should be contacted for individual assessment.

Definitions

Unless otherwise noted, the following definitions are used in these recommendations. Where specific terms are not defined, common definitions used in the construction industry are intended.

- **Building Area:** The area within and extending a minimum of 5 feet beyond the perimeter of the foundations for a structure. The building area also includes the

foundation areas (plus 5 feet to each side) of any ancillary structure that will be rigidly attached to the main structure and is expected to perform in the same manner as the main structure. Such structures could include staircases, covered walkways, covered work areas, patio covers, arbors, etc.

- **Surface Improvement Area:** The area within and extending a minimum of 2 feet beyond the perimeter of the surface improvement.

- **Scarified**: Ripping the exposed soil surface in two orthogonal directions to a minimum depth of 12 inches.

- **Moisture Conditioning:** Adjusting the soil moisture to optimum moisture content or slightly above, prior to the application of compaction effort.

- **Compacted or Recompacted:** Soils placed in level lifts not exceeding 8 inches in loose thickness, and compacted to a minimum of 90 percent of maximum dry density. A minimum of 95 percent will be required in the upper 1-foot of subgrade below vehicle pavement and in all AB. The standard tests used to define maximum dry density and field density should be ASTM D1557-12 and ASTM D6938-17a, respectively, or by other methods acceptable to the geotechnical engineer and the governing jurisdiction.

Site Preparation

1. The existing ground surface in the building and surface improvements areas should be prepared for construction by removing existing improvements, vegetation, large roots, debris, and other deleterious material. *Any existing fill soils should be completely removed and replaced as compacted fill.* Any existing utilities that will not remain in service should be removed or properly abandoned. The appropriate

method of utility abandonment will depend upon the type and depth of the utility. Recommendations for abandonment can be made as necessary.

2. Voids created by the removal of materials or utilities, and extending below the recommended overexcavation depth, should be immediately called to the attention of the geotechnical engineer. No fill should be placed unless the geotechnical engineer has observed the underlying soil.

Grading

1. Following site preparation, the soils in the building area should be removed on a level plane to a depth of 4 feet below the bottom of the deepest foundation element or 6 feet below existing grade, *whichever is deeper*. During construction, locally deeper removals may be recommended based on field conditions. The resulting soil surface should then be scarified, moisture conditioned, and compacted prior to placing any fill soil.

2. Following site preparation, the soils in the surface improvement area should be removed to a minimum depth of 2 feet below subgrade or 3 feet below existing grade, *whichever is deeper*. During construction, locally deeper removals may be recommended based on field conditions. The resulting soil surface should then be scarified, moisture conditioned, and compacted prior to placing any fill soil.

3. Following site preparation, the soils in fill areas beyond the building and surface improvement areas should be removed to a depth of 3 feet below existing grade. During construction, locally deeper removals may be recommended based on field conditions. The resulting soil surface should then be scarified, moisture conditioned, and compacted prior to placing any fill soil.

4. Voids created by dislodging cobbles and/or debris during scarification should be backfilled and compacted, and the dislodged materials should be removed from the area of work.

5. On-site material and approved import materials may be used as general fill. All imported soil should be nonexpansive. Nonexpansive material is defined as being a coarse-grained soil (ASTM D2487-17) and having an expansion index of 10 or less (ASTM D4829-11). The proposed imported soils should be evaluated by the geotechnical engineer before being used, and on an intermittent basis during placement on the site.

6. All materials used as fill should be cleaned of any debris and rocks larger than 6 inches in diameter. No rocks larger than 3 inches in diameter should be used within the upper 3 feet of finish grade. When fill material includes rocks, the rocks should be placed in a sufficient soil matrix to ensure that voids caused by nesting of the rocks will not occur and that the fill can be properly compacted.

7. The on-site soils are estimated to shrink by approximately 15 to 20 percent when prepared and graded as recommended above.

Utility Trenches

1. Unless otherwise recommended, utility trenches adjacent to foundations should not be excavated within the zone of foundation influence, as shown on Typical Detail A presented in Appendix E.

2. Utilities that must pass beneath foundations should be placed with properly compacted utility trench backfill and the foundation should be designed to span the trench.

3. A select, noncorrosive, granular, easily compacted material should be used as bedding and shading immediately around utilities. Generally, the soil found at the site may be used for trench backfill above the select material.

4. Utility trench backfill should be moisture conditioned and compacted; however, a minimum compaction of 95 percent of maximum dry density in trench backfill in existing or future public roadway areas. A minimum of 95 percent of maximum dry density should also be obtained where trench backfill comprises the upper 1-foot of subgrade beneath vehicle pavement, and in all AB. A minimum of 85 percent of maximum dry density will generally be sufficient where trench backfill is located in landscaped or other unimproved areas where settlement of trench backfill would not be detrimental.

5. Jetting of trench backfill should generally not be allowed as a means of backfill densification. However, to aid in *encasing* utility conduits, particularly corrugated conduits and multiple closely spaced conduits in a single trench, jetting or flooding may be useful. Jetting or flooding should only be attempted with extreme caution, and any jetting or flooding operation should be subject to review by the geotechnical engineer.

6. The Corrosion Evaluation Report prepared by CERCO Analytical and presented in Appendix C should be used by the architect/engineer in specifying appropriate corrosion protection measures for the utility improvements.

7. The recommendations of this section are minimums only and may be superseded by the architect/engineer based upon the soil corrosivity, or the requirements of the pipe manufacturer, the utility companies, or the governing jurisdiction.

Foundations

Shallow Foundations

1. Shallow conventional continuous and spread footings bearing on soil compacted per the "Grading" section of this report may be used to support the buildings/structures. Grade beams should also be placed across all large entrances into the buildings/structures. Footings and grade beams should have a minimum depth of 18 inches below lowest adjacent grade, and footing and grade beam dimensions should also conform to the applicable requirements of CBC Section 1809A (CBSCa, 2016). All spread footings should be a minimum of 2 feet square. Grade beams should also interconnect with spread footings that are less than 3 feet by 3 feet in size on at least two sides. Footing and grade beamreinforcement should be in accordance with the requirements of the architect/engineer; minimum continuous footing and grade beam reinforcement should consist of two No. 4 rebar, one near the top and one near the bottom of the footing or grade beam.

2. Footings should be designed using a maximum allowable bearing capacity of 2,000 psf dead plus live load. The allowable bearing capacity may be increased by 200 psf for each additional 6 inches of embedment below a depth of 18 inches below lowest adjacent grade. The allowable bearing capacity should not exceed 3,000 psf dead plus live loads.

3. Rigid mat foundations should be designed using an allowable bearing capacity of 400 psf dead plus live load for loads distributed over the foundation footprint. They may also be designed using a modulus of subgrade reaction of 50 psi/inch.

4. Using the criteria in the previous two paragraphs, maximum total and differential settlement under static conditions are expected to be on the order of 0.75 inches and 0.25 inches in 40 feet, respectively. Foundations should also be designed to accommodate total and differential settlement due to liquefaction and seismically

induced settlement of dry sand of 1.5 inches and 0.75 inches across the largest building footprint dimension, respectively.

5. Lateral loads may be resisted by soil friction and by passive resistance of the soil acting on foundations. Lateral capacity is based on the assumption that backfill adjacent to foundations is properly compacted. A passive equivalent fluid pressure of 300 pcf and a coefficient of friction of 0.35 may be used in design. These are ultimate values as no factors of safety, load factors, and/or other factors have been applied to any of the values.

Deep Foundations

6. CIDH piles should have a minimum diameter of 24 inches, should have a minimum depth of 10 feet below lowest adjacent grade, and should not be constructed closer than three pile diameters (clear span) to each other without approval from the geotechnical engineer.

7. Allowable skin friction values for compression are shown on the Allowable Axial Capacity for CIDH Piles in Compression Chart presented in Appendix F and should be used for the soil; all end bearing capacity should be neglected. The allowable tension values may be determined using two-thirds of the compression values. Using these criteria, individual pile settlement should not exceed 0.5 inches, and differential settlement between the piles should not exceed 0.125 inches.

8. An ultimate passive equivalent fluid pressure of 300 pcf for soil should be used to determine the lateral capacity of the piles. This ultimate value may require application of appropriate factors of safety, load factors, and/or other factors as deemed appropriate by the architect/engineer.

9. The upper soils may not stand vertically during pile construction. Casing, drill fluid, or other means of keeping the holes open could be necessary.

10. Depending on the location and depth of the piles and the weather conditions at and preceding the time of construction, subsurface water could be encountered during pile drilling operations. Therefore, pile reinforcing should be designed to accommodate a minimum 5-inch diameter tremie pipe. Any water encountered should be removed from the hole prior to placing PCC, or the PCC should be tremied. The recommended Tremie Method is presented in Appendix F.

11. As the piles will utilize skin friction for support, it is not necessary to thoroughly clean the bottoms of the excavations, although excessive loose debris and slough material should be removed. As stated earlier, use of any end bearing capacity is not recommended.

12. PCC used in the piles should be placed at a slump between 4 and 6 inches in dry excavations and between 7 and 9 inches when placed under water.

13. The piles should not deviate from a plumb line taken from the center of the pile by more than 2 percent of the pile length, from the top to the point of interest. Adequate pile oversize may be assumed to provide required tolerance.

General Recommendations and Comments for Shallow and Deep Foundations

14. The allowable bearing and friction capacities may be increased by one-third when transient loads such as wind or seismicity are included. The foundations should be designed using the seismic parameters presented within the Tetra Tech, Inc. Engineering Geology report.

15. Due to the sandy soil conditions at the site, settlement is expected to occur over a very short period of time after the loads on the foundations are applied; long term settlements are not anticipated to be significant.

16. Foundation excavations should be observed by the geotechnical engineer prior to placement of reinforcing steel or any formwork. Foundation excavations should be thoroughly moistened prior to PCC placement and no desiccation cracks should be present.

17. The Corrosion Evaluation Report prepared by CERCO Analytical and presented in Appendix C should be used by the architect/engineer in specifying appropriate corrosion protection measures for all foundation elements.

