PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

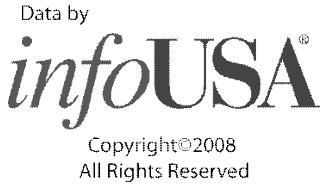
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1926 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Tetra Tech, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 435C-48F7-8633

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Tetra Tech, Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

G PROPERTY OWNNER DISCLOSURE OF EXISTING CONDITIONS

THIS PAGE INTENTIONALLY LEFT BLANK

MEMORANDUM

To: Joel Kirschenstein

From: Ken High

Re: Disclosure of existing conditions affecting Phase 1 Environmental Report.

Dated: October 5, 2017

Joel- The questionnaire your supplied from your Phase 1 consultant, which you asked the owners to fill out, is for OUHSD to prepare and sign as the "person who will use the Phase 1" as stated in the first paragraph and as the buyer, not the landowner/seller. It is intended to meet the due diligence standard for OUHSD claiming "innocent land owner protection" under CERCLA. Therefore, the landowners will not be providing it to you.

However, to provide full disclosure of the relevant facts concerning both existent and previously removed or abandoned improvements, facilities, and operations that could have created conditions needing investigation, the owners have authorized me to provide the following summary. They also are willing to meet and confer with you and/or your Phase 1 consultant to point out the exact location of all the facilities which are discussed below, provided an acceptable Access Agreement has been executed. Please be advised, that in no case will the owners permit coring's, without a plan showing exactly where they will be done, the depth, which is acceptable to them.

1. Farming Operations. Since the property was acquired by the Maulhardt Family ancestors about 1869, it has been used for farming operations with various crops over the years, including various dry farming crops in the early days, lemons and avocadoes, row crops and currently strawberries. Those operations involved the application of all the pesticides, herbicides, fertilizers, and other chemicals customarily used and/or permitted in such operations over the decades. No known sites of any spills or tanks or pits, or other locations where any particular concentration of chemicals existed or exists, except the metal building along the northern edge of the home site was historically used to store tractors and farm equipment and it has a hard packed dirt and/or concrete floor not evenly distributed, which could have absorbed gas, diesel fuel, oil or other chemicals resulting from such use.

2. Gas, Diesel, and Herbicide Tanks. The following tanks exist or existed over the years.

    a. Existing heating oil tank above ground adjacent to the west side of the big Ruth Maulhardt house.
    b. Underground gas tank removed about 20-30 years plus ago without any removal permit, although it is believed none was then required. It was at the south east corner of the apartment/2 car garage building. No known leak occurred.
    c. Above ground gas tank adjacent to the "gas house" which is the small building near the north end of the home site, adjacent to the large metal building adjacent to the northern edge of the home site. It was removed about 30 plus years ago, without any removal permit, although it is believed that none was required. No known leak occurred.
    d. Underground diesel fuel tank adjacent to the "gas house". It was removed about 30 plus years ago, without any removal permit, although it is believed that none was required. No known leak occurred.
    e. Above ground weed oil tank along north west corner of the gas house. It was removed about 30 plus years ago, without any removal permit, although it is believed that none was required. It is believed to have leaked and the last memory of it is that the dirt was stained before the hole was filled in.
    f. Inside the gas house in the concrete floor there exists a concrete pit, like those in oil change facilities, used to change the oil and/or do mechanical work on tractors, farm equipment and vehicles.
    g. Existing above ground propane gas tanks near the various buildings, which are plainly visible. They are owned and filled periodically by AAA Propane Gas, Oxnard, CA.

3. Septic Systems. There are the following septic systems which have been removed or still exist:

a. Existing septic tank at N/E corner of the big house just outside the kitchen window. The top is visible on the surface of the ground and is still in operation. The leach field for this 100 year old system is to the east in the road and/or in the orchard. It is still in service.
b. Existing septic tank in the road east of the big house S/E of the kitchen window. It was abandoned in place and not filled about 30 plus years ago, without a permit, which is believed not to have been necessary.
c. Existing prefabricated concrete septic tank near the N/E corner of the big house and east of the driveway into the home site. . It is still in service. Leach field is south of the tank.
d. Septic tank adjacent to office north of the big house and east of the apartment/garage building right at the front porch. Abandoned in place and filled with dirt and scrap concrete about 20 plus years ago.
e. Wooden septic tank adjacent to the office mentioned in d. located in the lawn about 10' from the front door and 8' west. It was abandoned and filled with dirt about 30 years ago.
f. Septic tank outside kitchen window of the office for kitchen discharge water, was abandoned and filled with dirt about 30 years ago.
g. Cesspool north 3-4' from the apartment building was abandoned and filled with dirt about 15 plus years ago, without any removal permit, although it is believed that none was required.
h. Existing septic tank about 8' north of the apartment building, which is still in service. It was installed about 20 years ago. The leach field is south of the tank. Whether there was a permit obtained is unknown.
i. Existing septic tank about 16' behind and about the middle of the double wide mobile home, which is in service. One leach field extends due east, which was abandoned about 20-25 years ago, and another, which is in service, extends south into the orchard.
j. Existing septic tank about 15-20' from the front of the T shaped house west of the other structures, which is in service. It was installed in 1973. The leach field extends south, with an offshoot added later to either the east or west.
k. West of the gas house, there used to be a bunk house for farm workers where the lemons are now. There was a cesspool crushed in place when the house was removed about 30 plus years ago.
l. Existing 4' diameter vertical concrete irrigation pipe at the S/E corner of the barn which was used for sewage from a trailer located there for 1 year and removed 43 years ago. It is capped now. No leach field existed.
m. There may be an abandoned washing machine septic tank east of the jacaranda tree by the back porch of the big house. If so it is believed to have been filled in about 25 plus years ago.
n. There may be an abandoned septic tank west of power pole to the east of the N/E corner of the big house. If so it is believed to have been filled in about 25 plus years ago.
o. There may be an abandoned septic tank west of the apartment building. If so it is believed to have been filled in about 25 plus years ago.
p. There was a hole in the floor of the apartment building garage that may have had oil deposited in it. It was plugged with concrete over 40 years ago to level the floor.

4. <u>Water Wells, Pipes and Wind Machines.</u>
   a. Existing above ground horizontal water tank located east of the driveway into the home site before it reaches the garage. South of that tank, there was a water well at the same location which was abandoned and properly backfilled, with a county permit about 25 plus years ago.
   b. There are is an existing 12" PVC water pipeline going west from the water well along the northern boundary. It then splits into 2 PVC pipes a few feet apart and goes south near or in the farm road leading to the road west of the gas house. Any excavation or coring nearby should be done only after precisely locating those pipes and their depths.
   c. There is also a separate irrigation pipeline system running from the well at the N?E corner throughout the fields. The locations must be precisely identified prior to conducting an coring's or grading by meeting with the agricultural tenant who knows the locations and approximate depths.
   d. There are no existing wind machines and all previously removed wind machines were electric.

CC All Maulhardt Ranch Owners, and Mike Penrod.

H CHECKLIST FOR PHASE I SITE VISIT

THIS PAGE INTENTIONALLY LEFT BLANK

PHASE I ENVIRONMENTAL SITE ASSESSMENT CHECKLIST

Project Name: Oxnard High School No. 8

Address: 1853 Camino Del Sol, Oxnard, CA 93030

General Site Description: Residential Property surrounded by private orchards, farm building and compound surrounded by strawberry fields

I. Pre-arrival Background Information

1. **Current Owner(s):** Maulhardt Family
   Owner Since: 1869

2. **Current Occupants:** Ruth Maulhardt, Sean Maulhardt
   Occupant Since: 1952

3. **Year Buildings Constructed :** Main Residence (1917), Barn (~~1908~~ 1908), Pesticide Storage shed (1890), Mobile homes (1970's)

4. **Site Zoning:** Residential Planned Development/General Commercial Planned Development /Community Resource

5. **Land Use(s):** Residential / Agricultural

II. Site Observations:

A. Lot/Property Observations:

1. **Current Groundcover (%):** Estimated from aerial photograph review.

Orchards	9 %	Buildings	2 %		
Strawberry Fields	83 %	Dirt	6 %		

Any concrete staining, soil staining or stressed vegetation? yes shown in Figure

2. **Is there any evidence of pesticide/herbicide use, storage or disposal on the property?** Yes
   If yes, describe: Agricultural Areas, Pesticide use and Storage shed
   Have any pesticides/herbicides been used on the property at any time?* Yes, Pesticide and herbicides used historically for agricultural activities

3. **Are there any electrical transformers or capacitors on the property?** Yes
   If yes, location: 2 identified at property, 3 have been removed
   Evidence of leaks? No
   Have they been tested for PCBs*? No
   Transformers owned by utility company, owner, or tenant?* Utility, So Cal Edison

* Indicates question that requires follow-up during site owner/occupant interview.

4a. Are there any visible aboveground or underground storage tanks on the property? Yes

If yes, location: 2 propane storage tanks, Abandoned heating oil tank

Currently in use? Propane tanks in use, heating oil tank no longer used

Contents: Propane, heating oil

Size (gallons): ~500 gallons

Evidence of leaks? No

When was the tank installed?* NA

Is there a permit for the tank? If so, who is the listed owner?* NA, AAA

Have any leak tests been performed?* N/A

If not in use, has the tank been "abandoned"? Documentation?* No

4b. Is there any evidence that an AST or UST has been removed from the site? Yes

If yes, describe: Property owners disclosed several former ASTs and UST that have been removed

When was the tank removed?* 25-30+ years ago

Documentation?* None

5. Are there any visible storage drums on the property? If yes, how many? Yes

If yes, location: One drum in pesticide use area, Drum in shed

Describe size and contents (if known): 25 gallons unknown contents, 25 gallons unknown contents

Evidence of spills/leaks? Stained areas in shed

Are they stored in a bermed area (any secondary containment)? No

6. Any evidence of solid waste disposal on the property? Yes

If yes, location: Miscellaneous solid waste present across site, shed and barn

Describe: old cars stored, miscellaneous trash

Evidence of any hazardous materials? Yes

7. Are there any ponds, pits, sumps, or ditches on the property? Yes

If yes, location: Sump inside garage / gas house

Describe: used historically for auto repair and oil changes

Evidence of any hazardous materials? Yes strong petroleum odors, abandoned gas tank piping

8. Describe the general air quality at the site: Good Air Quality

Are there activities on the site which produce air emissions (painting, printing, venting, exhaust): No

If yes, describe:

Are the emissions monitored or permitted?*

Documentation?*

9. Are there any curb cuts, footings, or other signs of former buildings on the property? Yes

If yes, location: Former bunkhouse west of the Farm yard

When was the former building built/demolished?* 1970's

* Indicates question that requires follow-up during site owner/occupant interview.

B. Buildings

1. **Is a building(s) present on site?** Yes
   If yes, when was it built?* 1880's - 1970's

2. **Are there any cracks or openings (drains or sumps) on the first floor?** N/A
   If yes, location: NA
   Are they connected to storm drains, sewer lines or discharged into the ground? NA

   Is there any evidence of spills or stains on the ground? NA

   Is there a possibility of hazardous waste spills or leaks?* NA

3. **Are there painted surfaces on the exterior or interior of the building?** Yes
   Evidence of lead based paint? Yes
   If yes, location: exteriors of building have chipped paint
   When were the walls painted?* Unknown painted multiple times, multiple layers
   Have they been tested for lead?* No

4. **Are there any electrical transformers or capacitors inside the building?** NA
   If yes, location:
   Evidence of leaks?
   Have they been tested for PCBs?*
   Transformers owned by utility company, owner, or tenant?*

5. **Is there any evidence of the presence of asbestos?** Unknown
   If yes, location:
   Friable?
   If no evidence of asbestos, but the building was built before 1979, has an asbestos survey been completed?*

6. **Are there any chemicals or drums stored or used in the building?** Yes
   If yes, location: sheds
   Evidence of leaks/spills? Yes, stained areas in shed
   If drums, secondary containment? No
   Have there been any documented leaks or spills of hazardous materials*? No
   If yes, describe and list documentation:

* Indicates question that requires follow-up during site owner/occupant interview.

III. Surrounding Properties

1. Describe generally the current use(s) of the adjacent properties (%):

Residential: 75 %, Agricultural: 25 %, Industrial: ____

Office: ____ Commercial: ____ Manufacturing: ____

Other (specify) ____

Describe any adjacent propertied used for industrial, manufacturing, or refining purposes: NA

Do they pose a possible threat to groundwater or air quality at the site? NO

If yes, explain: ____

Checklist completed by: Jason Dane

Date: 10/23/2017

Checked by: ____

Date: ____

* Indicates question that requires follow-up during site owner/occupant interview.

I USER QUESTIONNAIRE

THIS PAGE INTENTIONALLY LEFT BLANK

URGENT and CONFIDENTIAL

USER QUESTIONNAIRE for PHASE I ESA

AS REQUIRED by ASTM Standard E1527-05

Site Name: Portion of Maulhardt Ranch (approximately ~~45~~ 55 acres) proposed to be developed as Oxnard High School No. 8. (MTN)

Address: 1853 Camino Del Sol, Oxnard, CA 93030

Completed By: MR. SID ALBAUGH, ASST SUPT

The person who will use the Phase One should provide the following information. Please fill in this form to the best of your ability, explaining any Yes answers on a separate sheet of paper. Without these answers, our report would have to note that the Phase One is incomplete, and your Landowner Liability Protections could be at risk. We need these answers before we conduct the site visit.

* 1. **Environmental Cleanup Liens.** ASTM requires the User to check for environmental liens that may be filed or recorded against the subject property under federal, tribal, state or local law. Such liens might be listed in the "exceptions to coverage" in the property's title insurance commitment or policy. Failure to check for these liens could put your Landowner Liability Protections at risk.

Have you checked for these environmental cleanup liens? ☐ Yes ☑ No

Are you aware of any such liens against the subject property? ☐ Yes ☑ No

* 2. **Activity and Use Limitations (AULs).** These include engineering controls (e.g., slurry walls, caps) and land use restrictions or institutional controls (e.g., deed restrictions, covenants) that may be in place at the site or filed under federal, tribal, state or local law. The title commitment or policy might also list AULs.

Are you aware of any possible AULs involving the subject site? ☐ Yes ☑ No

3. **Specialized Knowledge.** This involves personal knowledge or experience related to the subject property or nearby properties. For example, if you are involved in the same line of business as the current or former occupants of the property or an adjoining property, you would probably know of any chemicals, oil, degreasers, gasoline, or other hazardous substances commonly used in that type of business.

Do you have any specialized knowledge that might indicate the past or present use or release of such substances on the subject or nearby properties? ☐ Yes ☑ No

4. **Fair Market Value (FMV).** A purchase price significantly below FMV may indicate an environmental problem. Please note that this question does not require an appraisal of the property. If the price is significantly below FMV, the User should consider whether it might be because contamination may be present at the property.

Is the purchase price significantly below fair market value? ☐ Yes ☑ No

5. **Obvious Indicators.** This involves past or present spills, stains, releases, cleanups, etc. on or near the site.

Do you know of any obvious indicators of possible contamination on or near the site? ☐ Yes ☑ No

6. **Common Knowledge.** Please use a separate sheet if necessary.

Describe the past uses of the property: RESIDENT, AGRICULTURE, BARN

Describe any specific chemicals that may have been present at the property: TBD

Describe any other information that may help us identify possible contamination:

# of separate sheets attached: ____

Your Signature [signature] **Date** 10-19-17

Explain Yes answers on a separate sheet.

* TO BE REVIEWED UPON OPENING OF ESCROW AND REVIEW OF PRELIMINARY TITLE REPORTS (MTN)

1.0 INTRODUCTION

This report presents the results of the Preliminary Environmental Assessment (PEA) for the proposed High School No, 8 in Oxnard, California (hereinafter referred to as the Site). The Oxnard Union High School District (School District) proposes to acquire a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California to construct the High School No. 8 campus (Figures 1 and 2). Book 214 page 2 of the County of Ventura's Assessor Map indicates that the Site comprises approximately the southernmost 48 Acres of Parcel 59, within the Rancho El Rio Santa Clara O'La Colonia Portion A of Subdivision 26 in the city of Oxnard. The geographic coordinates of the Site are approximately Latitude 34° 12' 27.76" North, Longitude 119° 9' 19.44" West. Surface elevations at the Site are approximately 63 feet above mean sea level (EDR 2017). Currently, the Site is used for the cultivation of strawberries. Historical aerial photographs, Google Earth images, and information from the Site owners indicate that the Site has been used for cultivation of row crops from as early as 1869 to the present. This PEA Report has been prepared by Tetra Tech and is being submitted to the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC), School Property Evaluation and Cleanup Division on behalf of the School District.

The PEA field investigation and laboratory analysis program were conducted in accordance with the *Technical Memorandum Field Sampling Plan Proposed High School No. 8 APN 214-002-089 on North Rose Avenue, Oxnard, California 93030* (FSP) dated July 27, 2018 (Tetra Tech 2018b). This PEA Report was prepared, and work at the Site was conducted, in accordance with the guidelines of the DTSC, as detailed in the *Preliminary Endangerment Assessment Guidance Manual* (DTSC 2015). Project-specific direction on the scope of the FSP and the PEA was provided by the DTSC during a project scoping teleconference attended by representatives of the DTSC, the School District, and Tetra Tech on July 25, 2018. Additional discussions were conducted via electronic mail and telephone during the course of the PEA.

1.1 PEA OBJECTIVES

In accordance with Senate Bill 162 and the California Education Code (CEC), the State of California has adopted an environmental policy requiring that all new school sites obtain "No Further Action" designation before proceeding with acquisition and/or construction. The DTSC has agreed to work cooperatively with the School District to provide environmental reviews of proposed sites for new schools. The review process requires completion of a Phase I Environmental Site Assessment (ESA) and/or a PEA for each proposed school site. The School District opted to proceed with a Phase I ESA (Tetra Tech 2018a) in advance of preparing the PEA.

The overall objectives of the PEA include:

- Evaluating historical information for indications of potential contamination due to past use, storage, disposal, or release of hazardous wastes/substances at the Site;
- Assessing the types, concentrations, and extent of contamination in Site media through a field sampling and analysis program; and
- Assessing the potential threat to public health (including potential future students and staff) and/or the environment posed by anthropogenic and naturally occurring hazardous

constituents at the Site via a human health screening evaluation using a residential land-use scenario.

1.2 SCOPE OF WORK

The scope of work to prepare this PEA Report included:

- Researching available Site background information regarding former and current land use;
- Scoping meetings and discussions with DTSC and School District representatives;
- Preparing the FSP;
- Collecting field and laboratory data and evaluating to assess environmental conditions at the Site;
- Preparing a human health screening evaluation;
- Preparing an ecological screening evaluation; and
- Preparing this PEA Report.

Numerous sources of information were reviewed as part of the background research for the Phase I ESA (Tetra Tech 2018a) and PEA. These sources were reviewed to develop an understanding of current and past land uses and practices that may have involved the handling, use, storage, and/or disposal of hazardous substances or wastes. Sources of information reviewed and activities performed in conducting the background research included:

- Site zoning, land-use maps, and assessor's maps;
- Current and historical U.S. Geological Survey (USGS) 7½-minute topographic maps;
- Historical aerial photographs;
- Geologic and hydrogeologic reports and maps;
- Building department records;
- Historical chain-of-title records;
- Environmental database record searches per American Society for Testing and Materials (ASTM) method E 1527-15;
- Agency files at federal, state, and local regulatory agencies;
- Agency files for listed facilities within one-quarter mile of the Site that were identified as having a potential to have impacted the Site;

- Site reconnaissance and observations of the area within one-quarter mile of the Site;
- Interviews with persons knowledgeable of Site history and operations;
- Reports of prior investigations and remedial activities performed at the Site; and
- Available information from School District files.

Results and findings of the background research are presented in Section 3.0.

The FSP (Tetra Tech 2018b) consisted of two parts: a soil gas sampling assessment and a soil and groundwater sampling assessment. For the FSP, the Site was divided into six areas of Recognized Environmental Concerns (RECs):

1. Potential toxic soil gas from potential formation leakage from the Oxnard Oil Field;

2. Potential residual organochlorine pesticides (OCPs), arsenic, semivolatile organic compounds (SVOCs), polyaromatic hydrocarbons (PAHs), and diesel (C_{13}-C_{22} carbon range) (TPHd) and heavy oil range total petroleum hydrocarbons (C_{23}-C_{40} carbon range) (TPHmo) collectively known as diesel extended range TPH (TPHde) (C_{13}-C_{40} carbon range) in soil from fuel oil in smudge pots that were formerly used for frost abatement as part of the agricultural production activities at the Site;

3. Potential impacts to shallow soil, soil gas, and groundwater in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas from above ground storage tanks (ASTs) and underground storage tanks (USTs) formerly used for the storage of motor fuel (Figure 3);

4. Potentially hazardous substances and petroleum products that contained volatile organic compounds (VOCs) and C_4-C_{12} carbon range gasoline range total petroleum hydrocarbons (TPHg) have been used and stored in the Tin Shed, Horse Barn, Garage, and Storage Shed on the Maulhardt Ranch that may have impacted shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch farmyard area (Figure 3);

5. Potential polychlorinated biphenyl (PCB) soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol (Figure 2); and

6. The following hazardous pipelines identified within 1,500 feet of the Site (Figure 2):

    - The City of Oxnard maintains a 12-inch diameter polyvinyl chloride (PVC) water pipeline routed north-south beneath North Rose Avenue immediately west of the Site;
    - The City of Oxnard maintains a 12-inch diameter asbestos concrete pipe (ACP) water pipeline routed east-west beneath Camino Del Sol immediately south of the Site;
    - The United Water Conservation District (UWCD) maintains a 42-inch water pipeline beneath North Rose Avenue immediately west of the Site; and
    - The Maulhardt Ranch maintains a 12-inch diameter PVC water pipeline routed east to west underlying the dirt access road just south of the northern boundary of the Maulhardt

Ranch, approximately 920 feet north of the Site. This pipeline is connected to two buried 12-inch diameter PVC water pipelines that are routed north-south beneath and just west of the main north-south road approximately 450 to 460 feet east of Rose Avenue through the Site to the farmyard/residential area of the Maulhardt Ranch. The Maulhardt Ranch water pipelines will be removed from the Site and surrounding areas prior to the development of the High School No. 8.

The scope of field sampling and laboratory analysis was presented in the FSP and included:

- Collection and laboratory analyses of soil gas samples from 25 locations to assess methane, hydrogen sulfide, and fixed gases (carbon dioxide, carbon monoxide, oxygen, and nitrogen), related to the underlying Oxnard Oil Field, and the collection of and laboratory analyses of soil gas samples from five locations to assess potential VOCs and TPHg from former ASTs and USTs in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas;

- Collection and laboratory analyses of surface soil samples from 60 locations for assessment of potential OCP residue and 15 locations for assessment of related arsenic, PAHs, SVOCs. TPHd, and TPHmo in surface and near surface soil due to former row crop production activities;

- Collection and laboratory analyses of surface soil samples from one location to assess potential PCB soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary; and

- Collection and laboratory analyses of soil and groundwater samples from five locations to assess for potential VOCs and TPHg from former ASTs and USTs in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas.

Using the data collected during the field and analytical program, a human health screening evaluation was performed following the PEA Guidance Manual (DTSC 2015).

1.3 PEA REPORT FORMAT

This PEA Report is organized in general accordance with the format presented in Chapter 3 of the PEA Guidance Manual (DTSC 2015). The PEA Report contains the following sections:

- Section 1 presents an introduction and summary of PEA Objectives and the PEA Report Format;

- Section 2 presents a Site Description;

- Section 3 includes Site History and Background Information;

- Section 4 identifies Potential Site Contamination;

- Section 5 contains a description of the Site Environmental Setting;

- Section 6 presents a discussion of Sampling Activities and Results;

- Section 7 presents the Human Health Screening Evaluation;
- Section 8 presents the Ecological Screening Evaluation;
- Section 9 presents Community Profile information;
- Section 10 includes a summary of Quality Assurance Project Plan (QAPP) implementation;
- Section 11 describes Health and Safety Plan implementation;
- Section 12 summarizes Field Variances from the FSP;
- Section 13 presents a discussion of Applicable or Relevant Laws and Regulations Pertaining to School Sites;
- Section 14 presents Conclusions of the PEA;
- Section 15 presents Recommendations;
- Section 16 presents a Disclaimer for this PEA Report; and
- Section 17 lists References cited in the document.

The PEA report also includes 14 appendices:

- Appendix A: Quality Assurance Project Plan;
- Appendix B: Health and Safety Plan;
- Appendix C: Environmental Data Resources Report;
- Appendix D: Historical Aerial Photographs;
- Appendix E: Historical Topographic Maps;
- Appendix F: Site Reconnaissance Photographs;
- Appendix G: Agency/Utility Contact Documentation;
- Appendix H: *Northeast Community Specific Plan, Maulhardt Property Urban Village Site Plan* (Jensen Design and Survey, Inc. [Jensen] 2018);
- Appendix I: Checklist for Phase I Site Visit;
- Appendix J: User Questionnaire;
- Appendix K: Boring Logs;

- Appendix L: Soil Gas Laboratory Reports and Chain-of-Custody Forms;
- Appendix M: Soil and Groundwater Laboratory Reports and Chain-of-Custody Forms; and
- Appendix N: Data Validation Memorandum.

2.0 SITE DESCRIPTION AND LOCATION

2.1 SITE NAME

The Site has been identified by the School District as the High School No. 8, located a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California.

2.2 SITE ADDRESS

The Site address is 1853 Camino del Sol in the City of Oxnard, California in the 93030 zip code area (Figure 1). The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California (Figures 1 and 2). Book 214 page 2 of the County of Ventura's Assessor Map indicates that the Site comprises approximately the southernmost 45 Acres of Parcel 59, within the Rancho El Rio Santa Clara O'La Colonia Portion A of Subdivision 26 in the City of Oxnard.

The Site is located in an area that is developed for commercial, residential, park, and agricultural land use (Figure 2). The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas (Figure 2). The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. The entire Maulhardt Ranch (APN 214-002-059) is bound by Camino Del Sol on the south, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site.

2.3 PROPOSED SCHOOL DEVELOPMENT

Tetra Tech's knowledge of the proposed project improvements is limited as of this time and is based on the Overall Site Plan Oxnard High School District High School No. 8 prepared by WLC Architects (WLC Architects 2018). The Site Plan is summarized in Table 1.

The proposed buildings will be of wood or metal frame construction or cast in place concrete tilt up construction with concrete slab-on-grade foundations. No other structures are planned. The proposed grading plan for the project and finish floor elevations were not provided to Tetra Tech for the preparation of this report. It is anticipated that the final grade will be similar to the existing grade and that the grading required to achieve the building pad subgrade will be minor and necessary only to provide adequate foundation and slab support and positive drainage away from the structures.

It is assumed that surface and subsurface improvements will also be constructed. Surface improvements will include concrete flat work for pedestrian use. Subsurface improvements will include underground utility conduits.

2.4 SITE OWNER

The current owner of the Site is the Maulhardt family. The Maulhardts are the current occupants on the Site. Eclipse Berry Farms is leasing the Site from the Maulhardt Ranch for strawberry cultivation.

2.5 DESIGNATED CONTACT PERSON

The designated contact person for the School District is Mr. Jeff Weinstein, Assistant Superintendent for Business Services, Oxnard Union High School District.

2.5.1 Mailing Address

The mailing address for Mr. Weinstein is:

Oxnard Union High School District
309 South K Street
Oxnard, California 93030

2.5.2 Telephone Number

The telephone number for Mr. Weinstein is 805-834-1461.

2.6 OTHER SITE NAMES

The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California (Figures 1 and 2) as indicated on the *Northeast Community Specific Plan, Maulhardt Property Urban Village Site Plan* (Appendix H).

2.7 U.S. EPA IDENTIFICATION NUMBER

Based on a review of the regulatory agency database report (Environmental Data Resources, Inc. [EDR] 2017) and contacts with regulatory agencies, the Site has not been issued a U.S. Environmental Protection Agency (U.S. EPA) identification number.

2.8 CALSITES DATABASE NUMBER

Based on a review of the regulatory agency database report and contacts with regulatory agencies, the Site is not identified in the CalSites database.

2.9 ASSESSOR'S PARCEL NUMBER AND MAP

The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California (Figures 1 and 2). Book 214 page 2 of the County of Ventura's Assessor Map indicates that the Site comprises approximately the southernmost 45 Acres of Parcel 59, within the Rancho El Rio Santa Clara O'La Colonia Portion A of Subdivision 26 in the City of Oxnard.

2.10 TOWNSHIP, RANGE, SECTION, AND MERIDIAN

Based on the Oxnard Quadrangle USGS topographic map, the Site is located in the south half of the of Section 35 Township 2 North, Range 22 West of the San Bernardino Baseline and Meridian (USGS

2015). The geographic coordinates of the Site are approximately Latitude 34° 12’ 27.76” North, Longitude 119° 9’ 19.44” West.

2.11 SITE ZONING

Information available from the City of Oxnard Development Services Planning Division (COPD) for the Site indicates the property is zoned for Residential Planned Development (RPD) (COPD 2017).

This page intentionally left blank.

3.0 SITE HISTORY AND BACKGROUND INFORMATION

3.1 BACKGROUND RESEARCH METHODOLOGY

The sources of information reviewed as part of the background research for this PEA are summarized below. These sources were reviewed to develop an understanding of current and past land uses and practices that may have involved the handling, use, storage, and/or disposal of hazardous substances or wastes. Information regarding site-specific waste handling and/or disposal was obtained and reviewed to develop a general Site history in an attempt to identify potential sources of environmental contamination. Sources reviewed in performing the background research for this PEA include:

Sanborn Map Search. Environmental Data Resources, Inc. maintains comprehensive environmental data sources including Sanborn Maps and City Directories, and specializes in providing such data for use in real estate and environmental documents. EDR reviewed their Sanborn Map collection for coverage in the site area. The EDR report (EDR 2017) is provided as Appendix C.

Environmental Lien Search. A specific search for environmental liens and activity use limitations (AULs) was not performed for the Site parcels; however, the EDR RadiusMap™ Report with Geocheck® (EDR 2017) (which contains regulatory agency database listings for environmental liens) was reviewed for such information. The EDR Report is provided in Appendix C.

Aerial Photograph Survey. Historical aerial photographs of the Site obtained from EDR were reviewed (EDR 2017). This review consisted of examining the photographs for evidence of previous activities, which may have contributed to onsite contamination. Copies of the aerial photographs are provided in Appendix D.

Topographic Map Review. Historical topographic maps obtained through EDR (EDR 2017) were reviewed to evaluate past land use and site development. The historical topographic maps are provided in Appendix E.

Agency Contacts. During the course of this assessment, the following agencies were contacted via telephone, personal interview, and/or internet-based records searches for information relating to the Site and surrounding areas:

- The California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR);
- Cal/EPA DTSC;
- Cal/EPA State Water Resources Control Board (SWRCB) Geotracker database (SWRCB 2017);
- Ventura County Environmental Health Division (VCEHD);
- Ventura County Agricultural Commissioner (VCOAC);
- Ventura County Air Pollution Control District;
- City of Oxnard Fire Department Certified Unified Program Agency (CUPA);

- City of Oxnard Development Services Planning Division (COPD);
- United Water Conservation District (UWCD);
- City of Oxnard Public Works Water Division:
- Office of the California State Fire Marshal; and
- Oxnard Union High School District.

Regulatory Agency Database. EDR maintains comprehensive environmental information databases and historical information and specializes in providing such data for use in real estate and environmental documents. EDR performed a database search of specific government records within a prescribed radius of the Site in accordance with ASTM Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (Designation E 1527-15) (ASTM 2015). The EDR report (EDR 2017) is provided in Appendix C.

Site Reconnaissance. The reconnaissance consisted of a walk-through visit of the Site and surrounding area with Sage Realty (the School District representative) and Lynn and Richard Maulhardt, representatives of the Site property owner (Maulhardt Ranch). During the reconnaissance, hazardous substance use, storage, and disposal practices were evaluated at the Site and adjacent areas. Site photographs taken during the reconnaissance are provided in Appendix F.

Interviews. Interviews were conducted by telephone or in person with School District representatives, Lynn and Richard Maulhardt, representatives of the Site property owner (Maulhardt Ranch), and regulatory agency representatives for information on site history, land use, surrounding land use, and regulatory agency data.

Literature Review. Available published and unpublished geologic, hydrogeologic, and environmental reports were reviewed. A list of these reports is presented in Section 17.0.

3.2 SITE STATUS AND HISTORICAL SITE INFORMATION

3.2.1 Property Ownership

The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California, which is owned by Maulhardt family.

3.2.2 Facility Ownership/Operators

Currently, the Site is used for the cultivation of strawberries (Figure 2) by Eclipse Berry farms.

3.2.3 Business Type and Years of Operation

The Maulhardt family has owned the Site since 1869 and used the land for crop production. Historical aerial photographs and Google Earth images indicate that the Site was previously used for cultivation of row crops from as early as 1927 to the present.

3.2.4 Sanborn Map Review

While the geographic coverage of Sanborn maps is comprehensive for most major cities, many rural areas and small towns may not be covered. No Sanborn maps were available for the Site area.

3.2.5 Aerial Photograph Review

A review of historical aerial photographs obtained from EDR included photographs dated 1927, 1938, 1947, 1959, 1967, 1978, 1985, 1994, 2005, 2009, 2010, and 2012 (EDR 2017). The photographs are included in Appendix D. A summary of the data from the aerial photography is provided below.

The 1927 photograph is a negative impression black and white photograph at a scale of one inch equals 500 feet with blurred imagery. The majority of the Site and surrounding areas appear graded and developed for agricultural land use. The land to the south, west, and north of the Site appears to be open fields planted in grain or row crops and areas north-northeast and east of the Site are planted in orchards. Colonia Road (the future site of Camino Del Sol) is visible directly south of the Site, and Rose Road (the future site of North Rose Avenue) is visible immediately west of the Site. The Main Residence, Apartment, Carriage House, Horse Barn, Tin Shed, Garage, and Storage structures are visible on the residential and farmyard areas of the Maulhardt Ranch property. A row of eucalyptus trees is visible along the east side of Rose Road extending approximately 550 feet to the north of Colonia Road. There are five unpaved roads entering the Maulhardt Ranch property. Four roads enter the residence-farmyard area. One road enters the Maulhardt Ranch property from the west along Rose Road approximately 550 feet north of Colonia Road and extends approximately 400 feet east into the farm yard area at the north end of the residential area and turns north for 200 along the west edge of the farm yard. Eucalyptus trees are located along the western edge of the farm yard. Three roads enter the residential and farmyard areas of the Maulhardt Ranch property from Colonia Road at approximately 300, 400, and 550 feet east of Rose Road extending into the residential area. The residential area is defined by the western and eastern roads that are lined with eucalyptus trees and extend approximately 550 and 400 feet north from Colonia Road, respectively. The central road entering the residential/farmyard areas from Colonia Road bifurcates into an oval loop approximately 100 feet north of Colonia Road that extends 150 feet to the main residence. Another road is located just east of a row of eucalyptus trees trending north to south approximately 700 feet east of the Horse Barn that extends across the entire length of current Maulhardt Ranch property and the Site. The cultivated area of the Site appears to be planted in grain or row crops on the west side of the row of eucalyptus trees and a citrus orchard east of them. Another farmhouse compound with surrounding trees is visible approximately 400 feet southwest of the Site across the intersection of Rose Road and Colonia Road. A second farmhouse compound is visible approximately 700 feet southeast of the Site across Colonia Road.

The 1938 photograph is a black and white photograph at a scale of one inch equals 500 feet with slightly blurred imagery. The Site and surrounding area appear similar to the 1927 photograph, developed in agricultural land use. The road entering the residential and farmyard areas of the Maulhardt Ranch property from Rose Road shown in the 1927 photograph is gone and is planted in row crops. The same structures at the residential and farmyard areas of the Maulhardt Ranch property and surrounding areas noted in the 1927 photograph are clearly visible. The western and eastern quarter of the Site and current Maulhardt Ranch property, and the area of the Site between the residential-farmyard areas and the row of eucalyptus trees approximately 700 feet east of the residential-farmyard areas are planted in row crops. Orchards are no longer present in the eastern portion of the Site. New rows of young eucalyptus trees have been planted along the east side of Rose Road along the entire western boundary of the current Maulhardt Ranch property and the Site. New rows of young eucalyptus trees have also been planted within the Maulhardt Ranch and Site at 400 and 800 feet east of Rose Road extending approximately

1,550 and 1,600 feet south from the current northern boundary of the Maulhardt Ranch. Young orchard trees are visible on the Maulhardt Ranch and Site in the area between the new rows of young eucalyptus trees located 400 and 800 feet east of Rose Road. No other significant changes were seen on the Site or surrounding areas.

The 1947 photograph is a black and white photograph at a scale of one inch equals 500 feet with slightly blurred imagery. The Site and surrounding area appear similar to the 1938 photograph except that entire eastern quarter of Maulhardt Ranch and Site are now developed in orchards. Two new structures approximately 350 square feet in size are visible just east of the Carriage House in the farmyard area of the Maulhardt Ranch. One of the Site owners, Richard Maulhardt, indicated that chicken coops were formerly located here. No other significant changes from the 1938 photograph were noted.

The 1959 photograph is a black and white photograph at a scale of one inch equals 500 feet with clear imagery. The Site and surrounding area appear generally similar to the 1947 photograph except for the changes noted below. The residential area of the Maulhardt Ranch has been reconfigured and reduced with a single entrance road off of Colonia Road at its current location. The eucalyptus tree-lined roads entering the Site from Colonia Road are gone and the eucalyptus trees formerly along the western edge of the farm yard are gone with orchards now occupying the area south of the main residence. The row of eucalyptus trees formerly located approximately 700 feet east of the Horse Barn is gone. Pole mounted power lines are visible trending east-west along the south side of Colonia Road with a north-south trending trunk line entering the residential and farmyard area of the Maulhardt Ranch approximately 550 feet east of Rose Road and extending approximately 375 into the Site. Two additional structures of approximately 350 square feet each are visible along the western edge of the farm yard. One of the Site owners, Richard Maulhardt, indicated that two worker bunk houses were formerly located here as long ago as the 1930s into the early 1980s. They were not observed in earlier photographs because they were obscured by the eucalyptus trees formerly located here. A small circular structure approximately 15 feet in diameter is visible in the open area between the Horse Barn and Tin Shed structures. This was noted to be the location of a recreational fire pit by the Site owner, Richard Maulhardt. New residential development is visible approximately 700 feet south of the Site along the west side of Rose Road. No other significant changes from the 1947 photograph were noted.

The 1967 photograph is a black and white photograph at a scale of one inch equals 500 feet, with slightly blurred imagery. The Site and area north of Colonia Road appear similar to the 1959 photograph except for the changes noted below. The Site and surrounding area is developed in agricultural (orchards) and residential use. The farmhouse compound formerly located southwest the intersection of Rose Road and Colonia Road is gone. New residential development is visible immediately south of Colonia Road to the south of the Site along newly constructed Gibralter Street, San Gorgonio Avenue, and San Jose Street. The 15-acre lot immediately south of the Site southeast of the intersection of Rose Road and Colonia Road was vacant and undeveloped. Rose Road has been realigned between 0.2 and 0.5 mile north of the Site eliminating two 90 degree turns with an s-curve. No other significant changes are seen on the Site or adjacent area since 1959.

The 1978 photograph is a black and white photograph at a scale of one inch equals 500 feet with clear imagery. The Site and surrounding area appear generally similar to the 1967 photograph except for the changes noted below. Two Mobile Homes, the Work Shop, and adjacent Shed next to the eastern Mobile Home have been erected in the residential area of the Maulhardt Ranch. The three chicken coop structures to the east of the Carriage House have been replaced by a single structure. The entire cultivated area of the Site and Maulhardt Ranch is now planted in orchards. It is assumed that the name of Rose Road has been changed to North Rose Avenue and Colonia Road to Camino Del Sol. Colonia Road has been realigned on the west side of North Rose Avenue to its current configuration as Camino Del Sol,

curving north then west. The eastern portion of the previously undeveloped parcel south of the site across Camino Del Sol has been developed into an apartment complex and the southern portion along the north side of San Gorgonio Avenue into single family homes. A six-acre lot immediately south of the Site southeast of the intersection of Rose Road and Colonia Road was vacant and undeveloped. No other significant changes are seen on the Site or adjacent areas since 1967.

The 1985 photograph is a thermal infrared image. It is at a scale of one inch equals 500 feet and features are somewhat blurred. The Site and surrounding area appear generally similar to the 1978 photograph except for the changes noted below. A swimming pool is visible to the north of the Main Residence in the residential area of the Maulhardt Ranch. The two bunk houses formerly located at the western edge of the farm yard are gone. The rows of eucalyptus trees formerly located 400 and 800 feet east of North Rose Avenue that extended approximately 1,550 and 1,600 feet south from the current northern boundary of the Maulhardt Ranch have been removed. The orchards have been cleared from a 2.3-acre area immediately east of the farm yard and a 9.9-acre area of the eastern Maulhardt Reach, including the 3.2-acre area in the northeast portion of the Site. An agricultural compound and number of associated buildings are visible approximately 625 feet northeast of the Site. Del Sol Park is visible southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. No other significant changes are seen on the Site or adjacent areas since 1978.

The 1994 photograph is a black and white photograph at a scale of one inch equals 500 feet and features are relatively clear. The Site and surrounding area appear generally similar to the 1985 photograph except for the changes noted below. Agricultural use changes are visible at the Site with the conversion of orchards to row crops notably in the eastern portion of the site. Vacant land to the north of parcel APN 214-002-059 has been developed into the St. John's Regional Hospital. Additional commercial buildings are present southwest of the Site along the south side of Camino Del Sol. No other significant changes are seen on the Site or adjacent areas since 1985.

The 2005 photograph is color photograph at a scale of one inch equals 500 feet and features are relatively clear. Significant changes have occurred to the Site and surrounding areas since 1994. The development of the Site and surrounding areas appear similar to the present. Most of the cultivated areas of the Maulhardt Ranch and Site have been converted to row crop cultivation of strawberries with the internal roads and drainages that are presently on the Site. Orchards are still present in the area surrounding the residences. The driveway accessing the Maulhardt Ranch from the south has been paved and the unpaved roads have been established within the Site that currently dissect strawberry fields. New residential development is present immediately to the north, south, west, and east of the Maulhardt Ranch property (APN 214-002-059) except along the eastern boundary at the future site of the Rio Rosales Elementary School and park where vacant land and a paved area with portable structures are visible adjacent to the northeast corner of the Site. Two large canvas roofed structures and various associated small circular storage tanks can be seen at the northeast corner of the Maulhardt Ranch where a water production well has been constructed.

The 2009 photograph is a color photograph at a scale of one inch equals 500 feet and features are slightly blurry. The conditions of the Site and surrounding areas are similar to those observed in the 2005 photograph. The paved area with portable structures that were adjacent to the northeast corner of the Site have been removed and the structures of the Rio Rosales Elementary School that currently occupies the site are visible.

The 2010, and 2012 images are color photographs at a scale of one inch equals 500 feet. The features on each of the photographs are relatively clear. The appearance of the Site and surrounding areas has not changed from the 2009 photograph.

3.2.6 Topographic Map Review

The following historical USGS topographic maps were obtained from EDR (EDR 2017): 15-Minute Topographic Series, Hueneme map dated 1904, 1943, and 1947; and 7.5 Minute Topographic Series, Oxnard map dated 1949, 1951, 1967, and 2012. Copies of the maps are provided in Appendix E. The maps were reviewed to evaluate previous development of the Site, adjoining properties, and surrounding areas.

The 1904 Hueneme map shows the Site located northeast of the intersection of Colonia Road and Rose Road. Three structures are seen on the residential and farmyard areas of the Maulhardt Ranch property that is adjacent to the Site with road entering the west side of the Site from Rose Road. The area surrounding the Site appears to be developed in large land holdings typical of areas of agricultural development with largely vacant land and individual farm houses and other structures spaced approximately one half to one mile apart within a network of roads also spaced approximately one half to one mile apart. The Southern Pacific Railway tracks are visible approximately six tenths of a mile south of the Site trending east-west, curving around to a north-south alignment approximately one mile southwest of the Site, then trending north-south one mile west of the Site with Oxnard Boulevard immediately west of the railroad tracks. Ventura Boulevard is present approximately one mile north of the Site trending northwest-southeast and Rice Avenue is present approximately six tenths of a mile east of the Site in a north-south alignment. The town of Oxnard is adjacent to the curve in the railway south-west of the Site and the town of El Rio is located at the intersection of Oxnard Boulevard and Ventura Boulevard approximately one and three quarters miles northwest of the Site.

On the 1943 and 1947 Hueneme maps minimal changes are seen at the Site and surrounding area. A single structure is present in the residential and farmyard areas of the Maulhardt Ranch property at the location of the current Main Residence with orchards in the northwest area of the Site and clear areas devoted to row crops in the remainder of the Site. The general road and railroad networks are similar to the 1904 map with "Alt Highway 101" (Oxnard Boulevard) depicted one mile west and Ventura Boulevard one mile north of the Site, and the Southern Pacific Railroad south and west of the Site. Fifth Street is now present just south of the south railroad tracks. To the southwest of the Site, the road network in the City of Oxnard has expanded to the north and south with residential/commercial development. The road network in El Rio has also expanded eastward with three additional roads. New residential development is present approximately one-mile northeast of the Site at Nyland, northeast of the intersection of Rice Road, Ventura Boulevard, and Santa Clara Avenue.

On the 1949 and 1951 Oxnard maps, structures are seen in residential and farmyard areas of the Maulhardt Ranch property at the current locations of the Main Residence, Apartment, Carriage House, Horse Barn, and Tin Shed. Orchards are present on the Site to the west and north of the residence-farm yard areas with open areas devoted to row crops in the remainder of the Site. The general road and railroad networks, and development of the Site area is similar to the 1943 and 1947 maps. One oil well is depicted within 0.25 mile of the Site, the Standard Schoelle No. 1 oil well, located approximately 1,000 feet north of the Site. The area surrounding the Site is developed in agricultural land use with orchards and open areas devoted to row crops. Development in the City of Oxnard has expanded further to the south and east with the city limit depicted approximately two tenths of a mile west of the Site.

The 1967 Oxnard map shows no changes at the Site and the areas to the west, north, and east of the Site from the 1949 and 1951 Oxnard maps. Residential development has expanded to the east from the City of Oxnard in a three tenths of a mile to four tenths of a mile wide area along the south side of Colonia Road to one tenth of a mile east of the Site. The 101 Freeway has been constructed just south of Ventura Boulevard approximately 1 mile north of the Site and Rose Road has been realigned between two tenths

of a mile and one half mile north of the Site eliminating two ninety degree turns with an s-curve. The Standard Schoelle No. 1 oil well is shown approximately 1,000 feet north of the Site and the Maulhardt No. 3 oil well is shown approximately 1,300 feet east of the Site.

On the 2012 Oxnard map no structures are shown on the Site or residential and farmyard areas of the Maulhardt Ranch property. The area comprising the 107.25-acre Maulhardt Ranch (APN 214-002-059) and the current site of Rio Rosales Elementary School and associated park to the east of the Site are shown as vacant land. The road networks and general development of the surrounding area is similar to the present with residential development present in the areas to the north, east, and west of the Maulhardt Ranch and the Site. Colonia Road has been renamed Camino Del Sol and Rose Road has been renamed North and South Rose Avenue. The two oil wells shown on the 1967 map are not present.

3.3 SURROUNDING PROPERTY LAND USES

The Site is located in an area that is developed for commercial, residential, park, and agricultural land use (Figure 2). The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas (Figure 2). The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. The entire Maulhardt Ranch (APN 214-002-059) is bound by Camino Del Sol on the South, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site.

3.4 HAZARDOUS SUBSTANCE/WASTE MANAGEMENT INFORMATION

3.4.1 Business/Manufacturing Activities

Based on the records of past Site land uses and on review of historical maps and aerial photographs, no manufacturing activities were conducted on the Site. Agricultural production is the only business type known to have been conducted at the Site.

3.4.2 Historical Records Review

3.4.2.1 Department of Oil, Gas, and Geothermal Resources Data Review

Tetra Tech reviewed DOGGR Map 214 (DOGGR 2001), the online DOGGR Well Finder (DOGGR 2017), and associated well history documents to evaluate potential presence of oil fields or wells within the Site vicinity. Records indicate that the site is located within the Oxnard Oil Field; however, no known active or abandoned oil wells are present on the Site. Additionally, no oil wells are present on 107.25-acre Maulhardt Ranch (APN 214-002-059) where the Site is located. Several plugged abandoned oil wells are located within one quarter mile of the Site. The nearest plugged and abandoned well is Maulhardt Community No. 11A, located approximately 850 feet south southwest of the Site on Imperial

Street near the intersection of San Luis Street. Plugged and abandoned well Maulhardt Community No. 10 is located approximately 870 feet west of the Site just north of Camino Del Sol. Plugged and abandoned well Maulhardt Community No. 3 is located approximately 1,350 feet west southwest of the Site on North Lombard Street. Plugged and abandoned well Maulhardt Community No. 7 is located approximately 1,500 feet west-northwest of the Site. Plugged and dry well Standard Schoelle No. 1 is located approximately 1,570 feet northeast of the Site on Ribera Place. Plugged dry well A. Pfeiler Est. No. 1 is located approximately 1,600 feet northwest of the Site in West Village Park. Plugged and abandoned well Maulhardt No. 9 is located approximately 1,750 feet east of the Site. Numerous other abandoned wells are present further south and east of the site but were not described in this report.

3.4.2.2 California State Water Resources Control Board

Tetra Tech reviewed online resources at the California Environmental Protection Agency (Cal EPA) State Water Resources Control Board (SWRCB) Geotracker database (SWRCB 2017) for any records pertaining to the Site. No records for the Site or other portions of the 107.25-acre property where the Site is located were found in the Geotracker database. According to the Geotracker database, a closed Leaking Underground Storage Tank (LUST) Cleanup Site GTE (T0611100137) is located adjacent to the Site at 751 N Rose Avenue. However, further research using the Ventura County Environmental Health Department database indicate that the actual address for GTE (T0611100137) LUST cleanup site is 751 S Rose Avenue such that the listing is outside of the relevant search radius and does not pose any risk to the Site. In addition, the Geotracker database search identified a completed case-closed voluntary cleanup program site, Arenales/Kohala Property (clan/meth lab) (T0611182768), located approximately 700 feet west of the site in a nearby residential neighborhood. Five other complete case closed LUST sites are also located within one quarter to one half mile downgradient of the site. These records are discussed further in Section 5.3.

3.4.2.3 Department of Toxic Substances Control

Tetra Tech reviewed the DTSC EnviroStor database for any records pertaining to the Site. The Site is identified as HS #8 (60002683) with an Inactive – Withdrawn as of 6/25/18 Cleanup Status (DTSC 2018c).

3.4.2.4 County of Ventura Environmental Health Division

A request was submitted by email to the VCEHD for the research and review of all the records pertaining to the Site. According to the response received there was one prior record of septic activity at the Site and one record of hazardous materials inventories pertaining to the Eclipse Berry Ranch No. 9 that cultivates strawberries at the Maulhardt Ranch, which includes the Site (Appendix G).

There were VCEHD records dating from July through November 1994 documenting the permitting of two residential septic systems present in the residential area of the Maulhardt Ranch, one located 60 feet east of the main residence, and a second one located 25 feet east of a second mobile home structure. The records include a questionnaire dated July 25, 1994 on the property condition that was completed by Richard Maulhardt, a memorandum dated August 29, 1994 from the VCEHD indicating the application was incomplete and requesting a scaled plot plan showing the septic systems and a septic pumping tank report, a memorandum dated November 14, 1994 from the VCEHD indicating that the application was complete, a VCEHD septic tank pumping inspection report dated August 31, 1994, indicating the system was in good condition, a scaled plot plan showing the septic systems, and an analytical report for water from FGL Environmental Laboratory for coliform bacteria that indicated they were not present.

A Hazardous Materials Inventory Report provided by VCEHD dated September 19, 2017 provided the following information for materials by the Eclipse Berry Farm at Ranch No. 9 (the Maulhardt Ranch, including the Site):

Common Name	Maximum Daily Amount Stored
calcium nitrate	500 gallons
diesel fuel	250 gallons
sulfuric acid	500 gallons

These materials are currently stored for use at the northeast corner of the Maulhardt Ranch (APN 214-002-059) approximately 1,050 feet north of the Site. No additional records for the Site were located using VCEHD online records database.

3.4.2.5 Ventura County Agricultural Commissioner

Pesticide use records on file with the VCOAC indicate that the Site and 107.25-acre APN 214-002-059 lot which the Site is located within was actively farmed between January 2011 and February 2016 (Appendix G). The VCOAC does not generally maintain records for longer than approximately 4 to 5 years; however, records for the Site were available through 2011 (Enriquez-Pratt 2017). However, due to evidence of ongoing agricultural activities from historical aerial photographs and information contained in the disclosure provided by the property owners (High 2017), it can be assumed that there was pesticide use prior to January 2011.

3.4.2.6 City of Oxnard Fire Department Certified Unified Program Agency

A request was submitted by email to the City of Oxnard Fire Department CUPA for the research and review of all records pertaining to the Site. According to the response received there have been no prior records of CUPA cases associated with the Site (Mattern 2017) (Appendix G).

3.4.3 Environmental Records Review

As part of this assessment, Tetra Tech retained the services of EDR, a Connecticut-based company that maintains comprehensive environmental information databases and specializes in providing such data for use in real estate and environmental documents, such as this Phase I ESA. EDR performed a database search of the target property in accordance with current ASTM standards. A copy of this report is included as Appendix C.

Among the environmental databases searched were National Priorities List (NPL) sites; Resource Conservation and Recovery Information System (RCRIS) facilities; Superfund Enterprise Management System (SEMS) sites; Cal-Sites; California Hazardous Materials Incident Report System (CHMIRS); Spills, Leaks, Investigation and Cleanup Cost Recovery System (SLIC); Facility Index System/Facility Identification Initiative Program Summary Report (FINDS); Facility Inventory Database (CA FID UST); Hazardous Substance Storage Container Database (HIST UST); California Environmental Protection Agency/Office of Emergency Information (CORTESE); and California Leaking Underground Storage Tank (LUST) sites. Each of the databases was searched at a radius appropriate for ASTM E1527-15. Sites identified in the databases are listed and plotted in the complete environmental database report provided in Appendix C. The following includes a summary of information regarding the Site itself, properties immediately adjacent to the Site, and/or properties that have the potential to affect the Site based on their proximity to the Site.

3.4.3.1 Onsite EDR Listings

Listings for the target property were in three databases in the EDR-Radius Map report. Eclipse Berry Ranch #9 with the address listed as 1853 Camino Del Sol, Oxnard, CA was listed in the FINDS database. FINDS contains both facility information and references to other sources that contain more detail. EDR included the following FINDS databases in their report: (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System). Further research indicated that Eclipse Berry Ranch #9 was listed on the Cal EPA regulated site portal. According to the Cal EPA site portal the Site is currently in compliance with Hazardous Materials Release Response Plans (HMRRP) requirements; however, one minor citation was listed for June 19, 2017 for failing to meet the annual deadline for business plan submittal. Records reviewed from the Cal-EPA site portal confirmed information documented in The Hazardous Materials Inventory Report provided by VCEHD indicating that hazardous agricultural chemicals and fuels are used and stored on the Maulhardt Ranch property for the Eclipse Berry Ranch #9 (Appendix G). According to the owners of the Maulhardt Ranch, the Eclipse Berry Ranch #9 stores these materials at the northeast corner of the Maulhardt Ranch (APN 214-002-059) approximately 550 feet north of the Site.

3.4.3.2 Site-Adjacent EDR Listings

- Maulhardt Farms with the address, 1853 Camino Del Sol, Oxnard, CA was listed in the Ventura County Business Plan, Hazardous Waste Producers, and Operating Underground Tanks (Ventura Co. BWT) and Facility and Manifest (HAZNET) Databases. The Ventura County BWT list indicates by site address whether the Environmental Health Division has a Business Plan (B), is a Waste Producer (W), and or any Underground Tank (T) information. The EDR findings indicate that a Farm-Business plan is on record with the VCEHD, confirming past and present agricultural use of the Site. A search on the VCEHD online database returned record of two septic tanks associated with residential properties located in the Maulhardt Ranch residential area which are considered low risk and are described in Section 2.5.4.4. The HAZNET database is made up of extracted data from copies of hazardous waste manifests received each year by the DTSC (Department of Toxic Substances Control). The EDR report identified HAZNET waste records from 1999 that indicated several waste streams originating at the site including organic solids, unspecified oil-containing waste, and unspecified solvent mixtures. These records confirm waste generation from historical agricultural activities at the Maulhardt Ranch and likely pesticide use at the Site.

- Vineyard Plaza Cleaners, is listed on the EDR Hist Cleaner database at the address of 1944 Camino Del Sol. This location is in the Holiday Manor apartments that are located south of the Site along Camino Del Sol. EDR searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed include, but were not limited to, dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash and dry, etc. This database falls within a category of information EDR classifies as High Risk Historical Records (HRHR). EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns but may not show up in current government records. The EDR report indicates that Vineyard Plaza Cleaners operated from 2011 through 2013. No additional records were found associated with this listed property indicating the release of hazardous materials, response, or

enforcement actions. 1944 Camino Del Sol is located downgradient from the Site. This listing is not considered to be a REC for the Site.

- Rio Rosales Elementary School is listed on the EDR DTSC EnviroStor database at Kohala and Jacinto streets in Oxnard CA 93030. A Phase 1 Environmental Site Assessment, and PEA were completed for this site during 2002 prior to the construction of the Rio Rosales Elementary School. The current site status is no further action. Relevant findings of the PEA are described in this Section 5.4.1. This is not considered to be a REC for the Site.

- Superior Carpet Cleaning, with the address listed 633 Ursula, Drive, Oxnard, CA 93030, was also listed on the EDR Hist Cleaner database. The listed address is located in a single family home in a residential neighborhood approximately 477 feet west of the Site. The EDR report indicates that this business operated in 2008. No additional records were found associated with this listed property indicating the release of hazardous materials, response, or enforcement actions. In general, this site is expected to be cross gradient from the Site. This listing is not considered to be a REC for the site.

3.4.3.3 EDR Listings in the Site Vicinity

Properties Between 1/8 and 1/4 Mile from the Site

Four listings were identified by the EDR Report database search located one eighth to one quarter mile from the Site.

- Arenales / Kohala Property, located at 765 Kohala Street, 670 feet east of the Site, was listed on the EDR LUST SLIC and CDL databases. The database indicates that this site was an illicit methamphetamine lab. The case was completed through the voluntary cleanup program in 2007. The case is closed. This listing is not considered to be a REC for the Site.

- Continental Heritage Corp, located at 275 Rose Avenue, 0.181 mile south of the site, was listed on the Ventura Co. UST database as an inactive site and is located downgradient from the Site. This listing is not considered to be a REC for the site.

- Maulhardt Farm, located at 1953 E Colonia Road, 0.237 miles west of the Site, was listed on the Hazardous Substance Storage Container database (HIST UST) maintained by the State Water Resource Control Board. The Record indicated that 500 gallons of Diesel fuel used for agricultural activities was stored at the site. Records did not indicate past spills or releases at this property, therefore this listing is not considered to be a REC for the site.

- McCaslin Oil Company, located at 2425 Colonia Road, 0.237 miles west of the Site, was listed on the EnviroStor, LUST, HIST UST, HIST CORTESE, SWEEPS UST, and CA FID UST databases. The site case was closed as of October 13, 1998. Given the distance from the Site, completed remedial actions, and no further action status this listing is unlikely to pose any risk to the Site. This listing is not considered to be a REC for the site.

Properties Between One Quarter and One Half Mile From the Site

Eight State and Tribal Leaking Storage tank listings were listed in the EDR database at elevation equal or higher than the Site at distances from one quarter to one half mile from the Site. All of these listings were completed or case closed sites and not considered to be RECs for the Site. These site listings are summarized as follows.

- Wilma Pacific Inc., located at Bernoulli Circle, 0.280 miles east of the Site, was listed on the LUST database.

- Oxnard Fire Station #5, located at 1450 Colonia Avenue, 0.283 miles west of the Site was listed on the LUST database.

- Standard Pacific of Ventura, located at 1191 Colonia Road, 0.411 miles west of the Site, was listed on the LUST, UST, and HIST CORTESE databases.

- Jones Intercable, located at 721 Maulhardt Avenue, 0.488 miles east of the Site, was listed on the LUST and HIST CORTESE databases.

- Maul-Graves Leasing Co., located at 833 Maulhardt Avenue, 0.487 miles east of the Site, was listed on the LUST, HIST UST, and HIST CORTESE databases.

- Certified Freight Lines, located at 965 Maulhardt Avenue, 0.488 miles east of the Site, was listed on the LUST database.

- System 99, located at 965 Maulhardt Avenue, 0.488 miles east of the Site, was listed on the LUST and HIST UST databases.

- Mission Linen, located at 505 Maulhardt Avenue, 0.489 miles east of the Site, was listed on the LUST, DRYCLEANERS, and HIST CORTESE databases.

Seven State and Tribal Leaking Storage tank records were identified at elevation lower than the Site at distances of one quarter to one half mile from the Site. None of these listings were considered to be RECs for the Site. These site listings are summarized below.

- Four records associated with the address 121 Rose Avenue, 0.291 miles south of the Site were identified. The first was associated with Exxon (Sanchez) and listed on the LUST and HIST CORTESE databases. This site gained regulatory closure in 1996. Three other records associated with Mobile Oil SS#18-P7C were listed on the LUST database. Two of these gained regulatory closure in 1996, and the third one in 2007. Based on the distance from the Site and downgradient location, these sites are not considered to be RECs for the Site.

- Oxnard (City) Treatment Plant, located at Perkins Road, 0.395 miles west of the Site, was listed on the LUST and HIST CORTESE databases. This site gained regulatory closure in 1992. Based on the distance from the Site and downgradient location, this site is not considered to be a REC for the Site.

- Two records associated with Oxnard (City), located at 300 Marquita N, 0.397 miles west of the Site were listed on the LUST database. These sites gained regulatory closure in 1994. Based on the distance from the Site and downgradient location, these sites are not considered to be RECs for the Site.

One SLIC site was identified that is located from one quarter to one half mile of the Site.

- Nishimori Farms / Cambridge Development Co., located Southeast of Williams Drive, Soccorro Way, and Wankel Way, 0.432 miles north of the Site, was listed on the SLIC database. This listing obtained completed – case closed status in 1999 and is not considered to be a REC for the Site.

Several other sites, including "orphan" (i.e., unmappable sites) were listed within ASTM recommended search distances. However, due to the type of listing, distance from the Site, location of the Site with respect to assumed regional groundwater flow, topographical features, and/or status of the listed sites, these nearby sites are not considered to be RECs in connection with the Site.

3.4.4 Site Reconnaissance and Interviews

On October 23, 2017, Tetra Tech performed a visual reconnaissance of the Site property and conducted interviews with the Site owners Lynn and Richard Maulhardt. The purpose of the reconnaissance was to evaluate the Site and neighboring properties for visible indications of potential hazardous substance use, storage, and disposal, including the presence of USTs, ASTs, asbestos-containing materials, PCB-containing transformers or electrical equipment, and/or evidence of soil staining, stressed vegetation, ponds, pits, sumps, suspicious odors, fill and depressions, drums and barrels, or any other condition indicative of potential contamination. A Site reconnaissance checklist is included in Appendix I.

The Site reconnaissance consisted of walking around the Site accompanied by the Site owners Lynn and Richard Maulhardt and interviewing them about the items observed. Photographs were taken to document current conditions. Copies of the Site photographs are included in Appendix F.

3.4.4.1 Buildings and Structures

There are no buildings located on the Site.

3.4.4.2 Storage Tanks and Drum Storage

No evidence for existing or past use of storage tanks (UST or ASTs) or drum storage was observed on the Site during the Site reconnaissance.

3.4.4.3 Hazardous Substances Excluding Petroleum Products

No hazardous substances were observed during the reconnaissance.

3.4.4.4 Petroleum Products

No evidence of petroleum products was observed during the reconnaissance.

No evidence of used oil storage was observed during the reconnaissance of the Site.

3.4.4.5 PCB-Containing Transformers and Equipment

One pole-mounted transformer was observed onsite along the southern Site boundary on the north side of Camino Del Sol (Figures 2 and 3). No evidence of transformers leakage, such as soil staining, was observed during the Site reconnaissance.

3.4.4.6 Stained Soils/Stains/Stressed Vegetation

During the Site reconnaissance, no evidence of stained soils/stains/stressed vegetation was observed.

3.4.4.7 Asbestos-Containing Materials

The environmental professional preparing this report has reviewed the site history and performed a site inspection such that an educated opinion could be rendered. This opinion shall in no means constitute confirmation of the presence or absence of asbestos-containing building materials (ACBM). For confirmation, a complete survey with sampling and analysis would need to be performed. The use of ACBM was generally discontinued after 1980, with certain types of insulation, fireproofing, and acoustical materials banned by 1978.

During the Site reconnaissance, no buildings or structures were identified, thus an asbestos survey was not necessary and was therefore not conducted.

3.4.4.8 Lead-Based Paint

The environmental professional preparing this report has reviewed the site history and performed a site inspection such that an educated opinion could be rendered. This opinion shall in no means constitute confirmation of the presence or absence of lead-based paint (LBP). For confirmation, a complete survey with sampling and analysis would need to be performed. The use of LBP was banned in 1978.

During the Site reconnaissance, no buildings or structures were identified thus a LBP survey was not necessary and therefore not conducted.

3.4.4.9 Pipelines

3.4.4.10 California Code of Regulations Hazardous Pipeline Requirements

California Code of Regulations (CCR) Title 5, Section 14010(h) requires that new school sites shall not be located or within 1,500 feet of the easement of an above ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional. Hazardous pipelines are defined as:

- Pipelines carrying chemical products, natural gas, and other hydrocarbon products that are operating at a pressure of 80 psig or higher; and

- High-volume water lines, which are defined as water lines 12 inches or greater in diameter and include open aqueducts of comparable and greater volume handling capacity.

The National Pipeline Mapping System (NPMS), Office of the California State Fire Marshall, City of Oxnard Utilities-Sewer, Trash, and Water Department, and Maulhardt Ranch were contacted for information on hazardous pipelines located within 1,500 feet of the Site.

National Pipeline Mapping System

The U.S. Department of Transportation (DOT) Pipeline and Hazardous Materials Safety Administration NPMS website is an interactive database that maps the locations of hazardous liquid and gas transmission pipelines under DOT jurisdiction. Tetra Tech reviewed the NPMS website for information on hazardous liquid and gas transmission pipelines in the Site area. The NPMS data base indicated that no hazardous liquid pipelines are located within 1,500 feet of the Site (Appendix G). The nearest natural gas pipeline transmission pipeline under NPMS jurisdiction is located approximately 0.65 miles east and south from the Site along North Rice Avenue and West Fifth Street respectively (NPMS 2017).

Office of the California State Fire Marshal

Tetra Tech contacted the California State Fire Marshal (CSFM) for information concerning potential high-pressure petroleum product or natural gas transmission pipelines in the Site vicinity. According to the response received there have been no prior records of hazardous pipelines within 1,500 feet of the Site (Henigan 2017) (Appendix G).

City Oxnard Public Works

The City of Oxnard Public Works Water Division is the water purveyor for the Site area. Tetra Tech contacted the City of Oxnard Public Works Water Division for information on water pipelines within 1,500 feet of the Site and was provided with the City of Oxnard Water Atlas pages showing water pipelines within 1,500 feet of the Site (City of Oxnard 2010; 2011). The City of Oxnard Water Atlas indicated that there were two water pipelines located within 1,500 feet of the Site that were 12 inches or greater in diameter:

- A 12-inch diameter PVC water pipeline routed north-south beneath North Rose Avenue directly west of the Site (Figure 2); and

- A 12-inch diameter ACP water pipeline routed east-west beneath Camino Del Sol immediately south of the Site (Figure 2)

Copies of the City of Oxnard Public Works Water Division Water Atlas pages for the Site area are included in Appendix G.

Maulhardt Ranch

The Maulhardt Ranch maintains a 12-inch diameter PVC water pipeline routed east to west underlying the dirt access road just south of the northern boundary of the Maulhardt Ranch, approximately 920 feet north of the Site. This pipeline is connected to two buried 12-inch diameter PVC water pipelines that are routed north-south beneath and just west of the main north-south road approximately 450 to 460 feet east of Rose Avenue through the Site to the farmyard/residential area of the Maulhardt Ranch. The Maulhardt Ranch water pipelines will be removed from the Site and surrounding areas prior to the development of the High School No. 8.

Pipeline Risk Assessment

The two hazardous pipelines identified as identified above will be assessed in a separate task in accordance with the *Guidance Protocol for School Site Pipeline Risk Analysis* (California Department of Education [CDE] 2007). The methods, findings, and recommendations of the hazardous pipeline risk analysis will be presented in a High School No. 8 Pipeline Risk Analysis Report that will be summarized in the PEA report and included as an addendum to the PEA report.

3.4.4.11 Electromagnetic Radiation

Title 5 of the California Code of Regulations (CCR) stipulates that a school site shall not be within the following distances from a high power electric transmission line:

- 100 feet from a 50-133 kilovolt (kV) line;

- 150 feet from a 220-230 kV line; or
- 350 feet from a 500-550 kV line.

Pole-mounted electrical power lines located within 350 feet of the Site that are owned and operated by Southern California Edison in the Site area are shown on Figures 2 and 3. These power lines are located as follows:

- Located along the north side of Camino Del Sol at the southern Site boundary; and
- Routed through the Site a north-south alignment approximately 210 feet east of North Rose Avenue.

Southern California Edison indicated that all noted pole-mounted power lines are rated at 16 kV (Wall 2017).

3.4.4.12 Hazardous Air Emitters

Tetra Tech evaluated the neighborhood during the Site reconnaissance for facilities or businesses considered likely to emit hazardous air pollutants; none were observed in the Site vicinity. Based on observations of surrounding properties, review of the EDR Radius Report (EDR 2017) (Appendix C), which tracks the emissions database inventory of the California Air Resources Board, there are no hazardous air emission sources located within 0.25 mile of the Site and it is unlikely that the Site would be impacted by hazardous air emissions.

3.4.4.13 Railways

CCR Title 5 stipulates that a railroad safety study must be completed for any proposed school site located within 1,500 feet of a railway track easement. Based on review of the Santa Maria, California Quadrangle, USGS, 7.5-minute topographic series map (USGS 2015), and a Google Earth Image dated October 2, 2016, the Site is not located within 1,500 feet of a railroad track easement. The railroad track easement located nearest to the Site is approximately 0.6 miles south of the Site.

3.4.4.14 Freeways and Busy Traffic Corridors

Senate Bill 352 created a requirement to determine whether a school site is located within 500 feet of a freeway or busy traffic corridor would create a health hazard from exposure to high levels of criteria pollutants. Freeways and busy traffic corridors are defined as roadways with average daily traffic in excess of 50,000 vehicles in rural areas and 100,000 daily vehicles in urban areas. Based on review of the Oxnard, California Quadrangle, USGS 7.5-minute topographic series map (USGS 2015), and a Google Earth Image dated January 5, 2015, there are no freeways or other busy traffic corridors located within 500 feet of the Site. Highway 101 is located approximately 1 mile north of the Site.

3.4.4.15 Airports

CCR Title 21 requires the State Department of Transportation to review any proposed school site that is located within 2 nautical miles of a runway. There are no airports within 2 nautical miles of the Site. Based on review of a Google Earth Image date January 5, 2015, and AirNav.com (AirNav.com 2017) (Appendix E), no airports are located within two nautical miles of the Site. The closest airport to the Site

is the Oxnard Airport, which is approximately 2.4 nautical miles west of the Site. In addition, the Camarillo Airport is located approximately 3.2 nautical miles east of the Site.

Based on review of data from AirNav.com, the Site is located within 2 nautical miles of a heliport. The St John's Regional Medical Center Heliport is located approximately 0.6 nautical miles north of the Site (AirNav.com 2016) (Appendix G).

3.4.4.16 Pesticides/Herbicides/Fertilizers

During the site visit the property owners disclosed that agricultural chemicals associated with the current strawberry cultivation activities performed on the Maulhardt Ranch and the Site are stored offsite at the northern end of the parcel. The VCOAC was contacted regarding past pesticide use for the Site, their response is discussed in Section 3.4.2.5. Discussion with the site owners and review of historical aerial photographs and Google Earth images dating from 1943 through 2015 indicate that the Site was used for crop production throughout the time period, that organochlorine pesticides (OCPs) were in use, and that OCPs were used at the Site.

3.4.4.17 Electronic Waste

During Site reconnaissance, no evidence of electronic waste was observed.

3.4.4.18 Rodents

During Site reconnaissance, no evidence of rodents was observed.

3.4.4.19 Potable Water Supply/Wells

No wells were observed during Site reconnaissance. The Site property owners indicated that the Maulhardt Ranch owns and operates an active water well offsite at the northeast corner of the Maulhardt Ranch property (Maulhardt 2017).

3.4.4.20 Wastewater

During Site reconnaissance, no industrial wastewater generation was observed.

3.4.4.21 Storm Water

Storm water runoff on the Maulhardt Ranch and Site drains to the south in furrows between the raised strawberry beds to shallow east west trending drainage channels along the east-west trending farm roads where it is routed to central drainage ditch located along the east side of the main north-south farm road in the eastern area of the Site (Figure 2). The central drainage ditch flow to the south and empties into the storm drain beneath Camino Del Sol through an inlet at the south boundary of the Site.

3.4.4.22 Wetlands/Intertidal Lagoon

The EDR report indicates that the Site is covered in the National Wetlands Inventory prepared by the U.S. Fish and Wildlife Service (USFWS) (EDR 2017) (Appendix C). Based on the information provided in the EDR report and by the USFWS, the nearest delineated wetland is located within approximately 1.3 miles southeast of the Site (EDR 2017; USFWS 2015).

3.4.4.23 Sewage Disposal System/Septic Systems

No evidence of septic systems was noted on the Site property during Site reconnaissance. Septic systems are located in the farmyard and residential areas of the adjacent Maulhardt Ranch property.

3.4.4.24 Drains/Sumps/Vaults/Pools

No drains, sumps, vaults, pools or similar receptacles where liquids drain, collect, or are stored were observed during the Site reconnaissance.

3.4.4.25 Solid Waste

No evidence of solid waste disposal was observed at the Site. Domestic trash collection and disposal is managed by the City of Oxnard.

3.4.4.26 Other Site-Specific Environmental Conditions

There were no other Site specific environmental conditions noted during the site reconnaissance.

3.4.5 Vicinity Reconnaissance

The land use of the area surrounding Site is depicted on Figures 2 and 3. The Maulhardt Ranch residential and farmyard areas are adjacent to the Site on the south and west (Figure 3). Areas of residential development are present to the west, south, and east of the Site. A strip mall is located south of the Site across Camino Del Sol at the southeast corner of Camino Del Sol and North Rose Avenue. Del Sol Park is located at the southeast corner of Camino Del Sol and North Rose Avenue and a park and Rio Rosales Elementary School are located across Jacinto Drive from the northeast corner of the Site. The area immediately north of the Site on Maulhardt Ranch is developed for strawberry cultivation. The Maulhardt Ranch farmyard and residential areas are immediately south and west of the Site.

A search of the Geotracker database identified two adjacent properties having previous remediation cases (SWRCB 2017). Eleven other previous remediation cases were identified within a 1-mile radius of the site in the EDR report (EDR 2017). These cases are discussed in Sections 3.4.2.2 and 3.4.2.4.

3.4.5.1 Maulhardt Ranch Residential and Farmyard Areas

The Maulhardt Ranch residential and farmyard areas that are adjacent to the Site on the south and west are described in detail in this section due to their close proximity to the Site (Figure 3). Table 2 lists the numbered items identified on Figure 3.

Tin Shed

The Tin Shed is a single-story warehouse-like structure that occupies approximately 5,140 square feet. It was reportedly originally constructed in the early 1900s (Maulhardt 2017) (Figure 3). It is of gable-roofed wood frame construction covered in sheet metal, with walls approximately 8.5 feet high and an open beam ceiling approximately 20 feet high at the roof ridge line. The Maulhardts indicated that the floor was partially paved with concrete; however, it was covered in soil at the time of the reconnaissance. Shelves, workbenches, cupboards full of various pieces of equipment and supplies are located along the north, west, and southwest walls of the building. The Tin Shed is used to store various pieces of farming equipment and farming equipment maintenance items and supplies. The general housekeeping was of

random organization. Items observed in this building included two tractors, a lima bean planting device fabricated by the Maulhardts, acetylene welding equipment and supplies (gas cylinders), a steel anvil, PVC irrigation pipe, aluminum ladders, three poly pesticide-fertilizer distribution tanks (approximately 100 to 300 gallon capacity), various pieces of aluminum greenhouse framework, several plastic portable fuel containers (approximately 5 to 20 gallon capacity), an old smudge pot, various lengths of rubber and plastic hose, an air compressor, mountain bike, various smaller gasoline and diesel fuel powered farm equipment, hand tool (shovels, rakes, etc.), a drill press, grinding wheel, a used automobile battery, automotive maintenance equipment (jacks, engine hoist, a 150-gallon (approximate) waste oil drum with a "Back Gold" label, two empty 20-gallon (approximate) oil drums, and other items. Stained soil was observed in the central area of the Tin Shed, and more may be present beneath the equipment and materials stored in the building. The Tin Shed is depicted in Photographs 18 through 31 in Appendix F.