Retaining Walls

1. All retaining wall foundations should be founded in soil compacted as recommended in the "Grading" section of this report and should be designed per the recommendations presented in the "Foundation" section of this report. It is assumed that retaining walls will not exceed 6 feet in height.

2. As we have assumed that retaining wall heights will not exceed a height of 6 feet, seismic design per CBC Section 1803A.5.12.1 (CBSCa, 2016) is not required. If retaining walls will retain more than 6 feet of soil, seismic design will be required by the geotechnical engineer.

3. Wall design should be based on the following parameters:

Active equivalent fluid pressure (native soils or imported sand or gravel backfill)	35 pcf
At-rest equivalent fluid pressure (native soils or imported sand or gravel backfill)	50 pcf
Passive equivalent fluid pressure (compacted fill)	300 pcf
Maximum toe pressure (compacted fill)	2,000 psf
Coefficient of sliding friction (compacted fill)	0.35

4. No surcharges are taken into consideration in the above values. The maximum toe pressure is an *allowable* value to which a factor of safety has been applied. No factors of safety, load factors, and/or other factors have been applied to any of the remaining values.

5. The above pressures are applicable to a horizontal retained surface behind the wall. Walls having a retained surface that slopes upward from the wall should be designed for an additional equivalent fluid pressure of 1 pcf for the active case and 1.5 pcf for the at-rest case, for every degree of slope inclination.

6. The active and at-rest values presented above are for drained conditions. Consequently, retaining walls should be drained with rigid perforated pipe encased in a free draining gravel blanket. The pipe should be placed perforations downward and should discharge in a nonerosive manner away from foundations and other improvements. The gravel blanket should have a width of approximately 1-foot and should extend upward to approximately 1-foot from the top of the wall. The upper foot should be backfilled with on-site soil, except in areas where a slab or pavement will abut the top of the wall. In such cases, the gravel backfill should extend up to the material that supports the slab or pavement. To reduce infiltration of the soil into the gravel, a permeable synthetic fabric conforming to the Standard Specifications Section 96-1.02B – Class "C," (Caltrans, 2015) should be placed between the two. Manufactured geocomposite wall drains conforming to the Standard Specifications Section 96-1.02C (Caltrans, 2015) are acceptable alternatives to the use of gravel, provided that they are installed in accordance with the recommendations of the manufacturer. Where drainage can be properly controlled, weep holes on maximum 4-foot centers may be used in lieu of perforated pipe. A filter fabric as described above should be placed between the weep holes and the drain gravel.

7. Retaining walls where moisture transmission through the wall would be undesirable should be *thoroughly* waterproofed in accordance with the specifications of the architect/engineer.

8. The architect/engineer should bear in mind that retaining walls by their nature are flexible structures, and that surface treatments on walls often crack. Where walls are to be plastered or otherwise have a finish applied, the flexibility should be considered in determining the suitability of the surfacing material, spacing of horizontal and vertical control joints, etc. The flexibility should also be considered where a retaining wall will abut or be connected to a rigid structure, and where the geometry of the wall is such that its flexibility will vary along its length.

Slabs-on-Grade and Exterior Flatwork

1. Conventional interior light duty PCC slabs-on-grade and exterior flatwork should have a minimum thickness of 4 full inches; however, the thickness of heavy duty slabs and flatwork should be specified by the architect/engineer. Conventional foundation slabs-on-grade should be doweled to footings and grade beams with dowels.

2. Reinforcement size, placement, and dowels should be as directed by the architect/engineer. Light duty exterior flatwork should be reinforced, at a minimum, with No. 3 rebar at 24 inches on-center each way. Heavy duty exterior flatwork should have minimum rebar sizing and spacing that meets the criteria of American Concrete Institute (ACI) 318, Section 7.12.2 (ACI, 2014). A modulus of subgrade reaction (K_{30}) of 50 psi/inch may be used in the design of heavy duty slabs-on-grade founded on compacted native soil. The modulus of subgrade reaction (K_{30}) may be increased to 150 psi/inch if the slab is underlain with a minimum of 6 inches of compacted Class 2 AB (Caltrans, 2015), and to 250 psi/inch if the slab is underlain with a minimum of 12 inches of compacted Class 2 AB.

3. Due to the current use of impermeable floor coverings, water-soluble flooring adhesives, and the speed at which buildings are now constructed, moisture vapor transmission through slabs is a much more common problem than in past years. Where moisture vapor transmitted from the underlying soil would be undesirable, the slabs should be protected from subsurface moisture vapor. A number of options for vapor protection are discussed below; however, the means of vapor protection, including the type and thickness of the vapor retarder, if specified, are left to the discretion of the architect/engineer.

4. Where specified, vapor retarders should conform to ASTM E1745-17. This standard specifies properties for three performance classes, Class "A", "B" and "C". The appropriate class should be selected based on the sensitivity of floor coverings to moisture intrusion and the potential for damage to the vapor retarder during placement of slab reinforcement and concrete.

5. Several recent studies, including those of ACI Document 302.1R-15 (ACI, 2015), have concluded that excess water above the vapor retarder increases the potential for moisture damage to floor coverings and could increase the potential for mold growth or other microbial contamination. The studies also concluded that it is preferable to eliminate the typical sand layer beneath the slab and place the slab concrete in direct contact with a Class "A" vapor retarder, particularly during wet weather construction. However, placing the concrete directly on the vapor retarder requires special attention to using the proper vapor retarder, a very low water-cement ratio in the concrete mix, and special finishing and curing techniques.

6. Probably the next most effective option would be the use of vapor-inhibiting admixtures in the slab concrete mix and/or application of a sealer to the surface of the slab. This would also require special concrete mixes and placement procedures, depending upon the recommendations of the admixture or sealer manufacturer.

7. Another option that may be a reasonable compromise between effectiveness and cost considerations is the use of a subslab vapor retarder protected by a sand layer, however this would increase the potential for moisture damage to floor coverings and for mold growth or other microbiological contamination. If a Class "A" vapor retarder is specified, the retarder can be placed directly on the material at pad grade. The retarder should be covered with a minimum 2 inches of clean sand. If a less durable vapor retarder is specified (Class "B" or "C"), a minimum of 4 inches of clean sand should be provided on top of the material at pad grade, and the retarder should be placed in the center of the clean sand layer. Clean sand is defined as well or poorly graded sand (ASTM D2487-17) of which less than 3 percent passes the No. 200 sieve. The site soils do not fulfill the criteria to be considered "clean" sand.

8. Regardless of the underslab vapor retarder selected, proper installation of the retarder is critical for optimum performance. All seams must be properly lapped, and all seams and utility penetrations properly sealed in accordance with the vapor retarder manufacturer's recommendations. Installation should conform to ASTM E1643-18a.

9. If sand is used between the vapor retarder and the slab, it should be moistened only as necessary to promote concrete curing; saturation of the sand should be avoided, as the excess moisture would be on top of the vapor retarder, potentially resulting in vapor transmission through the slab for months or years.

10. In conventional construction, it is common to use four to six inches of sand beneath exterior flatwork. Another measure that can be taken to reduce the risk of movement of flatwork is to provide thickened edges or grade beams around the perimeters of the flatwork. The thickened edges or grade beams could be up to 12 inches deep, with the deeper edges or grade beams providing better protection. At a minimum,

the thickened edge or grade beam should be reinforced by two No. 4 rebar, one near the top and one near the bottom.

11. Flatwork should be constructed with frequent joints to allow articulation as flatwork moves in response to seasonal moisture and/or temperature variations causing minor expansion and contraction of the soil, or variable bearing conditions. The soil in the subgrade should be moistened to at least optimum moisture content and no desiccation cracks should be present prior to casting the flatwork.

12. Where maintaining the elevation of the flatwork is desired, the flatwork should be doweled to the perimeter foundation as specified by the architect/engineer. In other areas, the flatwork may be doweled to the foundation or the flatwork may be allowed to "float free," at the discretion of the architect/engineer. Flatwork that is intended to float free should be separated from foundations by a felt joint or other means.

13. To reduce shrinkage cracks in PCC, the PCC aggregates should be of appropriate size and proportion, the water/cement ratio should be low, the PCC should be properly placed and finished, contraction joints should be installed, and the PCC should be properly cured. PCC materials, placement, and curing specifications should be at the direction of the architect/engineer. The Guide for Concrete Floor and Slab Construction (ACI, 2015) is suggested as a resource for the architect/engineer in preparing such specifications.

Pavement Sections

Two bulk samples were tested for R-value per ASTM D2488/D2488M-13. The two tests yielded R-values of 9 and 12. These R-value test results indicate that the upper site soils have a very low resistance to the types of loads imposed by traffic.

The following preliminary pavement structural sections are based on an average R-value of 10, and should be used for preliminary cost estimating purposes only. After the site soils are graded and placed up to near the subgrade elevation, the upper soils exposed within the access driveways and parking areas should then be tested for R-value to verify that these preliminary pavement structural sections are appropriate; otherwise, revised pavement sections should be prepared. Preliminary pavement structural sections are provided for Traffic Indices (TI) of 4.5, 5.0, 5.5, 6.0, 6.5, and 7.0. Determination of the appropriate TI for specific areas is left to others. The pavement sections were calculated in accordance with the Highway Design Manual (Caltrans, 2016). The calculated AB and HMA thickness are for compacted material. Normal Caltrans construction tolerances should apply.

Preliminary Pavement Structural Sections

R-value	TI	HMA (inches)	Class 2 AB (inches)
10	4.5	2.50	8.50
10	5.0	2.75	9.50
10	5.5	3.00	11.00
10	6.0	3.25	12.00
10	6.5	3.75	13.50
10	7.0	4.00	14.50

1. The upper 12 inches of subgrade and all AB should be compacted to a minimum of 95 percent of maximum dry density.

2. Subgrade and AB should be firm and unyielding when proof-rolled by heavy rubber-tired equipment prior to paving.

3. Where HMA will lie within 5 feet of landscape or drainage improvements, the HMA should be separated from these improvements by deepened curbs or other means that will reduce the potential for moisture fluctuations in the soils beneath the HMA and improve the stability of the curbs.

4. Finished HMA surfaces should slope toward drainage facilities such that rapid runoff will occur and no ponding is allowed on or adjacent to the HMA.

Drainage and Maintenance

1. Per CBC Section 1804A.4 (CBSCa, 2016) unpaved ground surfaces should be *finish graded* to direct surface runoff away from foundations and other improvements at a minimum 5 percent grade for a minimum distance of 10 feet. The site should be similarly sloped to drain away from foundations, and other improvements during construction. Where this is not practicable due to property lines, other structures or improvements, etc., swales with improved surfaces, area drains, or other drainage facilities, should be used to collect and discharge runoff.

2. The eaves of the new building/structure roofs should be fitted with gutters. Runoff from flatwork, roof gutters, downspouts, planter drains, area drains, etc. should discharge in a nonerosive manner away from foundations and other improvements in accordance with the requirements of the governing agencies. Erosion protection should be placed at all discharge points unless the discharge is on a pavement surface.

3. To reduce the potential for planter drainage gaining access to subslab areas, any raised planter boxes adjacent to foundations should be installed with drains and sealed sides and bottoms. Drains should also be provided for areas adjacent to the structure and in landscape areas that would not otherwise freely drain.

4. The site soils are highly erodible. If the soils are disturbed during construction, stabilization of the soils by vegetation or other means, *during* and *following* construction, is essential to reduce erosion damage. Care should be taken to establish and maintain vegetation. The landscaping should be planned and installed to maintain the surface drainage recommended above. Surface drainage should also be maintained during construction.

5. Maintenance of drainage improvements and other surface improvements is critical to the long-term stability of the site and the integrity of the buildings/structures. Site improvements should be maintained on a regular basis.

6. Finished flatwork surfaces should be sloped to freely drain toward appropriate drainage facilities. Water should not be allowed to stand or pond on or adjacent to exterior pedestrian flatwork, or other improvements as it could infiltrate into the AB and/or the subgrade soils, causing premature deterioration of pavement, flatwork, or other improvements. Any cracks that develop in the pavement and flatwork should be promptly sealed.

7. All exterior drains and drain outlets should be maintained to be free-flowing. Care should be taken to establish and maintain vegetation. Vegetation and erosion matting (if utilized) should be maintained or augmented as needed. Irrigation systems should be maintained so that soils around structures are maintained at a relatively uniform year-round moisture content, and are neither over-watered nor allowed to dry and desiccate.

8. The owner or site maintenance personnel should periodically observe the areas within and around the site for indications of rodent activity and soil instability. The owner or site maintenance personnel should also implement an aggressive program for controlling the rodent activity in the general area.

Construction Observation and Testing

1. It must be recognized that the recommendations contained in this report are based on a limited number of borings and CPT soundings, and rely on continuity of the subsurface conditions encountered. It is assumed that the geotechnical engineer will be retained to provide consultation during the design phase, to review final plans once

they are available, to interpret this report during construction, and to provide construction monitoring in the form of testing and observation.

2. At a minimum, the geotechnical engineer should be retained to provide:
    - Review of final grading, utility, and foundation plans
    - Professional observation during grading, foundation excavations, and trench backfill
    - Oversight of compaction testing during grading
    - Oversight of special inspection during grading

3. Special inspection of grading should be provided as per CBC Section 1705A.6 and CBC Table 1705A.6 (CBSCa, 2016). Deep foundation construction should be considered to fall under CBC Section 1705A.8 (CBSCa, 2016) "Cast-in-Place Deep Foundations." Special inspection of the installation of CIDH piles should be provided as per CBC Table 1705A.8 (CBSCa, 2016). The special inspector should be under the direction of the geotechnical engineer. In our opinion, all construction associated with the deep foundations should be subject to continuous special inspection. It is our opinion that none of the grading construction is of a nature that should warrant continuous special inspection; periodic special inspection should suffice. Subject to approval by the Building Official, the exception to continuous special inspection is described in CBC Section 1704A.2 (CBSCa, 2016) and should be specified by the architect/engineer and periodic special inspection of the following items should be provided by the special inspector.
    - Stripping and clearing of vegetation
    - Overexcavation to the recommended depths
    - Scarification, moisture conditioning, and compaction of the soil
    - Fill quality, placement, and compaction
    - Utility trench backfill
    - Retaining wall drains and backfill

- Foundation excavations
- Subgrade and AB compaction and proofrolling

4. A program of quality control should be developed prior to beginning grading. The contractor or project manager should determine any additional inspection items required by the architect/engineer or the governing jurisdiction.

5. Locations and frequency of compaction tests should be as per the recommendation of the geotechnical engineer at the time of construction. The recommended test location and frequency may be subject to modification by the geotechnical engineer, based upon soil and moisture conditions encountered, size and type of equipment used by the contractor, the general trend of the results of compaction tests, or other factors.

6. A preconstruction conference among the school district, the DSA project inspector, the geotechnical engineer, the City of Oxnard, the special inspector, the architect/engineer, and contractors is recommended to discuss planned construction procedures and quality control requirements.

7. The geotechnical engineer should be notified at least 48 hours prior to beginning construction operations. If Earth Systems Pacific is not retained to provide construction observation and testing services, it shall not be responsible for the interpretation of the information by others or any consequences arising therefrom.

8.0 CLOSURE

Our intent was to perform the investigation in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing in the locality of this project under similar conditions. No representation, warranty, or guarantee is either

expressed or implied. This report is intended for the exclusive use by the client as discussed in the “Scope of Services” section. Application beyond the stated intent is strictly at the user's risk.

This report is valid for conditions as they exist at this time for the type of project described herein. The conclusions and recommendations contained in this report could be rendered invalid, either in whole or in part, due to changes in building codes, regulations, standards of geotechnical or construction practice, changes in physical conditions, or the broadening of knowledge.

If changes with respect to the project become necessary, if items not addressed in this report are incorporated into plans, or if any of the assumptions used in the preparation of this report are not correct, this firm shall be notified for modifications to this report. Any items not specifically addressed in this report should comply with the CBC of other applicable standards, and the requirements of the governing jurisdiction.

The preliminary recommendations presented in this report are based upon the geotechnical conditions encountered at the site, and may be augmented by additional requirements of the client, or by additional recommendations provided by the geotechnical engineer based on peer or jurisdiction reviews, or conditions exposed at the time of construction.

This document, the data, conclusions, and recommendations contained herein are the property of Earth Systems Pacific. This report shall be used in its entirety, with no individual sections reproduced or used out of context. Copies may be made only by Earth Systems Pacific, the client, and the client’s authorized agents for use exclusively on the subject project. Any other use is subject to federal copyright laws and the written approval of Earth Systems Pacific.

Thank you for this opportunity to have been of service. If you have any questions, please feel free to contact this office at your convenience.

Santa Maria, CA 93454

Subject: Project No.: 301953-002
Project Name: Oxnard High School No.8, Oxnard, CA
Corrosivity Analysis – CalTrans Test Methods

Dear Mr. Dunham:

Pursuant to your request, CERCO Analytical has analyzed the soil samples submitted on August 08, 2018. Based on the analytical results, a brief corrosivity evaluation is enclosed for your consideration.

Based upon the resistivity measurements, all samples are classified as "corrosive". All buried iron, steel, cast iron, ductile iron, galvanized steel and dielectric coated steel or iron should be properly protected against corrosion depending upon the critical nature of the structure. All buried metallic pressure piping such as ductile iron firewater pipelines should be protected against corrosion.

The chloride ion concentrations ranged 23 to 47 mg/kg, and are determined to be insufficient to attack steel embedded in a concrete mortar coating.

The sulfate ion concentrations ranged from 340 to 1,500 mg/kg and are determined to be sufficient to damage reinforced concrete structures and cement mortar-coated steel at these locations. Therefore, concrete that comes into contact with this soil should use sulfate resistant cement such as Type II, in accordance with the California Building Code requirements with a maximum water-to-cement ratio of 0.50.

The pH of the soils ranged from 7.73 to 7.99, which does not present corrosion problems for buried iron, steel, mortar-coated steel and reinforced concrete structures.

This corrosivity evaluation is based on general corrosion engineering standards and is non-specific in nature. For specific long-term corrosion control design recommendations or consultation, please call *JDH Corrosion Consultants, Inc. at (925) 927-6630.*

We appreciate the opportunity of working with you on this project. If you have any questions, or if you require further information, please do not hesitate to contact us.

Very truly yours,
CERCO ANALYTICAL, INC.

J. Darby Howard, Jr., P.E.
President

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-2A
Plot: 2

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
3.8

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 8.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.17
Avg SF of Liquefiable Layers: 0.03

Probab	Total Induced Subsidence (inches)
Avg	
5%	
Max	
100%	0.6

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-3 Plot: 3

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
2.3

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 8.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.17
Avg SF of Liquefiable Layers: 0.02

Probab	Total Induced Subsidence (inches)

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-4
Plot: 4

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
7.2

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 8.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.18
Avg SF of Liquefiable Layers: 0.06

Probab Avg	Total Induced Subsidence (inches)
6%	Max
100%	1.2

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-5
Plot: 5

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
5.7

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 8.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.32
Avg SF of Liquefiable Layers: 0.06

Probab	Total Induced Subsidence (inches)
Avg	
4%	
Max	
98%	0.8

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA

Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-6A
Plot: 6

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
2.1

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.97	0.75
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	8.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0

Probab Avg	Total Induced Subsidence (inches)
3%	Required SF: 1.50
Max	Min SF of Liquefiable Layers: 0.27
99%	Avg SF of Liquefiable Layers: 0.02
	0.3

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA

Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-7
Plot: 7

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
3.1

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.97	0.75
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	8.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Required SF: 1.50
Unit Weight of saturated soils: 110 pcf
Min SF of Liquefiable Layers: 0.25
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Avg SF of Liquefiable Layers: 0.04

Probab	Total Induced Subsidence (inches)
Avg	2%
Max	99%
	0.4

Liquefaction Analysis – Groundwater at 20 feet

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-1
Plot: 1

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
1.1

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.97	0.75
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	20.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.63
Avg SF of Liquefiable Layers: 0.03