Horse Barn

The Horse Barn is a two-story warehouse-like structure that occupies approximately 7,740 square feet. It was reportedly originally constructed in 1908 (Maulhardt 2017) (Figure 3). It is of gable-roofed wood frame construction covered in wood siding. The first story floor walls are approximately 8.5 feet high and an open beam-joist construction. The Maulhardts indicated that the first story floor was partially paved with concrete; however, it was covered in soil at the time of the Site reconnaissance. Horses are housed in the southern half of the first floor. The northern half is used for storage of various items, including three vintage nonoperational automobiles and a small (10-foot-long) fishing boat. The second story is accessed by a 10-foot-wide wooden ramp that can be accessed by automobiles. The second story has a wood floor with an open ceiling and exposed post and beam construction with walls approximately 8 feet high on the north and south and 20 feet high on the gable ends. Three bales of hay, a motorcycle, and a 12-foot-long boat were observed in this area. The general housekeeping was reasonably organized. The Horse Barn area is depicted in Photographs 45 through 50 in Appendix F.

Garage

The Garage is a single-story structure that occupies approximately 700 square feet (Figure 3). It was reportedly originally constructed in the early 1900s (Maulhardt 2017). It is of gable-roofed wood frame construction covered in sheet metal, with walls approximately 7 feet high and an open beam ceiling approximately 12 feet high at the roof ridge line. It has a concrete floor with a concrete-lined mechanic's pit on the south side that was used for automotive repair and maintenance. Two vintage automobiles and a motorcycle were parked inside the garage during the Site reconnaissance and various automotive equipment and maintenance items were also stored inside. The general housekeeping was of random organization. A fuel storage AST and UST were formerly located adjacent to this building and the fuel dispenser equipment associated with them is still present in the eastern wall of the building interior. The Garage is depicted in Photographs 10 through 14 in Appendix F.

Storage Shed

The Storage Shed is a single-story structure that occupies approximately 400 square feet (Figure 3). It was reportedly originally constructed in the early 1900s (Maulhardt 2017). It is of gable-roofed wood frame construction covered in wood siding, with walls approximately 8.5 feet high and an open beam ceiling approximately 10 feet high at the roof ridge line and has a concrete floor. Various farming equipment and supplies were observed in the Storage Shed during the Site reconnaissance. The Maulhardts indicated that pesticides were formerly stored in this building. The Storage Shed is depicted in Photographs 15 and 16 in Appendix F.

Carriage House and Shed

The Carriage House is a single-story structure that occupies approximately 500 square feet (Figure 3). It was reportedly originally constructed in 1880 (Maulhardt 2017). It is of gable-roofed wood frame construction covered in wood siding, with walls approximately 8.5 feet high and an open beam ceiling approximately 10 feet high at the roof ridge line and has a concrete floor. This structure was empty during the Site reconnaissance. The Maulhardts indicated that horse carriages and automobiles were formerly stored in this building. The shed on the east side of the Carriage House is a former chicken coop originally constructed in the 1930s. It is single-story, occupies approximately 100 square feet of shed-roofed wood frame construction, and is covered in wood siding with a dirt floor. It was reportedly used as a chicken coop and for storage of various farm supplies.

Covered Livestock Pen

The Covered Livestock Pen is a single-story structure that occupies approximately 450 square feet. Review of historical aerial photographs indicates it was originally constructed between 2012 and the present (Figure 3). It is of gable-roofed, of wood frame construction, with open sides, with a dirt floor. It has been reportedly used to house pigs (Maulhardt 2017). The Covered Livestock Pen is depicted in Photograph 50 in Appendix F.

Workshop and Shed

The Workshop and adjacent Shed are single-story structures that occupies approximately 200 and 440 square feet, respectively (Figure 3). Review of historical aerial photographs indicates they were originally constructed between 1967 and 1978. They are roofed, of wood frame construction, covered in wood siding, with concrete floors. The general housekeeping of the Workshop was well-organized. Various woodworking tools and supplies were observed in the Workshop during the Site reconnaissance. The Workshop is depicted in Photograph 19 in Appendix F. The interior of the Shed was not observed during the reconnaissance. It is reportedly used for storage of various farm supplies.

Office

The Office is a single-story structure that occupies approximately 2,300 square feet (Figure 3). The north central portion was reportedly originally constructed in in the early 1900s with four additions gradually added (Maulhardt 2017). It is of gable-shed roofed wood frame construction covered in stucco and wood siding with a raised foundation. It was originally a laundry and has been used as a residence and the main office for the Maulhardt Ranch. The interior was divided into a back utility room, two bedrooms, a kitchen, and a sitting-parlor room area. During the reconnaissance, numerous old computers, printers, and various office related electronic equipment and supplies were stored throughout the building. The general housekeeping was of random organization. The Office is depicted in Photograph 33 in Appendix F.

Residential Structures

The residential structures adjacent to the Site are the Main Residence (approximately 4,420 square feet), Apartment (approximately 780 square feet), and two Mobile Homes (approximately 3,040 square feet each) (Figure 3). The Main Residence and Apartment were constructed in 1917 (Maulhardt 2017). The Main Residence and Apartment are two-story structures. The Main Residence is constructed with concrete walls and a stucco exterior with a roof that is hip-framed and covered with tile around the exterior of the building with a flat roofed interior area covered with asphaltic roofing material. The

Apartment is constructed with either concrete walls or wood framed walls and a stucco exterior. The roof is hip-framed and covered with tile. The Apartment has a garage on the first floor with living quarters on the second floor. The two Mobile Homes were constructed between 1967 and 1978 and are of wood frame construction with flat roofs. Tetra Tech did not access the interior of the residential structures during the Site reconnaissance because they were occupied.

Storage Tanks and Drum Storage

Based on information provided by the Maulhardts, two fuel storage USTs and one fuel storage AST were formerly located within the residential and farmyard areas of the Maulhardt Ranch and removed in the 1970s or 1980s. The USTs and AST were operated and removed without permits from the County of Ventura that the Maulhardts believed were not required at that time. A 500-gallon (approximate) AST formerly used to store gasoline and 500-gallon UST (approximate) formerly used to store diesel fuel were located adjacent to the Garage or "gas house" and were removed approximately 30 years ago (Figure 3; Table 2, Item 11). A gasoline 250-gallon (approximate) UST was formerly located adjacent to the southeast corner of the two-story Apartment and was removed 20-30 years ago (Figure 3; Table 2, Item 24). According to the Maulhardts, no known fuel releases occurred from either the AST or USTs. No evidence for spills or stained soils were observed at the former AST or UST locations during the reconnaissance (Appendix F, Photographs 10, 11, 36, and 37).

Four existing 500-gallon (approximate) propane ASTs owned and operated by AAA Propane Services, Inc. (AAA) were observed near to the Main Residence, Apartment, eastern Mobile Home, and western Mobile Home (Figure 3; Table 2, Items 25, 27, 30, and 32) (Appendix F, Photograph 35, and 41).

An existing abandoned 500-gallon (approximate) heating oil AST is present immediately west of the Main Residence (Figure 3; Table 2, Item 28); Appendix F, Photograph 40). The heating oil AST was formerly used to provide heating oil for an oil furnace to heat the Main Residence. The Main Residence is now heated with a natural gas furnace.

According to the property owners, a 500-gallon (approximate) weed oil AST was formerly located adjacent to the northwest corner of the Garage that was removed over 30 years ago. This AST was operated and removed without permits from the County of Ventura that the Maulhardts believed were not required at that time. The Maulhardts indicated that the AST likely leaked in the past and that stained soils were observed during removal (Figure 3; Table 2, Item 15).

One 30-gallon storage drum (approximate) was observed partially covered with debris near the southern wall inside of the Storage Shed (Appendix F, Photograph 16). Several trailer mounted pesticide and fertilizer distribution tanks of various sizes were observed inside of the Tin Shed building (Appendix F, Photographs 18-24). A heavily stained waste oil tank with a "Black Gold" label on it was observed within the Tin Shed (Appendix F, Photograph 22). Several small 5-gallon plastic portable fuel containers and an empty 25-gallon (approximate) waste oil drum were observed at the western end of the Tin Shed (Appendix F, Photograph 14). The drum was labeled however it was not legible due to age and condition.

3.4.5.2 Hazardous Substances and Petroleum Products

Small quantities of household hazardous chemicals, agricultural chemicals, petroleum products, and waste oil were observed within the Tin Shed, Garage, and Storage Shed (Appendix F, Photographs 14, 16, 18-20, 22, 24, 25 and 27-30). Lynn Maulhardt indicated that waste oil was discovered in the soil underlying the Apartment garage floor, and that this area was filled with concrete slurry over 40 years ago (Figure 3; Table 2, Item 23).

Records reviewed for this report indicate that hazardous substances including pesticides, herbicides, and various petroleum products, may have been stored in the Maulhardt Ranch farmyard area. According to the property owners, the current chemical storage area for the Maulhardt Ranch strawberry farm is located at the northern end of the parcel, which is not within the boundary of the Site.

3.4.6 Interviews

3.4.6.1 Interview with Owner

Two of the current owners of the property, Lynn and Richard Maulhardt, were interviewed by Tetra Tech during the October 23, 2017 Site reconnaissance. The Maulhardt brothers indicated that the Site is part of the 107.25-acre property located at the southeast corner of North Rose Avenue and Camino Del Sol that is currently being considered for sale and redevelopment. The past and current use of the Site was for agricultural purposes. The Maulhardt brothers indicated that their family has owned and occupied the property since 1869. The Maulhardt brothers indicated that various septic tanks, ASTs, and USTs are present or have been removed at the residential and farmyard areas of the Maulhardt Ranch over the years. These items were discussed during the Site reconnaissance and are included in the disclosure memorandum discussed in Section 5.7 of the 2018 Phase I ESA (Tetra Tech 2018a; High 2017). The approximate locations and descriptions of these items provided during the onsite interview are shown in Figure 3 and Table 2.

3.4.6.2 Interview with Site Manager

The Site is managed by the Maulhardt family as represented by Lynn and Richard Maulhardt. The interview with Lynn and Richard Maulhardt is discussed in Section 3.4.6.1.

3.4.6.3 Interview with Occupants

The interview was conducted with the Maulhardt family, who has owned the Site since 1869.

3.4.6.4 Interview with Past Owners and Occupants

The Maulhardt family has owned the Site since 1869. Therefore, there are no other past owner-occupants to interview.

3.4.6.5 Interview with Local Government Officials

Tetra Tech contacted local government officials at agencies where records for the Site were available and reviewed by Tetra Tech. Additional information from interviewed government officials, if any, is included in the discussion in previous sections of this report.

3.4.6.6 Interview with Others

No other interviews were conducted with individuals other than those cited above in this section of the report.

3.4.7 Prior Assessments

Tetra Tech completed a Phase I ESA for the Site in March 2018 (Tetra Tech 2018a). Relevant sections of the March 2018 Phase I ESA are cited in this PEA report.

3.4.8 Natural Hazards

3.4.8.1 Seismic Hazards

Regional Earthquake Fault Analysis

The high rate of seismic activity in California and the Site area is the result of large-scale earth processes in which the Pacific plate slides northwestward relative to the North American plate at about 2 inches/year. This plate motion results in horizontal slip (primarily on the San Andreas "strike-slip" fault) and crustal block rotation and compression within a restraining bend of the San Andreas Fault, that has created the series of the prominent mountain ranges and intervening valleys situated between Santa Monica and Santa Barbara and associated thrust and reverse faults (CGS 2002a). Although slower moving than the strike-slip faults of the San Andreas system, these numerous thrust and reverse faults account for over half of the significant earthquakes that have occurred in Southern California during the past century, including the damaging 1971 M 6.6 San Fernando, 1994 M 6.7 Northridge, and 2003 M 6.5 San Simeon earthquakes (Ross *et al.* 2004).

Active and potentially active faults in the Site area were evaluated by reviewing the *Fault Activity Map of California and Adjacent Areas* (Jennings 1994), *Map No. 0-6 California Geological Survey 150th Anniversary Fault Activity Map of California* (Jennings, *et* al. 2010), *Draft Background Report, City of Oxnard General Plan* (City of Oxnard 2006), Figures 2.2.1b, 2.2.2 and 2.2.3b of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013), and Earthquake Zones of Required Investigation Maps for the Saticoy Quadrangle (CDMG 1978), Camarillo Quadrangle (CDMG 1998b; CGS 2002a), and Santa Paula Quadrangle (CDMG 1998a; CGS 2002a). Active faults are defined as those faults with evidence of displacement within the last 11,000 years and potentially active faults are defined as those with evidence of displacement within the last 1.6 million years (CGS 2007). The terms active and inactive faults have been interpreted differently by geologists, seismologists, and agencies. For this report, active faults are defined as having evidence of surface displacement within the last 11,000 years and potentially active faults are defined as having evidence of surface displacement in the last 1.6 million years (CGS 2007).

The earthquake faults located nearest to the Site are the Springville Fault, located approximately 5.4 km (3.3 miles) east of the Site, the Wright Road Fault, located approximately 6.1 km (3.7 miles) north of the Site, the Oak Ridge Fault, located approximately 7.3 km (4.5 miles) north of the Site, the Camarillo Fault located approximately 8.3 km (5.1 miles) east of the Site, and the Ventura-Pitas Point Fault, located approximately 8.9 km (5.5 miles) north of the Site.

The Oak Ridge Fault System is a Late Quaternary dip slip fault dipping at approximately 65 degrees to the south that extends from the Santa Susana Mountains where it has been overridden by the north-dipping Santa Susana Thrust Fault, westward along the southerly side of the Santa Clara River Valley and thence into the Oxnard Plain. The Oak Ridge Fault System is an active reverse fault with a slip rate of 3.0 mm/year, a maximum moment magnitude of 6.9 and a recurrence interval of 299 years. It does not have a surface expression nor have any been shown to cut near-surface sediments (alluvium). It is conceivable that past movement of this fault system in the Oxnard Plain area has not resulted in surface displacements but, instead, has resulted in only broad warping or tilting of the near-surface alluvial sediments. The lack of surface evidence of fault displacement in the Oxnard Plain is not necessarily indicative of activity in the recent geologic past as surface features could easily have been obscured by fluvial processes (erosion or deposition of alluvium). Several recorded earthquake epicenters in the offshore as well as mainland area during historic time may have been associated with the Oak Ridge Fault System or within close proximity and associated with it (County of Ventura 2013).

The Ventura-Pitas Point Fault is a Holocene, oblique left lateral reverse fault, dipping at approximately 64 degrees to the north that extends along the base of the foothills on the north side of the Santa Clara River from Santa Paula westerly to the mouth of the Ventura River, thence westerly into the Santa Barbara Channel area. Evidence for the existence of the Ventura-Pitas Point Fault is based mainly upon minor faulting of terrace deposits north of San Buenaventura and evidence of faulting from the Tidewater Oil Company corehole #5. It has slip rate of 1.0 mm/yr, a maximum moment magnitude of 6.8 and a recurrence interval of 1,112 years (County of Ventura 2013).

The Wright Road Fault is considered to be an active "tear" fault, terminating the west end of the Camarillo and Springville anticlines. It may be interpreted as a structural boundary between the Ventura Anticline on the west and South Mountain to the east (Treiman 1997). This fault was not included in the Appendix A CFP, or discussed in the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013), so characteristics such as the configuration, slip rate, and maximum moment magnitude were not reviewed for this report.

The Springville Fault Zone marks the southern edge of the Camarillo Hills, which are largely the expression of the Camarillo Anticline. This fold is relatively young, having developed within the last few hundred thousand years above young, concealed thrust faults of the Springville Fault Zone, which may be a back thrust off of the Oakridge Fault Zone. The Springville Fault Zone is approximately 5.5 miles long. The southern trace is largely concealed, extending approximately 2.5 miles east from the west end of the Camarillo Hills, and is considered to be an active, Holocene fault, with an estimated an average earthquake recurrence interval of 900 years with a displacement of 0.6 to 11 meters per event. The northern trace lies along the main body of the Camarillo Hills, extending approximately 5.5 miles east from the west end of the Camarillo Hills, and is considered to be an active fault, and marks the southern margin of the Camarillo Anticline (Treiman 1997). This fault was not included in the Appendix A CFP, so characteristics such as the configuration, slip rate, and maximum moment magnitude were not reviewed for this report.

The Camarillo Fault is expressed by an east-west anticlinal ridge approximately 5.5 miles long located southwest of Camarillo. This fault extends in an east-west direction immediately south of Camarillo from Calleguas Creek to Camarillo Airport. The present of the fault is based primarily upon the abrupt uplifted sediments along the north side of the fault that resulted in the long linear hill of the southern portion of Camarillo just south of the 101 Freeway (County of Ventura 2013). Limited trenching has not revealed a surface trace for this fault; however, the straight planar nature of most of the escarpment and the steepening of bedding near the base of the slope strongly suggests a surface fault. Although there is no hard evidence for Holocene activity on this fault, the step in the Calleguas Creek flood plain across the fault trace appears to be Holocene. Therefore, this fault is considered to be active (Treiman 1997). This fault was not included in the Appendix A CFP, so characteristics such as the configuration slip rate and maximum moment magnitude were not reviewed for this report.

Analysis of Historical Earthquakes

The rate of seismic activity for the Site areas was estimated from the USGS Earthquake Hazards Program Search Earthquake Catalogue website for the Site area from 1900 through 2018 (USGS 2018).

According to the USGS database, 119 earthquakes with magnitudes exceeding 4.5 have occurred within 63 miles (100 kilometers) of the Site since 1900. Significant historical earthquakes of the Oxnard region include the 1812 earthquake that effected most of Southern California (Richter Magnitude [M_L] 7.0), the 1827 Ventura Earthquake (M_L 7.0), the 1857 Fort Tejon Earthquake (M_L 7.1), the 1952 Tehachapi Earthquake (M_L 7.7), and the 2004 Northridge Earthquake (M_L 6.7). While all of these earthquakes were

felt in the Site area, no historical earthquakes have caused a great amount of property damage or loss of human life in the Site area. However, the historical earthquake record of California spans a little over 200 years and provides only a partial indication of seismic hazards. The absence of earthquakes on many recognized active faults and fault-related folds in California probably reflects recurrence intervals greater than the historical record.

3.4.8.2 Flooding Potential

Flood Zoning

FEMA Flood Insurance Rate Map No. 06111C0910E indicates that the Western half of the Site is located in Zone X (Other Areas) and is defined as areas determined to be outside the 0.2 percent (%) (500-yr) annual chance floodplain , while the eastern portion of the site is located in Zone X (Other Flood Areas) and is defined as areas of 0.2% (500-yr) annual chance of flood; areas of 1% (100-yr) annual chance flood with average depths of less than one foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% (100-yr) annual chance flood (FEMA 2010).

Reservoir Failure

A review of Section 2.11 and Figures 2.11.1 and 2.11.2 of the *Ventura County General Plan, Hazards Appendix* (County of Ventura 2013) and Section 4.3.3.1; Tables 4-5, 4-6, and 4-7; and Figure 4-3 of the *Multi-Jurisdictional Hazard Mitigation Plan for Ventura County, California* (County of Ventura 2005) indicates that there are four major reservoirs in the Santa Clara River watershed upstream of the Site that are FEMA high hazard dams that would inundate the Site area in the event of a reservoir failure.

3.4.8.3 Radon

Radon is a naturally occurring, odorless, colorless gas produced by certain geologic materials. It is known to be a human carcinogen and can pose a cancer risk greater than one in one million in humans at concentrations equal to or greater than 4 picoCuries per liter (pCi/L).

The EDR environmental database search indicated that Ventura County is in a Radon Zone 1 area. Zone 1 areas have a predicted average indoor screening level greater than 4 pCi/L. The EDR database search reported that of 38 sites listed in the California Radon database that have been tested for the zip code of 93030, one had radon at levels greater than 4 pCi/L. The Federal Area Radon Information database reported 9 sites tested for radon in the 93454 zip code. The average concentration of tested sites was 0.478 pCi/L in first floor living areas (EDR 2017).

The EDR report gives a passing result for the Site with no further action required. These findings suggest there are no health concerns related to radon at the Site.

3.4.8.4 Asbestos-Containing Rocks

Based on review of available topographic and geologic maps for the Site area and *A General Location Guide for Ultramafic Rocks in California – Areas More Likely to Contain Naturally Occurring Asbestos* (CDMG 2000) the risk for naturally occurring asbestos (NOA) in the soils of the proposed High School No. 8 site is low.

This page intentionally left blank.

4.0 POTENTIAL SITE CONTAMINATION

Based on Tetra Tech's background research for the Site in the High School No. 8 Phase I ESA (Tetra Tech 2018a) and the discussion during the July 25, 2018 PEA scoping meeting between DTSC, Oxnard Union High School District (OUHSD) and Tetra Tech, the following six RECs require assessment:

1. Potential toxic soil gas from potential formation leakage from the Oxnard Oil Field;

2. Potential residual OCPs, arsenic, SVOCs, PAHs, TPHd and TPHmo collectively known as TPHde in soil from fuel oil in smudge pots that were formerly used for frost abatement as part of the agricultural production activities at the Site;

3. Potential impacts to shallow soil, soil gas, and groundwater in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas ASTs and USTs formerly used for the storage of motor fuel and equipment maintenance activities (Figure 3);

4. Potentially hazardous substances and petroleum products that contained VOCs and TPHg have been used and stored in the Tin Shed, Horse Barn, Garage, and Storage Shed on the Maulhardt Ranch that may have impacted shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch farmyard area (Figure 3);

5. PCB soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol (Figure 2); and

6. The following hazardous pipelines identified within 1,500 feet of the Site (Figure 2):

    - The City of Oxnard maintains a 12-inch diameter PVC water pipeline routed north-south beneath North Rose Avenue immediately west of the Site;

    - The City of Oxnard maintains a 12-inch diameter ACP water pipeline routed east-west beneath Camino Del Sol immediately south of the Site;

    - The United Water Conservation District (UWCD) maintains a 42-inch water pipeline beneath North Rose Avenue immediately west of the Site; and

    - The Maulhardt Ranch maintains a 12-inch diameter PVC water pipeline routed east to west underlying the dirt access road just south of the northern boundary of the Maulhardt Ranch, approximately 920 feet north of the Site. This pipeline is connected to two buried 12-inch diameter PVC water pipelines that are routed north-south beneath and just west of the main north-south road approximately 450 to 460 feet east of Rose Avenue through the Site to the farmyard/residential area of the Maulhardt Ranch. The Maulhardt Ranch water pipelines will be removed from the Site and surrounding areas prior to the development of the High School No. 8.

The FSP describes the procedures for performing the assessment of RECs 1 through 5.

This page intentionally left blank.

5.0 ENVIRONMENTAL SETTING

5.1 FACTORS RELATED TO SOIL PATHWAYS

5.1.1 Site Topography

The ground surface elevations at the Site range from approximately 60 to 65 feet above mean sea level (msl). In general, the Site surface slopes very gently toward the south-southwest (Jensen 2018).

5.1.2 Proximity to Surface Water Bodies

There are no perennial surface water bodies on or close to the Site.

5.1.3 Evidence of Releases to the Environment

5.1.3.1 Potential Releases to Soil Gas

The underlying Oxnard Oil Field could potentially release toxic vapors to soil gas beneath the Site.

Potential contamination of Site soil gas was assessed with the sampling program discussed in Section 6.0.

5.1.3.2 Potential Releases to Soil

- Known use of pesticides and smudge pots for agricultural production at the Site;
- Potential impacts to shallow soil in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas from ASTs and USTs formerly used for the storage of motor fuel; and
- Potential PCB soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol.

Potential contamination of Site soils was assessed with the sampling program discussed in Section 6.0.

5.1.3.3 Potential Releases to Groundwater

Potential impacts to groundwater in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas from ASTs and USTs formerly used for the storage of motor fuel.

Potential contamination of Site groundwater was assessed with the sampling program discussed in Section 6.0.

5.1.4 Site Geology and Soil Types

5.1.4.1 Regional Geology

The Site is located on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. The Transverse Ranges Province is a series of ranges and intervening valleys that extends for 325 miles "directly across the structural grain of California" (Oakeshott 1978). The province extends from Point Arguello and San Miguel Island eastward to the

Pinto and Eagle Mountains which end in the Mojave and Colorado Deserts respectively. The province ranges in width from 10 to 50 miles. The narrowest points are at the western extreme in the Santa Ynez Mountains and at the Cajon Pass, which separates the San Gabriel and San Bernardino Mountains. The province's broadest point is the distance from the Santa Monica coast, across the Santa Monica, Topatopa, and Pine Mountains to the Tehachapi Mountains.

The Ventura Basin is large synclinal structure situated between the Santa Ynez Range and Topatopa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (CGS 2002a).

5.1.4.2 Local Geology

The Site is located in the Oxnard Plain of the Ventura Basin. The Ventura Basin, including its offshore continuation into the Santa Barbara Channel, is filled with a thick sequence of Cenozoic sedimentary rocks estimated to be more than 20,000 feet in total thickness. Major east trending folds and reverse faults reflect regional north-south compression and are characteristic of the basin (Norris and Webb 1990). The Oxnard Plain is underlain by several thousand feet of Pleistocene-age sediments of the San Pedro Formation. The San Pedro Formation consists of marine and continental deposits of clay, silt, and gravel (Turner, et al. 1975). The predominant surface materials in this region include Pleistocene to Recent age alluvial, floodplain, and near-shore deposits, some of which have been uplifted, folded, and faulted.

Stratigraphy

The Site is underlain at the ground surface by Holocene deltaic alluvium and wash fan deposits to approximately 70 feet below ground surface (bgs). These are conformably underlain by upper Pleistocene alluvial sand and gravel deposits to approximately 400 feet bgs, and the marine – non-marine clays and gravels of the Lower Pleistocene San Pedro formation to approximately 2,000 feet bgs (Earth Systems Pacific [ESP] 2018; Gutierrez, et al. 2008; Turner, et al. 1975).

U.S. Department of Agriculture, Soil Conservation Service Data

The U.S. Department of Agriculture(USDA), Soil Conservation Service data identifies the native soil types at the Site to be Mocho loam, Pico sandy loam and sandy loam substratum, Hueneme sandy loam, and Camarillo sandy loam. These soils are nearly level and occur on alluvial fans and flood plains. Permeability is rapid and surface runoff is very slow, such that there is no hazard of erosion by water (USDA 1970).

Tetra Tech September 2018 Soil Boring Data

Tetra Tech completed 25 soil borings (borings SV-1 through SV-25) to 15.5 feet bgs and five borings (borings SV-26 through SV-30) to 25 feet bgs at the Site for the PEA on September 18-20, 2018. The boring locations are shown on Figures 4 and 5. The borings were drilled using a truck mounted direct push drill rig with continuous core drilling to collect soil samples, document soil conditions in boring logs, and install soil gas wells. In addition, soil and groundwater samples were collected from borings SV-26 through SV-30. A lithologic description of the materials encountered and collected was maintained on boring logs compiled by the field geologist, under the supervision of a California Registered Geologist. Soils were classified in accordance with the Unified Soils Classification System

(USCS) (ASTM 1990a, b), and descriptions included soil type, particle size and distribution, color (using the Munsell soil color chart), moisture content, and evidence of contamination (discoloration, unusual odors). The soils were screened for the presence of elevated organic vapor concentrations using a photoionization detector (PID), and the measurements were recorded on the boring logs (Appendix K).

The soil boring log data indicate that the Site is generally underlain by of silty sand at the ground surface extending to approximately 3 to 8 feet bgs, underlain by interbedded poorly to well graded sand to at least 25 feet bgs. Groundwater was encountered in at approximately 21 feet bgs in borings SV-26 through SV-30. The boring logs are provided in Appendix K.

Earth Systems Pacific April and July 2018 Soil Boring Data

ESP completed 53 geotechnical soil borings to depths ranging from 10 feet bgs to 51.5 feet bgs during April and July 2018 to collect soil samples and soil blow-count density data for the High School No. 8 Geotechnical Report (ESP 2018) that was completed as part of Tetra Tech's Geohazard Assessment/Geotechnical Investigation of the Site (Tetra Tech 2018c). The borings were completed using a truck mounted Mobile Model B-53 hollow stem auger drilling rig. The general subsurface profile observed in the borings consisted of silty sand at the ground surface extending to approximately 3 to 8 feet bgs, underlain by interbedded poorly to well graded sand and occasional gravel with clay and silt layers that are exposed in the borings completed for this project to 51.5 feet bgs. These alluvium and wash deposits were deposited by the Santa Clara River. Groundwater was encountered at depths ranging from approximately 20 to 25 feet bgs in the deeper borings completed for this project. The soils were in a slightly moist to moist condition above the water table and wet below the water table. The sandy soils have a loose to very dense consistency while the silt and clay soils were medium stiff to stiff. Several of these soil layers also had varying amounts of fine to coarse gravel and cobbles.

5.1.5 Site Accessibility and Controls

The Site is accessible from a driveway at 1853 Camino del Sol. The access to the Site is controlled by a six-foot high chain link perimeter fence installed by the Maulhardt Ranch for the security.

5.1.6 Proximity to Receptors

The residents nearest to the Site are located along west side of Festivo Street to the east, on the south side of Camino Del Sol to the south, on the west side of North Rose Avenue to west, and the north side of Cesar Chavez Drive to the North (Figure 2). The PEA sample locations are located approximately 150 feet west of residences on Festivo Street, 150 feet north of the residences on Camino Del Sol, 225 feet east of the residences on North Rose Avenue, and 900 feet south of the residences on Cesar Chavez Drive. A covered 6-foot-high chain link fence surrounds the entire Maulhardt Ranch, including the Site, and prevents the visual examination of the Site by the residents in the neighborhoods surrounding the Maulhardt Ranch. These are the nearest potential human receptors.

5.2 FACTORS RELATED TO WATER PATHWAYS

5.2.1 Groundwater

5.2.1.1 Hydrogeologic Setting

The Site is located in the northern portion of the Oxnard Plain Pressure Basin within the Santa Clara River Hydrologic Unit (Turner, et al. 1975; Ventura County Public Works Agency [VCPWA] 1975). The

Oxnard Plain Basin is a relatively flat alluviated area, which ranges in elevation from sea level to approximately 100 feet. The water bearing zones of the Oxnard Plain Basin are grouped into three major units; 1) the semi-perched aquifer and clay cap, 2) the Upper Aquifer System (UAS), and 3) the Lower Aquifer System (LAS).

The semi-perched aquifer and clay cap consists of all of the alluvial materials above the Oxnard aquifer. In the Site area, the semi-perched aquifer extends to depths of approximately 75 feet bgs and the clay cap from approximately 75 feet bgs to 150 feet bgs (Turner, et al. 1975). The semi-perched aquifer consists primarily of geologically Recent-aged stream deposited sands and gravels with minor silt and clay interbeds. Sand and gravel deposits are generally parallel to the deltaic channel complex of the ancestral Santa Clara River and form lenses perpendicular to the channels of the ancestral Santa Clara River (Figure 3). The depth to the historically highest groundwater elevation for the Site area shown on Plate 1.2 of the *Seismic Hazard Zone Report for the Oxnard 7.5-Minute Quadrangle. Ventura County, California* (CGS 2002a) is approximately 8 feet bgs. The "clay cap" underlies the semi-perched groundwater zone separating it from the underlying Oxnard aquifer of the UAS. This clay cap acts as an aquitard. Based on topographic controls, groundwater in the site vicinity is expected to flow toward the south to south-southwest.

The UAS system consists of the Oxnard and underlying Mugu aquifer zones. These two water bearing units were combined due to their similar, planar structure. Both the Oxnard and Mugu aquifers are composed of sediments deposited largely by the ancestral Santa Clara River during the Upper Pleistocene. The Oxnard aquifer zone extends from approximately 150 to 200 feet bgs in the Site area and is a laterally continuous layer gravel and cobbles and coarse to fine sand, with local fine-grained lenses deposited in non-marine environment. The underlying Mugu aquifer zone extends from approximately 200 to 400 feet bgs in the Site area and consists of laterally continuous sand and gravel deposited in a shallow marine embayment on an erosional unconformity on top of the San Pedro formation that forms the top of the LAS.

The LAS system in the Site area, in descending order, consists of the Hueneme and Fox Canyon aquifer zones. The sediments in the LAS are more structurally complex than the UAS resulting from folding and faulting. Both the Hueneme and Fox Canyon aquifer zones are composed of lower Pleistocene age San Pedro Formation.

5.2.1.2 Site Groundwater Elevations

Tetra Tech September 2018 PEA Field Assessment

Groundwater was encountered in the semi-perched aquifer zone at approximately 21 feet bgs in borings SV-26 through SV-30 completed for the PEA field assessment during September 2018. The boring logs are provided in Appendix K.

Earth Systems Pacific April and July 2018 Soil Boring Data

Groundwater was encountered in the semi-perched aquifer zone at depths ranging from approximately 20 to 25 feet bgs in the deeper borings completed for ESP geotechnical investigation during April and July 2018.

5.2.1.3 Groundwater Quality

Groundwater in the borings completed for this project in the semi-perched zone is generally considered to be of poorer quality and of limited beneficial use (Turner, et al. 1975). The groundwater in the underlying UAS system, the Oxnard and underlying Mugu aquifer zones is generally of good quality and serves as a major source of water for agriculture, municipal, and industrial use in the Oxnard area.

5.2.1.4 Aquifers Impacted by Site Releases

Potential impacts to the groundwater of the semi-perched zone from fuel formerly stored in ASTs and USTs in the Maulhardt Ranch farmyard area was identified in the Phase I ESA report (Tetra Tech 2018a). Potential impacts to soil and groundwater from the former fuel storage ASTs and USTs in being assessed as part of this PEA.

5.2.2 Surface Water

No surface water was observed at the Site during the reconnaissance performed on July 2, 2018. It is likely that during periods of moderate rainfall, free surface water that accumulates on the Site may flow south and southwest and possibly into gutters along Camino Del Sol and North Rose Avenue (Figures 1 and 2). However, the USDA, Soil Conservation Service report indicates that soil permeability at the Site is moderate to rapidly moderate and surface runoff is very slow, such that there is a low hazard of erosion by water (USDA, Soil Conservation Service 1970).

5.3 FACTORS RELATED TO AIR PATHWAYS

5.3.1 Potential Air Pathway Sources

There is no documented evidence of releases of hazardous substances to the atmosphere from the Site. Based on the graded agricultural Site land use documented in aerial photographs and images dating from 1927 to 2012 (Appendix D), there is a potential for releases to the air from fugitive dust emissions of potentially contaminated surface soils.

The Site overlies the Oxnard Oil Field. There is a potential for methane and hydrogen sulfide toxic gas to occur in near surface soil due to the presence of the underlying Oxnard Oil Field.

The prevailing wind direction for the Site area is from the west from April through October and the north from October through April. The average wind speeds are 6.6 miles per hour (mph) from November through May and 4.8 mph from June through October (Weather Spark 2018).

5.3.2 Site Climatologic Setting

The City of Oxnard is situated in a Mediterranean (dry subtropical) climate zone, experiencing mild and relatively wet winters, and warm, dry summers, in a climate called the warm-summer Mediterranean climate. Onshore breezes keep the communities of Oxnard cooler in summer and warmer in winter than those further inland. The average mean temperature is 61 degrees Fahrenheit (F). The average minimum temperature is 52 degrees F and the average maximum temperature is 69 degrees F. Generally, the weather is mild and dry, with 354 days of sunshine annually. The average annual precipitation is 15.62 inches (Wikipedia 2018).

This page intentionally left blank.

6.0 SAMPLING ACTIVITIES AND RESULTS

6.1 SUMMARY OF ACTIVITIES

Based on the background data collected for the PEA, the objectives of the sampling program, as detailed in the FSP (Tetra Tech 2018b), were as follows:

- Assess the potential presence and/or migration of methane, hydrogen sulfide, and fixed gases (carbon dioxide, carbon monoxide, oxygen, and nitrogen) in soil gas due to the underlying Oxnard Oil Field;
- Assess the potential presence of OCP residues, arsenic, SVOCs, PAHs, and TPHde in surface soil due to former crop production activities;
- Assess the potential presence of PCBs in surface soil beneath the pole-mounted electrical transformer located onsite adjacent to Camino Del Sol; and
- Assess the potential VOC, SVOC, TPHg, and TPHde impacts to soil gas, shallow subsurface soil, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch residential and farmyard areas from former ASTs and USTs formerly used for the storage of motor fuel and herbicides in these areas.

The field sampling program described in the FSP consisted of two parts: a soil gas sampling assessment and a soil and groundwater sampling assessment. The soil gas, soil, and groundwater sampling were conducted on September 18 through 20, 2018. All field activities were conducted according to the guidelines provided in the QAPP (Appendix A) and Site Health and Safety Plan (Appendix B). Summaries of the soil gas, soil, and groundwater sampling programs are provided in Tables 3, 4, and 5, respectively.

Sixty soil gas samples were collected from 30 locations across the Site at depths of 5 and 15 feet bgs. Samples from each location were used to address one or more of the objectives described above. The soil gas sample analyses and rationale are provided in Table 3.

Surface soil samples were collected from a total of 61 locations (SS-1 through SS-61) (Figure 4). Surface soil samples from each location were used to address one or more of the objectives described above. Surface soil samples and analyses and the rationale for each are provided on Table 4.

Ten subsurface soil samples were collected from a total of five locations (SV-26 through SV-30) (Figure 4). Subsurface soil samples from each location were used to address one or more of the objectives described above. The subsurface soil samples and analyses and the rationale for each are provided on Table 4.

Five groundwater samples were collected from a total of five locations (SV-26 through SV-30) (Figure 4). Groundwater soil samples from each location were used to address one or more of the objectives described above. The groundwater samples and analyses conducted are provided on Table 5.

The following sections describe the sampling strategy, assessment methods and procedures, analytical program, sample handling, decontamination procedures, and management of investigation-derived waste (IDW).

6.2 FIELD DOCUMENTATION

6.2.1 Field Log Book/Health and Safety Documentation

During field activities, a field log book and Health and Safety Documentation Forms were used to document where, when, how, and from whom any vital project information was obtained, and heathy safety practices. Log book and health and safety form entries were complete and accurate enough to permit reconstruction of field activities. Each page was dated and numbered and the time of each entry noted. All entries were legible, written in black permanent ink, and signed by the individual making the entries. At a minimum, the following items were recorded in the field log:

- Site name and address;
- Recorder's name;
- Team members and their responsibilities;
- Time of site arrival/entry onsite and time of site departure;
- Weather characteristics;
- Other personnel onsite;
- A summary of any onsite meetings;
- Health and safety PID monitoring data;
- Deviations from sampling plans and site safety plans; and
- Calibration readings for any equipment used and equipment model.

During sample collection, the following information was recorded in the logbook:

- Sample identification number;
- Sample location and description;
- Sampler's name(s);
- Date and time of sample collection;
- Type of sample (i.e., matrix);
- Type of sampling equipment used;
- Field observations and details important to analysis or integrity of samples (e.g., weather and odors); and
- Instrument readings (e.g., PID).

6.2.2 Boring Logs

The boring logs were prepared under the direct supervision of, and signed by, a California Registered Geologist. A lithologic description of the materials encountered and collected was maintained on boring logs compiled by the field geologist. Soils were classified in accordance with the USCS (ASTM 1990a, 1990b), and descriptions included soil type, particle size and distribution, color (using the Munsell soil color chart), moisture content, and evidence of contamination (discoloration, unusual odors). The soil samples were screened for the presence of elevated organic vapor concentrations using a PID and the measurements were recorded on the boring logs (Appendix K).

6.2.3 Chain-of-Custody

Each shipment of samples sent to the laboratory was accompanied by a chain-of-custody (COC) record. COC records are used to maintain the custodial integrity of the samples. A sample is considered to be in someone's custody if it is either in their physical possession, in their view, locked up, or kept in a secured area that is restricted to authorized personnel. COC records are also used to identify the contents of each sample shipment and the desired analyses to be performed on each sample. Copies of COC records are provided with the laboratory report in Appendices L (soil gas samples) and M (soil samples).

6.3 UTILITY CLEARANCE

Underground Service Alert (USA) was notified for utility clearance at the Site for locations of proposed boreholes.

6.4 SAMPLING RATIONALE

6.4.1 Soil Gas Sampling Locations and Rationale

A soil gas survey was conducted by InterPhase and A&R under subcontract to Tetra Tech to assess potential oil field–related toxic gases in soil gas beneath the Site. The direct push drilling and soil probe installation was performed by InterPhase and the soil gas sample collection and analysis was performed by A&R. The soil gas survey was used to assess potential toxic gas contamination associated with: (1) the underlying Oxnard Oil Field and (2) to assess potential risks from VOC and TPHg impacts to soil gas in the areas of the Site adjacent to the Maulhardt Ranch residential and farmyard areas from former ASTs and USTs formerly used for the storage of motor fuel in these areas. These potential risks were evaluated by collecting soil gas samples from 30 direct-push borings (SV-1 through SV-30) configured in a grid pattern across the Site (Figure 4). Two soil gas samples were collected from each of the borings, one at 5 feet bgs and the second at 15 feet bgs.

Soil gas samples were analyzed onsite at A&R's onsite mobile laboratory for methane, H_2S, VOCs, and TPHg. Soil gas were analyzed for fixed gases (carbon dioxide, oxygen, nitrogen, and carbon monoxide) at A&R's stationary laboratory in Ontario, California. The soil gas samples were analyzed for methane by EPA method 8015B, for H_2S using a Jerome H_2S Analyzer Model 631-X hand held portable gas analyzer instrument, VOCs by EPA method 8260B, TPHg by LUFT GCMS, and fixed gases by ASTM Method D-1946 (Table 3). Laboratory detection limits are provided in Table 6. Six field duplicate samples were collected for quality assurance/quality control (QA/QC) purposes (Table 3). The soil gas survey was conducted in accordance with *Advisory – Active Soil Gas Investigations* (DTSC and Los Angeles Regional Water Quality Control Board [LARWQCB] 2015).

6.4.2 Surface Soil Sampling Locations and Rationale

There were three objectives of the surface soil sampling program: (1) to assess potential OCP and arsenic contamination associated with agricultural activities; and (2) to assess potential hydrocarbon contamination from former smudge pot frost abatement activities, and to assess potential PCB contamination in the surface soil beneath the pole-mounted electrical transformer located onsite adjacent to Camino Del Sol.

Surface soil was sampled from a total of 61 locations (SS-1 through SS-61) (Figure 4).

Following guidelines recommended in *Interim Guidance for Sampling Agricultural Fields for School Sites* (Ag Guidance) (DTSC 2008), surface soil samples were collected on an approximate grid pattern at a density of approximately 1.2 sample locations per acre for a total of 60 locations: SS-1 through SS-60 (Figure 4) to assess potential OCP impacts and were analyzed for OCPs using EPA method 8081A. Surface soil samples were collected from 15 locations (SS-1, SS-4, SS-6, SS-9, SS-16, SS-23, SS-29, SS-34, SS-35, SS-38, SS-42, SS-44, SS-47, SS-57, and SS-60) to assess potential impacts to from arsenic following using EPA method 6061B and potential impacts from smudge pot fuel (for SVOCs using EPA method 8270C, PAHs using EPA method 8310, and TPHde using EPA method 8015B). Surface soil sample SS-61 was collected from beneath the pole-mounted electrical transformer located onsite adjacent to Camino Del Sol to assess the potential PCBs impacts using EPA method 8082. The soil sample and analyses and the rationale for each are listed in Table 4. Laboratory detection limits are provided in Table 7. Surface soil samples were collected by Tetra Tech using hand sampling methods.

6.4.2.1 Subsurface Soil Sampling Locations and Rationale

Subsurface soil samples were collected in the areas of the Site adjacent to the Maulhardt Ranch residential and farmyard areas to assess potential VOC, SVOC, TPHg, and TPHde impacts from ASTs and USTs formerly used for the storage of motor fuel and herbicides in these areas.

Ten subsurface soil samples were collected at 10 and 20 feet bgs from 5 direct-push borings (SV-26 through SV-30). Soil sample and analyses and the rationale for each are provided in Table 4. Laboratory detection limits are provided in Table 7. Continuous core direct push drilling was performed by InterPhase. The five borings were sampled continuously from the surface to the total depth for lithologic logging and to inspect for visible evidence of potential impacts from the ASTs and USTs formerly used for the storage of motor fuel and herbicides in the Maulhardt Ranch residential and farmyard areas. Soil sample and analyses and the rationale for each are provided in Table 4. The ten subsurface soil samples were analyzed for VOCs via EPA method 8260B, TPHg (C_4-C_{12} carbon range) via EPA method 8015B, and TPHde via EPA method 8015B. The TPHde analysis is broken out as C_{13}-C_{22} carbon range (TPHd), C_{23}-C_{40} carbon range (TPHmo), and C_{13}-C_{40} carbon range (TPHde) as shown on Table 4. Laboratory detection limits are provided in Table 7.

6.4.2.2 Groundwater Sampling Locations and Rationale

Groundwater samples were collected in the areas of the Site adjacent to the Maulhardt Ranch residential and farmyard areas to assess potential VOC, TPHg, and TPHde impacts from ASTs and USTs formerly used for the storage of motor fuel and herbicides in these areas.

Five hydropunch groundwater samples were collected using direct push drilling methods at 20 feet bgs from 5 direct-push borings (SV-26 through SV-30). Groundwater sample and analyses and the rationale for each are provided in Table 5. Laboratory detection limits are provided in Table 8. The groundwater

samples were analyzed for VOCs via EPA method 8260B and TPHg (C_4-C_{12} carbon range) via EPA method 8015B, and TPHde via EPA method 8015B. The TPHde analysis is broken out as C_{13}-C_{22} carbon range (TPHd), C_{23}-C_{40} carbon range (TPHmo), and C_{13}-C_{40} carbon range (TPHde) as shown on Table 5.

6.4.2.3 Rationale for Extractable Petroleum Hydrocarbons Analysis by Massachusetts Department of Environmental Protection Method

If TPHg or TPHde is detected in surface soil samples, subsurface soil samples, or groundwater samples at concentrations greater than the San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Levels (ESLs) for soil (SFRWQCB 2016), they will also be analyzed for extractable petroleum hydrocarbons (EPH) by Massachusetts Department of Environmental Protection Method in accordance with the recommendation in the PEA Guidance Manual (DTSC 2015) for performing simplified risk exposure analysis for TPH. Sample volume will be collected during the mobilization and archived with the laboratory pending review of TPH sample results.

6.5 SAMPLE COLLECTION PROCEDURES

6.5.1 Soil Gas Sampling

Soil gas sample collection was performed by InterPhase in accordance with *Advisory – Active Soil Gas Investigations* (DTSC and LARWQCB 2015). A brief description of the sample collection procedures is provided below. The soil gas sampling contractor's field sampling procedures are included in the FSP QAPP in Appendix A.

The 60 soil gas probes were installed in 30 soil borings completed using a direct push drilling rig. The borings were drilled using a 2.25-inch core sampler lined with acetate sleeves to recover continuous core soil samples for logging purposes. The temporary soil gas sampling probes were constructed by attaching 0.25-inch diameter polyethylene tubing to a gas permeable sampling screen and lowering the screen to the deep target sampling depth (15 feet bgs). Clean sand was poured into the borehole until it covered the sampling screen by at least 6 inches. Bentonite granular chips were then poured into the borehole to fill the annular space to approximately 6 inches below the next target sampling depth. The bentonite chips were then hydrated to seal the sampling probe. This process was repeated to install the shallower sampling point at 5 feet bgs. The sampling points were finished with approximately 1 to 2 feet of the sample tubing extending above the ground surface, and the borehole sealed to ground surface with hydrated bentonite. No purging or sampling was performed for a minimum of 30 minutes after probe completion, so that the bentonite had time to form a seal between sample probes.

Sixty discrete and 6 duplicate soil gas samples were collected from the 60 soil gas probes. A leak test was performed at all locations to ensure a tight seal at the surface. The leak tests were performed by placing a cloth saturated with isopropyl alcohol (IPA) around the above ground sampling system at the surface of each boring during purging and sampling. If the above ground sampling system seal was not intact, IPA would be detected in the soil gas sample. Very low concentrations of IPA were detected in 23 of the 47 soil gas samples at concentrations less than 10 times the laboratory reporting limit. The *Advisory – Active Soil Gas Investigations* (DTSC and LARWQCB 2015) states that:

> "If the concentration of the leak check compound is greater than or equal to 10 times the reporting limit for the target analyte(s), then corrective action is necessary."

IPA was not detected in any of the soil gas samples. Therefore, the test results for the 60 soil gas samples are useable.

Sixty normal soil gas samples and six duplicate samples were collected from the 60 soil gas probes using a sampling system that includes a vacuum pump, vacuum gauge, a calibrated flow indicator, moisture trap, and a metering valve. The sampling system was purged by vacuum pump. Prior to purging or sampling soil gas, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test consists of assembling the above-ground apparatus (e.g., valves, lines, fittings, vacuum manifold and pump downstream from the top of the probe) and evacuating the lines to a measured vacuum of about 100 inches of water column (in-H_2O), then shutting the vacuum in with closed valves on opposite ends of the sampling train. The vacuum gauge installed on the vacuum manifold was observed for at least one minute and there was no observable loss of vacuum, therefore, the fittings were tight and not leaking.

Two soil gas sample aliquots were collected from each probe, one was collected in Tedlar bags, one for onsite analysis and one for off-site analysis. The soil gas samples collected for off-site analysis were stored in boxes and were transported by A&R to their laboratory in Ontario, California for analysis.

Soil gas samples were analyzed in A&R's mobile laboratory in the field for methane by EPA method 8015B, H_2S using a Jerome H_2S Analyzer Model 631-X hand held portable gas analyzer instrument, VOCs by EPA method 8260B, and TPHg by LUFT GCMS. The soil gas samples analyzed for fixed gases were analyzed offsite at A&R's laboratory in Ontario, California by ASTM Method D-1946.

6.5.2 Surface Soil Sampling

Sixty-one discrete surface soil samples bgs (SS-1 through SS-61; Figure 4) and 11 duplicate surface samples were collected from 61 locations on the Site at depths of 0.0 to 0.5 feet bgs (Table 3). The surface soil samples were collected by hand directly into pre-cleaned glass sample containers fitted with Teflon-lined screw-caps.

6.5.3 Subsurface Soil Sampling

Soil borings were advanced at five locations (SV-26 through SV-30) using a direct-push drilling rig (Figure 4). Ten subsurface soil samples and one duplicate subsurface soil sample were collected at depths of 15 feet to 15.5 feet bgs and 20.0 to 20.5 feet bgs from the five direct-push borings to test for fuel related contaminants (Figure 4 and Table 4). The shallow subsurface soil samples were collected in acetate sleeves, which were sealed with Teflon sheets and end caps.

The original subsurface soil sampling schedule presented in the FSP (Tetra Tech 2018b) indicated that the soil samples would be collected at 5 feet to 5.5 feet bgs and 10.0 to 10.5 feet bgs based on the assumption that groundwater would be encountered at 15 feet bgs. The subsurface soil sample collection schedule was adjusted to 15 feet to 15.5 feet bgs and 20.0 to 20.5 feet bgs because groundwater was encountered at approximately 21 feet bgs.

6.5.4 Groundwater Sampling

Soil borings were advanced at five locations (SV-26 through SV-30) using a direct-push drilling rig (Figure 4). Five discrete and one duplicate groundwater samples were collected at depths of 21.0 to 21.5 feet bgs from the five borings using direct push drilling procedures. The groundwater samples were collected in 40 ml VOA vials and 1-liter amber glass containers (Table 5).

6.5.5 Soil Logging

The borings were logged using the Unified Soil Classification System (USCS) as defined in the ASTM methods D 2487-90 (ASTM 1990a) and D 2488-90 (ASTM 1990b). During sampling, a PID calibrated with isobutylene gas was used to monitor the potential presence and concentrations of organic vapors in the breathing zone for workers at each sample location and to screen soil samples. These organic vapor readings were recorded on field logs prepared by the field geologist/engineer during sampling activities. The drill cuttings and soil samples were evaluated in the field for staining and odor. The labeled samples were placed in an ice chest containing pre-cooled artificial ice pending delivery to the analytical laboratory with COC records.

6.5.6 Field Log

The following sampling information was recorded on the field logs: sample number and location, date and time, sample depth, lithologic description in accordance with the USCS (ASTM 1990a, 1990b), description of any visible evidence of soil contamination (i.e., odor, staining), and PID readings.

6.5.7 Sample Handling

6.5.7.1 Sample Containers and Preservatives

Sample containers utilized for this assessment were glass jars, acetate sleeves, and EPA 5035 kits for soil samples, and Tedlar bags for soil gas samples, and 40 ml glass VOA vials and 1-liter amber glass bottles for groundwater samples. All containers were received pre-cleaned. Preservatives are also not required for soil gas samples, as they are sealed in airtight containers and analyzed within method holding times. EPA 5035 kit chemical preservatives were used for soil samples to be analyzed for VOCs via EPA method 8260B and TPHg via EPA method 8015B. Groundwater samples that were analyzed for VOCs via EPA method 8260B and TPHg via EPA method 8015B were preserved with hydrochloric acid (HCL), All the soil and groundwater samples were placed on ice following collection to ensure sample integrity. Preservatives are not required for soil gas samples, as they are sealed in airtight containers and analyzed within method holding times.

Analytical methods, number of samples, types of containers, and holding times are summarized in Appendix A, Tables 3-5.

6.5.7.2 Soil Sample Packing and Shipping

To identify and manage samples collected in the field, sample labels were affixed to each sample container. The sample labels included the following information:

- Project number;
- Site name;
- Sample identification number;
- Sampler's initials;
- Date and time of collection; and

- Requested analyses.

Following collection and labeling, soil samples were immediately placed in a sample cooler for temporary storage. The following protocol was observed for sample packaging:

- Sample containers were placed in clear, plastic, leak-resistant, resealable bags prior to placement in the ice chest.
- Samples were placed in the ice chest with enough packaging material to minimize the potential for disturbance and/or breakage of the sample containers.
- Ice packs were placed in the coolers to keep samples cold during transport to the analytical laboratory.
- The COC form was placed in a water-resistant plastic bag and taped on the inside of the ice chest lid.

Soil gas samples collected from September 19 and 20, 2018 for analysis onsite in A&R's mobile laboratory for methane by EPA method 8015B, H_2S using a Jerome H_2S Analyzer Model 631-X hand held portable gas analyzer instrument, VOCs by EPA method 8260B, and TPHg by LUFT GCMS (Table 3). Soil gas samples analyzed for fixed gases by ASTM Method D-1946 at A&R's stationary laboratory in Ontario, California were retained by A&R personnel on September 20, 2018 and stored in boxes under COC documentation and transported by A&R to their stationary laboratory on September 20, 2018.

The soil samples and groundwater samples were transported to American Environmental Testing Laboratory (AETL) by courier under COC documentation on September 20, 2018.

6.5.8 Field Instrument Calibration

A Landtech GEM 2000 and PID were used for health and safety monitoring and field screening during soil sampling. The data were used as an immediate indicator of methane and H_2S gas, and VOC vapors in Site soils or in the breathing zone of Site workers.

The Landtech GEM 2000 was calibrated at the vendor prior to use. The PID must be calibrated in order to display concentration in units equivalent to parts per million (ppm). A span gas, containing a known concentration of an ionizable gas or vapor, was used to set the sensitivity. Isobutylene at 100 ppm and ambient air were used to calibrate the PID. The PID was calibrated once per day.

6.5.9 Decontamination Procedures

All equipment that came into contact with potentially contaminated soil or water was decontaminated consistently to ensure the quality of samples collected. Disposable equipment intended for one-time use was decontaminated and packaged for appropriate disposal. Equipment was decontaminated prior to and after each use. All drilling and sampling devices used were decontaminated using the following procedures:

- Non-phosphate detergent and tap water wash, using a brush if necessary;
- Tap-water rinse;

- Initial deionized/distilled water rinse; and
- Final deionized/distilled water rinse.

Equipment was decontaminated in a pre-designated area, and clean bulky equipment was stored on plastic sheeting in uncontaminated areas. Cleaned small equipment was stored in plastic bags. Materials stored more than a few hours were also covered.

6.6 SAMPLE ANALYSES AND RESULTS

Summaries of the total number of samples and corresponding analytical methods for soil gas samples are provided in Table 3, soil samples in Tables 4, and groundwater samples in Table 5.

Soil gas samples were analyzed onsite in A&R's mobile laboratory for methane by EPA method 8015B, H_2S using a Jerome H_2S Analyzer Model 631-X hand held portable gas analyzer instrument, VOCs by EPA method 8260B, and TPHg by LUFT GCMS (Table 3). Soil gas samples were analyzed for fixed gases by ASTM Method D-1946 at A&R's stationary laboratory in Ontario, California. A&R's analytical procedures and QA/QC measures are detailed in the laboratory's Standard Operating Procedure, provided as Attachment B to the QAPP (Appendix A). The laboratory's detection levels are provided in Table 6. Analytical results for soil gas samples are summarized in Tables 9 and 10. A&R's laboratory's report packages are provided in Appendix L.

The soil and groundwater samples were analyzed at AETL, in Burbank, California. Analytical procedures and QA/QC measures are detailed in the QAPP (Appendix A). Method detection limits (MDLs) and method reporting limits (MRLs) are provided in Tables 7 (soil) and 8 (groundwater). Analytical results for soil samples are summarized in Table 11. Compounds that were detected at concentrations below the MRL (i.e., between the MDL and RL) are reported as estimated concentrations and flagged with a "J" qualifier in data tables. The laboratory report packages are provided in Appendix M.

6.6.1 Field Quality Control Samples

Field duplicate samples were collected to assess the consistency of sampling procedures and precision of laboratory analyses. Field duplicate soil gas samples were collected by filling two Summa canisters at a single location and depth. Duplicate soil samples were obtained by collecting two adjacent sleeves from a single boring probe. For example, if a sample was collected from 5 to 5.5 feet bgs, then its duplicate was collected from 5.5 to 6 feet bgs in the same boring. For the surface soil composite duplicate, a discrete duplicate sample was collected side-by-side with the discrete samples collected for one of the composite groups and submitted to the laboratory to comprise the duplicate composite sample.

Six soil gas duplicate samples (SV Dupe 1 through SV Dupe 6) (Table 3), 12 soil duplicate samples (Soil Dup 1, Soil Dup 2, Soil Dup 2-1, Soil Dup 2-2, Soil Dup 3, Soil Dup 3-1, Soil Dup 3-2, Soil Dup 3-3, Soil Dup 3-4, Soil Dup 5, Soil Dup 6, and Soil Dup 7) (Table 4), and one duplicate groundwater sample (GW Dupe) (Table 5) were collected during fieldwork for the PEA.

6.6.2 Soil Gas Sample Analytical Results

During the soil gas sampling on September 19 and 20, 2018, 66 soil gas samples, including 6 duplicates, were collected from 30 locations (SV-1 through SV-30) to assess potential toxic soil gas related to the underlying Oxnard Oil Field. The 66 soil gas samples were analyzed in A&R's onsite laboratory for

methane by EPA method 8015B and H_2S using a Jerome H_2S Analyzer Model 631-X hand held portable gas analyzer instrument, and at A&R's stationary laboratory in Ontario, California for fixed gases by ASTM Method D-1946. The soil gas sample results for methane, H_2S, and fixed gases are summarized in Table 9. Methane, hydrogen sulfide, carbon monoxide, and carbon dioxide, were not detected in any soil gas samples. In the fixed gas analyses, oxygen content ranged between 22.4 and 10.3%, and the nitrogen content ranged between 66.6 and 90.6%.

During the soil gas sampling on September 19 and 20, 2018, 11 soil gas samples, including 1 duplicate, were collected from 5 locations (SV-26 through SV-30) to assess potential fuel related compounds in soil gas from the former ASTs and USTs in the adjacent Maulhardt Ranch farmyard and residential areas. The soil gas samples were analyzed in A&R's onsite laboratory for VOCs by EPA method 8260B and TPHg by LUFT GCMS. The soil gas sample results for VOCs by EPA method 8260B and TPHg by LUFT GCMS are summarized in Table 10. Toluene was detected at concentrations below the DTSC Screening Level (310 micrograms per liter [µg/L]) ranging from 0.030 µg/L in samples SV-26-15, SV-26-15 Dup, SV-27-15, SV-28-5, SV-29-5, SV-29-15, SV-30-5, and SV-30-15 to 0.070 µg/L in sample SV-26-5. Naphthalene was detected at concentrations below the DTSC Screening Level (11 µg/L) in samples SV-27-15, SV-28-15, and SV-30-5 at 0.020 µg/L.

6.6.3 Soil Sample Analytical Results

The following sections summarize the analytical results for soil samples collected during the PEA.

6.6.3.1 Analytical Results for Organochlorine Pesticides

Sixty discrete surface soil and nine duplicate surface soil samples were collected from 60 locations to assess OCPs in former row crop areas of the Site. The OCP surface soil sample results are summarized in Table 11. The surface soil sample locations are shown on Figure 4 and the surface soil sample locations for samples with OCPs detected at concentrations that exceed DTSC Screening Levels are shown on Figure 5. The discrete soil samples were to be combined into 15 composite samples and two duplicate composite samples by AETL, the analytical laboratory in accordance with the FSP (Tetra Tech 2018b). The 60 discrete soil samples were not combined into 15 composite samples or two duplicate composite and all 60 discrete soil samples and nine duplicate samples were analyzed for OCPs via EPA method SW8081A.

OCPs were detected in all 60 of the discrete surface oil samples and the nine duplicate samples collected for OCP analysis (Table 11). The analytical results for OCPS are summarized below.

- The OCPs 4,4'-DDD (DDD) and 4,4'-DDT (DDT) were detected in all the samples at concentrations below their respective DTSC Screening Levels (1,900 µg/kg and 1,900 µg/kg). 4,4'-DDE (DDE) was detected in 68 out of 69 samples at concentrations below its respective DTSC Screening Level (2,000 µg/kg) and was not detected at a concentration above the laboratory MDL (1.0 µg/kg) in sample SS-35-0 (Table 11).

- Chlordane (total) was detected in 54 samples at concentrations below its respective DTSC Screening Level (1,700 µg/kg) and was not detected at a concentration above the MDL (1.0 µg/kg) in 16 samples (Table 11).

- Chlordane (alpha) was detected in 43 samples and was not detected at a concentration above the MDL (1.0 µg/kg) in 26 samples. There is no DTSC Screening Level for Chlordane (alpha) (Table 11).

- Chlordane (gamma) was detected in 43 samples at concentrations below its respective DTSC Screening Level (1,700 µg/kg) and was not detected at a concentration above the laboratory MDL (1.0 µg/kg) in 26 samples (Table 11).

- Dieldrin was detected in 51 samples at concentrations below its respective DTSC Screening Level (34 µg/kg), in three samples at concentrations above its respective DTSC Screening Level SS-49 (Soil Dupe 3) at 37.20 µg/kg, SS-51 (Soil Dupe 3-3) at 34.70 µg/kg, and SS-59 at 40.40 µg/kg), and was not detected at a concentration above the MDL (1.0 µg/kg) in 17 samples (Figure 5 and Table 11).

- Toxaphene was detected in 20 samples at concentrations below its respective DTSC Screening Level (490 µg/kg), in 33 samples at concentrations above its respective DTSC Screening Level and was not detected at a concentration above the MDL (85.0 µg/kg) in 10 samples. The toxaphene concentrations in the 33 samples with concentrations above its respective DTSC Screening Level ranged from 510 µg/kg in sample SS-32 to 2,600 µg/kg in sample SS-49 (Soil Dupe 3-1) (Figure 5 and Table 11).

No other OCPs were detected at concentrations above their respective MDLs or DTSC Screening Levels.

6.6.3.2 Analytical Results for Arsenic

Fifteen surface soil samples and two duplicate samples were collected from 15 locations (SS-1, SS-4, SS-6, SS-16, SS-9, SS-23, SS-29, SS-34, SS-35, SS-38, SS-42, SS-44, SS-47, SS-57, and SS-60) to assess potential impacts to Site soils from arsenic using EPA method 6061B. Arsenic was detected in one sample (sample SS 42-0) at 2.65 milligrams per kilogram (mg/kg). Arsenic was not detected at concentrations above the laboratory MDL (2.5 mg/kg) or the DTSC arsenic screening value for soil at California School Sites (DTSC-ASL) (DTSC 2008) of 12 mg/kg in any other of the 16 samples (Appendix M).

6.6.3.3 Surface Soil Analytical Results for SVOCs, PAHs, VOCs, and TPHde

Fifteen surface soil samples and two duplicate sample were collected from 15 locations (SS-1, SS-4, SS-6, SS-9, SS-16, SS-23, SS-29, SS-34, SS-35, SS-38, SS-42, SS-44, SS-47, SS-57, and SS-60) to assess potential impacts to Site soils from smudge pot fuel. The samples were analyzed for SVOCs using EPA method 8270C, PAHs using EPA method 8310, and TPHde using EPA method 8015B. SVOCs were not detected at concentrations above their respective laboratory MDLs or DTSC Screening Levels (refer to Table 7) in any of the 17 samples (Appendix M). The PAHs fluoranthene and phenanthrene were detected in sample Soil Dup 3, the duplicate sample for SS-29 at concentrations of 0.0100 mg/kg (0.0117 mg/kg), respectively. The DTSC Screening Level for fluoranthene is 2,400 mg/kg and there is no DTSC Screening Level for phenanthrene (Table 7 and Appendix M). TPH as diesel fuel (C9-C22 carbon range) was detected in surface soil sample SS-35 (8 mg/kg) as compared to the DTSC Screening Level of 230 mg/kg. TPH as heavy hydrocarbons (C22-C40 carbon range) was detected in surface soil samples SS-4 (4.3 mg/kg), SS-29 (9.9 mg/kg), the duplicate sample for SS-29, Soil Dup 3 (11.3 mg/kg), SS-35 (19.1 mg/kg), SS-57 (12.6 mg/kg), and the duplicate sample for SS-57, Soil Dup 5 (5.8 mg/kg) as compared to the DTSC Screening Level of 5,100 mg/kg. TPH as diesel and heavy hydrocarbons (C9-C40 carbon range) was detected in surface soil samples SS-4 (4.3 mg/kg), SS-29 (9.9 mg/kg), the duplicate sample for SS-29, Soil Dup 3 (11.3 mg/kg), SS-35 (27.1 mg/kg), SS-57 (12.6 mg/kg) and the duplicate sample for SS-57, Soil Dup 5 (5.8 mg/kg) as compared to the DTSC Screening Level of 230 mg/kg. TPH was not detected in any other surface soil samples (Table 12 and Appendix M).

6.6.3.4 Subsurface Soil Analytical Results for VOCs, SVOCs, and TPHde

Ten subsurface soil samples and one duplicate sample were collected from the 5 direct push borings SV-26 though SV-30 at depths of 15 and 20 feet bgs to test for potential fuel related soil contamination from the ASTs and USTs formerly located in the adjacent area of the Maulhardt Ranch farmyard and residential areas. The samples were analyzed for VOCs using EPA method 8260B, SVOCs using EPA method 8270C, and TPHg and TPHde using EPA method 8015M. VOCs and SVOCs were not detected in any of the samples at concentrations above their respective MDLs or DTSC Screening Levels (Table 7 and Appendix M). Gasoline (C4-C12 carbon range), diesel (C9-C22 carbon range), and diesel and heavy hydrocarbons range (C9-C40 carbon range) TPH were detected in sample SV-28-20 at concentrations of 0.128 mg/kg, 2.7 mg/kg, and 2.7 mg/kg, respectively (Table 12). TPH was not detected in any other subsurface soil samples.

6.6.4 Groundwater Analytical Results for VOCs, TPHg, and TPHde

Five groundwater samples and one duplicate sample were collected from approximately 21 feet bgs in the 5 direct push borings SV-26 though SV-30 to test for potential fuel related groundwater contamination from the ASTs and USTs formerly located in the adjacent area of the Maulhardt Ranch farmyard and residential areas. The samples were analyzed for VOCs using EPA method 8260B, and TPHg and TPHde using EPA method 8015M. VOCs, TPHg, and TPHde were not detected in any of the groundwater samples at concentrations above their respective MDLs or DTSC Screening Levels (Table 8 and Appendix M).

The original subsurface soil sampling schedule presented in the FSP (Tetra Tech 2018b) indicated that the groundwater samples would be collected at 15.0 to 15.5 feet bgs based on the assumption that groundwater would be encountered at 15 feet bgs. The subsurface soil sample collection schedule was adjusted to 21 feet to 21.5 feet bgs because groundwater was encountered at approximately 21 feet bgs.

6.7 DISPOSAL OF INVESTIGATION DERIVED WASTE

In the process of collecting environmental samples during the field sampling program, different types of potentially contaminated IDW were generated that included the following:

- Used personal protective equipment (PPE);
- Disposable sampling equipment; and
- Decontamination fluids.

The EPA's National Contingency Plan (NCP) requires that management of IDW comply with all applicable or relevant and appropriate requirements (ARARs) to the extent practicable. The sampling plan followed the U.S. EPA *Office of Emergency and Remedial Response (OERR) Directive 9345.3-02* dated May 1991, which provides the guidance for the management of IDW. In addition, other legal and practical considerations that may affect the handling of IDW were considered.

Listed below are the procedures that were followed for handling the IDW:

- Used PPE and disposable equipment were bagged and placed in a municipal refuse dumpster. These wastes are not considered hazardous and can be sent to a municipal

landfill. Any PPE and disposable equipment that was disposed of which could have been reused was rendered inoperable before disposal in the refuse dumpster.

- Approximately 10 gallons of decontamination water were placed in one 55-gallon DOT drum, and approximately 0.5 cubic yards of soil cuttings were placed on two 55-gallon DOT drums and stored at the Site pending receipt of the analytical results. Based on the concentrations of contaminants detected, the decontamination water and drill cuttings will be properly disposed of offsite though a treatment and disposal facility.

6.8 DISCUSSION OF RESULTS

The analytical results of the soil gas survey are summarized in Tables 9 and 10. The analytical results for soil and groundwater samples are presented in Appendix M. The analytical results OCPS in surface soil are summarized in Table 11 and the analytical TPH in soil are summarized Table 12. A brief summary of the PEA investigation results is presented below.

6.8.1 Soil Gas Survey

The soil gas survey was conducted to assess potential toxic gases related the underlying Oxnard Oil Field and potential VOCs and TPHg in the area of the Site adjacent to the former AST and UST sites in the Maulhardt Ranch farmyard and residential areas. No significant impacts to soil gas from the Oxnard Oil Field or the AST and UST sites in the Maulhardt Ranch farmyard and residential areas was identified.

Methane, hydrogen sulfide, carbon monoxide, and carbon dioxide, were not detected in any soil gas samples. In the fixed gas analyses, oxygen content ranged between 22.4 and 10.3%, and the nitrogen content ranged between 66.6 and 87.1% (Table 9).

Low concentrations of naphthalene and toluene were detected the soil gas samples collected from borings that were located adjacent to the Maulhardt Ranch farmyard and residential areas (SV-26 through SV-30). Toluene was detected in all eleven samples and naphthalene in three (Table 10). For each VOC detected at concentrations above the laboratory MDL, the maximum detected concentration and number of samples it occurred in are listed in Section 6.6.2.

6.8.2 Analytical Results for Organochlorine Pesticides in Surface Soil

OCPs were detected in all 60 of the discrete surface oil samples and the nine duplicate samples collected for OCP analysis (Table 11). The OCPs 4,4'-DDD (DDD), 4,4'-DDT (DDT), 4,4'-DDE (DDE), Chlordane (total), Chlordane (alpha), and Chlordane (gamma) were detected at concentrations below their respective DTSC Screening Levels (Table 11). Dieldrin was detected in three samples at concentrations of 34.70 µg/kg, 37.20 µg/L, and 40.40 µg/kg, slightly above its DTSC Screening Level of 34 µg/kg. Toxaphene was detected in 33 samples at concentrations above its DTSC Screening Level (490 µg/kg) at concentrations ranging from 510 µg/kg to 2,450 µg/kg over an area of approximately 28 acres (Figure 5).

6.8.3 Analytical Results for Arsenic in Surface Soil

Of the 17 surface soil samples analyzed for arsenic, it was detected in one sample (sample SS 42-0) at 2.65 milligram per kilogram (mg/kg). Arsenic was not detected at concentrations above the laboratory MDL (2.5 mg/kg) or the DTSC-ASL of 12 mg/kg (DTSC 2008) in any other of the 16 samples (Appendix M). No significant impacts to the Site from arsenic in surface soil were identified.

6.8.4 Analytical Results for SVOCs, PAHs, TPHde, and TPHg in Surface Soil e

Seventeen surface soil samples analyzed for SVOCs, PAHs, TPHde, and TPHg to assess potential impacts to Site soils from smudge pot fuel. SVOCs were not detected at concentrations above their respective laboratory MDLs or DTSC Screening Levels (refer to Table 7) in any of the 17 samples (Appendix M). The PAHs fluoranthene and phenanthrene were detected in sample Soil Dup 3, the duplicate sample for SS-29 at concentrations well below their respective DTSC Screening Levels (Table 7 and Appendix M). TPH as diesel fuel (C9-C22 carbon range) and as heavy hydrocarbons (C22 -C40 carbon range) were detected in six of the surface soil samples at concentrations well below their respective DTSC Screening Levels (Table 7, Table 12, and Appendix M). TPH was not detected in any other surface soil samples. No significant impacts to Site surface soils from SVOCs, PAHs, TPHde, and TPHg were identified.

6.8.5 Analytical Results for VOCs, SVOCs, and TPHde in Subsurface Soil

Eleven subsurface soil samples were analyzed for VOCs, SVOCs, and TPHde to assess potential fuel related soil contamination from the ASTs and USTs formerly located in the adjacent area of the Maulhardt Ranch farmyard and residential areas. VOCs and SVOCs were not detected in any of the samples at concentrations above their respective MDLs or DTSC Screening Levels (Table 7 and Appendix M). Gasoline (C4-C12 carbon range), diesel (C9-C22 carbon range), and diesel and heavy hydrocarbons range (C9-C40 carbon range) TPH were detected one sample well below then DTSC Screening Level (Table 12). No significant impacts to Site subsurface soils from VOCs, SVOCs, and TPHde were identified.

6.8.6 Analytical Results for VOCs, TPHg, and TPHde in Groundwater

Six groundwater samples were collected from approximately 21 feet bgs in the 5 direct push borings SV-26 though SV-30 to assess potential fuel related VOCs, TPHg, and TPHde groundwater contamination from the ASTs and USTs formerly located in the adjacent area of the Maulhardt Ranch farmyard and residential areas. VOCs, TPHg, and TPHde were not detected in any of the groundwater samples at concentrations above their respective MDLs or DTSC Screening Levels (Table 8 and Appendix M). No significant impacts to Site groundwater from VOCs, TPHg, and TPHde were identified.

.

7.0 HUMAN HEALTH SCREENING EVALUATION

7.1 INTRODUCTION

The PEA screening evaluation for human health effects consists of three steps: (1) identifying potentially complete exposure pathways based on the conceptual site model, (2) identifying chemicals of potential concern (COPCs), and (3) estimating exposures to the COPCs and the associated potential health risks. The findings of the human health screening evaluation are summarized in the risk characterization summary.

7.2 EXPOSURE PATHWAYS AND MEDIA OF CONCERN

7.2.1 Conceptual Site Model

A conceptual site model (CSM) provides a description of the links between contaminant sources at a site, the chemicals detected at the Site, the mechanisms by which chemical transport or migration may occur in the environment, and the persons potentially exposed to environmental media at the Site. The CSM (Figure 6) identifies the potential sources, mechanisms of transport, environmental media of concern, and exposure routes for current and future human receptors at this Site.

As discussed in Sections 2.0 and 3.0, the Site is a 48.6-acre (approximate) portion of the 107.25-acre Maulhardt Ranch property in the City of Oxnard, California. The Site is bounded by Camino Del Sol on the south, North Rose Avenue on the west, Cesar Chavez Drive on the north, and a residential neighborhood to the east. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol, and neighborhoods of single family housing are located to the east and west of the Site.

The Site and adjacent areas have been used for agricultural production (row crops) since at least 1869. The Site is currently being used for strawberry cultivation. Records indicate that the Site is located within the Oxnard Oil Field; however, no known active or abandoned oil wells are present on the Site. Additionally, no oil wells are present on the 107.25-acre Maulhardt Ranch where the Site is located. The oil well located nearest to the site is the Maulhardt Community No. 11A, located approximately 850 feet south of the Site. Formerly, ASTs and USTs were located in the Maulhardt Ranch farm yard and residential area.

Organochlorine pesticides came into wide use in the late 1950s, and prior to that, arsenic-based pesticides were commonly used. Therefore, OCPs and arsenic-based compounds may have been used at the Site during agricultural production activities. Oil production activities and the underlying Oxnard Oil Field may have resulted in the release of contaminants to Site soils and soil gas, including metals, SVOCs, PAHs, PCBs, VOCs, TPHde and TPHg.

As shown in the CSM (Figure 6), five potential sources of chemicals have been identified at this Site: (1) pesticide and fuel oil releases from former agricultural operations (2), soil gas impacts from the underlying Oxnard Oil Field), (3) petroleum fuel releases from the ASTs and USTs formerly located in the adjacent Maulhardt Ranch farmyard and residential areas, (4) , potentially hazardous substances and petroleum products that contained VOCs and TPHg used and stored in the Tin Shed, Horse Barn, Garage, and Storage Shed on the Maulhardt Ranch that may have impacted shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch farmyard area, and (5) PCB soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol. As a result of these findings, soil gas samples were collected at the Site and analyzed

for VOCs, methane, and hydrogen sulfide. Soil samples were collected at the Site and analyzed for OCPs, metals, SVOCs, PAHs, PCBs, VOCs, TPHde, and TPHg, and groundwater samples were collected at the Site and analyzed for VOCs, TPHg, and TPHde.

School children and staff at the proposed High School are the receptor groups most likely to be exposed to any chemicals potentially present at the Site. PEA guidance (DTSC 2015) indicates that sites should be evaluated assuming unrestricted residential land use, regardless of current and future uses. Therefore, the unrestricted land use scenario (i.e., residential land use) was evaluated for this Site, which is protective of future school use since the exposure assumptions for a residential scenario are more conservative than those for a school scenario.

7.2.2 Soil Exposure Pathways

Currently, the Site is unpaved and bare soils may be contacted directly. COPCs have been detected in soils at the Site. Therefore, the potential exists for humans to be exposed to COPCs through direct dermal contact with soil and by incidental soil ingestion. In the future, it is likely buildings will be constructed at the Site. These buildings will act to limit exposures to soils by onsite receptors. However, in accordance with PEA guidance, all soils at the Site were considered available for dermal contact, incidental ingestion, and the generation of dusts (DTSC 2015). Additionally, the school-based exposure guidance (OEHHA 2004) assumes that dusts may be tracked indoors where receptors may incidentally ingest them.

7.2.3 Water Exposure Pathways

Hydrogeologic data from the vicinity of the Site indicate the water table is approximately 21 feet bgs or deeper (Section 5.2.1.2). Groundwater does not come to the surface at this Site and groundwater at the Site will not be used as a potable water source for the planned school. Direct exposure to groundwater beneath the Site is, therefore, not likely to occur. The potential release of petroleum products to groundwater from ASTs and USTs formerly located in the Maulhardt Ranch farmyard and residential areas, and from farm maintenance activities in the farmyard areas was assessed as part of this PEA. No evidence for release of petroleum products to groundwater beneath the Site from the adjacent areas of the Maulhardt Ranch farmyard and residential areas was identified in the samples collected for this PEA. Contamination of groundwater beneath the Site from off-site sources is considered unlikely. Therefore, potential groundwater exposure pathways are considered incomplete and were not evaluated in this human health screening evaluation.

No permanent surface water bodies occur on the Site. Therefore, surface water exposure pathways are likely to be incomplete and were not evaluated.

7.2.4 Air Exposure Pathways

There is no documented evidence of releases of hazardous substances to the atmosphere from the Site. Based on the graded agricultural Site land use documented in aerial photographs and images dating from 1943 to 2015 (Appendix D), there is a potential for releases to the air from fugitive dust emissions of potentially contaminated surface soils (Section 5.3.1). Nonvolatile chemicals may also sorb to soils. Wind erosion and dispersion of soil particulates could potentially result in exposure to these nonvolatile chemicals associated with airborne soil particulates (i.e., dusts). Therefore, it was assumed that receptors could potentially be exposed to COPCs by the inhalation of airborne dusts.

The prevailing wind direction for the Site area is from the west from April through October and the north from October through April. The average wind speeds are 6.6 miles per hour (mph) from November through May and 4.8 mph from June through October (Weather Spark 2018).

The Site overlies the Oxnard Oil Field and oil wells and oil production activities occurred in the vicinity of the Site area. There is a potential for methane and hydrogen sulfide toxic gas to occur in near surface soil due to former oil production activities in the Site area and the presence of the underlying Oxnard Oil Field. Therefore, it was assumed that receptors could potentially be exposed to COPCs in groundwater and/or soil gas migrating into indoor and ambient air.

The Site is adjacent to the Maulhardt Ranch farmyard and residential areas where ASTs and USTs were formerly used for fuel storage. In addition, farm vehicle and equipment maintenance occurred in the farmyard area and various petroleum containing products have been stored there. There is a potential for VOC gas to occur in near surface soil due to the former ASTs and USTs fuel storage, equipment maintenance, and petroleum containing product storage in the Maulhardt Ranch farmyard and residential areas. Therefore, it was assumed that receptors could potentially be exposed to COPCs in groundwater and/or soil gas migrating into indoor and ambient air.

7.2.5 Summary of Selected Exposure Pathways

Although the Site is planned as high school, for the purpose of this PEA screening evaluation, a residential/unrestricted land use scenario was assumed. Receptors were assumed to be potentially exposed to chemicals at the Site by direct dermal contact with soils, incidental ingestion of soils, the inhalation of airborne dusts, and the inhalation of volatiles emitted from soil gas to indoor and outdoor air. These potentially complete exposure pathways are shown in the CSM for planned future Site conditions (Figure 6).

7.3 CHEMICALS AND EXPOSURE POINT CONCENTRATIONS

Tables 9 through 12 present the results of chemical analyses for soil, soil gas, and groundwater samples collected at the Site.

7.3.1 Volatile Organic Compounds and H_2S

Soil gas samples collected at the Site were analyzed for VOCs potentially emitted from the Maulhardt Ranch farmyard and residential areas (Table 10). In accordance with *Advisory – Active Soil Gas Investigations* (DTSC and LARWQCB 2015), soil gas samples were analyzed for VOCs using EPA method 8260B. All chemicals detected in soil gas were selected as COPCs and are summarized in Table 13.

Methane and H_2S were not detected in soil gas and were therefore not selected as COPCs. The methane and H_2S sampling results are presented in Table 9.

Groundwater samples collected at the Site were analyzed for VOCs, TPHg, and TPHde associated with potential fuel and petroleum product releases from the ASTs, USTs, and activities in the adjacent Maulhardt Ranch farmyard and residential areas (Appendix L).

7.3.2 Total Metals

Consistent with the Tetra Tech Field Sampling Plan (Tetra Tech 2018b), only arsenic was analyzed for in soil. This was done based on a review of the Ventura County Agricultural Commissioner's information, which indicated that recently used pesticides are restricted to those with relatively short half-lives (hours to months). Historically, arsenical pesticides may have been used. To determine the presence of arsenic and ensure a health-protective assessment, soil samples were analyzed for arsenic using EPA method 6010B.

Metals present at concentrations equivalent to (or lower than) background concentrations do not need to be considered in the screening evaluation (DTSC 2015). Arsenic was detected at a maximum concentration of 2.65 mg/kg, which is well below the DTSC screening level of 12 mg/kg. As indicated in the DTSC *Interim Guidance for Sampling Agricultural Properties* (DTSC 2008), if all arsenic data are equal to or less than 12 mg/kg, then arsenic does not need to be considered a COPC and this determination does not require collection and comparison to a background data set. Therefore, arsenic was not selected as a COPC and was not evaluated.

7.3.3 Pesticides

The OCP soil sample results are summarized in Table 11. The Site has been used for agricultural production since at least 1869; therefore, it is assumed that OCPs were applied at the Site in the row crop areas.

To determine the presence of pesticides and ensure a health-protective assessment, soil samples collected at the Site were analyzed for OCPs using EPA method 8081A. The following nine organochlorine pesticides were detected in soils at the Site:

- DDD;
- DDE;
- DDT;
- Chlordane (total);
- Chlordane (gamma);
- Chlordane (alpha)
- Dieldrin; and
- Toxaphene.

All of the detected pesticides were selected as COPCs and evaluated. For chlordane, only the chlordane (total) results were evaluated since these results included gamma-chlordane and alpha-chlordane. This was done so that gamma-chlordane and alpha-chlordane were not double counted in the risk evaluation.

7.3.4 Chemicals of Potential Concern Summary

All of the detected organic chemicals at the Site were selected as COPCs and are evaluated in this screening-level evaluation. As previously indicated, only arsenic was analyzed for in soil and was only detected in one sample at a concentration well below the DTSC screening level of 12 mg/kg. Based on this data, arsenic was not selected as a COPC. Soil and soil gas COPCs were identified at the Site as follows:

Soil

- **No Metals**;
- **Six Organochlorine pesticides** (DDD, DDE, DDT, chlordane (total), dieldrin, and toxaphene); and
- **Two PAHs** (fluoranthene and phenanthrene).

Soil Gas

- **Two VOCs** (toluene and naphthalene).

Groundwater

- **None** (VOCs, TPHg, and TPHde reported as not detected).

All of the COPCs were included in the human health risk evaluation.

7.3.5 Exposure Point Concentrations

For this evaluation, the maximum detected concentration was used as the exposure point concentration (EPC) in accordance with DTSC's PEA guidance (DTSC 2015). The EPCs used in this screening assessment are summarized in Tables 13 through 16.

In the event that detected concentrations exceeded the corresponding screening level, risk was also calculated based on the 95% upper confidence limit (95% UCL) of the arithmetic mean. 95% UCLs were calculated for dieldrin and toxaphene. The 95% UCLs used in this screening are summarized in Table 16.

7.4 RISK-BASED SCREENING LEVELS

VOCs found in soil gas may migrate to indoor air. Although the proposed future use of the Site is a school, for this evaluation, the Site is being evaluated assuming residential/unrestricted land use. As such, potential future residents were identified as the potential future receptors that could be exposed to vapors emitted from soil gas. To be protective of potential school receptors, soil gas screening levels were developed to be protective of potential vapor intrusion risks.

For COPCs in soil, potential residential receptors could be exposed via ingestion, dermal contact, and inhalation of dusts and vapors. For this evaluation, soil screening levels were developed to be protective of potential exposures to COPCS in soil through these exposure pathways.

In accordance with the Human and Ecological Risk Office's (HERO's) Human Health Risk Assessment (HHRA) Note 3 (DTSC 2018), DTSC-modified air and soil screening levels and United States Environmental Protection Agency (USEPA) regional screening levels (RSLs) for air and soil were used as the basis for developing soil gas and soil screening levels protective of residential receptors potentially exposed via vapor intrusion into indoor air and contact with soil. DTSC-modified screening levels were used if available, otherwise USEPA RSLs were used.

Target Risk Levels

For this evaluation, target risk levels were determined according to USEPA and Cal/EPA guidance. USEPA's 1990 guidance indicates that a carcinogenic risk probability between 1 in 1,000,000 and 1 in 10,000 (1×10^{-6} to 1×10^{-4}) are generally acceptable. The lower end of the target risk range is typically applied to residential scenarios, whereas the higher range is typically considered appropriate for commercial/industrial situations. Thus, for this evaluation, carcinogenic air and soil screening levels were developed based on a target risk of 1×10^{-6} for residential receptors. For potential non-carcinogenic effects, USEPA (1990) indicates that non-carcinogenic chemicals should not be present at levels expected to cause adverse health effects. Therefore, for this evaluation, potential hazards for school receptors are evaluated based on a target hazard index (HI) of 1. Individual chemical exposures that yield HIs of less than one is not expected to result in adverse non-cancer health effects (USEPA 1989).

Soil Gas Risk-Based Screening Levels (RBSLs)

Soil gas screening levels were derived from the DTSC-modified air screening levels and USEPA air RSLs in accordance with HHRA Note Number 3 (DTSC 2016) using the DTSC default soil gas to indoor air attenuation factor for a future building of 0.001 (DTSC 2011). The soil gas to indoor attenuation factor represents the relationship between soil gas concentrations and the resulting indoor air concentrations. Since the DTSC default soil gas attenuation factor was developed to be applied to soil gas samples collected at a depth of 5 feet bgs, it provides a conservative screening for soil gas samples collected at a depth of 15 feet bgs that would be associated with greater attenuation.

The soil gas RBSLs for this evaluation were derived by dividing the DTSC and USEPA residential air screening levels by the DTSC default soil gas attenuation factor of 0.001. The derivation of the residential soil gas screening levels is summarized in Table 5 of the Tetra Tech Field Sampling Plan (Tetra Tech 2018), which was approved by DTSC.

Soil Risk-Based Screening Levels (RBSLs)

For this evaluation, DTSC-modified soil screening levels and USEPA soil RSLs protective of residential exposures were conservatively used to evaluate potential exposures to soil. The residential screening levels are conservative since they are based on exposure parameters that assume higher levels of exposure than would be associated with a school site. For example, the exposure frequency and exposure time in a residential scenario are 350 days per year and 24 hours per day, respectively. For a school scenario, the maximum exposure frequency and exposure time are 250 days per year and 10.3 hours per day, respectively.

7.5 RISK CHARACTERIZATION

Risks were characterized for potential residential receptors using the ratio of concentrations measured at the Site to the RBSLs identified for each environmental medium. This evaluation consisted of three steps: (1) specifying the target risk and hazard quotient to use in calculating the RBSLs; (2) estimating EPCs for each environmental medium (i.e., the maximum detected concentration); and (3) comparing the

EPCs to the RBSLs to estimate risks and hazards for potential receptors. Each of these steps is described below.

7.5.1 Risk Estimation Procedures

The RBSLs were calculated for a specified target risk (i.e., a carcinogenic risk of 1 x 10^{-6} for residential receptors) and concentrations greater than the RBSLs represent carcinogenic risks proportionally greater than the target risk. Similarly, concentrations less than the RBSLs represent carcinogenic risks proportionally less than the target risk. Risks were calculated as follows, using the ratio of each COPC's EPC and its media-specific RBSL:

Risk for residential receptors:

$$Risk = \frac{\text{EPC}}{\text{carcinogenic RBSL}} \times 10^{-6}$$

Hazard quotient (HQ) for residential receptors:

$$HQ = \frac{\text{EPC}}{\text{non - cancer RBSL}}$$

In accordance with USEPA and DTSC guidance, the risk and hazard ratios for each chemical and potentially complete exposure pathway were summed to determine the multi-pathway cumulative carcinogenic risk estimates and noncarcinogenic HI for potential receptors.

7.5.2 Site-Specific Cancer Risk and Hazard Estimates for Soil Gas

7.5.2.1 Soil Gas Sampling Depth of 5 Feet

As shown in Table 13, based on the maximum detected results for chemicals detected in soil gas at a sampling depth of 5 feet bgs, the estimated cancer risk for potential residential receptors exposed to indoor vapors based on the soil gas RBSLs is 5 x 10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for school receptors (1 x 10^{-6}). The maximum estimated non-carcinogenic HI is 0.007, which is well below the target HI of 1.

7.5.2.2 Soil Gas Sampling Depth of 15 Feet

As shown in Table 14, based on the maximum detected results for chemicals detected in soil gas at a sampling depth of 15 feet bgs, the estimated cancer risk for potential residential receptors exposed to indoor vapors based on the soil gas RBSLs is 5 x 10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for school receptors (1 x 10^{-6}). The maximum estimated non-carcinogenic HI is 0.007, which is well below the target HI of 1.

7.5.3 Cancer Risk and Hazard Estimates for Soil

As shown in Table 15, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for potential school receptors exposed to COPCs in soil based on the residential soil RBSLs is 7 x 10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6}, but exceeds

the target risk level for residential receptors (1×10^{-6}). The maximum estimated non-carcinogenic HI is 0.1, which is below the target HI of 1.

The primary contributors to the estimated risk for residential receptors exposed to soil are toxaphene (71%) and dieldrin (16%). No other chemicals were detected at levels exceeding the corresponding soil screening level. Risks estimated for all other COPCs is 1×10^{-6}, which is equal to the low end of the of the USEPA target risk range of 10^{-4} to 10^{-6} and equal to the target risk of 1×10^{-6} established for residents. Toxaphene was detected at 34 sampling locations at levels that exceeded the corresponding residential screening level of 490 µg/kg. Dieldrin was detected at three sampling locations (SS-49, SS-51, and SS-59) with concentrations ranging from (34.7 µg/kg to 40.4 µg/kg) that exceeded the corresponding residential screening level of 34 µg/kg.

The estimated cancer risks summarized in Table 15 are conservative as they are based on the maximum detected concentrations for each chemical rather than a representative exposure concentration such as the 95% UCL of the arithmetic mean concentration.

Table 16 provides a risk estimate based on the 95% UCLs for all pesticides detected in soil. The pesticides are the primary contributors to risk at the Site. As shown in Table 16, the estimated cancer risk for potential school receptors exposed to COPCs in soil based on the 95% UCLs for pesticides and residential soil RBSLs is 4×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} but exceeds the target risk level for residential receptors (1×10^{-6}). The estimated non-carcinogenic based on the 95% UCLs for pesticides HI is 0.09, which is below the target HI of 1. Only toxaphene is associated with a 95% UCL that exceeds the corresponding screening level. Risks estimated for all other COPCs is 8×10^{-7}, which is below the low end of the of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk of 1×10^{-6} established for residents.

7.5.4 Cumulative Risk and Hazard Estimates for Soil Gas and Soil

The estimated cumulative cancer risk associated with potential exposures to soil gas and soil based on the maximum detected concentrations is 8×10^{-6}, for both soil gas sampling depths, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the target risk level for residential receptors (1×10^{-6}). The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.2, which is below the target HI of 1.

The estimated cumulative cancer risk associated with potential exposures to soil gas and soil based on the 95% UCLs for pesticides maximum detected concentrations for other chemicals is 4×10^{-6}, for both soil gas sampling depths, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the target risk level for residential receptors (1×10^{-6}). The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.09, which is below the target HI of 1.

The results of this conservative evaluation, indicates that toxaphene levels detected in soil result in estimated risk that exceed the residential target risk level (1×10^{-6}). With the exception of toxaphene, it is very unlikely that the other COPCs detected in soil gas and soil are present at levels that would be expected to result in adverse health effects under a residential exposure scenario.

7.6 UNCERTAINTY ANALYSIS

This section presents an evaluation of several potential sources of uncertainty in the risk estimates presented in section 7.5. Uncertainty may have been introduced into the risk calculations as a result of:

- Assumed exposure to maximum detected concentrations; and
- Assumed exposure to all soils at the Site.

7.6.1 Use of Maximum Detected Concentrations

For this evaluation, it was conservatively assumed that potential receptors were exposed to the maximum detected concentration of each chemical detected in soil gas and soil. This is considered conservative since receptors are assumed to move around the site in such manner that they would likely be exposed to levels such as the average concentration for a site. For this reason, risk assessment guidance recommends using the reasonable maximum exposure (RME) point concentration represented by the 95% upper confidence limit (UCL_{95}) on the mean concentration, which is usually significantly lower than the maximum detected concentration. For this reason, risk and hazard estimates based on the UCL_{95} for the primary contributors to risk (i.e., pesticides) were also provided for the soil (refer to Tables 15 [maximum estimated risk] and 16 [estimated risk based on UCL_{95}]).

7.6.2 Exposure to All Soils at the Site

Future development at the Site will likely include several buildings and paved areas. Buildings and paved areas will act to prevent exposure to the soils underneath them, thus reducing soil exposures at the Site. Reduced exposure to the soils at the Site would also result in lower risk estimates for any future receptors at the Site.

7.7 RISK SUMMARY

A screening level human health risk evaluation was conducted for residential exposures to the COPCs identified in soil gas, groundwater, and soils at the proposed High School No. 8 Site. The COPCs identified in soils at the Site include OCPs, TPHs, and VOCs. Exposures to these COPCs were evaluated for direct dermal contact with soils, incidental ingestion of soils, inhalation of airborne dusts from soils, and inhalation of vapors migrating from soil gas into indoor air. Receptors were evaluated for: (1) carcinogenic risks and (2) noncarcinogenic hazards. Assumed exposures at the Site result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors. Noncarcinogenic hazard from assumed exposures to the COPCs in soil and soil gas at the Site (HI = 0.2) is well below the threshold level of 1.

The estimated risk is primarily attributable to toxaphene (71%) and dieldrin (16%). No other chemicals were detected at concentrations that exceeded the corresponding screening levels. Toxaphene was detected at 34 sampling locations at levels that exceeded the corresponding residential screening level of 490 µg/kg. Dieldrin was detected at three sampling locations (SS-49, SS-51, and SS-59) with concentrations ranging from (34.7 µg/kg to 40.4 µg/kg) that slightly exceeded the corresponding residential screening level of 34 µg/kg.

This page intentionally left blank.

8.0 ECOLOGICAL SCREENING EVALUATION

The purpose of the ecological screening evaluation is to qualitatively assess the potential for adverse ecological impacts posed by hazardous constituents at the site. The approach is to identify potentially complete exposure pathways between areas of contamination and biota or habitats that occupy, or could occupy, the site or areas affected by the site (DTSC 2015). Results of this ecological screening evaluation may be used to assist decision makers in deciding whether further site characterization, risk assessment, or remediation is necessary.

In accordance with DTSC guidance (DTSC 2015), this ecological screening evaluation consists of the following elements:

- Site characterization;
- Biological characterization;
- Pathway assessment; and
- Qualitative summary.

8.1 SITE CHARACTERIZATION

8.1.1 Site Description

The Site comprises approximately 48.6 acres of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property within the Rancho El Rio Santa Clara O'La Colonia Portion A of Subdivision 26 in the City of Oxnard. The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas.

The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue.

The entire Maulhardt Ranch (APN 214-002-059) is bounded by Camino Del Sol on the south, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site.

The Site is located in an area that is developed for commercial, residential, park, and agricultural land use (Figure 2).

8.1.2 Soils

Based on the Geologic Map of the Oxnard 7.5' Quadrangle, Ventura County, California the Site is underlain at the ground surface by Holocene deltaic alluvial fan deposits composed predominantly of clay with interbeds of sand and occasional gravel that were deposited by the Santa Clara River and extend to approximately 70 feet bgs (Gutierrez, et al. 2008; Turner, et al. 1975). These are conformably underlain by upper Pleistocene alluvial sand and gravel deposits to approximately 400 feet bgs, and the marine – non-marine clays and gravels of the Lower Pleistocene San Pedro formation to approximately 2,000 feet bgs.

Historic farming activities (1869 to present) have included surface tilling and regrading of surface soils.

8.1.3 Hydrology

8.1.3.1 Surface Water

There is no surface water present at the Site. The nearest surface water bodies are Revolon Slough 2.4 miles to the east of the site, and the Santa Clara River 2.9 miles north-west. The Pacific Ocean is located 5.1 miles to the south and southwest of the Site.

8.1.3.2 Groundwater

Groundwater was encountered at approximately 21 feet bgs at the Site in geotechnical drilling during May and July 2018. Historically groundwater has been as shallow as approximately 8 bgs at the Site (CGS 2002). Based on topographic controls, the groundwater in the semi-perched zone in the Site vicinity is expected to flow toward the south to south-southwest toward the Pacific Ocean.

8.1.4 Chemicals of Potential Concern

Chemicals of potential ecological concern (COPECs) include chemicals detected at the site that may adversely impact plant or wildlife populations. For this ecological screening evaluation, metals detected in accessible soils (i.e., surface soils from 0 to 0.5 feet bgs for surface dwelling wildlife or subsurface soils from 0.5 to 5 feet bgs for burrowing wildlife) that are greater than background levels may be identified as COPECs. In addition, all organic compounds that were detected in accessible soils or soil gas samples between 0 and 5 feet bgs are also considered COPECs. Total petroleum hydrocarbons (TPH) is not considered a COPEC because its constituents (e.g., VOCs and PAHs) are considered the toxic agents for plants and wildlife.

In addition, any organic compound that was detected in the soil gas survey will be included as a COPEC.

Arsenic was the only metal that was analyzed for in the PEA. Of the 17 samples analyzed for arsenic, it was detected only once at a concentration of 2.65 mg/kg. Background metals data were determined during the PEA for the nearby Rio Rosales Elementary School (ENSR 2002). Arsenic concentrations in the eight background samples obtained in the Rio Rosales study ranged from 1.8 to 4 mg/kg.

Given the low frequency of detection (1 of 17 samples) and the fact that the only detected concentration is within the range of background concentrations at the nearby Rio Rosales site, arsenic is considered to be naturally occurring and is not considered a COPEC in soils.

Sixty-eight VOCs were analyzed in 11 soils samples using EPA Method 8260B. No VOCs were detected in any of these samples.

SVOCs were analyzed by EPA Method 8270C in 18 soil samples. None of the 69 SVOCs analyzed for were detected in soils.

Eighteen PAHs were analyzed for in 18 soil samples using EPA Method 8310. Of the 18 PAHs analyzed, fluoranthene was detected in a single soil sample at a concentration of 0.01 mg/kg. Likewise, phenanthrene was detected in a single sample at 0.0117 mg/kg. No other PAHs were detected.

Nine PCB Aroclors were analyzed in two samples by EPA Method 8082. No PCBs were detected in these analyses.

Organochlorine pesticides were the most frequently detected compounds in soil. Twenty-two organochlorine pesticides were analyzed by EPA Method 8081A in 69 soil samples. Of the 22 analytes, 8 organochlorine pesticides were detected in 35 to 69 of the soils samples. DDT and its metabolites were the most frequently detected in between 68 and 69 of the samples. Chlordane (alpha, gamma, and total) was detected in 35 to 42 of the samples. Dieldrin was detected in 51 of the 69 samples, and toxaphene was detected in 58 of the 69 samples.

Therefore, the soil COPECs to be addressed in this assessment include phenanthrene and fluoranthene; and the organochlorine pesticides including DDT/DDE/DDD, chlordane (alpha, gamma, and total), dieldrin, and toxaphene (Table 17). Chemicals identified as COPECs for this ecological screening evaluation are listed in Table 17.

8.1.4.1 Soil Gas

Soil gas sampling was conducted to assess the potential presence of VOCs at the Site in borings SV-26 through SV-30 in soil gas probes set at 5 and 15 feet bgs. Ten regular and one duplicate soil gas samples were collected. VOCs including naphthalene (3 detections) and toluene (11 detections) were identified in the soil gas samples. No other VOCs were detected. Therefore, naphthalene and toluene are included as COPECs in soil gas.

8.1.4.2 Surface Water and Groundwater

No COPECs were identified for surface water and groundwater since no permanent surface water exists at or near the site and groundwater is located at a depth that is inaccessible to plants and wildlife (see Section 8.3, Pathway Assessment).

8.2 BIOLOGICAL CHARACTERIZATION

Ecological receptors are the focus of this screening evaluation:

- Terrestrial and aquatic plants and wildlife that potentially reside or forage in areas potentially affected by chemicals released at the Site; and
- Terrestrial and aquatic plants and wildlife that may potentially be exposed to chemicals transported from the Site to nearby habitats.

Aerial images of the Oxnard High School No. 8 Site were reviewed to evaluate potential habitats that occur at and within 1 mile of the Site. Additionally, the California Department of Fish and Wildlife (CDFW) Natural Diversity Database was queried for the USGS 7.5' quadrangle (Oxnard) containing the Site, supplemented with data from surrounding quadrangles, to determine whether any sensitive and special-status plant and wildlife species have been observed in the region (CDFW 2018).

A formal Site-specific wetlands delineation was not performed. However, based on review of the USFWS National Wetlands Inventory, no wetlands are known to occur on the Site (USFWS 2018), and no other wet areas or potential wetlands have been observed within the Site boundaries. Therefore, aquatic plant and wildlife species are not anticipated to occur on the Site due to the lack of persistent surface water.

The Site has been used for continuous agricultural row crop production for approximately 150 years, and the entire property has been graded and tilled. Orchard and ornamental trees are located on the residential and farmyard portion of the property and a line of trees is located along the road to the west of the Site.

Due to the general lack of vegetation at the Site, terrestrial species that occur in croplands and disturbed areas, such as the European starling (*Sturnus vulgaris*), Brewer's blackbird *(Euphagus cyanocephalus*), song sparrow (*Melospiza melodia*), mourning dove (*Zenaida macroura*), and house sparrow (*Passer domesticus*) as well as mice, voles, gophers, and ground squirrels are reasonably expected to occur as transient visitors to the Site.

8.2.1 Off-site Habitats

The predominant land uses within a one-mile radius of the Site are residential housing (east, south, and west of the Site) commercial development (north and east), and agricultural row crops (east and south). Several schools and a hospital are also present within 1 mile of the Site. Cropland habitats are regulated by the crop cycle and do not conform to natural habitat stages.

Several species of rodents and birds have adapted to croplands and were controlled through the use of fences, traps, and poison to mitigate crop losses (Mayer and Laudenslayer 1988). Species potentially occurring at the Site (e.g., starlings, mourning doves, and sparrows) are also likely to be observed at the nearby agricultural areas. Residential and commercial areas are typically characterized by the introduction of new, often non-native, vegetation, and the presence of human-subsidized wildlife species that are highly tolerant of human disturbance. Species observed may include western fence lizards (*Sceloporus occidentalis*), mourning doves, sparrows, mice (*Mus* spp.), and raccoons (*Procyon lotor*) (Mayer and Laudenslayer 1988).

8.2.2 Special-status Species

A search of the California Natural Diversity Database (CDFW 2018) was conducted for the Oxnard USGS 7.5' quadrangle search to determine if any sensitive or special-status plant and wildlife species had been observed in the area (CDFW 2018). Table 18 lists the sensitive and special-status species that were found in this search. Of the species listed in Table 18, the following species have the potential to utilize the site as occasional visitors:

- American peregrine falcon (*Falco peregrinus anatum*);
- Burrowing owl (*Athene cunicularia*);

- Coast horned lizard (*Phrynosoma blainvillii*);
- Monarch butterfly (*Danaus plexippus*); and
- Crotch bumble bee (*Bombus crotchii*).

The burrowing owl has the potential to reside at the Site should suitable burrows (primarily ground squirrel) be present. The monarch butterfly may roost in trees surrounding the Site. The other species identified in Table 18 are unlikely to occur at the Site due to their habitat requirements.

8.3 PATHWAY ASSESSMENT

Potentially complete exposure pathways consist of a source and mechanism of COPEC release, a transport medium (e.g., soil, water, tissue), a point or area where receptors of concern may be exposed to COPECs, and an exposure route through which COPEC uptake occurs (e.g., ingestion). Exposure routes considered in the ecological screening evaluation include:

Soil

- Uptake of COPECs in soil by plants and soil invertebrates; and
- Incidental ingestion of COPECs in surface soil by terrestrial wildlife.

Air (in Burrows)

- Inhalation of volatile COPECs in soils by burrowing animals.

Food Items

- Ingestion of COPECs in food items by terrestrial wildlife.

Uptake is defined as the accumulation of COPECs across tissue surfaces and retention of COPECs by biota. Plants may take up COPECs in soils in the root zone (< 5 feet bgs for most plants). Even for deeper-rooted plants, most of the root mass and uptake processes occur in relatively shallow soils (Raven et al. 1986).

Dermal absorption of COPECs was considered to be an insignificant exposure pathway for identified wildlife receptors because:

- Dense undercoats or down effectively prevent the COPECs from reaching the skin of wildlife species and significantly reduce the total surface area of exposed skin (Peterle 1991; U.S. Army Corps of Engineers [USACE] 1996); and
- Results of exposure studies indicate that exposures due to dermal absorption are insignificant compared to ingestion for terrestrial receptors (Peterle 1991).

Inhalation of volatile COPECs by surface-dwelling wildlife was not evaluated because:

- Concentrations of volatile chemicals released from soil to above ground air are drastically reduced, even near the soil surface USACE 1996; and

- Concentrations of VOCs in soils would have to be great to induce noncarcinogenic effects in wildlife based on inhalation toxicity data for laboratory rats and mice (USACE 1996).

Inhalation of volatile COPECs was assessed for burrowing animals at the site. Burrowing animals may be exposed to higher concentrations of volatile COPECs while in their burrows because ventilation may be limited. VOCs in soils surrounding underground burrows are assumed to migrate into the confined air spaces of these animal burrows.

Conceptual exposure pathway models that identify the source, mechanisms of transport, media of concern, exposure routes, and receptors at the site are shown in Figures 7 and 8 for current conditions and planned future conditions, respectively. Exposure pathways under "Current Conditions" and under "Planned Future Conditions" are discussed further below.

8.3.1 Exposure Pathways Under Current Conditions

For most wildlife receptors, existing information suggests incomplete exposure pathways (Figure 7).

Groundwater. Groundwater is located below approximately 20 feet bgs and is inaccessible to plants and terrestrial wildlife at the site. Furthermore, groundwater does not discharge to the surface at or near the site. Exposure to groundwater, therefore, is considered an incomplete pathway.

Surface Water. No long-standing or permanent surface water bodies exist at the site or immediately adjacent to the site. Thus, the site and off-site areas provide no habitat for aquatic receptors and provide no attractive drinking water sources for terrestrial receptors. Uptake by aquatic receptors and drinking exposure pathways are considered to be incomplete pathways.

Soils. Organochlorine pesticides and PAHs have been identified as COPECs in soil. Uptake of COPECs in soils by plants and soil invertebrates and incidental soil ingestion by wildlife are considered to be potentially complete exposure pathways (Figure 7).

Air in Burrows. VOCs (i.e., naphthalene and toluene) were detected in a number of soil gas samples distributed throughout the Site. Due to continued disturbance of the surface soils by farming activities, burrowing animals are unlikely to be present. Therefore, inhalation of COPECs in burrow air is considered to be an incomplete pathway due to absence of receptors.

Food Items. The organochlorine pesticides and PAHs are known to bioaccumulate in animals. However, wildlife at the site are likely to be infrequent, transient visitors. Given limited exposure durations, bioaccumulation is likely to be limited. Nonetheless, potential ingestion of organic compounds and metals in food items is considered to be a complete pathway (Figure 7).

8.3.2 Planned Future Conditions

For most wildlife receptors, existing information suggests incomplete exposure pathways under future conditions (Figure 8).

Groundwater. Groundwater will likely continue to be inaccessible to plant and terrestrial wildlife at the site due to its depth.

Surface Water. Plans indicate that the school site will not support any aquatic habitats. Uptake by aquatic receptors and drinking exposure pathways under planned future conditions, therefore, are also considered to be incomplete pathways.

Soils. Plans for the construction of the school and landscaping of the grounds indicate that much of the site will be paved or support school buildings. Other areas of the site are likely to be re-sodded to create playing fields. Though potentially complete pathways, exposures due to uptake of COPECs in soils by plants (other than grass or ornamental shrubs and trees) are considered to be negligible (Figure 8). Soil invertebrates may continue to be exposed to COPECs in soils. Herbivorous birds may visit the site to feed on seeds and soil invertebrates. Burrowing mammals such as mice and ground squirrels may be present in grassed areas.

Air in Burrows. Volatile organic compounds were detected in a number of soil gas samples throughout the Site. Burrowing mammals may be exposed to volatile organic compounds in soils. Similarly, burrowing owls may utilize ground squirrel burrows for nesting sites.

Food Items. Given planned future use, exposures of surface soils to plants and wildlife will likely be limited. Moreover, wildlife observed at the site are likely to be infrequent, transient visitors. Based on this information, bioaccumulation of COPECs in soils is likely to be negligible and exposure via the ingestion of tainted food is likely to be negligible.

8.4 SCREENING CRITERIA

Toxicity screening criteria were developed based on review of U.S. EPA Ecological Soil Screening Criteria (Eco-SSL) documents, supplemented with screening criteria prepared by U.S. EPA Region 4 (2015). These screening criteria are provided in Table 19. Screening criteria are available separately for major taxonomic groups for soil exposures. However, only a single value is available to screen soil gas exposures and is applicable to both mammals and birds.

8.5 SUMMARY

8.5.1 Hazard Quotient Calculation

Hazard quotients were calculated to allow comparison of measured exposure point concentrations to the ecological screening criteria to evaluate the potential for adverse toxic effects to organisms present at the Site (Table 20). To provide a conservative evaluation of the potential for adverse effects, the lowest screening criterion for each COPEC (Table 19) was used for this screening. It is also assumed that the organisms spend 100% of their time at the Site.

Based on the screening calculations, ecological effects due to exposures to PAHs (phenanthrene and fluoranthene) and to volatile compounds in soil gas (toluene and naphthalene) are considered to be negligible. The primary COPECs of concern are the organochlorine pesticides, primarily DDT/DDE/DDD, Dieldrin, and Toxaphene (Table 20).

8.5.2 Current Exposures.

Currently, the Site does not support any aquatic habitat. In addition, the Site does not support any vegetation that would present attractive habitat for terrestrial wildlife populations. Species from off-site areas that are likely to be exposed at the site are common, abundant species that are frequently observed in residential areas or row crop fields of central California. Many of these species are highly tolerant of

human disturbance (e.g., house finch). However, due to the lack of habitat, exposures are considered minimal.

Given current conditions, exposures to COPECs in groundwater and surface water are considered to be incomplete or insignificant. Exposure pathways to organic compounds in soils and food items are considered to be complete. Although exposure pathways to organic compounds in soils and in food items are considered to be complete, wildlife exposures to these COPECs are considered to be minimal because wildlife observed on the Site are likely to be infrequent visitors.

Based on the ecological risk screening previously presented, current conditions at the Site do not appear to pose significant risks to ecological receptors.

8.5.3 Planned Future Exposures.

Based on future plans, much of the Site will be paved or support school structures and is not expected to support vegetation that would provide attractive habitat for terrestrial wildlife populations. Species likely to be exposed are likely to be common, abundant species that are tolerant of human disturbance (e.g., European starling, house finch).

Once the school is built, exposure pathways to COPECs in groundwater or surface water are considered to be incomplete. Although exposure pathways to organochlorine pesticides in soils and in food items are considered to be complete, wildlife exposures to these COPECs are likely to be limited because wildlife observed on school grounds are likely to be infrequent visitors.

Based on the ecological risk screening presented above, future conditions at the Site do not appear to pose significant risks to ecological receptors.

9.0 COMMUNITY PROFILE

9.1 COMMUNITY BACKGROUND INFORMATION

The City of Oxnard is an incorporated agricultural and manufacturing community located on the coast of California, approximately 60 miles west of downtown Los Angeles and 300 miles south of San Francisco. Housing costs remain among the most affordable in the area, attracting many young families and retired persons. Year-round crops attract many Hispanic families who work in the agricultural fields or other service industries. The City's population was estimated to be 210,037 in July 2017 (United States Census 2018).

English is the most common language. The second most commonly spoken language is Spanish. Oxnard has a Mayor/City Council government. The City was incorporated in 1903 (Wikipedia 2018).

The proposed High School No. 8 Site is located on the east side of Oxnard. The proposed school is designed to accommodate high school students in the surrounding new housing developments and adjacent neighborhoods.

The community demographic profile available from the City of Oxnard (United States Census 2018) is as follows:

Population:	
2017 Census	210,037
2010 Census	197,899
Percent Population Change 2010–2017	6.1%
Households:	
2012-2016 Census	50,839
Occupied Housing Units (2015 Census):	
Owner occupied 2012-2016	53.5%
Renter occupied 2012-2016	46.5%
Estimated population by race (2010 Census):	
Asian[a]	7.6%
Black[a]	2.7%
Hispanic Origin[b]	74.3%
White[a]	75.5%

a - Includes persons reporting only one race.
b - Hispanics may be of any race, so also are included in applicable race categories.

Age (2010 Census):	
Age 0–4	7.9%
Age 5–18	20.3%
Age 19–64	62.3%
Age 65 and older	9.5%

Education level (2010 Census, persons 18 years and over):	
No high school diploma	33.9%
High school graduate or higher	66.1%
Bachelor's degree or higher	16.3%
Median Household Income:	
2012-2016	$61,709
Per Capita Income in Last 12 Months (2015 Dollars):	
2016-2016	$21,102
Persons in Poverty Percent:	
2011-2015	16.3%

9.2 COMMUNITY CONCERNS

The project has not generated much public attention to date. An Environmental Impact Report (EIR) will be prepared according to California Environmental Quality Act (CEQA) guidelines and will be made available for public review and comment.

9.3 PUBLIC PARTICIPATION

California Education Code (CEC) 17210.1(b) requires that residents in line-of-sight of the Site be notified, in writing, of the proposed field sampling. The residents nearest to the Site are located along west side of Festivo Street to the east, on the south side of Camino Del Sol to the south, on the west side of North Rose Avenue to west, and the north side of Cesar Chavez Drive to the North (Figure 2). The proposed PEA sample locations are located approximately 150 feet west of residences on Festivo Street, 150 feet north of the residences on Camino Del Sol, 225 feet east of the residences on North Rose Avenue, and 900 feet south of the residences on Cesar Chavez Drive. A covered six-foot-high chain link fence surrounds the entire Maulhardt Ranch, including the Site, and prevents the visual examination of the Site by the residents in the neighborhoods surrounding the Maulhardt Ranch. Given the distance from the surrounding residential properties to the PEA sample locations, and that the Site is not within the line-of-site of the surrounding residential properties, public notification is not necessary for these residences and was not performed.

Two public information repositories for review of the PEA are being established by the School District. One is the City of Oxnard Library located at 251 South A Street, Oxnard, California 93030 and the other is the School District's Headquarters Office located at 309 South K Street, Oxnard, California 93030. A copy of the PEA Report will be placed in these two repositories for access by local community members.

10.0 QUALITY ASSURANCE PROJECT PLAN IMPLEMENTATION

An integral part of the PEA sampling and analysis plan is the QA/QC program to ensure the reliability and compatibility of all data generated during the PEA. The QAPP provides specific descriptions of the field and laboratory procedures to be used for verifying and maintaining performance quality for collection of environmental samples and subsequent chemical analysis. The QAPP sets forth the policies, procedures, and activities for the identification and documentation of the precision, accuracy, completeness, and representativeness of the data during the performance of the PEA. The QAPP is presented in Appendix A.

During the PEA investigation, a variety of data were collected. Each sample was analyzed for a number of different chemicals, depending on the rationale for sample collection. Data collected were evaluated to determine which of the chemicals identified are likely to be site-related and to assess whether the reported concentrations for these chemicals are of acceptable quality for use in the screening evaluation.

10.1 EVALUATION OF ANALYTICAL METHODS

The analytical methodology used for data collection was assessed for appropriateness for use in the screening evaluation. Analytical results that are not specific for a particular compound or results of screening analytical methods (e.g., PID readings) were not used for the Human Health Screening Evaluation.

10.2 EVALUATION OF DETECTION LIMITS

Detection limits associated with the analytical data were reviewed before eliminating chemicals because they were not detected. In some cases, the detection limit for a chemical may be greater than the corresponding standards, criteria, or concentrations derived from toxicity reference values; therefore, the chemical may be present at levels greater than these corresponding reference concentrations, which may result in undetected risk. In other cases, a particular detection limit may be significantly higher than positively detected values in other samples in a data set. After considering these cases and any other reasonable explanations why contaminants may not have been detected, chemicals that were not detected in any medium were eliminated.

10.3 EVALUATION OF QUALIFIED DATA

For analytical results, various qualifiers pertaining to the quality of the data are attached to certain data points by either the laboratories conducting the analysis or by persons conducting the data validation (procedures for data validation are discussed in Section 8.3 of the QAPP [Appendix A]). A number of data points were qualified as estimated ("J" flagged) because the detected concentration was below the MRL for the analyte.

Methane and hydrogen sulfide were analyzed in the field using a mobile laboratory. Methane was analyzed via U.S. EPA method 8015B and hydrogen sulfide using a handheld Jerome H_2S Analyzer Model 631-X analyzer in accordance with the guidelines in *Advisory – Active Soil Gas Investigations* (DTSC and LARWQCB 2015). No detections of methane or hydrogen sulfide were reported. Since a field instrument was used to obtain the hydrogen sulfide data, the data does not meet the definitive data protocols used for all other data in this data set. Therefore, no definitive data QC results are available to determine the true data quality. These data are usable as qualitatively determined data only.

No data were rejected as unusable.

10.4 DATA VALIDATION RESULTS

A typical PEA validation effort consists of a review of 10% of the analytical data; however, due to the limited number of analytical batches associated with the subject investigation, 100% of the data were reviewed. The validation guidance used in evaluating the data is presented in *USEPA National Functional Guidelines for Inorganic Data Review* (U.S. EPA 2014a) and *USEPA National Functional Guidelines for Organic Data Review* (U.S. EPA 2014b). The data review consisted of an evaluation of all applicable Quality Control (QC) sample results as they relate to the field data under review. Raw data were not reviewed. The review determines the usability of the data based on the Data Quality Objectives (DQOs) for the project.

The data were evaluated by results from the following QC elements:

- Holding Times;
- Method Blanks;
- Laboratory Control Samples;
- Surrogate Recovery (Organic Methods);
- Field Replicate Analysis;
- Spiked Duplicate Analysis; and
- Relative Percent Difference (RPD) Compliance.

The A & R Laboratory data for soil gas analyses had compliant QC results for all QC samples. Based on the results of this data validation review, it is concluded that the A & R Laboratory soil gas data are usable as reported. The results are considered correct and reliable. The DQOs were satisfied per the FSP (Tetra Tech 2018b) and the data are usable for their intended purpose.

The AETL data for soil sample and groundwater analyses had compliant QC results for all QC samples. The AETL soil and groundwater data are usable as stated and qualified. The results are considered correct and reliable The DQOs were satisfied per the FSP (Tetra Tech 2018b) and the data are usable for their intended purpose.

No target analytes were detected in method blanks, laboratory control sample recoveries were within control limits, holding times were met, surrogate recoveries were within control limits, spiked duplicate analyses were within recovery and RPD control limits, compounds were identified correctly, the analytical methods were performed correctly, and the COC documentation was in compliance.

The only data that were qualified as estimated ("J" flagged) were results that were reported at concentrations below the MRL. No data were rejected.

The results of the data validation review indicate that the data meet the DQOs of the PEA and are usable as reported. The data validation memorandum is provided in Appendix N.

10.5 COMPARISON OF SITE WITH BACKGROUND DATA

Arsenic

The *Interim Guidance for Sampling Agricultural Properties* (DTSC 2008) states "If all the arsenic results for the site are at or below 12 milligrams per kilogram (mg/kg), then collection of background samples will not be required." The FSP stated that "If the arsenic concentrations in any of the 15 discrete and two duplicate surface soil samples collected for arsenic analysis exceed 12 mg/kg, additional actions, including sample collection and remedial actions may be required." However, the maximum arsenic concentration from the 17 discrete and two duplicate soil samples collected at the Site was 2.65 mg/kg (refer Section 6.8.3), which is well below the 12 mg/kg DTSC screening level. Therefore, no background arsenic samples were collected.

10.6 IDENTIFICATION OF CHEMICALS OF POTENTIAL CONCERN

All chemicals that were not eliminated by any of the above evaluations were considered COPCs for the Site and evaluated further through the Human Health Screening Evaluation (Section 7.0). Tables 13 and 14 list the soil gas COPCs and Table 15 lists the soil COPCs identified for this Site. The associated soil gas and soil risks are summarized in Tables 13 through 16. Exposures to these COPCs were evaluated for direct dermal contact with soils, incidental ingestion of soils, inhalation of airborne dusts from soils, and inhalation of vapors migrating from soil gas into indoor air. Receptors were evaluated for: (1) carcinogenic risks and (2) noncarcinogenic hazards. Assumed exposures at the Site result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors. Noncarcinogenic hazard from assumed exposures to the COPCs in soil and soil gas at the Site (HI = 0.2) is well below the threshold level of 1.

The detected VOCs naphthalene and toluene were selected soil gas COPCs, the detected OCPs chlordane (total), 4,4'-DDD (DDD), 4,4'-DDE (DDE), 4,4'-DDT (DDT), dieldrin, and toxaphene, PAHs, fluoranthene and phenanthrene, and TPH-gasoline (C4-C12), TPH-diesel (C9-C22, and TPH-motor oil (C23-C40) were selected as soil COPCs. As indicated in the DTSC *Interim Guidance for Sampling Agricultural Properties* (DTSC 2008), if all arsenic data are equal to or less than 12 mg/kg, then arsenic does not need to be considered a COPC and this determination does not require collection and comparison to a background data set. Therefore, arsenic was not selected as a COPC and was not evaluated.

This page intentionally left blank.

11.0 HEALTH AND SAFETY PLAN IMPLEMENTATION

Tetra Tech prepared a site-specific Health and Safety Plan (HSP) pursuant to Health and Safety Code 1910.120 (Appendix B). The plan:

- Identified and described potentially hazardous substances that may be encountered during field operations;
- Specified PPE and clothing for Site activities; and
- Outlined measures to be implemented in the event of an emergency.

Tetra Tech field personnel reviewed the HSP prior to commencing field work. Prior to initiation of field activities each day, a site safety briefing was conducted to identify potential physical and chemical hazards and outline measures to be taken in event of an emergency. All onsite personnel were required to sign the site safety briefing form.

During field activities, appropriate Level D PPE was worn by all personnel within the exclusion zone. Operator breathing zone PID readings were obtained on a regular basis as required by the HSP. All PID readings during field activities were 0.0 ppm. Based on these measurements, an upgrade to Level C PPE was not required.

Potential hazards to public health and safety were minimal due to the nature of the sampling activities and the absence of detectable vapors in the exclusion zone. No incidents or emergency actions occurred during the field program.

This page intentionally left blank.

12.0 VARIANCES

The following two variances to the FSP (Tetra Tech 2018b) occurred during the course of the PEA investigation:

- The discrete soil samples were to be combined into 15 composite samples and two duplicate composite samples by AETL, the analytical laboratory in accordance with the FSP (Tetra Tech 2018b). The 60 discrete soil samples were not combined into 15 composite samples or two duplicate composite and all 60 discrete soil samples and nine duplicate samples were analyzed for OCPs via EPA method SW8081A; and

- The original subsurface soil sampling schedule presented in the FSP (Tetra Tech 2018b) indicated that the groundwater samples would be collected at 5 to 5.5 feet bgs and 10 to 10.5 feet bgs based on the assumption that groundwater would be encountered at 15 feet bgs. The subsurface soil sample collection schedule was adjusted to 15 feet to 15.5 feet bgs and 20 to 20.5 feet bgs because groundwater was encountered at approximately 21 feet bgs.

The two variances discussed above are not expected to have a significant negative impact on the DQOs of the PEA investigation.

This page intentionally left blank.

13.0 EVALUATION OF APPLICABLE OR RELEVANT LAWS AND REGULATIONS PERTAINING TO SCHOOL SITES

Public Resources Code Section 21151.8 and Education Code Section 17213 prohibit the approval of an Environmental Impact Report or Negative Declaration for a project involving the purchase of a school site or construction of a new elementary or secondary school unless all of the following occur:

- The EIR or Negative Declaration (ND) includes information needed to determine if the property is any of the following:
  - The site of a current or former hazardous waste disposal site or solid waste disposal site and, if so, whether the wastes have been removed;
  - A hazardous substance release site identified by the State Department of Health Services in a current list adopted pursuant to Section 25356 for removal or remedial action pursuant to Chapter 6.8 (commencing with Section 25300) of Division 20 of the Health and Safety Code; or
  - A site that contains one or more pipelines, situated underground or above ground, which carries hazardous substances, acutely hazardous materials, or hazardous wastes, unless the pipeline is a natural gas line which is used only to supply natural gas to that school or neighborhood.
- Facilities located within a one-quarter mile radius of the proposed site that might reasonably emit hazardous or acutely hazardous air emissions have been identified; and
- It has been determined that the health risks from facilities do not and will not constitute an actual or potential endangerment of public health to persons who attend or are employed at the school; or
- If impacts are identified, mitigation of all chronic or accidental hazardous air emissions must be made prior to school occupancy and a determination of no actual or potential endangerment shall be certified by the governing board.

A comprehensive review of relevant background information was undertaken for preparation of this PEA Report. This information, including a list of agencies contacted for information regarding the Site, is summarized in Section 3.0. On the basis of the information reviewed, there is no documentation that the Site is a current or former hazardous waste disposal site, as defined in Section 25114 of the Health and Safety Code. No active or former landfills are known to be located within one-half mile of the Site and the Site is not known to be situated upon a current or former disposal site. The Site is not listed in regulatory agency databases as a hazardous substances release site.

Records indicate the Site has been used for agricultural production since at least 1869 and is located in the Oxnard Oil Field. Sources of potential environmental contamination identified at the Site are summarized in Section 4.0.

The following hazardous pipelines identified within 1,500 feet of the Site (Figure 2):

- The City of Oxnard maintains a 12-inch diameter PVC water pipeline routed north-south beneath North Rose Avenue immediately west of the Site;

- The City of Oxnard maintains a 12-inch diameter ACP water pipeline routed east-west beneath Camino Del Sol immediately south of the Site;

- The UWCD maintains a 42-inch water pipeline beneath North Rose Avenue immediately west of the Site; and

- The Maulhardt Ranch maintains a 12-inch diameter PVC water pipeline routed east to west underlying the dirt access road just south of the northern boundary of the Maulhardt Ranch, approximately 920 feet north of the Site. This pipeline is connected to two buried 12-inch diameter PVC water pipelines that are routed north-south beneath and just west of the main north-south road approximately 450 to 460 feet east of Rose Avenue through the Site to the farmyard/residential area of the Maulhardt Ranch. The Maulhardt Ranch water pipelines will be removed from the Site and surrounding areas prior to the development of the High School No. 8.

Pursuant to California Code of Regulations, Title 5, Section 14010 [h], a pipeline risk assessment will be performed in accordance with *Guidance Protocol for School Site Pipeline Risk Analysis* (CDE 2007) to determine whether the pipelines operated by the City of Oxnard and UWCD pose a safety hazard. The Pipeline Risk Analysis Report will be included as an addendum to the PEA report. Because the Maulhardt Ranch water pipelines will be removed from the Site and surrounding areas prior to the development of the High School No. 8, they will not be included in the Pipeline Risk Analysis.

14.0 CONCLUSIONS

14.1 BACKGROUND RESEARCH

The Site is located in an area that has historically been developed for petroleum and agricultural production. The Site is part of the Maulhardt Ranch and is currently being used for strawberry cultivation. The Site is planned for development as a high school within a new mixed residential/commercial development, the Maulhardt Property Urban Village. The properties surrounding the Site are currently for residential/commercial land use. Based upon the information reviewed, the Site is not located at a known hazardous waste disposal site, hazardous substance release site, or landfill.

Research of available Site background information, including regulatory agency database lists and agency file searches, and owner interviews, indicates the Site area was used primarily for agricultural purposes since at least 1869. Petroleum production also occurred in the Site area, but not on the Site in the past. Although documentation of known release(s) of hazardous materials at the Site was not obtained, activities conducted at the Site have the potential to result in releases. Potential sources of hazardous materials impact to the Site identified during the investigations include:

1. Potential toxic soil gas from potential formation leakage from the Oxnard Oil Field;

2. Potential residual OCPs, arsenic, SVOCs, PAHs, TPHd and TPHmo collectively known as TPHde in soil from fuel oil in smudge pots that were formerly used for frost abatement as part of the agricultural production activities at the Site;

3. Potential impacts to shallow soil, soil gas, and groundwater in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas ASTs and USTs formerly used for the storage of motor fuel (Figure 3);

4. Potentially hazardous substances and petroleum products that contained VOCs and TPHg have been used and stored in the Tin Shed, Horse Barn, Garage, and Storage Shed on the Maulhardt Ranch that may have impacted shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch farmyard area (Figure 3); and

5. PCB soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol (Figure 2).

A database search did not reveal any off-site facilities within one-half mile of the Site where releases to the environment have been documented. Tetra Tech reviewed agency files for facilities surrounding the Site. Based upon the information reviewed, none of the surrounding facilities appears to have a significant potential to have impacted the Site.

The following hazardous pipelines identified within 1,500 feet of the Site (Figure 2):

- The City of Oxnard maintains a 12-inch diameter PVC water pipeline routed north-south beneath North Rose Avenue immediately west of the Site;

- The City of Oxnard maintains a 12-inch diameter ACP water pipeline routed east-west beneath Camino Del Sol immediately south of the Site;

- The UWCD maintains a 42-inch water pipeline beneath North Rose Avenue immediately west of the Site; and

- The Maulhardt Ranch maintains a 12-inch diameter PVC water pipeline routed east to west underlying the dirt access road just south of the northern boundary of the Maulhardt Ranch, approximately 920 feet north of the Site. This pipeline is connected to two buried 12-inch diameter PVC water pipelines that are routed north-south beneath and just west of the main north-south road approximately 450 to 460 feet east of Rose Avenue through the Site to the farmyard/residential area of the Maulhardt Ranch. The Maulhardt Ranch water pipelines will be removed from the Site and surrounding areas prior to the development of the High School No. 8.

Pursuant to California Code of Regulations, Title 5, Section 14010 [h], a pipeline risk assessment will be performed in accordance with *Guidance Protocol for School Site Pipeline Risk Analysis* (CDE 2007) to determine whether the pipelines operated by the City of Oxnard and UWCD pose a safety hazard. The Pipeline Risk Analysis Report will be included as an addendum to the PEA report. Because the Maulhardt Ranch water pipelines will be removed from the Site and surrounding areas prior to the development of the High School No. 8, they will not be included in the Pipeline Risk Analysis.

14.2 PEA INVESTIGATION

Field and laboratory investigations were conducted to develop site-specific data regarding the potential presence of contaminants in Site media (soil gas, soil, and groundwater). The results of the investigation indicate that soil gas beneath the Site has not been impacted by emissions from the Oxnard Oil Field, and fuel or petroleum products that may have been released from ASTs and USTs formerly located in the adjacent Maulhardt Ranch farm maintenance activities performed in farmyard and residential areas. No methane, carbon monoxide, carbon dioxide, hydrogen sulfide, or TPHg were detected in any of the soil gas samples (Tables 9 and 10). Naphthalene and toluene were detected at concentrations well below DTSC Screening Levels.

The Site appears to have been impacted by agricultural production activities. OCPs were detected in all 60 of the discrete surface oil samples and the nine duplicate samples collected for OCP analysis (Table 11). The OCPs 4,4'-DDD (DDD), 4,4'-DDT (DDT), 4,4'-DDE (DDE), Chlordane (total0, Chlordane (alpha), and Chlordane (gamma) were detected at concentrations below their respective DTSC Screening Levels (Table 11). Dieldrin was detected in three samples at concentrations of 34.70 µg/kg, 37.20 µg/kg, and 40.40 µg/kg, slightly above its DTSC Screening Level of 34 µg/kg. Toxaphene was detected in 33 samples at concentrations above its DTSC Screening Level (490 µg/kg) at concentrations ranging from 510 µg/kg to 2,600 µg/kg over an area of approximately 28 acres (Figure 5). No other significant impacts were identified at the Site.

Arsenic was detected in one sample with J-Flagged results at a concentration 2.65 mg/kg. Arsenic was not detected at concentrations above its laboratory MDL (2.5 mg/kg) or the DTSC-ASL of 12 mg/kg (DTSC 2008) in any of the other 16 samples (Appendix M). No significant impacts to the Site from arsenic in surface soil were identified.

The Site surface soils do not appear to have been significantly impacted by smudge pot fuel. SVOCs, PAHs, TPHde, and TPHg were not detected at concentrations above their respective DTSC Screening Levels (refer to Table 7 and Appendix M).

The Site subsurface soil in areas of the Site adjacent to the Maulhardt Ranch farmyard and residential areas do not appear to have been significantly impacted by releases of VOCs, TPHg, and TPHde from

petroleum products that may have been released from ASTs and USTs and farm maintenance activities. VOCs, TPHg, and TPHde were not detected at concentrations above their respective DTSC Screening Levels (refer to Appendix M).

The groundwater in areas of the Site adjacent to the Maulhardt Ranch farmyard and residential areas does not appear to have been significantly impacted by releases of VOCs, SVOCs, and TPHde from petroleum products that may have been released from ASTs and USTs and farm maintenance activities.

The detected VOCs naphthalene and toluene were selected soil gas COPCs, the detected OCPs chlordane (total), 4,4'-DDD (DDD), 4,4'-DDE (DDE), 4,4'-DDT (DDT), dieldrin, and toxaphene, PAHs, fluoranthene and phenanthrene, and TPH-gasoline (C4-C12), TPH-diesel (C9-C22, and TPH-motor oil (C23-C40) were selected as soil COPCs. As indicated in the DTSC *Interim Guidance for Sampling Agricultural Properties* (DTSC 2008), if all arsenic data are equal to or less than 12 mg/kg, then arsenic does not need to be considered a COPC and this determination does not require collection and comparison to a background data set. Therefore, arsenic was not selected as a COPC and was not evaluated.

No evidence for release of petroleum products to groundwater beneath the Site from the adjacent areas of the Maulhardt Ranch farmyard and residential areas was identified in the samples collected for this PEA. Contamination of groundwater beneath the Site from off-site sources is considered unlikely. Therefore, potential groundwater exposure pathways are considered incomplete and were not evaluated in this human health screening evaluation.

The compounds listed in Tables 13 and 14 (VOCs) and Table 15 (OCPs, PAHs, and TPH) were evaluated in the human health screening evaluation. Potential risks were estimated using a residential/unrestricted land use scenario, which evaluates hypothetical Site residents. Exposures to the COPCs listed in Tables 13, 14 and 15 were evaluated for direct dermal contact with soils, incidental ingestion of soils, and the inhalation of airborne dusts and vapors. Receptors were evaluated for carcinogenic risks and noncarcinogenic hazards.

A screening level human health risk evaluation was conducted for residential exposures to the COPCs identified in soil gas, groundwater, and soils at the proposed High School No. 8 Site. The COPCs identified in soils at the Site include OCPs, TPHs, and VOCs. Exposures to these COPCs were evaluated for direct dermal contact with soils, incidental ingestion of soils, inhalation of airborne dusts from soils, and inhalation of vapors migrating from soil gas into indoor air. Receptors were evaluated for: (1) carcinogenic risks, and (2) noncarcinogenic hazards. Assumed exposures at the Site result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors.

Noncarcinogenic hazard from assumed exposures to the COPCs in soil and soil gas at the Site (HI = 0.2) is well below the threshold level of 1

Ecological risks were evaluated qualitatively. This assessment consisted of identifying onsite habitats, ecological receptors, and the likelihood that sensitive receptors could be exposed to COPECs. Currently, the Site does not support any aquatic habitat. In addition, the Site does not support any vegetation that would present attractive habitat for terrestrial wildlife populations. Species likely to be exposed at the Site are common, abundant species that are frequently observed in row crop fields of central California. Many of these species are introduced and are highly tolerant of human disturbance. Special-status species that occur within the Oxnard USGS 7 1/2-minute quadrangle special-status species are unlikely to occur at the Site. Given current conditions, ecological exposure pathways related to groundwater, surface water, and air are considered to be incomplete or insignificant. Although exposure pathways to

organochlorine pesticides in soils and in food items are considered to be complete, wildlife exposures to these COPECs are likely to be limited because wildlife observed on school grounds are likely to be infrequent visitors. Based on the ecological risk screening presented, future conditions at the Site do not appear to pose significant risks to ecological receptors.

14.3 SUMMARY

Based on the results of the PEA, including the human health screening evaluation (Section 7.0) and the ecological screening evaluation (Section 8.0), OCPs detected at the Site (primarily toxaphene) appear to be present at significant concentrations that pose a threat to likely human receptors, including residential/unrestricted land use. Assumed exposures at the Site result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors. The estimated cumulative cancer risk associated with potential exposures to soil based on the 95% UCLs for pesticides maximum detected concentrations for other chemicals is 4×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the point of departure of 1×10^{-6} for potential residential receptors.

15.0 RECOMMENDATIONS

Findings of this PEA indicate that the Site surface soils have been significantly impacted by OCPs. Potential health risks due to chemicals detected at the Site were evaluated using a residential/unrestricted land use exposure scenario. The residential exposure scenario using the maximum concentrations of COPCs provides conservative risk estimates for the Site based on the planned future use and the distribution of COPCs in soil. Based on the results of the PEA, including the human health screening evaluation (Section 7.0) and the ecological screening evaluation (Section 8.0), OCPs detected at the Site (primarily toxaphene) appear to be present at significant concentrations that pose a threat to likely human receptors, including residential/unrestricted land use. Assumed exposures at the Site result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors.

The surface soil sampling performed for PEA has adequately defined the lateral extent of OCP-impacted soil at the Site at concentrations exceeding DTSC Screening Levels. Tetra Tech recommends that a Supplemental Site Investigation (SSI) workplan be developed and implemented at the Site under DTSC oversight to assess the depth of OCP-impacted soil at the Site at concentrations exceeding DTSC Screening Levels (specifically toxaphene and dieldrin). A remedy for the OCP-impacted soil at the Site will be developed following completion of the SSI.

- Surface Soil Sample (0 to 0.5 ft bgs) (PCB analysis only)
- Soil Gas Well (0 to 10 to 15 ft bgs)
- Soil/Groundwater Sample Boring and Soil Gas Well (0 to 10 to 15 ft bgs)

Notes:

1.) All features, including PEA sample, building, utility, and boundary locations are approximate.

2.) The maximum concentrations are show where duplicate soil samples were collected.

Definitions:

As - Arsenic

DTSC - California Department of Toxic Substances Control

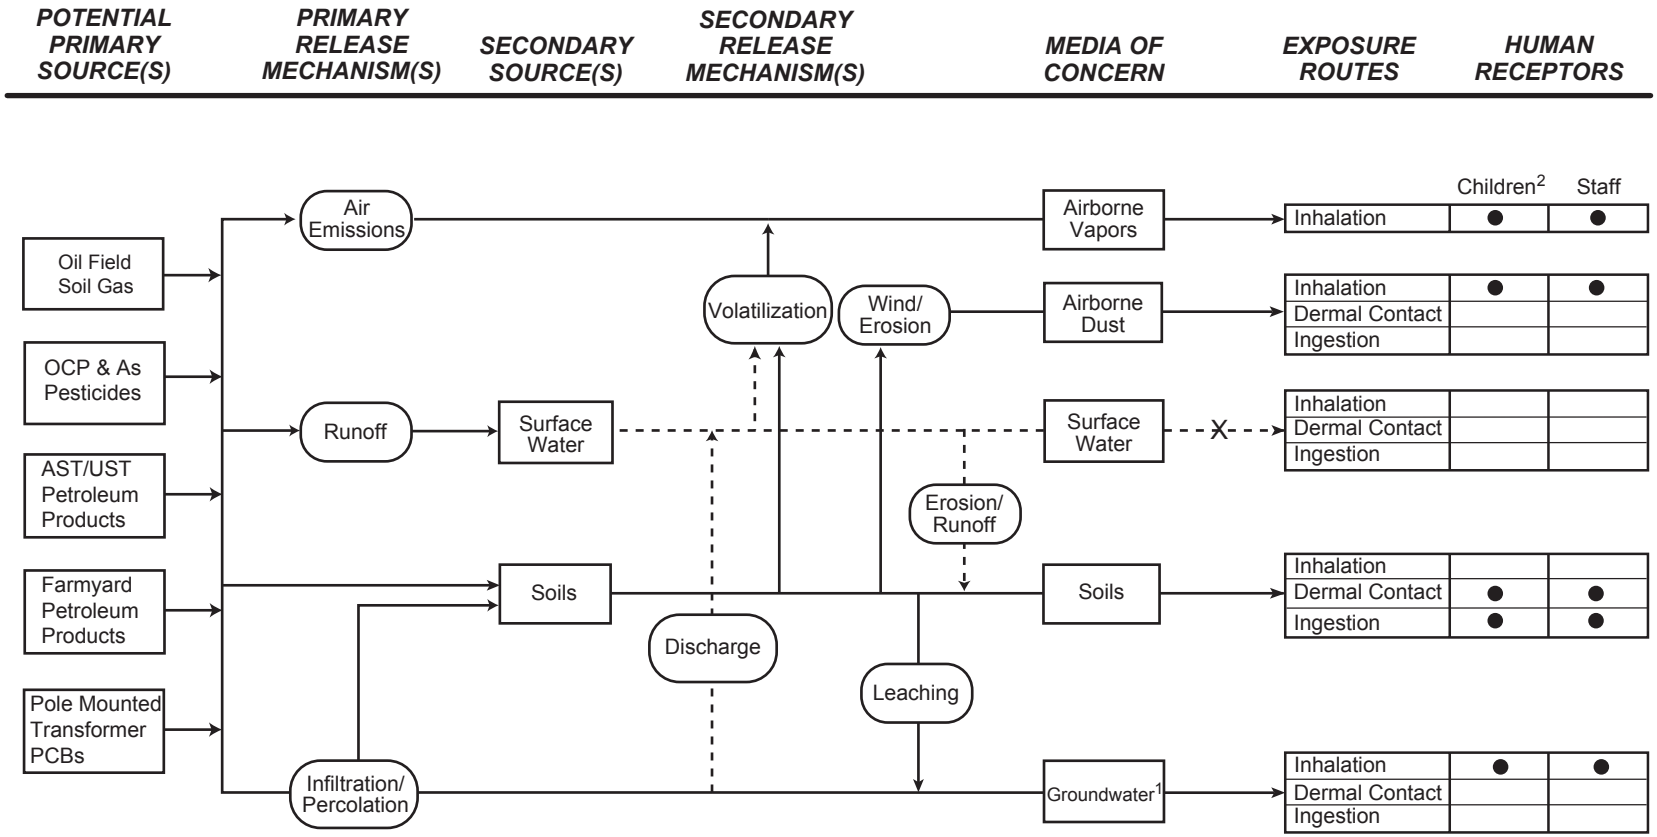
OCP - Oganochlorine Pesticide

PAH - Polyaromatic Hydrocarbon

PCB - Polychlorinated Biphenyl

µg/L - Micrograms per Kilogram

SVOC - Semivolatile Organic Compond



TPHde - Diesel and Heavy Oil Range Total Petroleum Hydrocarbons

Background imagery: Ventura County, 2016

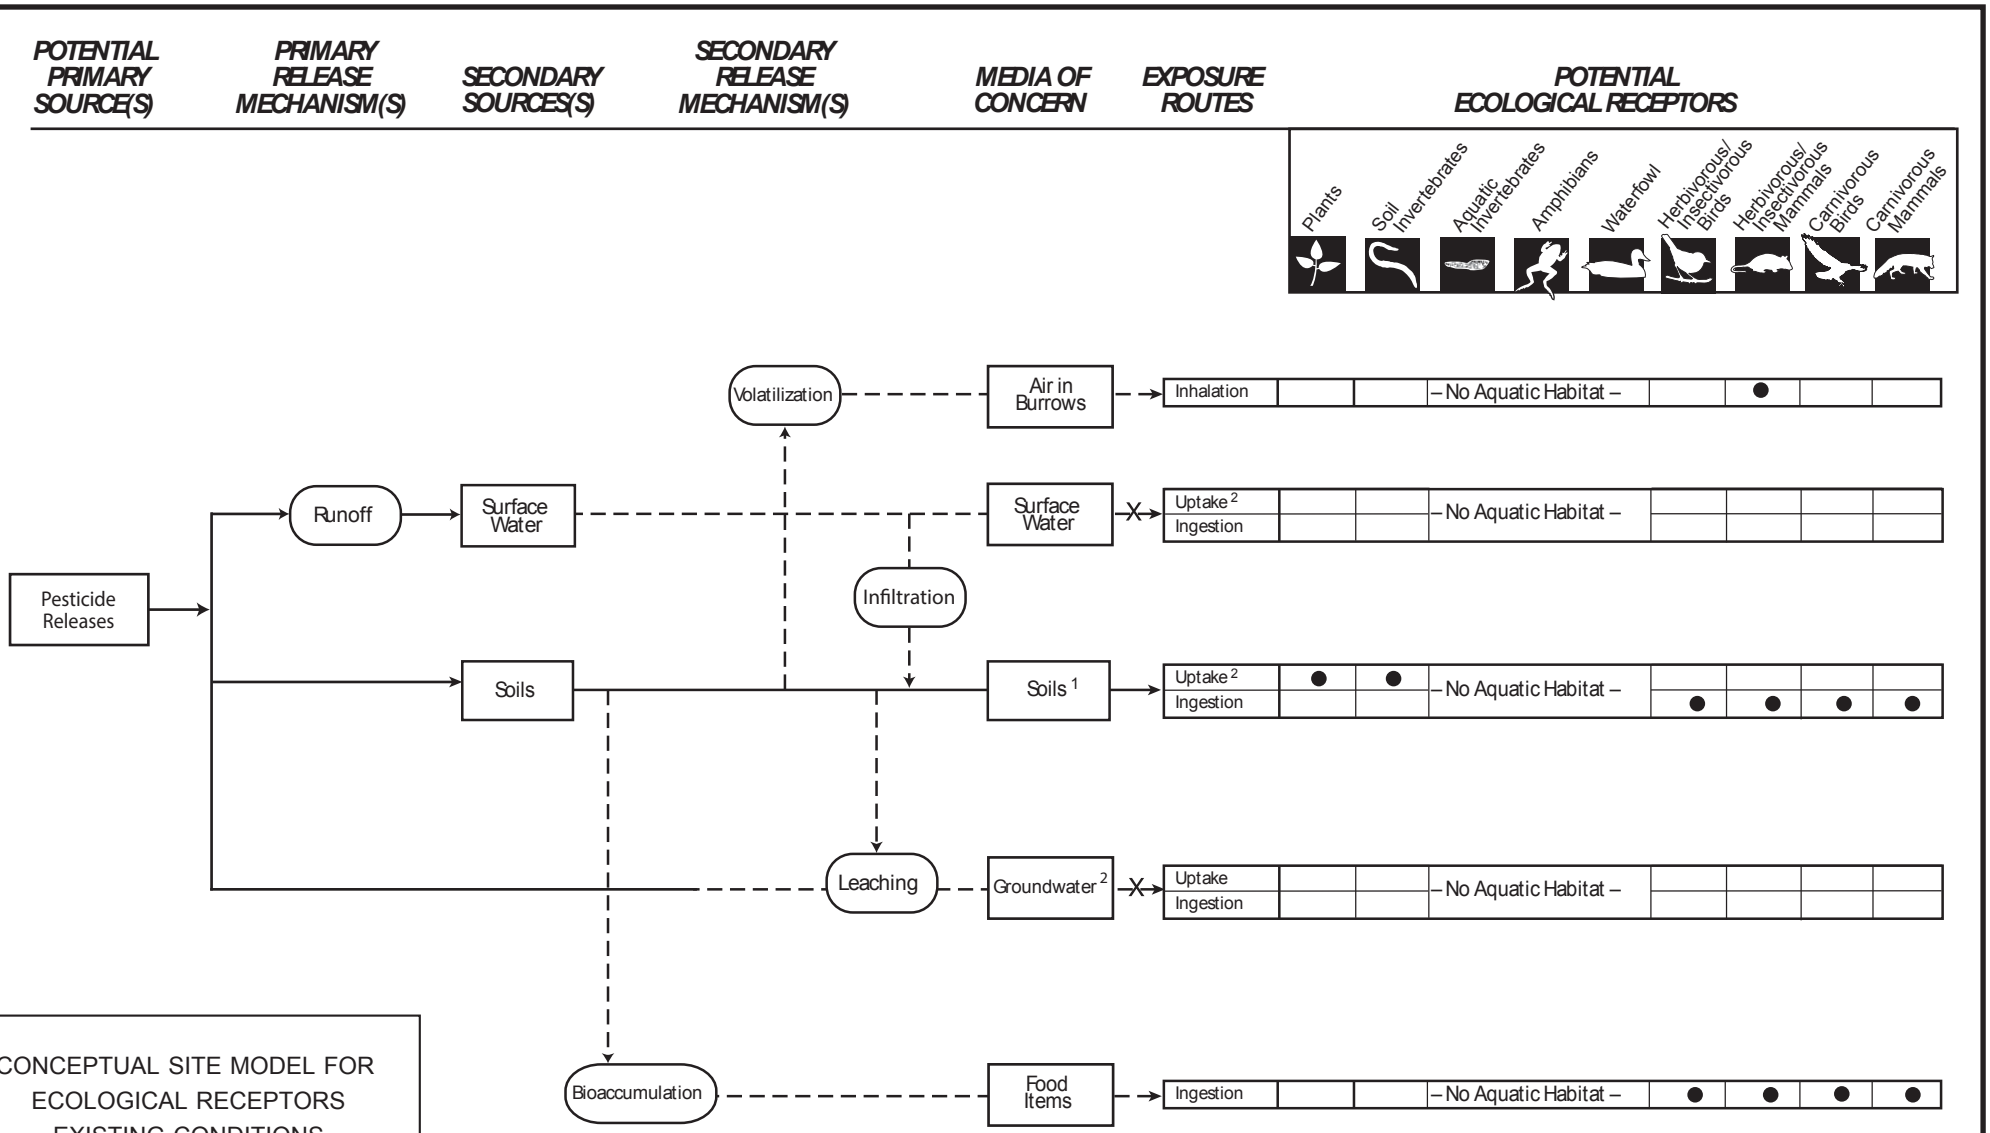
● Potentially complete exposure route.

1 Groundwater at depth greater of 21 feet below ground surface.

2 School children and staff are conservatively evaluated assuming residential exposure assumptions.

→ Potentially complete exposure pathway



- - - → Potentially incomplete exposure pathway

- - X - → Incomplete exposure pathway

Pool	7,240	Paved
Total	**802,987**	

Note:
ft^2 - Square Foot. All square footage estimates are approximate.

Table 2
Site Reconnaissance Features

Number	Item	Location
1	Series of active concrete residential septic tanks.	East of Main Residence near kitchen window.
2	Potential abandoned septic tank	Underlying driveway east of the Main Residence.
3	Underground laundry room wastewater septic tank.	Under northeast corner of Main Residence.
4	Abandoned cesspool	Near northeastern corner of orchard on the east side of the Main Residence.
5	Pole mounted transformer	In citrus orchard south of eastern Mobile Home.
6	Eastern Mobile Home septic tank	Approximately 10-15 feet east of eastern Mobile Home.
7	Abandoned water well	Southwest of Workshop.
8	Power pole and former location of three pole mounted transformers	Northwest of Workshop.
9	Abandoned septic tank	South of Horse Barn.
10	Bonfire area	North of Horse Barn and south of Tin Shed.
11	Former location of removed 500-gallon (approximate) gasoline fuel above ground storage tank (AST) removed in 1980's.	Southwest corner of Garage.
12	Former location of 500-gallon (approximate) diesel fuel UST removed in 1980's.	Southeast corner of Garage.
13	Oil Change Sump.	Inside of Garage.
14	Former location of two 2-story Bunkhouses removed in 1970's. Abandoned septic tank and cesspool likely present.	In orchard west of Garage and Storage Shed.
15	Former 500-gallon (approximate) weed oil AST removed in the 1970's without a removal permit.	Located along northwest corner of Garage.
16	Former pesticide mixing area.	Located near southwest corner of Tin Shed.
17	Smudge Pot	Inside of Tin Shed at northwest corner.
18	Soil/ floor staining observed.	Located inside of Tin Shed.
19	Old concrete footing from removed wind electric machine.	Located north of Tin Shed.
20	Abandoned septic tank.	North of Office.
21	Abandoned redwood septic tank	Northwest of Office.
22	Apartment septic tank	North of Apartment.
23	Oil residue under Apartment garage. Area was backfilled with concrete slurry.	Inside Apartment garage at southeast corner.
24	Former location of 250-gallon (approximate) gasoline UST and pump.	South of the Apartment.
25	500-gallon (approximate) propane AST owned and operated by AAA Propane Services, Inc. (AAA).	Northwest corner of Apartment.
26	Septic Tank	East of western Mobile Home.
27	500-gallon (approximate) propane AST owned and operated by AAA	West of Main Residence.
28	Abandoned 500-gallon (approximate) heating oil AST.	West of Main Residence.
29	Pole mounted transformer	In orchards west of Main Residence.
30	500-gallon (approximate) propane AST owned and operated by AAA	North of eastern Mobile Home.
31	Recreational Vehicle	East of the Horse Barn.