Probab	Total
Avg	Induced
1%	Subsidence

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-2A
Plot: 2

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
3.8

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.21
Avg SF of Liquefiable Layers: 0.05

Probab	Total Induced Subsidence (inches)
Avg	
5%	
Max	
100%	0.6

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-3
Plot: 3

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
2.3

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.97	0.75
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	20.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0

Probab	Total Induced Subsidence (inches)
Avg	4%
Max	100%
	0.3

Required SF: 1.50
Min SF of Liquefiable Layers: 0.23
Avg SF of Liquefiable Layers: 0.03

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-4
Plot: 4

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
3.8

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.24
Avg SF of Liquefiable Layers: 0.05

Probab	Total Induced Subsidence (inches)
Avg	3%
Max	99%
	0.5

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-5
Plot: 5

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
1.8

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.40
Avg SF of Liquefiable Layers: 0.03

Probab	Total Induced Subsidence (inches)

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-6A
Plot: 6

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
2.1

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.36
Avg SF of Liquefiable Layers: 0.03

Probab	Total Induced Subsidence (inches)
Avg	0
3%	0
Max	0
99%	0.3

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-7
Plot: 7

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
1.3

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.97 (0.75)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.33
Avg SF of Liquefiable Layers: 0.03

Probab	Total Induced Subsidence (inches)
Avg	0
1%	0
Max	0
97%	0.1

Seismically Induced Settlement of Dry Sand Analysis – Groundwater at 8 feet

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-1
Plot: 1

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.65	0.50
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	8.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR

Unit Weight of unsaturated soils: 100 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0

Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-2A
Plot: 2

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 8.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*$K\sigma$/CSR

Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 100 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total Induced Subsidence (inches)
Avg	
0%	
Max	
0%	0.1

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-3
Plot: 3

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.65	0.50
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	8.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 100 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total Induced Subsidence (inches)
Avg	
0%	
Max	
0%	0.0

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-4
Plot: 4

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 8.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 100 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total Induced Subsidence (inches)
Avg	0.0
0%	
Max	
0%	0.0

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-6A
Plot: 6

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 8.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 100 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-7
Plot: 7

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.65	0.50
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	8.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 100 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total Induced Subsidence (inches)

Seismically Induced Settlement of Dry Sand Analysis – Groundwater at 20 feet

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-1
Plot: 1

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.65	0.50
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	20.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total Induced Subsidence (inches)
Avg	0.1

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-2A
Plot: 2

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:

Magnitude:	6.77	7.5
PGA, g:	0.65	0.50
MSF:	1.30	
GWT, feet:	20.0	
Design GWT, feet:	20.0	

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab Avg 0%	Total Induced Subsidence (inches)
Max 0%	0.2

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-3
Plot: 3

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR

Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total Induced Subsidence (inches)

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-4
Plot: 4

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR

Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0

Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

Probab	Total Induced Subsidence (inches)

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-5
Plot: 5

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0
Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-6A
Plot: 6

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0

Probab Avg	Total Induced Subsidence (inches)
0%	Max
Required SF: 1.50	0.1
Min SF of Liquefiable Layers: 0.00	0%
Avg SF of Liquefiable Layers: 0.00

CPT-LIQUEFY.XLS - A SPREADSHEET FOR EMPIRICAL ESTIMATION OF LIQUEFACTION POTENTIAL USING CPT DATA
Developed 2003 by Shelton L. Stringer, GE, Earth Systems Southwest

Project: Oxnard High School No. 8
Job No: 301953-001
Date: 8/14/2018
Sounding: CPT-7
Plot: 7

Methods: Liquefaction Analysis using 1998 NCEER workshop methods (Robertson & Wride)
Post-liquefaction Settlement Analysis from Tokimatsu & Seed (1987)
Dry Sand Settlement by Pradel, ASCE Journal of G&GE, Vol 124, No. 4

Total Liquefied Thickness (feet)
0.0

EARTHQUAKE INFORMATION:
Magnitude: 6.77 (7.5)
PGA, g: 0.65 (0.50)
MSF: 1.30
GWT, feet: 20.0
Design GWT, feet: 20.0

Induced CSR (M=7.5): = 0.65*PGA*(po/p'o)*rd/MSF
Clean Sand Qc1n = C_Q*K_C*K_H*Qc
SF = $CRR_{7.5}$*Kσ/CSR
Use Tokimatsu & Seed (0) or Ishihara &Yoshmine (1): 0
Unit Weight of unsaturated soils: 110 pcf
Unit Weight of saturated soils: 110 pcf
Limiting Ic for liquefiable soils: 2.60
Limiting Ic for K_H: 2.0

Probab	Total Induced Subsidence (inches)
Avg	0%
Max	0%

Required SF: 1.50
Min SF of Liquefiable Layers: 0.00
Avg SF of Liquefiable Layers: 0.00

APPENDIX F

Allowable Axial Capacity for CIDH Piles in Compression Chart

Tremie Method

Oxnard High School No. 8

Allowable Axial Capacity for CIDH Piles in Compression

RECOMMENDED PROCEDURE FOR TREMIE-PLACED CONCRETE IN CAISSON (DRILLED SHAFT) FOUNDATION CONSTRUCTION

The following are general guidelines only, and may be subject to modification by the architect/engineer and/or geotechnical engineer.

1. Concrete should be placed in caisson excavations by means of a tremie when the depth of water in the excavation cannot be limited to a maximum of 2 inches, or when the freefall of the concrete would result in the concrete striking the rebar or excavation walls as it falls.

2. The concrete should be pumped to the tremie pipe or, a hopper with a tremie pipe attached should be used. An "elephant's trunk" should not be used to place concrete under water; however, an elephant's trunk may be used to direct the fall of the concrete in dry excavations. The elephant's trunk should be of sufficient length to prevent the concrete from striking the rebar or excavation walls as it falls.

3. Concrete for dry excavations should be designed for, and placed at, a slump of 4 to 6 inches. Concrete to be placed below water should be designed for, and placed at, a slump of 7 to 9 inches.

4. The tremie pipe should consist of rigid steel pipe with tight couplings. The tremie pipe should be 4 to 6 inches in diameter and should be longer than the deepest caisson excavation.

5. The tremie pipe should be lowered with caution through the center of the reinforcing to within 1 foot of the bottom of the excavation; the tremie should not be allowed to penetrate into the muck on the bottom of the hole

6. The pump hose and tremie pipe should be "slicked" with Portland cement slurry. No clay, bentonite, or other material should be used unless approved by the architect/engineer and geotechnical engineer.

7. Pumping of the concrete should begin immediately after the reinforcing and the tremie pipe have been placed in the excavation and the excavation has been inspected. The tremie pipe should not be raised until the concrete surface in the caisson excavation is at least 5 feet above the bottom of the tremie pipe. The bottom of the tremie pipe should then be kept at least 5 feet below the top of the concrete until the pour is completed.

8. The concrete should be pumped until all muck, laitance, and unsuitable concrete has been lifted above the top-of-caisson elevation. All muck, laitance, and unsuitable concrete should be immediately removed from the excavation.

9. Concrete poured at a 6-inch or greater slump should *not* be vibrated during the pour, unless directed by the architect/engineer. When vibration is required, it should *not* be started until the concrete pour is completed and the muck, laitance and unsuitable concrete have been removed. At a minimum, the upper 10 feet of the concrete should then be vibrated. Additional concrete may be added as necessary during vibration. The vibrator should not be allowed to contact the reinforcing.

10. During the pour, if the tremie pipe has to be removed from the concrete, (e.g., to allow removal of casing), it should be reset at the top of the concrete. The tremie should then be purged, as directed by the inspector, and then immediately lowered to at least 5 feet below the top of the concrete as the concrete is being pumped. All degraded concrete should be lifted with the continuing pour and removed from the top of the caisson.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

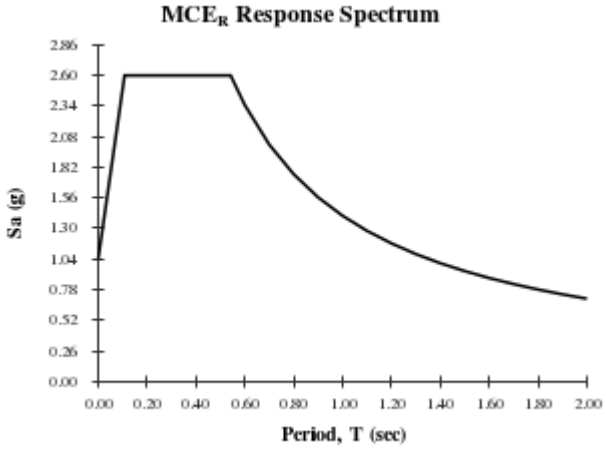
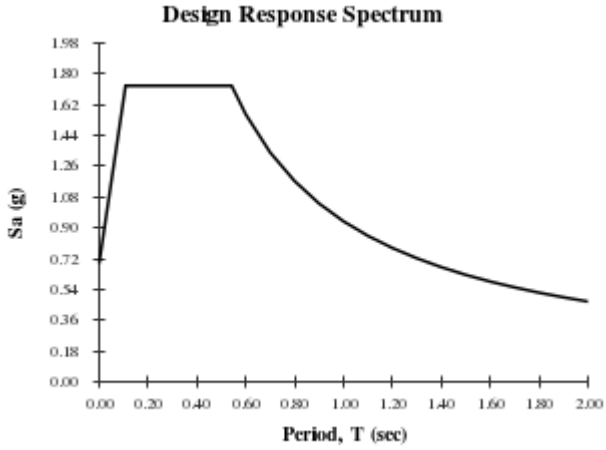
C USGS ANALYSES OUTPUT

USGS Design Maps Summary Report

User–Specified Input



Report Title	High School No. 8 Wed May 16, 2018 02:09:37 UTC
Building Code Reference Document	ASCE 7-10 Standard (which utilizes USGS hazard data available in 2008)
Site Coordinates	34.2077°N, 119.1554°W
Site Soil Classification	Site Class D – "Stiff Soil"
Risk Category	I/II/III



USGS–Provided Output

S_S =	2.596 g	S_{MS} =	2.596 g	S_{DS} =	1.731 g
S_1 =	0.938 g	S_{M1} =	1.407 g	S_{D1} =	0.938 g

For information on how the SS and S1 values above have been calculated from probabilistic (risk-targeted) and deterministic ground motions in the direction of maximum horizontal response, please return to the application and select the "2009 NEHRP" building code reference document.