Extra sample volume will be archived and analysis determined for MADEP-EPH-04 pending review of TPHg and TPHde soil sample analytical results.	Subsurface Soil impacts from former offsite UST/AST fuel storage

Notes:
1 - The sample locations are shown on Figure 4.
bgs - below ground surface
EPA - U. S. Environmental Protection Agency
EPH - Extractable Petroleum Hydrocarbons
MADEP - Massachusetts Department of Environmental Protection
OCP - organochlorine pesticide
PCB - polychlorinated biphenyl
PEA - Preliminary Environmental Assessment
TPHg - gasoline range total petroleum hydrocarbons
TPHde - diesel-heavy end range total petroleum hydrocarbons
VOC - volatile organic compound

Table 5
Groundwater Sampling Schedule
High School No. 8 PEA
Oxnard, California

Boring	Sample ID[1]	Sample Depth (ft)	Analysis	Sample Count	Rationale
SV-26	SVGW-26-10	15.0–16.5	1, 2, 3, and 4	1	Groundwater impacts from former offsite UST/AST fuel storage
SV-27	SVGW-27-10	15.0–16.5	1, 2, 3, and 4	2	Groundwater impacts from former offsite UST/AST fuel storage
SV-27	GWDup1	15.0–16.5	1, 2, 3, and 4	3	Groundwater impacts from former offsite UST/AST fuel storage
SV-28	SVGW-28-10	15.0–16.5	1, 2, 3, and 4	4	Groundwater impacts from former offsite UST/AST fuel storage
SV-29	SVGW-29-10	15.0–16.5	1, 2, 3, and 4	5	Groundwater impacts from former offsite UST/AST fuel storage
SV-30	SVGW-30-10	15.0–16.5	1, 2, 3, and 4	6	Groundwater impacts from former offsite UST/AST fuel storage

Sample Analyses:
1. EPA method 8260B for VOCs
2. EPA method 8015B for TPHg
3. EPA method 8015B for diesel and heavy oil range TPH (TPHde)
4. Hold for MADEP-EPH-04 - MA EPH Aliphatics and Aromatics

Notes:
1 - The sample locations are shown on Figure 4.
AST - Above ground storage tank
bgs - below ground surface
EPA - U. S. Environmental Protection Agency
EPH - Extractable Petroleum Hydrocarbons
MADEP - Massachusetts Department of Environmental Protection
PEA - Preliminary Environmental Assessment
TPHg - gasoline range total petroleum hydrocarbons
TPHde - diesel-heavy end range total petroleum hydrocarbons
UST - Under ground storage tank
VOC - volatile organic compound

Notes:

1 - The listed Residential Air Screening Levels are DTSC-Modified Air Screening Levels from Table 3 of *HERO Note Number 3., DTSC-modified Screening Levels (DTSC-SLs)* (DTSC 2018) (DTSC HHRA Note 3), if available, or USEPA Region 9 Air Regional Screening Levels (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

2 - The Residential Soil Gas Screening Levels for VOCs and hydrogen sulfide were dervied by dividing the Residential Air Screening Levels by the future residential contaminant source attenuation factor of 0.001 from Table 2 of the *Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (DTSC 2011).

3 - Residential Air Screening Level is the DTSC-Modified Air Screening Level from Table 3 of DTSC HHRA Note 3 (DTSC 2018).

4 - Residential Air Screening Level is the USEPA Region 9 Air RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

5 - Residential Air Screening Level and Soil Gas Screeing Level are from Tier 1 Enviromental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2016).

6 - Residential Soil Gas Screeing Level is from the recommended action level for further investigation in *Advisory on Methane Assessment and Common Remedies at School Sites* (DTSC 2005).

% - Percent by volume

EPA - U.S. Environmental Protection Agency

LUFT GCMS - California Regional Water Quality Control Board, Los Angeles Region Environmntal Laboratory Accreditation Program certified method for analyzing TPHg in vapor samples.

M - Modified

MDL - method detection limit

MS - mass spectrometry

NA - Not applicable

TPHg - micrograms per cubic meter

ppmV - parts per million by volume

RL - reporting limit

TPHg - Gasoline range total petroleum hyocarbons (C_4-C_{12} carbon range)

VOC - volatile organic compound

Notes:
1 - Residential Soil Screeing Levels are from Tier 1 Enviromental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2016).
2 - Residential Soil Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).
3 - Residential Soil Screening Level is the DTSC-Modified Soil Screening Level from Table 1 of DTSC HHRA Note 3 (DTSC 2018).
4 - Residential Soil Screening Level for arsenic is the DTSC Screening Level for School Sites from the *Interim Guidance for sampling Agricultural Properties* (DTSC 2008
EPA - U.S. Environmental Protection Agency
MDL - method detection limit
PQL - practical quantitation limit
NA - not applicable
mg/kg - milligrams per kilogram
µg/kg - micrograms per kiologram
RPD - relative percent difference

Notes:

1 - Residential Groundwater Screeing Levels are from Tier 1 Enviromental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2016).

2 - Residential Groundwater Screening Level is the DTSC-Modified Soil Screening Level from Table 2 of DTSC HHRA Note 3 (DTSC 2018).

3 - Residential Groundwater Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

EPA - U.S. Environmental Protection Agency

MDL - method detection limit

PQL - practical quantitation limit

NA - not applicable

mg/L - milligrams per liter

µg/L - micrograms per liter

RPD - relative percent difference

Table 9
Methane, Hydrogen Sulfide
and Fixed Gases in Soil Gas
High School No. 8
Oxnard, California

Notes:

a - Hydrogen Sulfide analysis peformed with a HACH HS-C field instrument, methane analysis peformed by EPA method 8015M, and fixed gases analysis performed by menthod ASTM D-1946.

b - non carcinogenic

c - Residential Air Screening Level is the DTSC-Modified Air Screening Level from Table 3 of DTSC HHRA Note 3 (DTSC 2018).

d - Residential Soil Gas Screeing Level is from the recommended action level for further investigation in Advisory on Methane Assessment and Common Remedies at School Sites (DTSC 2005).

EPA - U.S. Environmental Protection Agency

MDL - method detection limit

ppmv - parts per million by volume

% - percent

RL - method reporting limit

SL - Screening Level

Table 10
Summary of TPHg and VOC Concentrations in Soil Gas Samples (µg/L)
High School No. 8
Oxnard, California

Notes:

a - C4-C12 TPH (Gasoline) analysis peformed via LUFT GCMS. The remainder of analytes were analyzed by EPA method 8260B.
b - non carcinogenic
c - carcinogenic
d - Residential Air Screening Level is the DTSC-Modified Air Screening Level from Table 3 of DTSC HHRA Note 3 (DTSC 2018).
DQ - data qualifier
e - Residential Air Screening Level is the USEPA Region 9 Air RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).
EPA - U.S. Environmental Protection Agency
f - Residential Air Screening Level and Soil Gas Screeing Level are from Tier 1 Enviromental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2016).
J - J flagged, where concentration of the analyte detected is between RL and MDL.
MDL - method detection limit
µg/L - micrograms per liter
RL - method reporting limit
SL - Screening Level
TPH - Total Petroleum Hydrocarbons

Table 11
Organochlorine Pesicides in Soil
High School No. 8
Oxnard, California

Notes:
a - Organochlorine pesticides analyzed by EPA method 8081A.
b - non carcinogenic
c - carcinogenic
d - Residential Soil Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).
e - Table 6 lists compound-specific MDLs and PQLs for analytes that were not detected.
MDL - method detection limit
ND - not detected
PQL - practical quantitation limit
SL - Screening Level
The analytical results in red font are J-flagged, where concentration of the analyte detected is between MDL and PQL.
The analyte concentrations in yellow highligted cells exceed their relevant screening level.

TPH- total petroleum hydrocarbons

Table 13
Estimated Risk for Potential Residential Vapor Intrusion Exposures from Soil Gas (Depth = 5 feet)
Proposed High School No. 8
Oxnard, California

Chemical	Maximum Detect (µg/L)	Residential Soil Gas Screening Levels (µg/L)[1]		Residential Risk Screen	
		Carcinogenic	Non-carcinogenic	Maximum Estimated Risk[2]	Maximum Estimated Hazard Quotient[3]
Naphthalene	0.020	0.042	3.1	4.8E-07	6.5E-03
Toluene	0.070	----	310	----	2.3E-04
Maximum Estimated Cumulative Risk and Hazard Index[4]				5.E-07	0.007

Definitions:

µg/L - micrograms per liter

---- = screening criteria not calculated as appropriate toxicity data is not available.

Notes:

[1] Screening levels are derived by dividing residential DTSC-Modified Air Screening Levels, if available, or USEPA Region 9 residential Air RSLs (USEPA 2018) by the DTSC default future residential soil gas attenuation factor of 0.001 (DTSC 2011).

[2] Estimated cancer risk = (soil gas concentration/cancer soil gas screening level) x 10^{-6}.

[3] Estimated hazard = (soil gas concentration/non-cancer soil gas screening level).

[4] Cumulative risk and hazard index represent the sum of chemical-specific cancer risks and hazard quotients.

Table 14
Estimated Risk for Potential Residential Vapor Intrusion Exposures from Soil Gas (Depth = 15 feet)
Proposed High School No. 8
Oxnard, California

Chemical	Maximum Detect (µg/L)	Residential Soil Gas Screening Levels (µg/L)[1]		Residential Risk Screen	
		Carcinogenic	Non-carcinogenic	Maximum Estimated Risk[2]	Maximum Estimated Hazard Quotient[3]
Naphthalene	0.020	0.042	3.1	4.8E-07	6.5E-03
Toluene	0.040	----	310	----	1.3E-04
Maximum Estimated Cumulative Risk and Hazard Index[4]				5.E-07	0.007

Definitions:

µg/L - micrograms per liter

---- = screening criteria not calculated as appropriate toxicity data is not available.

Notes:

[1] Screening levels are derived by dividing residential DTSC-Modified Air Screening Levels, if available, or USEPA Region 9 residential Air RSLs (USEPA 2018) by the DTSC default future residential soil gas attenuation factor of 0.001 (DTSC 2011).

[2] Estimated cancer risk = (soil gas concentration/cancer soil gas screening level) x 10^{-6}.

[3] Estimated hazard = (soil gas concentration/non-cancer soil gas screening level).

1.0 INTRODUCTION/BACKGROUND

This Quality Assurance Project Plan (QAPP) has been prepared by Tetra Tech, Inc. (Tetra Tech) on behalf of the Oxnard Union High School District (School District) to address quality assurance (QA) and quality control (QC) policies associated with the collection of environmental data at the proposed Measure T School Site, located in Santa Maria, California (hereinafter referred to as the Site). Together with the *Technical Memorandum Field Sampling Plan Proposed High School No. 8 Site APN 214-002-059 on North Rose Avenue, Oxnard, California 93030* (Tetra Tech 2018b) (FSP), this QAPP presents the plan for sampling and analysis as part of the Preliminary Environmental Assessment (PEA) performed under the direction of the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC). U.S. Environmental Protection Agency (U.S. EPA) policy requires a QAPP for all environmental data collection projects mandated or supported by the U.S. EPA through regulations or other formalized means (U.S. EPA 1998a). The purpose of this QAPP is to identify the methods to establish technical accuracy, precision, and validity of data that are generated at the site.

The sampling program is formally described in the FSP. This QAPP contains general and specific details regarding field sampling, laboratory, and analytical procedures that apply to activities described in the FSP. It provides field and laboratory personnel with instructions regarding activities to be performed before, during, and after field investigations. These instructions will insure that data collected for use in project decisions will be of the type and quality needed and expected for their intended purpose.

Guidelines followed in the preparation of this QAPP are described in *EPA Requirements for Quality Assurance Plans for Environmental Data Operations, External Review Draft Final, EPA QA/R-5* (U.S. EPA 1998a) and *EPA Guidance for Quality Assurance Project Plans, EPA QA/G-5* (U.S. EPA 1998b). Other documents that have been referenced in this plan include *Guidance for the Data Quality Objectives Process, EPA QA/G-4* (U.S. EPA 1994a), *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (U.S. EPA 1996), *Preliminary Endangerment Assessment Guidance Manual* (DTSC 1994, Revised 2015), *Interim Guidance for sampling Agricultural Properties (Third Revision)*(DTSC 2008), and the *Advisory – Active Soil Gas Investigations* (Cal/EPA, DTSC, and Los Angeles Regional Water Quality Control Board [LARWQCB] 2015).

1.1 PROJECT HISTORY AND OBJECTIVES

The Site is located in the Oxnard Oil Field and is currently being used for agricultural production. The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California. The review of historical aerial photographs and maps, and interviews with the current owner, indicate the Site and adjacent areas have been used for agricultural production (row crops) since at least 1869. The Site is located in an area that is developed for commercial, residential, park, and agricultural land use. The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas. The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. The entire Maulhardt Ranch (APN 214-002-059) is bound by Camino Del Sol on the South, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue.

High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site. A more complete description of the historical land use of the Site and surrounding area is provided in the High School No. 8 Phase I ESA (Tetra Tech 2018a).

Based on Tetra Tech's background research for the Site in the High School No. 8 Phase I ESA (Tetra Tech 2018a) and the discussion during the July 25, 2018 PEA scoping meeting between DTSC, OUHSD and Tetra Tech, the following six RECs require assessment:

1. Potential toxic soil gas from potential formation leakage from the Oxnard Oil Field;

2. Potential residual organochlorine pesticides (OCPs), arsenic, semivolatile organic compounds (SVOCs), polyaromatic hydrocarbons (PAHs), and diesel (C_{13}-C_{22} carbon range) (THPd) and heavy oil range total petroleum hydrocarbons (C_{23}-C_{40} carbon range) (TPHmo) collectively known as diesel extended range TPH (TPHde) (C_{13}-C_{40} carbon range) in soil from fuel oil in smudge pots that were formerly used for frost abatement as part of the agricultural production activities at the Site;

3. Potential impacts to shallow soil, soil gas, and groundwater in the area of the Site adjacent to the Maulhardt Ranch farm yard and residential areas from above ground storage tanks (ASTs) and underground storage tanks (USTs) formerly used for the storage of motor fuel;

4. Potentially hazardous substances and petroleum products that contained volatile organic compounds (VOCs) and C_4-C_{12} carbon range gasoline range total petroleum hydrocarbons (TPHg) have been used and stored in the Tin Shed, Horse Barn, Garage, and Storage Shed on the Maulhardt Ranch that may have impacted shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch farmyard area;

5. Potential polychlorinated biphenyl (PCB) soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol; and

6. Hazardous pipelines identified within 1,500 feet of the Site.

The data collected as part of this PEA will be used to assess the relative threat associated with any found releases of hazardous substances using the accepted methods for evaluating human and ecological risks. The field sampling program has been designed to provide sufficient data through adequate numbers of samples, a comprehensive analytical program, and proper QC procedures.

2.0 PROJECT DESCRIPTION

This section presents information concerning the proposed sampling activities, selected analytical parameters, data objectives, and the resulting project decisions. The FSP (Tetra Tech 2018b) provides specifications for field activities.

2.1 ANALYTICAL SCOPE

The planned sampling effort includes the sampling and analysis of surface and subsurface soils for OCPs, arsenic, SVOCs, PAHs, PCBs, diesel and heavy hydrocarbon range total petroleum hydrocarbons (TPHde), VOCs, and gasoline and light hydrocarbon range total petroleum hydrocarbons (TPHg). Sampling and analysis of soil gas will be performed for VOCs, hydrogen sulfide (H_2S), methane, and fixed gases. A detailed plan of this investigation is provided in the FSP (Tetra Tech 2018b), and includes specified numbers and locations of samples to be collected. The FSP also includes specific procedures for use in collecting samples from the designated locations. Samples will be collected in accordance with methods presented in the FSP. Matrices to be sampled and analytical methods to be used are summarized below.

- Soil samples will be analyzed for OCPs via U.S. EPA method SW8081A.
- Soil samples will be analyzed for arsenic via U.S. EPA method SW6010B/ SW7471A.
- Soil samples will be analyzed for SVOCs via U.S. EPA method SW8260B.
- Soil samples will be analyzed for PAHs via U.S. EPA method SW8310.
- Soil samples will be analyzed for PCBs via U.S. EPA method SW8082.
- Soil samples will be analyzed for TPHg and TPHde via U.S. EPA method SW8015B modified for C3–40 carbon range characterization.
- Soil and groundwater samples will be analyzed for VOCs via U.S. EPA method SW8260B.
- Soil and groundwater samples will be analyzed for gasoline TPHg via U.S. EPA method 8015B.
- Soil gas samples will be analyzed in an onsite mobile laboratory for VOCs via U.S. EPA method SW8260B.
- Soil gas samples will be analyzed onsite mobile laboratory for methane via U.S. EPA method 8015M, for H_2S using a Jerome H_2S Analyzer Model 631-X hand held portable gas analyzer instrument.
- The soil gas samples will also be analyzed at A&R's stationary laboratory in Ontario, California for the fixed gases carbon dioxide, oxygen, nitrogen, and carbon monoxide using ASTM Method D-1946.

The soil samples in which TPHg and/or TPHde are detected will also be analyzed for extractable petroleum hydrocarbons (EPH) by Massachusetts Department of Environmental Protection Method in accordance with the recommendation in the PEA Guidance Manual (DTSC 2015) for performing simplified risk exposure analysis for TPH. Sample volume will be collected during the mobilization and archived with the laboratory pending review of TPH sample results.

American Environmental Testing Laboratory, Inc. (AETL) in Burbank, California has been selected to provide analytical services for soil samples. AETLs current Method Detection Limits (MDLs) and Method Reporting Levels (MRLs) for analytes to be assessed during this PEA are provided in Table A-1.

A & R Laboratories, Inc (A&R) in Ontario California has been selected to perform the soil gas sample collection and analysis for this project. The soil gas sample collection and analyses will be performed in accordance with the Cal/EPA, DTSC, and LARWQCB *Advisory – Active Soil Gas Investigations* (Cal/EPA, DTSC, and LARWQCB 2015).

A&R will analyze soil gas samples on-site for methane via EPA method 8015B, VOCs via EPA method 82060B, and TPHG via LUFT GCMS, and for H_2S using a Jerome H_2S Analyzer Model 631-X hand held portable gas analyzer instrument. The Jerome H_2S Analyzer Model 631-X will be calibrated in the field in accordance with the manufacturer's specifications before use.

A&R will collect soil gas samples for off-site analysis at A&R's stationary laboratory in Ontario, California for the fixed gases carbon dioxide, oxygen, nitrogen, and carbon monoxide using ASTM Method D-1946.

The method reporting limits for soil gas analytical methods are provided in Table A-2.

2.2 DATA USE

It is intended that data collected through implementation of this QAPP will satisfy federal, state, and local data quality requirements. These data will be used to characterize the nature and extent of any contamination, support risk assessment, support the evaluation of corrective/remedial action if warranted, or assist in determination of additional actions. If results from the risk screening evaluations indicate no risks of exposure with respect to the proposed use of the property, then the School District will use the data to support a No Further Action decision by DTSC, and the proposed school development may continue without modification. If the evaluation indicates unacceptable risks, then the data will be used by the School District to determine appropriate further action.

3.0 PROJECT ORGANIZATION

This section provides a description of the organizational structure and responsibilities of the individual positions for this project. This description defines the lines of communication and identifies key personnel assigned to various activities for the project.

3.1 REGULATORY AGENCY

Mr. Aslam Shareef, will act as DTSC's Project Manager and provide regulatory oversight for the project. Mr. Shareef's responsibilities will include reviewing and approving work plans, work activities, and reports for the duration of the project. Mr. Shareef will provide direction based on DTSC policy and environmental objectives.

3.2 SANTA MARIA-BONITA SCHOOL DISTRICT

Mr. Jeff Weinstein is the Assistant Superintendent for Business Services for the School District. The School District has agreed to seek the review and approval of the DTSC on environmental matters relating to the selection of sites for new educational facilities. Mr. Weinstein will be responsible for the directional decisions, as well as budget control, for work conducted on behalf of the School District. Mr. Weinstein, or designee, may perform document review of related work plans, reports, and drawings for activities associated with this project.

3.3 TETRA TECH

The investigation contractor has responsibility for assigned phases of investigation and reporting. Together the management team (Technical Director, Project Manager, and Field Managers) will be responsible for the technical planning and implementation of the work prescribed in FSP. The QA staff has responsibility for effective planning, verification, and management of QA activities associated with the assigned project.

Mr. Randy Westhaus is the Tetra Tech California Schools Director. Mr. Westhaus has the authority to commit the necessary resources of Tetra Tech to ensure timely completion of project tasks. His responsibilities include strategy development, budget control, and document review.

Mr. James R. Steele is the Tetra Tech Project Manager for the investigation. Mr. Steele will serve as the primary contact for the School District. He is responsible for implementing the described field program. As Project Manager, Mr. Steele will provide day-to-day management and tracking of the project schedule and budget. Other responsibilities include coordination and preparation of the required reports, and assignment of technical responsibilities to appropriate personnel or subcontractors.

Mr. Jason Dane is the Tetra Tech Field Manager and Site Safety Officer. Mr. Morse will be responsible for the day-to-day coordination of field activities under the direction of the Project Manager. Other responsibilities include coordination of subcontractors and field crews to ensure that field activities conform to the specifications presented in the FSP and Health and Safety Plan.

Mr. Steele is the Tetra Tech QA Manager. Mr. Steele will be responsible for the QA and QC aspects of the project. It is the responsibility of the QA Manager to ensure that all required QA/QC protocols are met in the field and laboratory. Mr. Steele will also provide oversight of related data validation activities.

Mr. Mathew Horrigan of Tetra Tech, is the project's Risk Assessment Coordinator. Mr. Horrigan will compile the necessary data for determination of human and ecological health risk assessment. Mr. Horrigan will perform her tasks under the direction of the Project Manager.

3.4 LABORATORY

The primary laboratory for soil sample analyses will be AETL. AETL will perform off-site analytical testing for soil samples collected for this investigation at their laboratory in Burbank, California. A&R will perform laboratory analyses of soil-gas samples with an on-site field instruments and at their stationary laboratory in Ontario, California. Both of the laboratory's project managers will report to the Tetra Tech Field Manager or QA Manager on all aspects of the sample analyses. In addition, the Tetra Tech QA Manager will be advised of any matters related to data quality during the course of the investigation. The laboratories will conform to the QA and QC procedures outlined in their standard operating procedures (SOPs) and QA manuals (Attachments A and B).

4.0 DATA QUALITY OBJECTIVES

Data Quality Objectives (DQOs) have been specified for each data collection activity, and the work will be conducted and documented so the data collected are of sufficient quality for their intended use (U.S. EPA 1998a, 1998b). DQOs specify the data type, quality, quantity, and uses needed to make decisions, and are the basis for designing data collection activities. The DQOs have been used to design the data collection activities presented in the FSP. The DQOs for the project are discussed in the following sections.

4.1 DATA QUALITY OBJECTIVE PROCESS

The project DQOs developed specifically for the planned sampling and analysis program have been determined based on U.S. EPA's seven-step DQO process (U.S. EPA 1994a). The Project Manager will evaluate the project DQOs to determine if the quantitative and qualitative needs of the sampling and analysis program have been met. The project definition associated with each step of the DQO process can be summarized as follows:

State the Problem: The purpose of the sampling program is to determine if the site is acceptable for an elementary school.

Identify the Decision: The data obtained from the sampling and testing activities will be used to evaluate whether historical uses of the Site have resulted in hazardous substance releases. The data will be further evaluated to determine the extent to which any found contamination will result in risk of exposure. The data will be compiled and used to assess the relative threat associated with any found contamination through a screening risk evaluation. Based on the calculation of human health and ecological risks for the site, the suitability of the property for its intended development/use will be determined.

Identify Inputs to the Decision: Inputs to the decision will include results of analytical testing of soil samples and soil gas samples collected from selected locations on the Site. Each of these matrices will be tested for the specified analytes listed in Section 2.0.

Define the Study Boundaries: The boundaries of the field sampling and analysis program will be the perimeter of the Site as detailed in the FSP (Tetra Tech 2018b).

Develop a Decision Rule: Decisions will be based upon laboratory results for the target constituents presented in Tables A-1, A-2, and A-3 for each matrix tested. If no valid detectable concentrations of target compounds are reported for the given samples, then a decision will be made that the Site is fully characterized with respect to the compounds tested and no further sampling will be required as part of this PEA. If target constituents are detected in the samples tested, then the data will be compiled for use in calculating the human health and ecological risk of exposure. The results of the risk evaluation will be used by the School District to request a No Further Action decision from DTSC, or to guide further action as warranted.

Specify Limits on Decision Error: Data are determined to be valid if the specified limits on precision, accuracy, representativeness, comparability, and completeness are achieved. The results of any detected target constituents will be considered in evaluating the need for additional sampling of soil and/or soil gas, and assessing the necessity for reducing any risks posed by the potential contamination.

Optimize the Design: The field sampling program has been designed to provide the type and quantity of data needed to satisfy each of the aforementioned objectives. The FSP provides the details of the data

collection activities, including the number of samples, sampling locations, and sampling techniques. The quality of the data will be assessed through the procedures described in this QAPP.

4.2 PRECISION, ACCURACY, REPRESENTATIVENESS, COMPARABILITY, AND COMPLETENESS

The basis for assessing the elements of data quality is discussed in the following subsections. In the absence of laboratory-specific precision and accuracy limits, the QC limits listed in this section must be met.

4.2.1 Precision

Precision measures the reproducibility of repetitive measurements. It is strictly defined as the degree of mutual agreement among independent measurements as the result of repeated application of the sample process under similar conditions.

Analytical precision is a measurement of the variability associated with duplicate or replicate analyses of the same sample in the laboratory, and is determined by analysis of laboratory quality control samples, such as duplicate control samples and laboratory duplicates. If the variability of results from the specified control samples are comparable within established control limits, then precision is within limits.

Total precision is a measurement of the variability associated with the entire sampling and analytical process. It is determined by analysis of duplicate or replicate field samples, and measures variability introduced by both the laboratory and field operations. Field duplicate samples are analyzed to assess field and analytical precision.

Duplicate results are assessed using the relative percent difference (RPD) between duplicate measurements. If the RPD for laboratory quality control samples exceeds the statistically determined control limit, data will be qualified as described in the applicable validation procedure. If the RPD between primary and duplicate field samples exceeds 40 percent for soil or soil gas, data will be qualified as described in the applicable validation procedure. The RPD will be calculated as follows:

$$\%RPD = 100 \times \frac{X_2 - X_1}{(X_2 + X_1)/2}$$

where X_2 is the larger of the two observed values, and X_1 is the smaller of the two observed values.

4.2.2 Accuracy

Accuracy is a statistical measurement of correctness and includes components of random error (variability due to imprecision) and systematic error. It reflects the total error associated with a measurement. A measurement is accurate when the value reported is within a degree of agreement with the true value or known concentration of the spike or standard.

Laboratory control samples (LCSs), surrogate standards, matrix spikes (MS), and initial and continuing calibrations of instruments will assess accuracy of laboratory analyses. Laboratory accuracy is expressed as the percent recovery (%R). Accuracy limits are statistically generated by the laboratory or required by specified EPA methods. Current laboratory limits are provided in Attachment A for LCSs, surrogates,

and matrix spikes. If the percent recovery is determined to be outside of acceptance criteria, data will be qualified as described in Section 8. The formula for percent recovery is:

$$\%R = 100 \times \frac{X_S - X}{T}$$

where X_s is the measured value of the spiked sample, X is the measured value of the unspiked sample, and T is the true value of the spike solution added.

4.2.3 Representativeness

Representativeness is the degree to which data accurately and precisely represent selected characteristics of the media sampled. Representativeness of data collection is addressed by careful preparation of sampling and analysis programs. This QAPP, together with the FSP, address representativeness by specifying sufficient and proper numbers and locations of samples; incorporating appropriate sampling methodologies; specifying proper sample collection techniques and decontamination procedures; selecting appropriate laboratory methods to prepare and analyze soil and soil gas samples; and establishing proper field and laboratory QA/QC procedures.

4.2.4 Completeness

Completeness is the amount of valid data obtained compared to the amount that was expected under ideal conditions. The number of valid results divided by the number of possible results, expressed as a percentage determines the completeness of the data set. The objective for completeness is to recover at least 90 percent of the planned data to support field efforts. For background samples, no less than 100 percent completeness of the planned data set will be acceptable. The formula for completeness is:

$$\%Completeness = 100 \times \frac{N_V}{N_E}$$

where N_V is the number of valid results and N_E is the number of expected results.

4.2.5 Comparability

Comparability is an expression of confidence with which one data set can be compared to another. The objective of comparability is to ensure that data developed during the investigation are comparable to site knowledge and adequately address applicable criteria or standards established by the U.S. EPA and California Department of Health Services (CADOHS). This QAPP addresses comparability by specifying laboratory methods that are consistent with the current standards of practice as approved by the U.S. EPA and CADOHS. Field methods are discussed in the FSP (Tetra Tech 2018b).

This page intentionally left blank.

5.0 QUALITY CONTROL ELEMENTS

This section presents QC requirements relevant to analysis of environmental samples that will be followed during all project analytical activities. The purpose of the QC program is to produce data of known quality that satisfy the project objectives and that meet or exceed the requirements of the standard methods of analysis. This program provides a mechanism for ongoing control and evaluation of data quality measurements through the use of QC materials.

5.1 QUALITY CONTROL PROCEDURES

The chemical data to be collected for this effort will be used to determine that the extent of contamination is properly evaluated. As such, it is critical that the chemical data be reliable and of the highest quality. Consequently, strict QA/QC procedures will be adhered to. These procedures include:

- Adherence to strict protocols for field sampling and decontamination procedures;
- Collection and laboratory analysis of appropriate field blanks to monitor for contamination of samples in the field or the laboratory;
- Collection and laboratory analysis of matrix spike, matrix spike duplicate, and blind split samples to evaluate analytical precision and accuracy; and
- Attainment of completeness goals.

5.1.1 Equipment Decontamination

Non-dedicated equipment will be decontaminated before and after each sample is collected. The equipment will be washed in a non-phosphate detergent and potable water, rinsed in potable water, and then double rinsed in distilled water. All decontaminated equipment will be allowed to air dry or be dried with clean paper towels before being used again. A description of the specific methodologies to be followed to maximize proper decontamination of non-dedicated sampling equipment is provided in the FSP.

5.1.2 Standards

Standards used for calibration or to prepare samples will be certified by National Institute of Standards and Technology (NIST), U.S. EPA, or other equivalent source. The standards will be current. The expiration date will be established by the manufacturer, or based on chemical stability, the possibility of contamination, and environmental and storage conditions. Standards will be labeled with expiration dates, and will reference the primary standard sources if applicable. Expired standards will be discarded.

5.1.3 Supplies

All supplies will be inspected prior to their use in the field or laboratory. The descriptions for sample collection and analysis contained in the methods will be used as a guideline for establishing the acceptance criteria for supplies. A current inventory and appropriate storage system for these materials will assure their integrity prior to use. Efficiency and purity of supplies will be monitored through the use of standards and blank samples.

5.1.4 Holding Time Compliance

Sample preparation and analysis will be completed within the required method holding time (Table A-4). Holding time begins at the time of sample collection. If holding times are exceeded, and the analyses are performed, the associated results will be qualified as described in the applicable validation procedure. The following definitions of extraction and analysis compliance are used to assess holding times:

- Preparation or extraction completion: completion of the sample preparation process as described in the applicable method, prior to any necessary extract cleanup.

- Analysis completion: completion of all analytical runs, including dilutions, second-column confirmations, and any required re-analyses.

5.1.5 Preventative Maintenance

The Tetra Tech Field Manager is responsible for documenting the maintenance of all field equipment as prescribed in the manufacturer's specifications. Trained Tetra Tech personnel will perform scheduled maintenance. Procedures specific to the calibration, use, and maintenance of field equipment are presented in the FSP. The analytical laboratory is responsible for all analytical equipment calibration and maintenance as described in their laboratory QA Plan. Subcontractors are responsible for maintenance of all equipment needed to carry out subcontracted duties.

5.2 QA/QC MONITORING COMPONENTS

The purpose of this QA/QC program is to produce data of known quality that satisfy the project objectives and that meet or exceed the requirements of the standard methods of analysis. This program provides a mechanism for ongoing control and evaluation of data quality measurements through the use of QA/QC monitoring components. The QA/QC monitoring components discussed below will be utilized as part of the overall QA/QC program.

5.2.1 Field Equipment Blanks

A field equipment blank is a sample that is prepared in the field by pouring de-ionized, distilled water into cleaned sampling equipment. The water is then collected and analyzed as a sample. The field equipment blank gives an indication of contamination from field procedures (e.g., improperly cleaned sampling equipment, cross-contamination). Field equipment blanks will be collected as warranted when non-dedicated equipment is used. The field equipment blanks will be analyzed using the same methods requested for the associated primary samples.

5.2.2 Trip Blanks

The primary purpose of trip blanks is to detect additional sources of contamination that could potentially influence contaminant values reported in field samples, both quantitatively and qualitatively. Trip blanks serve as a mechanism of control for sample bottle preparation, blank water quality, sample handling, and potential cross-contamination during sample transport. They are submitted to the laboratory for VOC analysis.

The trip blank consists of a VOC sample vial filled at the laboratory with American Society for Testing and Materials (ASTM) Type II reagent grade water. The trip blank travels to the site with the empty sample bottles and returns from the site with the collected field samples in an effort to simulate sample-

handling conditions. One trip blank will be included in each shipping container transporting samples for VOC analysis. The following are potential sources of contamination in trip blanks:

- Sample containers;
- Cross-contamination during shipment;
- Ambient air or contact with analytical instrumentation during preparation and analysis at the laboratory; and
- Laboratory reagents used in analytical procedures.

When a trip blank is identified as contaminated, the appropriate validation flag, as described in the applicable validation procedure, will be applied to the associated sample results.

The temperature of the trip blanks during storage will be maintained at 4 ±2 degrees Celsius. The holding time for analysis of trip blanks begins when the first associated field sample is collected.

5.2.3 Sample Receiving Temperature.

Temperature of the samples will be recorded upon arrival at the laboratory. The temperatures will be compared to the recommended preservation temperatures specified in Table A-4. If the temperature deviates from the recommended preservation temperatures, professional judgment will be used to determine if the deviation warrants qualification of the data.

5.2.4 Laboratory or Method Blanks

A laboratory blank or method blank consists of reagent grade (analyte free) water that is extracted by the laboratory and analyzed as a sample. Analysis of the reagent blank indicates potential sources of contamination from laboratory procedures (e.g., contaminated reagents, improperly cleaned laboratory equipment, or persistent contamination due to presence of certain compounds in the ambient laboratory air). A reagent blank will be analyzed at least once each day for each method utilized by the laboratory for that day.

5.2.5 Laboratory Control Samples

The LCS consists of reagent grade water spiked with known concentrations of target analytes and is used to determine if the analytical system is in control. Results from the LCS are considered free of any matrix effects and analyte recoveries outside control limits are used to qualify data.

5.2.6 Surrogates

For many methods, surrogate compounds are added to every sample at the beginning of sample preparation and are used to monitor the analytical process and give information concerning possible matrix effects. Surrogate recoveries are the single most useful QC entity for evaluating environmental analytical data. The ubiquitous use of surrogates in analytical methods has afforded a large database of results from which useful correlated information can be obtained. Surrogates are chemically similar to target analytes and their recovery within control limits indicates the process is in control. Surrogates are the primary indicators of matrix effects.

5.2.7 Second Column Confirmation.

When specified by the relevant analytical method, the presence of analytes detected on the primary column will be confirmed by detection on the secondary column. Analytes that cannot be confirmed on the second column will be qualified and considered not-detected.

5.2.8 Matrix Spike Samples

Matrix spikes are analyzed by the laboratory to evaluate the efficiency of the sample extraction and analysis procedures, and are necessary because matrix interference may have a widely varying impact on the accuracy and precision of the extraction and analysis. Matrix spikes are performed in duplicate in order to evaluate the precision of the procedures as well as the accuracy. The MS/MSD is prepared by the addition of known quantities of target compounds to a field sample. The spiked sample is then extracted and analyzed like normal field samples. The results of the analysis are compared with the known additions and the percent recovery is calculated giving an evaluation of the accuracy of the extraction and analysis procedures. MS/MSD recoveries are reviewed to check that they are within an acceptable range; however, the acceptable ranges vary widely with both sample matrix and analytical method. Precision objectives (represented by agreement between MS and MSD recoveries) and accuracy objectives (represented by MS and MSD recovery results) are based on statistically generated limits established annually by the analytical laboratory. It is important to note that these objectives are to be viewed as goals, not as criteria. MS/MSDs will be analyzed by the laboratory at a frequency of at least one per twenty, or 5 percent of the primary field samples; moreover, a minimum of one MS/MSD pair of samples will be prepared for each soil type encountered at the Site.

5.2.9 Field Duplicate Samples

Field duplicate samples will be collected and analyzed to evaluate sampling and analytical precision. Field duplicates are collected and analyzed in the same manner as the primary samples. Agreement between duplicate sample results will indicate good sampling and analytical precision. Field duplicates will be collected at a frequency of 10 percent of the primary samples collected. The duplicate samples will be analyzed for all laboratory analyses requested for the primary samples. The precision goal for field duplicate analyses will be an RPD of 40 or less.

5.2.10 Internal Standards

Internal standards are measured amounts of method-specified compounds added after preparation, or extraction, of a sample. Internal standards are added to field samples, control samples, and blanks in accordance with method requirements to identify column injection losses, purging losses, or viscosity effects.

Acceptance limits for internal standard recoveries are set forth in the applicable method. If the internal standard recovery falls outside of acceptance criteria, the instrument will be checked for malfunction and the corrective action will be in accordance with the method and the laboratory's SOP (Attachment A).

5.2.11 Retention Time Windows

Retention time windows will be established as described in SW-846 method 8000B for applicable analyses of organic compounds. Retention time windows are used for qualitative identification of analytes and are calculated based on multiple, replicated analyses of a respective standard.

Retention times will be checked daily. Acceptance criteria for retention time windows are established in the referenced method. If the retention time falls outside the respective window, actions will be taken to correct the problem.

5.2.12 Instrument Calibration

Analytical instruments will be calibrated in accordance with the procedures specified in the applicable method. All analytes that are reported will be present in the initial and continuing calibrations, and these calibrations must meet the acceptance criteria specified in the reference method. Records of standard preparation and instrument calibration will be maintained. Records will unambiguously trace the preparation of standards and their use in calibration and quantitation of sample results. Calibration records will be traceable to standard materials as described in Section 5.1.2.

At the onset of analysis, instrument calibrations will be checked using all of the analytes of interest. This applies equally to multi-response analytes. At a minimum, calibration criteria will satisfy method requirements. Analyte concentrations can be determined with either calibration curves or response factors, as defined in the method. Guidance provided in SW-846 should be considered to determine appropriate evaluation procedures.

5.2.13 Performance Evaluation Samples

Double blind performance evaluation (PE) samples may be submitted to the analytical laboratory during any site investigation. These samples may be of soil or water matrix, and are used to assess the accuracy of analytical procedures employed for a given sample set. PE samples will be used if questionable data quality is suspected as determined during laboratory audits or data validation.

If used, double blind PE samples will be prepared by Environmental Resources Associates, or similar supplier, in sample containers similar to those for the project field samples and shipped from the field to the laboratory for analysis.

The project-specific PE samples will contain known concentrations of the analytes of interest. Laboratory results will be evaluated against the original Certificates of Analysis for precision and accuracy. PE samples may be submitted for analysis as part of the laboratory pre-qualification process, or as part of a given sampling event.

This page intentionally left blank.

6.0 SAMPLING PROCEDURES

The defensibility of data is dependent on the use of well-defined, accepted sampling procedures. This section describes the sampling and handling procedures that will be followed for each sampling event.

6.1 FIELD PROCEDURES

Collection of environmental samples of high integrity is important to the quality of chemical data to be generated. To this end, strict field procedures have been developed that will be used during the field investigation. These procedures are detailed in the FSP (Tetra Tech 2018b).

6.2 SAMPLE CONTAINERS, PRESERVATION, AND HOLDING TIMES

Table A-4 lists the required sample containers, preservatives, and recommended maximum holding times for samples. Sample containers provided by the laboratory will be purchased commercially from I-Chem, Eagle Pitcher, or other equivalent source.

6.3 SAMPLE HANDLING AND STORAGE

In the field, each sample container will be marked with the sample identification number, the analytical methods to be performed on the sample, and the date and time of sample collection. All sample containers will be wiped with paper towels and securely packed, in a cooler on ice, in preparation for delivery to the laboratory.

Upon receipt of the samples, the laboratory will immediately notify the Field Manager if conditions or problems are identified which require immediate resolution. Such conditions include container breakage, missing or improper chain-of-custody forms, exceeded holding times, missing or illegible sample labels, or temperature excursions.

6.4 SAMPLE CUSTODY

For each sample that is submitted to the laboratory for analysis, an entry will be made on a chain-of-custody form. The information to be recorded includes the sampling date and time, sample identification number, matrix type, requested analyses and methods, preservatives, and the sampler's name. Sampling team members will maintain custody of the samples until they are relinquished to laboratory personnel or a professional courier service. The chain-of-custody form will accompany the samples from the time of collection until they are received by the laboratory. Each party in possession of the samples (except the professional courier service) will sign the chain-of-custody form signifying receipt. The chain-of-custody form will be placed in a plastic bag and shipped with samples inside the cooler. After the samples, ice, and chain-of-custody forms are packed in the coolers, the cooler will be appropriately sealed before it is relinquished to the courier. A copy of the original completed chain-of-custody form will be provided by the laboratory along with the report of results. Upon receipt, the laboratory will inspect the condition of the sample containers and report the information on the chain-of-custody or similar form.

This page intentionally left blank.

7.0 ANALYTICAL PROCEDURES

The analytical methods used for this project are U.S. EPA approved methods and are listed in Table A-4. Specific analytical method procedures are detailed in the laboratories' SOPs and QA manual (Attachments A and B). Tetra Tech quality assurance staff may review these documents during laboratory audits to ensure that project specifications are met. Analytical methods to be used for the sample analyses are detailed in *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods*, *SW-846*, 3rd Edition Updates III (U.S. EPA 1996). All guidelines and procedures specified in the analytical methods will be strictly adhered to. Deviations from those guidelines and procedures will be documented and immediately reported to the Tetra Tech Project Manager or QA Manager. If a deviation from the method renders the data unusable for its intended purpose, resampling and/or re-extraction and reanalysis may be required.

7.1 DETECTION LIMITS

Detection limits are required for all methods of quantitative analysis to evaluate each method's performance. Detection limits for any analytical procedures depend on the matrix of the sample being tested. The MDL is the minimum concentration of an analyte, or compound, that can be measured and reported with 99 percent confidence that the concentration is greater than zero. MDLs are established for each method, matrix, and analyte. MDLs are derived using the procedures described in 40 CFR 136 Appendix B (U.S. EPA 1990a). U.S. EPA requires that MDLs be established on an annual basis.

7.2 QUANTITATION LEVELS

All analytes have an established practical quantitation level (PQL), which is validated by having the level of the PQL included as one level in the multilevel calibration curve. Any concentrations reported at or above the PQL are considered quantitated data of known precision and accuracy, in contrast to concentrations reported below the PQL, which are considered estimated values. STL has set their reporting levels, presented in Table A-1, at a value equal to or greater than their PQLs.

This page intentionally left blank.

8.0 DATA REPORTING

This section presents reporting requirements relevant to the analysis data produced during this project.

8.1 FIELD DATA

Data measured by field instruments will be recorded in field notebooks, laptops, and/or on required field forms. Units of measure for field analyses are identified with the recorded measurement. The field data will be reviewed by the Tetra Tech Project Manager or Field Manager to evaluate completeness of the field records and appropriateness of the field methods employed. All field records will be retained in the project files.

8.2 LABORATORY DATA

Analytical data will contain the necessary sample results and quality control data to evaluate the data quality objectives defined for the project. Laboratory report packages will include the following data and summary forms:

- The original signed Chain-of-Custody form showing the date and time the sample was received.
- A cross-reference to relate field sample IDs to laboratory sample IDs.
- A cross-reference to relate applicable laboratory QC samples with associated field samples.
- A glossary defining the symbols and terms used in the laboratory report.
- Sample collection date, sample receiving temperature, sample extraction/preparation dates, and sample analysis dates.
- A list of the method detection limits and practical quantitation limits.
- Analysis data sheets for all field samples (including second column confirmations and all dilutions), blanks, MS/MSDs, and LCSs.
- Method blank summary reports that identify all related field samples, MS/MSDs, and LCSs.
- Surrogate compound recovery reports with control limits for all field samples, blanks, MS/MSDs, and LCSs.
- Matrix spike/matrix spike duplicate recovery reports with control limits.
- LCS recovery reports with control limits.
- A case narrative that discusses each QC element for each method and whether each QC element was acceptable or not and why. For any QC element that is outside acceptance criteria, the value and the criteria will be noted; corrective action taken will be described; and the impact to the data quality will be evaluated and discussed.

- Associated raw data and magnetic tape or equivalent upon request.

8.3 DATA VALIDATION

Data validation criteria are derived from the U.S. EPA Contract Laboratory Program National Functional Guidelines for Organic and Inorganic Data Review (U.S. EPA 1994b and 1994c). The Functional Guidelines provide data validation criteria that can be applied to data generated for this investigation.

The laboratory data will be reviewed for compliance with the applicable method and the quality of the data reported. The following summarizes the areas of data validation:

- Data completeness;
- Holding times;
- Calibrations;
- Blanks;
- Laboratory control samples;
- Matrix spike/matrix spike duplicates;
- Surrogates/internal standards (as applicable);
- Field quality control samples; and
- Compound identification and quantification.

The application of data validation criteria is a function of project-specific DQOs. The QA/QC Manager will determine if the DQOs for the analytical data have been met.

The data validation procedures were designed to review each data set and identify biases inherent to the data and determine its usefulness. Data validation flags are applied to those sample results that fall outside of specified tolerance limits, and, therefore, did not meet the DQOs described in Section 4.0. Data validation flags to be used for this project are defined in the *National Functional Guidelines* (U.S. EPA 1994b, 1994c). Data validation flags will indicate if results are considered anomalous, estimated, or rejected. Only rejected data are considered unusable for decision-making purposes; however, other qualified data may require further verification.

A preliminary review of the data will be conducted to determine whether comprehensive data validation of all data points is required. Data validation will be documented in a manner consistent with the functional guidelines. The results of the data validation will be included in a Data Validation Memorandum. This documentation will be maintained by Tetra Tech in the project files.

9.0 PERFORMANCE AND SYSTEM AUDITS

Audit programs are established and directed by the Tetra Tech quality assurance staff to ensure that field and laboratory activities are performed in compliance with project controlling documents. This section describes responsibilities, requirements, and methods for scheduling, conducting, and documenting audits of field and laboratory activities.

9.1 FIELD AUDITS

Field audits focus on appropriateness of personnel assignments and expertise, availability of field equipment, adherence to project controlling documents for sample collection and identification, sample handling and transport, use of QA samples, chain of custody procedures, equipment decontamination, and documentation. Field audits are not required, but may be performed in the event significant discrepancies are identified that warrant evaluation of field practices.

9.2 LABORATORY AUDITS

Laboratory audits include reviews of sample handling procedures, internal sample tracking, SOPs, analytical data documentation, QA/QC protocols, and data reporting. Any selected mobile or offsite laboratory will be licensed by the State of California as a certified testing laboratory, and will participate in the WP/WS Performance Program for hazardous waste, wastewater, and drinking water analyses. Tetra Tech may conduct a scheduled audit to ensure the integrity of sample handling and processing by the laboratory.

9.3 DATA AUDITS

Data audits will be performed on analytical results received from the laboratories. These audits will be accomplished through the process of preliminary review and/or data validation as described in Section 8.3, or may involve a more detailed review of laboratory analytical results. Data audits require the laboratory to submit complete raw data files to Tetra Tech for validation. Tetra Tech chemists will perform a review of the data consistent with the level of effort described in the *National Functional Guidelines* (U.S. EPA 1994b, 1994c). This level of validation consists of a detailed review of sample data, including verification of data calculations for calibration and quality control samples to assess whether these data are consistent with method requirements. Upon request, the laboratory will make available all supporting documentation in a timely fashion.

9.4 SCHEDULING

Audits will be scheduled such that field and laboratory activities are adequately monitored, or in the event discrepancies are identified. The overall frequency of audits conducted for these activities will be based on the importance and duration of work, as well as significant changes in project scope or personnel.

9.5 REPORTS TO MANAGEMENT AND RESPONSIBILITIES

Upon completion of any audit, the auditor will submit to the Tetra Tech Project Manager and Field Manager a report or memorandum describing any problems or deficiencies identified during the audit. It is the responsibility of the Project Manager to determine if the deviations will result in any adverse effect on the project conclusions. If it is determined that corrective action is necessary, procedures outlined in Section 9.6 will be followed.

9.6 CORRECTIVE ACTION

Corrective actions will be initiated whenever data quality indicators suggest that DQOs have not been met. Corrective actions will begin with identifying the source of the problem. Potential problem sources include failure to adhere to method procedures, improper data reduction, equipment malfunctions, or systemic contamination. The first level of responsibility for identifying the problems and initiating corrective action lies with the analyst/field personnel. The second level of responsibility lies with any person reviewing the data. Corrective actions may include more intensive staff training, equipment repair followed by a more intensive preventative maintenance program, or removal of the source of systemic contamination. Once resolved, the corrective action procedure will be fully documented and, if DQOs were not met, the samples in question will be recollected and/or reanalyzed using a properly functioning system.

Notes:
1 - Residential Soil Screeing Levels are from Tier 1 Enviromental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2016).
2 - Residential Soil Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).
3 - Residential Soil Screening Level is the DTSC-Modified Soil Screening Level from Table 1 of DTSC HHRA Note 3 (DTSC 2018).
4 - Residential Soil Screening Level for arsenic is the DTSC Screening Level for School Sites from the *Interim Guidance for sampling Agricultural Properties* (DTSC 2008).
EPA - U.S. Environmental Protection Agency
MDL - method detection limit
PQL - practical quantitation limit
NA - not applicable
mg/kg - milligrams per kilogram
µg/kg - micrograms per kiologram
RPD - relative percent difference

Toluene-d8			µg/Kg	*75*	*125*		NA	NA		
4-Bromofluorobenzene			µg/Kg	*75*	*125*		NA	NA		
Dibromofluoromethane			µg/Kg	*75*	*125*		NA	NA		

Notes:

1 - Residential Groundwater Screeing Levels are from Tier 1 Enviromental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2016).

2 - Residential Groundwater Screening Level is the DTSC-Modified Soil Screening Level from Table 2 of DTSC HHRA Note 3 (DTSC 2018).

3 - Residential Groundwater Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

EPA - U.S. Environmental Protection Agency

MDL - method detection limit

PQL - practical quantitation limit

NA - not applicable

mg/L - milligrams per liter

µg/L - micrograms per liter

RPD - relative percent difference

Notes:

1 - The listed Residential Air Screening Levels are DTSC-Modified Air Screening Levels from Table 3 of *HERO Note Number 3., DTSC-modified Screening Levels (DTSC-SLs)* (DTSC 2018) (DTSC HHRA Note 3), if available, or USEPA Region 9 Air Regional Screening Levels (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

2 - The Residential Soil Gas Screening Levels for VOCs and hydrogen sulfide were dervied by dividing the Residential Air Screening Levels by the future residential contaminant source attenuation factor of 0.001 from Table 2 of the *Final Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance)* (DTSC 2011).

3 - Residential Air Screening Level is the DTSC-Modified Air Screening Level from Table 3 of DTSC HHRA Note 3 (DTSC 2018).

4 - Residential Air Screening Level is the USEPA Region 9 Air RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).

5 - Residential Air Screening Level and Soil Gas Screeing Level are from Tier 1 Enviromental Screening Levels (ESLs) (San Francisco Bay Regional Water Quality Control Board 2016).

6 - Residential Soil Gas Screeing Level is from the recommended action level for further investigation in *Advisory on Methane Assessment and Common Remedies at School Sites* (DTSC 2005).

% - Percent by volume

EPA - U.S. Environmental Protection Agency

LUFT GCMS - California Regional Water Quality Control Board, Los Angeles Region Environmntal Laboratory Accreditation Program certified method for analyzing TPHg in vapor samples.

M - Modified

MDL - method detection limit

MS - mass spectrometry

NA - Not applicable

TPHg - micrograms per cubic meter

ppmV - parts per million by volume

RL - reporting limit

TPHg - Gasoline range total petroleum hyocarbons (C_4-C_{12} carbon range)

VOC - volatile organic compound

Quality Control/Quality Assurance Manual

PURPOSE

The purpose of this manual is to formally document the principles and procedures by which the laboratory produces its data. The objective of this QA/QC program is to provide a system of checks and controls which enables the laboratory to reliably and consistently provide data that is performed according to established EPA methodologies, of known precision and accuracy, and defensible in court, if necessary.

To meet this commitment, a comprehensive QA/QC program has been established. American Environmental Testing Laboratory (hereinafter called AETL) adheres to the principles and procedures outlined in this manual.

SCOPE

This manual presents an overview of the Quality Assurance/Quality Control (QA/QC) program that governs all data which is produced by AETL. The essential components of AETL's QA/QC program are outlined in the following sections. Detailed information regarding specific methods/procedures should be directed to documented Standard Operating Procedures (SOPs) or to laboratory management.

AETL has modeled its program after guidelines as outlined in "Interim Guidelines and Specifications for Preparing Quality Assurance Program Plans," QAMS-004/80, December 29, 1980 and "Interim Guidelines and Specifications for Preparing Quality Assurance Project Plans," QAMS_005/80, February, 1983, both of which have been issued by the Office of Monitoring Systems and Quality Assurance, Office of Research and Development, USEPA. All routine QA/QC practices follow EPA "Minimum Guidelines for the Evaluation of Laboratory DATA" as reporting in the Thursday, February 8, 1990 (page 4440) issue of the Federal Register.

INTRODUCTION

American Environmental Testing Laboratory is an analytical laboratory offering specialized environmental testing services. The laboratory has expertise in the analysis of organic and inorganic compounds in support of various

environmental activities including investigations, remediations, monitoring services, underground tank (UST) programs and other related events.

The laboratory routinely analyses in full compliance with the following agencies:

- US Environmental Protection Agency (USEPA)
- California Department of Health Services (CA DHS)
- American Society of Materials and Testing (ASTM)
- Arizona Department of Health Services (ADHS)
- Nevada Department of Health Services (UST work only)

Outside laboratories are audited for Quality Control procedures for all analyses not performed by AETL. An objective list of standard features is used for each outside laboratory with each laboratory listed in the order in which they are graded.

DEFINITIONS

Analytical Batch- is the basic unit for analytical quality control. The analytical batch is a group of samples which are analyzed together with the same method sequence and same lots of reagents and with manipulations common to each sample within the same time period or in continuous sequential time periods. Samples in each batch should be similar in composition (matrix) and must be analyzed within the same 24 hour time frame as a unit.
An analytical batch at AETL is composed of 15 or less samples. Every analytical batch has a corresponding QC batch number which is the extraction date for extractable organic compounds and the analysis date for non-extractable organic compounds. The QC batch number for wet chemistry and analysis of metals is the corresponding preparation date of each analytical method.

Method Detection Limit (MDL)- is a statistically derived number specific to each instrument, each instrument detector and in some instances, each different analyte, the amount of which is distinctively detectable, and is above zero concentration (99% sure).

Practical Quantitation Limit (PQL)- is a mathematical multiple of the MDL. The value of the multiple which can range from 1 to 10 is dependent upon factors such as the method of analysis and the actual practice that is followed by individual chemists in the laboratory.

Environmental Sample (or field sample)- is a representative portion of any material collected from any source for which determination of composition or portions thereof is requested.

Initiate Analysis- is the point in time that the sample, extract or digestate is introduced into an instrument or process for analysis of the parameter of interest.

Method Blank- is an analysis involving all of the reagents or chemical solutions common to a given analysis using reagent grade water (see below) as the matrix.

QA/QC Program- is the complete plan of policies and procedures incorporated by the laboratory in order to produce acceptable data.

Reagent Grade- is a reagent which conforms to the current specifications of the Committee on Analytical Reagents of the American Chemical Society. The burden of verification of this is generally left to the chemical manufacturer.

Replicate Sample- is a sample prepared by dividing a sample into two or more separate aliquots. Duplicate samples are considered to be two replicates.

Standard Curve- is a plot of instrument response to an analyte versus the known concentration of a standard analyte.

Reagent Water- is an analyte-free or laboratory pure water which is either distilled and/or de-ionized and is free of contaminants that may interfere with the analytical test in question.

LABORATORY STRUCTURE

The current management structure of AETL consists of a Laboratory Director, Project Managers, Laboratory Supervisors, and Chemists. The laboratory is structured into two main branches, the Organic Branch that includes the analysis of all organic compounds by GC/FID/PID/HALL, GC/MS, HPLC and IR, and the Inorganic Branch that includes the analysis of all inorganic compounds such as metals by ICP, FLAA, GFAA, anions, and cations by wet chemistry methods.

QA/QC OBJECTIVES FOR DATA MEASUREMENT

The Quality Assurance/Quality Control program is an essential part of the analytical protocol. It has been integrated into all facets of the laboratory operation. Its purpose is to detect and correct problems in the measurement process, to ensure that all data is valid, of known precision and accuracy and legally defensible. It is designed to monitor and control the quality of data

generated by the laboratory. The conscientious execution of the QA/QC procedures described herein ensures that the results will meet or exceed the minimum requirements of data acceptability as established by the EPA and California DHS. It assures the proper sample collection, preservation, labeling and storage procedures are applied to maintain sample integrity and identification. The specific procedures implemented to obtain valid data are described in the following sections.

The QA/QC program objectives include:

- Demonstration of the ability of the laboratory to perform analyses accurately, reproducibly and reliably.
- Reduction of measurement errors to acceptable minimum levels.
- Evaluation and control of data generation.
- Documentation of the laboratory's performance on a daily basis.

An essential part of the formally documented QA/QC program is the sound judgment of the technical staff. It is the technical staff that interprets events that may have caused an out-of-control condition. A function of the QA/QC program is to alert the staff that a nonconformity may exist. This ensures that corrective action can be administered without delay. Samples analyzed under conditions that are found to be out-of-control are reanalyzed utilizing a properly operating system.

SAMPLING PROCEDURES

In an attempt to minimize sample preservation effects, samples should be analyzed as soon as possible after receipt into the laboratory. Since it is not always possible to perform analyses immediately, sample must be maintained in an unaltered state. Samples are always preserved with consideration for desired analyte(s).

Sample collection technique preservation conditions and storage conditions may have a significant impact on chemical/physical analysis. AETL has a policy of providing certified pre-cleaned sampling containers to clients so that container integrity is not an issue. The use of proper sampling containers, protocols and performance of analyses within the established holding time limit are criteria for data acceptance that are not compromised at AETL. The following items demand attention to ensure sample integrity:

- Samples must be collected and stored in contaminant-free containers.
- Samples must consist of an adequate volume and /or weight.

- Samples must be clearly and completely labeled corresponding to the client chain of custody record.
- Samples must be properly preserved immediately after collection.

A listing of sampling and preservation requirements for analyses performed by AETL is presented in Appendix 1.

When sample containers and labels are provided to clients, AETL adheres to the EPA's established guidelines for sample preservation, storage, and holding times. For the analyses of water and waste water, the laboratory follows the guidelines found in Table 1060: I, page 1-22 in "Standard Methods for the Examination of Water and Waste Water," 1995, 19th edition, APHA, AWWA, WEF and Table 2-16 in SW-846, September 1986, 3rd edition, Volume 1A, pages 31-32.

SAMPLE CUSTODY

The chain of custody procedure employed by AETL follows procedures established by the EPA and is applied to all samples whether they are analyzed immediately, in the field, by the laboratory or sent to an outside laboratory by courier. The objective of the chain of custody procedure is to establish legal documentation describing the transfer of samples. The procedure records the custody of the samples from the sampling event, through shipment and receipt by the laboratory. The samples may be considered legal evidence and it is the intention of AETL to treat them accordingly.

The chain of custody procedure is outlined below:

1. When samples are received in the laboratory, they are checked against the chain of custody to make sure that samples and chain of custody match. If any discrepancies such as missing samples, miss-matching of numbers or quantity of sample are observed the information is conveyed to the pre-assigned project manager, who in turn will inform the sampler or client for explanation or new instructions.
   After matching of samples and the chain of custody, up to three pages of chains of custody are grouped together and assigned an AETL job number. This is done in order to avoid generation of large document files in AETL Laboratory Information Management System (LIMS). All documents in relation to all the samples in an AETL job are filed in the specific folder for that AETL job number. These documents could be specific instructions for the analysis of the samples or AETL generated chains of custody for subcontract work, etc. If a group of samples are subdivided into many AETL jobs, then all instructions for that group of samples are filed in every corresponding AETL job.

2. All samples that are received by the laboratory, and which have been grouped in an AETL job, are individually assigned an unambiguous, laboratory identification number at the time of receipt in the laboratory. Samples that are to be archived, are not assigned a laboratory identification number. These samples are stored in the pre-determined area in a refrigerator. Archived samples will be held until an analysis is assigned to them. At that time, they will be assigned a laboratory identification number and processed.

3. The sample containers are fully identified with this laboratory identification number. Sample labels are completed and are permanently fixed to the sample container. The time and date of the sampling event, the identity of the sampler and the preservative, if any, are documented on the chain of custody record.

4. Each sample on the chain of custody is marked with the assigned laboratory identification number and the record is compared with the labeling of the sample container. Information noted on the chain of custody record includes: client name, project name and location, sampler's signature, sample identification, analysis requested, turn around time requirements, number of containers per sample, description of sample matrix, date and time of the sampling event, laboratory's name and the laboratory sample number.

5. Each transfer of sample custody is recorded on the form. The relinquishing party and the receiving party accepting the samples must sign the chain of custody record and document the time and date of the transfer.

6. All information with regards to sample identity and requested analysis is transferred to the laboratory logbook. The chain of custody which now contains an AETL job number and individual laboratory identification numbers are forwarded to data entry. At the data entry all samples with the requested analysis are logged in to the Laboratory Information Management System (LIMS). After entry into the LIMS, a work order is generated. Project manager then checks the work order for corrections and completeness. The project manager will make sure that all the information with regards to a project, samples, and requested analysis have been transcribed correctly and completely into the LIMS.

7. After the samples have been logged in and tagged with their individual laboratory identification number, they will be transferred to the corresponding refrigerator for soil, water and air samples. Samples will be grouped by AETL job number and placed in pre-assigned locations

according to their laboratory identification number. Range of laboratory identification numbers are posted outside individual refrigerators so that samples can be located by the analysts for analysis.

8. There is usually a time laps between receipt of samples and the issuance of a work order. In order to avoid any delays in the analysis of the samples, after logging in of the samples in the laboratory log book, every analyst that has to perform any analysis will receive a copy of the chain of custody with the requested analysis hi-lighted for that analyst. Each of the pertinent analysts are also informed of incoming samples with the required turn around times by the project managers as soon as the information is available. If laboratory is at capacity, then alternative arrangements will be made.

9. When the analyst is ready for the analysis of samples, he or she will remove the samples from their corresponding storage space and will return the samples to the same place after completion of his or her work.

10. If a sample has to be shared by more than one analyst, then the analysts are informed by the project manager of the requirement so that the sample will be analyzed in accordance with the proper order of analytical priorities. The order of analytical priorities at AETL is as such: VOC, Organics, Wet Chem, Metals.

11. Samples are kept in cold storage for up to 3 months. After this period they are kept in ambient storage for up to 6 months. Unless the client requests that sample be held longer, all samples will be disposed by certified waste disposal companies. All samples are documented by their laboratory identification number prior to their disposal. All wastes that are disposed, are manifested and the manifest documents filed and kept for six years.

A copy of the AETL chain of custody record is presented in Appendix 2.

CALIBRATION PROCEDURES AND FREQUENCY

The accuracy of calibration is dependent on the purity of the standard solutions and reagents used in the analytical operation. AETL continually monitors the quality of its reagents and standard solutions. When possible, standards acquired have traceability to the USEPA or the National Institute of Standards and Technology (NIST). Permanent records are maintained to document standard traceability. This information is recorded in a Standards Log Book. An example form is given in Appendix 3.

The generation of valid data is dependent on the accurate and reliable calibration of the instrument. Although calibration and standardization procedures vary depending on the type of system and analytical method employed, the principles of calibration are universal. Proper calibration ensures that the analytical system is operating correctly and functioning at the proper sensitivity to meet established method detection limits. Before a system is used for analyses, the calibration range is defined, detection limits are determined and potential interferences are identified and eliminated where possible. The calibration status is checked periodically to ensure that the system is functioning properly. Each instrument is calibrated with standards appropriate to the type of analysis and the calibration range established for the method employed. The calibration program at AETL is instrument/method specific. The calibration procedure for selected instruments are given in the following sections.

Gas Chromatography/Mass Spectroscopy (GC/MS) Analysis

Commercially available standards or standards prepared from neat compounds, validated by comparison to EPA or NIST reference materials when possible, are used to determine the detectability and adjust the selectivity of the chromatographic system for all compounds or multi-response mixtures being measured.

The calibration procedure is initiated after the system has been reviewed to ensure proper operation. A blank is analyzed immediately prior to the analysis of calibration standards to indicate the absence of interferences. Calibration is completed by analyzing standard solutions at a minimum of five concentration levels according to the standard operating procedure for the method under consideration. The standard of lowest concentration is at or slightly above the established limit of quantification for each analyte. Analyzing a standard with a concentration in the midpoint level completes the calibration process. The source of this standard is independent of the calibration standards. It is also verified at least once for every 15 measurements and at the beginning and end of a batch.

The criteria of retention time stability and sensitivity of instrumentation for every method are met prior to the start of any analysis of samples.

Bromofluorobenzene (BFB) Tuning criteria and calibration verification (SPCC and CCC) criteria must be met before analyzing samples and checked every 12 hours during sample analyses. When the response for all parameters is within the limits set for acceptance, the analysis of environmental samples may continue. When an individual response falls outside this range, the system must be recalibrated for that parameter after checking the original response.

Internal Standard Calibration

All GC/MS procedures at AETL use the internal standard calibration procedure concentrations.

Gas Chromatography (GC) Analysis

Commercially available standards or standards prepared from neat compounds, validated by comparison to EPA or NIST reference materials when possible, are used to determine the detectibility and adjust the selectivity of the chromatographic system for all compounds or multi-response mixtures being measured.

The calibration procedure is initiated after the system has been reviewed to ensure proper operation. A blank is analyzed immediately prior to the analysis of calibration standards to indicate the absence of interferences. Calibration is completed by analyzing standard solutions at a minimum of five concentration levels according to the standard operating procedure for the method under consideration. The standard of lowest concentration is at or slightly above the established limit of quantification for each analyte. The other standards should be limited by the working range of the detector(s) in use. The calibration process is completed by analyzing a standard, usually a midpoint level concentration, that originates from a source independent of the calibration standards. It is also verified at least once for every 15 measurements and at the beginning and end of a batch.

When the response for all parameters is within the limits set for acceptance (usually $\pm$ 15%), the analysis of environmental samples may continue. When an individual response falls outside this range, the system must be recalibrated for that parameter after checking the original response. In addition, the samples analyzed under the failed check standard must be reanalyzed for the parameter that failed.

High Performance Liquid Chromatography (HPLC)

Commercially available standards or standards prepared from neat compounds, validated by comparison to EPA or NIST reference materials when possible, are used to determine the detectibility and adjust the selectivity of the chromatographic system for all compounds or multi-response mixtures being measured.

The calibration procedure is initiated after the system has been reviewed to ensure proper operation. A blank is analyzed immediately prior to the analysis

of calibration standards to indicate the absence of interferences. Calibration is completed by analyzing standard solutions at a minimum of five concentration levels according to the standard operating procedure for the method under consideration. The standard of lowest concentration is at or slightly above the established limit of quantification for each analyte. The other standards should be limited by the working range of the detector(s) in use. The calibration process is completed by analyzing a standard, usually a midpoint level concentration, that originates from a source independent of the calibration standards. It is also verified at least once for every 15 measurements and at the beginning and end of a batch.

When the response for all parameters is within the limits set for acceptance (usually $\pm$ 15%), the analysis of environmental samples may continue. When an individual response falls outside this range, the system must be recalibrated for that parameter after checking the original response. In addition, the samples analyzed under the failed check standard must be reanalyzed for the parameter that failed.

External Standard Calibration

All Chromatographic procedures at AETL use the external standard calibration procedure. A calibration curve is constructed with peak height or area versus concentration for the analyte of interest. An R squared value of 98% or greater for the external five point calibration curves are forced through the origin to account for background noise. The calibration factor can then be used to determine analyte concentrations.

Metals Analyses

Commercially available standards or standards prepared from neat compounds, validated by comparison to EPA or NIST reference materials when possible, are used to determine the concentrations of each metal analyzed.

For Flame Atomic Absorption (FLAA) or Graphite Furnace Atomic Absorption (GFAA), a three-point calibration curve is initiated by analyzing a minimum of three different concentrations and a calibration curve is initiated by analyzing a minimum of three different concentrations and a calibration blank. For Inductively Coupled Plasma (ICP) a calibration blank and a high concentration standard for each of the elements of interest are analyzed. Concentrations of each level are specified by the manufacturer or are in the EPA methods. This is to ensure proper operation and calibration of the system before commencing the analysis scheme. A blank is analyzed immediately prior to the

analysis of calibration standards to indicate the absence of interferences and a clean system. In addition, a method blank is always run after a high or off-scale analysis has been run. The calibration process is completed by analyzing a standard, usually at midpoint level concentration, that originates from a source independent of the calibration standards.

After every 10 samples the working standard curve is verified by measuring a midpoint standard. For ICP analyses, this check standard value must be within 10% of the true value or the previous 10 samples need to be reanalyzed. For FLAA analyses, this check standard value must be within 15% of the true value or the previous 10 samples need to be reanalyzed. For GFAA, this check standard value must be within 20% of the true value or the previous 10 samples need to be reanalyzed.

For ICP analyses the interelement and background correction factors must be verified at the beginning and end of each analytical run or twice every 8-hour work shift, which ever is more frequent. Results must be within 20% of the true value or analyses cannot continue.

All EDL or hollow cathode lamps for FLAA or GFAA are checked each time they are used to determine if they are within manufacturer's specified energy levels.

Conventional Wet Chemistry Analyses

Conventional wet analyses utilize various instrumentation, which are applied to specific analytical methodologies. Each instrument is calibrated or checked prior to sample analysis. A method blank and a minimum of three standards are prepared when appropriate. Calibration is deemed acceptable when a linear response is obtained or when the calibration response is within method guidelines. Reagent grade standards are used for calibration purposes. Check standards are obtained from an independent source.

IR analyses for EPA 418.1 and 413.2 use at least a five-point calibration and preferably a seven-point calibration. Since it is unlikely that the calibration will ever fail unless there is an instrument malfunction, a single midpoint calibration check should be sufficient for each batch of IR analyses. After every 10 samples the working standard curve is verified by measuring a midpoint standard. This sample value must be within 20% of the true value or the previous 10 samples need to be reanalyzed.

ANALYSTS TRAINING

All analysts who are hired by AETL are screened rigorously for their professional backgrounds and formal education. After hiring, every analyst is assigned a supervisor and a peer member who will work with the new analyst. The new analyst is then issued a Good Laboratory Practice Standards Manual and the Standard Operating Procedure (SOP) of the assigned analytical method. The analyst will then work with the peer member under the supervision of an assigned supervisor. When the analyst feels confident enough that he or she can perform the method, he or she is asked to proceed with an Initial Demonstration of Proficiency (IDP). When the analyst can show an IDP of 90% or better he or she will be given a blind internal QC sample. After passing of the QC sample and achievement of a 90% or better result on the IDP, the analysts will be allowed to work independently. All analysts constantly work under the supervision of their section supervisor at all times.

ANALYTICAL PROCEDURES

The laboratory routinely provides analyses of organic and inorganic parameters in conformity with US EPA and CA DHS methodologies. Appropriate analytical techniques are incorporated into methods and procedures as prescribed by the EPA and ASTM. The origination of these procedures and techniques is presented in Appendix 4.

Each analytical method employed is documented in the form of a Standard Operating Procedure (SOP). The purpose of establishing these procedures is to standardize the methods so that all samples are analyzed consistently, correctly and without bias. In addition, the SOPs provide a good starting point for the training of new analysts. The SOP is constructed so that it contains detailed instructions describing the use and performance of the method. All pertinent QA/QC program procedures are integrated into the SOP.

Before an analytical method is used to generate data, the method is validated. Method validation includes definition of detection limits, the determination of the calibration range, and precision and accuracy. A list of recommended methods for the analysis of specific parameters to be used in this laboratory and in outside laboratories is presented in Appendix 1.

DATA MANAGEMENT

All data generated at AETL is extensively checked to ensure that it is valid, of known precision and accuracy and defensible. The data validation

process consists of data generation, reduction, and review. After this process has been completed to the satisfaction of the QA/QC project plan, the laboratory report is generated and reviewed.

Data Reduction

Data reduction is the process by which raw data is transformed into final results. The analyst who generated the analytical data has the primary responsibility for its quality. All data is generated and reduced following procedures specified by the laboratory SOPs. Each analyst reviews the quality of his/her work based on these established QA/QA procedures, his/her technical knowledge, and experience. The analysts reviews the data package to ensure that:

- Raw data generated from the analysis is correct and complete
- Appropriate SOPs have been followed
- Analytical results are correct and defensible
- Method blank test results are within control limits
- Matrix spike/spike duplicate results are within control limits
- Laboratory control sample results are within established limits
- Documentation is complete

Data Validation

After the data reduction package is reviewed, initialed, and dated by the analyst, it is then forwarded to the laboratory manager for review. This review also includes verification of calculations and raw data to provide a complete independent audit of the data package. When no errors are found, the reviewed data are then approved for release and the final report is prepared.

Report Documentation

The purpose of the Laboratory Report is to provide a concise and complete description of the analytical results generated for a specific set of samples. The Laboratory Report consists of three parts: general client and lab information, laboratory results and the Quality Assurance/Quality Control summary.

General information issued in the laboratory report consists of the client identification and address, project identification and address, date of the report, laboratory job number and client job number, the date the sample(s) was

collected, the date it was received by the laboratory, the date it was analyzed and the physical state of the sample.

The QA/QC summary issued in the laboratory report consists of a description of the parameter investigated, the method used, the QC type (Matrix Spike/Spike Duplicate or Laboratory Control Sample), the recovery, the acceptable range for recovery, the reproducibility and the acceptable range for reproducibility.

The laboratory results section of the laboratory report identifies the test performed, the sample on which the test was performed, the parameters investigated, the level determined for each parameter investigated with the appropriate units and the method detection limit for each parameter.

Additional information issued in the laboratory report includes a statement as to the condition of the sample(s) on receipt. In addition, any qualifications about the sample analysis such as fuel type, method alterations, etc. will be places in the laboratory report summaries on footnotes.

INTERNAL QUALITY CONTROL CHECKS

Data quality is monitored with internal QC checks. The checks are used to determine whether the laboratory is operating within acceptable limits. Sample matrix effects are also evaluated by the use of QC checks.

Method Blanks

Method blanks are analyzed to assess the level of background interference or contamination in the analytical system. A method blank is analyzed each time a batch is processed. When compounds are found in the blank, their values are evaluated to determine their effect on the analysis of environmental samples. Three possibilities exist:

1. There are no compounds found in the blank.
   No action is required.

2. Compound(s) is (are) found in the blank, but are not found in the sample.
   No action is required.

3. Compound(s) is (are) found in the blank and are found in the sample. The results are not corrected by subtracting any blank value from the sample. No positive sample result is reported unless the concentration of the

compound in the sample exceeds five times the amount of the compound in question found in the blank or if it exceeds 10 times the amount in any blank for the common contaminants listed below:

a. methylene chloride
b. acetone
c. toluene
d. 2-butanone
e. phthalate esters

Certain other compounds such as Freon 113, hexane, and pentane may be present in blanks if they are being used in the vicinity of analyses. The presence of these compounds in the blank and sample should be dealt with using the five times rule listed above.

Calibration Check Standards

Calibration check standards are analyzed to confirm that measurements were performed in an in-control mode of operation. The calibration check standard concentration is established near the midpoint of the calibration range. Instrument calibration is checked with every analytical batch. It is also verified once for at least every 15 measurements or at the end of a batch, whichever is more frequent. Calibration checks must be within 15% for all analytes of interest before proceeding with the analysis of samples.

Laboratory Control Samples

Laboratory Control Samples (LCS) are prepared/obtained from sources independent of the calibration standards. The LCS concentration is established near the midpoint calibration range. An LCS must be prepared and analyzed once per batch of samples.

Matrix Spikes

A matrix spike is an environmental sample into which known concentrations of analyte(s) have been added. The matrix spike sample is analyzed with environmental samples of the same matrix type in each batch and the results are used to evaluate sample matrix effects on method accuracy. For each method at least two compounds or 10 percent of the analytes of interest must be spiked.

Matrix Spike Duplicates

A matrix spike duplicate is one of two QC checks of an environmental sample. It is spiked with the same concentration of an analyte(s) as the matrix spike. The matrix spike duplicate sample is analyzed with environmental samples of the same matrix type in each batch. The results evaluate sample matrix effects on method accuracy. Values obtained from the matrix spike and matrix spike duplicate analyses are compared to evaluate sample matrix effects on method precision. Statistics are kept for each analyte recovery for each matrix type.

Surrogates

Surrogates are organic compounds, which are similar to the analytes of interest, but are not normally found in environmental samples. Surrogates must be spiked into blanks, standards, spikes, and samples for organic analyses to monitor sample specific effects on method accuracy. They should not interfere with target analytes.

Field / Trip Blanks

Field blanks are used to monitor contamination origination from the collection and transportation of environmental samples. They are prepared and sealed in the laboratory using reagent grade water (preferably Type II) and are released to the sample collector prior to the collection event. These blanks are analyzed immediately in order to eliminate interferences from storage effects.

There are two types of field blanks; field blanks which are opened in the field during the time that a sample is being collected and equipment blanks, which are the rinsate from sample collection.

A trip blank remains sealed the entire from the laboratory to sample collection to the laboratory again. It measures any effects due to the sample container, transportation effects, and sample environment to and from the laboratory.

INTRALABORATORY AUDITS

Audits are an integral part of the QA/QC program. Audits conducted at AETL are of two types: system audits, which quantitatively evaluate the operational details of the QA/QC program, and performance audits which

quantitatively evaluate the accuracy of analytical data generated. It is the responsibility of the laboratory manager or an outside auditing entity such as CA DHS personnel to conduct these audits.

System Audits

System audits consist of checks of critical operations in randomly selected test record that are reviewed to assure that all required documentation are retrievable. Data is examined in detail to determine the quality as well as the completeness of the information. This detailed examination also ensures that all steps of the QA/QC program are performed. The frequency of system audits depends on the critical nature of the data output, the importance of different certifications/recertifications, and the number of system changes.

Performance Audits

Performance audits evaluate test methods. The laboratory manager conducts these audits by introducing reference samples into the analysis stream without the knowledge of the analyst when possible. The audit is completed upon evaluation of the analytical results of reference samples by the laboratory manager.

PREVENTIVE MAINTENANCE

A preventive maintenance schedule exists for each instrument, which enables consistent generation of quality data. Routine instrument maintenance is conducted by designated laboratory personnel in accordance with the manufacturer’s specification and/or the experience of the operator. Instrument repairs are performed by trained staff of instrument manufacturer representatives. AETL maintains logbooks documenting the preventive maintenance and repairs performed on each instrument.

DATA ASSESSMENT

The effectiveness of a QA/QC program is measured by the quality of data generated by the laboratory. Data generated by the laboratory is assessed in terms of the measure of its precision, accuracy, representativeness, completeness, and comparability. The quantification procedure for each of these terms is detailed in the following sections.

Precision

Precision is the degree to which a measurement can be reproduced without assumption of any prior knowledge as to the true result. Precision is assessed by the means of duplicate/replicate sample analyses. The acceptability of replicate analyses at AETL is the evaluation of the relative percent difference (RPD) of control sample values. The RPD is calculated in all cases where matrix spike and matrix spike duplicate determination are made. Its definition is given below:

$$RPD = \{(X_1 - X_2) \div [(X_1 + X_2) \div 2]\} \times 100$$

Where X_1 and X_2 are measurements of the same parameter of duplicate/replicate sample analyses.

Accuracy

Accuracy is the determination of how close a measurement is to the actual value. It can be assessed by means of laboratory control samples (LCS), standard reference materials or spiked samples and their corresponding percent recoveries. The calculation of accuracy is terms of percent recovery is as follows:

$$\text{Percent Recovery} = [(\text{Observed Value} - \text{Sample Value}) \div \text{Known Value}] \times 100$$

The determination of the accuracy of a measurement requires knowledge of the known value for the parameter being measured.

Representativeness

Representativeness expresses the degree to which data accurately and precisely represents a characteristic of a given set of samples or data sets to that of the site from which the samples were collected. The use of appropriate methods and sound judgment in the field will ensure that samples are representative of the site and that their collection was performed in accordance with the appropriate project sampling and analysis plan (SAP). To maximize representatieness of results, sampling procedures should follow established protocols and sample locations should be chosen based on sound judgment and knowledge of the particular site. Laboratory personnel will be able to advise the client on these matters. Some samples may require analysis of multiple phases to obtain representative results. The client is always consulted as to which phase of a multi-phase sample is to be analyzed.

Completeness

Completeness is defined as the ratio of usable (i.e. non-rejected) laboratory measurements to the total number of planned measurements for an investigation.

Percent completeness=(NUR ÷TNPR) x 100

NUR = Number of Usable Results i.e. Non-rejected Results
TNPR = Total Number of Possible Results

AETL goal is to achieve Percent Completeness of 90% or better.

Comparability

Comparability is an evaluation of the relative consistency of the laboratory measurement data. Since comparability cannot be measured quantitatively, therefore professional judgment is relied upon. Internal comparability will be achieved for samples by adhering to consistent sample collection procedures and analyses methods throughout each investigation.

Control Charts / QA Statistics

Statistics are maintained by the laboratory to determine laboratory specific Quality Control limits. Matrix Spike/Matrix Spike Duplicate data are tabulated on a Semi-Annually basis for each parameter for each matrix type. Control charts are established using this data to monitor trends and shifts in data generation. Check standards and matrix spike/matrix spike duplicates sets or laboratory control sample spikes are used in conjunction with laboratory control charts to monitor the daily performance of analytical methods. Precision and accuracy are evaluated for each QC sample and compared to established laboratory acceptance criteria. If laboratory criterion has not been established, or the laboratory has produced an insufficient number of data points, then the EPA method should be consulted for control limits.

The control chart is a graph of the mean value line with upper and lower control limits. There are two types of control limits that evaluate data acceptability: the warning limit and the out-of-control limit. The warning limit is set at $\pm$ 2 standard deviations of the mean and the out-of-control limit at $\pm$ 3 standard deviations of the mean. QC results in the 2-3 standard deviation range alert the analyst to a potential out of range event. Data lying beyond the third standard deviation requires that the test be repeated for all samples affected. For the

purpose of control chart interpretation, an out of range event is defined as any QC data point or set of points that meet the following conditions:

- A single data point outside of 3 standard deviations.
- Two points which are consecutively outside of 2 standard deviations (warning limit).

The following criteria define a trend or shift, respectively:

- The steady increase or decrease in value of seven consecutive measurements.
- A series of seven or more consecutive points above or below the mean.

When any of the above conditions exists, all analyses pertaining to the method which is out-of-control must cease, corrective action must be initiated, and all samples analyzed under the out-of-control situation must be reanalyzed. The instrument or procedure should be examined for possible causes.

CORRECTIVE ACTION

Regardless of the cause, any activity in the laboratory which adversely affects the quality of the data is considered a nonconformance. Non-conformances are defined as errors, deficiencies or out-of-control situations. These situations can arise due to method procedural problems, equipment malfunctions, improper data reduction or nonsystematic errors. The QA/QC program provides systematic procedures called corrective actions to resolve these non-conformances and restore the system to its proper condition. The analyst, who performs the initial review of the situation and the initial diagnosis of the nonconformance, often handles corrective action procedures. If the problem persists or cannot be identified, the matter is referred to laboratory management for further investigation. Once a nonconformance has been confirmed, analysis must be stopped and the integrity of the results determined. When the analyses are adversely affected, the samples in question must be reanalyzed utilizing a system that is functioning properly. Once resolved, full documentation of the corrective action procedure is filed with management, placed into the maintenance logbook, and all reanalyzed samples noted in the instrument logbook. An example of a non-conformance report is presented in Appendix 5.

QUALITY ASSURANCE REPORTS

Once per month or more often if necessary, management discusses QA/QC issues that have relevance to the previous month’s performance. The

purpose of this discussion is to provide a monthly monitoring and review of the data produced by the laboratory. A continual effort is made through SOPs and QA/QC documents to upgrade the quality of data being produced by the laboratory.

Document Control

In relation to every project two types of document are generated. The first type is any document that is generated outside the laboratory by the client and the sampler. The second type is any document that is generated by the laboratory. All documents that are generated outside the laboratory and which are forwarded to the laboratory are filed in the corresponding AETL Job folder and returned to the client with the original results of analysis.
A copy of these documents with a copy of the analytical results are kept in the AETL job folder and eventually filed in storage in accordance with AETL job number.
All new data that are generated by the laboratory are also filed in the corresponding daily folder for each method and kept in storage in accordance with dates and AETL job numbers. All documents that are stored at AETL are kept for at least 6 years.

SECURITY

The laboratory maintains two levels of security to limit access to samples or associated data. Facility security is maintained through controlled access to the laboratory by keeping the doors locked with limited access for cleared laboratory employees. The door of the sample storage room, which is kept locked at all times, is only accessible by the sample custodian. Access to clients' old data and files, which are kept in locked files in the laboratory's main office, is only possible through the laboratory secretary with the approval of the laboratory director. Clients' new data is kept in computer network, which can be accessed through a password by the laboratory secretary with the approval of the laboratory director.

In addition all employees of AETL sign a confidentiality agreement when they become employed at AETL. Unless authorized by the laboratory director, none of AETL employees are allowed to discuss any of the results with any client. Only project manager and the laboratory director are authorized to discuss data with the clients. Data of no client is discussed with any third party unless, the client authorizes AETL in writing.

Data generated by AETL is transcribed into AETL LIMS by data entry staffs that are assigned a personal security pass codes. Once a data has been entered into

the LIMS, it can no longer be changed, deleted or added to unless, it is authorized by the corresponding project manager or laboratory director.
All information on AETL LIMS is stored on tape on a weekly basis. A copy of the tape is always kept by the laboratory director in storage outside the laboratory premises for safety.

APPENDIX 1

SAMPLING AND PRESERVATION REQUIREMENTS

AMERICAN ENVIRONMENTAL TESTING LABORATORY

INORGANIC TESTS

Determination	Method No.	Matrix	Preservative	Sample Required	Container	Holding Time
Acidity	305.1	Water	Cool, 4°C	100 mL	P / G	14 days
Alkalinity	310.1	Water	Cool, 4°C	100 mL	P / G	14 days
Ammonia	350.1 auto 350.2 manual 350.3 electrode	Water	Cool, 4°C; H_2SO_4 to pH <2	500 mL	P / G	28 days
BOD	405.1	Water	Cool, 4°C	1000 mL	P / G	48 hours
Boron	200.7 212.3	Water	None Required	600 mL	P	28 days
Bromide	320.1 300	Water	None Required	100 mL	P / G	28 days
Calcium	215.2 200.7	Water	Cool, 4°C; H_2SO_4 to pH <2	600 mL	P / G	6 months
Chloride	325.3 300	Water	None Required	100 mL	P / G	28 days

AMERICAN ENVIRONMENTAL TESTING LABORATORY

Determination	Method No.	Matrix	Preservative	Sample Required	Container	Holding Time
Chlorine, residual	330.4	Water	None Required	100 mL	P / G	Analyze Immediately
COD	410.4	Water	Cool, 4°C; H_2SO_4 to pH <2	100 mL	P / G	28 days
Color	110.2	Water	Cool, 4°C	100 mL	P / G	48 hours
Cyanide, Total	335.2 9010	Water Soil	Cool, 4°C; NaOH to pH>12 0.6 gm Ascorbic acid Cool, 4°C	500 mL 20 gm	P / G	14 days, 24h if sulfide is present
Cyanide, Amenable to Chlorination	335.1 9012	Water Soil	Cool, 4°C; NaOH to pH>12 0.6 gm Ascorbic acid Cool, 4°C	500 mL 20 gm	P / G	14 days, 24h if sulfide is present

I SCOPE AND APPLICATION

This method is used to determine the concentration of certain trace metals, in solution, using an inductively coupled plasma-atomic emmision spectrometry (ICP). All matrices, excluding filtered groundwater samples but including ground water, aqueous samples, TCLP and STLC extracts, soils, aqueous sludge, waste solvents, tars, fibrous wastes, filter cakes, spent carbons, spent catalysts, sediments and hazardous waste matrices require digestion prior to analysis. Samples that have been prefiltered and acidified will not need digestion. Samples which are not digested must be matrix matched with the standards. These matrices are prepared for analysis, by utilizing a variety of digestion techniques, primarily EPA method 3005A and 3050B.

The Laboratory Supervisor and Chemist share responsibility for performance of this SOP. The experience of the analyst is crucial to the successful application of this method, and only experienced ICP analysts may use this method. The analyst must be able to interpret instrument performance and detector responses. Prior to data generation, the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of proficiency. This demonstration, which utilizes repeat quality control (QC) check sample analysis is described in Method 8000B in SW-846, Third Edition, Final Update III, December 1996, Section 8.4. The guidance specified in Method 8000B is used since procedures for determining such parameters for inorganic analyses is not specified elsewhere in SW-846. Instructions for performing the initial demonstration of proficiency are detailed in Appendix 1.

Method Detection Limit (MDL): Routinely analyzed compounds and laboratory-determined method detection limits are provided in Appendix 8. Detection limits are determined by conducting a method detection limit study as detailed in Appendix 4. The method detection limits have been generated using clean aqueous and solid matrices and are not achievable for many “real” sample matrices. The listed detection limit may vary based on the amount of sample used.

Practical Quantitation Limit (PQL): The practical quantitation limit (PQL) of this method is approximately 5 mg/kg (wet weight) for soil/sediments, and 0.05 mg/L for water (see Appendix 6). The LOQ will vary based upon the same factors that affect detection limits (dilutions and sample size).

II SUMMARY OF METHOD

Samples must be solubilized or digested using appropriate sample preparation methods (see Appendix 2). The digestates then undergo multielemental determination by ICP using a simultaneous optical system receiving and measuring emission from radial or axial viewing of the plasma.

Samples are nebulized and the resulting aerosol is transported to the plasma torch. Element-specific emission spectra are produced by a radio-frequency inductively coupled plasma. The spectra are dispersed by a grating spectrometer, and the intensities of the emission lines are monitored by photosensitive devices.

Background correction is required for trace element determination. Background must be measured adjacent to analyte lines on samples during analysis. The position selected for the background intensity measurement, on either or both sides of the analytical line, will be determined by the complexity of the spectrum adjacent to the analyte line. In one mode of analysis the position used should be as free as possible from spectral interference and should reflect the same change in background intensity as occurs at the analyte wavelength measured. The instrument provides automatic and programmable background correction for each spectral frequency used.

III SAMPLE COLLECTION, PRESERVATION, AND STORAGE

The maximum holding time from sampling to analysis, collection volume, and digestion volumes are given for trace metals analysis in the following table:

Measurement	Digestion Volume[a,c] (mL)	Collection Volume[a,c] (mL)	Treatment and/or Preservative	Holding Time[b]
Aqueous (Total)	100	600	HNO_3 to pH < 2	6 months
Aqueous (Dissolved)	100	600	Filter on site; HNO_3 to pH < 2	6 months
Aqueous (Suspended)	100	600	Filter on site	6 months
Solid (Total)	2 g	200 g	N/A	6 months

a Unless stated otherwise
b Either glass or plastic containers may be used
c Any sample volume reduction from the reference methods's instructions must be made in the exact proportion as described in the method and representative sampling must be maintained.

Samples slated for duplicate or MS/MSD determinations must be provided to the lab in duplicate and triplicate amounts respectively.

Samples received for trace metals analysis are stored in a sample refrigerator at 4^0C until analysis. At the time of analysis, all samples and standards are warmed to room temperature.

The laboratory will attempt to meet all holding time requirements, as dictated by this method and project-specific plans. Client requests for analysis after holding time expiration should be made in writing and the client made aware that data will be estimated. The lab will narrate any missed holding times to the client.

IV INTERFERENCES

Reagents, labware, glassware, and other sample processing hardware may yield discrete artifacts and/or elevated signals, causing misinterpretation of the instrument response. All of

these materials must be demonstrated to be free from interferences, under the conditions of the analysis, by running method blanks.

Physical interferences are effects associated with the sample nebulization and transport processes. Changes in viscosity and surface tension can cause significant in accuracies, especially in samples containing high dissolved solids or high acid concentrations. If physical interferences are present, they must be reduced by diluting the sample, by using a peristaltic pump or by using a high solids nebulizer. Another problem that can occur with high dissolved solids is salt buildup at the tip of the nebulizer, affecting aerosol flow rate and causing instrumental drift. The problem can be controlled by wetting the argon prior to nebulization, using a tip washer, using a high solids nebulizer or diluting the sample. Also, it has been reported that better control of the argon flow rate (by mass flow controller), especially to the nebulizer, improves instrument performance.

Chemical interferences include molecular compound formation, ionization effects, and solute vaporization effects. Normally, these effects are not significant with the ICP technique, but if observed, can be minimized by careful selection of operating conditions, by buffering of the sample, by matrix matching, and by standard addition procedures. Chemical interferences are highly dependent on matrix type and the specific analyte element.

Memory interferences result when analytes in a previous sample contribute to the signals measured in a subsequent sample. Memory effects can result from sample deposition on the uptake tubing to the nebulizer and from the build up of sample material in the plasma torch and spray chamber. The site where these effects occur is dependent on the element and can be minimized by flushing the system with a rinse blank between samples. The possibility of memory interferences should be recognized within an analytical run and suitable rinse times should be used to reduce them. The rinse times necessary for a particular element must be estimated prior to analysis.

High salt concentrations can cause analyte signal suppressions and confuse interference tests. Dilution of the sample may be necessary or a spike recovery determination may be used to determine if sample results are valid from an undiluted run.

Spectral interferences are caused by background emission from continuous or recombination phenomena, stray light from the line emission of high concentration elements, overlap of a spectral line from another element, or unresolved overlap of molecular band spectra. Automatic and programmable background corrections are employed by the instrument to compensate for any stray light or emissions. Interference element checks (standards containing trace metals which contribute emission to the analyte spectral line of another) are employed to correct the quantitation of each element regardless of the presence of any other element within the analyzed digestate. See section 3.0 of the reference method for a full discussion of interelement corrections.

V EQUIPMENT AND SUPPLIES

Analytical Balance: Used to accurately weigh solid samples for preparation (±0.1mg sensitivity).

Analytical system (Perkin Elmer 4300):

a) Autosampler: AS 93 Plus
b) Detector: Simultaneous polychromator optics
c) RF generator: Controlled at 27.12 MHz
d) Instrument software: WinLab 32
e) Water circulator
f) Liquid argon tank with two-stage pressure regulator

Autosampler tubes

Beakers: 250 mL

Block digestor

Digestion tubes: With caps and watch glasses

Filter paper: Whatman No. 41 or equivalent

Filters: Filter inserts for digestion tubes

Filtration tubes: With caps

Funnels

Sample Spatulas, Stainless Steel: Used in the sample preparation of solid samples

Sieve: No. 10 ASTM

Volumetric Flasks: 10 mL, 50 mL, 100 mL, Class A with ground glass stoppers

Watch glasses

VI REAGENTS AND STANDARDS

Reagent water: Free of inorganic contamination. Reagent water used is Sparkletts™ distilled drinking water.

Digestion reagents:

a) Hydrochloric acid, concentrated, Baker Instra-Analyzed or equivalent
b) Hydrogen peroxide, 30%, Fisher Scientific or equivalent
c) Nitric acid, concentrated, Baker Instra-Analyzed or equivalent

The source and manufacturer may change from time to time; therefore, the brand and lot number must be documented in the sample preparation and standard preparation logs.

Calibration stock standards are purchased from the following manufacturers:

Environmental Express

QC stock standards are purchased from the following manufacturers:

SPEX

The calibration and QC stock standards are prepared using the following analytes:

A	B
Antimony	Aluminum
Arsenic	Calcium
Barium	Iron
Beryllium	Magnesium
Cadmium	Potassium
Chromium	Sodium
Cobalt	
Copper	
Lead	
Manganese	
Molybdenum	
Nickel	
Selenium	
Silver	
Thallium	
Vanadium	
Zinc	

Standards are divided into two mixes: A and B. Separate calibration curves are analyzed for both mixtures (see Section VII). Additionally, the two mixes are employed in interelement interference corrections by the separate analysis of Interference Check B and Interference Check A + B standard mixes.

Calibration and QC standards are purchased from a number of suppliers based on varying concentration and quality needs. All preparations are detailed by the analyst in the metals standards preparation logbook including documented standard sources and lot numbers.

The primary and working standard solutions expire 6 months after receipt or preparation and should be replaced immediately if comparison with an independent source or any other

nonconformance indicates a problem. The expiration date and standard number is recorded in the logbook and on the storage vial.

VII QUALITY CONTROL

A summary of the quality control samples, performance criteria, and calibration requirements are given in the following example of an analytical sequence for the testing of an analytical batch.

1. Summary

a) Initial Calibration Standard Curve (minimum of 3 points, see section VIII 3)
0.5, 5, 10 mg/L (STD A) or 10, 50, 100 mg/L (STD B)
b) ICB (analyte less than ½ LOQ)
c) ICV (90-110% recovery)
d) CCV
e) Interference check B
f) Interference check A+B
g) Method blank (analyte less than ½ LOQ)
d) LFB or LCS (see Appendix 6)
e) LFBD or LCSD (see Appendix 6)
f) Sample 1
e) Sample 1 MS (see Appendix 6)
f) Sample 1 MSD (see Appendix 6)
g) Sample 2-8
h) CCV
i) CCB
j) Sample 9-15
k) Sample 2 Duplicate
l) Interference check B (end of daily sequence)
m) Interference check A+B (end of daily sequence)
n) CCV
o) CCB

2. Initial Calibration Standard (IC) and Continuing Calibration Verification Standard (CCV)

The initial calibration is performed by generating a 3-point calibration curve for each analyte to be reported. *Every analyte to be reported must be run at a minimum of three levels*. Level 1 is at or below the limit of quantitation, and the high level standard is below the upper limit of the linear range of the system. Instructions for preparing the calibration standards are detailed in Appendix 3.

For each analysis batch the calibration must initially be verified prior to analyzing any samples. As a general rule, the initial calibration must be verified at the beginning of each day during which samples are analyzed. The daily analytical shift begins with the analysis of the first initial calibration standard. The shift ends after *completion* of the tenth analysis that can be

analyzed within the beginning of the shift. A midpoint (or 1.0 ppm) level standard is used to prepare the CCV standard. Percent recovery criteria for the CCV must be met before continuing the analysis batch and conducting any sample analyses. See Section VIII 4.

3. Initial Calibration Blank (ICB) and Continuing Calibration Blank (CCB)

The calibration blank is prepared by acidifying reagent water to the same concentrations of the acids found in the standards and samples. Prepare a sufficient quantity to flush the system between standards and samples. The calibration blank will also be used for all initial and continuing calibration blank determinations

4. Laboratory Reagent Blank (LRB) or Method Blank (MB)

An LRB must be prepared and treated exactly as a typical field sample including exposure to all glassware, equipment, solvents, filtration and reagents that are used with field samples. Data produced are used to assess instrument performance of a blank sample and evaluate contamination from the laboratory environment. Values that exceed ½ the LOQ indicate a laboratory or reagent contamination is present. The source of the contamination must be determined prior to conducting any sample analysis.

5. Laboratory Fortified Blank (LFB) or Laboratory Control Sample (LCS)

Prepare a secondary dilution stock using a different stock solution used to prepare the calibration standards. This separate, secondary dilution stock is used as a concentrate to fortify the LCS and MS/MSD. A LCS is required to be analyzed with each analysis batch immediately following the LRB. By analyzing the LCS initially, a control check is performed on the concentrated solution used to prepare the MS/MSD. If any deviations in the trace metals concentration(s) are present, it will be reflected in the LCS and not exclusively attributed to a matrix upon analysis of the MS/MSD. The percent recovery for trace metals must fall in the acceptable ranges (85-115%) prior to analyzing samples. If the LCS recovery for an analysis batch does not meet these recovery criteria the data are considered invalid, and the source of the problem should be identified and resolved before continuing analyses.

All analytes requested for analysis are spiked and reported.

6. Laboratory Fortified Matrix (LFM) or Matrix Spike (MS)

The laboratory must add a known amount of the target analyte to one sample within each analytical batch (of 15 samples). Samples which require such pretreatment require a MS to be taken through all sample handling and preparation procedures in order to confirm any matrix effects and that the laboratory performed the pretreatment step appropriately.

It is recommended that the solutions used to fortify the MS be prepared from different stocks than used to prepare the calibration standards.

The fortified concentration must be equal to or greater than the native sample concentration. Fortified samples that exceed the calibration range must be diluted to be within the linear calibration range. In the event that the fortified level is less than the observed native level of the unfortified matrix, the recovery should not be calculated. The sample should be fortified at a higher level and reanalyzed or a different sample should be chosen for the MS. For normal drinking waters, the MS typically should be prepared in the range of 1 mg/L. The MS should not be prepared at a concentation greater than ten times the highest concentration observed in any field sample and should be varied to reflect the range of concentrations expected in field samples. Ideally, the MS fortified spike concentration should be 3-5 times the native concentration.

Calculate the percent recovery for trace metals, corrected for concentrations measured in the unfortified sample, by using the following equation:

$$\%REC = ((C_s-C)/s) \times 100$$

Where,

%REC = Percent Recovery
C_s = measured trace metals in the fortified sample
C = measured native trace metals sample concentration
s = concentration equivalent of analyte added to the sample

If the recovery for trace metals falls outside the acceptance limits and the laboratory's performance for all other quality control performance criteria is acceptable, the accuracy problem encountered with the fortified sample is judged to be matrix related, not system related and should be noted as such by data qualifier or in the case narrative. Repeated failure indicates potential problems with the procedure which may require corrective action.

All analytes requested for analysis are spiked and reported.

7. Duplicate LFM or Matrix Spike Duplicate (MSD)

This quality control sample must be analyzed with each analytical batch (fifteen samples). Calculate the relative percent difference (RPD) of the initial quantitated concentration (I_c) and duplicate quantitated concentration (D_c) using the following formula:

$$RPD = ((I_c-D_c)/([I_c+D_c]/2)) \times 100$$

If the RPD for the duplicate measurement of PAH falls outside ±15% and if all other quality control performance criteria are met, laboratory precision is out of control for the sample. The precision problem encountered with the fortified sample may judged to be matrix related, depending on the evaluation of other QC data, and not system related and should be noted as such by data qualifier or in the case narrative. Repeated failure indicates potential problems with the procedure that may require corrective action.

8. Initial Calibration Verification (ICV) or Quality Control Standard (QCS)

After calibration curves have initially been established or have been reestablished, or as required to meet data quality needs, verify both the calibration and acceptable instrument performance with the preparation and analyses of an external/second source ICV. If the determined concentration is not within ±10% of the stated value, performance of the calibration is unacceptable. The source of the problem must be corrected before continuing with sample analysis.

9. Interference Check Standards

Verify the inerelement and background correction factors at the beginning and end of each sequence or analytical run by analyzing the interference check B and interference check A + B solutions. Results should be within ±20% of the true value.

10. Dilution Test, Post Digestion Spike Addition, and Method of Standard Additions

It is recommended that whenever a new or unusual sample matrix is encountered, a series of tests be performed prior to reporting concentration data for analyte elements. These tests, as outlined as follows, will ensure that neither positive nor negative interferences are operating on any of the analyte elements to distort the accuracy of the reported values.

Dilution Test: If the analyte concentration is sufficiently high (minimally, a factor of 10 above the instrument detection limit [IDL] after dilution), an analysis of a 1:5 dilution should agree within ± 10% of the original determination. If not, a chemical or physical interference effect should be suspected; therefore proceed with the Post Digestion Spike Addition.

Post Digestion Spike Addition: An analyte spike added to a portion of a prepared sample, or its dilution, should be recovered to within 75% to 125% of the known value. The spike addition should produce a minimum level of 10 times and a maximum of 100 times the IDL. If the spike is not recovered within the specified limits, a matrix effect should be suspected.

Method of Standard Additions (MSA): When the MSA is used, standards are added at one or more levels to portions of a prepared sample. This technique compensates for enhancement or depression of an analyte signal by a matrix. This procedure calls for two identical aliquots of the sample solution to be taken. To the first aliquot a small volume of standard is added; while to the second aliquot, a volume of acid blank is added equal to the standard addition. The sample concentration is calculated by:

Multiplying the intensity value for the unfortified aliquot by the volume (liters) and concentration (mg/L or mg/Kg) of the standard addition to make the numerator; the difference in intensities for the fortified sample and unfortified sample is multiplied by the volume (liters) of the sample aliquot for the denominator. The quotient is the sample concentration.

VIII PROCEDURE

1. Sample Preparation

Prepare matrix-specific batches of 15 samples or less. Matrices are typically defined as soil, water, and other. Due to differences in preparation of soils and waters, various matrices cannot be batched together.

Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

Consult all project-specific plans for matrix spike and duplicate preparation requirements. Samples from two clients that each require project-specific matrix spikes can be prepared together; however, two sets of QC will have to be prepared using each client's designated samples.

Prepare at least one set of the following QC samples with each batch (up to 15 samples with the same matrix): method blank, matrix spike, matrix spike duplicate, sample duplicate and LCS/LCSD.

Appendix 2 provides instructions for extraction of water and solid samples.

2. Instrument Start-up

Set up the instrument with the proper operating parameters as listed in Appendix 7. Specific wavelengths are listed in Appendix 8. Other wavelengths may be substituted if they can provide the needed sensitivity and are corrected for spectral interference.

After standards, QC samples, and field samples have been prepared, load the instrument autosampler. All samples should be in autosampler tubes and should be placed in sequential order and grouped by analysis batch. The autosamplers have a greater sample capacity that can be analyzed with one continuing calibration standard or initial calibration; therefore, multiple CCV and CCB standards need to be prepared if multiple batches of field samples, and associated QC are to be loaded within the autosampler. The autosampler capacity is approximately 150 vials.

To operate the Perkin Elmer 4300, first turn on monitor, printer and computer (in that order). Select the WinLab 32 software icon. Select the Plasma icon from the toolbar. Select On to light the plasma. Select the Workspace icon from the toolbar to access the Sample Information Editor and the Automated Analysis Control windows.

After allowing the instrument to stabilize for 30 minutes, perform the signal optimization alignment by selecting Tools from the menu options and then select Spectrometer Control. Select Axial as the mode and select Align View from the window options. After a 10 ppm Mn standard has begun being manually aspirated to the nebulizer, select OK. The window will read Idle when alignment is complete. Select Radial as the mode and repeat the above steps for a second alignment.

Select the appropriate instrument method for the Method field. Create the calibration sequence in the Automated Analysis Control window.

Create an instrument sequence. Select the Sample Information Editor and edit the Sample ID field plus the A/S (autosampler) field for each entry. The method blank should be edited first with the preparation batch number (different than the analytical batch number) and date of analysis. All remaining samples in the preparation batch should be analyzed subsequent to the method blank including required QC samples. Use the Laboratory Sample ID for the Sample ID fields and include any dilution factor or non-standard final digestate volume as a suffix after the Sample ID such as X5 or X10, for dilution factors of 5 and 10, respectively; or FV=10mL for a final volume of 10 mL.

Select Edit as the menu option and select Save As. Next, select Sample Info File and enter the file name as the date of analysis (yymmdd). Select the Automated Analysis Control window next, and select the Set-up page. Edit the sequence name (file name saved as) and edit the sample sequence numbers to be run. *Note: Do not enter autosampler position numbers.*

Reports are generated automatically and their format is based on the report options selected within the instrument method.

3. Initial Calibration

The initial calibration is performed by generating a 3-point calibration curve for each analyte to be reported. *Every analyte to be reported must be run at three levels*. Due to the interference effects and detection limits of various analytes, it is routinely necessary to analyze six separate standards to achieve three levels for each analyte.

Profile and calibrate the instrument according to the instrument manufacturer's recommended procedures, using the typical mixed calibration standard solutions described in Section VI. Flush the system with calibration blank between each standard and sample, and use the average intensity of multiple exposures for both standardization and sample analysis to reduce random error.

Linear or non-linear response curves (especially for alkali and alkaline earth metals which may exhibit non-linear response curves due to ionization and self absorbtion effects) may be used; however, the effective range must be checked (the upper range limit should be an observed signal no more than 10% below the level extrapolated from lower standards).

If the calibration values are acceptable for all analytes, quantitate the ICV standard against the 3-point initial calibration. All target compound recoveries must be within 90%-110% of the

expected value. If any target compounds do not meet the criteria, reanalyze the standard and/or proceed with other corrective action.

4. Continuing Calibration

Sample analysis may proceed with the incorporation of continuing calibration standards every 10 samples analyzed within an instrument sequence. Multiple CCV/ICV standards are required for each extraction batch (15 samples, one Method Blank, a pair of Matrix Spike and Matrix Spike Duplicate, one LCS/LCSD pair, and one Sample Duplicate).

The CCV/ICV standard is checked for percent recovery of the instrument response between the initial calibration and each subsequent analysis of the verification standard.

The percent recovery for the calibration verification standard must be within ± 10% for each analyte before any sample analysis may take place.

In those instances where the percent difference for one or more analytes exceeds 10%, *all* samples following the last acceptable ICV, CCV or check standard must be reanalyzed.

6. Method Blank Analysis

Analyze and check the method blank for contamination. When contamination of any type is found, the results should be documented so that a history of routine levels can be established. Analysis cannot continue until the criteria for a contaminant-free blank is met.

7. Sample Evaluation

Evaluate the following for quality control.

Matrix spikes will be evaluated based on the percent recovery. The recoveries will be compared to the ranges provided in Appendix 6. If the two recoveries are within the ranges provided, the data would be reported as valid. If any of the recoveries are outside of the ranges, the cause will be determined and an explanation provided. In many cases, a recovery problem is limited to the individual sample only, and will not affect the validity of the other samples in the run.

A Lab Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) is run at the rate of one per matrix per batch. This sample is the QC check sample prepared and analyzed in the identical manner as the samples. The results of the LCS are compared to criteria dictated in Appendix 6.

If the matrix spike duplicate or sample duplicate analysis fails to meet the designated criteria due to its sample matrix, the LCS is used as the means to demonstrate that the system is capable of generating acceptable data. If any analyte falls outside of the criteria established in Appendix 6, the analyst must provide an explanation in the narrative and determine the validity of the individual analyte.

8. Reporting of Results

The following is a summary of the calculation used by the computer, or the analyst to generate the reported data:

Percent Recovery (P) is calculated by the following equation:

$$P = \frac{C_{\chi \times 100}}{T}$$

Where:

C_χ = The concentration of the analyte spike or standard from the analysis.
T = The true value of the spike or standard added.

Sample concentration calculations for linear and non-linear calibration curves:

For aqueous samples, directly report ug/L of metal from the calibration curve or directly from the read-out of the system.

For diluted aqueous samples,

ug/L metal in sample = A x (C+B)/C

Where,

A = ug/L of metal in diluted aliquot from calibration curve.
B = Acid blank matrix used for dilution, mL.
C = Sample aliquot, mL.

For solid samples,

ug metal/ kg sample = (A x V)/W

Where,

A = ug/L of metal in processed sample from calibration curve.
V = Final volume of processed sample.
W = Weight of sample, g.

Concentrations are derived from calibration curves plotting instrument response versus concentration. Normally, a linear relationship exists between these two sets of data and the concentration may be determined from a first-order curve. In instances where a non-linear relationship between analyte concentration and response is present over the working range, or when similar calibration approaches have not met the acceptance criteria, the instrument data

system should be employed to calculate analyte concentrations via second order calibration curves. In order to be an acceptable calibration, the coefficient of the determination must be greater than or equal to 0.995.

Standard Deviation is calculated by the following equation:

$$SD = \sqrt{\frac{\sum_{N}\left(X_i - X_{Avg}\right)^2}{N-1}}$$

Where:

X_i = Analyte concentrations

X_{Avg} = Analyte mean concentration

N = Number of data points

Relative Percent Difference:

$$RPD = \left| \frac{\left[Conc_{MS} - Conc_{MSD}\right]}{\left[\frac{Conc_{MS} + Conc_{MSD}}{2}\right]} \right| \times 100$$

Where:

$Conc_{MS}$ = Matrix Spike (or Sample) Concentration
$Conc_{MSD}$ = Matrix Spike Duplicate (or Sample Duplicate) Concentration
RPD = Relative percent difference

IX CORRECTIVE ACTION

See Appendix 5 for specific information regarding quality system nonconformances and associated corrective actions.

X METHOD PERFORMANCE

Appendix 8 gives the results for the Initial Demonstration of Capability plus LOD (MDL) study results. See Appendix 6 for LOQ (PQL) data.

XI WASTE DISPOSAL AND WASTE PREVENTION

Whenever feasible, laboratory personnel should use pollution prevention techniques to address waste generation. Wastes should be reduced or minimized at the point of generation which includes the use of any reagent, standard, or eluent.

Wastes must be disposed of in accordance with all applicable rules and regulations. Wastes shall be disposed of in the following manner:

Water samples (not digested): Water waste
Soil samples (not digested): Soil drum waste
Sample digestates: Acid waste
Sample leachates: Acid waste
Waste hydrochloric acid: Acid waste
Waste nitric acid: Acid waste
Waste hydrogen peroxide: Acid waste
Trace metals standard solutions: Acid waste

XII SAFETY

The toxicity or carcinogenicity of each reagent used in this method has not fully been established. Each chemical should be regarded as a potential health hazard and exposure should be as low as reasonably achievable. Cautions are specifically listed on the corresponding MSDS sheet.

The following chemicals have the potential to be highly toxic or hazardous:

Nitric Acid: Toxic. Corrosive. Oxidizing. May be fatal if swallowed or inhaled. Extremely corrosive. Contact with eyes or skin may cause severe burns and permanent damage. Use safety glasses and face mask, *gloves*, and work within a fume hood.

Hydrochloric Acid: Toxic. Corrosive. Extremely corrosive. Inhalation of vapor can cause serious injury. Ingestion may be fatal. Liquid can cause severe damage to skin and eyes. Use safety glasses, face mask, gloves, and effective ventilation.

Hydrogen Peroxide, 30%: Toxic. Corrosive. Chemically unstable, readily decomposes to water and oxygen. Can cause serious burns. Eye contact can cause serious injury, possibly blindness. Harmful by inhalation, ingestion, and skin contact.

GLOSSARY

The following terms are defined for use in this document:

ACCURACY: The closeness of agreement between an observed value and an accepted reference value. When applied to a set of observed values, accuracy will be a combination of a random component and of a common systematic error (or bias) component.

BATCH: A group of samples which are similar with respect to the sampling or the testing procedures being employed and which are processed as a unit. For QC purposes, each group of 15 samples or less will be determined to be one batch.

BIAS: The deviation due to matrix effects of the measured value from a known spiked amount. Bias can be assessed by comparing a measured value to an accepted reference value in a sample of known concentration or by determining the recovery of a known amount of contaminant spiked into a sample (matrix spike). Thus, the bias (B) due to matrix effects based on a matrix spike is calculated as:

$B = (Xs - Xu) - K$

Where:

X_s = measured value for spiked sample,

X_u = measured value for unspiked sample, and

K = known value of the spike in the sample.

Using the following equation yields the percent recovery (%R).

$\%R = 100 (X_S - X_U) / K$

BLANK: see Equipment Rinsate, Method Blank, Trip Blank.

CONTROL SAMPLE: A QC sample introduced into a process to monitor the performance of the system.

DUPLICATE: see Matrix Duplicate, Field Duplicate, Matrix Spike Duplicate.

EQUIPMENT BLANK: see Equipment Rinsate.

EQUIPMENT RINSATE: A sample of analyte-free media which has been used to rinse the sampling equipment. It is collected after completion of decontamination and prior to sampling. This blank is useful in documenting adequate decontamination of sampling equipment.

PRACTICAL QUANTITATION LIMIT: The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. The PQL or Limit of Quantitation (LOQ) is generally 2 to 10 times the MDL.

FIELD DUPLICATES: Independent samples which are collected as close as possible to the same point in space and time. They are two separate samples taken from the same source, stored in separate containers, and analyzed independently. These duplicates are useful in documenting the precision of the sampling process.

LABORATORY CONTROL SAMPLE: A known matrix spiked with compound(s) representing the target analytes. This is used to document laboratory performance.

MATRIX: The component or substrate (e.g., surface water, drinking water) which contains the analyte of interest.

MATRIX DUPLICATE: An intralaboratory split sample which is used to document the precision of a method in a given sample matrix.

MATRIX SPIKE: An aliquot of sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

MATRIX SPIKE DUPLICATE: Intralaboratory split samples spiked with identical concentrations of target analyte(s). The spiking occurs prior to sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.

METHOD BLANK: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting form the analytical process.

For a method blank to be acceptable for use with the accompanying samples, the concentration in the blank of any analyte of concern should not be higher than the highest of either:

(1) ½ the LOQ, or
(2) Five percent of the regulatory limit for that analyte, or
(3) Five percent of the measured concentration in the sample.

METHOD DETECTION LIMIT (MDL): The minimum concentration of a substance that is measureable and reportable with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte. Also, Limit of Detection (LOD).

PRECISION: The agreement among a set of replicate measurements without assumption of knowledge of the true value. Precision is estimated by means of duplicate/replicate analyses. These samples should contain concentrations of analyte above the MDL, and may involve the use of matrix spikes. The most commonly used estimates of precision are the Relative Standard Deviation (RSD) or the Relative Percent Difference (RPD)

$RSD = (s/x_i) \times 100$

Where:
x_i = the arithmetic mean of the x_i measurements
S = standard deviation

$RPD = 100 \times [(x_1 - x_2)/ \{(x_1 + x_2)/2\}]$

Where:
x_1 = First replicate result
x_2 = Second replicate result

REAGENT BLANK: See Method Blank

REAGENT GRADE: Analytical reagent (AR) grade, ACS reagent grade, and reagent grade are synonymous terms for reagents, which conform to the current specifications of the Committee on Analytical Reagents of the American Chemical Society.

REAGENT WATER: Water that has been generated by any method which would achieve the performance specifications for ASTM Type I water. For organic analyses, see the definition of organic-free reagent water.

REFERENCE MATERIAL: A material containing known quantities of target analytes in solution or in a homogeneous matrix. It is used to document the bias of the analytical process.

SPLIT SAMPLES: Aliquots of sample taken from the same container and analyzed independently. In cases where aliquots of samples are impossible to obtain, field duplicate samples should be taken for the matrix duplicate analysis. These are usually taken after mixing or compositing and are used to document intra- or inter- laboratory precision.

STANDARD CURVE: A plot of concentrations of known analyte standards versus the instrument response to the analyte. Calibration standards are prepared by successively diluting a standard solution to produce working standards, which cover the working range of the instrument. Standards should be prepared at the frequency specified in the appropriate section. The calibration standards should be prepared using the same type of acid or solvent and at the same concentration as will result in the samples following sample preparation. This is applicable to organic and inorganic chemical analyses.

Appendix 1
Initial Demonstration of Capability

The initial demonstration of capability is performed to demonstrate that the system and the analyst can successfully perform the analysis. This is accomplished by running four aliquots of the Quality Control Check Sample in the same manner that samples are run.

The QC Check Sample standard is purchased from a certified source different than that used for the calibration standards. The following concentrations and volumes are used:

Standard Name	Final Concentration

1. Prepare the reference sample by adding 1.0 mL of the QC Check Sample standard to each of four 50 mL aliquots of organic-free water.
2. Analyze the four replicate aliquots of the well-mixed reference samples by the same procedures used to analyze actual samples. This will include a digestion method as well as the determinative method of 6010B.
3. Calculate the average recovery (x) in ug/L, and the standard deviation of the recoveries in ug/L, for each analyte of interest using the four results.
4. The QC acceptance criteria for this method is as follows:

Once an analyst and instrument have passed the accuracy and precision criteria for all analytes to be reported by the method, the analyst and instruments are certified as having established initial proficiency with the method.

Appendix 2
Sample Preparation

Aqueous Samples

1. Acid digestion of aqueous samples by EPA Method 3005A

a) Add 50 mL of well mixed sample to the polypropylene digestion tube.
b) Add 1.0 mL Concentrated HNO_3 and 2.5 mL HCl and mix.
c) Place tube in digestion block to heat to 85°C and cover with polypropylene watch glass. *Note: Sample templerature should rise to approximately 95°C with the addition of the watch glass.*
d) Heat sample for 2.5 hours.
e) Remove sample from digestion block and allow to cool to room temperature.
f) Dilute to 50 mL mark with reagent water.
g) Filter sample
    a. For samples containing significant amounts of suspended material, use the digestion tube filters (Filter Mate).
    b. For typical samples, decant the digestate into a filtration tube through a funnel containing Whatman No. 41 filter paper.
h) Analyze sample
i) Record all information on the Sample Preparation Logsheet.

Solid Samples

1. Acid digestion of sediment, sludge and soil samples by EPA Method 3050B

a) Exactly weigh (±0.01g) approximately 1g of thoroughly homogenized sample to a polypropylene digestion tube.
b) Add 10.0 mL of reagent water, 2.0 mL concentrated HNO_3, and 2.0 mL concentrated HCl
c) Place tube in digestion block to heat to 85°C and cover with polypropylene watch glass. *Note: Sample templerature should rise to approximately 95°C with the addition of the watch glass.*
d) Heat sample for 30 minutes and remove from block digestor.
e) Add 2.0 mL of 30% H_2O_2 and allow the samples to stand for 10 minutes. During this time readjust the digestor temperature to equilibrate to 75°C.
f) Place the samples back with the block digestor for 30 minutes (without watchglass).
g) Remove samples from the digestor and allow to cool to room temperature.
h) Filter sample
    a. For samples containing significant amounts of suspended material, use the digestion tube filters (Filter Mate).
    b. For typical samples, decant the digestate into a filtration tube through a funnel containing Whatman No. 41 filter paper.
j) Analyze sample
k) Record all information on the Sample Preparation Logsheet.

Appendix 3
Standards Preparation

All standard preparations are documented in the Metals Standards Preparation Logbook. Each entry must include the standard source or manufacturer, the standard lot number, the initial concentration, the final concentration, the solvent used, the date, and the analyst's initials. The expiration date and standard identification number are also recorded in the logbook and on the storage vial. The expiration date for stock and intermediate solutions is six months, although more frequent preparation may be required.

Appendix 4
Method Detection Limit (MDL) Study

The method detection limit (MDL) or limit of detection (LOD) is the minimum concentration of a substance that can be identified, measured, and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix.

AETL's limit of detection procedure follows the EPA MDL procedure as described in 40 CFR part 136 Appendix B – Revision 1.11. See the SOP for Determination of LOD and LOQ for specific information regarding the procedures used in the calculation of this value. The LOD study shall incorporate all sample preparation procedures and shall be completed by analyte and matrix. LOD studies shall be conducted each time there is a significant change in the method, for the addition of new analytes, or if there is a significant change in the instrument type.

In brief, detection limit studies are performed using reagent water for aqueous matrices and clean sand for soil and solid matrices. Seven replicate standards are prepared using the calibration standard spiked at a level that is between 3 to 5 times the estimated MDL. The laboratory standard fortified blanks are analyzed and the mean recovery and standard deviation (SDEV) is calculated for each analyte. The MDL is then calculated as follows:

$$MDL = (3.143) \times SDEV$$

The Limit of Quantitation (LOQ) or Practical Quantitation Limit (PQL), must be equal to or greater than the LOD and MDL

Appendix 5
Corrective Action

The following table lists the criteria and corrective action for the QC samples. These limits are evaluated at least yearly and may be adjusted to reflect updated laboratory-established limits.

QC Sample	Frequency	Acceptance Criteria	Corrective Action
Method Blank/ CCB	One per matrix per batch	Less than ½ LOQ	1) Evaluate magnitude of sample results against the concentration of the method blank; if sample results exceed 3x the blank level, narrate to the client 2) Otherwise, re-prep and reanalyze batch if sample detections are within 3x window
System blanks	As needed	Less than ½ LOQ	1) This is a corrective action when a contaminated system is identified.
MS/MSD	One per matrix per batch	Water: 80%-120% Soil: 80%-120%	1) Evaluate results against the LCS 2) If the LCS was compliant: narrate failed MS to client 3) Otherwise, re-prep and reanalyze batch including spikes.
RPD limits	One per batch	RPD %15	1) Check calculations 2) Narrate failed RPD to client
ICV/CCV	Every 10th sample	%R within 90%-110%	1) Check calculations 2) Reanalyze 3) Reanalyze all samples associated ICV/CCV that fails criteria
LCS/LCSD	One per matrix per batch	%R within 80%-120%	1) Reanalyze LCS/LCSD 2) If still non-compliant, re-prep batch and reanalyze.

Appendix 6

Target Compounds	Wavelength nm[a]	RPD Limits	Water %R Limits	Soil %R Limits	Water PQL mg/L	Soil PQL mg/Kg

Method Performance

AMERICAN ENVIRONMENTAL TESTING LABORATORY

STANDARD OPERATING PROCEDURE

FOR

TPH DIESEL

BY

METHOD 8015B

Prepared by
Ziba Hosseini

Ziba Hosseini
Principal Analyst

Approved by
C. Razmara

Cyrus Razmara, Ph.D.
Laboratory Director

1. SCOPE AND APPLICATION

1.1. Diesel range organics (DROs) correspond to the range of Alkanes from C_{10} to C_{28} and covering a boiling point range of approximately 170°C-430°C.

1.2. Method 8015M (DHS-LUFT) is used to determine the concentration of diesel range organics compound. Signal response ranges from C10 to C40 with reference to window defining standards.

1.3. The quantitation limit for this method is 1.0 mg/L for water and 20 mg/Kg for soil.

1.4. This method can also be used as screening tool (for semi-volatile organics) to obtain semi quantitative data for the prevention of sample overload during quantitative analysis on a GC/MS system.

2. SUMMARY OF METHOD

2.1. This method provides gas chromatographic conditions for the detection of alkanes (Diesel Range Organic Compounds).

2.2. Samples are introduced into the GC following solvent extraction and concentration using an autosampler. The separated organics are detected by the response to the detector, which are further quantitated and calculated by a data system.

2.3. Fused silica capillary column and temperature program is used in the gas chromatograph to separate the organic compounds. Detection is achieved by a flame ionization detector (FID).

2.4. This method is restricted to be used by, or under the supervision of analysts experienced in the use of gas chromatographs and skilled in the interpretation of gas chromatograms. Prior to the generation, the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of capability. This demonstration, which utilizes repeat quality control (QC) check sample analysis is described in Method 8000B in SW-846 Revision 2, Dec. 1997 Section 8.4. Specific laboratory instruction for performing this initial demonstration of capability is detailed in Section 9.

3. INTERFERENCES

3.1. Contamination by carryover can occur whenever high-concentration samples are concentrated following the extraction.

3.2. All glassware must be scrupulously cleaned. Clean all glassware as soon as possible after use by rinsing with the last solvent used. This should be followed by detergent washing with hot water, and rinses with tap water and organic free reagent water. Rinse with Methylene Chloride and drain.

4. SAMPLE COLLECTION, PRESERVATION, AND HANDLING

4.1 Samples analyzed by this method are waste waters, ground waters, soils, sludge, waste solvents, oily wastes, tars, fibrous wastes, filter cakes and sediments from various sources.

4.2 The maximum holding time from sampling to extraction is 7 days for water. The holding time for soil samples is fourteen days from collection to extraction. The extracts, if not analyzed at the same day, should be refrigerated. The holding time for the extracts is 40 days. Both solid and aqueous samples should be temperature preserved to 4°C. All preservation measures should be noted on the chain of custody.

4.3 Water samples must be collected in 1L pre-cleaned amber glass bottles. The analyst requires 20-30g of solid samples. This is to be collected in pre-cleaned jars. Enough sample for duplicate or MS/MSD determinations must be provided.

4.4 The laboratory will attempt to meet all holding time requirements, as dictated by this method and project specific plans. Client requests for analysis after holding time expiration should be made in writing and the client made aware that data will be estimated. The lab will narrate any missed holding times to the client.

5. MATERIALS AND REAGENTS

5.1. All chemicals and analytes must be considered hazardous and handled in a cautious manner. MSDS data concerning the chemicals and standards must be on file and reviewed by laboratory personnel.

5.2. Sodium Sulfate-Granular, anhydrous sodium sulfate. Purify by heating to 400°C for four hours in a shallow tray, or by precleaning the sodium sulfate with methylene chloride.

5.3. Glass wool: Pyrex glass wool. Prewashed with 50 mL of methylene chloride.

5.4. Methylene chloride- reagent grade, boiling point 39°C. The source and manufacturer may change from time to time; therefore, the brand and lot number must be documented in the sample preparation and standard preparation logs.

5.5. Stock Standards: Certified stock standards are purchased from known manufacturers based on varying concentration and quantity needed. The standards for calibration, calibration verification and surrogate are prepared by first making primary stock standard solution from the original stock standard. If the concentration is still high, a secondary stock solution is prepared. Varying volumes of the standard solution are transferred into 10 or 100 mL volumetric flasks containing appropriate solvent, then making each flask to the final volume with the solvent (methylene chloride in this case). All preparations are documented in the organic standard preparation logbook, with standard sources and lot number.

5.5.1. A minimum of 5 standards is used to calibrate the system. All standards must be within the linear range of the system. A reagent blank must be run in addition to the standards.

5.5.2. Initial calibration verification standard should be analyzed with each initial calibration. The ICV standard is prepared using the same procedures as those for standards. The ICV standard is prepared from an independent source.

5.5.3. The stock standard solutions are good for 6 months, if closed tightly and refrigerated properly. Fresh standards should be prepared if the drift from the starting standard exceeds 20%. Special attention should be paid to the possibility of standards getting concentrated due to the evaporation of methylene chloride. The working standard solutions should be monitored more frequently. If comparison with an independent source indicates a problem, it should be replaced. The expiration date and standard number is recorded in the logbook and on the storage vial.

5.5.3.1. Table 1 is an example of the volumes used to prepare stock standard solutions.

Table 1

Standard	Supplier	Cat #	Initial Conc.	Amount used mL	Final volume mL	Final conc. ug/mL
Diesel	Accu Std	FU-009-D-40X	20.0 mg/mL	1.00	4	5000
Diesel	Diesel#2 (Mobile)	NA	Neat	1000mg	100	10,000
Chlorobenzene	J. T. Baker	D46656	Neat	250mg	50	5,000
Carbon chain	Accu Std	DRH-004S-R1-5X	1.0mg/mL	200µL	1.0mL	200

5.5.3.2 Table 2 is an example of the volumes used to prepare working standard solutions.

Table 2

Standard	Supplier	Initial Conc. µg/ml	Volume used µL	Final volume ml	Final conc. µg/ml
Diesel	AccuStd	5000	1000	10	500
Chlorobenzene	J. T. Baker	Neat	250m g	50	5000

6. APPARATUS AND MATERIALS

6.1. Balance – Top loading, accurate to two decimal points.
6.2. Sample spatulas – stainless steel.
6.3. Microsyringe – Hamilton 702 N or equivalent
6.4. Autosampler
    6.4.1. Hewlett Packard 7637 Injector with a tray of 100 sample vials.
6.5. Gas chromatograph – Agilent 5890, equipped with FID detector.

6.5.1. Column – 20 meter Phenomenex, ZB-5ms, 0.18D, 0.18 micrometer film thickness.

Data System – Chemstation Revesion A.09.01 (1206)

7. SAMPLE PREPARATION AND ANALYSIS PROCEDURES

7.1. Prepare matrix-specific batches of 15-20 samples. Matrices are typically defined as soil, water and solid/or liquid waste.

7.2. Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

7.3. Consult all project-specific plans for matrix spike and duplicate preparation requirements. Samples from two clients that each requires project-specific matrix spikes can be prepared together; however, two sets of QC will have to be prepared using each client's designated samples.

7.4. Prepare at least one set of the following QC smples with each batch: method blank, matrix spike/matrix spike duplicate and lab control sample (LCS).

7.5. Samples, standards and QC samples are placed into various positions of the autosampler. The positions and sample identifications are logged into the sample analyses log book and computer system.

7.6. Reserve the first few positions for standard and QC samples. Prepare the calibration standards, initial calibration verification standard, spike standard, and surrogate standard using the guidelines set forth in sections 5.5.3.1 and 5.5.3.2.

7.7. Solids: Weigh the appropriate amount (20) g of solid material into a 40 ml vial. spike with the appropriate volume of surrogates and add 20 mL of Methylene Chloride. Sonicate 15 minutes and leave to settle and inject by autosampler.

7.8. Liquid samples-allow the sample to come to ambient temperature. Transfer 1 Liter of water into a 2 liter separatory funnel. Add surrogate before extraction and extract three times with Methylene Chloride. Filter through pre dried Sodium Sulfate in a concentrating flask. Concentrate the extract to a final volume of 10.0 ml. Inject the appropriate volume of extract on GC.

8. OPERATING CONDITIONS

8.1. Gas chromatograph conditions are as follow:

Carrier gas (Helium) flow rate:	1.6 mL/minute
Makeup gas (Helium) flow rate:	30 mL/minute
Injector temperature:	240° C
Detector temperature:	360° C
Temperature Program:	
Initial temperature:	43° C hold 2.6 minutes
Program:	43° C to 260° C at 16°C/minute, held 0.1 minutes
	260° C to 350° C at 6°C/minutes,
Final temperature	350° C
Final hold:	6.0 minutes

Injector: Hewlett Packard 7673

9. INITIAL CALIBRATION

The calibration of Diesel Range Organics is markedly different from that of single component analytes. The response used for calibration must represent the entire area of the chromatogram within the retention time range or the fuel type, including the unresolved complex mixture that lies below the individual peaks.

Since Diesel contains a large number of compounds that will produce well-resolved peaks in a GC/FID chromatogram, it contains many other components that are not chromatographically resolved. This unresolved complex mixture results in the “bump” in the

chromatogram that is characteristic of these fuels. In addition, although the resolved peaks are important for the identification of the specific fuel type, the area of the unresolved complex mixture contributes a significant portion of the area of the total response

For the analysis of Diesel Range Organics (DROs), sum of the area of all peaks eluting between time ranges of 5.9 to 20.2 (depending on method) Minutes is integrated. This corresponds to C10 (n-Octane) -to C28 (Octacosane). This area is used to calculate the DRO concentration. However, heavier hydrocarbons are quantified and reported to the client with a note regarding the carbon range recognized with reference to window defining hydrocarbon standard. Column bleed subtraction may be performed if necessary. (Sec. 7.7.2.2/EPPA Method 8015B)

9.1 The initial calibration is performed by generating a 7-point calibration curve. Standards 1 and 2 are at or near the reporting limit, and the upper limit of the linear range of the system.

9.1.1 Add following volume of working standard (as prepared in section 5.5.3.1) to 1.0 mL vial and make to volume with Methylene Chloride.

	standard con.	Volume of stock Standard 5000 µg/mL	Final Volume
Standard 1	20µg/L	100µL	1mL
		40µL	1mL
Standard 2	50 µg/L	100µL	1mL
		100µL	1mL
Standard 3	100 µg/L	100µL	1mL
		200µL	1mL
Standard 4	200 µg/L	40µL	1mL
Standard 5	500 µg/L	100µL	1mL
Standard 6	1000 µg/L	200µL	1mL
Standard 7	2000 µg/L	400µL	1mL

9.1.2 Add the corresponding volume of surrogate standard and inject 2 µL to the Gas Chromatograph. Determine the area of the response as described in section 10. Calculate the response factor (RF) for each fuel type as below:

RF = Concentration of each level /Total area of the standard

9.2 Calibration linearity: The linearity of the calibration must be assessed. If the percent relative standard deviation (%RSD) of the calibration factors is less than 20% over the working range, linearity through the origin can be assumed, and the average calibration

factor can be used in place of a calibration curve. The % RSD is calculated by using the following equation:

$$\%RSD = \frac{\text{Standard Deviation of the RFs} \times 100}{\text{Average of the RFs}}$$

10. CALIBRATION VERIFICATION

10.1. The calibration curve and retention times must be verified at the beginning of each working day and it is repeated every 10 injections. Verification is accomplished by the measurement of one standard (normally mid-point) that contains all Diesel Range Organics and surrogates when individual target analytes are being analyzed. Verification is accomplished by the measurement of the fuel standard and the hydrocarbon retention time standard when petroleum hydrocarbons are being analyzed.

10.2. Linearity of calibration is per formed by calculation of the percent drift or percent difference of the instrument response between the initial calibration and each subsequent analysis of the verification standard.

$$\%difference = \frac{CFv - \overline{CF}}{\overline{CF}} \times 100$$

Where:
CFv = Calibration factor from verification standard.
CF = Mean calibration factor from initial calibration.

10.3. If the response for any analyte is within $\pm$15% of the response obtained during the initial calibration, then the initial calibration is considered still valid, and analyst may continue to use the mean CF values from the initial calibration to quantitate sample results. If the response varies from the predicted response by more than 15%, corrective action must be taken to restore the system or a new calibration curve must be prepared.

10.4. All n-alkanes in the calibration verification analysis must fall within previously established retention time windows. If the retention times do not fall within +/- 3 windows, corrective action must be taken to restore the system or a new calibration curve must be prepared for that compound.

10.5. Solvent blanks and any method blanks should be run with calibration verification analysis to confirm that laboratory contamination does not cause false positives.

11. SAMPLE ANALYSIS

11.1. Samples are analyzed in matrix specific batches of 15-20 samples. The sequence starts with calibration verification, followed by method blank, QC samples, and samples. Additional analysis of the verification standard (S) throughout a 12 hour shift are strongly recommended, especially when running samples that contain visible concentrations of oily material. Verification standard is also necessary at the end of a sequence.

11.2. Samples are analyzed with the same instrument configuration as is used during calibration

11.3. A window defining hydrocarbon standard is injected at least once a week to confirm the retention times.

11.4. Sample concentrations are calculated by comparing sample response data with the initial calibration of the system. If sample response exceeds the limits of the initial calibration range, a dilution of the sample must be analyzed. Computer reproduction of chromatograms, manipulated to ensure all peaks are on scale over a 100 fold range, are acceptable as long as calibration limits are not exceeded.

11.5. Use the following equation for calculation of aqueous samples:

$$Conc : mg / L = AsxDxRF$$

C = Concentration of the sample
As= Area of the sample
D = Dilution and/or concentration Factor
RF = mean Calibration factor from the initial calibration

11.6. Use the following equation for calculation of non-aqueous samples:

$$Concentration(mg / kg) = AsxDxRF$$

As= Area of the sample
D = Dilution and/or concentration Factor
RF = mean Calibration factor from the initial calibration

12. QUALITY CONTROL

12.1. Initial demonstration of proficiency: whenever new staff is trained or significant changes in instrumentation are made, initial demonstration of proficiency has to be performed. This is accomplished by running four aliquots of the Quality Control Check Sample in the same manner that samples are run.

12.1.1. The QC Check Sample is prepared by making an intermediate standard (as mentioned in section 5.5.3.1 and 5.5.3.2)

12.1.2. Prepare four Lab Control Samples for each matrix and analyze after the instrument has been calibrated.

12.2. Sample Quality Control for prepration and Analysis:

12.2.1. QC samples include analysis of a method blank, matrix spike, matrix spike duplicate and a Laboratory Control Sample (LCS) in each analytical batch and the addition of surrogates to each field sample and QC sample before extraction.

12.2.2. A Lab Control Sample (LCS) is included with each analytical batch. The LCS consists of an aliquot of a clean (Control) matrix similar to the sample matrix and of the same weight or volume. The LCS is spiked with the same analytes at the same concentrations as the matrix spike. When the results of the matrix spike analysis indicate a potential problem due to the sample matrix itself, the LCS results are used to verify that the laboratory can perform the analysis in a clean matrix.

12.2.3. Surrogate recoveries. The surrogate recovery data from individual samples is evaluated versus the surrogate. Control limits developed by the laboratory, and percent recoveries are reported with the samples.

APPENDIX A

The following table lists the criteria and corrective action for the QC samples. These limits are evaluated at least yearly and may be adjusted to reflect updated laboratory-established limits.

QC Sample	Frequency	Acceptance Criteria	Corrective Action
Method Blank	One per matrix per batch	Less than detection limit	1) Evaluate magnitude of sample results against the concentration of the method blank; if sample results exceed 3x the blank level, narrate to the client 2) Otherwise, re-prep and reanalyze batch if sample detections are within 3x window
System blanks	As. needed	Less than detection limit	1) This is a corrective action when a contaminated system is identified.
Matrix Spike/Matrix Spike Duplicate	One per matrix per batch	Water: Diesel 70-130 Soil: Diesel 75-130	1) Evaluate results against the LCS 2) If the LCS was compliant: narrate failed MS to client 3) Otherwise, re-prep and reanalyze batch including spikes.
RPD limits		Less than 20%	1) Check calculations 2) Narrate failed RPD to client
Surrogate Spikes	Every sample, method blank and standard	Water: Surrog. 60-140 Soil: Surrog. 70-135	1) Check calculations 2) Check LCS; if LCS recoveries within limits, narrate outlying surrogate(s) to client
Laboratory Control Sample	One per matrix per batch	Water: Diesel 70-130 Soil: Diesel 75-130	1) Reanalyze LCS 2) If still Non-compliant, re-prep batch and reanalyze.

APPENDIX B

B.1. Liquid-liquid extraction of water (separatory funnel)

B.1.1. Apparatus and materials:

C.1.1.1. Separatory funnel: 2 L

C.1.1.2. Drying column: 20 mm I.D. Pyrex chromatorgraphic column with pyrex glass wool at bottom and a Teflon stopcock.

C.1.1.3. Erlenmeyer flask: 250 and 500 mL

C.1.1.4. Graduated cylinder

C.1.1.5. Extraction solvent; Mthylene chloride:

B.1.2 Procedure:

B.1.2.1. Using a 1 L graduated cylinder transfer 1 L of the sample to a 2 L separatory funnel. Add proper amount of spike standard to each of tow 1 L distilled water used as matrix. Add appropriate amount of spiking Sample standard to 1 L of distilled water. Add appropriate amount of surrogate standard to all.

B.1.2.2. Add 60 ml of Methylene Chloride to the separatory funnel. Immediately after the funnel is mixed, vent the funnel and repeat this procedure several times. Then shake the funnel vigorously for 2-3 minutes with periodic venting to release excess pressure.

B.1.2.3. Let the phases to separate for 10 minutes. Collect the solvent extract in an Erlenmeyer flask. If emulsion is present, mechanical techniques are employed to help the phase separation. Repeat the extraction two more times using fresh portions of methylene chloride. Combine the three extracts.

B.1.2.4. Dry the extract by passing through pre dried sodium sulfate and concentrate to 10.0 ml final volume.

B.2. Ultrasonic extraction of soil

B.2.1 Apparatus and materials:

B.2.1.1. A device for grinding or homogenization

B.2.1.2. Balance – Top loading accurate to .01 g

B.2.1.3. Ultrasonicator.

B.2.1.4. Centrifuge

B.2.1.5. Glass Vials

B.2.1.6. Sample spatulas – stainless steel

B.3.1 Sample handling:

B.3.1.1. Sediment/soil samples- Decant and discard any water layer on a sediment sample. Mix sample thoroughly, especially composited samples. Discard any foreign objects such a s sticks, leaves, or rocks.

B.3.1.2. Dry waste samples amenable to grinding: grind or otherwise subdivide the waste so that it either passed through a 1-mm sleeve or can be extruded through a 1-mm hole. Introduce sufficient sample into the grinding apparatus to yield at least 50g after grinding.

B.3.1.3. Gummy, fibrous, or oily materials not amenable to grinding should be cut, shredded, or otherwise reduced in size to allow mixing and maximum exposure of the sample surfaces for the extraction. The addition of anhydrous sodium sulfate to the sample (1:1) may make the mixture amenable to grinding.

B.3.2 Determination of percent of dry weight- When sample results are to be calculated on a dry weight basis, a second portion of sample should be weighed out at the same time as the portion used for analytical determination. Immediately after weighing the sample for extraction, weigh 5-10g of the sample into a tared crucible. Dry this aliquot overnight at 105C. Allow to cool in a desiccator before weighing. Calculate the % dry weight as follows:

$$\%\ dry\ weight = \frac{g\ of\ dry\ sample}{g\ of\ sample} \times 100$$

B.3.3 Extraction method for samples expected to contain low concentrations of organics (less than or equal to 20 mg/kg)

B.3.3.1. Weigh 20g of sample into a 40 ml-vial glass jar. Add enough sodium sulfate to have a free flowing sample mixture. Add proper amount of surrogate standard.

B.3.3.2. Immediately add 20 mL of the appropriate extraction solvent or solvent mixture. ($MeCl_2$)

B.3.3.3. Extract the mixture in an ultrasonicator for 15 minutes. Mix several times and let the particles to settle down. If still cloudy, decant the extract into a centrifuge bottle and centrifuge at low speed to remove particles.

B.3.4. Extraction method for samples expected to contain high concentrations of organics (greater than 20mg/kg).

B.3.4.1. Transfer 2g of sample to a 40mL glass vial. Wipe the mouth of the vial with a tissue to remove any sample material. Record the exact weight of the sample taken. Cap the vial before proceeding with the next sample to avoid any cross contamination.

B.3.4.2. Add 2g of anhydrous sodium sulfate to the sample and mix well. Add proper amount of surrogate spiking solution to sample mixture. For the sample in each analytical batch selected for spiking, add proper amount of matrix spiking standard and surrogate standard solution.

B.3.4.3. Immediately add appropriate volume of solvent to bring the final volume to 10mL considering the added volume of surrogate and matrix spike standard. Sonicate the vial in the ultrasonicator for 15 minutes.

B.3.4.4. Centrifuge the vial and collect a volume appropriate for the sensitivity of the determinative method. It is advisable to collect a standard volume for such samples to simplify the final calculation.

B.3.4.5. If analysis will not be performed immediately, the extract is transferred to a vial with PTFE-line caps and refrigerated.

APPENDIX C:
Extract Concentration

C.1. Apparatus and Materials:

C.1.1. Kuderna-Danish (K-D) apparatus:

C.1.1.1. Concentrator tube – 10mL, graduated with ground glass stopper.

C.1.1.2. Evaporation flask: 500mL attached to concentrator tube with springs.

C.1.1.3. Snyder column: three ball (macro) and two ball (micro).

C.1.1.4. Springs or clamps

C1.1.5. boiling chips – Solvent extracted approximately 10/40 mesh (silicon carbide) or equivalent.

C.1.2. Water bath – Heated with concentric ring cover, capable of temperature control (+/- 5 C).

C.1.3. Drying column – 20-mm 1.d, Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.

C.2. Pass the solvent extract through a drying column containing about 10cm of anhydrous sodium sulfate. Collect the dry extract in an evaporation flask connected to a K-D concentrator. Rinse the Erlenmeyer flask with 20-25 mL of methylene chloride, pass it through the drying column, and add it to the evaporation flask.

C.3. Add one or two clean boiling chips to the concentrator tube, and attach it to a three ball Snyder column. Pre-wet the Snyder column b%R within 75-130 y adding 1 ml of methylene chloride to the top of the column.

C.4. Place the K-D apparatus on a hot water bath (60-65 C) so that the concentrator tube is partially immersed in the hot water. The concentration should be complete in 10-20 minutes. When the apparent volume of liquid is reached to 1 ml, remove the K-D apparatus from water bath and let it drain and cool for 10 minutes. Make it to the desired volume regarding the method sensitivity.

STANDARD OPERATING PROCEDURE

FOR ANALYSIS OF

POLYCHLORINATED BIPHENYLS

BY

GAS CHROMATOGRAPHY / ELECTRON CAPTURE

CAPILLARY COLUMN TECHNIQUE

EPA METHOD 8082

Prepared by

Cyrus Razmara, Ph.D.
Laboratory Director

I SCOPE AND APPLICATION

This method is used to determine the concentrations of various polychlorinated biphenyls (PCB) as Aroclors or as individual PCB congeners by gas chromatography with electron capture detectors (ECD) and dual capillary columns (analytical and confirmation). The method is applicable to the determination of pesticides residues in air sampling media, waters, soils, aqueous sludge, caustic liquors, acid liquors, waste solvents, oily wastes, ground waters, tars, fibrous wastes, polymeric emulsions, filter cakes, spent carbons, spent catalysts, sediments and hazardous wastes. These matrices are prepared for analysis by utilizing a variety of extraction techniques; primarily EPA method 3510C (separatory funnel liquid-liquid extraction), 3550B (ultrasonic extraction), 3580 (waste dilution), and 3541 (automated soxhlet extraction).

Multi-component mixtures (Aroclors) are listed as target analytes within this method. When samples contain more than one multi-component analyte, a higher level of analyst expertise is required to attain acceptable levels of qualitative and quantitative analysis. The same is true of multi-component analytes that have been subjected to environmental degradation or degradation by treatment technologies. These result in “weathered’ multi-component mixtures that may have significant differences in peak patterns than those of standards.

This SOP includes the use of dual column analysis. This option allows one injection to be used for dual-column analysis where both columns are used for compound identification. Quantitation is determined from the column giving the best performance for a given analyte in consideration of the quality of the chromatography, although quantitation results should be comparable, from both columns, within given acceptance criteria.

The Laboratory Supervisor and chemist share responsibility for performance of this SOP. The experience of the analyst is crucial to the successful application of this method, and only experienced GC/MS analysts may use this method. The analyst must be able to interpret retention times and detector responses. Prior to data generation, the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of proficiency. This demonstration, which utilizes repeat quality control (QC) check sample analysis is described in Method 8000B in SW-846, Third Edition, Final Update III, December 1996, Section 8.4. Specific instructions for performing the initial demonstration of proficiency are detailed in Appendix 1.

Method Detection Limit (MDL): Routinely analyzed compounds and laboratory-determined method detection limits are provided in Appendix 8. Detection limits are determined by conducting a method detection limit study as detailed in Appendix 4. The method detection limits have been generated using clean

aqueous and solid matrices and are not achievable for many “real” sample matrices. The listed detection limit may vary based on the amount of sample used.

Practical quantitation limit (PQL): The value of this method is approximately 50 µg/Kg (wet weight) for soil/sediments, and 1-2 µg/L for ground water samples. The PQL will vary based upon the same factors that affect detection limits (dilutions and sample size). See Appendix 6.

II SUMMARY OF METHOD

Liquid samples are prepared for analysis by EPA method 3510C. Solid samples are prepared for analysis by EPA method 3550B and waste samples utilize EPA method 3580. Sample preparation procedures are found in Appendix 2.

Depending on the nature of interference, different cleanup methods may be applied. Florisil cleanup (EPA Method 3620B), silica gel cleanup (EPA Method 3630C), or sulfuric acid/permaganate cleanup (EPA Method 3665A) are usually used. Cleanup methods are fully described in Appendix 2 of this SOP.

When the extraction is complete, sample extracts are injected to the gas chromatograph. Two analytical columns joined to a single injection port are used. The second column and second detector are used to confirm all positive results. Separated peaks are detected by the responses of the detector, identified by retention time, and quantitated by calculation via a data system. This method utilizes the external standard method of quantitation.

III SAMPLE COLLECTION, PREVERVATION, AND STORAGE

Samples that can be analyzed by this method are waste waters, ground waters, soils, acid and base liquors, sludge, waste solvents, oily wastes, tars, fibrous wastes, filter cakes, spent catalysts and carbons, polymeric emulsions and sediments from various sources. They may contain some solid matter or chemicals that may interfere with the efficiency of extraction or system. Interference problems require use of professional judgment regarding necessary changes to sample size or sample preparation and/or cleanup.

The maximum holding time from sampling to extraction is seven (7) days for aqueous samples and (14) days for solid samples. The maximum holding time from extraction to analysis is 40 days. Extracts must be refrigerated in the dark before analysis.

Aqueous samples should not be chemically preserved in the field. Both solid and aqueous samples should be temperature preserved at 4°C$\pm$2°C. All preservation measures should be noted on the chain of custody.

Soil samples must be collected in adequately cleaned (non-plastic) jars and water samples must be collected in 1-liter amber color bottles. The requested volumes are 200 grams of solid and one 1-liter bottle for aqueous samples. Data points slated for duplicate or MS/MSD determinations must be provided to the lab in duplicate and triplicate amounts, respectively.

Samples received are stored in a sample refrigerator at 4°C±2°C until extraction. Hexane extracts are stored in a 4°C±2°C until analysis. All extracts are kept refrigerated up to 40 days after extraction. Prior to analysis, all samples and standards are warmed to room temperature.

The laboratory will attempt to meet all holding time requirements, as dictated by this method and project-specific plan. Client requests for analysis after holding time expiration should be made in writing and the client made aware that data would be estimated. The lab will narrate any missed holding times to the client.

IV INTERFERENCES

Sources of interference in this method can be grouped into three broad categories: (1) Contaminated solvents, reagents, or sample processing hardware; (2) Contaminated GC carrier gas, parts, column surfaces, or detector surfaces; (3) Compounds extracted from the sample matrix to which the detector will respond.

Interferences by phthalate esters introduced during sample preparation can pose a major problem. Interferences from phthalate esters can best be minimized by avoiding contact with any plastic materials and checking all solvents and reagents for phthalate contamination. Common flexible plastics contain varying amounts of phthalate esters which are easily extracted or leached from such materials during laboratory operations. Exhaustive cleanup of solvents, reagents, and glassware may be required to eliminate background phthalate ester contamination. These materials may be removed prior to analysis using Method 3630 (silica gel cleanup). See Appendix 2 for other cleanup methods.

The presence of sulfur will result in broad peaks that interfere with the detection of PCBs. Sulfur contamination should be expected with sediment samples. EPA Method 3660 is recommended for removal of elemental sulfur.

Cross contamination can occur whenever high-contamination samples are analyzed. Care should be taken regarding the glassware used for extraction and concentration. The glassware must be washed out with a detergent solution, rinsed with water, acetone, and finally with methylene chloride or hexane.

Some sample matrices may need to be diluted to reduce interference. When this occurs, the reporting limits will be increased to reflect the dilutions. The possibility for instrument (column) damage exists whenever an attempt is made

to run a highly contaminated sample. The analyst must consider available screening method as a way to avoid damage or cross contamination. All decision-making should be documented.

V EQUIPMENT AND SUPPLIES

Analytical Balance: Used to accurately weigh solid samples for preparation (±0.1mg sensitivity).

Analytical system:

System 1

Aglient 6890 GC; Dual column, Dual detector

(2) Agilent 2397A ECD

Column 1: Zebron, Multiresidue-1; 30m x 0.32mm ID x 0.5 um

Column 2: Zebron, Multiresidue-2; 30m x 0.32mm ID x 0.25 um

Agilent 7683 Autosampler

HP Chemstation Software, Rev. B.04.03 (54)-2011

Boiling chips: Solvent extracted, approximately 10/40 mesh (silicon carbide or equivalent).