For PGA_M, T_L, C_{RS}, and C_{R1} values, please view the detailed report.

Design Maps Detailed Report

ASCE 7-10 Standard (34.2077°N, 119.1554°W)

Site Class D – "Stiff Soil", Risk Category I/II/III

Section 11.4.1 — Mapped Acceleration Parameters

Note: Ground motion values provided below are for the direction of maximum horizontal spectral response acceleration. They have been converted from corresponding geometric mean ground motions computed by the USGS by applying factors of 1.1 (to obtain S_S) and 1.3 (to obtain S_1). Maps in the 2010 ASCE-7 Standard are provided for Site Class B. Adjustments for other Site Classes are made, as needed, in Section 11.4.3.

From Figure 22-1 [1]	S_S = 2.596 g
From Figure 22-2 [2]	S_1 = 0.938 g

Section 11.4.2 — Site Class

The authority having jurisdiction (not the USGS), site-specific geotechnical data, and/or the default has classified the site as Site Class D, based on the site soil properties in accordance with Chapter 20.

Table 20.3–1 Site Classification

Site Class	$\bar{v}_s$	$\bar{N}$ or $\bar{N}_{ch}$	$\bar{s}_u$
A. Hard Rock	>5,000 ft/s	N/A	N/A
B. Rock	2,500 to 5,000 ft/s	N/A	N/A
C. Very dense soil and soft rock	1,200 to 2,500 ft/s	>50	>2,000 psf
D. Stiff Soil	600 to 1,200 ft/s	15 to 50	1,000 to 2,000 psf
E. Soft clay soil	<600 ft/s	<15	<1,000 psf
	Any profile with more than 10 ft of soil having the characteristics: • Plasticity index PI > 20, • Moisture content w ≥ 40%, and • Undrained shear strength $\bar{s}_u$ < 500 psf		
F. Soils requiring site response analysis in accordance with Section 21.1	See Section 20.3.1		

For SI: 1ft/s = 0.3048 m/s 1lb/ft² = 0.0479 kN/m²

Section 11.4.3 — Site Coefficients and Risk–Targeted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration Parameters

Table 11.4–1: Site Coefficient F_a

Site Class	Mapped MCE $_R$ Spectral Response Acceleration Parameter at Short Period				
	$S_S \leq 0.25$	$S_S = 0.50$	$S_S = 0.75$	$S_S = 1.00$	$S_S \geq 1.25$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of S_S

For Site Class = D and S_s = 2.596 g, F_a = 1.000

Table 11.4–2: Site Coefficient F_v

Site Class	Mapped MCE $_R$ Spectral Response Acceleration Parameter at 1–s Period				
	$S_1 \leq 0.10$	$S_1 = 0.20$	$S_1 = 0.30$	$S_1 = 0.40$	$S_1 \geq 0.50$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.7	1.6	1.5	1.4	1.3
D	2.4	2.0	1.8	1.6	1.5
E	3.5	3.2	2.8	2.4	2.4
F	See Section 11.4.7 of ASCE 7				

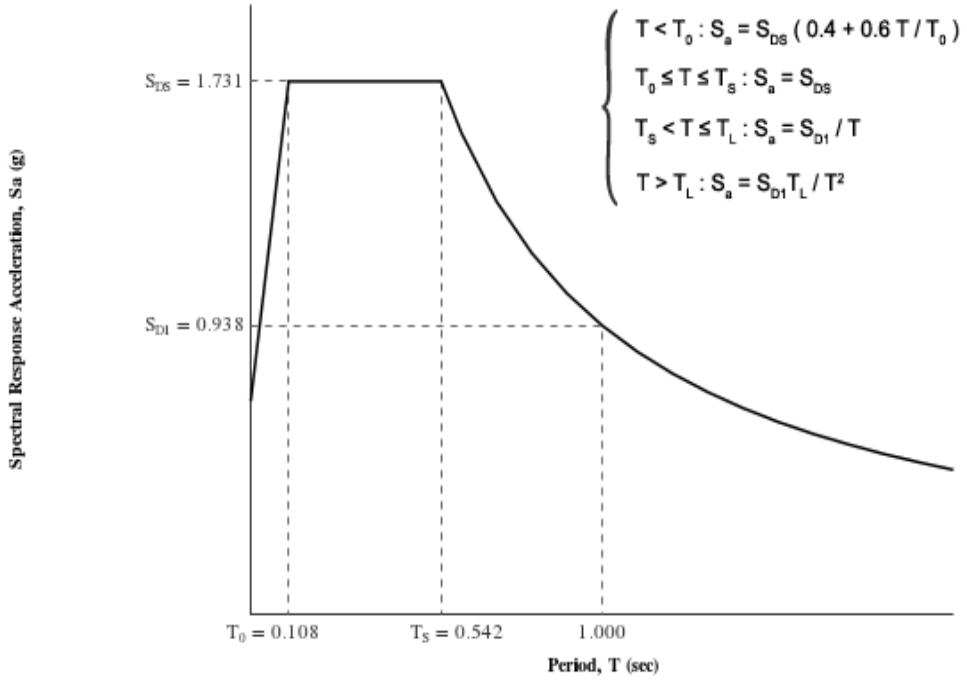
Note: Use straight–line interpolation for intermediate values of S_1

For Site Class = D and S_1 = 0.938 g, F_v = 1.500

Equation (11.4–1): $S_{MS} = F_a S_S = 1.000 \times 2.596 = 2.596$ g

Equation (11.4–2): $S_{M1} = F_v S_1 = 1.500 \times 0.938 = 1.407$ g

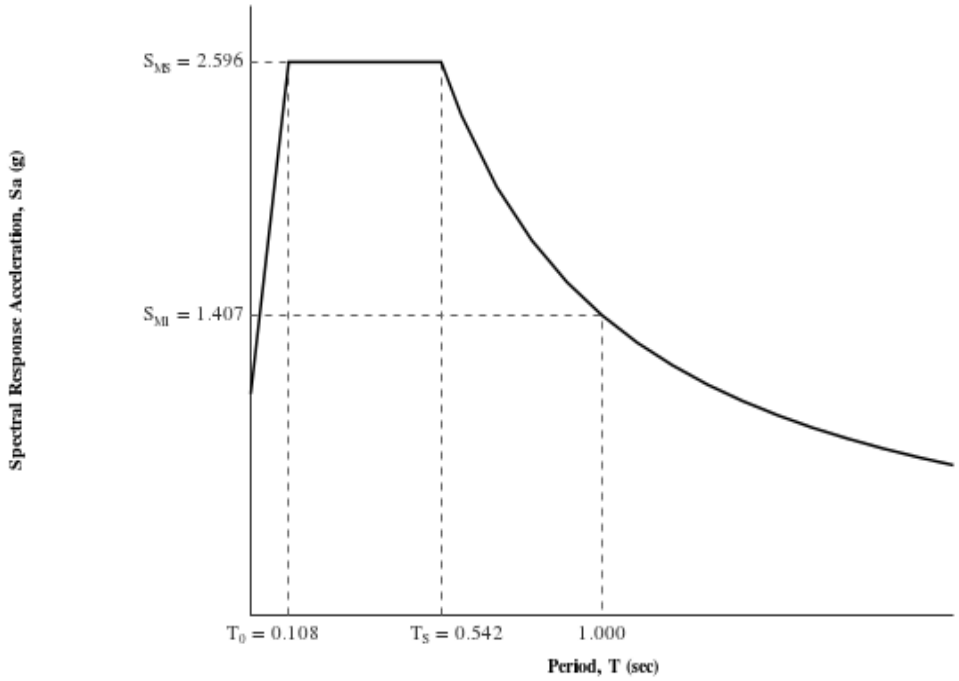
Section 11.4.4 — Design Spectral Acceleration Parameters



Equation (11.4–3): $S_{DS} = ⅔ S_{MS} = ⅔ \times 2.596 = 1.731$ g

Equation (11.4–4): $S_{D1} = ⅔ S_{M1} = ⅔ \times 1.407 = 0.938$ g

Section 11.4.5 — Design Response Spectrum



From Figure 22-12 [3] $T_L = 8$ seconds

Figure 11.4–1: Design Response Spectrum

Section 11.4.6 — Risk-Targeted Maximum Considered Earthquake (MCE_R) Response Spectrum

The MCE_R Response Spectrum is determined by multiplying the design response spectrum above by 1.5.

Section 11.8.3 — Additional Geotechnical Investigation Report Requirements for Seismic Design Categories D through F

From Figure 22-7 [4] PGA = 1.020

Equation (11.8–1): $PGA_M = F_{PGA}PGA = 1.000 \times 1.020 = 1.02$ g

Table 11.8–1: Site Coefficient F_{PGA}

Site Class	Mapped MCE Geometric Mean Peak Ground Acceleration, PGA				
	PGA ≤ 0.10	PGA = 0.20	PGA = 0.30	PGA = 0.40	PGA ≥ 0.50
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of PGA

For Site Class = D and PGA = 1.020 g, F_{PGA} = 1.000

Section 21.2.1.1 — Method 1 (from Chapter 21 – Site-Specific Ground Motion Procedures for Seismic Design)

From Figure 22-17 [5] C_{RS} = 0.910

From Figure 22-18 [6] C_{R1} = 0.909

Section 11.6 — Seismic Design Category

Table 11.6-1 Seismic Design Category Based on Short Period Response Acceleration Parameter

VALUE OF S_{DS}	RISK CATEGORY		
	I or II	III	IV
$S_{DS} < 0.167g$	A	A	A
$0.167g \le S_{DS} < 0.33g$	B	B	C
$0.33g \le S_{DS} < 0.50g$	C	C	D
$0.50g \le S_{DS}$	D	D	D

For Risk Category = I and S_{DS} = 1.731 g, Seismic Design Category = D

Table 11.6-2 Seismic Design Category Based on 1-S Period Response Acceleration Parameter

VALUE OF S_{D1}	RISK CATEGORY		
	I or II	III	IV
$S_{D1} < 0.067g$	A	A	A
$0.067g \le S_{D1} < 0.133g$	B	B	C
$0.133g \le S_{D1} < 0.20g$	C	C	D
$0.20g \le S_{D1}$	D	D	D

For Risk Category = I and S_{D1} = 0.938 g, Seismic Design Category = D

Note: When S_1 is greater than or equal to 0.75g, the Seismic Design Category is **E** for buildings in Risk Categories I, II, and III, and **F** for those in Risk Category IV, irrespective of the above.