Crimper: Used to seal 1 mL glass vials with crimp tops.

Decrimper: Used to unseal 1 mL glass vials with crimp tops.

Erlenmeyer flask: 250 mL

Graduated cylinder: 1000 mL

Kuderna-Danish (K-D) apparatus:

a) Concentrator tube: 10 mL, graduated
b) Evaporation flask: 500 mL. Attach to concentrator tube with springs, clamps, or equivalent.
c) Condenser

d) Springs – ½ inch

Microliter syringes: 10µL, 25µL, 50µL, 100µL, 250µL, 500µL, 1000µL, and 5000µL for standard and spike transfers and sample dilutions.

Sample extract vials: 1 mL glass vials with crimp tops and Teflon liners

Sample Spatulas, Stainless Steel: Used in the sample preparation of solid samples

Separation funnels: 2000 mL separation funnel used for water extractions

Ultrasonic bath.

Volumetric Flasks: 10 mL, 50 mL, 100 mL, Class A with ground glass stoppers

Water bath: Heated, with concentric ring cover, capable of temperature control (85°C±5°C)

VI REAGENTS AND STANDARDS

Reagent water should be free of organic contamination. Water is purchased from Sparkletts^{R} (Distilled Drinking Water-Sodium Free).

Organic solvents: Hexane, acetone and methylene chloride are pesticide quality or equivalent. The source and manufacturer may change from time to time; therefore, the brand and lot number are documented in the sample preparation and standard preparation logbooks.

Stock Standards - Certified stock standards are purchased from the following manufacturers:

Chem Service	Accu Standard, Inc.	Supelco Corporation
660 Tower Lane	25 Science Park	595 North Harrison Rd.
West Chester, PA 19381	New Haven, CT 06511	Bellefonte, PA 16823

All standards are stored in a standard refrigerator at 4°C $\pm$ 2°C.

Surrogate Standards are prepared with the following analytes:

Tetrachloro-m-xylene
Decachlorobiphenyl

LCS and Matrix Spike Compounds

Aroclor 1016
Aroclor 1260

Analytical Stock Standards can be prepared using the following list:

Aroclor-1016
Aroclor-1221
Aroclor-1232
Aroclor-1248
Aroclor-1254
Aroclor-1260
Aroclor-1262
Aroclor-1268

Standards and surrogates are purchased from a number of suppliers based on varying concentration and quantity needed. The analyst records details of preparation in the Semi-volatiles Standard Preparation Logbook, with documented standard sources and lot numbers. Appendix 3 provides instructions for standard preparation.

The working standard solutions are good for 6 months or sooner if comparison with an independent source indicates a problem. The expiration date and standard number is recorded in the logbook and on the storage vial.

The surrogate standard is prepared from an independent source. This solution is added to all standards, samples, blanks, and QC Check Samples. This standard is good for 6 months. The expiration date and standard number is recorded in the logbook and on the storage vial.

Appendix 2 gives examples of the volumes used to prepare stock and intermediate standards.

VII QUALITY CONTROL

1. Summary

A summary of the quality control samples, performance criteria, and calibration requirements are given in the following example of an analytical sequence for the testing of an analytical batch.

a) Initial Calibration Standard Curve (minimum of 5 points)

b) Initial calibration verification standard from an independent source, followed by continuing calibration standard

c) LRB or Method Blank
d) LFB or LCS
e) MS
f) MSD
g) Sample 15 to 20
h)

2. Initial Calibration Standard (IC) and Continuing Calibration Check Standard (CCC)

The initial calibration is performed by generating a 6-point calibration curve for each analyte to be reported. *Every analyte to be reported must be run at a minimum of five levels*. Due to the various responses of the analytes, it is sometimes necessary to analyze six standards to achieve five levels for each analyte. Level 1 is at or below the limit of quantitation, and the high level standard is below the upper limit of the linear range of the system. Instructions for preparing the calibration standards are detailed in Appendix 2. Normally, the concentrations used to achieve a five point calibration are: 50, 100, 200, 500, 1000, and 2000 ppb. See Section VIII 3.

For each analysis batch the initial calibration must first be verified prior to analyzing any samples. As a general rule, the initial calibration must be verified at the beginning of each shift during which samples are analyzed. The analytical shift begins with the injection of the calibration check standard. The shift ends after *completion* of the analysis of the last sample that can be *injected* within 10 analytical runs of the beginning of the shift. The midpoint (or 500 ppb) level standard used to prepare the linear calibration curve must be used. Percent difference or percent drift criteria for the CCC must be met before continuing the analysis batch and conducting any sample analyses. See Section VIII 4.

4. Laboratory Reagent Blank (LRB) or Method Blank (MB)

An LRB must be prepared and treated exactly as a typical field sample including exposure to all glassware, equipment, solvents, filtration and reagents that are used with field samples. Data produced are used to assess instrument performance of a blank sample and evaluate contamination from the laboratory environment. Values that exceed ½ the LOQ indicate a laboratory or reagent contamination is present. The source of the contamination must be determined prior to conducting any sample analysis.

5. Laboratory Fortified Blank (LFB) or Laboratory Control Sample (LCS)

Prepare a secondary dilution stock using a different stock solution used to prepare the calibration standards. This separate, secondary dilution stock is used as a concentrate to fortify the LCS and MS/MSD. A LCS is required to be analyzed with each analysis batch immediately following the LRB. By analyzing

the LCS initially, a control check is performed on the concentrated solution used to prepare the MS/MSD. If any deviations in the PCBs concentration(s) are present, it will be reflected in the LCS and not exclusively attributed to a matrix upon analysis of the MS/MSD. The percent recovery for PCBs must fall in the acceptable ranges (see Appendix 6) prior to analyzing samples. If the LCS recovery for an analysis batch does not meet these recovery criteria the data are considered invalid, and the source of the problem should be identified and resolved before continuing analyses.

All compounds are spiked; however only the following are reported:

Aroclor-1016
Aroclor-1260

6. Laboratory Fortified Matrix (LFM) or Matrix Spike (MS)

The laboratory must add a known amount of the target analyte to one sample within each analytical batch (of 15-20 samples). Samples which require such pretreatment require a MS to be taken through all sample handling and preparation procedures in order to confirm any matrix effects and that the laboratory performed the extraction step appropriately.

It is recommended that the solutions used to fortify the MS be prepared from different stocks than used to prepare the calibration standards.

The fortified concentration must be equal to or greater than the native sample concentration. Fortified samples that exceed the calibration range must be diluted to be within the linear calibration range. In the event that the fortified level is less than the observed native level of the unfortified matrix, the recovery should not be calculated. The sample should be fortified at a higher level and reanalyzed or a different sample should be chosen for the MS. The MS should not be prepared at a concentration greater than ten times the highest concentration observed in any field sample and should be varied to reflect the range of concentrations expected in field samples. Ideally, the MS fortified spike concentration should be 3-5 times the native concentration.

Calculate the percent recovery for PCBs, corrected for concentrations measured in the unfortified sample, by using the following equation:

$$\%REC = ((C_s-C)/s) \times 100$$

Where,

%REC = Percent Recovery
C_s = measured PCB in the fortified sample
C = measured native PCB sample concentration

s = concentration equivalent of analyte added to the sample

If the recovery for PCB falls outside the acceptance limits and the laboratory's performance for all other quality control performance criteria is acceptable, the accuracy problem encountered with the fortified sample is judged to be matrix related, not system related and should be noted as such by data qualifier or in the case narrative. Repeated failure indicates potential problems with the procedure which may require corrective action.

The following Aroclors are reported for LCS/LCSD and MS/MSD:

Aroclor-1016
Aroclor-1260

7. Duplicate LFM or Matrix Spike Duplicate (MSD)

This quality control sample must be analyzed with each analytical batch (fifteen samples). Calculate the relative percent difference (RPD) of the initial quantitated concentration (I_c) and duplicate quantitated concentration (D_c) using the following formula:

$$RPD = ((I_c-D_c)/([I_c+D_c]/2)) \times 100$$

If the RPD for the duplicate measurement of PCBs falls outside ±15% and if all other quality control performance criteria are met, laboratory precision is out of control for the sample. The precision problem encountered with the fortified sample may judged to be matrix related, depending on the evaluation of other QC data, and not system related and should be noted as such by data qualifier or in the case narrative. Repeated failure indicates potential problems with the procedure that may require corrective action.

8. Quality Control Standard (QCS)

After calibration curves have initially been established or have been reestablished, or as required to meet data quality needs, verify both the calibration and acceptable instrument performance with the preparation and analyses of an external/second source QCS. If the determined concentration is not within ±30% of the stated value, performance of the calibration is unacceptable. The source of the problem must be corrected before continuing with sample analysis.

VIII PROCEDURE

1. Sample Preparation

Matrix-specific batches of 15-20 samples or less are prepared. Matrices are typically defined as soil, water, and other. Due to differences in preparation of solid and liquid samples, various matrices cannot be batched together.

Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

All project-specific plans for matrix spike and duplicate preparation requirements should be considered. Samples from two clients that each requires project-specific matrix spikes can be prepared together; however, two sets of QC (MS/MSD) should be prepared using each client's designated samples.

At least one set of the following QC samples are prepared with each batch (up to 20 samples with the same matrix): method blank (use pre-washed sand for solid matrix and reagent water for liquid matrix), matrix spike, matrix spike duplicate and a laboratory control sample (LCS). A laboratory control sample is a sample, the matrix of which is free any of the target analytes (use pre-washed sand for solid matrix and reagent water for liquid matrix), which is spiked with known amounts of analytes, and processed simultaneously through the same steps of preparation and analysis and under the same conditions as real samples.

All samples are spiked with surrogates prior to extraction. The surrogate recoveries are evaluated based upon the known concentrations added and known sample matrix interferences. The surrogate recovery provides additional evaluation of unknown samples without the use of a matrix spike. Procedures for surrogate standard preparation are listed in Appendix 3. Instructions for extraction of water and soil samples are provided in Appendix 2.

2. Instrument Startup

The gas chromatographic conditions are checked each day prior to use, in accordance with scheduled preventive maintenance measures, as defined in the laboratory QA/QC Manual. These measures include checking and replacing septa and liner, checking all gases, etc. All maintenance requirements are logged into the maintenance logbook assigned to each instrument. GC system operating conditions are set and maintained as listed in Appendix 7.

All sample standards, QC samples and field sample extracts which are to be analyzed, are placed in capped 1 mL vials and placed within the instrument autosampler. The chemist must ensure that the sequence vial number and actual vial placement in the HP 7683 autosampler rack are the same. The autosamplers have a greater sample capacity that can be analyzed with one continuing calibration standard or initial calibration; therefore, multiple CCC standards need to be prepared if multiple batches of field samples, and associated QC are to be loaded within the autosampler. The autosampler capacity is approximately 100 vials.

3. Initial Calibration

The initial calibration is performed by generating a 6-point calibration curve. Calibration point 1 is at or near the reporting limit for the analytes, and Point 6 is near the upper limit of the linear range of the system.

After generating the initial calibration curve, calculate calibration factors (CF) for each analyte. This procedure is performed by the instrument and software using the following equation:

$$CF = \frac{Concentration_{st}}{Area_{st}}$$

The average response factor for each analyte is calculated for the series of calibration standards.

The calibration factors for the initial calibration standards are used to evaluate whether the CFs are constant over the calibration range. Relative Standard Deviation (%RSD) is used to show the linearity of the calibration curve. The value can be calculated using the following equation:

$$\%RSD = \frac{\text{Standard Deviation of the } CF_S \times 100}{\text{Average of the } CF_S}$$

The RSD for a given analyte must be <20% to assume linearity over the calibration range.

If the RSD for any analyte is greater than 20%, the analyst should review the results (area counts, calibration factors and RSD) for those anaytes to ensure that the problem is not associated with just one of the five initial calibration standards. If the problem appears to be associated with a single standard that one standard may be reanalyzed and the RSD recalculated.

A second alternative is to narrow the calibration range be replacing one or more of the higher level calibration standards with a lower concentration standard.

A third option is to use the area ratios versus concentration using first order or higher regression fit of the five calibration points. The regression calculation will generate a correlation coefficient (*r*) that is a measure of the fit of the regression line to the data. A value of 1.0 indicates a perfect fit. In order to be used for quantitative purposes, *r* must be equal to 0.99.

Before establishing retention time windows, made sure that the chromatographic system is functioning reliably and that the operating parameters have been optimized for the analytes and surrogates in the sample matrix to be analyzed.

Record the retention time to three decimal places for each analyte for at least three injections over at least a 72-hour period. Calculate the mean and standard deviation of these peaks.

The width of the retention time (RT) window for each component is defined as ± 3 times the standard deviation of the mean absolute retention time established during the 72-hour period. The retention time range is then calculated based on the lower limit of the RT window for the first eluting component and the upper limit of the RT window for the last eluting component and the upper limit of the RT window for the last eluting component.

4. Continuing Calibration

Sample analysis may precede with incorporation of continuing calibration standard every 10 injections. High and low concentration mixtures of single component analytes are alternated. For each extraction batch of 15 samples, one method blank, a pair of Matrix Spike and Matrix Spike duplicates and one Lab Control Sample (LCS) are extracted and run with the samples.

The CCC standard is checked for retention time shifts and percent difference of the instrument response between the initial calibration and each subsequent analysis of the verification standard as follows:

$$\%\text{Difference} = ((C_c - C_e)/C_e) \times 100$$

Where:
C_e = Expected amount of standard, concentration units
C_c = Calculated amount of standard concentration units

The % difference or % drift calculated for the calibration verification standard must be within $\pm$ 15% for each analyte before any sample analysis may take place.

If a non-linear calibration is used in the initial calibration, then %drift or % difference between the initial calibration and each subsequent verification standard will be used to verify the continuing calibration. The following equation is used for this purpose:

$$\%Drift = \frac{\text{Calculated concentration} - \text{Theoretical concentration}}{\text{Theoretical concentration}} \times 100$$

5. Sample Evaluation

The system uses two analytical columns for generating data; therefore, the second column is used to confirm the positive results. When sample results are confirmed by a second column, the relative percentage difference (RPD) between the two results is calculated. If RPD is less than 40%, and no evidence of chromatographic problems exists, the higher result is reported. If RPD is greater than 40%, the chromatograph is checked for anomalies and results are selected based on the best professional judgment. If no evidence of any chromatographic problems exists, the higher result is reported.

The surrogate recoveries for each analysis will be evaluated until at least 25 to 30 surrogate recoveries are generated. Once sufficient data points are established, a recovery range will be developed. This recovery range will not be changed unless the system parameters are modified to the point that the recoveries cannot meet the tolerance limits. Limits will be evaluated annually at a minimum.

All QC data that exceeds the control limits designated in Appendix 6 must be narrated to the client. The narrative is invaluable to secondary reviewers, such as validators and regulators, in tracking the decision making and corrective action steps employed.

Matrix spikes will be evaluated based on the percent recovery. The recoveries will be compared to the ranges provided in Appendix 6. If the two recoveries were within the ranges provided, the data would be reported as valid. If any of the recoveries are outside of the ranges, the cause will be determined and an explanation provided. In many cases, a recovery problem is limited to the individual sample only, and will not affect the validity of the other samples in the run.

A Lab Control Sample (LCS) is run at the rate of one per matrix per batch. This sample is the QC checks sample prepared and analyzed in the identical manner as the samples. The results of the LCS are compared to criteria dictated in Appendix 6.

If the matrix spike duplicate analysis fails to meet the designated criteria due to its sample matrix, the LCS is used as the means to demonstrate that the system is capable of generating acceptable data. If any analyte falls outside of the criteria established in Appendix 6, the analyst must provide an explanation in the narrative and determine the validity of the individual analyte.

6. Reporting of Results

The following is a summary of the calculation used by the data system, or the analyst to generate the reported data:

Percent Recovery (P) is calculated by the following equation:

$$P = \frac{C_{\chi} \times 100}{T}$$

Where,

C_{χ} = the concentration of the analyte spike or surrogate from the analysis.
T = the true value of the spike or surrogate standard added.

Sample concentration is calculated by the following equation(s):

External standard calibration – linear calibration

Aqueous samples

$$C(ppb) = A_{\chi} \times V_t \times D/CF_{avg} \times V_i \times V_s$$

Where,

C(ppb) = The concentration of analyte in the sample.
A_{χ}= Area of the peak of the analyte being measured
CF_{avg}= The calibration factor of the analyte being measured.
D = Dilution factor
V_t = Total volume of the concentrated extract (uL). For purge-and-trap analysis, V_t is not applicable and therefore is set at 1.
V_i = Volume of the extract injected (uL). The injection volume for samples and calibration standards must be the same. For purge-and-trap analysis, V_i is not applicable and therefore is set at 1. If concentration units are used in calculating the calibration factor, then V_i is not used in this equation.
V_s = Volume of the aqueous sample extracted or purged in mL.

Nonaqueous samples

$$C(ppb) = A_{\chi} \times V_t \times D/CF_{avg} \times V_i \times W_s$$

Where,

C(ppb) = The concentration of analyte in the sample.
A_{χ}= Area of the peak of the analyte being measured
CF_{avg}= The calibration factor of the analyte being measured.

D = Dilution factor
V_t = Total volume of the concentrated extract (uL). For purge-and-trap analysis, V_t is not applicable and therefore is set at 1.
V_i = Volume of the extract injected (uL). The injection volume for samples and calibration standards must be the same. For purge-and-trap analysis, V_i is not applicable and therefore is set at 1. If concentration units are used in calculating the calibration factor, then V_i is not used in this equation.
W_s = Weight of the sample extracted or purged in g.

Calculations for a non-linear calibration curve.

In instances where a non-linear relationship between analyte concentration and response is present over the working range, or when similar calibration approaches have not met the acceptance criteria, the instrument data system should be employed to calculate analyte concentrations via second or third order calibration curves. In order to be an acceptable calibration, the coefficient of the determination must be greater than or equal to 0.99.

Standard Deviation is calculated by the following equation:

$$SD = \sqrt{\frac{\sum(xi - Xavg)^2}{N - 1}}$$

Where:
x_i = Analyte values
x_{avg} = Analytes average value
N = number of points

Relative Percent Difference:

$$RPD = (MS\%_{rec} - MSD\%_{rec})/((MS\%_{rec} + MSD\%_{rec})/2)) \times 100$$

Where,

$MS\%_{rec}$ = Matrix Spike Percent Recovery
$MSD\%_{rec}$ = Matrix Spike Duplicate Percent Recovery
RPD = Relative Percent Difference

IX CORRECTIVE ACTION

See Appendix 5 for specific information regarding quality system nonconformances and associated corrective actions.

Corrective measures for chromatographic system maintenance may involve one or more of the following remedial actions. This list is by no means comprehensive and analysts should develop expertise in troubleshooting their specific instruments and analytical procedures. The manufacturers of chromatographic instruments, detectors, columns, and assessories generally provide detailed information regarding the proper operation and limiting factors associated with their products. The reading and reviewing of this information is essential to routine maintenance and repair.

Capillary GC columns

Routine maintenance may compel the analyst to clean and deactivate the glass injection port insert or replace it with a fresh insert that has been cleaned and deactivated with dichlorodimethylsilane. Cut off 0.5 – 1.0 m of the injector end of the column using a 90° cut. Place ferrule onto the column before cutting.

X METHOD PERFORMANCE

Appendix 8 gives the results for the Initial Demonstration of Capability plus LOD (MDL) study results. See Appendix 6 for LOQ (PQL) data.

XI WASTE DISPOSAL AND WASTE PREVENTION

Whenever feasible, laboratory personnel should use pollution prevention techniques to address waste generation. Wastes should be reduced or minimized at the point of generation which includes the use of any reagent, standard, or eluent.

Wastes must be disposed of in accordance with all applicable rules and regulations. Wastes shall be disposed of in the following manner:

Water samples (after extraction): Water waste
Soil samples: Vial waste
Hexane sample extracts: Vial waste
Waste acetone: Solvent waste
Waste hexane: Solvent Waste
Waste methylene chloride: Solvent waste
PCB standard solutions: Solvent waste

XII SAFETY

The toxicity or carcinogenicity of each reagent used in this method has not fully been established. Each chemical should be regarded as a potential health hazard and exposure should be as low as reasonably achievable. Cautions are specifically listed on the corresponding MSDS sheet.

The following chemicals have the potential to be highly toxic or hazardous:

Methylene Chloride: Toxic and suspect carcinogen. Harmful if absorbed through skin, may be fatal if swallowed or inhaled. Avoid contact with eyes, skin, clothing. Use safety glasses and effective ventilation.

Acetone: Toxic, highly flammable. Exposure to acetone may enhance the liver toxicity, causes irritation to eyes, skin, mucous membranes and respiratory tract. Use safety glasses and effective ventilation.

Hexane: Toxic, highly flammable. May cause impaired fertility. Harmful by inhalation. Irritant. May cause CNS depression. Prolonged exposure may cause serious health damage. Use safety glasses and effective ventilation.

GLOSSARY

The following terms are defined for use in this document:

ACCURACY: The closeness of agreement between an observed value and an accepted reference value. When applied to a set of observed values, accuracy will be a combination of a random component and of a common systematic error (or bias) component.

BATCH: A group of samples which are similar with respect to the sampling or the testing procedures being employed and which are processed as a unit. For QC purposes, each group of 15 samples or less will be determined to be one batch.

BIAS: The deviation due to matrix effects of the measured value from a known spiked amount. Bias can be assessed by comparing a measured value to an accepted reference value in a sample of known concentration or by determining the recovery of a known amount of contaminant spiked into a sample (matrix spike). Thus, the bias (B) due to matrix effects based on a matrix spike is calculated as:

$B = (Xs - Xu) - K$

Where:

X_s = measured value for spiked sample,

X_u = measured value for unspiked sample, and

K = known value of the spike in the sample.

Using the following equation yields the percent recovery (%R).

$\%R = 100 (X_S - X_U) / K$

BLANK: see Equipment Rinsate, Method Blank, Trip Blank.

CONTROL SAMPLE: A QC sample introduced into a process to monitor the performance of the system.

DUPLICATE: see Matrix Duplicate, Field Duplicate, Matrix Spike Duplicate.

EQUIPMENT BLANK: see Equipment Rinsate.

EQUIPMENT RINSATE: A sample of analyte-free media which has been used to rinse the sampling equipment. It is collected after completion of decontamination and prior to sampling. This

blank is useful in documenting adequate decontamination of sampling equipment.

PRACTICAL QUANTITATION LIMIT: The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. The PQL or Limit of Quantitation (LOQ) is generally 2 to 10 times the MDL.

FIELD DUPLICATES: Independent samples which are collected as close as possible to the same point in space and time. They are two separate samples taken from the same source, stored in separate containers, and analyzed independently. These duplicates are useful in documenting the precision of the sampling process.

LABORATORY CONTROL SAMPLE: A known matrix spiked with compound(s) representing the target analytes. This is used to document laboratory performance.

MATRIX: The component or substrate (e.g., surface water, drinking water) which contains the analyte of interest.

MATRIX DUPLICATE: An intralaboratory split sample which is used to document the precision of a method in a given sample matrix.

MATRIX SPIKE: An aliquot of sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

MATRIX SPIKE DUPLICATE: Intralaboratory split samples spiked with identical concentrations of target analyte(s). The spiking occurs prior to sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.

METHOD BLANK: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting form the analytical process.

For a method blank to be acceptable for use with the accompanying samples, the concentration in the blank of

any analyte of concern should not be higher than the highest of either:

(1) ½ the LOQ, or
(2) Five percent of the regulatory limit for that analyte, or
(3) Five percent of the measured concentration in the sample.

METHOD DETECTION LIMIT (MDL): The minimum concentration of a substance that is measureable and reportable with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte. Also, Limit of Detection (LOD).

PRECISION: The agreement among a set of replicate measurements without assumption of knowledge of the true value. Precision is estimated by means of duplicate/replicate analyses. These samples should contain concentrations of analyte above the MDL, and may involve the use of matrix spikes. The most commonly used estimates of precision are the Relative Standard Deviation (RSD) or the Relative Percent Difference (RPD)

$RSD = (s/x_i) \times 100$

Where:
x_i = the arithmetic mean of the x_l measurements
S = standard deviation

$RPD = 100 \times [(x_1 – x_2)/ \{(x_1 + x_2)/2\}]$

Where:
x_1 = First replicate result
x_2 = Second replicate result

REAGENT BLANK: See Method Blank

REAGENT GRADE: Analytical reagent (AR) grade, ACS reagent grade, and reagent grade are synonymous terms for reagents, which conform to the current specifications of the Committee on Analytical Reagents of the American Chemical Society.

REAGENT WATER: Water that has been generated by any method which would achieve the performance specifications for ASTM Type I

water. For organic analyses, see the definition of organic-free reagent water.

REFERENCE MATERIAL: A material containing known quantities of target analytes in solution or in a homogeneous matrix. It is used to document the bias of the analytical process.

SPLIT SAMPLES: Aliquots of sample taken from the same container and analyzed independently. In cases where aliquots of samples are impossible to obtain, field duplicate samples should be taken for the matrix duplicate analysis. These are usually taken after mixing or compositing and are used to document intra- or inter- laboratory precision.

STANDARD CURVE: A plot of concentrations of known analyte standards versus the instrument response to the analyte. Calibration standards are prepared by successively diluting a standard solution to produce working standards, which cover the working range of the instrument. Standards should be prepared at the frequency specified in the appropriate section. The calibration standards should be prepared using the same type of acid or solvent and at the same concentration as will result in the samples following sample preparation. This is applicable to organic and inorganic chemical analyses.

SURROGATE: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples.

Appendix 1
Initial Demonstration of Capability

Initial demonstration of proficiency is performed to demonstrate that the system and the analyst can successfully perform the analysis. Four aliquots of the Quality Control Check Sample are prepared and analyzed.

The QC Check Sample standard is purchased from a certified source independent of the calibration standards. The following concentrations and volumes are used:

Standard Name	Initial Conc. µg/L	Volume used µL	Final extract Volume	Sample Final Concentration µg/L
Aroclor 1016 and Aroclor 1260 PCB Surrogate mix	10,000 2000	250 250	5 mL 5 mL	5.0 1.0

Transfer 250 uL of the QC Check Sample concentrate and 250 µL of surrogate standard to 1 Liter of reagent water. Proceed with the extraction, concentration and solvent exchange as detailed in Appendix 2. Transfer 1mL of the extract to a crimp vial and seal the cap.

Repeat the above step three more times until a total of four aliquots of QC Check Sample are prepared.

Analyze the four QC Check Samples and compare the accuracy and precision data with those listed in Appendix 6. If accuracy and precision measurements are within the ranges cited in the table, the system is ready for use and analysis may begin. If the average recovery for any analyte falls outside the range, corrective action must be taken and the analysis repeated. All corrective actions must be noted in the maintenance logbook.

Once an analyst and instrument have passed the recovery criteria for all analytes to be reported by the method, the analyst and instruments are certified as having established initial proficiency with the method.

Appendix 2
Sample Preparation

1. Liquid-liquid extraction of water (separatory funnel)

1.1. Apparatus and materials:

1.1.1. Separatory funnel: 2 L
1.1.2. Drying column: 20 mm I.D. Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.
1.1.3. Erlenmeyer flask: 250 mL
1.1.4. Graduated cylinder
1.1.5. Extraction solvent; Methylene chloride: acetone (1:1,v:v) or methylene chloride for water and hexane: acetone (1:1,v: v) for soil

1.2 Procedure:

1.2.1. For each batch of 15-20 samples one pair of LCS/LCSD, one pair of MS/MSD and one method blank is prepared. Using a 1 L graduated cylinder transfer 1 L of the sample to a 2 L separatory funnel. Add proper amount of spike standard to each of two 1 L distilled water used as matrix. Add proper amount of Lab Control Sample standard to 1 L of distilled water. Add proper amount of surrogate standard to all.

1.2.2. Add 60 ml of methylene chloride to the separatory funnel. Immediately after the funnel is shaked once, vent the funnel and repeat this procedure several times. Then shake the funnel vigorously for 2-3 minutes with periodic venting to release excess pressure.

1.2.3. Let the phases to separate for 10 minutes. collect the solvent extract in an Erlenmeyer flask. If emulsion is present, mechanical techniques are employed to help the phase separation. Repeat the extraction two more times using fresh portions of methylene chloride. Combine the three extracts.

1.2.4. Record all information on the Sample Preparation Logsheet.

2. Ultrasonic Extraction of Soil

2.1 Apparatus and Materials:

2.1.1. A device for grinding or homogenization
2.1.2. Balance – Top loading accurate to .01 g
2.1.3. Ultrasonicator.
2.1.4. Centrifuge
2.1.5. Glass Vials

2.1.6. Sample spatulas – stainless steel

2.2 Sample Handling:

2.2.1 Sediment/soil samples- Decant and discard any water layer on a sediment sample. Mix sample thoroughly, especially composite samples. Discard any foreign objects such as sticks, leaves, or rocks.

2.2.2. Dry waste samples amenable to grinding: grind or otherwise subdivide the waste so that it either pass through a 1-mm sieve or can be extruded through a 1-mm hole. Introduce sufficient sample into the grinding apparatus to yield at least 20g after grinding.

2.2.3. Gummy, fibrous, or oily materials not amenable to grinding should be cut, shredded, or otherwise reduced in size to allow mixing and maximum exposure of the sample surfaces for the extraction. The addition of anhydrous sodium sulfate to the sample (1:1) may make the mixture amenable to grinding.

2.3 Determination of Percent of Dry Weight

2.3.1 When sample results are to be calculated on a dry weight basis, a second portion of sample should be weighed out at the same time as the portion used for analytical determination. Immediately after weighing the sample for extraction, weigh 5-10g of the sample into a crucible. Dry this aliquot overnight at 105C. Allow cooling in a desiccator before weighing. Calculate the % dry weight as follows:

$$\%\ Dry\ weight = \frac{g\ of\ dry\ sample}{g\ of\ sample} \times 100$$

2.4 Extraction method for samples expected to contain low concentrations of organics (less than or equal to 20 mg/kg)

2.4.1. Weigh 20g of sample into a 4-oz glass jar. Add enough sodium sulfate to have a free flowing sample mixture.

2.4.2. Add proper amount of matrix spike standard to 20 g of designated soil sample and its duplicate. Add proper amount of lab control sample standard to 20g of clean sand. Add proper amount of surrogate standard to all.

2.4.3 Immediately add about 40 mL of the extraction solvent or solvent mixture (Hexane:Acetone 1:1).

2.4.4. Extract the mixture in an ultrasonicator for 15 minutes. Decant the extract into a concentrating tube.

2.4.5. Repeat the extraction two or more times with two additional 40 mL portion of the solvent. Decant off the solvent after each ultrasonic extraction. Transfer the entire sample to the concentrating tube.

2.4.5 The extract is ready for cleanup and/or solvent exchange.

2.4.6. If analysis will not be performed immediately, the extract is transferred to a vial with PTFE-line caps and refrigerated.

2.4.7. Record all information on the Sample Preparation Logsheet.

3. Extract Concentration

3.1. Apparatus and Materials:

3.1.1. Kuderna-Danish (K-D) apparatus:

3.1.1.1. Concentrator tube – 10mL, graduated with ground glass stopper.

3.1.1.2. Evaporation flask: 500mL attached to concentrator tube with springs.

3.1.1.3. Snyder column: three ball (macro) and two ball (micro).

3.1.1.4. Springs or clamps

3.1.1.5. Boiling chips – Solvent extracted, approximately 10/40 mesh (silicon carbide) or equivalent.

3.1.2. Water bath – Heated with concentric ring cover, capable of temperature control (+/- 5 °C).

3.1.3. Drying column – 20-mm 1.d, Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.

3.1.4. Exchange solvent: Hexane – Pesticide grade

3.2 Procedure

3.2.1 Pass the solvent extract through a drying column containing about 10cm of anhydrous sodium sulfate. Collect the dry extract in an evaporation flask connected to a K-D concentrator. Rinse the Erlenmeyer flask with 10-15 mL of methylene chloride, pass it through the drying column, and add it to the evaporation flask.

3.2.2 Add one or two clean boiling chips to the concentrator tube, and attach it to a three-ball Snyder column. Pre wet the Snyder column by adding 1 ml of Hexane to the top of the column.

3.2.3 Place the K-D apparatus on a hot water bath (80-90 °C) so that the concentrator tube is partially immersed in the hot water. The concentration should be complete in 20-25 minutes. When the apparent volume of liquid is reached to 1 ml, remove the K-D apparatus from water bath and let it drain and cool for 10 minutes.

3.2.4 Increase the temperature of the hot water bath to 95-100 C. Remove the Snyder column; add 5-9 mL Hexane (according to the color of the extract) mix it well and a new boiling chip. Attach a two ball micro Snyder column. Pre wet the column with 1ml hexane. Place the K-D apparatus on the water bath so that the concentrator tube is immersed in the hot water. The concentration is complete in 15-20 minutes. When the apparent volume of the liquid reaches 1 mL, remove the K-D apparatus and rinse its lower joint with 1 mL of hexane into the concentrator tube. Adjust the final volume of the extract to 5 to 10 mL according to the extract color. Transfer the extract to a Teflon-sealed screw-cap vial.

3.2.5 If the extract is clear, proceed with the analysis by transferring 1-2 mL of the extract to a crimp vial, seal the cap and load it to the auto sampler.

3.2.6 If the sample extract is dark, proceed with proper clean up method. Method 3620B (Florisil cleanup) PCB only.

3.2.7 Record all information on the Sample Preparation Logsheet.

4. Florisil Cleanup

Florisil is a magnesium silicate with basic properties; (registered trade name of a U.S. Silica Co.).

Florisil cleanup may be accomplished using a glass chromatographic column packed with Florisil or using solid phase interaction cartridges containing Florisil. Generally, the traditional column chromatography technique uses larger amounts of adsorbent; therefore, has a greater clean up capacity.

4.1. Summary of the Method

This method provides the option of using either standard column chromatography techniques or solid-phase extraction cartridge. Generally, the standard column chromatography techniques use larger amounts of absorbent and therefore have a greater cleanup capacity.

In the standard column cleanup, the column is packed with the required amount of adsorbent, topped with a water adsorbent, and then loaded with the sample to be analyzed. Elution of the analytes is accomplished with suitable solvent(s) that leaves the interfering compounds on the column. The eluate is then concentrated.

The cartridge clean up protocol uses solid-phase extraction cartridges packed with 1-2 g of silica gel (silicic acid) adsorbent. Each cartridge is solvent washed immediately prior to use. Aliquots of sample extracts are loaded into the cartridges, which are then eluted with suitable solvents. The collected fractions may be further concentrated and solvent exchanged.

4.2. Apparatus and Materials

4.2.1. Chromatographic column – 250 mm long x 10 mm ID; with Pyrex Glass wool at bottom and PTFE stop cock.
4.2.2. Beakers – Appropriate size.
4.2.3. Vials – 2,10,25,40 mL glass with PTFE-lined screw – caps or crimp tops.
4.2.4. Erlenmeyer flasks – 50 and 250 mL.
4.2.5. Silica gel for chromatography – 100/200 mesh. Before use, activate at least 16 hours at 130 C in a shallow glass tray, loosely covered with foil.
4.2.6. Sodium sulfate (granular, anhydrous)
4.2.7. Methylene chloride, Hexane, and Acetone – pesticide grade.

4.3. Procedure

4.3.1. Condition the cartridge by adding 4mL of hexane to each cartridge. Allow a few drops of solvent to pass through the manifold to remove air bubbles. Close the valve and allow the solvent to soak the entire sorbent for 5 minutes.

4.3.2. Slowly, open cartridge valves to allow hexane to pass through the cartridges. Close the valve when there is still at least 1 mL of solvent above the sorbet bed. Do not allow cartridge go dry. If cartridges go dry, repeat the conditioning step.

Reduce the sample extract volume to 10mL prior to cleanup for organochlorine pesticides prior to cleanup. The extract solvent

should be hexane. Given the sensitivity of the method, only 1mL of the 10mL extract needs to be subjected to the Forisil cleanup procedure.

4.3.3. Transfer the 1mL of the extract to the cartridge. Open the cartridge valve to allow the extract to pass through the cartridge bed at approximately 2mL/minutes. After the entire extract has passed through the cartridge, but before drying out, rinse the sample vial with 0.5mL of hexane and add it to the cartridge.

4.3.4. After the solvent passed, but before drying, add 5mL acetone/hexane (10:90). Turn the vacuum on. After soaking for 1 minute, slowly open the cartridge valve and collect the eluate into the collection vial. Concentrate the sample to final volume required by the method and exchange with Hexane to 5.0mL final volume.

4.3.5. Record all information on the Sample Preparation Logsheet.

5. Sulfuric Acid/Permaganate Cleanup

This method is used for clean up of sample extracts before analyzing for PCBs. It should not be used for pesticide extracts because it will destroy Aldrin, Dieldrin, Endrin, Endosulfan (I & II) and Endosulfan sulfate. This cleanup procedure will not destroy chlorinated benzenes, chlorinated naphthalenes, and some other chlorinated pesticides.

5.1 Reagents

Sulfuric acid: (1:1,v/v) with water, Reagent grade
Potassium permanganate: $KMnO_4$, 5% in water (w/v), Reagent grade
Hexane: Pesticide grade.

5.2 Procedure

5.2.1 Sulfuric Acid cleanup

5.2.1.1 One or two milliliters of hexane extract are transferred to a 10.0 mL vial. 5 mL of 1:1 sulfuric acid/water solution is added. (This procedure should be carried out in a hood).

5.2.1.2 The vial is tightly capped and mixed in a vortex for one minute. A vortex must be visible in the vial.

5.2.1.3 After the phase separation, the hexane phase should not be cloudy. If the hexane layer is colored, the hexane layer is separated and treated once more with another 5.0 mL 1:1

sulfuric acid/water solution. If the hexane layer is clear, the hexane layer is removed and the acid layer is extracted with one mL hexane and mixed in vortex. This takes care of the residual sample in the acid layer. The hexane layer is removed and added to the first extract and the volume is reduced to the original volume of the sample (1 or 2 mL).

5.2.1.4 If the hexane layer is not clear the permanganate cleanup is followed. This helps to get rid of the residual color.

5.2.1.5 Record all information on the Sample Preparation Logsheet.

5.2.2 Permanganate Cleanup

5.2.2.1 Two 5 mL of 5% potassium permanganate solution is added to the hexane extracts separated from acid cleanup. The mixture is vortexed for 1 minute. After the phase separation, the hexane layer is checked.

5.2.2.2 If it is not clear, the permanganate layer is separated and procedure is repeated with another fresh 5 mL potassium permanganate. If the hexane layer is clear, the hexane layer is removed to another vial and the permanganate layer is extracted with another 1 mL of fresh hexane using a vortex. Both portions of the hexane extracts are mixed and dried using sodium sulfate. The hexane is then reduced to the starting volume of 1 or 2 mL.

5.2.2.3 Record all information on the Sample Preparation Logsheet.

Appendix 3
Standard Preparation

All standard preparations are documented in the Semivolatiles Standards Preparation Logbook. Each entry must include the standard source or manufacturer, the standard lot number, the initial concentration, the final concentration, the solvent used, the date, and the analyst's initials. The expiration date and standard identification number are also recorded in the logbook and on the storage vial. The expiration date for stock and intermediate solutions is three months, although more frequent preparation may be required.

The standards for the calibration curve are prepared by first making primary stock standard solution from the original stock standard. If the concentration is too high for instrumental analysis, a secondary stock solution is prepared. Varying volumes of the standard solution are placed into volumetric flasks containing hexane, and then making each flask to the final volume with hexane.

Table 1 – Primary stock standard solutions*

Standard	Supplier	Cat #	Initial Conc.	Volume Used	Final Volume	Final Conc.
Arochlor 1016/1260 calibration std.	Supelco	46846-U	500µg/mL in Hexane	100 µL	5mL	10,000 µg/L
Arochlor 1016+1260	Chemservice	S-11086J4	10,000 µg/L	500 µL	50mL	10000 µg/L
PCB Surrogate Mix	Chemservice	SM-8080U5	2000 µg/mL in Toluene	250 µL	250 mL	2000 µg/L
Arochlor 1016	Chemservice	F-107 S	100µg/mL in Methanol	100µL	5.0mL	2000µg/L
Arochlor 1260	Chemservice	F-112 S	100µg/mL in Methanol	100µL	5.0mL	2000µg/L
Arochlor 1221	RESTEK	32007	1000µg/mL in Hexane	100µL	10mL	10,000 µg/L
Arochlor 1232	RESTEK	32008	1000µg/mL in Hexane	100µL	10mL	10,000 µg/L
Arochlor 1242	RESTEK	32009	1000µg/mL in Hexane	100µL	10mL	10,000 µg/L
Arochlor 1248	RESTEK	32010	1000µg/mL in Hexane	100µL	10mL	10,000 µg/L
Arochlor 1254	RESTEK	32011	1000µg/mL in Hexane	100µL	10mL	10,000 µg/L
Arochlor 1262	Chemservice	F-293 S	100µg/mL in Methanol	500µL	5.0mL	10,000 µg/L
Arochlor 1268	Chemservice	F-295 S	100µg/mL in Methanol	500µL	5.0mL	10,000 µg/L

*Each standard solution is prepared in a separate volumetric flask using Hexane as solvent.

Table 2- Initial calibration standard preparation:

STANDARD	STANDARD CONCENTRATION µg/L	AMOUNT OF STOCK STANDARD µL (2000µg/L)	TOTAL VOLUME mL
1	50	125	5.0mL
2	100	250	5.0mL
3	200	100	1.0mL
4	500	250	1.0mL
5	1000	500	1.0mL
6	2000	1.0mL	1.0mL

Appendix 4
Method Detection Limit

The method detection limit (MDL) or limit of detection (LOD) is the minimum concentration of a substance that can be identified, measured, and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix.

AETL's limit of detection procedure follows the EPA MDL procedure as described in 40 CFR part 136 Appendix B – Revision 1.11. See the SOP for Determination of LOD and LOQ for specific information regarding the procedures used in the calculation of this value. The LOD study shall incorporate all sample preparation procedures and shall be completed by analyte and matrix. LOD studies shall be conducted each time there is a significant change in the method, for the addition of new analytes, or if there is a significant change in the instrument type.

In brief, detection limit studies are performed using reagent water for aqueous matrices and clean sand for soil and solid matrices. Seven replicate standards are prepared using the calibration standard spiked at a level that is between 3 to 5 times the estimated MDL. The laboratory standard fortified blanks are analyzed and the mean recovery and standard deviation (SDEV) is calculated for each analyte. The MDL is then calculated as follows:

$$MDL = (3.143) \times SDEV$$

The Limit of Quantitation (LOQ) or Practical Quantitation Limit (PQL) must be equal to or greater than the LOD and MDL.

Appendix 5
Corrective Action

The following table lists the criteria and corrective action for the QC samples. These limits are evaluated at least yearly and may be adjusted to reflect updated laboratory-established limits.

QC Sample	Frequency	Acceptance Criteria	Corrective Action
Method Blank	One per matrix per batch	Less than ½ of LOQ	1) Evaluate magnitude of sample results against the concentration of the method blank; if sample results exceed 3x the blank level, narrate to the client 2) Otherwise, re-prep and reanalyze batch if sample detections are within 3x window
System blanks	As needed	Less than ½ of LOQ	1) This is a corrective action when a contaminated system is identified.
Matrix Spike/ Matrix Spike Duplicate	One per matrix per batch	**%Recovery** **Water**: Aroclor 1016 50-150% Aroclor 1260 50-150% **Soil**: Aroclor 1016 50-150% Aroclor 1016 50-150%	1) Evaluate results against the LCS 2) If the LCS was compliant: narrate failed MS to client 3) Otherwise, re-prep and reanalyze batch including spikes.
RPD limits	One per batch	For Water and Soil: RPD < 30%	1) Check calculations 2) Narrate failed RPD to client
Surrogate Spikes	Every sample, method blank QC samples and standard	For Water and Soil : Tetrachloro-m-xylene: 30-150% Decachlorobiphenyl: 30-150%	1) Check calculations 2) Check LCS; if LCS recoveries within limits, narrate outlying surrogate(s) to client
Laboratory Control Sample and MS / MSD	One per matrix per batch	Recovery: Within 50-135%; All components	1) Reanalyze LCS 2) If still Non-compliant, re-extract the batch and reanalyze.

AMERICAN ENVIRONMENTAL TESTING LABORATORY INC.

STANDARD OPERATING PROCEDURE

FOR ANALYSIS OF

SEMIVOLATILE ORGANIC COMPOUNDS BY

GAS CHROMATOGRAPHY / MASS SPECTROMETRY

CAPILLARY COLUMN TECHNIQUE

BY EPA METHOD 8270C

Prepared by

Ziba Hosseini

Ziba Hosseini
Principal Analyst

Approved by

C. Razmara

Cyrus Razmara, Ph.D.
Laboratory Director

I. PURPOSE:

To measure semivolatile organic compounds in environmental samples using a gas chromatograph equipped with a mass spectrometer detector.

II. SCOPE:

This method is used to determine the concentration of semi volatile organic compounds by gas chromatograph with a mass spectrometer detector (GCMS), and a capillary column. The method is applicable to the determination of organic components in soils, aqueous sludges, caustic liquors, acid liquors, waste solvents, oily wastes, ground waters, tars, fibrous wastes, polymeric emulsions, filter cakes, spent carbons, spent catalysts, sediments and hazardous wastes. These matrices are prepared for analysis, by utilizing a variety of extraction techniques: primarily EPA method 3510, 3550, 3580.

Routinely analyzed compounds and laboratory-determined method detection limits are provided in Appendix F, Table 1. The method detection limits have been generated using clean aqueous and solid matrices and are not achievable for many "real" sample matrices. The listed detection limit may vary based on the amount of sample used. The method detection limit for both soil and water is performed at least once a year. Guideline for determination of MDL is provided in Appendix D.

The practical quantitation limit (PQL) of this method is approximately 500 µg/Kg (wet weight) for soil/sediments, and 10 µg/L for ground waters. The PQL will vary based upon the same factors that affect detection limits (dilutions and sample size).

III. RELATED DOCUMENTATION:

This SOP is derived from the following sources:
A sample SOP provided by Qsea Corporation.
SW-846 Method 8270C, Revision 3 December 1996 –Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)
SW-846 Method 3510, 3550, 3580
HP 5890 II Gas Chromatograph Operating Manual
HP 5970 Mass Selective Detector Operating Manual

IV. RESPONSIBILITIES:

The section supervisor and organic chemist share responsibility for performance of this SOP.

IV. METHOD SUMMARY:

5.1. The analytical system is as follows:

System 1

HP 5970 MSD

HP 5890 II GC

HP 7673 ALS

HP Target Compound Software

5.2. The liquid sample is prepared for analysis by EPA method 3510. The solid sample is prepared for analysis by EPA method 3550 and waste samples utilize EPA method 3580. When the extraction is complete, Internal Standards are added and the sample extracts are injected to the gas chromatograph. The separated organics are detected and identified by the responses of the detector, and quantitations are calculated by a data system.

5.3. This method utilizes the internal standard method of quantitation. Specifically, six internal standards (sec. 8.5) are assigned to various compounds based on relative retention time.

5.4. Confirmatory information and quantitation is based upon the mass spectra generated by each compound. The primary and secondary ions used for identification are listed in Appendix F, Table 1.

5.5. The experience of the analyst is crucial to the successful application of this method, and only experienced GC/MS analysts may use this method. The analyst must be able to interpret retention times, detector responses, and internal standard responses. Prior to data generation, the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of capability. This demonstration, which utilizes repeat quality control (QC) check sample analysis is described in Method 8000A in SW-846 Revision 3 December 1996 Section 8.6. Specific laboratory instructions for performing this initial demonstration of capability are detailed in Appendix A.

VI. SAMPLE TYPE, HOLDING TIMES, AND PRESERVATION:

6.1. The samples analyzed by this method are waste waters, ground waters, soils, acid and base liquors, sledges, waste solvents, oily wastes, tars, fibrous wastes, filter cakes, spent catalysts and carbons, polymeric emulsions and sediments from various sources. They may contain some solid matter or chemicals that may interfere with the efficiency of the extraction or system. Interference problems require use of professional judgment regarding necessary changes to sample size or sample preparation, and consultation with the client regarding possibly compromised data.

6.2. The maximum holding time from sampling to extraction is seven (7) days for aqueous samples and (14) days for solid samples. The maximum holding time for the extract is 40 days from extraction.

6.3. Aqueous samples should not be preserved in the field. Both solid and aqueous samples should be temperature preserved at 4°C±2°C. All preservation measures should be noted on the chain of custody.

6.4. Soil samples must be collected in adequately cleaned (non-plastic) jars and water samples are collected in 1-liter amber color bottles. The requested volumes are 200 g of solid and three 1-liter bottles of aqueous sample. Data points slated for duplicate or MS/MSD determinations must be provided to the lab in duplicate and triplicate amounts, respectively.

6.5. The laboratory will attempt to meet all holding time requirements, as dictated by this method and project-specific plans. Client requests for analysis after holding time expiration should be made in writing and the client made aware that data will be estimated. The lab will narrate any missed holding times to the client.

VII. SAMPLE HANDLING FOR ANALYSIS:

7.1. Samples received are stored in a sample refrigerator at 4°C±2°C until analysis. At the time of analysis, all samples and standards are warmed to room temperature.

IIX. REAGENTS AND MATERIALS:

8.1. All chemicals and analytes must be considered hazardous and handled in a cautious manner. MSDS data concerning the chemicals and standards must be on file and reviewed by laboratory personnel.

8.2. Reagent water is free of organic contamination. Water is purchased from Sparkletts (Distilled Drinking Water-Sodium Free).

8.3. Organic solvents: acetone and methylene chloride should be pesticide quality or equivalent. The source and manufacturer may change from time to time; therefore, the brand and lot number must be documented in the sample preparation and standard preparation logs.

8.4. Stock Standards - Certified stock standards are purchased from the following manufacturers:

Chem Service
660 Tower Lane
West Chester, PA 19381

Accu Standard, Inc.
25 Science Park
New Haven, CT 06511

All standards are stored in a standard refrigerator at -15°C $\pm$ 5°C.

8.5. Tuning check standard contains the following analytes
Benzidine
Decafluorotri-Phenyl Phosphine (DFTPP)
P, P'-DDT
Pentachlorophenol

8.6. Internal Standards are prepared using the following analytes:

1,4-Dichloro benzene-d_4
Naphthalene- d_8
Acenaphthene-d_{10}
Phenanthrene-d_{10}
Chrysene- d_{12}
Perylene- d_{12}

8.7. Surrogate Standards are prepared with the following analytes:

2-Fluorophenol
Phenol-d_5
Nitrobenzene-d_5
2-Fluorobiphenyl
2,4,6-Tribromophenol
Terphenyl-d_{14}

8.8. LCS and Matrix Spike Compounds

4-chloro-3-methylphenol
2-chlorophenol
4-Nitrophenol
Acenaphthene
1,4-Dichlorobenzene
2,4-Dinitrotoluene

Pentachlorophenol
Phenol
1,2,4-Trichlorobenzene
N-nitrosodi-n-propylamine
Pyrene

8.9. Analytical Stock Standards can be prepared using the following list:

Aniline
Phenol
Bis(2-chloroethyl)ether
2-Chlorophenol
1,3-Dichlorobenzene
1,4-Dichlorobenzene
Benzyl alcohol
1,2-Dichlorobenzene
N-Nitrosodimethylamine
Bis(2-chloroisopropyl)ether
Methyl methanesulfonate
N-Nitrosodi-n-propylamine
Hexachloroethane
Nitrobenzene
Isophorone
2-Nitrophenol
2,4-Dimethylphenol
Bis(2-chloroethoxy)methane
Benzoic acid
2,4-Dichlorophenol
2,6-Dichlorophenol
Ethyl methanesulfonate
1,2,4-Trichlorobenzene
Naphthalene
Hexachlorobutadiene
4-Chloro-3-methylphenol
2-Methylnaphthalene
2-Methylphenol
Hexachlorocyclopentadiene
4-Methylphenol
2,4,6-Trichlorophenol
3,Methylphenol
2-Chloronaphthalene
2-nitroaniline
Dimethylphthalate
Acenaphthylene
2,6-Dinitrotoluene
3-Nitroaniline
Acenaphthene
2,4-Dinitrophenol
4-Nitrophenol
Diethylphthalate
Fluorene
4-Chlorophenyl phenyl ether
4,6-Dinitro-2-methylphenol
N-Nitrosodiphenylamine
4-Bromophenyl phenyl ether
2,4,5-Trichlorophenol
Hexachlorobenzene
Pentachlorophenol
4-Nitroaniline
Phenanthrene
Anthracene
Di-n-butyl phthalate
2,3,4,6-Tetrachlorophenol
Fluoranthene
Benzidine
Pyrene
Butyl benzyl phthalate
Benz(a)anthracene
3,3’-Dichlorobenzidine
Chrysene
Bis(2-ethylhexyl)phthalate
Benzo(b)fluoranthene
Benzo(k)fluoranthene
Benzo(a)pyrene
Indeno(1,2,3-cd)pyrene
Dibenz(a,h)anthracene
Benzo(g,h,I)perylene
1,2-Diphenylhydrazine(Azobenzene)
1,4-Dichlorobenzene-d_{14}
Naphthalene-d_8
Acenaphthene-d_{10}
Phenanthrene-d_{10}
Chrysene-d_{12}
Perylene-d_{12}
2-Fluorobiphenyl
2-Fluorophenol
Nitrobenzene- d_5
Phenol- d_6

4-Chloroaniline	Terphenyl- d_{14}
Dibenzofuran	2,4,6-Tribromophenol
2,4-Dinitrotoluene	Di-n-octylphthalate
Pyridine	n-Nitrosodimethylamine

8.10. Standards and surrogates are purchased from a number of suppliers based on varying concentration and quantity needs. All preparations are detailed by the analyst in the Organic Standards Preparation Logbook, with documented standard sources and lot numbers. Appendix B provides instructions for standard, internal standard, and surrogate standard preparations.

IX. SAMPLE PREPARATION AND ANALYSIS PROCEDURES:

9.1. Prepare matrix-specific batches of 15 samples or less. Matrices are typically defined as soil, water, and other. Due to differences in preparation of soils and waters, various matrices cannot be batched together.

9.2. Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

9.3. Consult all project-specific plans for matrix spike and duplicate preparation requirements. Samples from two clients that each requires project-specific matrix spikes can be prepared together; however, two sets of QC will have to be prepared using each client's designated samples.

9.4. Prepare at least one set of the following QC samples with each batch (up to 15 samples with the same matrix): method blank, matrix spike, matrix spike duplicate and LCS.

9.5. All samples are spiked with surrogates prior to extraction. The internal standards are spiked, post-extraction. The internal standards and surrogates are evaluated based upon the known concentrations added and known sample matrix interferences. The internal standard and surrogate recoveries provide additional evaluation of unknown samples without the use of a matrix spike. The internal standards are made to a final analytical concentration of 40 mg/L. The surrogate final concentration is 100mg/L for base/neutral surrogates and 200 mg/L for acid surrogates. Surrogate and internal standard preparation procedures are listed in Appendix B. Appendix C provides instructions for extraction of water & soil samples.

9.6. Apparatus and Materials

Specific to solid samples only:
Balance to accommodate up to 20 grams and accurate to two decimal places
Sample spatulas

Needed for all samples:
1-mL syringe for sample preparation
10 µL syringe for Internal Standard addition

Instruments utilized: (See Section 5.1)

X. HP 7673 LOADING PROCEDURE

10.1. All samples extracts, standards, etc., which are to be analyzed, must be placed in an autosample vial and capped. Make sure that the sequence vial number and actual vial placement in the 7673 autosampler rack are the same.

XI. OPERATING CONDITIONS:

11.1. The typical operating conditions for the gas chromatograph and mass spectrometer are as follows:

System I

GC parameters

Agilent HP-5 MS Semivol, 30m/. 25mm ID/0.5 micron Film
Injector: HP split/splitless
Gas: Helium 99.999 purity @ 80 psi
Injector Temp: 250°C
Detector A: NA
Detector B: 280°C (MSD Transfer Line)

Initial Temp: 40°C
Initial Hold: 5 min.
Rate: 12°C/min.
Temp2: 290°C
Hold 2: 6min.
Rate: 20°C/min.
Temp3: 325°C
Hold 3: 10min

Detector: Agilent Mass Selective Detector 5973N

MS-EM: Variable
Mass Range: 35-500
Scan Rate: 1.73 scans/second
Ionization: Ei 70 EV

XII. INSTRUMENT STARTUP:

12.1. The gas chromatographic conditions are checked each day prior to use, in accordance with scheduled preventive maintenance measures, as defined in the laboratory Quality Assurance Plan. These measures include checking and replacing septa, checking all gases, etc. All maintenance requirements are logged into the maintenance logbook assigned to each instrument.

12.2. The Mass Spectrometer is checked for air leaks daily by the following procedure: the water (mass 18 peak), Nitrogen (mass 28 peak), and Oxygen (mass 32 peak) are examined and compared. If the water mass peak is greater than the oxygen and the nitrogen mass peaks, the system is airtight and ready for use. If the ratios of the oxygen and nitrogen peaks are greater than the water peak, an air leak is possible. The system must be further checked for air leaks and corrective action must be taken prior to proceeding.

XIII. TUNING, CALIBRATION AND SYSTEM EVALUATION:

13.1. The instrument must meet tuning, calibration and contamination criteria prior to engaging in sample analysis. The following instrument startup sequence is employed:

DFTPP Tune Standard check:
Methylene Chloride Blank with Internal Standards
5-point Initial Calibration, containing SPCC and CCC Compounds (ICAL) and additional target compounds
Initial Calibration Verification Standard (ICV) (Second Source)

A run and evaluation criterion for each of these standards and blanks is discussed as below:

13.1.1. A 50 ng injection of the DFTPP tune standard is required to assess hardware tuning, column performance, and injection port inertness. The following mass abundance criteria must be met for the tune standard:

Mass Relative Abundance

Table 1.

51	30-60% of mass 198
68	<2% of mass 69
70	<2% of mass 69
127	40-60% of mass 198
197	<1% of mass 198
198	Base Peak, 100% relative abundance
199	5-9% of mass 198
275	10-30% of mass 198
365	<1% of mass 198
441	Present but less than mass 443
442	>40% of mass 198
443	17-23% of mass 442

13.1.1.1. The chromatogram for the tune standard should be evaluated for possible degradation of the column or injection port problems. Perform column and injection port maintenance as needed. Do not proceed with the calibration until the tune criteria are met.

13.1.1.2. A tune check standard must be run every 12 hours of sample analysis. All the passing criteria must be met before sample analysis.

13.1.1.3. At the beginning of each 12 hr. Shift that base/neutral fraction is to be analyzed for EPA method 8270C/625 the tailing factor for benzidine and pentachlorophenol must be calculated. Calculation of tailing factor is calculated by the Chemstation software and a print out is generated daily. Since the tuning check standard solution contains DDT, it is used to detect the degradation of DDT to DDE and DDD. This calculation is also performed by the software and a print out is generated daily.

13.2. The initial calibration is performed by generating a 5-point calibration curve for each analyte to be reported. *Every analyte to be reported must be run at five levels*. Due to the various responses of analytes, it is routinely necessary to analyze six standards to achieve five levels for each analyte. Standards 1 and 2 are at or near the reporting limit for the analytes, and the high level standard is near the upper limit of the linear range of the system.

	Standard Conc
Standard 1	10 mg/L
Standard 2	20 mg/L
Standard 3	50 mg/L
Standard 4	80 mg/L
Standard 5	80 mg/L
Standard 6	120 mg/L

Instructions for preparing these calibration standards and internal standards are defined in Appendix B.

13.2.1.1. A Second Source Standard (ICV) is prepared using the methodology listed in Appendix B. This standard is prepared from a second independent source that may also be used as the MS and LCS spiking solution, if volume permits. The ICV standard is run as a standard.

13.3. PROCEDURE FOR SYSTEM EVALUATION: Initial Calibration

13.3.1. After generating the initial curve, calculate response factors (RF) for each analyte. This procedure is performed by the instrument software using the following equation:

$$RF = \frac{Area_{std} \times Conc_{InternalStd}}{Area_{InternalStd} \times Conc_{std}} \equiv \frac{A_s C_{IS}}{A_{IS} C_s}$$

13.3.2. The System Performance Check Compounds (SPCC) must be assessed for attaining the minimum average relative response factors. The SPCC compounds must have minimum response factors as follows:

SPCC	RRF_{MIN}
N-nitroso-di-n-propylamine	≥0.050
Hexachlorocyclopentadiene	≥0.050
2,4-Dinitrophenol	≥0.050
4-Nitrophenol	≥0.050

13.3.3. Failure of any of these four SPCC compounds to meet minimum RRF criteria prohibits proceeding with sample analysis until the cause for poor response is determined. The following is a summary of the systematic problems indicated by each of the SPCC analytes:

Compound	System Performance
N-nitroso-di-n-propylamine	Standard deterioration
Hexachlorocyclopentadiene	Column deterioration
2,4-Dinitrophenol	Active sites in column
4-Nitrophenol	injection port contamination

13.3.4. If the SPCC criteria are met, use the response factors to evaluate whether the RFs are constant over the calibration range. This is done by generating the Percent Relative Standard Deviation (%RSD). The computer system calculates the value by using the following equation:

$$\%\,RSD = \frac{\text{Standard Deviation of the RFs}}{\text{Average of the RFs}} \times 100$$

13.3.5. The %RSD among RFs of each analyte for the calibration check compounds (CCCs) must be less than 30%.

Calibration Check Compounds (CCCs)	
Acenaphthene	4-chloro-3-methylphenol
1,4-Dichlorobenzene	2,4-dichlorophenol
Hexachlorobutadiene	2-Nitrophenol
N-nitrosodiphenylamine	Phenol
Di-n-octylphthalate	Pentachlorophenol
Fluoranthene	2,4,6-Trichlorophenol
Benzo(a)pyrene	

13.3.6. The CCCs are chosen for monitoring because they are representative of the list of compounds being tested. Their satisfactory performance assures the analyst that the system is operating properly. Often if the %RSD criteria are exceeded, it indicates a possible leak in the system that requires attention. If the 30% RSD criteria (sec. 7.3.5.3 8270C) is met for the CC compounds, then all other analytes are evaluated against 15% RSD criteria.

13.3.7. If the %RSD is less than 15% for all other calibrated compounds, the RF can be considered invariant and the average RF can be used for calculations.

13.3.8. If the %RSD of any compound is greater than 15%, the analyst may use the area ratios versus concentration using first order or higher regression fit of the five calibration points. This approach should not be used if review of the data indicates a possible error

in standard preparation. If standard preparation is the cause of the problem, new standards must be made and the calibration curve rerun. Professional judgment of the analyst is required before regression calculation can be used, since its use will be subject to increased scrutiny by data reviewers.

13.3.9. If the %RSD values are acceptable for all analytes, check the ICV standard and internal standards against the initial calibration for relative retention time and response compliance.

13.3.10. The response for each internal standard must be within –50% - +100% response to the average response of the internal standard during calibration. If the response is greater than these criteria, the system must be inspected for malfunctions and the appropriate corrections made. Sample analysis cannot proceed until the variation in response is fixed.

13.3.11. The retention time of the internal standards must not drift more than 30 seconds from the average retention time developed during the initial calibration. If the retention time drifts greater than 30 seconds, the chromatographic system must be inspected for malfunctions and corrections made. Sample analysis cannot proceed until the retention time drift is corrected.

13.3.12. Finally, check the reagent blank for contamination and carry over. Phthalates are common laboratory contamination in extracted samples and method blanks.

13.3.13. After all of the conditions above have been satisfied the analysis of samples may begin. All adjustments and troubleshooting processes must be documented in the maintenance logbook. Reference to manufacturer supplied solutions, i.e. operation manuals, maintenance manuals, etc. must also be documented in the maintenance logbook.

XIV. SAMPLE ANALYSIS:

14.1 Sample analysis may proceed with incorporation of the following standards every 12 hours of run time:

DFTPP Tune Standard
Continuing Calibration Verification (CCV) Standard

14.1.1. The DFTPP standard is checked for adherence to mass abundance requirements as detailed in 13.1.1. When method 625 is used for analysis of aquous samples, the tailing factor for benzidine and pentachlorophenol must be less than 3.0
Degradation of DDT to DDE and DDD should not exceed 20%.

14.1.2. The Continuing Calibration Verification (CCV) is checked for CCC %difference, SPCC minimum RFs, internal response values and retention time shifts. All analytes other than CCCs are also checked for %drift or %difference.

14.1.2.1. Analytes are checked for %drift or %difference by the following equation, which is performed by the instrument software:

$$\%\ Drift = \frac{\left[C_{True} - C_{Measured}\right]}{C_{True}} \times 100$$

14.1.2.2. If any CCC compound is determined to have a %drift that exceeds 20%, corrective action is required. First a fresh verification standard is run. If the analyte fails again, the initial calibration is considered invalid and a new 5-point curve must be generated.

14.1.2.3. CCV response factors for SPCC analytes are compared against the average response factors generated in the initial calibration. Minimum response factors of 0.050 must be obtained for these compounds before continuing.

14.1.2.4. CCV internal standard response value and retention times are checked against the limits established by the initial calibration as discussed in 13.3.10. and 13.3.11. These tolerance limits must be met before proceeding.

XV. SAMPLE EVALUATION:

15.1. Data is evaluated by both the analytical group and QA group, prior to being released to the client. This section refers to analytical group evaluations only.

15.2. All samples are spiked with internal standards and surrogates, and these spikes serve as the best indicator for data acceptability. Evaluate the internal standards and surrogates for recovery and retention time compliance.

15.3. The response for each internal standard must be 50% to 150% of the average response of the internal standard during calibration. If the response is greater than this criteria, the system must be inspected for malfunctions and the appropriate corrections made. Sample analysis cannot proceed until the variation in response is fixed.

15.3.1. Low internal standards cause a high bias on sample detections. Non-detect results are unaffected. Surrogates are evaluated for culmination of this bias.

15.3.2. High internal standards cause a low bias on sample detections and non-detections. Surrogates are evaluated for culmination of this bias.

15.4. The retention time of the internal standard is monitored. The retention times of the internal standard must not vary more than ±0.5 minutes from the average. If the retention time variance is exceeded, the system is considered out of control and corrective action is needed. All analysis performed on the out-of-control system should be repeated, if possible. If this is not possible, the data will be reported and the deviation narrated.

15.5. The relative retention times (RRT) of the individual components must not vary by more than ±0.06 minutes. If this drift occurs, the analyst must make a professional judgment regarding the effect of the shift on data validity. If compliant data is not generated, the deviation must be reported to the client. The cause for RT shift must be corrected.

15.6. The surrogate recoveries for each blank, QC Check Sample, set of standards, and samples will be evaluated against recovery limits (see Appendix E) until sufficient data points are established, in order for a recovery range will be developed. This recovery range will not be changed unless the system parameters are modified to the point that the recoveries cannot meet the tolerance limits. Limits will be evaluated annually at a minimum.

15.7. Environmental samples often have contamination and interference. The most common interfering compounds are hydrocarbons, which can often be detected in advance by an oily appearance or screening technique. The client must be contacted in all cases involving interfering compounds such that guidance can be provided for analysis, and problems communicated regarding elevated quantitation limits. The amount of common laboratory contaminants, such as phthalates, and chloride, should be no greater than the reporting limit on any given day. The judgement of the analyst is critical to this evaluation.

15.8. Contamination by carryover can occur whenever high-concentration samples are analyzed. Whenever an unusually concentrated sample is encountered, it should be followed by an analysis of a solvent blank to check for carry over. Samples suspected to have contributions from carryover must be subject to re-analysis. The

column may also require conditioning between runs or after a series of runs to remove contamination.

15.9. All data that exceeds the criteria must be narrated to the client. The narrative is invaluable to secondary reviewers, such as validators and regulators, in tracking the decision-making and corrective action steps employed.

15.10. It is possible that some sample matrices may need to be diluted to reduce interferences. When this occurs, the reporting limits will be increased to reflect the dilutions. The possibility for instrument damage exists whenever an attempt is made to run a sample with severe interferences. The analyst must consider available screening methods as a way to avoid damage or cross-contamination. All decision-making should be documented.

15.11. Due to the variety of sample concentration ranges, the matrix spiking concentration has been set at 100 mg/L for Base/neutral compounds and 200 mg/L for acid compounds. It may be changed to meet any regulatory or project-specific requirements. Periodically, the samples will be spiked with all target compounds using the SSS solution. Only those analytes listed in section 8.7 will be evaluated for matrix spiking purposes. The remaining compounds are used for historical data and evaluation of system performance.

15.12. Matrix Spikes will be evaluated based upon the percent recovery (see Appendix E). If the recoveries were within the provided ranges, the data would be reported as valid. If any of the recoveries are outside of the ranges, the sample would be analyzed a second time and the results compared. The cause will be determined and an explanation will be provided. In many cases a recovery problem is limited to the individual sample only, and will not affect the validity of the other samples in the run.

15.13. The spiked sample recovery analysis will be calculated for percent recovery. If a sample recovery is outside of the limits, the analyst will evaluate the reason for the outlier. If the sample has a history of analytical matrix problems, the percent recovery range may be changed for that matrix only. The evaluation requires the analysis of a minimum of five-sample spike analysis. The evaluation will be updated after the analysis of 10 new spike sample analysis.

15.14. An LCS is run at the rate of one per matrix per batch. This sample is the QC-check sample prepared and analyzed in the identical manner as the samples. The results of the LCS are compared to criteria of Appendix F for the compounds in section 8.7. All other compounds, if spiked, are for reference only. LCS for aqueous samples is run on organic free reagent water and for soil samples is run on Ottawa sand.

15.15. If the matrix spike and matrix spike duplicate analysis fail to meet the designated criteria due to the sample matrix, the LCS is used as the means to demonstrate that

the system is capable of generating acceptable data. If any analyte falls outside of the criteria established the analyst must provide an explanation in the narrative and determine the validity of the individual analyte.

15.16. The Mass Spectral fragmentation data must be examined when identifying the compounds. The system provides a report that allows the analyst to examine the relative fit and purity of each identified compound to the mass spectral library. If the spectral fit or purity is less than 50% or 0.5 for any compound, the analyst will examine the mass spectra and determine if the compound identification is accurate. The professional judgment of the analyst will prevail.

XVI. REPORTING OF RESULTS:

16.1 The following is a summary of the calculation used by the computer to generate the reported data:

16.1.1. Percent Recovery (P) is calculated by the following equation:

$$P = \frac{C_x}{T} \times 100$$

Where:
C_x = Is the concentration of the analyte spike, surrogate, or internal standard from the analysis.
T = The true value of the spike, surrogate, and internal standard added.

16.1.2. Sample Concentration is calculated by the following equation:

$$C_{(\mu g/L)} = \frac{A_x \times I_s}{A_{IS} \times RF}$$

Where:
C = The concentration of the analyte sample.
A_x = Area of the characteristic ion of the analyte being measured.
I_s = Concentration of the internal standard.
A_{IS} = Area of the characteristic ion of the internal standard.
RF = The response factor of the analyte being measured.

16.1.3. Standard Deviation is calculated by the following equation:

$$SD = \sqrt{\frac{\sum_{N}\left(X_i - X_{Avg}\right)^2}{N-1}}$$

Where:
X_i = analyte values
X_{Avg} = Analytes average value
N = Number of points

6.1.4. Relative Percent Difference:

$$\%RPD = \left| \frac{\left[Conc_{MS} - Conc_{MSD}\right]}{\left[\frac{Conc_{MS} + Conc_{MSD}}{2}\right]} \right| \times 100$$

Where:
MS = Matrix Spike
MSD = Matrix Spike Duplicate
100 = Conversion factor to %

Appendix A

Initial Demonstration of Proficiency

The sample analysis and system verification is performed to demonstrate that the system and the analyst can successfully perform the analysis. This is accomplished by running four aliquots of the Quality Control Check Sample in the same manner that samples are run.

A.1. The QC Check Sample is prepared by Adding 1 mL of the of matrix spike standard plus 1 mL of surrogate standard to 1 Liter of ultra pure water and extract per EPA method 3510.

A.2. Analyze and reduce data.

A.3. Extract and analyze a method blank with the LCS batch.

A.4. Compare the four LCS recoveries. If average recoveries of analytes are within acceptable limits, the system is ready to use and analysis may begin. If the average recovery for any analyte falls outside the range, corrective action must be taken and the analysis repeated for the failed analytes. All corrective action must be noted in the Maintenance Logbook.

A.5. Once an analyst and instrument have passed the recovery criteria for all analytes to be reported by the method, the analyst and instrument are certified as having established initial proficiency with the method.

Appendix B

The standards, surrogates, internal standards, initial calibration verification, and spiking solutions are prepared as follows:

B.1. The standards for the calibration curve are prepared by first making one intermediate standard at 200mg/L in methylene chloride that includes all compounds. From the 200 mg/L standard, serial dilutions which result in 1 mL of each of the following standard concentrations are prepared: 10, 20, 50, 80, 100, 120 mg/L. It is recommended to make 10 mL of the 50 mg/L standard for use as the daily calibration check standard.

B.2. A minimum of 5 standards is used to calibrate the system. All standards must be within the linear range of the system. A reagent blank should be run in addition to the standards.

B.3. An initial calibration verification (ICV) standard should be analyzed with each initial calibration. The ICV is prepared using the same procedures as those for the standards. The ICV is prepared from an independent source.

B.4. The intermediate solutions are good for one year. The expiration date and standard number is recorded in the logbook and on the storage vial.

B.5. To prepare the surrogate standard: Add 1 mL of a 5,000 mg/L Base/Neutral surrogate standard plus 1 mL of a 10,000 mg/L acid surrogate standard to a 50 mL volumetric flask and bring to volume with methylene chloride. The resulting surrogate standard solution is 100 mg/L for Base/Neutral compounds and 200 mg/L for Acid compounds. Add 1 mL of final surrogate standard to sample prior to extraction.

B.6. To prepare the matrix-spiking standard, follow the surrogate standard preparation procedure (B.5.). (Use matrix spike standard instead of the surrogate standard.)

Appendix C

C.1. Liquid-liquid extraction of water (separatory funnel)

C.1.1. Apparatus and materials

- Separatory funnel: 2 L
- Drying column: 20 mm I.D. Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.
- Erlenmeyer flask: 250 ml
- Graduated cylinder
- Extraction solvent; methylene chloride: acetone (1:1,v:v) or methylene chloride

C.1.2. Procedure:

C.1.2.1. Using a 1 L graduated cylinder transfer 1 L of the sample to a 2 L separatory funnel. Add proper amount of spike standard to each of 3 one liter distilled water used as matrix. Add proper amount of surrogate standard to all. Make all samples acidic by adding (1:1, v:v) sulfuric acid. Check the pH by pH paper. Adjust to PH<2

C.1.2.2. Add 60 ml of methylene chloride to the separatory funnel. Shake the funnel once, vent the funnel and repeat this procedure several times. Then shake the funnel vigorously for 2-3 minutes with periodic venting to release excess pressure.

C.1.2.3. Let the phases to separate for 10 minutes. Collect the solvent extract in an Erlenmeyer flask. If emulsion is present, mechanical techniques are employed to help the phase separation. Repeat the extraction two more times using fresh portions of methylene chloride. Combine the three extracts.

C.1.2.4. Repeat steps C.1.2.2 & C.1.2.3, but make the water samples basic with 10 M Sodium Hydroxide. Adjust the pH to >11. Combine all the extracts.

C.2. Ultrasonic extraction of soil

C.2.1. Apparatus and materials:

- A device for grinding or homogenization
- Balance – Top loading accurate to 10 g.

- Ultrasonicator
- Centrifuge
- Glass Vials
- Sample spatulas – stainless steel

C.3. Sample handling:

C.3.1. Sediment/soil samples- Decant and discard any water layer on a sediment sample. Mix sample thoroughly, especially compo sited samples. Discard any foreign objects such as sticks, leaves, or rocks.

C.3.2. Dry waste samples amenable to grinding: grind or otherwise subdivide the waste so that it either passed through a 1-mm sleeve or can grinding apparatus to yield at least 2g after grinding.

C.3.3. Gummy, fibrous, or oily materials not amenable to grinding should be cut, shredded, or otherwise reduced in size to allow mixing and maximum exposure of the sample surfaces for the extraction. The addition of anhydrous sodium sulfate to the sample (1:1) may make the mixture amenable to grinding.

C.3.4. Determination of percent of dry weight-when sample results are to be calculated on a dry weight basis, a second portion of sample should be weighed out at the same time as the portion used for analytical determination. Immediately after weighing the sample for extraction, weight 5-10g of the sample into a tarred weighing. Calculate the % dry weight as follows:

$$\%DryWeight = \frac{gofDrySample}{gofSample} \times 100$$

C.3.5. Extraction method for samples expected to contain low concentrations of organics (less than or equal to 20 mg/kg)

C.3.5.1. Weigh 20g of sample into a 4-oz glass jar. Add enough sodium sulfate to have a free flowing sample mixture.

C.3.5.2. Add proper amount of matrix standard solution to matrix spike, and spike duplicate and add proper amount of surrogate standard to all.

C.3.5.3. Immediately add 100 ml of the appropriate extraction solvent or solvent mixture.

C.3.5.4. Extract the mixture in an ultrasonicator for 15 minutes. Decant the extract into a centrifuge bottle and centrifuge at low speed to remove particles.

C.3.5.5. Repeat the extraction two more times with two additional 100 ml portion of the solvent. Decant off the solvent after each ultrasonic at low speed and then decant the solvent from the bottle.

C.3.6. Extraction method for samples expected to contain high concentrations of organics (greater than 20mg/kg).

C.3.6.1. Transfer 2g of sample to a 40ml glass vial. Wipe the mouth the vial with a tissue to remove any sample material. Record the exact weight of the sample taken. Cap the vial before proceeding with the next sample to avoid any cross contamination.

C.3.6.2. Add 2g of anhydrous sodium sulfate to the sample and mix well. Add proper amount of surrogate spiking solution to sample mixture. For amount of matrix spiking and surrogate standard solution.

C.3.6.3. Immediately add the necessary volume of solvent to bring the final volume to 10 ml considering the added volume of surrogate and matrix spike standard. Sonicate the vial in the ultrasonicator for 15 minutes.

C.3.6.4. Centrifuge the vial and collect a volume appropriate for the sensitivity of the determinative method. It is advisable to collect a standard volume for such samples to simplify the final calculation.

C.3.6.5. The extract is ready for cleanup and/or analysis

C.3.6.6. If analysis will not be performed immediately, the extract is transferred to a vial with PTFE-line caps and refrigerated.

C.4. Extract Concentration:

C.4.1. Apparatus and Materials:

- Kuderna-Danish (K-D) apparatus:
- Concentrator tube–10 ml, graduated with ground glass stopper.

- Evaporation flask: 500ml attached to concentrator tube with springs.
- Snyder column: three ball (macro) and two ball (micro).
- Springs or clamps
- Boiling chips-Solvent extracted, approximately 10/40 mesh (silicon carbide) or equivalent.
- Water bath – Heated with concentric ring cover, capable of temperature control (+/-5 C).
- Drying column –20-mm 1.d, Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.

C.4.2. Pass the solvent extract through a drying column containing about 10cm of anhydrous sodium sulfate. Collect the dry extract in an evaporation flask connected to a K-D concentrator. Rinse the Erlenmeyer flask with 20-25 ml of methylene chloride, pass it through the drying column, and add it to the evaporation flask.

C.4.3. Add one or two clean boiling chips to the concentrator tube, and attach it to a three-ball Snyder column. Pre-wet the Snyder column by adding 1ml of methylene chloride to the top of the column.

C.4.4. Place the K-D apparatus on a hot water bath (80-90° C) so that the concentrator tube is partially immersed in the hot water. The concentration should be complete in 10-20 minutes. When the apparent volume of liquid is reached to 1ml, remove the K-D apparatus from water bath and let it drain and cool for 10 minutes. Transfer the extract to 2.0 ml crimp vial quantitatively

C.4.5. If the extract is clear, proceed with the analysis by adding 10 µL of the internal standard to each 1ml of the extract.

C.5. Sample Analysis

C.5.1. Add 10 µL of a 4000 mg/L internal standard to the 1 mL final volume sample extract (ISTD concentration in extract is 40 mg/L).

C.5.2. Analyze sample

C.5.3. If any internal standards or surrogates are outside control limits reanalyze the sample extract to confirm results.

C.5.4. If any target analytes are outside the calibration range dilute and reanalyze. (Make sure internal standard concentration is 40 mg/L in the diluted extract.

APPENDIX D
Method Detection Limit

Method detection limit is the lowest concentration of a substance that can be identified, measured and reported with 99% confidence that the analyte concentration is greater than zero.

Making 7 replicates of a certain concentration of calibration standard in water for aqueous matrices and clean sand for soil and solid matrices performs Method detection limit. The seven replicates of each matrix are then extracted using the exact same procedure used for extracting sample. The final 1mL extracts are analyzed and the standard deviation is calculated for each analyte. To obtain the method detection limit, the standard deviation is multiplied by 3.143. The PQL is about 2-3 times the method detection limit.

Appendix E

The following table lists the criteria and corrective action for the QC samples. These limits are evaluated at least yearly and may be adjusted to reflect updated laboratory-established limits.

QC Sample	Frequency	Acceptance Criteria		Corrective Action
Method blank	One per matrix per batch	Less than detection limit		1) Evaluate magnitude of sample results against the concentration of the method blank; if sample results exceed 3x the blank level, narrate to the client 2) Otherwise, re-prep and reanalyze batch if sample detections are within 3x window 3) Common laboratory contaminants are subject to a 10x window (acetone and methylene chloride)
System blanks	As needed	*		1) This is a corrective action when a contaminated system is identified
Matrix Spike/Matrix Spike Duplicate	One per matrix per batch	Water*	Soil*	1) Evaluate results against the LCS 2) If the LCS was compliant; narrate failed MS to client 3) Otherwise, re-prep and reanalyze batch including spikes
RPD Limits		*		1) Check calculations 2) Narrate failed RPD to client
Surrogate spikes	Every sample, method blank and standard	Water*	Soil*	1) Check calculations 2) Check LCS; if LCS recoveries within limits, narrate outlying surrogate(s) to client
Internal standard	Every sample, method blank and standard	Within RT windows and response windows of continuing calibration ISs.		1) Evaluate system 2) Reanalyze sample 3) Report both analyses to the client
Laboratory control sample	One per matrix per batch	*		1) Reanalyze LCS 2) If still non-compliant, reprep batch and reanalyze

*See Appendix F

Appendix F

Table 1

Target Analyte Compound	CAS Number	RT Minutes	RPD Water, Soil	Water Limits	Soil Limits	Quant Ion	Secondary Ions	Water MDL µg/L	Soil MDL mg/Kg	Water RDL µg/L	Soil RDL mg/Kg

Appendix G

DEFINITIONS

The following terms are defined for use in this document:

ACCURACY:

The closeness of agreement between an observed value and an accepted reference value. When applied to a set of observed values, accuracy will be a combination of a random component and of a common systematic error (or bias) component.

BATCH:

A group of samples which behave similarly with respect to the sampling or the testing procedures being employed and which are processed as a unit. For QC purposes, if the number of samples in a group is greater than 15, then each group of 15 samples or less will all be handled as a separate batch.

BIAS:

The deviation due to matrix effects of the measured value from a known spiked amount. Bias can be assessed by comparing a measured value to an accepted reference value in a sample of known concentration or by determining the recovery of a known amount of contaminant spiked into a sample (matrix spike). Thus, the bias (B) due to matrix effects based on a matrix spike is calculated as:

$$B = (Xs - Xu) - K$$

Where:

X_s = measured value for spiked sample,
X_u = measured value for unspiked sample, and
K = known value of the spike in the sample.

Using the following equation yields the percent recovery (%R).

$$\%R = 100 (X_S - X_U) / K$$

BLANK: see Equipment Rinsate, Method Blank, Trip Blank.

CONTROL SAMPLE: A QC sample introduced into a process to monitor the performance of the system.

DATA QUALITY OBJECTIVES (DQOs): A statement of the overall level of uncertainty that a decision-maker is willing to accept in results derived from environmental data. This is qualitatively distinct from quality measurements such as precision, bias, and detection limit.

DATA VALIDATION: The process of evaluating the available data against the project DQOs to make sure that the objectives are met. Data validation may be very rigorous, or cursory, depending on project DQOs. The available data reviewed will include analytical results, filed QC data and lab QC data, and may also include field records.

DUPLICATE: see Matrix Duplicate, Field Duplicate, Matrix Spike Duplicate.

EQUIPMENT BLANK: see Equipment Rinsate.

EQUIPMENT RINSATE: A sample of analyte-free media which has been used to rinse the sampling equipment. It is collected after completion of decontamination and prior to sampling. This blank is useful in documenting adequate decontamination of sampling equipment.

PRACTICAL QUANTITATION LIMIT (PQL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. The PQL is generally 5 to 10 times the MDL. However, it may be nominally chosen within these guidelines to simplify data reporting.

FIELD DUPLICATES: Independent samples which are collected as close as possible to the same point in space and time. They are two separate samples taken from the same source, stored in separate containers, and analyzed independently. These duplicates are useful in documenting the precision of the sampling process.

LABORATORY CONTROL SAMPLES: A known matrix spiked with compound(s) representative of the target analytes. This is used to document laboratory performance.

MATRIX: The component or substrate (e.g., surface water, drinking water) which contains the analyte of interest.

MATRIX DUPLICATE: An intralaboratory split sample which is used to document the precision of a method in a given sample matrix.

MATRIX SPIKE: An aliquot of sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

MATRIX SPIKE DUPLICATE: Intralaboratory split samples spiked with identical concentrations of target analyte(s). The spiking occurs prior to sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.

METHOD BLANK: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting form the analytical process.

For a method blank to be acceptable for use with the accompanying samples, the concentration in the blank of any analyte of concern should not be higher than the highest of either:

(1) The method detection limit, or
(2) Five percent of the regulatory limit for that analyte, or
(3) Five percent of the measured concentration in the sample.

METHOD DETECTION LIMIT (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

ORGANIC-FREE REAGENT WATER: For volatiles, all references to water in the methods refer to water in which an interferant is not observed at the method detection limit of the compounds of interest.

PRECISION: The agreement among a set of replicate measurements without assumption of knowledge of the true value. Precision is estimated by means of duplicate/replicate analyses. These samples should contain concentrations of analyte above the MDL, and may involve the use of matrix spikes. The most commonly used estimates of precision are the relative standard deviation (RSD) or the coefficient of variation (CV),

$$RSD = CV = 100S / \bar{x}$$

Where:
x = the arithmetic mean of the x_I measurements, and S = variance; and the relative percent difference (RPD) when only two samples are available.

$$RPD = 100 [(x_1 - x_2)/ \{x_1 + x_2)/2\}]$$

PROJECT: Single or multiple data collection activities that are related through the same planning sequence.

QUALITY ASSURANCE PROJECT PLAN (QAPjP): An orderly assemblage of detailed procedures designed to produces date of sufficient quality to meet the data quality objectives for a specific data collection activity.

REAGENT BLANK: See Method Blank

REAGENT GRADE: Analytical reagent (AR) grade, ACS reagent grade, and reagent grade are synonymous terms for reagents, which conform to the current specifications of the Committee on Analytical Reagents of the American Chemical Society.

REAGENT WATER: Water that has been generated by any method which would achieve the performance specifications for ASTM Type II water. For organic analyses, see the definition of organic-free reagent water.

REFERENCE MATERIAL: A material containing known quantities of target analytes in solution or in a homogeneous matrix. It is used to document the bias of the analytical process.

SPLIT SAMPLES: Aliquots of sample taken from the same container and analyzed independently. In cases where aliquots of samples are impossible to obtain, field duplicate samples should be taken for the matrix duplicate analysis. These are usually taken after mixing or compositing and are used to document intra - or inter laboratory precision.

STANDARD ADDITION: The practice of adding a known amount of an analyte to a sample immediately prior to analysis. It is typically used to evaluate interference.

STANDARD CURVE: A plot of concentrations of known analyte standards versus the instrument response to the analyte. Calibration standards are prepared by successively diluting a standard solution to produce working standards, which cover the working range of the instrument. Standards should be prepared at the frequency specified in the appropriate section. The calibration standards should be prepared using the same type of acid or solvent and at the same concentration as will result in the samples following sample preparation. This is applicable to organic and inorganic chemical analyses.

SURROGATE: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples.

TRIP BLANK: A sample of analyte-free media taken from the laboratory to the sampling site and returned to the laboratory unopened. A trip blank is used to document contamination attributable to shipping

and field handling procedures. This type of blank is useful in documenting contamination of volatile organic samples.

AMERICAN ENVIRONMENTAL TESTING LABORATORY INC.

STANDARD OPERATING PROCEDURE

FOR ANAYLYSIS OF

POLYNUCLEAR AROMATIC HYDROCARBONS

BY

EAP METHOD 8310

Prepared by:

Ziba Hosseini
Ziba Hosseini.
Pricipal Analyst

Approved by:

Cyrus Razmara, Ph.D.
Laboratory Director

1. SCOPE:

This method is used to determine the concentration of certain polynuclear aromatic hydrocarbons using a high performance liquid chromatography apparatus with UV and Fluorescence detectors. The method is applicable to soils, ground waters, waste water, aqueous sludge, waste solvents, tars, fibrous wastes, filter cakes, spent carbons, spent catalysts, sediments and hazardous matrices.

Routinely analyzed compounds and laboratory determined method detection limits are provided in Appendix F, Table 1. The method detection limits have been generated using clean aqueous and solid matrices and are not achievable for many "real" sample matrices. The listed detection limit may vary based on the amount of sample used.

The estimated quantity limit (EQL) of this method is 20ug/kg (wet weight) for soil/sediments and 0.2ug/L for ground waters. The EQL will vary with the factors that affect detection limits (dilutions and sample size).

2. RELATED DOCUMENTATION:

SW-846 method 8310, Revision 0, September 1986 – Poly Nuclear Aromatic Hydrocarbons by High Performance Liquid chromatography
Hewlett Packard 1100 series operating manual
Hewlett Packard 1100 series pumping system operating manual
Hewlett Packard 1100 Variable Wavelength detector operating manual
Agilent G1321 A Fluorescence detector operating manual

3. RESPONSIBLITIES:

Responsibility for performance of the SOP is shared by the Section Supervisor and Organic Chemist.

4. METHOD SUMMARY:

4.1 The analytical system consists of the following parts:

- 4.1.1 Auto Sampler – Predetermined amount of sample extract is injected through a sampling loop.
- 4.1.2 Mobile-phase reservoirs and solvent treatment systems – Four 1 Liter solvent reservoirs equipped with helium sparger for removing dissolved gases.
- 4.1.3 Pumping system – Quaternary pump capable of producing pressure up to 250 Bar.
- 4.1.4 Column oven with Reverse phase packed column.
- 4.1.5 Variable Wavelength and fluorescence detectors.

4.2 The final extract (in this case 25μL) is injected to the column through a sampling loop. The pressurized mobile phase passes through a reverse phase column and the components are separated by means of gradient elution. The separated compounds are detected and identified by responses of the detectors and quantities are calculated by a data system.

4.3 This method utilizes the external method of quantitation.

4.4 Confirmatory information and quantitation is based on the retention time of each component and confirmation by a second detector.

4.5 The experience of the analyst is crucial to the successful application of this method and only experienced analysts may use this method. The analyst must be able to interpret the chromatograms. Prior to data generation the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of capability. This demonstration which utilizes repeat quality control (QC) check sample analysis is described in method 8000B in SW-846 Revision 2 December 1996 Section 8.4. Specific laboratory instructions for performing this initial demonstration of capability are detailed in Appendix A.

5. SAMPLE TYPE, HOLDING TIME, AND PRESERVATION

5.1 The samples analyzed by this method are wastewaters, ground waters, soils, sludge, waste solvents, oily wastes, tars, fibrous wastes, filter cakes, and sediments from various sources. Some samples may contain non-target compounds which interfere by responding to either UV or Fluorescence detectors by shifting the baseline. General cleanup of the solvent extract reduces the interference. Instruction for silica gel cleanup is described in Appendix D. Interference problems require use of professional judgement regarding necessary changes to sample size and sample dilution and consultation with the client regarding possibly compromised data.

5.2 The maximum holding time from sampling to extraction is seven days for water and 14 days for soil samples. Extraction to analysis should be performed within 40 days after extraction for both water and soil samples. The holding time for soil samples is fourteen days from collection. Both solid and aqueous samples should be temperature preserved to 4^0C. All preservation measures should be noted on the chain of custody.

5.3 Water samples must be collected in 1L pre-cleaned amber glass bottles. The analyst requires 20-30 g of solid samples. This is to be collected in pre-cleaned jars. Data points slated for duplicate or MS/MSD determinations must be provided to the lab in duplicate and triplicate amounts respectively.

5.4 Samples received for PAHs analysis are stored in a sample refrigerator at 4^0C until analysis. At the time of analysis, all samples and standards are warmed to room temperature.

5.5 The laboratory will attempt to meet all holding time requirements, as dictated by this method and project-specific plans. Client requests for analysis after holding

time expiration should be made in writing and the client made aware that data will be estimated. The lab will narrate any missed holding times to the client.

6. REAGENTS AND MATERIALS.

6.1 All chemicals and analytes must be considered hazardous and handled in a cautious manner. MSDS data concerning the chemicals and standards must be on file and reviewed by laboratory personnel.

6.2 Reagent water is free of organic contamination. Water used as mobile phase is provided through purchase of HPLC grade water. Reagent water used is Sparkletts^{TM} distilled drinking water. The condition of non-pure system is checked daily and documented.

6.3 Sodium sulfate – Granular, anhydrous sodium sulfate. Purify by heating to 400^0 C
for four hours in a shallow tray, or by per-cleaning the sodium sulfate with methylene chloride. If the sodium sulfate is pre-cleaned with methylene chloride, a method blank must be analyzed, demonstrating that there is no interference from sodium sulfate.

6.4 Glass wool: Pyrex glass wool. Prewashed with 50mL acetone followed by 50mL of methylene chloride.

6.5 Extraction/exchange/mobile phase solvents:

6.5.1 Methylene chloride CH_2Cl_2 – HPLC grade, boiling point 39^0C.

6.5.2 Acetonitrile, CHCN – HPLC grade, boiling point 81.6^0C.

6.5.3 Water – HPLC grade.

The source and manufacturer may change from time to time; therefore, the brand and lot number must be documented in the sample preparation and standard preparation logs.

6.6 Stock standard – Certified stock standards are purchased from the following manufacturers:

Supelco, Inc.	Chemservice
Supelco Park,	660 Tower Lane, P.O. Box 599
Bellefonte, PA 16823-0048	West Chester, PA 19381-0599

6.7 Analytical Stock Standard is prepared using the following analytes:

Acenaphthene	Chrysene
Acenaphthylene	Dibenzo(a,h)anthracene
Anthracene	Fluoranthene
Benzo(a)anthracene	Fluorene
Benzo(a)pyrene	Indeno(1,2,3-cd)pyrene
Benzo(b)fluoranthene	Naphthalene
Benzo(g,h,I)perylene	Phenanthren

Benzo(k)fluoranthene Pyrene

Stock used at the time of SOP generation is Polynuclear Aromatic Hydrocarbons mixture-550 Catalog # PNA-550JM @ 2000ug/mL of each component.

6.8 Calibration verification stock standard contains the following analytes with the corresponding concentration :

Component	ug/mL
Acenapthene	1000
Acenaphthylene	2000
Anthracene	100
Benzo(a)anthracene	100
Benzo(b)fluoranthene	200
Benzo(k)fluoranthene	100
Benzo(ghi)eprylene	200
Benzo(a)pyrene	100
Chrysene	100
Dibenzo(a,h)anthracene	200
Fluoranthene	200
Fluorene	200
Indeno(1,2,3-cd)pyrene	100
Naphthalene	1000
Phenanthrene	100
Pyrene	100

Solvent: acetonitrile

Stock used at the time of SOP generation is Supelco Catalog # 48743 @ the above concentrations.

6.9 Standards and surrogate are purchased from a number of suppliers based on varying concentration and quality needs. All preparations are detailed by the analyst in the organic standards preparation log book with documented standard sources and lot numbers.

6.10 The standards for the calibration curve are prepared by first making primary stock standard solution from the original stock standard. If the concentration is still high, a secondary stock solution is prepared. Varying volumes of the standard solution are placed into five 5mLs volumetric flasks containing acetonitrile, then making each flask to the final 5mL volume with acetonitrile.

6.10.1 A minimum of 5 standards are used to calibrate the system. All standards must be within the linear range of the system. A reagent blank must be run in addition to the standards.

6.11 An initial calibration verification standard should be analyzed with each initial calibration. The ICV standard is prepared using the same procedure as those for standards. The ICV standard is prepared from an independent source.

6.12 The working standard solutions are good for 6 months or sooner if comparison with an independent source indicates a problem. The expiration date and standard number is recorded in the log book and on the storage vial.

6.13 The surrogate standard is made by making an intermediate standard of 20 µg/mL. This solution is added to all standards, samples, blanks, and QC Check Samples. This standard is good for 6 months. The expiration date and standard number is recorded in the log book and on the storage vial.

6.14 Table 1 & 2 are examples of the volumes used to prepare stock and intermediate standards:

6.14.1 Table 1 – Primary stock standard solutions*

Standard	Supplier	Cat #	Initial Conc. µg/mL	Volume Used/wt	Final Volume mL	Final Conc. µg/mL
TLC PAH	CHEM SERV	PNA-550JM	200	100 µl	10	2.00
P-Terphenyl-d_{14}	Supelco	44-2734	2000	100mg	50	2000
PAH mixture	Supelco	48743	100→ 2000	1.25 mL	50	2.5-50

*Each standard solution is prepared in a separate volumetric flask using acetonitrile or methylene chloride as a solvent.

6.14.2 Table 2 – Intermediate standard solutions:

Standard	Used as	Initial Conc.	Volume Used	Final Volume mL	Final Conc.
TLC PAH	Calibration Standard	2000 µg/L	1mL	10	200µg/L
P-Terphenyl-d_{14}	Surrogate Standard	2000 µg/mL	2 mL	200	20µg/mL
PAH mixture	Calibration Verification Std.	2.5-50 µg/mL	200 µL	10	50-1000 µg/L

7. SAMPLE PREPARATION AND ANALYSIS PROCEDURES

7.1 Prepare matrix specific batches of 15-20 samples. Matrices are defined as soil, water and other. Due to difference in extraction and preparation of soils and waters, various matrices cannot be batched together.

7.2 Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

7.3 Consult all project-specific plans for matrix spike and duplicate preparation requirements. Samples from two clients that each require project specific matrix

spikes can be prepared together; however, two sets of MS/MSD will have to be prepared using each client's designated samples.

7.4 At least one set of the following QC samples are preparedwith each batch: method blank, matrix spike, matrix spike duplicate and lab control sample (LCS).

7.5 All samples are spiked with surrogate. Surrogate is evaluated upon the known concentrations added and known matrix interference. Surrogate standard preparation procedure is listed in sections 6.14.1 & 6.14.2.

7.6 Extraction – Appendix B provides instructions for extraction of water and soil samples.

7.7 Concentration and solvent exchange – Appendix C provides instructions for concentration of extracts using Kuderna-Danish Apparatus.

7.8 Silica gel clean up – Appendix D provides instructions for silica gel clean up of polluted samples

8. OPERATING CONDITIONS

8.1 The operating conditions for the HPLC are as follows:

8.1.1 Column: reverse phase 201 TP, 4.6 mm x 15 cm

8.1.2 Mobile phase: Acetonitrile/Water

8.1.3 Gradient: 60 – 100% acetonitrile over 33 minutes.

8.1.4 Column Temperature 30 C.

8.1.5 Variable Wavelength Detector: Wavelength 230nm

8.1.6 Fluorescence Detector time table:

Time Table:

Time [min]	Excitation [nm]	Emission [nm]	PmtGain
4.5	260	350	13
7.16	227	310	10
9.44	260	360	9
10.57	260	460	10
11.70	260	460	11
12.60	260	440	13
13.50	260	380	10
17.00	260	440	9
18.40	260	420	8
19.30	260	420	9
20.30	260	420	11
21.70	260	400	11
22.80	260	495	11
24.50	260	350	9

9 INSTRUMENT START-UP

9.1 The detectors and pump are turned on at least 30 minutes before the first sample is run.

9.2 The mobile phases are to be degassed properly. The channels should be checked carefully for the presence of any tiny bubble. If so, each channel should be purged separately to pass the bubbles.

9.3 The column temperature and pump pressure should be stabilized before the analysis.

9.4 The mobile phase used for HPLC must be accurately pressurized before it enters the injector. The rate of delivery depends on the column used (1.5mL/min at the time of SOP generation). Flow rates should be checked by collecting column effluent in a graduated cylinder. Most pumping systems are capable of changing solvent concentration during analysis (i.e. gradient elution). Gradients are generated by either high pressure mixing of two injector or by proportional mixing of the solvents before they are pumped. In either case, solvent mixing can cause changes in the solubility of dissolved gasses, the formation of bubbles in the mobile phase, or non-reproductive gradients.

9.5 Air bubbles result in erratic baseline. Therefore, HPLC solvents should be degassed prior to use.

9.5 Non-reproducible gradients can result in significant changes in retention times from run to run.

10 CALIBRATION AND SYSTEM EVALUATION

10.1 The instrument must meet calibration and contamination criteria prior to engaging in sample analysis. The following instrument startup sequence is employed:
Raegent Blank
5-Point Initial Calibration
Initial Calibration Verification Standard (ICV)
Run and Evaluation Criteria for each of these standards and blanks is discussed below:

10.1.1 The initial calibration is performed by generating a 5-point calibration curve for each analyte. Standards 1 and 2 are at or near the reporting limit for the analytes, and the high level is near the upper limit of the linear range of the system.

STANDARD	STANDARD CONCENTRATION µg/L	AMOUNT OF STOCK STANDARD (at 2000/sl) µL	TOTAL VOLUME mL
1	20	100	10
2	50	250	10
3	100	250	5
4	200	100	1
5	400	200	1
6	600	300	1
7	1000	500	1
8	2000	--	1

10.1.2 An Initial Calibration Verification (ICV) standard is prepared using the methodology given in section 6.14.1. This standard is prepared from an independent source that may also be used as the MS and LCS spiking solution. The ICV is run as a sample.

10.1.3 A matrix blank must be run and prepared from the reagents used for the sample. This blank is also run as a sample, without zeroing.

10.2 Procedure

10.2.1 After generating the initial curve, calculate calibration factors (CF) for each analyte. This procedure is performed by the instrument and software using the following equation:

$$CF = \frac{Concentration_{st}}{Area_{st}}$$

10.2.2 The average response factor for each analyte is calculated for the calibration standards.

10.2.3 The response factors for ICV standard are used to evaluate whether the Rfs are constant over the calibration range. This is done by generating the Relative Standard Deviation (%RSD). The value can be calculated using the following equation :

$$\%RSD = \frac{Standard\ Deniation\ of\ the\ RFS \times 100}{Average\ of\ the\ RFs}$$

10.2.4 The RSD for all of the analytes must be <20% (Section 7.5.1.1 SW846 8000 methods for Non-MS Detection methods)

11 SAMPLE ANALYSIS AND EVALUATION

11.1 Sample analysis may proceed with incorporation of continuing calibration standard every 10 samples for each extraction batch of 15-20 samples, one method blank, a pair of matrix spike and matrix spike duplicate and one lab control sample are extracted and run with the samples.

11.1.5 The CCV standard is checked for retention time shifts and % difference of the instrument response between the initial calibration and each subsequent alaysis of the verification standard.

$$\%difference = \frac{CF_V - CF}{CF} \times 100$$

where: CF_v = calibration factor from verification standard
CF = mean-calibration factor from initial calibration

11.1.6 The % difference or % drift calculated for the calibration verification standard must be within ± 15% for each analyte before any sample analysis may take place.

12 SAMPLE EVALUATION

12.1 Data is evaluated by both the analytical group, and QA group, prior to being released to the client. This section refers to analytical group evaluations only.

12.1.2 All samples are spiked with surrogate standard. Evaluate the surrogate recovery and retention time compliance according to Appendix E.

12.1.3 The surrogate recoveries for each blank, QC Check Sample, set of standards and samples will be evaluated until at least 25 to 30 surrogate recoveries are generated. Once sufficient data points are established, a recovery range will be developed. this recovery range will not be changed unless the system parameters are modified to the point that the recoveries cannot meet the tolerance limits. Limits will be evaluated annually at a minimum.

12.1.4 Cross contamination can occurs whenever high-contamination samples are analyzed. Care should be taken regarding the equipment's used for extraction and concentration. The glassware must be washed out with a detergent solution, rinsed with acentone, and finally with methylene chloride.

12.1.5 All data that exceeds the criteria designated in Appendix E, must be narrated to the client. The narrative is invaluable to secondary reviewers, such as validators and regulators, in tracking the decision making and corrective action steps employed.

12.1.6 It is possible some sample matrices may need to be diluted to reduce interference. When this occurs, the reporting limits will be increased to reflect the dilutions. The possibility for instrument (column) damage exists whenever an attempt is made to run a sample. The analyst must consider available screening method as a way to avoid damage or cross contamination. All decision making should be documented.

12.1.7 Matrix spikes will be evaluated based on the percent recovery. The recoveries will be compared to the ranges provided in Appendix E. If the two recoveries are within the ranges provided, the data would be reported as valid. If any of the recoveries are outside of the ranges, the cause will be determined and an explanation provided. In many cases, a recovery problem is limited to the individual sample only, and will not affect the validity of the other samples in the run.

12.1.8 A Lab Control Sample (LCS) is run at the rate of one per matrix per batch. This sample is the QC check sample prepared and analyzed in the identical manner as

the samples. The results of the LCS are compared to criteria dictated in Appendix E.

12.1.9 If the matrix spike/matrix spike duplicate analysis fails to meet the designated criteria due to its sample matrix, the LCS is used as the means to demonstrate that the system is capable of generating acceptable data. If any analyte falls outside of the criteria established in Appendix E, the analyst must provide an explanation in the narrative and determine the validity of the individual anlyte.

13 REPORTING OF RESULTS :

13.1 The following is a summary of the calculation used by the computer, or the analyst to generate the reported data:

13.1.5 Percent Recovery (P) is calculated by the following equation:

$$P = \frac{C_{\chi} \times 100}{T}$$

Where:

C_{χ} = The concentration of the analyte spike or surrogate from the analysis.

T = The true value of the spike or surrogate standard added.

13.1.6 Sample concentration is calculated by the following equation :

$$C(\mu g/L) = A_{\chi} \times RF \times Dil$$

Where:

C= The concentration of the analyte sample.

A_{χ}= Area of the characteristic target analyte being measured

RF= The response factor of the analyte being measured.

13.1.7 Standard Deviation is calculated by the following equation:

$$SD = \sqrt{\frac{\sum(Xi - Xavg)^2}{N-1}}$$

Where:

X_i = Analyte values

X_{avg} = Analytes average value

N = Number of points

13.1.8 Relative Percent Differnce:

$$\%RPD = \frac{\left| MS\%rec - MSD\%rec \right|}{\frac{MS\%rec + MSD\%rec}{2}} \times 100$$

Where:

$MS\ \%_{rec}$ = Matrix Spike Percent Recovery
$MSD\ \%_{rec}$ = Matrix Spike Duplicate Percent Recovery
100 = Conversion factor to

APPENDIX A

The system verification is performed to demonstrate that the system and the analyst can successfully perform the analysis. This is accomplished by running four aliquots of the Quality Control Check Sample in the same manner that samples are run.

A.1 The QC Check Sample standard is purchased from a certified source. The following concentrations and volumes are used:

Standard Name	Initial Conc. µg/ml	Volume used µL µg/L	Final extract Volume mL	Final Conc. µg/L
PAH Mixture	2.5-50	200	10	50-1000
P-Terphenyl-d_{14}	20.0	200	10	400

A.3. Transfer 200µL of the QC Check Standard concentrate and 200µL of surrogate standard to 1 Liter of reagent water. Proceed with the extraction, concentration and solvent exchange as detailed in Appendices B, C, and D. Transfer 1mL of the extract to a crimp vial and seal the cap.

A.4. Repeat step A.3 three more times until a total of four aliquots of QC Check Sample are prepared.

A.5. Analyze the four QC Check Samples and compare the recoveries with the Appendix E Table 1. If average recoveries of anlytes are within the ranges cited in the table, the system is ready for use and analysis may begin. If the average recovery for any analyte falls outside the range, corrective action must be taken and the analysis repeated for the failed analytes. All corrective actions must be noted in the Maintenance logbook.

A.6. Once an analyst and instrument have passed the recovery criteria for all analytes to be reported by the method, the analyst and instruments are certified as having established initial proficiency with the method.

APPENDIX B

B.1. Liquid-liquid extraction of water (separatory funnel)

B.1.1. Apparatus and materials:

C.1.1.1. Separatory funnel: 2 L

C.1.1.2. Drying column: 20 mm I.D. Pyrex chromatorgraphic column with pyrex glass wool at bottom and a Teflon stopcock.

C.1.1.3. Erlenmeyer flask: 250 mL

C.1.1.4. Graduated cylinder

C.1.1.5. Extraction solvent; Mthylene chloride: acetone (1:1,v:v) or methylene chloride

B.1.2 Procedure:

B.1.2.1. Using a 1 L graduated cylinder transfer 1 L of the sample to a 2 L separatory funnel. Add correct amount of spike standard to each of two 1-Liter distilled waters used as matrix. Add correct amount of surrogate standard to all.

B1.2.2. Add 80 ml of methylene chloride to the separatory funnel. Immediately after the funnel is shaked once, vent the funnel and repeat this procedure several times. then shake the funnel vigorously for 2-3 minutes with periodic venting to release excess pressure.

B1.2.3. Let the phases to separate for 10 minutes. collect the solvent extract in an Erlenmeyer flask. If emulsion is present, mechanical techniques are employed to help the phase separation. Repeat the extraction two more times using fresh portions of methylene chloride. Combine the three extracts.

B.2. Ultrasonic extraction of soil

B.2.1 Apparatus and materials:

B.2.1.1. A device for grinding or homogenization

B.2.1.2. Balance – Top loading accurate to .01 g

B.2.1.3. Ultrasonicator.

B.2.1.4. Centrifuge

B.2.1.5. Glass Vials

B.2.1.6. Sample spatulas – stainless steel

B.3.1 Sample handling:

B.3.1.1. Sediment/soil samples- Decant and discard any water layer on a sediment sample. Mix sample thoroughly, especially composited samples. Discard any foreign objects such a s sticks, leaves, or rocks.

B.3.1.2. Dry waste samples amenable to grinding: grind or otherwise subdivide the waste so that it either passed through a 1-mm sleeve or can be extruded through a 1-mm hole. Introduce sufficient sample into the grinding apparatus to yield at least 20g after grinding.

B.3.1.3. Gummy, fibrous, or oily materials not amenable to grinding should be cut, shredded, or otherwise reduced in size to allow mixing and maximum exposure of the sample surfaces for the extraction. The addition of anhydrous sodium sulfate to the sample (1:1) may make the mixture amenable to grinding.

B.3.2 Determination of percent of dry weight- When sample results are to be calculated on a dry weight basis, a second portion of sample should be weighed out at the same time as the portion used for analytical determination. Immediately after weighing the sample for extraction, weigh 5-10g of the sample into a tared crucible. Dry this aliquot overnight at 105C. Allow to cool in a desiccator before weighing. Calculate the % dry weight as follows:

$$\%\ dry\ weight = \frac{g\ of\ dry\ sample}{g\ of\ sample} \times 100$$

B.3.3 Extraction method for samples expected to contain low concentrations of organics (less than or equal to 20 mg/kg)

B.3.3.1. Weigh 20g of sample into a 4-oz glass jar. Add enough sodium sulfate to have a free flowing sample mixture.

B.3.3.2 Add correct amount of matrix standard solution, matrix spike, and spike duplicate. Add correct amount of lab control sample standard to 20g of clean sand. Add correct amount of surrogate standard to all.

B.3.3.3 Add 50 mL of the appropriate extraction solvent or solvent mixture.

B.3.3.4. Extract the mixture in an ultrasonicator for 15 minutes. Decant the extract into a centrifuge bottle and centrifuge at low speed to remove particles.

B.3.3.5. Repeat the extraction two or more times with two additional 50mL portion of the solvent. Decant off the solvent after each ultrasonic extraction. Transfer the entire sample to the centrifuge bottle. Centrifuge at low speed and then decant the solvent from the bottle.

B.3.4. Extraction method for samples expected to contain high concentrations of organics (greater than 20mg/kg).

B.3.4.1. Transfer 2g of sample to a 40mL glass vial. Wipe the mouth of the vial with a tissue to remove any sample material. Record the exact weight of

the sample taken. Cap the vial before proceeding with the next sample to avoid any cross contamination.

B.3.4.2. Add 2g of anhydrous sodium sulfate to the sample and mix well. Add surrogate spiking solution to sample mixture. For the sample in each analytical batch selected for spiking, add correct amount of matrix spiking and surrogate standard solution.

B.3.4.3. Immediately add necessary volume of solvent to bring the final volume to 10mL considering the added volume of surrogate and matrix spike standard. Sonicate the vial in the ultrasonicator for 15 minutes.

B.3.4.4. Centrifuge the vial and collect a volume appropriate for the sensitivity of the determinative method. It is advisable to collect a standard volume for such samples to simplify the final calculation.

B.3.4.5 The extract is ready for cleanup and/or solvent exchange.

B.3.4.6. If analysis will not be performed immediately, the extract is transferred to a vial with PTFE-line caps and refrigerated.

APPENDIX C:
Extract Concentration

C.1. Apparatus and Materials:

C.1.1. Kuderna-Danish (K-D) apparatus:

C.1.1.1. Concentrator tube – 10mL, graduated with ground glass stopper.

C.1.1.2. Evaporation flask: 500mL attached to concentrator tube with springs.

C.1.1.3. Snyder column: three ball (macro) and two ball (micro).

C.1.1.4. Springs or clamps

C1.1.5. boiling chips – Solvent extracted, approximately 10/40 mesh (silicon carbide) or equivalent.

C.1.2. Water bath – Heated with concentric ring cover, capable of temperature control (+/- 5 C).

C.1.3. Drying column – 20-mm 1.d, Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.

C.1.4. Exchange solvent: Acetonitrile – HPLC grade

C.2. Pass the solvent extract through a drying column containing about 10cm of anhydrous sodium sulfate. Collect the dry extract in an evaporation flask connected to a K-D concentrator. Rinse the Erlenmeyer flask with 20-25 mL of methylene chloride, pass it through the drying column, and add it to the evaporation flask.

C.3. Add one or two clean boiling chips to the concentrator tube, and attach it to a three ball Snyder column. Pre-wet the Snyder column by adding 1 ml of methylene chloride to the top of the column.

C.4. Place the K-D apparatus on a hot water bath (80-90 C) so that the concentrator tube is partially immersed in the hot water. The concentration should be complete in 10-20 minutes. When the apparent volume of liquid is reached to 1 ml, remove the K-D apparatus from water bath and let it drain and cool for 10 minutes.

C.5. Increase the temperature of the hot water bath to 95-100 C. Remove the Snyder column, add 5-9 mL acetonitrile (according to the color of the extract) and a new boiling chip. Attach a two ball micro Snyder column. Pre-wet the column with 1ml acetonitrile. Place the K-D apparatus on the water bath so that the concentrator tube is immersed in the hot water. The concentration is complete in 15-20 minutes. When the apparent volume of the liquid reaches 1 mL, remove the K-D apparatus and rinse its lower joint with 0.5 mL of acetonitrile into the concentrator tube. Adjust the final volume of the extract to 5 to 10 mL according to the extract color. Transfer the extract to a Teflon-sealed screw-cap vial.

C.6. If the extract is clear, proceed with the analysis by transferring 1-2 mL of the extract to a crimp vial, seal the cap and load it to the auto sampler.

C.7. If the sample extract is dark, proceed with the silica gel clean up.

APPENDIX D:
Silica Gel Clean up

D.1 Summary of the method: This method provides the option of using either standard column chromatography techniques or solid-phase extraction cartridge. Generally, the standard column chromatography techniques use larger amounts of absorbent and therefore, have a great cleanup capacity.

D.1.1 In the standard column cleanup, the column is packed with the required amount of adsorbent, topped with a water adsorbent, and then loaded with the sample to be analyzed. Elution of the analytes is accomplished with suitable solvent(s) that leaves the interfering compounds on the column. The eluate is then concentrated.

D1.2. The cartridge clean up protocol uses solid-phase extraction cartridges packed with 1-2 g of silica gel (silicic acid) adsorbent. Each cartridge is solvent washed immediately prior to use. Aliquots of sample extracts are leaded onto the cartridges, which are then eluted with suitable solvents. The collected fractions may be further concentrated and solvent exchanged.

D.2. Apparatus and materials

D.2.1. Chromatographic column – 250 mm long x 10 mm ID; with Pyrex Glass wool at bottom and PTFE stop cock.
D.2.2. Beakers – Appropriate size.
D.2.3. Vials – 2,10,25,40 mL glass with PTFE-lined screw – caps or crimp tops.
D.2.4. Erlenmeyer flasks – 50 and 250 mL.
D.2.5. Silica gel for chromatography – 100/200 mesh. Before use, activate at least 16 hours at 130 C in a shallow glass tray, loosely covered with foil.
D.2.6. Sodium sulfate (granular, anhydrous)
D.2.7. Cyclohexane – HPLC grade.
D.2.8. Pentane – HPLC grade.

D.3. Clean up procedure:

D.3.1. The extract solvent (in this case methylene chloide) must be exchanged to cyclohexane. the exchange is performed by adding 4 mL of cyclohexane following reduction of the sample extract to 1-2 mL using an appropriate concentration technique. The final extract volume is 2.0 mL.

NOTE: When the volume of solvent is reduced below 1 mL, semi-volatile analytes may be lost. If the extract goes to dryness, the extraction must be repeated.

D.3.2. Prepare a slurry of 10 g of activated silica gel in methylene chloride and place this into a 10 mm ID chromatographic column. Top the column to settle the silica gel

and elute the methylene chloride. Add 1 to 2 cm of anhydrous sodium sulfate to the top of the silica gel.

D.3.3. Pre-elute the column with 40 mL of pentane, the rate for all elutions should be about 2 mL/min.
Discard the eluate and just prior to exposure of the sodium sulfate layer to the air, transfer the 2 mL cyclohexane smaple extact onto the column using an additional 2 mL cyclohexane to complete the transfer. Just prior to exposure of the sodium sulfate layer to the air, add 25 mL of pentane and continue the elution of the column. Discard the pentane eluate.

D.3.4. Elute the column with 25 mL of methylene chloride/pentane (2:3)(v/v) into a flask for concentration. Concentrate the collected fraction to whatever volume required (1-10mL). Finally exchange the solvent with acetonitrile.

APPENDIX E

The following table lists the criteria and corrective action for the QC samples. These limits are evaluated at least yearly and may be adjusted to reflect updated laboratory-established limits.

QC Sample	Frequency	Acceptance Criteria	Corrective Action
Method Blank	One per matrix per batch	Less than detection limit	1) Evaluate magnitude of sample results against the concentration of the method blank; if sample results exceed 3x the blank level, narrate to the client 2) Otherwise, re-prep and reanalyze batch if sample detections are within 3x window
System blanks	As needed	Less than detection limit	1) This is a corrective action when a contaminated system is identified.
Matrix Spike/Matrix Spike Duplicate	One per matrix per batch	Water: Naphthalene 60-120 Bezo(a)pyrene 70-120 Bezo(a)anthracene 70-120 Soil: Naphthalene 65-125 Bezo(a)pyrene 75-125 Bezo(a)anthracene 75-125	1) Evaluate results against the LCS 2) If the LCS was compliant: narrate failed MS to client 3) Otherwise, re-prep and reanalyze batch including spikes.
RPD limits	One per batch	RPD 15 for matrix soil 15 for matrix water	1) Check calculations 2) Narrate failed RPD to client
Surrogate Spikes	Every sample, method blank and standard	For water and soil P-terphenyl-d_{14} 75-125	1) Check calculations 2) Check LCS; if LCS recoveries within limits, narrate outlying surrogate(s) to client
Laboratory Control Sample	One per matrix per batch	%R within 75-125	1) Reanalyze LCS 2) If stil Non-compliant, re-prep batch and reanalyze.

AMERICAN ENVIRONMENTAL TESTING LABORATORY INC.

STANDARD OPERATING PROCEDURE

FOR ANALYSIS OF

ORGANOCHLRINE PESTICEDES

BY

GAS CHROMATOGRAPHY / ELECTRON CAPTURE

CAPILLARY COLUMN TECHNIQUE

EPA METHOD 8081A

Prepared by

Ziba Hosseini

Ziba Hosseini
Principal Analyst

Approved by

C. Razmara

Cyrus Razmara, Ph.D.
Laboratory Director

I. PURPOSE:

To measure pesticides residues in environmental samples using a gas chromatograph equipped with double column and double Electron Capture detectors.

II. SCOPE:

This method is used to determine the concentrations of organochlorine pesticides by gas chromatograph with Electron Capture detector (ECD), and two capillary columns. The method is applicable to the determination of pesticides residues in soils, aqueous sludge, caustic liquors, acid liquors, waste solvents, oily wastes, ground waters, tars, fibrous wastes, polymeric emulsions, filter cakes, spent carbons, spent catalysts, sediments and hazardous wastes. These matrices are prepared for analysis, by utilizing a variety of extraction techniques: primarily EPA method 3510 (separatory funnel liquid-liquid extraction, 3550(ultrasonic extraction), and 3541(automated soxhlet extraction).

Routinely analyzed compounds and laboratory-determined method detection limits are provided in Appendix F, Table 1. The method detection limits have been generated using clean aqueous and solid matrices and are not achievable for many "real" sample matrices. The listed detection limit may vary based on the amount of sample used. The method detection limit for both soil and water is performed at least once a year. Guideline for determination of MDL is provided in Appendix D.

The practical quantitation limit (PQL) of this method is approximately 2-4 µg/Kg (wet weight) for soil/sediments, and 0.1-0.2 µg/L for ground water samples. The PQL will vary based upon the same factors that affect detection limits (dilutions and sample size).

III. RELATED DOCUMENTATION:

This SOP is derived from the following sources:
SW-846 Method 8081A, Revision 1 December 1996 –Organochlorine Pesticides by Gas Chromatography/Electron Capture Detector (GC/ECD)
SW-846 Extraction Methods 3510 and3550
HP 6890 Volume II Gas Chromatograph Operating Manual

IV. RESPONSIBILITIES:

The section supervisor and organic chemist share responsibility for performance of this SOP.

IV. METHOD SUMMARY:

5.1. The analytical system is as follows:

System 1

Agilent 2397A ECD; dual detector

HP 6890 GC; dual column

Agilent 7683 ALS

HP Chemstation Software Rev. B.04.03 (54)-2011

5.2. The liquid sample is prepared for analysis by EPA method 3510C. The solid sample is prepared for analysis by EPA method 3550 and waste samples utilize EPA method 3580. Depending on the nature of interference different cleanup methods may be applied. Florisil cleanup (EPA Method3620B) and silica gel cleanup (EPA Method 36230) are usually used. Cleanup methods are fully described in Appendix D of this SOP. When the extraction is complete, the sample extracts are injected to the gas chromatograph. The separated peaks are detected and identified by the responses of the detector, and quantitations are calculated by a data system.

5.3. This method utilizes the external standard method of quantitation.

5.4. Two analytical columns joined to a single injection port are used. Therefore a second column and a second detector confirm all the positive results.

5.5. The experience of the analyst is crucial to the successful application of this method, and only experienced GC analysts may use this method. The analyst must be able to interpret retention times, detector responses, and peak shapes. Prior to data generation, the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of capability. This demonstration, which utilizes repeat quality control (QC) check sample analysis is described in Method 8000A in SW-846 Revision 3 December 1996 Section 8.6. Specific laboratory instructions for performing this initial demonstration of capability are detailed in Appendix A of this SOP.

VI. SAMPLE TYPE, HOLDING TIMES, AND PRESERVATION:

6.1. The samples analyzed by this method are waste waters, ground waters, soils, acid and base liquors, sludge, waste solvents, oily wastes, tars, fibrous wastes, filter cakes, spent catalysts and carbons, polymeric emulsions and sediments from various sources. They may contain some solid matter or chemicals that may interfere with the efficiency of the extraction or system. Interference problems require use of professional judgement regarding necessary changes to sample size or sample preparation and/or cleanup, and consultation with the client regarding possibly compromised data.

6.2. The maximum holding time from sampling to extraction is seven (7) days for aqueous samples and (14) days for solid samples. The maximum holding time from extraction to analysis is 40 days. Extracts must be refrigerated in the dark before analysis. If the aqueous samples are not extracted within 72 hours of collection, the pH should be adjusted to 5.0-9.0 with either sulfuric acid (to lower the pH) or sodium hydroxide solution (to increase the pH). If the water is known to have residual chlorine, and aldrine is to be determined, then it should be preserved with sodium thiosulfate solution.

6.3. Aqueous samples should not be preserved in the field. Both solid and aqueous samples should be temperature preserved at 4°C$\pm$2°C. All preservation measures should be noted on the chain of custody.

6.4. Soil samples must be collected in adequately cleaned (non-plastic) jars and water samples are collected in 1-liter amber color bottles. The requested volumes are
6.5. 200 Grams of solid and three 1-liter bottles of aqueous sample. Data points slated for duplicate or MS/MSD determinations must be provided to the lab in duplicate and triplicate amounts, respectively.

6.5. The laboratory will attempt to meet all holding time requirements, as dictated by this method and project-specific plan. Client requests for analysis after holding time expiration should be made in writing and the client made aware that data would be estimated. The lab will narrate any missed holding times to the client.

VII. SAMPLE HANDLING FOR ANALYSIS:

7.1. Samples received are stored in a sample extract refrigerator at 4°C$\pm$2°C until analysis. At the time of analysis, all samples and standards are warmed to room temperature.

IIX. REAGENTS AND MATERIALS:

8.1. All chemicals and analytes are considered hazardous and handled with care. Material Safety Data Sheets (MSDS) data concerning the chemicals and standards are kept on file and reviewed by laboratory personnel.

8.2. Reagent water is free of organic contamination. Water is purchased from Sparkletts^{R} (Distilled Drinking Water-Sodium Free).

8.3. Organic solvents: Hexane, acetone and methylene chloride are pesticide quality or equivalent. The source and manufacturer may change from time to time; therefore, the brand and lot number are documented in the sample preparation and standard preparation logbooks.

8.4. Stock Standards - Certified stock standards are purchased from the following manufacturers:

Chem Service	Accu Standard, Inc.	Restek Corporation
660 Tower Lane	25 Science Park	110 Benner Circle
West Chester, PA 19381	New Haven, CT 06511	Bellefonte, PA 16823

All standards are stored in a standard refrigerator at 4°C $\pm$ 2°C.

8.5. Surrogate Standards are prepared with the following analytes:

Tetrachloro-m-xylene
Decachlorobiphenyl

8.6. LCS and Matrix Spike Compounds

Aldrin	Endrin
4,4'-DDT (DDT)	Heptachlor
Dieldrin	Gamma-Hexachlorocyclohexane (Gamma-BHC,Lindane)

8.7. Analytical Stock Standards can be prepared using the following list:

Aldrin	Endrin Aldehyde
Chlordane	Endrin Ketone
Alpha-Chlordane	Gamma-Chlordane
4,4'-DDD (DDD)	heptachlor
4,4'-DDE (DDE)	Heptachlor epoxide
4,4'-DDT (DDT)	Alpha-Hexachlorocyclohexane (Alpha-BHC)
Dieldrin	Belta-Hexachlorocyclohexane (Betta-BHC)
Endosulfan I	Delta-Hexachlorocyclohexane(Delta-BHC)
Endosulfan II	Gamma-Hexachlorocyclohexane(Gamma-BHC, Lindane)
Endosulfan sulfate	Methoxychlor
Endrin	Toxaphene

8.8. Standards and surrogates are purchased from a number of suppliers based on varying concentration and quantity needed. The analyst records the details of preparation in the Standard Preparation Logbook, with documented standard sources and lot numbers. Table 1 and 2 provides instructions for standard preparation.

Table 1 – Primary stock standard solutions*

Standard	**Supplier**	**Cat #**	**Initial Conc.** µg/mL	**Volume Used µL**	**Final Volume mL**	**Final Conc. µg/L**
Organochlorine Pesticides Cal std.	CHEM SERV	M-OCP5081 T4	1000 in t-Butylmethyl ether	100	10	10,000
Organochlorine Pesticides QC	CHEM SERV	M-OCPMSB99	Varied con. in Acetone	250	50	1000-2500
Organochlorine Pesticides 2nd source std.	Accu Standard	M-8081-SC	1000 in Acetone:Toluene	50	10	10,000
Organochlorine Pesticides Surrogate std.	CHEM SERV	M-SM8080U5	2000 in toluene	250	250	2000
Toxaphene Cal std.	RESTEK	32005	1000 in Hexane	100	10	10,000
Toxaphene 2nd source std	Accu Standard	P-093S-H-10X	1000 in Hexane	100	10	10,000

*Each standard solution is prepared in a separate volumetric flask using Hexane as solvent.

Table 2- Initial calibration standard preparation:

A. Secondary stock standard solution:

Cal Standard Working solution	Standard Concentration µg/L	AMOUNT OF STOCK STANDARD µL	TOTAL VOLUME mL
1	1000	1000	10

B. Calibration Curve

STANDARD	STANDARD CONCENTRATION µg/L	AMOUNT OF STOCK STANDARD µL	TOTAL VOLUME mL
1	2	50	25
2	4	100	25
3	`10	250	25
4	20	200	10
5	50	500	10
6	100	500	5
7	200	1000	5

8.9. IX. SAMPLE PREPARATION AND ANALYSIS PROCEDURES:

9.1. Matrix-specific batches of 20 samples or less are prepared. Matrices are typically defined as soil, water, and other. Due to differences in preparation of solid and liquid samples, various matrices cannot be batched together.

9.2. Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

9.3. All project-specific plans for matrix spike and duplicate preparation requirements should be considered. Samples from two clients that each require project-specific matrix spikes can be prepared together; however, two sets of QC (MS/MSD) would have to be prepared using each client's designated samples.

9.4. At least one set of the following QC samples are prepared with each batch (up to 20 samples with the same matrix): method blank, matrix spike, matrix spike duplicate and LCS.

9.5. All samples are spiked with surrogates prior to extraction. The surrogate recoveries are evaluated based upon the known concentrations added and known sample matrix interferences. The surrogate recovery provides additional evaluation of unknown samples without the use of a matrix spike. Procedures for surrogate

standard preparation are listed in Section 6.13. Instructions for extraction of water & soil samples are provided in Appendix B & C.

9.6. **Apparatus and Materials**

Specific to solid samples only:
Balance to accommodate up to 100 grams and accurate to two decimal places
Sample spatulas-stainless steel
Ultrasonicator

Needed for all samples:
1.0-mL; 500µL &100µL syringe for sample preparation

Instruments utilized: (See Section 5.1)

X. HP 7683 LOADING PROCEDURE

10.1. All sample extracts, standards, etc., which are to be analyzed, are placed in an autosampler vial and capped. The chemist makes sure that the sequence vial number and actual vial placement in the 7683 autosampler rack are the same.

XI. OPERATING CONDITIONS:

11.1. The typical operating conditions for the gas chromatograph and Electron CaptureDetector are as follows:

System I

Injector:

Both system use the same injector
Injector: HP split/splitless 7683
Gas: Helium 99.999 purity @ 10.4 psi
Purge flow: 128 ml/min
Purge time: 2.00 min
Total flow: 134 mL/min
Injector Temp: 250°C
Injection volume: 2.00µL

Column :

Column I Column II

Zebron, Multiresidue-1
30m, 0.32mm ID, 0.5 µm Film
Primary (front) column

Zebron, Multiresidue-2
30m, 0.32mm ID, 0.25 µm Film
Confirmation (back) column

Zebron Guard Column 5mx0.32mm

Both column 1 and column 2 use the same GC operating conditions

GC operating conditions:

Initial Temp: 160°C
Initial Hold: 1 min.
Rate: 45°C/min.
Temp-2: 200°C
Hold-2: 1 min.
Rate:3 25°C/min.
Temp-3: 300°C
Hold- 3: 4.5min

Detector:

ECD-1
Temperature: 300°C
Flow: 60.0 mL/min
Makeup Gas: Nitrogen

ECD-2
Temperature: 300°C
Flow: 60.0 mL/min
Makeup Gas: Nitrogen

XII. INSTRUMENT STARTUP:

12.1. The gas chromatographic conditions are checked each day prior to use, in accordance with scheduled preventive maintenance measures, as defined in the laboratory Quality Assurance Plan. These measures include checking and replacing septa and liner, checking all gases, etc. All maintenance requirements are logged into the maintenance logbook assigned to each instrument.

XIII. CALIBRATION AND SYSTEM EVALUATION

13.1 The instrument must meet calibration and contamination criteria prior to engaging in sample analysis. The following instrument startup **sequence** is employed:

- Reagent Blank
- At least 5-Point Initial Calibration
- Initial Calibration Verification Standard (ICV) (2^{nd} source standard)

Evaluation Criteria for each of these standards and blanks is discussed as follow:

Standards and surrogate are purchased from a number of suppliers based on varying concentration and quality needs. The analyst details all preparations in the organic standard preparation logbook with documented standard sources and lot numbers.

The standards for the calibration curve are prepared by first making primary stock standard solution from the original stock standard. If the concentration is still high, a secondary stock solution is prepared. Varying volumes of the standard solution are placed into volumetric flasks containing hexane, and then making each flask to the final volume with hexane.

A minimum of 5 standards is used to calibrate the system. All standards must be within the linear range of the system. A reagent blank must be run in addition to the standards.

13.2 An ICV (Initial Calibration Verification) standard should be analyzed with each initial calibration. The ICV standard is prepared using the same procedure as those for standards. The ICV standard is prepared from an independent source.

13.3 The working standard solutions are good for 6 months or sooner if comparison with an independent source indicates a problem. The expiration date and standard number is recorded in the logbook and on the storage vial.

13.4 The surrogate standard is prepared from an independent source. This solution is added to all standards, samples, blanks, and QC Check Samples. This standard is good for 6 months. The expiration date and standard number is recorded in the logbook and on the storage vial.

13.5 Table 1 & 2; section8.8 are examples of the volumes used to prepare stock and intermediate standards.

13.6 The initial calibration is performed by generating a 7-point calibration curve. Calibration points 1 and 2 are at or near the reporting limit for the analytes, and the high level is near the upper limit of the linear range of the system.

13.7 An Initial Calibration Verification (ICV) standard is prepared using the methodology given in section 6.14.1. This standard is prepared from an independent

source, which may also be used as the MS and LCS spiking solution. The ICV is run as a sample.

13.8 A matrix blank must be run. It should be prepared from the reagents used for the sample. This blank is also run as a sample.

14.0 **Procedure**

14.1 After generating the initial calibration curve, calculate calibration factors (CF) for each analyte. This procedure is performed by the instrument and software using the following equation:

$$CF = \frac{Concentration_{st}}{Area_{st}}$$

14.2 The average response factor for each analyte is calculated for the calibration standards.

14.3 The response factors for ICV standard are used to evaluate whether the Rfs are constant over the calibration range. Relative Standard Deviation (%RSD) is used to show the linearity of the calibration curve. The value can be calculated using the following equation:

$$\%RSD = \frac{\text{Standard Deviation of the RFS x 100}}{\text{Average of the RFs}}$$

14.4 The RSD for all of the analytes must be <20 (Section 7.4.5.2. of Method 8081A SW846, Revision 1 Dec 1996.

15. SAMPLE ANALYSIS AND EVALUATION

15.1.1 Sample analysis may proceed with incorporation of continuing calibration standard every 10 injections. High and low concentration mixtures of single component analytes are alternated. For each extraction batch of 15-20 samples, one method blank, a pair of Matrix Spike and Matrix Spike duplicates and one Lab Control Sample (LCS) are extracted and run with the samples.

15.1. The CCV standard is checked for retention time shifts and % difference of the instrument response between the initial calibration and each subsequent alaysis of the verification standard.

$$\%difference = \frac{CF_V - CF}{CF} \times 100$$

Where: CF_v = calibration factor from verification standard
CF = mean-calibration factor from initial calibration

15.1.2. The % difference or % drift calculated for the calibration verification standard must be within $\pm$ 15% for each analythe before any sample analysis may take place.

If a non-linear calibration is used in the initial calibration, then %drift or % difference between the initial calibration and each subsequent verification standard will be used to verify the continuing calibration. The following equation is used for this purpose (section 7.7.1 & 7.7.2 of Method 8000 SW846 revision 2):

$$\%Drift = \frac{Calculatedconcentration - Theoreticalconcentration}{Theoreticalconcentration} x100$$

16. SAMPLE EVALUATION

16.1. Both the analytical group, and QA group evaluate data, prior to being released to the client. This section refers to analytical group evaluations only.

16.1.2. All samples are spiked with surrogate standard. The surrogate recovery and retention times are evaluated according to Appendix F.

16.1.3. The system uses two channels for generating data. Therefore a second channel should confirm the positive results. When sample results are confirmed by a second column, the relative percentage difference (RPD) between the two results is calculated. If RPD is less than 40%, and no evidence of chromatographic problems, the higher result is reported. If RPD is greater than 40%, the chromatograph is checked for anomalies and results are selected based on the best professional judgement. If no evidence of any chromatographic problems, the higher result is reported.

16.1.4. The surrogate recoveries for each blank, QC Check Sample, set of standards and samples will be evaluated until at least 25 to 30 surrogate recoveries are generated. Once sufficient data points are established, a recovery range will be developed. This recovery range will not be changed unless the system parameters are modified to the point that the recoveries cannot meet the tolerance limits. Limits will be evaluated annually at a minimum.

16.1.5. Cross contamination can occurs whenever high-contamination samples are analyzed. Care should be taken regarding the glassware used for extraction and concentration. The glassware must be washed out with a

detergent solution, rinsed with water, acetone, and finally with methylene chloride or hexane.

16.1.6. All data that exceeds the control limits designated in Appendix F, must be narrated to the client. The narrative is invaluable to secondary reviewers, such as validators and regulators, in tracking the decision making and corrective action steps employed.

16.1.7. Some sample matrices may need to be diluted to reduce interference. When this occurs, the reporting limits will be increased to reflect the dilutions. The possibility for instrument (column) damage exists whenever an attempt is made to run a highly contaminated sample. The analyst must consider available screening method as a way to avoid damage or cross contamination. All decision-making should be documented.

16.1.8. Matrix spikes will be evaluated based on the percent recovery. The recoveries will be compared to the ranges provided in Appendix F. If the two recoveries were within the ranges provided, the data would be reported as valid. If any of the recoveries are outside of the ranges, the cause will be determined and an explanation provided. In many cases, a recovery problem is limited to the individual sample only, and will not affect the validity of the other samples in the run.

16.1.9. A Lab Control Sample (LCS) is run at the rate of one per matrix per batch. This sample is the QC checks sample prepared and analyzed in the identical manner as the samples. The results of the LCS are compared to criteria dictated in Appendix F.

16.1.10. If the matrix spike duplicate analysis fails to meet the designated criteria due to its sample matrix, the LCS is used as the means to demonstrate that the system is capable of generating acceptable data. If any analyte falls outside of the criteria established in Appendix E, the analyst must provide an explanation in the narrative and determine the validity of the individual anlyte.

17. REPORTING OF RESULTS:

17.1 The following is a summary of the calculation used by the computer, or the analyst to generate the reported data:

17.1.1 Percent Recovery (P) is calculated by the following equation:

$$P = \frac{C_{\chi} \times 100}{T}$$

Where: C_{χ} = the concentration of the analyte spike or surrogate from the analysis.
T = the true value of the spike or surrogate standard added.

17.1.2 Sample concentration is calculated by the following equation:

$$C\ (\mu g/L) = A_{\chi} \times RF \times Dilution$$

Where: C= the concentration of the analyte sample.
A_{χ}= Area of the target compounds
RF= the response factor of the target compound being measured.

17.1.3 Standard Deviation is calculated by the following equation:
Where: xi = Analyte values
x avg = Analytes average value
N = number of points

$$SD = \sqrt{\frac{\sum(xi - Xavg)^2}{N-1}}$$

17.1.4 Relative Percent Difference:

$$\%RPD = \frac{Con_{MS} + Con_{MSD}}{2} \times 100$$

Where: MS = Matrix Spike
MSD = Matrix Spike Duplicate
100 = Conversion factor to %

APPENDIX A

Initial Demonstration of Proficiency

Initial demonstration of proficiency is performed to demonstrate that the system and the analyst can successfully perform the analysis. Four aliquots of the Quality control Check Samples are prepared and analyzed similar to real sample.

A.1 The QC Check Sample standard is purchased from a certified source. The following concentrations and volumes are used:

Standard Name	Initial Conc. µg/L	Volume used µL	Final extract Volume	Sample Final Concentration µg/L
Pesticide Mixture Pesticide Surrogate Mix	1000-2500	200 250	5mL	40-100 100

A.3. Transfer 200µL of the QC standard mix and 250µL of surrogate standard to 1 Liter of reagent water. Proceed with the extraction, concentration and solvent exchange as described in Appendices B, C, and D. Transfer 1mL of the extract to a crimp vial and seal the cap.

A.4. Repeat step A.3 three more times until a total of four aliquots of QC Check Sample are prepared.

A.5. Analyze the four QC Check Samples and compare the recoveries with the Appendix F Table 1. If average recoveries of anlytes are within the ranges cited in the table, the system is ready for use and analysis may begin. If the average recovery for any analyte falls outside the range, corrective action must be taken and the analysis repeated. All corrective actions must be noted in the Maintenance logbook.

A.6. Once an analyst and instrument have passed the recovery criteria for all analytes to be reported by the method, the analyst and instruments are certified as having established initial proficiency with the method.

APPENDIX B

B.1. Liquid-liquid extraction of water (separatory funnel)

B.1.1. Apparatus and materials:

C.1.1.1. Separatory funnel: 2 L

C.1.1.2. Drying column: 20 mm I.D. Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.

C.1.1.3. Erlenmeyer flask: 250 mL

C.1.1.4. Graduated cylinder

C.1.1.5. Extraction solvent; Mthylene chloride: acetone (1:1,v:v) or methylene Chloride for water and hexane: acetone (1:1,v: v) for soil

B.1.2 Procedure:

B.1.2.1. For each batch of 15-20 samples one pair of LCS/LCSD, one pair of MS/MSD and one method blank is prepared.
Using a 1 L graduated cylinder transfer 1 L of the sample to a 2 L separatory funnel. Add proper amount of spike standard to each of two 1 L distilled water used as matrix. Add proper amount of Lab Control Sample standard to 1 L of distilled water. Add proper amount of surrogate standard to all.

B1.2.2. Add 60 ml of methylene chloride to the separatory funnel. Immediately after the funnel is shaked once, vent the funnel and repeat this procedure several times. Then shake the funnel vigorously for 2-3 minutes with periodic venting to release excess pressure.

B1.2.3. Let the phases to separate for 10 minutes. Collect the solvent extract in an Erlenmeyer flask. If emulsion is present, mechanical techniques are employed to help the phase separation. Repeat the extraction two more times using fresh portions of methylene chloride. Combine the three extracts.

B.2. Ultrasonic extraction of soil

B.2.1 Apparatus and materials:

B.2.1.1. A device for grinding or homogenization
B.2.1.2. Balance – Top loading accurate to .01 g
B.2.1.3. Ultrasonicator.
B.2.1.4. Centrifuge
B.2.1.5. Glass Vials
B.2.1.6. Sample spatulas – stainless steel

B.3.1 Sample handling:

B.3.1.1. Sediment/soil samples- Decant and discard any water layer on a sediment sample. Mix sample thoroughly, especially composite samples. Discard any foreign objects such as sticks, leaves, or rocks.

B.3.1.2. Dry waste samples amenable to grinding: grind or otherwise subdivide the waste so that it either pass through a 1-mm sieve or can be extruded through a 1-mm hole. Introduce sufficient sample into the grinding apparatus to yield at least 20g after grinding.

B.3.1.3. Gummy, fibrous, or oily materials not amenable to grinding should be cut, shredded, or otherwise reduced in size to allow mixing and maximum exposure of the sample surfaces for the extraction. The addition of anhydrous sodium sulfate to the sample (1:1) may make the mixture amenable to grinding.

B.3.2 Determination of percent of dry weight: When sample results are to be calculated on a dry weight basis, a second portion of sample should be weighed out at the same time as the portion used for analytical determination. Immediately after weighing the sample for extraction, weigh 5-10g of the sample into a crucible. Dry this aliquot overnight at 105C. Allow cooling in a desiccator before weighing. Calculate the % dry weight as follows:

$$\%\ Dry\ weight = \frac{g\ of\ dry\ sample}{g\ of\ sample} \times 100$$

B.3.3 Extraction method for samples expected to contain low concentrations of organics (less than or equal to 20 mg/kg)

B.3.3.1. Weigh 20g of sample into a 4-oz glass jar. Add enough sodium sulfate to have a free flowing sample mixture.

B.3.3.2 Add proper amount of matrix spike standard to 20 g of designated soil sample and its duplicate. Add proper amount of lab control sample standard to 20g of clean sand. Add proper amount of surrogate standard to all.

B.3.3.3 Immediately add about 40 mL of the extraction solvent or solvent mixture (Hexane : Acetone 1:1).

B.3.3.4. Extract the mixture in an ultrasonicator for 15 minutes. Decant the extract into a concentrating tube.

B.3.3.5. Repeat the extraction two or more times with two additional 40 mL portion of the solvent. Decant off the solvent after each ultrasonic extraction. Transfer the entire sample to the concentrating tube.

B.3.4.5 The extract is ready for cleanup and/or solvent exchange.

B.3.4.6. If analysis will not be performed immediately, the extract is transferred to a vial with PTFE-line caps and refrigerated.

APPENDIX C:

Extract Concentration

C.1. Apparatus and Materials:

C.1.1. Kuderna-Danish (K-D) apparatus:

C.1.1.1. Concentrator tube – 10mL, graduated with ground glass stopper.

C.1.1.2. Evaporation flask: 500mL attached to concentrator tube with springs.

C.1.1.3. Snyder column: three ball (macro) and two ball (micro).

C.1.1.4. Springs or clamps

C1.1.5. Boiling chips – Solvent extracted, approximately 10/40 mesh (silicon carbide) or equivalent.

C.1.2. Water bath – Heated with concentric ring cover, capable of temperature control (+/- 5 C).

C.1.3. Drying column – 20-mm 1.d, Pyrex chromatographic column with Pyrex glass wool at bottom and a Teflon stopcock.

C.1.4. Exchange solvent: Hexane – Pesticide grade

C.2. Pass the solvent extract through a drying column containing about 10cm of anhydrous sodium sulfate. Collect the dry extract in an evaporation flask connected to a K-D concentrator. Rinse the Erlenmeyer flask with 10-15 mL of methylene chloride, pass it through the drying column, and add it to the evaporation flask.

C.3. Add one or two clean boiling chips to the concentrator tube, and attach it to a three-ball Snyder column. Pre-wet the Snyder column by adding 1 ml of Hexane to the top of the column.

C.4. Place the K-D apparatus on a hot water bath (80-90 °C) so that the concentrator tube is partially immersed in the hot water. The concentration should be complete in 20-25 minutes. When the apparent volume of liquid is reached to 1 ml, remove the K-D apparatus from water bath and let it drain and cool for 10 minutes.

C.5. Increase the temperature of the hot water bath to 95-100 C. Remove the Snyder column; add 5-9 mL Hexane (according to the color of the extract) mix it well and a new boiling chip. Attach a two ball micro Snyder column. Pre-wet the column with 1ml hexane. Place the K-D apparatus on the water bath so that the concentrator tube is immersed in the hot water. The concentration is complete in 15-20 minutes. When the apparent volume of the liquid reaches 1 mL, remove the K-D apparatus and rinse its lower joint with 1 mL of hexane into the concentrator tube. Adjust the final volume of the extract to 5 to 10 mL according to the extract color. Transfer the extract to a Teflon-sealed screw-cap vial.

C.6. If the extract is clear, proceed with the analysis by transferring 1-2 mL of the extract to a crimp vial, seal the cap and load it to the auto sampler.

C.7. If the sample extract is dark, proceed with proper clean up method. Method 3620B (Florisil cleanup).

APPENDIX D

Florisil cleanup

Florisil is a magnesium silicate with basic properties; (registered trade name of a U.S. Silica Co.).

Florisil cleanup may be accomplished using a glass chromatographic column packed with Florisil or using solid phase interaction cartridges containing Florisil. Generally, the traditional column chromatography technique uses larger amounts of adsorbent; therefore, has a greater clean up capacity.

D.1. **Summary of the method:**

This method provides the option of using either standard column chromatography techniques or solid-phase extraction cartridge. Generally, the standard column chromatography techniques use larger amounts of absorbent and therefore, have a great cleanup capacity.

In the standard column cleanup, the column is packed with the required amount of adsorbent, topped with a water adsorbent, and then loaded with the sample to be analyzed. Elution of the analytes is accomplished with suitable solvent(s) that leaves the interfering compounds on the column. The eluate is then concentrated.

The cartridge clean up protocol uses solid-phase extraction cartridges packed with 1-2 g of silica gel (silicic acid) adsorbent. Each cartridge is solvent washed immediately prior to use. Aliquots of sample extracts are loaded into the cartridges, which are then eluted with suitable solvents. The collected fractions may be further concentrated and solvent exchanged.

D.2. **Apparatus and materials:**

D.2.1. Chromatographic column – 250 mm long x 10 mm ID; with Pyrex Glass wool at bottom and PTFE stop cock.
D.2.2. Beakers – Appropriate size.
D.2.3. Vials – 2,10,25,40 mL glass with PTFE-lined screw – caps or crimp tops.
D.2.4. Erlenmeyer flasks – 50 and 250 mL.
D.2.5. Silica gel for chromatography – 100/200 mesh. Before use, activate at least 16 hours at 130 C in a shallow glass tray, loosely covered with foil.
D.2.6. Sodium sulfate (granular, anhydrous)
D.2.7. Methylene chloride, Hexane, and Acetone – pesticide grade.

D.3. Procedure:

D.3.1. Condition the cartridge by adding 4mL of hexane to each cartridge. Allow a few drops of solvent to pass through the manifold to remove air bubbles. Close the valve and allow the solvent to soak the entire sorbent for 5 minutes.

D.3.2. Slowly, open cartridge valves to allow hexane to pass through the cartridges. Close the valve when there is still at least 1 mL of solvent above the sorbet bed. Do not allow cartridge go dry. If cartridges go dry, repeat the conditioning step.

Reduce the sample extract volume to 10mL prior to cleanup for organochlorine pesticides prior to cleanup. The extract solvent should be hexane. Given the sensitivity of the method, only 1mL of the 10mL extract needs to be subjected to the Forisil cleanup procedure.

D.3.3. Transfer the 1mL of the extract to the cartridge. Open the cartridge valve to allow the extract to pass through the cartridge bed at approximately 2mL/minutes. After the entire extract has passed through the cartridge, but before drying out, rinse the sample vial with 0.5mL of hexane and add it to the cartridge.

D.3.2. After the solvent passed, but before drying, add 5mL acetone/hexane (10:90). Turn the vacuum on. After soaking for 1 minute, slowly open the cartridge valve and collect the eluate into the collection vial. Concentrate the sample to final volume required by the method and exchange with Hexane to 5.0mL final volume.

APPENDIX E
Method Detection Limit

Method detection limit is the lowest concentration of a substance that can be identified, measured and reported with 99% confidence that the analyte concentration is greater than zero.

Method detection limit is performed by making 7 replicates of a certain concentration of calibration standard in water for aquous matrices and clean sand for soil and solid matrices. The seven replicates of each matrix are than extracted using the exact same procedure used for extracting sample. The final 5 ml extract are analyzed and the standard deviation is calculated for each analyte. To obtain the method detection limit, the standard deviation is multiplied by 3.143. The PQL is about 2-3 times the method detection limit.

Table 1

Not routinely analyzed	CAS Number	RT(min.) DETA	RT(min.) DETB	Average[1] Range for X µg/L	SD[2] of Recovery µg/L	% Recovery [3] Range	Water MDL µg/L	Soil MDL µg/Kg	Water RDL µg/L	Soil RDL µg/Kg

APPENDIX F

Corrective Action

The following table lists the criteria and corrective action for the QC samples. These limits are evaluated at least yearly and may be adjusted to reflect updated laboratory-established limits.

QC Sample	Frequency	Acceptance Criteria	Corrective Action
Method Blank	One per matrix per batch	Less than ½ of detection limit	1) Evaluate magnitude of sample results against the concentration of the method blank; if sample results exceed 3x the blank level, narrate to the client 2) Otherwise, re-prep and reanalyze batch if sample detections are within 3x window
System blanks	Ass needed	Less than detection limit	1) This is a corrective action when a contaminated system is identified.
Matrix Spike/Matrix Spike Duplicate MS/MSD	One per matrix per batch	**%Recovery** **Water**: Aldrin 50-135 4,4'-DDT 50-135 Dieldrin 50-135 Endrin 50-135 Heptachlor 50-135 Lindane 50-135 **Soil**: Aldrin 40-135 4,4'-DDT 40-135 Dieldrin 40-135 Endrin 40-135 Heptachlor 40-135 Lindane 40-135	1) Evaluate results against the LCS 2) If the LCS was compliant: narrate failed MS to client 3) Otherwise, re-prep and reanalyze batch including spikes.
RPD limits	One per batch	%RPD less than 30% for soil and water	1) Check calculations 2) Narrate failed RPD to client
Surrogate Spikes	Every sample, method blank QC samples and standard	For water and soil : 2,4,5-Tetrachloro-m-xylene 30-150% Decachlorobiphenyl	1) Check calculations 2) Check LCS; if LCS recoveries within limits, narrate outlying surrogate(s) to client
Laboratory Control Sample and MS / MSD	One per matrix per batch	Recovery: Within 40/50-135%; All the component in MS/MSD	1) Reanalyze LCS 2) If still Non-compliant, re-extract the batch and reanalyze.

STANDARD OPERATING PROCEDURE

FOR

TPH GASOLINE

BY

METHOD 8015G

Prepared by

Daljit S. Khangura

Daljit Khangura
Principal Analyst

Approved by

C. Razmara

Cyrus Razmara, Ph.D.
Laboratory Director

1. SCOPE AND APPLICATION

1.1. Method 8015M is used to determine the concentration of various non-halogenated volatile organic compounds by gas chromatography.

1.2. This method is applicable to the analysis of petroleum hydrocarbons including Gasoline Range Organics (GRO) that appear between the range of 2-methylpentane and 1,2,4-trimethylbenzene on the chromatogram. For specific projects Gasoline Range Organic compounds in the range of C4-C12 can be included. Non-TPH compounds can interfere with this analysis.

1.3. The quantitation limit for this method is 50 µg/L for water and 100 µg /Kg for soil.

1.4. This method can also be used as screening tool to obtain semi-quantitative data for the prevention of sample overload during quantitative analysis on a GC/MS system.

1. SUMMARY OF METHOD

1.1. This method provides gas chromatographic conditions for the detection of certain non-halogenated volatile organic compounds.