Seismic Design Category ≡ "the more severe design category in accordance with Table 11.6-1 or 11.6-2" = E

Note: See Section 11.6 for alternative approaches to calculating Seismic Design Category.

U.S. Geological Survey - Earthquake Hazards Program

Unified Hazard Tool

Please do not use this tool to obtain ground motion parameter values for the design code reference documents covered by the U.S. Seismic Design Maps web tools (e.g., the International Building Code and the ASCE 7 or 41 Standard). The values returned by the two applications are not identical.

Subject: **Third Engineering Geology and Seismology Review for Oxnard Union High School District – New High School No. 8 North Rose Avenue and Camino Del Sol, Oxnard, CA CGS Application No. 03-CGS3810**

Dear Mr. Weinstein:

In accordance with your request and transmittal of documents received on January 18, May 16, and May 31, 2019, the California Geological Survey has reviewed the engineering geology and seismology aspects of the consulting reports prepared for the Oxnard Union High School District. It is our understanding this project involves construction of a new high school campus. This review was performed in accordance with Title 24, California Code of Regulations, 2016 California Building Code (CBC) and followed CGS Note 48 guidelines. We reviewed the following report:

> **Second Addendum Report, Geohazard Assessment/Geotechnical Investigation, High School No. 8, APN 214-002-059 on North Rose Avenue, Oxnard, California:** Earth Systems Pacific, 2049 Preisker Lane, Suite E, Santa Maria, California 93454; company Project No. 301953-002, response dated May 31, 2019, 10 pages, 2 tables, 6 figures, 3 appendices.

In addition, we previously reviewed the following reports:

> **Geotechnical Engineering Report, Oxnard High School No. 8, Northeast of Camino Del Sol and North Rose Avenue, Oxnard, California:** Earth Systems Pacific, 2049 Preisker Lane, Suite E, Santa Maria, California 93454; company Project No. 301953-002, report dated August 31, 2018, 10 pages, 6 appendices.
>
> **Geohazard Assessment/Geotechnical Investigation, High School No. 8, APN 214-002-059 on North Rose Avenue, Oxnard, California:** Tetra Tech, Inc., 5383 Hollister Avenue, Suite 130, Santa Barbara, California 93111; company Project No. 100-SBA-T38628, report dated October 11, 2018, 34 pages, 10 figures, 3 tables, 3 appendices.
>
> **Foundation Recommendations in the Geohazard Assessment/Geotechnical Investigation High School No. 8, APN 214-002-059 on North Rose Avenue, Oxnard, California:** Tetra Tech, Inc., 5383 Hollister Avenue, Suite 130, Santa Barbara, California 93111; company Project No. 100-SBA-T38628, report dated December 12, 2018, 1 page.

Addendum Report, Geohazard Assessment/Geotechnical Investigation, High School No. 8, APN 214-002-059 on North Rose Avenue, Oxnard, California: Earth Systems Pacific, 2049 Preisker Lane, Suite E, Santa Maria, California 93454; company Project No. 301953-002, response dated May 15, 2019, 10 pages, 2 tables, 6 figures, 3 appendices.

CGS previously reviewed and submitted our findings regarding this project in letters dated April 5, 2019 and May 24, 2019, in which additional information was requested regarding the site-specific ground motion analysis.

Discussion of Site-Specific Ground Motion Analysis

Based on this third review, the consultants have revised their site-specific ground motion analysis to appropriately incorporate spectral accelerations in the direction of maximum horizontal response. Their deterministic and probabilistic MCE spectra appear reasonable based on comparison with results from the State-Wide Model (from Petersen et al., 2008). The consultants report their site-specific seismic design parameters are: $\mathbf{S_{DS} = 1.385}\boldsymbol{g}$ and $\mathbf{S_{D1} = 1.204}\boldsymbol{g}$. The site-specific ground motion analysis presented appears to be reasonable and in accordance with ASCE 7-10.

Based on the discussion above, the consultants have addressed our earlier concern regarding the site-specific ground motion analysis. The consultants have now provided a thorough evaluation of engineering geology and seismology issues with respect to the proposed improvements.

In conclusion, ***the engineering geology and seismology issues at this site are adequately assessed in the referenced reports, and no further information is requested***. If you have any further questions about this review letter, please contact the primary reviewer at erik.frost@conservation.ca.gov.

1.0 INTRODUCTION

On behalf of the Oxnard Union High School District (OUHSD), Tetra Tech has prepared this Second Addendum Report to the *Geohazard Assessment/Geotechnical Investigation High School No. 8 APN 214-002-05 on North Rose Avenue, Oxnard, California* (Tetra Tech 2018) (Geohazard Assessment/Geotechnical Investigation Report). This Second Addendum Report was prepared in response to the California Geological Survey's (CGS's) comment in their letter dated May 24, 2019 (CGS 2019b) on the *Addendum, Geohazard Assessment/Geotechnical Investigation High School No. 8 APN 214-002-05 on North Rose Avenue, Oxnard, California* (Addendum Report) (Tetra Tech 2019). The CGS comment indicates that the Site Specific Ground Motion Analysis in the Addendum Report is based on geometric mean spectral accelerations and that the analysis should be revised using the spectral accelerations in the direction of maximum horizontal response (also known as "maximum rotated component" or MRC). In response to CGS's comment, the Site Specific Ground Motion Analysis presented in this Second Addendum Report has been revised using EZ-FRISK calculations with attenuation relationships that consider MRC accelerations. The revised Site Specific Ground Motion Analysis presented in Sections 2.0 through 2.10 of this Second Addendum Report addresses the CGS comment and should be used in place of Sections 6.0 through 6.2.8 of the Geohazard Assessment/Geotechnical Investigation Report (Tetra Tech 2018) and Sections 2.0 through 2.10 of the Addendum Report (Tetra Tech 2019).

This Second Addendum Report contains three appendices as references for the information presented in the report:

- Appendix A – Recommendations for Shear Wave Velocity (Earth Systems Pacific [ESP] 2019);
- Appendix B – EZ-FRISK Program Reports and Data Tables; and
- Appendix C – USGS Earthquake Hazards Program Website Data.

2.0 SITE SPECIFIC EARTHQUAKE GROUND MOTION ANALYSIS

2.1 SETTING

The Site location is shown on Figure 1. The Site located within the Maulhardt Ranch at 1853 Camino Del Sol in the City of Oxnard, California in the 93030-zip code area (Figure 1). The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California (Figures 1 and 2). The geographic coordinates of the Site are approximately Latitude 34° 12' 27.76" North, Longitude 119° 9' 19.44" West. Surface elevations at the Site are approximately 63 feet above mean sea level (EDR 2017).

The Site is in a region of generally high seismicity and has the potential to experience strong ground shaking from earthquakes on regional or local causative faults. According to the 2016 California Building Code (CBC) Section 1616A.1.3 (International Code Council [ICC] 2017), the Site should be assigned to Seismic Design Category E or F, as the Site's mapped spectral response acceleration parameter at a 1-second period (S_1) is 0.938 g, which is greater than 0.75 g (see Table 1 American Society of Civil Engineers [ASCE] 7-10 Standard Acceleration Parameters in Section 2.6 of this report). Based on this S_1 parameter, a site-specific response analysis is warranted to analyze the ground motion hazard at the Site. The site-specific response analysis is intended to be in general conformance with the CBC (ICC 2017) and ASCE Standard 7-10, Chapter 21, Site Specific Ground Motion Procedures

for Seismic Design, Sections 21.1.1 through 21.5.3 (ASCE 2013). ASCE 7-10 (ASCE 2013) requires that the following site-specific seismic information be developed:

- Risk-Targeted Maximum Considered Earthquake (MCE_R) Probabilistic and Deterministic response curves;
- Site-Specific MCE_R spectral response curve; and
- Site Design Response Curve (2/3 Site-Specific MCE); and 4) Site Design Acceleration Parameters.

The MCE_R is defined as an event having a 2 percent chance of exceedance in 50 years, with a return period of approximately 2,475 years, which is expected to achieve a 1 percent probability of partial or total structure collapse within a 50-year period. The deterministic and probabilistic ground motions were calculated using the USGS 2008 Lower 48 California outside of Cascadia seismic source database and Next Generation Attenuations (NGA) from the EZ-FRISK program Version 7.65 by Fugro (Fugro 2019). The NGAs used for this ground motion analysis consider MRC accelerations and were as follows: 1) Boore & Atkinson, 2008 NGA USGS MRC; 2) Campbell & Bozorgnia, 2008 NGA USGS MRC; and 3) Chiou & Young, 2007 NGA USGS MRC, all of which are applicable to shallow crustal earthquakes in the western United States. These three NGAs was used for determining the Probabilistic MCE_R and Deterministic MCE_R.

2.2 SITE SPECIFIC SHEAR WAVE VELOCITY (V_{S30})

ASCE 7-10 (ASCE 2013) Section 20.1 requires that site soils shall be classified in accordance with Table 20.3-1 and Section 20.3 based on the upper 100 feet (30 meters) of the site profile. Earth Systems Pacific developed a Site Specific Shear Wave Velocity (V_{S30}) for the geologic profile of the Site from upper 100 feet (30 meters) using the average of the sampler blow counts from the seven deeper borings B-1, B-2, B-16, B-22, B-35, B-43, and B-51, which are shown on Figure 2 circled in red. Cal sampler blow counts were converted to equivalent SPT blow counts by using a reduction factor of 0.63. The boring logs for borings B-1, B-2, B-16, B-22, B-35, B-43 are included as Appendix A of ESP's report in Appendix A. The sampler blow counts used are circled in red on the boring logs (ESP 2019).

The average field standard penetration resistance or average SPT N blow counts were determined by using the equation listed in Section 20.4-2 of Chapter 20 of the ASCE 7-10 (ASCE 2013). Two analyses of the blow count information were performed. One analysis only considered the upper approximately 50 feet of soil and the other used the same information from the upper 50 feet of soil and then used the deepest SPT blow counts to extrapolate information down to a depth of 100 feet. The results of the analyses yielded average SPT N blow counts of approximately 17 for the 50-foot analysis and 21 for the 100-foot analysis. See the analyses presented in Appendix B of ESP's report in Appendix A.

Based on the analyses, ESP recommended using the higher average SPT blow count of 21 for estimating the shear wave velocity as this will likely lead to a higher ground acceleration than using the lower average SPT blow count of 17. Table 20.3-1 of ASCE 7-10 (ASCE 2013) indicates that the V_{S30} for Class D Soils ranges from 600 feet/second to 1,200 feet/second. Comparing the average SPT blow count of 21 to the information listed in Table 20.3-1 Site Classification of ASCE 7-10, a V_{S30} shear wave velocity of 705 feet/second (215 meters/second) was estimated for the Site Specific Ground Motion Analysis. This V_{S30} value of 705 feet/second (215 meters/second) was used in the ground motion analyses performed by

Fugro's EZ-FRISK program Version 7.65 as described in Sections 2.3 and 2.4 and documented in the program output in Appendix B.

2.3 PROBABILISTIC (MCE_R) GROUND MOTIONS

To develop the probabilistic MCE_R spectrum for the Site, the EZ-FRISK program Version 7.65 by Fugro was used (Fugro 2019). Mapped faults within a 105-kilometer radius (65 miles) were selected from the program database. The peak horizontal ground acceleration (PGA) and spectral accelerations, at 5 percent damped for a Site Class "D" (ASCE, 2013), were estimated using the NGAs mentioned above. The MRC of these three generated curves was used as the probabilistic MCE_R response spectrum. The ordinates of the probabilistic ground motions were then computed using Method 1 of ASCE 7-10 Section 21.2.1.1 (ASCE, 2013). To obtain the probabilistic MCE_R spectrum using this method, at each spectral response period for which the acceleration is computed, the ordinates of the probabilistic ground motion are determined as the product of the risk coefficient C_R, and the spectral response acceleration from a 5 percent damped acceleration response spectrum having a two percent probability of exceedance within a 50-year period. The value of the risk coefficient C_R is determined using the values of C_{RS} (0.910) and C_{R1} (0.909) from Figures 22-17 and 22-18 of ASCE 7-10 (ASCE, 2013) that were obtained from the USGS Earthquake Hazards Program website (USGS 2018a) (Appendix C). The ground motions were multiplied by the mapped risk coefficient C_{RS} (0.910) at periods up to 0.2 seconds, and C_{R1} the mapped risk coefficient (0.909) at periods greater than or equal to 1 second. At response spectral periods greater than 0.2 seconds and less than 1.0 seconds, C_R was based on linear interpolation of C_{RS} and C_{R1}. The Probabilistic Response Spectra (MCE_R) are included in a single graph presented in Figure 3. The Probabilistic MRC with Risk Component PGA (MCE_G) is 0.943g (includes risk factor), which is the PGA with a 2 percent probability of exceedance within a 50-year period.

2.4 DETERMINISTIC (MCE_R) GROUND MOTIONS

A deterministic analysis using the NGAs was performed using the EZ-FRISK program Version 7.65 by Fugro (Fugro 2019) in accordance with ASCE 7-10 (ASCE, 2013). The parameters used in this analysis included the stiff soil classification (Site Class "D"), and the controlling seismic source being the late Quaternary Oak Ridge—Connected-Fault with a maximum magnitude of 7.40 and 5.04 kilometers from the Site and the Oak Ridge (Onshore)-Fault with a maximum magnitude of 7.20 and 5.72 kilometers from the Site. Values for the three spectral NGA curves were calculated using EZ-FRISK. The MRC of the obtained values was used as the basis for calculating the Deterministic Response Spectrum (MCE_R) presented on the graph in Figure 4. The Deterministic (MCE_R) Lower Limit was calculated using F_a = 1.00 and F_v = 1.50, obtained from the USGS Earthquake Hazards Program website (USGS 2018a) (Appendix C). The Deterministic Response Spectra (MCE_R) are included in a single graph presented in Figure 4.

ASCE 7-10 Section 21.2.2 (ASCE, 2013) requires that the ordinates of the deterministic ground motion response spectrum shall not be less than the corresponding ordinates of the Deterministic Lower Limit determined in accordance with Figure 21.2.1. The ordinates of the Deterministic MRC (MCE_R) spectrum are higher than or equal to the corresponding ordinates of the Deterministic Lower Limit response spectrum at all spectral periods. Therefore, it is our opinion that the Deterministic MRC spectrum curve should comprise the Deterministic Site Specific (MCE_R) curve at all spectral periods. This Deterministic Site-Specific (MCE_R) is indicated by the red dashed line on the Deterministic Response Spectra graph presented in Figure 4.

The Deterministic MRC (MCE_R) PGA is 1.03g, which was calculated from the largest source earthquake from the Oak Ridge-Connected-Fault.

2.5 SITE-SPECIFIC (MCE_R)

The Site-Specific (MCE_R) was developed in accordance with ASCE 7-10 (ASCE, 2013). The Site-Specific (MCE_R) is defined by ASCE 7-10, Section 21.2.3 (ASCE, 2013) as the lesser of the Probabilistic (MCE_R) and the Deterministic (MCE_R). A review of the Probabilistic and Deterministic MRC Response Spectra graphs presented in Figure 5 indicates that the Probabilistic (MCE_R) spectral response acceleration curve is the lesser curve for periods less than 0.13 seconds and greater than 0.23 seconds and the Deterministic MRC spectral response acceleration curve is the lesser curve for periods greater than 0.13 seconds and less than 0.23 seconds. Therefore, the Site-Specific (MCE_R) should consist of the Probabilistic MRC with Risk Coefficient spectral response curve for periods less than 0.13 seconds and greater than 0.23 seconds and the Deterministic MRC spectral response acceleration for periods greater than 0.13 seconds and less than 0.23 seconds. The Probabilistic MRC with Risk Coefficient curve, Deterministic Site Specific (MCEr) curve, and Site-Specific (MCE_R) curve are presented in Figure 5.

2.6 ASCE 7-10 STANDARD ACCELERATION PARAMETERS

The site coefficients mapped and design seismic ground motions that could occur at the Site were analyzed based on the CBC (ICC 2017) and ASCE 7-10 Standard method (ASCE, 2013). The site coordinates used in this analysis were latitude 34.2077 north and longitude 119.1554 west (Google Earth 2018), with a Site Classification of "D". The ASCE 7-10 Standard method available on the USGS Earthquake Hazards Program website (USGS 2018a) was used (Appendix C). The results of the seismic ground motion analysis are presented in Table 1.

Table 1
ASCE 7-10 Standard Acceleration Parameters

Mapped Acceleration Values for Site Class "B"		**Site Coefficients and Adjusted MCE_R Design Response Spectrum Acceleration Parameters For Site C ass "D"**					
Seismic Parameters	**Values (g)**	**Site Coefficients**	**Values**	**Seismic Parameters**	**Values (g)**	**Seismic Parameters**	**Values (g)**
S_S	2.596	F_a	1.000	S_{MS}	2.596	S_{DS}	1.731
S_1	0.938	F_v	1.500	S_{M1}	1.407	S_{D1}	0.938

2.7 DESIGN RESPONSE SPECTRUM

The Site Design Response Spectra were developed in accordance with ASCE 7-10 (ASCE, 2013). Per ASCE 7-10 Section 21.3 (ASCE, 2013), the Site Design Response Spectra is obtained by taking 2/3 of the Site-Specific (MCE_R), except that the ordinates shall not be less than those obtained from 80% of the ASCE 7-10 Standard adjusted Design Response Spectra values per ASCE 7-10 Section 11.4.5 (ASCE, 2013). The accelerations for 2/3 of the Site-Specific (MCE_R) were lower than 80% of the ASCE 7-10 Standard adjusted Design Response Spectra for periods between 0.013 and 0.63 seconds, and higher for periods lower than 0.013 seconds and greater than 0.63 seconds, as shown on the Site Design Response Spectra graph presented in Figure 6. Therefore, the Governing Site Design Response Spectrum should consist of the ground accelerations for 80% of the ASCE 7-10 Standard adjusted Design Response Spectrum for periods between 0.013 and 0.63 seconds, and the ground accelerations for 2/3 of the Site-Specific (MCE_R) for periods lower than 0.013 seconds and greater than 0.63 seconds. This Governing

Site Design Response Spectrum combination is indicated by the red dashed line on the Site Design Response Spectra graph presented in Figure 6.

Note that ASCE 7-10, Section 21.4 (ASCE, 2013), requires that the parameter S_{DS} shall be obtained from site-specific spectra as the spectral acceleration S_a, determined in accordance with ASCE 7-10, Section 21.3, at a period of 0.2 second (1.385g), except it shall not be taken as less than 90 percent of the peak acceleration, S_a, at any period larger than 0.2 seconds. In this case, S_a is greater than 90 percent of the peak acceleration spectral acceleration at any period larger than 0.2 seconds. The parameter S_{D1} shall be taken as the greater of the spectral acceleration, S_a, at a period of 1 second (1.020g) or two times the spectral acceleration, S_a, at 2 seconds (0.602g). In this case, the value at two times the spectral acceleration, S_a, at a period of 2 seconds is higher (2 x 0.602g = 1.204g), and therefore, 1.204g shall be used as the value for S_{D1}. The parameters S_{MS} and S_{M1} were taken as 1.5 times S_{DS} and S_{D1}, respectively. The Site Design Response Parameters are provided in Table 2.

Table 2

S_{M1}	1.125	**S_{D1}**	0.750	**S_{M1}**	1.805	**S_{D1}**	1.204

2.8 MAXIMUM CONSIDERED EARTHQUAKE MRC (MCE_G) PEAK GROUND ACCELERATION

2.8.1 Probabilistic (MCE_G) Peak Ground Acceleration

The Probabilistic MRC PGA (MCE_G) is 0.943g (includes risk factor), taken as the MRC PGA with a 2% probability of exceedance over a 50-year period.

2.8.2 Deterministic (MCE_G) Peak Ground Acceleration

The Deterministic MCE_G MRC PGA is 1.03g, taken as the MRC peak ground acceleration of the largest 84th percentile earthquake, which was the late Quaternary Age Oak Ridge—Connected-Fault located approximately 5.04 kilometers north of the Site and the Oak Ridge (Onshore)-Fault located approximately 5.72 kilometers north the Site.

ASCE 7-10, Section 11.8.3 (ASCE, 2013) indicates that the Site PGA for evaluation of potential liquefaction and soil strength loss shall be determined based on the peak ground acceleration adjusted for site class effects (PGA_M) from equation 11.8-1 ($PGA_M = F_{PGA}$ PGA) using the coefficient F_{PGA} from Table 11.8-1. The PGA value is based on the mapped Maximum Considered Earthquake (MCE) ground motion peak ground acceleration shown on Figure 22-7 of ASCE 7-10 (1.02g) that was obtained from the USGS Earthquake Hazards Program website (USGS 2018) (Appendix C). For Site Class = D, PGA = 1.02g, and $F_{PGA} = 1.0$. Therefore, $PGA_M = 1.02$g and should be used as the Deterministic MCE_G MRC PGA.

2.8.3 Site Specific (MCE_G) Peak Ground Acceleration

ASCE 7-10 Section 21.5.3 indicates that the site-specific MCE_G PGA is the lesser of the Probabilistic (MCE_G) and the Deterministic (MCE_G) except that it cannot be less than 80 percent of the PGA_M determined from ASCE 7-10 Equation 11.8-1. In this case, the Probabilistic (MCE_R) MRC PGA of 0.943g is the lesser PGA. The Probabilistic (MCE_R) MRC PGA of 0.943g is greater than 80 percent of the PGA_M = 1.02g X 80% = 0.816g determined from ASCE 7-10 Eq. 11.8-1 (ASCE, 2013). Therefore, the site-specific MCE_G PGA should be Probabilistic (MCE_R) MRC PGA of 0.943g (ASCE 2013).

2.9 DEAGGREGATED SEISMIC PARAMETERS

A seismic hazards analysis procedure was used to estimate the probabilistic modal magnitude at the Site using the USGS Unified Hazard Tool available at the USGS Earthquake Hazards Program Website (USGS 2018b) (Appendix C; USGS 2018b). The Probabilistic Maximum Considered Earthquake (MCE) was used in the analysis. The MCE is defined as having a 2 percent chance of exceedance in 50 years, with a return period of approximately 2,475 years. The results of this analysis indicate that the Site could experience a probabilistic mean magnitude of 7.01g at a distance of 10.78 km.

2.10 SEISMIC DESIGN CATEGORY

The S_1 calculated for the Site is 0.938g (Appendix C; USGS 2018b). CBC Section 1613A.3.5 (CBSC, 2013) states that structures assigned to Risk Category I, II, or III where the $S_1 \geq 0.75$g should be assigned to Seismic Design Category E. If structures are assigned to Risk Category IV, they should be assigned to Seismic Design Category F.

3.0 CONCLUSIONS AND RECOMMENDATION

The Site Specific Ground Motion Analysis presented in Sections 2.0 through 2.10 of this Second Addendum Report was performed using the spectral accelerations in the direction of maximum horizontal response (also knowns as "maximum rotated component" or MRC). Sections 2.0 through 2.10 of this Second Addendum Report should be used in place of Sections 6.0 through 6.2.8 of the Geohazard Assessment/Geotechnical Investigation Report (Tetra Tech 2018) and Sections 2.0 through 2.10 of the Addendum Report (Tetra Tech 2019). No other changes were made to the findings, conclusions, or recommendations of the Geohazard Assessment/Geotechnical Investigation Report (Tetra Tech 2018) based on the results of the Site Specific Ground Motion Analysis presented in this Second Addendum Report. Tetra Tech concludes that with the inclusion of this Second Addendum Report to the Geohazard Assessment/Geotechnical Investigation Report (Tetra Tech 2018), the engineering geology and seismology issues for the OUHSD High School No. 8 Site are adequately addressed in accordance with CGS Note 48 guidelines (CGS 2014). Tetra Tech recommends that the CGS issue a letter stating that with the inclusion of this Second Addendum Report to the Geohazard Assessment/Geotechnical Investigation Report (Tetra Tech 2018), the engineering geology and seismology issues for the OUHSD High School No. 8 Site are adequately addressed in accordance with CGS Note 48 guidelines (CGS 2014).

4.0 DISCLAIMER

This report was compiled based partially on information supplied to Tetra Tech from outside sources and other information, which is in the public domain. The conclusions and recommendations herein are based solely on the information Tetra Tech obtained in compiling the report. Documentation for the statements made in the report is on file at Tetra Tech's offices in Santa Barbara, California. Tetra Tech makes no warranty as to the accuracy of statements made by others which may be contained in the report, nor are any other warranties or guarantees, expressed or implied, included or intended by the report, except that it has been prepared in accordance with the current generally accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professional consultants or firms performing the same or similar services. Since the facts forming the basis for the report are subject to professional interpretation, differing conclusions could be reached. Tetra Tech does not assume responsibility for the discovery and elimination of hazards that could possibly cause accidents, injuries, or damage. Compliance with submitted recommendations or suggestions does not assure elimination of hazards or the fulfillment of client's obligation under local, state, or federal laws or any modifications or changes to such laws.

None of the work performed hereunder shall constitute or be represented as a legal opinion of any kind or nature, but shall be a representation of findings of fact from records examined.

Respectfully submitted,

PROJECT: OXNARD HIGH SCHOOL NO. 8
NORTHEAST OF CAMINO DEL SOL AND NORTH ROSE AVENUE
OXNARD, CALIFORNIA

SUBJECT: Recommendations for Shear Wave Velocity

REF: Geotechnical Engineering Report, Oxnard High School No. 8, Northeast of Camino Del Sol and North Rose Avenue, Oxnard, California, by Earth Systems Pacific, dated August 31, 2018, Doc. No. 1808-091.SER

Dear Mr. Steele:

This letter presents our recommendations for the shear wave velocity that should be used for the site-specific seismic analysis at the Oxnard High School No. 8 project. The project is located northeast of Camino Del Sol and North Rose Avenue in the City of Oxnard, California.

To develop the estimated shear wave velocity, we used the average of the sampler blow counts from the seven deeper borings (B-1, B-2, B-16, B-22, B-35, B-43, and B-51). Cal sampler blow counts were converted to equivalent SPT blow counts by using a reduction factor of 0.63. Please refer to the borings presented in Appendix A. The sampler blow counts used are circled in red.

We determined the average field standard penetration resistance or average SPT N blow counts by using the equation listed in Section 20.4-2 of Chapter 20 of the American Society of Civil Engineers (ASCE) 7-10. We performed two analyses of the blow count information. One analysis only considered the upper approximately 50 feet of soil and the other used the same information from the upper 50 feet of soil and then used the deepest SPT blow counts to extrapolate information down to depth of 100 feet. The results of the analyses yielded average SPT N blow counts of approximately 17 for the 50-foot analysis and 21 for the 100-foot analysis. See the analyses presented in Appendix B.

Based on the analyses, we recommend using the higher average SPT blow count of 21 for estimating the shear wave velocity as this will likely lead to a higher ground acceleration than using the lower average SPT blow count of 17. Comparing the average SPT blow count of 21 to the information listed in Table 20.3-1 Site Classification, we estimated a shear wave velocity of 705 feet/second or 215 meters/second and recommend using this value for the site-specific seismic analysis.

If there are any questions concerning this letter, please do not hesitate to contact the undersigned.

Sincerely,

Earth Systems Pacific

Doug Dunham

Doug Dunham, GE

PLOTTING PARAMETERS
  Period at which to plot PGA: 0.005

CALCULATIONAL PARAMETERS
  Fault Seismic Sources -
    Maximum inclusion distance           :   105 km
    Down dip integration increment       :   1 km
    Horizontal integration increment     :   1 km
    Number rupture length per earthquake :   1
  Subduction Interface Seismic Sources -
    Maximum inclusion distance           :   1000 km
    Down dip integration increment       :   5 km
    Horizontal integration increment     :   20 km
    Number rupture length per earthquake :   1
  Subduction Slab Seismic Sources -
    Maximum inclusion distance           :   1000 km
    Down dip integration increment       :   5 km
    Horizontal integration increment     :   20 km
    Number rupture length per earthquake :   1
  Area Seismic Sources -
    Maximum inclusion distance           :   200 km
    Vertical integration increment       :   3 km
    Number of rupture azimuths           :   3
    Minimum epicentral distance step     :   0.5 km
    Maximum epicentral distance step     :   10 km
  Gridded Seismic Sources -
    Maximum inclusion distance            :   200 km
    Default number of rupture azimuths    :   20
    Maximum distance for default azimuths :   40 km
    Minimum distance for one azimuth      :   150
    Use binned calcuations if possible    :   true
    Bins per decade in distance (km)      :   20
```

```
  All Seismic Sources -
    Magnitude integration step          :   0.1 M
    Apply magnitude scaling             :   NO
    Include near-source directivity     :   NO