2.2. The sample is placed into an Archon or EST autosampler. An inert gas is bubbled through a liquid media in the sparging tube. The purgeable organics are then transferred with the inert gas to trap where they are concentrated. When the transfer is complete, the trap is heated and the purgeable organics are transferred to the gas chromatograph and separated. The separated organics are detected and identified by the responses of the detector, which are further quantitated and calculated by a data system.

2.3. Fused silica capillary column and temperature program is used in the gas chromatograph to separate the organic compounds. Detection is achieved by a flame ionization detector (FID).

2.4. This method is restricted for used by, or under the supervision of analysts experienced in the use of gas chromatographs and skilled in the interpretation of gas chromatograms. Prior to the generation, the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of capability. This demonstration, which utilizes repeat quality control (QC) check sample analysis is described in Method 8000B in SW-846 Revision 2, Dec. 1997 Section 8.4. Specific laboratory instruction for performing this initial demonstration of capability are detailed in section 14.

3. INTERFERENCES

3.1. When analyzing for volatile organics, samples can be contaminated by diffusion of volatile organics through the sample container septum during shipment and storage. A trip blank prepared from organic-free reagent water and carried through sampling and subsequent storage and handling must serve as a check on such contamination.

3.2. Contamination by carryover can occur whenever high-concentration and low-concentration samples are analyzed in sequence. To reduce the potential for carry-over, the sample syringe or purging device must be rinsed out between samples with an appropriate solvent. whenever an unusually concentrated sample is encountered it should be followed by injection of a reagent water blank to check for cross contamination.

3.2.1. Clean purging tubes and all glassware with a detergent solution, rinse with distilled water, and rinse with methanol between analyses. Clean syringes or autosamplers by flushing all surfaces that contact samples using appropriate solvents.

3.2.2. After running polluted samples, it is very important to decontaminate the transfer line between the Archon or EST autosampler and OI analytical concentrator and between concentrator and GC.

3.2.3. Program the sequence and purge all the contaminated positions. Make sure to wipe the purge tube with a kimwipe after purging.

3.2.4. The next step is to clean the autosampler trap. Bake the trap at 200°C for 15 minutes.

3.3. The flame ionization detector (FID) is a non-selective detector, therefore, non-target compounds present in the samples will interfere with the analyses.

4. SAMPLE COLLECTION, PRESERVATION, AND HANDLING

4.1. Samples analyzed by this method are waste waters, ground waters, soils, sludge's, waste solvents, oily wastes, spent catalysts and carbons, and sediments from various sources.

4.2. Samples should be stored in vials with PTFE-lined caps with no headspace at 4 C in an area free of solvent fumes. The requested amounts are 30 g of solid and three 40 ml vials of aqueous samples. If a bubble is present in a vial, observe the cap and septum to ensure that a proper seal was made at time of sampling. If the sample was improperly sealed, the sample should be discarded.

4.3. The maximum holding time from sampling to analysis is 14 days for preserved water samples and seven days for non-preserved water samples. The maximum holding time for solid samples is 14 days from collection. The lab will attempt to meet all holding times.

4.4. Aqueous samples should be preserved in the field with concentrated hydrochloric acid to a pH of less than 2.

5. MATERIALS AND REAGENTS

5.1. All chemicals and analytes must be considered hazardous and handled with care. MSDS data concerning the chemicals and standards must be on file and reviewed y laboratory personnel.

5.2. Reagent water is free of organic contamination. The reagent water used in the lab is distilled drinking water supplied by Sparkletts.

5.3. Methanol – Methanol should be purge and trap grade and demonstrated to be free of interference's by method blank analysis. The source and manufacturer may change from time. to time, therefore, the brand and lot number must be documented in the sample preparation logs.

5.4. Trap Material – The traps are purchased from different manufacturers. The trap type and manufacturer used at the time of SOP generation is as follows:
OI No. 7 or equivalent.

5.5. Stock Standards: Certified stock standards are purchased from known manufacturers based on varying concentration and quantity needed. The standards for calibration, calibration verification and surrogate are prepared by first making primary stock standard solution from the original stock standard. For working standards, a secondary stock solution is prepared. Varying volumes of the primary standard solution are transferred into 10 or 100ml volumetric flasks containing appropriate solvent, and then diluted to mark with the solvent. All preparations are detailed by the analyst in the organic standard preparation log book, with documented standard sources and lot number.

5.5.1 A minimum of 5 standards is used to calibrate the system. All standards must within the linear range of the system. A reagent blank must be run in addition to the standards.

5.5.2 An initial calibration verification standard should be analyzed with each initial calibration. The ICV standard is prepared using the same procedures as those for standards. The ICV standard is prepared from an independent source.

5.5.3 The stock standard solution expiration date is 6 months after preparation, if kept with minimum headspace and refrigerated properly. Fresh standards should be prepared if the drift from the staring standard exceeds 15%. The working standard solutions should be monitored more frequently. If comparison with an independent

source indicates a problem, it should be replaced. The expiration date and standard number is recorded in the logbook and on the storage vial.

5.5.3.1 Table 1 is an example of the volumes used to prepare stock standard solutions.

Table 1

Standard	Supplier	Cat #	Initial Conc.	Volume used mL	Final volume mL	Final conc. µg/mL
Gasoline	Supelco	47516-U	20 mg/ml	0.25	5.0	1000
α,α,α-tri-fluoro toluene	AccuStandard	M-602-SS-10x	2000 µg/mL	1.25	10	250
4-bromo-fluorobenzene	Supelco	4-8083	2000 µg /mL	1.25	10	250

5.5.3.2 Table 2 is an example of the volumes used to prepare working standard solutions.

Table 2

Standard	Supplier	Initial Conc. mg/ml	Volume used mL	Final volume ml	Final conc. µg/ml
Gasoline	AccuStandard	5.00	1.0	5.0	1000

6. APPARATUS AND MATERIALS

6.1. Balance – Top loading, accurate to two decimal points.
6.2. Sample spatulas – stainless steel.
6.3. Syringe – 5 and 10 mL Luer lock gas tight.
6.4. Microsyringe – Hamilton 702 N or equivalent
6.5. Sparge tubes – 5.0 mL.
6.6. Autosampler
6.6.1. 16-port autosampler Archon or EST
6.6.2. Purge and trap concentrator-4560 O.I.Corporation, equipped with OI-7 trap equivalent
6.7. Gas chromatograph – Hewlett Packard 5890, equipped with FID and PID detectors in series.
6.7.1. Column – 30 meter J & W scientific, DB-5, .53mm I.D., 1.5 micron film thickness.

6.8. Data System –ChemStation

7. SAMPLE PREPARATION AND ANALYSIS PROCEDURES

7.1. Prepare matrix-specific batches of 15 samples. Matrices are typically defined as soil, water and other. Due to differences in preparation of soils and waters, various matrices cannot be batched together. Samples must be analyzed quantitated using a calibration curve generated specific to the matrix.

7.2. Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

7.3. Consult all project-specific plans for matrix spike and duplicate preparation requirements. Samples from two clients that each requires project-specific matrix spikes can be prepared together, however, two sets of QC will have to be prepared using each client's designated samples.

7.4. Prepare at least one set of the following QC samples with each batch-method blank, matrix spike/matrix spike duplicate and lab control sample (LCS).

7.5. Samples, standards, and QC samples are placed into various positions of the autosampler. The positions and sample identifications are logged into the sample analyses log book and computer system.

7.6. Solid samples-Prepare the 5-mg in 40 ml vial or 5035 kit with reagent water. Using a certified balance, weigh 1-5 g of sample in the purging tube and record the exact weight. Try to minimize the amount of time the sample is exposed to air.

7.6.1. Solids requiring extraction- Weigh the appropriate amount (1-10) g of solid material into the extraction vessel. Add 10 mL of methanol. Shake and leave to settle. Withdraw the desired amount of methanol extract (μLs). Transfer this amount of extract into a sample syringe containing 5-mL of reagent water. Add internal standard/surrogate standard mix and introduce into a sparging tube attached to the autosampler via the sparging tube valve.

7.6.2. Liquid samples-Allow the sample to come to ambient temperature. Put sample in 40 ml vial in Archon or EST autosampler, and internal standard/surrogate standard mix and introduce automatically by autosampler into sample.

7.6.3. Liquid samples requiring dilution- Dilution may be made in volumetric flasks (10-100mL). Intermediate dilutions may be necessary for extremely large dilutions. Calculate the approximate volume of organic-free reagent water to be added to the

volumetric flask selected and add slightly less than this quantity of organic-free reagent water to the flask. Inject the proper aliquot of sample using a syringe. Aliquots of less than 1 mL are not recommended. Dilute the sample to the mark with organic-free reagent water. Cap the flask, invert, and shake three times. Repeat this procedure for additional dilutions. Fill a 5-mL syringe with the diluted sample. Add proper amount of surrogate spiking solution. Transfer to the purge vessel.

8. OPERATING CONDITIONS

8.1. Purge and Trap Sample Concentrator
Trap – OI-7 (or equivalent)
Purge Gas: Helium 99,99970 purity

Purge Flow: 40mL/min.

Purge program:

Purge Time: 11 min.
Desorb Temp: 180°C
Desorb Time: 2 min.
Bake Temp: 200°C
Bake Time: 15 min.

8.2. Gas Chromatograph

Column: J&W, DB-5, 30m x 0.53mm ID x 1.5 micron film thickness
Carrier Gas: Helium 99.99970 purity
Carrier Gas Flow Rate: 10mL/min.
Injector Temp: 180°C
Signal 1: FID detector, range 2
Signal 2: PID detector, range 4

Temperature Program:

Initial Temp: 45°C
Initial Time: 2 min.
Rate: 8°C /min.
Final Temp: 180°C
Final Time: 1.5 min.

8.3 Flame Ionization Detector

Air Flow: 400ml/min
Make up gas: Helium @ 10ml/min
Reaction gas: Hydrogen @ 40 mL/min.

8. 4 PID Detector

Reactor base temperature: 220°C
Lamp intensity: 6

9. INITIAL CALIBRATION

The calibration of Gasoline Range Organics is markedly different from that of single component analytes. The response used for calibration must represent the entire area of the chromatogram within the retention time range or the fuel type, including the unresolved complex mixture that lies below the individual peaks.

9.1 The initial calibration is performed by generating a 5-point calibration curve. Standards 1 and 2 are at or near the reporting limit, and the upper limit of the linear range of the system.

9.1.1 Add following volume of working standard (prepared as in section 5.5.3.1) To 40 mL vial containing reagent water.

Water	Standard Concentration	Volume of Stock Standard (1000µg/mL)
Standard 1	50 µg/L	2.0 µL
Standard 2	100 µg/L	4.0 µL
Standard 3	250 µg/L	10.0 µL
Standard 4	1000 µg/L	40.0 µL
Standard 5	2000 µg/L	80.0 µL
Standard 6	3000 µg/L	120 µL

Soil standards are prepared in 5.0 gr clean soil in 40 ml vial.

Soil	Standard Concentration	Volume of Stock Standard (1000µg/mL)
Standard 1	100 µg/kg	0.5 µL
Standard 2	250 µg/kg	1.25 µL
Standard 3	1000 µg/kg	5.00 µL
Standard 4	2000 µg/kg	10.0 µL
Standard 5	3000 µg/kg	15.0 µL
Standard 6	5000 µg/kg	25.0 µL

9.1.2 Determine the area of the response as described in section 10. Calculate the response factor as follows:

$$RF = \frac{A_x \times Cis}{A_{IS} \times Cx}$$

where:

Cx = The concentration of the analyte sample.

A_x = Area response of the analyte being measured.

Cis = Concentration of the internal standard.

A_{is} = Area response of the internal standard.

9.2 Calibration linearity: The linearity of the calibration must be assessed. If the percent relative standard deviation (%RSD) of the response factors is less than 20% over the working range, linearity through the origin can be assumed, and the average calibration factor can be used in place of a calibration curve. The % RSD is calculated by using the following equation:

$$\%RSD = \frac{\text{Standard Deviation of the RFs} \times 100}{\text{Average of the RFs}}$$

10. RETENTION TIME WINDOWS

10.1 Before establishing retention time windows, made sure that the chromatographic system is functioning reliably and that the operating parameters have been optimized for the analytes and surrogates in the sample matrix to be analyzed.

10.2. The retention time range for Gasoline Range Organics is defined during initial calibration. Two specific gasoline components are used to establish the range, 2-methylpentane and 1,2,4-trimethylbenzene. Use the following procedure to establish the retention time windows.

10.2.1. Make three injections of the component mentioned in section 10.2 over a 72-hour period.

10.2.2. Record the retention time for each analyte to three decimal places. Calculate the mean and standard deviation of these peaks.

10.2.3. The width of the retention time window for each component is defined as $\pm$3 times the standard deviation of the mean absolute retention time established during the 72-hour period. The retention time range is then calculated based on the lower limit of the RT window for the first eluting component and the upper limit of the RT window for the last eluting component and the upper limit of the RT window for the last eluting component.

11. CALIBRATION VERIFICATION

11.1. The calibration curve and retention times must be verified at the beginning of each 12-hour work as a minimum requirement. Verification is accomplished by the measurement of one standard (normally mid-point) that contain all of the target analytes and surrogates when individual target analytes are being analyzed. Verification is accomplished by the measurement of the fuel standard and the hydrocarbon retention time standard when petroleum hydrocarbons are being analyzed.

11.2. Linearity of calibration is performed by calculation of the percent drift or percent difference of the instrument response between the initial calibration and each subsequent analysis of the verification standard.

$$\%difference = \frac{CFv - \overline{CF}}{\overline{CF}} \times 100$$

where:

CFv = Calibration factor from verification standard.
CF = Mean calibration factor from initial calibration.

11.3. If the response for any analyte is within $\pm$15% of the response obtained during the initial calibration, then the initial calibration is considered still valid, and analyst may continue to use the mean CF values from the initial calibration to quantitate sample results. If the response varies from the predicted response by more than +1-15%, corrective action must be taken to restore the system or a new calibration curve must be prepared.

11.4. All n-alkanes in the calibration verification analysis must fall within previously established retention time windows. If the retention times does not fall within the +/- 3s window, corrective action must be taken to restore the system or a new calibration curve must be prepared for that compound.

11.5. Solvent blanks and any method blanks should be run with calibration verification analyzes to confirm that laboratory contamination does not cause false positives.

12. SAMPLE ANALYSIS

12.1. Samples are analyzed in a matrix specific batch of 15 samples. The sequence starts with daily calibration verification, followed by method blank, samples, and QC samples. Additional analysis of the verification standard (S) throughout a 12 hour

shift are strongly recommended, especially when running samples that contain visible concentrations of oily material.

12.2. Samples are analyzed with the same instrument configuration as is used during calibration. At least two sample vials (for the water samples) are required. After opening the first vial, therefore creating headspace, the second vial should be used for any dilution or reanalysis.

12.3. Sample concentrations are calculated by comparing sample response data with the initial calibration of the system. If sample response exceeds the limits of the initial calibration range, a dilution of the sample must be analyzed. For volatile organic aqueous samples, the dilution must be performed on a second aliquot of the sample which has been properly sealed and stored at 4°C. Extracts should be diluted so that the response is in the upper half of the calibration range. Computer reproduction of chromatograms, manipulated to ensure all peaks are on scale over a 100 fold range, are acceptable as long as calibration limits are not exceeded.

13. CALIBRATIONS

13.1. The concentrations of analytes in the sample may be determined by calculating the amount of standard purged, from the peak response, using the calibration curve or the mean RF from the initial curve.

13.2. Since gasoline contains a large number of compounds that will produce well-resolved peaks in a GC/FID chromatogram, it contain many other components that are not chromatographically resolved. This unresolved complex mixture results in the "bump" in the chromatogram that is characteristic of these fuels. In addition, although the resolved peaks are important for the identification of the specific fuel type, the area of the unresolved complex mixture contributes a significant portion of the area of the total response

13.3. For the analysis of gas range organics, sum the area of all peaks eluting between 2-methylpentane and 1,2,4-trimethylbenzene. This area is used to calculate the GRO concentration. Column bleed subtraction is not generally required for gas range organics.

13.4. Use the following equation for calculation of aqueous samples:

$$C\mu g / L = \frac{Ax \times Cis}{Ais \times CF} \times DF$$

C = Concentration of the sample
Ax= Area response of the sample
Ais = Area response of the internal standard
DF = Dilution Factor
RF = mean response factor from the initial calibration

13.5. Use the following equation for calculation of non-aqueous samples:

$$C\mu g / kg = \frac{Ax \times Cis}{Ais \times CF} \times DF$$

C = Concentration of the sample
Ax= Area response of the sample
Ais = Area response of the internal standard
DF = Dilution Factor

14. QUALITY CONTROL

14.1. Initial demonstration of proficiency-whenever new staff is trained or significant changes in instrumentation are made, initial demonstration of proficiency has to be performed. This is accomplished by running four aliquots of the Quality Control Check Sample in the same manner that samples are run.

14.1.1. The QC Check Sample is prepared by making an intermediate standard (as mentioned in section 5.5.3.2.)

14.1.2. Add 40µL of 1000µg/ml standard in 40 ml vial with distilled water to achieve 1000µg/l for water. For soil, we add 5.0 µL of 1000 µg/ml standard and 5.0gr clean soil in 40 ml vial to achieve 1000 µg/kg standard.

14.1.3. Analyze the four samples in section 14.1.2. and compare the recoveries acceptance criteria listed in the method. If average recoveries are within the ranges cited in the table, the system is ready to use.

14.2. Sample Quality Control for Preparation and Analysis:

14.2.1. QC samples includes the analysis of a method blank, matrix spike, matrix spike duplicate and a Laboratory Control Sample (LCS) in each analytical batch and the addition of surrogates to each field sample and QC sample.

14.2.2. A Lab Control Sample (LCS) is included with each analytical batch. The LCS consists of an aliquot of a clean (Control) matrix similar to the sample matrix and of the same weight or volume. The LCS is spiked with the same analytes at the same concentrations as the matrix spike. When the results of the matrix spike analysis indicate a potential problem due to the sample matrix itself, the LCS results are used to verify that the laboratory can perform the analysis in a clean matrix.

14.2.3. Surrogate recoveries. The surrogate recovery date from individual samples is evaluated versus the surrogate. Control limits developed by the laboratory. Percent recoveries are compared with the table in Appendix A.

Standard Operating Procedure for the Determination of Volatile Organic Compounds by EPA Method 8260B

I SCOPE AND APPLICATION

This method is used to determine purgeable organics using an autosampler, purge and trap concentrator, gas chromatograph with a capillary column, and a mass spectrometer detector. The method is applicable to the determination of purgeable organics in air and/or air sampling media, waters, soils, aqueous sludges, caustic liquors, acid liquors, waste solvents, oily wastes, tars, fibrous wastes, polymeric emulsions, filter cakes, spent carbons, spent catalysts, sediments and hazardous wastes. Method 8260B can be used to quantify most volatile organic compounds that have boiling points below 200^0 C and that are insoluble or slightly soluble in water. These matrices are prepared for analysis, by utilizing a variety of extraction techniques, primarily EPA methods 5030B and 5035.

The Laboratory Supervisor and Chemist share responsibility for performance of this SOP. The experience of the analyst is crucial to the successful application of this method, and only experienced GC/MS analysts may use this method. The analyst must be able to interpret retention times, detector responses, and internal standard responses. Prior to data generation, the analyst must demonstrate analytical proficiency and system performance by successfully completing the initial demonstration of proficiency. This demonstration, which utilizes repeat quality control (QC) check sample analysis is described in Method 8000B in SW-846, Third Edition, Final Update III, December 1996, Section 8.4. Specific instructions for performing the initial demonstration of proficiency are detailed in Appendix 1.

Method Detection Limit (MDL) or Limit of Detection (LOD): Routinely analyzed compounds and laboratory-determined method detection limits are provided in Appendix 9. Detection limits are determined by conducting a method detection limit study as detailed in Appendix 4. The method detection limits have been generated using clean aqueous and solid matrices and are not achievable for many “real” sample matrices. The listed detection limit may vary based on the amount of sample used.

Practical Quantitation Limit (PQL) or Limit of Quantitation (LOQ): The practical quantitation limit (PQL) of this method is approximately 10 µg/kg (wet weight) for soil/sediments, and 5 µg/L for water (see Appendix 6). The PQL will vary based upon the same factors that affect detection limits (dilutions and sample size).

II SUMMARY OF METHOD

The sample is placed into a purge vessel, usually 5 milliliters (mL) of aqueous sample or 5 grams (g) of solid sample plus 5 mL of reagent water. An inert gas is bubbled through the sample in the purge vessel. The purgeable organics are

then transferred from the aqueous phase to the vapor phase. The vapor is swept through a sorbent column where the purgeables are trapped. When purging is complete, the trap is heated and backflushed with the inert gas to desorb the purgeable organics onto a gas chromatographic column. The gas chromatograph is temperature programmed to separate the purgeables, which are then detected with a mass spectrometer. The separated organics are detected by the responses of the detector, identified by retention time and mas spectrum, and quantitations are calculated by integration of the peak area via a data system.

This method utilizes the internal standard method of quantitation. Specifically, four internal standards are assigned to various compounds based on relative retention time.

Confirmatory information and quantitation is based upon the mass spectra generated by each compound. The primary and secondary ions used for identification are listed in Appendix 6.

III SAMPLE COLLECTION, PRESERVATION, AND STORAGE

The maximum holding time from sampling to analysis is fourteen (14) days for preserved water samples and seven (7) days for non-preserved water samples. The maximum holding time for solid samples is fourteen (14) days from collection. Samples collected using EPA method 5035 have a holding time of 48 hours.

Aqueous samples should be preserved in the field with concentrated hydrochloric acid to a pH of less than 2. Aqueous samples that are suspected to contain residual chlorine should be preserved with sodium thiosulfate (10 mg per 40 mL vial). Both solid and aqueous samples should be temperature preserved to 4C°$\pm$2°C. All preservation measures should be noted on the chain of custody.

Samples must be collected in adequately cleaned jars and vials with PTFE-lined caps. The requested volumes are 200 grams of solid and two 40 mL vials of aqueous sample. Samples slated for duplicate or MS/MSD determinations must be provided to the lab in duplicate and triplicate amounts, respectively.

The laboratory will attempt to meet all holding time requirements, as dictated by this method and project-specific plans. Client requests for analysis after holding time expiration should be made in writing and the client made aware that data will be estimated. The lab will narrate any missed holding times to the client.

Samples received for purgeable organic analysis are stored in a sample refrigerator at 4°C+2°C until analysis. At the time of analysis, all samples and standards are warmed to room temperature.

IV INTERFERENCES

The samples analyzed by this method are waste waters, ground waters, soils, acid and base liquors, sludges, waste solvents, oily wastes, tars, fibrous wastes, filter cakes, spent catalysts and carbons, polymeric emulsions and sediments from various sources. They may contain some solid matter or chemicals that may interfere with the efficiency and or selectivity of the analytical system. Interference problems require use of professional judgment regarding necessary changes to sample size or sample preparation.

Major contaminant sources are volatile materials in the laboratory and impurities in the purging gas and in the sorbent trap. Use of *non*-polytetrafluoroethylene (PTFE or Teflon) thread sealants, plastic tubing, or flow controllers with rubber components should be avoided, since such materials out-gas organic compounds which will be concentrated in the trap during the purge operation. Analyses of reagent blanks provide information about the presence of contaminants. When potential interfering peaks are noted in the blanks, the analyst should change the purge gas source and filter.

Contamination may occur when a sample containing low concentrations of volatile organic compounds is analyzed immediately after a sample containing high concentrations of volatile organic compounds. A technique to prevent this problem is to rinse the purging apparatus and sample syringes with two portions of organic-free water between samples. A non-contaminated system is established by the analysis of a reagent blank free of target analytes.

For samples containing large amounts of water-soluble materials, suspended solids, high boiling compounds, or high concentrations of analytes, it may be necessary to wash the purging device with a soap solution, rinse it with analyte-free water, and then dry the purging device in an oven at 105°C. This is especially the case for 25 mL purging vessels where some analytes exhibit poor purging efficiencies. In extreme cases, the entire purge-and-trap system may need to be cleaned and rinsed. Analysis of reagent blanks after cleaning procedures should be run to ensure the proper performance of the instrument system.

Special precautions must be taken to analyze for methylene chloride. The analytical and sample storage areas should be isolated from all atmospheric sources of methylene chloride; otherwise, random background levels will result.

Samples can be contaminated by diffusion of volatile organics (particularly methylene chloride and freons) through the septum seal of the sample container into the sample during shipment and storage. A trip blank prepared from organic-free water and carried through the sampling, handling, and storage procedures can serve as a check on contamination.

Some contamination (semi-volatile compound) may be eliminated by baking out the column between analyses. A post-run bake out temperature program may be necessary to ensure that semi-volatiles are volatilized. A portion of the column may need to be removed in the case of extreme contamination. Changing the injection liner will also reduce the potential of cross contamination from less volatile analytes.

V EQUIPMENT AND SUPPLIES

Analytical Balance: Used to accurately weigh solid samples for preparation (±0.1mg sensitivity).

Analytical column: J & W DB-VRX or equivalent; 60m x 0.25 mm ID x 1.4 um film thickness.

Gas Syringes: 5 mL gas-tight syringes for sample preparation

Microliter syringes: 10µL, 25µL, 50µL, 100µL, 250µL, 500µL, 1000µL, 5000µL, and 10000µL for standard and spike transfers and sample dilutions.

Sample Vials: 40 mL glass vials with screw tops and Teflon liners

Sample Spatulas, Stainless Steel: Used in the sample preparation of solid samples

Volumetric Flasks: 10 mL, 50 mL, 100 mL, Class A with ground glass stoppers

The analytical systems are as follows:

System 1	System 2	System 3
HP 5972 MSD	HP 5972 MSD	HP 5972 MSD
HP 5890 GC	HP 5890 II GC	HP 5890 II GC
OI 4560 Concentrator	Tekmar LSC 2000 Concentrator	OI 4560 Concentrator
EST Centurion Autosampler	EST Centurion Autosampler	ARCHON Autosampler
HP Chemstation Software	HP Chemstation Software	HP Chemstation Software

System 5	System 6
Aglient 5973 MSD	HP 5971 MSD
Aglient 6850 GC	HP 5890 II GC
OI Analytical Eclipse 4660 Concentrator	Encon Evolution Concentrator
ARCHON Autosampler	EST Centurion Autosampler
HP Chemstation Software	HP Chemstation Software

VI REAGENTS AND STANDARDS

Methanol: Methanol must be purge and trap grade and demonstrated to be free of contaminants by method blank analysis. The source and manufacturer may change from time to time; therefore, the brand and lot number must be documented in the sample preparation and standard preparation logs.

Reagent Water: Water free of organic contamination. Water is purchased from Sparkletts (Distilled Drinking Water-Sodium Free).

Trap Material: Supelco K trap (Vocarb 3000) or equivalent.

Calibration Standards: Purchased from a number of suppliers based on varying concentration and quantity needs. Primarily they are purchased from the following manufacturers:

Supelco, Inc.
Supelco Park
Bellefonte, PA 16823-0048

AccuStandard, Inc.
25 Science Park
New Haven, CT 06511

Quality Control Standards: Certified stock standards are purchased from the following manufacturers:

Supelco, Inc.
Supelco Park
Bellefonte, PA 16823-0048

AccuStandard, Inc.
25 Science Park
New Haven, CT 06511

All standards are stored in a standard refrigerator at -10°C $\pm$ 5°C.

Standard solutions are purchased containing the following compounds:

Acetone	Benzene
Bromobenzene	Bromochloromethane
Bromodichloromethane	Bromoform
Bromomethane	2-Butanone
n-Butylbenzene	sec-Butylbenzene
tert-Butylbenzene	Carbon disulfide
Carbon tetrachloride	Chlorobenzene
Chloroethane	2-Chloroethyl vinyl ether
Chloroform	Chloromethane
2-Chlorotoluene	4-Chlorotoluene
1,2-Dibromo-3-Chloropropane	Dibromochloromethane
1,2-Dibromoethane	Dibromomethane

1,2-Dichlorobenzene	1,3-Dichlorobenzene
1,4-Dichlorobenzene	Dichlorodifluoromethane
1,1-Dichloroethane	1,2-Dichloroethane
1,1-Dichloroethene	cis 1,2-Dichloroethene
trans 1,2-Dichloroethene	1,2-Dichloropropane
1,3-Dichloropropane	2,2-Dichloropropane
1,1-Dichloropropene	cis,1,3-Dichloropropene
trans1,3-Dichloropropene	Ethylbenzene
Hexachlorobutadiene	2-Hexanone
Isopropylbenzene	P-Isopropyltoluene
MTBE	4-Methyl-2-Pentanone
Methylene chloride	Naphthalene
n-Propylbenzene	Styrene
1,1,1,2-Tetrachloroethane	1,1,2,2-Tetrachloroethane
Tetrachloroethene	Toluene
1,2,3-Trichlorobenzene	1,2,4-Trichlorobenzene
1,1,1-Trichloroethane	1,1,2-Trichloroethane
Trichloroethene	Trichlorofluoromethane
1,2,3-Trichloropropane	1,2,4-Trimethylbenzene
1,3,5-Trimethylbenzene	Vinyl acetate
Vinyl chloride	o-Xylene
m,p-Xylenes	
1,1,2-Trichloro-1,2,2-trifluoroethane	
Ethyl alcohol (Ethanol)	
Ethyl-tert-butyl ether (ETBE)	
Diisopropyl ether (DIPE)	
tert-Amyl methyl ether (TAME)	
tert-Butyl alcohol (TBA)	

Internal Standard Stock Solutions are purchased containing the following compounds:

Pentafluorobenzene	1,4-Difluorobenzene
Chlorobenzene-d5	1,4-Dichlorobenzene-d4

Surrogate Standard Stock Solutions are purchased containing the following compounds:

4-Bromofluorobenzene	Dibromofluoromethane
Toluene-d8	1,2-Dichloroethane-d_4

Quality Control Standards: Purchased containing the same compounds as the calibration standards but obtained from a separate source. These standards are

used to prepare the laboratory control sample (LCS), matrix spike (MS), matrix spike duplicate (MSD) and Quality Control Standard (QCS).

All preparations are recorded by the Chemist in the Volatiles Standards Preparation Logbook, with documented standard sources and lot numbers. Appendix 2 provides instructions for preparing the tune check standard, the internal and surrogate standard mix, the calibration standards, and the laboratory control and matrix spike standard solutions. The primary and working standard solutions expire 3 months after receipt or preparation and should be replaced immediately if comparison with an independent source or any other nonconformance indicates a problem. See the Standards Preparation and Storage SOP for further details.

VII QUALITY CONTROL

A summary of the quality control samples, performance criteria, and calibration requirements are given in the following example of an analytical sequence for the testing of an analytical batch.

1. Summary

a) BFB Tuning Check Standard (see section VIII 3)
b) Initial Calibration Standard Curve (minimum of 5 points; see section VIII 4): 5, 10, 25, 50, 100, 200 ppb
or
Continuing Calibration Standard (see section VIII 5): 50 ppb
c) LRB or Method Blank
d) LFB or LCS
e) MS
f) MSD
g) Sample 1-12

2. BFB Tuning Check Standard

Each GC/MS system must be hardware-tuned to meet the criteria in Appendix 8 for a 50ng purging of 4-bromofluorobenzene. Analyses must not begin until these criteria are met. The mass spectrum must be taken in a straightforward manner. Use the guidelines as follows: Three scans (the apex and the scans immediately preceding and following the apex) are averaged. Background subtraction is required and must be accomplished using a single scan no more than 20 scans prior to the elution of BFB. Do not subtract part of the BFB peak. Use identical mass spectrometer settings to analyze all standards, blanks, QC samples, and samples within a 12 hour analysis shift defined as beginning with the injection time of a successful BFB analysis. Another 12-hour analysis shift will require an additional and successful BFB analysis.

3. Initial Calibration Standard (IC) and Continuing Calibration Check Standard (CCC)

The initial calibration is performed by generating a 5-point calibration curve for each analyte to be reported. *Every analyte to be reported must be run at a minimum of five levels*. Due to the various detection limits of the analytes, it is sometimes necessary to analyze more than five standards to achieve five levels for each analyte. Level 1 is at or below the limit of quantitation, and the high level standard is below the upper limit of the linear range of the system. Instructions for preparing the calibration standards are detailed in Appendix 2. Normally, the concentrations used for the seven data points used to achieve a five-point calibration are: 1, 5, 10, 25, 50, 100, and 200 ppb. See Section VIII 4.

For each analysis batch the calibration must initially be verified prior to analyzing any samples. As a general rule, the initial calibration must be verified at the beginning of each 12-hour shift during which samples are analyzed. The 12-hour analytical shift begins with the injection of the calibration check standard (or tuning standard in GC/MS methods). The shift ends after *completion* of the analysis of the last sample that can be *injected* within 12 hours of the beginning of the shift. The midpoint (or 50 µg/L and 50 µg/Kg) level standard used to prepare the linear calibration curve must be used. Percent difference or percent drift criteria for the CCC must be met before continuing the analysis batch and conducting any sample analyses. See Section VIII 5.

4. Laboratory Reagent Blank (LRB) or Method Blank (MB)

An LRB must be prepared and treated exactly as a typical field sample including exposure to all glassware, equipment, solvents, filtration and reagents that are used with field samples. Data produced are used to assess instrument performance of a blank sample and evaluate contamination from the laboratory environment. Values that exceed ½ the LOQ indicate a laboratory or reagent contamination is present. The source of the contamination must be determined prior to conducting any sample analysis.

5. Laboratory Fortified Blank (LFB) or Laboratory Control Sample (LCS)

Prepare a secondary dilution stock using a different stock solution used to prepare the calibration standards. This separate, secondary dilution stock is used as a concentrate to fortify the LCS and MS/MSD. A LCS is required to be analyzed with each analysis batch immediately following the LRB. By analyzing the LCS initially, a control check is performed on the concentrated solution used to prepare the MS/MSD. If any deviations in the VOC concentration(s) are present, it will be reflected in the LCS and not exclusively attributed to a matrix upon analysis of the MS/MSD. The percent recovery for VOCs must fall in the range of 75-125% prior to analyzing samples. If the LCS recovery for an analysis

batch does not meet these recovery criteria the data are considered invalid, and the source of the problem should be identified and resolved before continuing analyses.

If a large number of analytes are in the LCS, it becomes statistically likely that a few will be outside control limits. However, this may not indicate that the analytical system is out of control. See Section 3.6.3 of the QA/QC manual for more details on multi-analyte LCS samples.

All compounds are spiked; however only the following are reported:

Benzene
Toluene
Chlorobenzene
Trichloroethene
1,1-Dichloroethene

6. Laboratory Fortified Matrix (LFM) or Matrix Spike (MS)

The laboratory must add a known amount of the target analyte to one sample within each analytical batch (of >15 samples). Samples which require such pretreatment require a MS to be taken through all sample handling and preparation procedures in order to confirm any matrix effect and that the laboratory performed the pretreatment step appropriately.

It is recommended that the solutions used to fortify the MS be prepared from an independent stock than used to prepare the calibration standards.

The fortified concentration must be equal to or greater than the native sample concentration. Fortified samples that exceed the calibration range must be diluted to be within the linear calibration range. In the event that the fortified level is less than the observed native level of the unfortified matrix, the recovery should not be calculated. The sample should be fortified at a higher level and reanalyzed or a different sample should be chosen for the MS. For normal drinking waters, the MS typically should be prepared in the range of 50 µg/L. The MS should not be prepared at a concentration greater than ten times the highest concentration observed in any field sample and should be varied to reflect the range of concentrations expected in field samples. Ideally, the MS fortified spike concentration should be 3-5 times the native concentration.

Calculate the percent recovery for VOC, corrected for concentrations measured in the unfortified sample, by using the following equation:

$$\%REC = ((C_s\text{-}C)/s) \times 100$$

Where,

%REC = Percent Recovery
C_s = measured VOC in the fortified sample
C = measured native VOC sample concentration
s = concentration equivalent of analyte added to the sample

If the recovery for VOC falls outside 75-125% and the laboratory's performance for all other quality control performance criteria is acceptable, the accuracy problem encountered with the fortified sample is judged to be matrix related, not system related and should be noted as such by data qualifier or in the case narrative. Repeated failure indicates potential problems with the procedure which may require corrective action.

If a large number of analytes are in the MS, it becomes statistically likely that a few will be outside control limits. However, this may not indicate that the analytical system is out of control. See Section 3.6.4 of the QA/QC manual for more details on multi-analyte MS samples.

All compounds are spiked; however only the following are reported:

Benzene
Toluene
Chlorobenzene
Trichloroethene
1,1-Dichloroethene

7. Duplicate LFM or Matrix Spike Duplicate (MSD)

This quality control sample must be analyzed with each analytical batch (fifteen samples). Calculate the relative percent difference (RPD) of the initial quantitated concentration (I_c) and duplicate quantitated concentration (D_c) using the following formula:

$$RPD = ((I_c-D_c)/([I_c+D_c]/2)) \times 100$$

If the RPD for the duplicate measurement of VOC falls outside ±15% and if all other quality control performance criteria are met, laboratory precision is out of control for the sample. The precision problem encountered with the fortified sample may judged to be matrix related, depending on the evaluation of other QC data, and not system related and should be noted as such by data qualifier or in the case narrative. Repeated failure indicates potential problems with the procedure that may require corrective action.

8. Quality Control Standard (QCS)

After calibration curves have initially been established or have been reestablished, or as required to meet data quality needs, verify both the calibration and acceptable instrument performance with the preparation and analyses of an external/second source QCS. If the determined concentration is not within ±30% of the stated value, performance of the calibration is unacceptable. The source of the problem must be corrected before continuing with sample analysis.

VIII PROCEDURE

1. Sample Preparation

Matrices are typically defined as soil, water and other. Due to differences in preparation of soils and waters, various matrices cannot be batched together. Solid samples must be analyzed using a heated purge, and they must be quantitated using a calibration curve generated using a heated purge. Aqueous samples are generally processed unheated and quantitated against an unheated calibration curve. It is permissible to apply a heated calibration curve to liquid samples, so long as the aqueous samples are heated as well.

Difficult matrices from a given client are best processed together to contain the contamination and QC problems.

Matrix-specific batches contain 15 samples or less. Each batch must include the following QC samples: Method blank, matrix spike, matrix spike duplicate, and laboratory control sample.

Routinely, the internal standards and surrogates are mixed into one solution, which is injected into every standard, blank, and sample. The internal standards and surrogates are evaluated based upon the known concentrations added and known sample matrix interferences. The internal standard and surrogate recoveries provide additional QC evaluation of field samples without the use of a matrix spike.

2. Instrument Startup

The gas chromatographic conditions are checked each day prior to use, in accordance with scheduled preventive maintenance measures, as defined in the laboratory preventative maintenance logbooks. These measures include checking and replacing septa, checking all gases, etc. A maintenance logbook assigned to each instrument.

The mass spectrometer is checked for air leaks weekly by the following procedure: The water (mass 18 peak), nitrogen (mass 28 peak), and oxygen (mass 32 peak) are examined and compared. If the water mass peak is greater than the oxygen and the nitrogen mass peaks, the system is airtight and ready for use. If the ratios of the oxygen and nitrogen peaks are greater than the water peak, an air leak is possible. The system must be further checked for air leaks and corrective action must be taken prior to proceeding.

All adjustments and troubleshooting processes must be documented in the maintenance logbook. Reference to manufacturer supplied solutions, i.e. operation manuals, maintenance manuals, etc. must also be documented in the maintenance logbook.

The typical operating conditions for the sample concentrator, gas chromatograph, and mass spectrometer are listed in Appendix 7.

The following procedure describes the instrument control procedures for the acquisition of data for BFB tuning standards, calibration standards, quality control samples, and field samples.

After standards, QC samples, and field samples have been prepared, load the instrument autosampler. All samples should be in 40 mL vials and should be placed in sequential order and grouped by analysis batch. The autosamplers have a greater sample capacity that can be analyzed in one 12-hour analytical shift; therefore, multiple tuning standards, calibration standards, and quality control samples need to be prepared if multiple batches of field samples are to be loaded within the autosampler. The autosampler capacity is approximately 50 vials.

Create an instrument sequence. Within the ChemStation application, bring up the Environmental window. Go to menu option Sequence and select Load Sequence. Choose a template or the previous sequence to load. Next, from the menu option Sequence, select Edit Sample Log Table and edit (sample) Type, Vial (number), Data File (ID), Method (GC/MS method), and Sample Name. Select OK when the sequence editing is complete. Return to menu option Sequence and select Save and then select Load and Run Sequence. Select OK to ready the instrument for autosampler prompt or ready signal.

Create an autosampler sequence.

ARCHON: Select Method on autosampler keypad. Enter an established instrument Method Number for either water or soil analysis and select Enter. (The – key will move the user “up” the menu or to the previous menu selection). Select Enter on autosampler keypad for the next menu option of Edit Method. Select Auto on the key pad to start the autosampler, but first edit the following

options as they appear (selected by the Enter key), and the appropriate value should be kept or changed according to requirements of the analytical batch:

Parameter	Soil Method	Water Method
Sample Type*	Soil	Water
First Vial	Beginning Vial Number	Ending Vial Number
Last Vial	Beginning Vial Number	Ending Vial Number
Sample Volume	05	05
Dilution Factor	-	NO
Rinse Volume	00	05
# Rinses	00	02
Standard 1 (Y/N)	YES**	YES**
Standard 2 (Y/N)	NO	NO
Pre Heat Stir (Y/N)	NO	-
Stir (Y/N)	NO	NO
Water Stir Time	-	0.0
Water Settle Time	-	0.0
Syringe Flushes	01	01
Preheat	YES	-
Preheat Temp	040	-
Preheat Time	01.0	-
Purge Time (m)	011.0	-
Desorb Time (m)	02.0	02.0
Operation Mode	Remote	Remote
Cycle Timer	00.0	00.0
Aux Timer	00.0	00.0
Link to Method	XX***	XX***

* Select by using keypad arrows

** Select NO for BFB tuning standard analyses

*** Number of method to be used after last vial of the current method has been analyzed. To be used where soil and water batches are both loaded within the autosampler and continuous analysis is desired.

PRECEPT II: Select the TEKLINK Precept Icon. Select menu option Instrument and select Edit Schedule. Edit the following options as they appear (selected by the Tab key), and the appropriate value should be kept or changed according to requirements of the analytical batch:

Parameter	Water/Soil
Start	Beginning Vial Number
Stop	Ending Vial Number

Dilution	1	
Blanks	None (Options: None/Every/End)	
#Blanks	1	
Samples per Vial	1	
Runs per Sample	1	
Matrix Spike	None	(BFB tuning standard)
	IS1	(Standards, QC samples, and field samples)
	IS1/IS2	(MS/MSD samples)

After editing the autosampler routine select Send. Next, select OK. To begin analyses select Step.

To generate reports for standards, QC samples, and field samples, use the following procedure. Within the ChemStation application, bring up the Data Analysis window. Go to the menu option File, and select Load Data File. (Select the desired sequence and also the data file ID corresponding to the sample of interest). Next, select the menu option Quant and select Qedit Quant Results. (The initial calibration option should be selected, if not, select such and generate a new quant report using the last step in this paragraph). Edit the quantitation of each compound. A cursor is selected for manual integrations. Select Qdel to remove a compound from the generated report (if qualitiative and quantitative criteria were not met). When finished editing the file select Qedit menu option and select Exit and Save Changes. Then, select menu option Quant and select Generate Report.

3. Tuning

A tune check must be analyzed and must meet all criteria before any calibration standards, QC samples and/or field samples are analyzed. These criteria must be demonstrated each 12-hour shift during which samples are analyzed. In detail, A 50 ng purge of the BFB tune check standard is required to assess hardware tuning, column performance, and injection port inertness. The mass abundance criteria found in 8 must be met as a requirement for acceptable mass spectrometer performance.

The chromatogram for the tune standard should be evaluated for possible degradation of the column or injection port problems. Column and injection port maintenance are performed as needed.

To generate a report for the BFB tuning standards, use the following procedure. Select File as the menu option from the Environmental window within the Chem Station application. Select Load Data File (select the desired sequence and also the data file ID corresponding to the sample of interest). Next, select the menu option Tuner and select Evaluate BFB.

At this point, the Autofind BFB to Screen option should be chosen to obtain a data system generated spectrum. The tabulated mass spectral data results, including the indication of criteria pass/fail will be listed on the data system monitor. If this spectrum passes all criteria select the Tuner option again, select Evaluate BFB, and select Autofind BFB to Printer. Check the hardcopy to verify that the tune passes all criteria and save the hardcopy in a folder (titled with the sequence name which is denoted by date) to begin collection and organization of all data associated with the specific tune.

If the Autofind option does not yield a spectrum that passes criteria, select the Tuner menu option and select Evaluate BFB option again. Select Evaluate BFB to Screen to prepare for manual determination of a BFB spectrum. Find the BFB peak by double-right clicking on the apex of the peak near the expected retention time of the tuning standard. Once the apex peak has been chosen, select a background spectrum, to the left of the peak, no more than approximately 20 scans away from the apex. Select the Tuner menu option and select Subtract.

At this point, the Evaluate BFB to Screen option should be chosen to obtain the manually generated spectrum. The tabulated mass spectral data results, including the indication of criteria pass/fail will be listed on the data system monitor. If this spectrum passes all criteria select the Tuner option again, select Evaluate BFB, and select Evaluate BFB to Printer. Check the hardcopy to verify that the tune passes all criteria and save the hardcopy in a folder (titled with the sequence name which is denoted by date) to begin collection and organization of all data associated with the specific tune. If this tune fails, additional apex and background spectrums may be attempted in finding a spectrum that meets all tuning criteria, with the condition that all spectrum selections and manipulations are done in a straightforward manner.

Initial Calibration

Prior to performing a 5-point calibration, a tune check must be run and pass the acceptance criteria. A water blank, prepared from the reagent water used for dilutions, is also run prior to the calibration standards to confirm the system is free of contamination. This blank is run as a sample.

The initial calibration is performed by generating a 5-point calibration curve for each analyte to be reported. *Every analyte to be reported must be run at five levels*. Due to the various detection limits of the analytes, it is sometimes necessary to analyze more than five standards to achieve five levels for each analyte. Level 1 is at or below the reporting limit, and the high level standard is below the upper limit of the linear range of the system. Instructions for preparing the calibration standards are detailed in Appendix 2. Normally, the concentrations used for the seven data points used to achieve a five point calibration are: 1 μg/l, 5 μg/l, 10 μg/l, 25 μg/L, 50 μg/L, 100 μg/L, and 200 μg/L

A second reagent blank is run after the 200 µg/L calibration standard to document how much, if any, carry-over occurs after that concentration.

An initial calibration quality control standard (QCS) is prepared as detailed in Appendix 2. This standard is prepared from a second source that is also used as the matrix spike and laboratory control sample spiking solution. The QCS standard is run after the 5-point initial calibration.

After generating the initial calibration curve, the response factors (RF) for each analyte is calculated. This procedure is performed by the instrument software using the following equation:

$$RF = \frac{Area_{Std} \times Conc_{InternalStd}}{Area_{InternalStd} \times Conc_{Std}} \equiv \frac{A_S C_{IS}}{A_{IS} C_S}$$

The System Performance Check Compounds (SPCC), listed below, must be assessed for attaining minimum average response factors. The SPCC compounds must have minimum mean response factors as follows:

SPCC	RF_{MIN}
Chloromethane	0.10
1,1,2,2 Tetrachloroethane	0.30
Chlorobenzene	0.30
Bromoform	0.10
1,1-Dichloroethane	0.10

Failure of any of these five SPCC compounds to meet minimum response factor criteria prohibits proceeding with sample analysis until the cause for poor response is determined. The following is a summary of the systematic problems indicated by each of the SPCC analytes:

Compound	System Performance
Chloromethane	Lost if flow is too high
1,1,2,2-Tetrachloroethane	Degrades if lines are contaminated
Chlorobenzene and Bromoform	Poor purge if flow is too slow; also affected by cold spots in transfer line or active sites in line or column
1,1-Dichloroethene	Will degrade if lines are contaminated

If the SPCC criteria are met, use the response factors to evaluate whether the RFs are constant over the calibration range. This is done by calculating the

percent Relative Standard Deviation (%RSD). The data system calculates the value by using the following equation:

$$RSD = \frac{\text{Standard Deviation of the RFs}}{\text{Average of the RFs}} \times 100$$

The RSD for the calibration check compounds (CCC) must be equal or less than 30%. These compounds are as follows:

1,1-Dichloroethene
Chloroform
1,2-Dichloropropane
Toluene
Ethylbenzene
Vinyl Chloride

The CCCs are chosen for monitoring because they are representative of the list of compounds being tested. Their satisfactory performance assures the analyst that the system is operating properly. Often if the RSD criteria are exceeded, it indicates a possible leak in the system that requires attention. If the 30% RSD criteria are met for the CCC compounds, then all other analytes are evaluated against 15% RSD criteria as follows.

If the %RSD is less than 15% for all other calibrated compounds, the RF can be considered invariant and the average RF can be used for calculations.

Given the large number of analytes it is likely that some analytes may exceed the 15% acceptance limit for the RSD for a given calibration. If the RSD for any analyte is greater than 15%, the analyst should review the results (area counts, response factors and RSD) for those anaytes to ensure that the problem is not associated with just one of the five initial calibration standards. If the problem appears to be associated with a single standard that one standard may be reanalyzed and the RSD recalculated.

A second alternative is to narrow the calibration range be replacing one or more of the higher level calibration standards with a lower concentration standard.

A third option is to use the area ratios versus concentration using first order or higher regression fit of the five calibration points. The regression calculation will generate a correlation coefficient (*r*) that is a measure of the fit of the regression line to the data. A value of 1.0 indicates a perfect fit. In order to be used for quantitative purposes, *r* must be equal to 0.99.

If the RSD values are acceptable for all analytes, quantitate the QCS standard against the 5-point initial calibration. All target compound recoveries must be within 70%-130% of the expected value. If any target compounds do not meet the criteria, reanalyze the standard.

To evaluate initial calibration curves with the data system, first acquire and generate reports for all six initial calibration runs. Select the File menu option and select Load Data File (choose a file corresponding to one of the IC standards). Next, select the InitCal menu option and select Update Levels. Select the appropriate concentration level within the window (1, 5, 10, 25, 50, 100, 200) and then select Do Update. Repeat this procedure for all the initial calibration standards.

4. Continuing Calibration

The initial calibration curve of each target compound is checked and verified every 12 hours of analysis time. This is done by analyzing a 50 µg/L Continuing Calibration Check standard. The CCC standard is checked for minimum SPCC RFs, CCC percent difference, internal standard response, and retention time shifts. The CCC must meet the following criteria in order to proceed with sample analysis:

The System Performance Check Compounds must be assessed for attaining the minimum average relative response factors. Each SPCC compound in the calibration verification standard must meet its minimum response factor (see Section VIII 4). This is the same check that is applied during the initial calibration.

The response factor is calculated for each compound. These response factors are then compared to the average response factor of the initial calibration and the percent difference is calculated. The percent difference for the Calibration Check Compounds must be equal to or less than 20%.

CCC analytes that have a linear regression calibration are checked for %Drift by the following equation:

$$\%Drift = \frac{\left[C_{True} - C_{Measured}\right]}{C_{True}} \times 100$$

As stated above, the % Drift should be equal to or less than 15%.

Where,

C_{True} = Prepared Concentration of Calibration Standard
$C_{Measured}$ = Reported Concentration of Calibration Standard

To evaluate continuing calibration standards with the data system, first acquire and generate reports for the calibration run. Select the File menu option and select Load Data File (choose the file corresponding to the CCC standard). Next, select the ConCal menu option and select Evaluate Data File as Continuing Calibration to Screen. Evaluate CCC and SPCC criteria as stated above and verify the CCC and SPCC analyte status as to the number of compounds failed at the bottom of the tabulated report. If the CCC passes all criteria, select the ConCal menu option and select Evaluate Data File as Continuing Calibration to Printer. Check the hardcopy to verify that the CCC passes all criteria and save the hardcopy in a folder (titled with the sequence name which is denoted by date) to continue collection and organization of all data associated with the specific calibration standard.

5. Method Blank Analysis

Analyse and check the method blank for contamination. It is common to have environmental contamination such as methylene chloride and acetone. When contamination of this type is found, the results are documented so that a history of routine levels can be established. Presence of these common laboratory contaminants must be narrated to the client. If analytes other than common laboratory contaminants are detected, the source must be located. Analysis cannot continue until the criteria for a contaminant-free blank is met. The analysis of samples cannot be “blank corrected”.

6. Sample Evaluation

Evaluate the following for quality control performance and sample analyte qualitative and quantitative identification.

A) Quality Control Procedures

The peak area response for each internal standard must be 50% to 200% of the mid-point standard level response of the most recent initial calibration. If the response for any internal standard changes by more than the above factor from that in the mid-point standard level of the most recent initial calibration sequence, then the chromatographic system must be inspected for malfunctions and corrections must be made, as required.

If the retention time for any internal standard changes by more than 30 seconds from that in the mid-point standard level of the most recent initial calibration sequence, then the chromatographic system must be inspected for malfunctions and corrections must be made, as required.

The surrogate recoveries for all analyses will be evaluated against 75%-125% recovery.

B) Qualitative Analysis

The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other.

The relative retention times (RRT) of the individual components must not vary by more than ±0.06 RRT units. If this drift occurs, the cause for RRT shift must be corrected. In cases where reanalysis is not possible, the analyst must make a professional judgment regarding the effect of the shift on data validity

The mass spectral data must be examined when identifying the compounds. The relative abundance of the secondary ions in the mass spectrum of a sample should agree within 30% compared to the abundance of the ions in the calibration standard.

The system provides a report that allows the analyst to examine the relative fit and purity of each identified compound to the mass spectral library. If the spectral fit or purity is less than 50% the analyst will examine the mass spectra and determine if the compound identification is accurate.

Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is less than 25% of the sum of the two peak heights. Otherwise structural isomers are identified as isometric pairs.

Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing ions contributed by more than one analyte. When GC peaks obviously represent more than one sample component, appropriate selection of analyte spectra and background spectra is important.

For sample containing components not associated with the calibration standards, a library search may be made for the purpose of tentative identification. The necessity to perform this type of identification will be determined by the specific client's project plan. Use the following guidelines for making tentative identifications:

1) Relative intensities of major ions in the reference spectrum (ions greater than 10% of the base peak) should be present in the sample spectrum.

2) The relative intensities of the major ions should agree within ±20%.

3) Molecular ions present in the reference spectrum should be present in the sample spectrum.

4) Ions present in the sample spectrum but not in the reference spectrum should be reviewed for possible background contamination or presence of coeluting compounds.

5) Ions present in the reference spectrum but not in the sample spectrum should be reviewed for possible subtraction from the sample spectrum because of background contamination or coeluting peaks.

C) Quantiative analysis

Once a compound has been identified, the quantitation of that compound will be based on the integrated abundance from the primary characteristic ion. The internal standard used shall be the one nearest the retention time of that of a given analyte.

If the RSD of a compound's response factor is 15% or less, then the concentration in the sample may be determined using the average response factor from the initial calibration data; otherwise, the concentration is calculated by equations for linear or non-linear calibrations.

Where applicable, the concentration of any non-target analyte identified in the sample should be estimated. The same formulae should be used with the following modifications: The areas A_x and A_{is} should be from the total ion chromatograms, and the response factor should be assumed to be 1 (see Section VIII 7). The resulting concentration should be reported indicating: (1) that the value is an estimate, and (2) which internal standard was used to determine concentration. Use the nearest internal standard free of interferences.

7. Reporting of Results

The following is a summary of the calculations used by the data system to generate the reported data:

Percent Recovery (P) is calculated by the following equation:

$$P = \frac{C_x - C_u}{T} \times 100$$

Where

C_x = The concentration of the analyte spike, surrogate, or internal standard from the analysis.
C_u = The concentration in the unspiked sample. C_u= 0 for surrogates and internal standards.
T = The true value of the spike, surrogate, and internal standard added.

Sample Concentration is calculated by the following equation(s):

Internal standard calibration – linear calibration

Aqueous samples

$$C(ppb) = A_\chi \times C_{is} \times V_i \times D/RF_{avg} \times A_{is} \times V_s \times 1000$$

Where,

C(ppb) = The concentration of analyte in the sample.
A_χ= Area of the peak of the analyte being measured
A_{is} = Area of the internal standard peak or quantitation ion
RF_{avg}= The response factor of the analyte being measured.
D = Dilution factor
C_{is} = Concentration of the internal standard in the concentrated extract or volume purged in µg/L.
V_i = Volume of the extract injected (µL). The injection volume for samples and calibration standards must be the same. For purge-and-trap analysis, V_i is not applicable and therefore is set at 1. If concentration units are used in calculating the calibration factor, then V_i is not used in this equation.
V_s = Volume of the aqueous sample extracted or purged in mL.

Nonaqueous samples

$$C(ppb) = A_\chi \times C_{is} \times V_i \times D/RF_{avg} \times A_{is} \times W_s \times 1000$$

Where,

C(ppb) = The concentration of analyte in the sample.
A_χ= Area of the peak of the analyte being measured
A_{is} = Area of the internal standard peak or quantitation ion
RF_{avg}= The response factor of the analyte being measured.
D = Dilution factor
C_{is} = Concentration of the internal standard in the concentrated extract or volume purged in µg/L.
V_i = Volume of the extract injected (µL). The injection volume for samples and calibration standards must be the same. For purge-

and-trap analysis, V_i is not applicable and therefore is set at 1. If concentration units are used in calculating the calibration factor, then V_i is not used in this equation.
W_s = Weight of the sample extracted or purged in g.

Calculations for a non-linear calibration curve.

In instances where a non-linear relationship between analyte concentration and response is present over the working range, or when similar calibration approaches have not met the acceptance criteria, the instrument data system should be employed to calculate analyte concentrations via second or third order calibration curves. In order to be an acceptable calibration, the coefficient of the determination must be greater than or equal to 0.99.

Standard Deviation is calculated by the following equation:

$$SD = \sqrt{\frac{\sum_{N}\left(X_i - X_{Avg}\right)^2}{N-1}}$$

Where

X_i = analyte values
X_{Avg} = Analytes average value
N = Number of points

Relative Percent Difference is calculated by the following equation:

$$\%RPD = \left| \frac{\left[Conc_{MS} - Conc_{MSD}\right]}{\left[\frac{Conc_{MS} + Conc_{MSD}}{2}\right]} \right| \times 100$$

Where,

RPD = Relative Percent Difference
$Conc_{MS}$ = Matrix Spike Concentration
$Conc_{MSD}$ = Matrix Spike Duplicate Concentration

8. ARCHON Autosamplers

The ARCHON can be used for soil or water samples. For water samples, the 40 mL vials are placed in the autosampler, which automatically withdraws 5 mL of

sample, adds the Internal Standard and Surrogate Mix, and transfers the sample to the front panel purge vessel on the concentrator.

Water samples may also be run on without using the ARCHON autosampler. The samples may be directly injected into the front panel purge vessel on the concentrator. In this case the Internal Standard and Surrogate Mix are added manually. After the bake cycle is complete the sample is withdrawn and the purge vessel rinsed three times with reagent water.

Soil samples are weighed into a 40 mL vial and placed in the ARCHON autosampler. The autosampler adds 5 mL of reagent water plus the Internal Standard and Surrogate Mix. The soil sample is then heated to 40°C and purged directly in the vial.

Soil samples for method 5035 are first weighed for final weight and then directly placed in ARCHON autosampler. The autosampler adds 5 mL of reagent water plus the Internal Standard and Surrogate Mix. The soil sample is then heated to 40°C and purged directly from the vial.

IX CORRECTIVE ACTION

See Appendix 5 for specific information regarding quality system nonconformances and associated corrective actions.

Corrective measures for chromatographic system maintenance may involve one or more of the following remedial actions. This list is by no means comprehensive and analysts should develop expertise in troubleshooting their specific instruments and analytical procedures. The manufacturers of chromatographic instruments, detectors, columns, and assessories generally provide detailed information regarding the proper operation and limiting factors associated with their products. The reading and reviewing of this information is essential to routine maintenance and repair.

Capillary GC columns

Routine maintenance may compel the analyst to clean and deactivate the glass injection port insert or replace it with a fresh insert that has been cleaned and deactivated with dichlorodimethylsilane. Cut off 0.5 – 1.0 m of the injector end of the column using a 90° cut. Place ferrule onto the column before cutting.

Additional maintenance may compel the analyst to replace gas traps and backflush the column with solvent according to the manufacturer's instructions. If these procedures fail to eliminate the degradation problem, it may be necessary to deactivate the metal injector body and/or replace the column.

Metal (GC) injector body

Turn off the oven and remove the analytical column when the oven has cooled. Remove the glass injection port insert. Lower the injection port temperature to room temperature. Inspect the injection port and remove any noticeable foreign material.

Place a beaker beneath the injection port inside the GC oven. Using a wash bottle, serially rinse the entire inside of the port with acetone and then toluene, catching the rinsate in the beaker.

Prepare a solution of deactivating agent (dichlorodimethylsilane) following manufacturer's directions. After all metal surfaces inside the injector body have been thoroughly coated with the deactivation solution; serially rinse the injector body with toluene, methanol, acetone, and hexane. Reassemble the injector and replace the GC column.

X METHOD PERFORMANCE

Appendix 9 gives the results for the Initial Demonstration of Capability plus LOD (MDL) and LOQ (PQL) data.

XI WASTE DISPOSAL AND WASTE PREVENTION

Whenever feasible, laboratory personnel should use pollution prevention techniques to address waste generation. Wastes should be reduced or minimized at the point of generation which includes the use of any reagent, standard, or eluent.

Wastes must be disposed of in accordance with all applicable rules and regulations. Wastes shall be disposed of in the following manner:

Water samples: Water waste
Soil samples: Vial waste
Methanol extract samples: Vial waste
Methanol: Solvent waste
VOA Standard Solutions: Solvent waste
ARCHON rinsate waste: Water waste

XII SAFETY

The toxicity or carcinogenicity of each reagent used in this method has not fully been established. Each chemical should be regarded as a potential health hazard and exposure should be as low as reasonably achievable. Cautions are specifically listed on the corresponding MSDS sheet.

The following chemicals have the potential to be highly toxic or hazardous:

Methanol: Toxic and highly flammable. Toxic by inhalation, ingestion or skin absorption. May be a reproductive hazard. Ingestion may be fatal. Risk of very serious, irreversible damage if swallowed. Exposure may cause eye, kidney, heart and liver damage. Chronic or substantial acute exposure may cause serious eye damage, including blindness. Irritant. Narcotic. Use safety glasses and effective ventilation.

GLOSSARY

The following terms are defined for use in this document:

ACCURACY: The closeness of agreement between an observed value and an accepted reference value. When applied to a set of observed values, accuracy will be a combination of a random component and of a common systematic error (or bias) component.

BATCH: A group of samples which are similar with respect to the sampling or the testing procedures being employed and which are processed as a unit. For QC purposes, each group of 15 samples or less will all be handled as a separate batch.

BIAS: The deviation due to matrix effects of the measured value from a known spiked amount. Bias can be assessed by comparing a measured value to an accepted reference value in a sample of known concentration or by determining the recovery of a known amount of contaminant spiked into a sample (matrix spike). Thus, the bias (B) due to matrix effects based on a matrix spike is calculated as:
B = (Xs – Xu) – K
Where:
X_s = measured value for spiked sample,
X_u = measured value for unspiked sample, and
K = known value of the spike in the sample.

Using the following equation yields the percent recovery (%R).

$$\%R = 100 (X_S – X_U) / K$$

BLANK: see Equipment Rinsate, Method Blank, Trip Blank.

CONTROL SAMPLE: A QC sample introduced into a process to monitor the performance of the system.

DUPLICATE: see Matrix Duplicate, Field Duplicate, Matrix Spike Duplicate.

EQUIPMENT BLANK: see Equipment Rinsate.

EQUIPMENT RINSATE: A sample of analyte-free media which has been used to rinse the sampling equipment. It is collected after completion of decontamination and prior to sampling. This

blank is useful in documenting adequate decontamination of sampling equipment.

PRACTICAL QUANTITATION LIMIT: The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. The PQL or Limit of Quantitation (LOQ) is generally 2 to 10 times the MDL. However, it may be nominally chosen within these guidelines to simplify data reporting.

FIELD DUPLICATES: Independent samples which are collected as close as possible to the same point in space and time. They are two separate samples taken from the same source, stored in separate containers, and analyzed independently. These duplicates are useful in documenting the precision of the sampling process.

LABORATORY CONTROL SAMPLE: A known matrix spiked with compound(s) representing the target analytes. This is used to document laboratory performance.

MATRIX: The component or substrate (e.g., surface water, drinking water) which contains the analyte of interest.

MATRIX DUPLICATE: An intralaboratory split sample which is used to document the precision of a method in a given sample matrix.

MATRIX SPIKE: An aliquot of sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

MATRIX SPIKE DUPLICATE: Intralaboratory split samples spiked with identical concentrations of target analyte(s). The spiking occurs prior to sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.

METHOD BLANK: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting form the analytical process.

For a method blank to be acceptable for use with the accompanying samples, the concentration in the blank of any analyte of concern should not be higher than the highest of either:

(1) ½ the LOQ, or
(2) Five percent of the regulatory limit for that analyte, or
(3) Five percent of the measured concentration in the sample.

METHOD DETECTION LIMIT (MDL): The minimum concentration of a substance that is measureable and reportable with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte. Also, Limit of Detection (LOD).

PRECISION: The agreement among a set of replicate measurements without assumption of knowledge of the true value. Precision is estimated by means of duplicate/replicate analyses. These samples should contain concentrations of analyte above the MDL, and may involve the use of matrix spikes. The most commonly used estimates of precision are the Relative Standard Deviation (RSD) or the Relative Percent Difference (RPD)

$RSD = (s/x_i) \times 100$

Where:
x_i = the arithmetic mean of the x_I measurements
S = standard deviation

$RPD = 100 \times [(x_1 – x_2)/ \{(x_1 + x_2)/2\}]$

Where:
x_1 = First replicate result
x_2 = Second replicate result

REAGENT BLANK: See Method Blank

REAGENT GRADE: Analytical reagent (AR) grade, ACS reagent grade, and reagent grade are synonymous terms for reagents, which conform to the current specifications of the Committee on Analytical Reagents of the American Chemical Society.

REAGENT WATER: Water that has been generated by any method which would achieve the performance specifications for ASTM Type I

water. For organic analyses, see the definition of organic-free reagent water.

REFERENCE MATERIAL: A material containing known quantities of target analytes in solution or in a homogeneous matrix. It is used to document the bias of the analytical process.

SPLIT SAMPLES: Aliquots of sample taken from the same container and analyzed independently. In cases where aliquots of samples are impossible to obtain, field duplicate samples should be taken for the matrix duplicate analysis. These are usually taken after mixing or compositing and are used to document intra - or inter laboratory precision.

STANDARD CURVE: A plot of concentrations of known analyte standards versus the instrument response to the analyte. Calibration standards are prepared by successively diluting a standard solution to produce working standards, which cover the working range of the instrument. Standards should be prepared at the frequency specified in the appropriate section. The calibration standards should be prepared using the same type of acid or solvent and at the same concentration as will result in the samples following sample preparation. This is applicable to organic and inorganic chemical analyses.

SURROGATE: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples.

TRIP BLANK: A sample of analyte-free media taken from the laboratory to the sampling site and returned to the laboratory unopened. A trip blank is used to document contamination attributable to shipping and field handling procedures. This type of blank is useful in documenting contamination of volatile organic samples.

Appendix 1
Initial Demonstration of Capability

The initial demonstration of capability is performed to demonstrate that the system and the analyst can successfully perform the test method. This is accomplished by running four aliquots of the Quality Control Check Sample as described below.

1. Prepare a QC standard in methanol at a concentration of 25 µg/mL. The QC standard must be made from a separate source than the calibration standards.

2. Add 10 µL of the QC standard to 5 mL of organic-free reagent water in a 5 mL gas-tight syringe. Add 10 µL of the internal standard and surrogate mix. Inject the into the purge & trap vessel through the valve on the system. Repeat three more times until a total of four QC check samples are analyzed.

3. For the soil matrix, weigh 5 grams of organic-free sand into a purge vessel. Repeat step 2 except add the 5 mL of the QC check sample to the purge vessel containing the sand. Repeat three more times until a total of four QC check samples are analyzed.

4. Calculate the average recovery in µg/L, and the standard deviation of the recovery for each analyte. If average recoveries of analytes fall within the acceptance limits of 70%-130%, and the percent relative standard deviation is less than 20%, the system is ready to use and analysis may begin. If the average recovery for any analyte falls outside the range, corrective action must be taken and the analysis repeated for the failed analytes. All corrective action must be noted in the Maintenance Logbook.

5. Once an analyst and instrument have passed the recovery criteria for all analytes to be reported by the method, the analyst and instrument are certified as having established initial proficiency with the method.

Appendix 2
Sample Preparation

Aqueous samples

Aqueous samples are prepared by withdrawing five milliliters of sample from the sample container using a gas-tight syringe. The Internal standard and surrogate mix is added to the sample. The sample is then placed on the autosampler. All samples must be analyzed such that all target analytes are within the calibration range. The analyst must dilute samples as necessary to achieve this. Water samples are diluted by withdrawing an aliquot using a gas-tight syringe and injecting this aliquot into a volume of reagent water that will bring the total volume to five milliliters.

Solid samples

A solid, sludge, or any other type of sample that can not be injected like a liquid, must be weighed. The top portion of the sample is discarded and a representative sample is withdrawn from the container. Using a certified balance, exactly weigh 5 ± 0.2 grams of sample into the purge vessel. The purge vessel is immediately placed on the autosampler, which minimizes loss of analytes and the possibility of contamination.

A 5 mL gas-tight syringe is filled with reagent water and spiked with 10 µL the internal standard and surrogate mix. The contents are then injected into the purge vial and then placed on the autosampler.

Soil samples may be run at low level by reducing the sample weight. The minimum weight is 1.0 grams. Further dilution may be performed by methanol extraction as required.

Record all information on the Sample Preparation Logsheet.

Solids requiring extraction (medium or high level analysis)

The appropriate amount (1-10 g) of solid material is weighed into a 40-mL VOA vial. Ten (10) mL of methanol are added. The extract is shaken and allowed to settle. The extract may be centrifuged if necessary. A minimum of 5 µL and a maximum of 100 µL of extract may be used. The desired amount of methanol extract is injected into a gas-tight syringe containing 5 mL of reagent water spiked with the internal standard and surrogate mix. The contents are injected into the purge vessel through the 3-port valve or the autosampler is used. If 5 µL of extract diluted to 5 mL is over calibration range of the instrument, a secondary dilution of the methanol extract may be prepared in methanol until a concentration within the calibration range of the instrument is reached.

Record all information on the Sample Preparation Logsheet.

Appendix 3
Standard Preparation

All standard preparations are documented in the Volatiles Standards Preparation Logbook. Each entry must include the standard source or manufacturer, the standard lot number, the initial concentration, the final concentration, the solvent used, the date, and the analyst's initials. The expiration date and standard identification number are also recorded in the logbook and on the storage vial. The expiration date for stock and intermediate solutions is three months, although more frequent preparation may be required.

The Tune Check, the Internal and Surrogate Standard Mix, the Calibration Standards, and the Laboratory Control and Matrix Spike solution are prepared as follows:

1. The Tune Check Stock Standard is prepared by diluting 1 mL of a 2000 µg/mL 4-Bromofluorobenze standard to 10 mL with methanol. The final concentration is 200 µg/mL .

2. The Tune Check Working Standard is prepared by diluting 1.25 mL of the Tune Check Stock Standard to 10 ml with methanol. The final concentration is 25 µg/mL.

3. The Internal Standard and Surrogate Mix is prepared from a 2000 µg/mL 8260 Internal Standard Mix and a 2000 µg/mL 8240/60 Surrogate Standard Mix. One hundred twenty five (125) µL of each standard is diluted to 10 mL with methanol. The final concentration is 25 µg/mL. Ten (10) µL of this solution is added to all standards, samples, blanks, and QC check samples to give a final concentration of 50 µg/L.

4. The Calibration Standard is used for the initial 5-point calibration curve and the continuing calibration verification. The standard is prepared from nine separate stock standards that contain all the target compounds (listed in Appendix 6) at 2000 µg/mL in methanol. One hundred twenty five (125) µL of each standard is added to a 10 mL volumetric flask, and diluted to 10 mL with methanol. The final concentration is 25 µg/mL.

5. This standard is then used to prepare the various concentrations for the calibration curve. The amounts indicated in Table 1 below are injected into 5 mL of reagent water in a gas-tight syringe. Each level is also spiked with 10 µL of the Internal and Surrogate Standard Mix.

Table 1

Levels	Amt of 25ppm Calibration Standard	Final Conc
Level 1	0.2 µL	1 µg/L
Level 2	1.0 µL	5 µg/L
Level 3	2.0 µL	10 µg/L
Level 4	5.0 µL	25 µg/L
Level 5	10 µL	50 µg/L
Level 6	20 µL	100 µg/L
Level 7	40 µL	200 µg/L

6. The Laboratory Control Sample and Matrix Spike solution is prepared from a separate source than the Calibration Standard. It is used to prepare the Laboratory Control Sample and the Matrix Spikes. This standard is also used to perform the initial demonstration of proficiency and the initial calibration verification via Quality Control Sample analysis. The standard is prepared from five separate stock standards that contain all the target compounds (listed in Appendix 6) at 2000 µg/mL in methanol. One hundred twenty five (125) µL of each standard are diluted to 10 mL with methanol. The final concentration is 25 µg/mL.

Appendix 4
Method Detection Limit (MDL) Study

The method detection limit (MDL) or limit of detection (LOD) is the minimum concentration of a substance that can be identified, measured, and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix.

AETL's limit of detection procedure follows the EPA MDL procedure as described in 40 CFR part 136 Appendix B – Revision 1.11. See the SOP for Determination of LOD and LOQ for specific information regarding the procedures used in the calculation of this value. The LOD study shall incorporate all sample preparation procedures and shall be completed by analyte and matrix. LOD studies shall be conducted each time there is a significant change in the method, for the addition of new analytes, or if there is a significant change in the instrument type.

In brief, detection limit studies are performed using reagent water for aqueous matrices and clean sand for soil and solid matrices. Seven replicate standards are prepared using the calibration standard spiked at a level that is between 3 to 5 times the estimated MDL. The laboratory standard fortified blanks are analyzed and the mean recovery and standard deviation (SDEV) is calculated for each analyte. The MDL is then calculated as follows:

$$MDL = (3.143) \times SDEV$$

The Limit of Quantitation (LOQ) or Practical Quantitation Limit (PQL), must be equal to or greater than the LOD and MDL

Appendix 5
Corrective Action

The following table lists the criteria and corrective action for the QC samples. These limits are evaluated at least yearly and may be adjusted to reflect updated laboratory-established limits.

QC Sample	Frequency	Acceptance Criteria		Corrective Action
Method blank	One per matrix per batch	Less than ½ LOQ		1) Evaluate magnitude of sample results against the concentration of the method blank; if sample results exceed 3x the blank level, narrate to the client 2) Otherwise, re-prep and reanalyze batch if sample detections are within 3x window 3) Common laboratory contaminants are subject to a 10x window (acetone and methylene chloride)
System blanks	As needed	Less than ½ LOQ		1) This is a corrective action when a contaminated system is identified
Matrix Spike /Matrix Spike Duplicate	One per matrix per batch	Water 75%-125%	Soil 75%-125%	1) Evaluate results against the LCS 2) If the LCS was compliant; narrate failed MS to client 3) If the LCS was non-compliant, re-prep and reanalyze batch including spikes
RPD Limits	One per batch	RPD <15% for water, < 25% for soil		1) Check calculations 2) Narrate failed RPD to client
Surrogates	Every sample, method blank and standard	Water 75%-125%	Soil 75%-125%	1) Check calculations 2) Check LCS; if LCS recoveries within limits, narrate outlying surrogate(s) to client
Internal standards	Every sample, method blank and standard	Within 30 second RT window and response window of 50% to 200% of initial calibration internal standard (midpoint).		1) Evaluate system 2) Reanalyze sample 3) Report both analyses to the client
Laboratory Control Sample	One per matrix per batch	%Recovery within 75%-125% for 80% of compounds		1) Reanalyze LCS 2) If still non-compliant, reprep batch and reanalyze

A & R Laboratories

Standard Operating Procedure

Mobile Lab Operations

Revision 2.0

Sept. 30, 2015

Appoved by 

QA/QC Manager: _____ **Jenny J.**

Table of Contents

1. Scope and Application 3
2. Pre-Departure Tasks 3
3. Travel Tasks 3
4. Site Arrival Tasks 3
5. Site Departure Tasks 5
6. Fixed Lab Arrival Tasks 5

1. Scope and Application

1.1. This is a checklist of the tasks to be preformed daily by the mobile lab chemist

2. Pre-Departure Tasks

2.1. Print job information sheet and directions to the site.

2.2. Review the required analysis and matrices listed in the information sheet and start appropriate instrument calibration.

2.3. Check mobile lab supplies for proper containers, extraction solvents, COCs, gloves, water or other supplies that might be needed.

2.4. Check that the vapor sampling pump is charged for vapor jobs.

2.5. Check He, Air and H_2 tank levels.

2.6. If a large number of samples are expected bring an ice chest and ice for more storage.

2.7. Check oil level on generator(s) and main engine.

2.8. Check radiator water level on generator(s) and main engine.

2.9. Check battery water level on generator(s) and main engine.

2.10. Visually check tires for wear and low pressure. If low tire pressure is suspected check with a gauge.

2.11. Turn off air conditioners or heaters.

2.12. Start main engine then start generator(s). Note: Diesel engines may need to be preheated.

2.13. Wait until generators are running smooth, and then turn off breakers at the main panel to the mobile lab power.

2.14. Disconnect power, network and phone lines.

2.15. Turn air conditioners or heaters back on.

3. Travel Tasks

3.1. Drive safely and slow. Sharp turns and sudden stops may cause instrument damage or stall generator(s).

3.2. Stop for fuel as necessary. Keep all receipts for purchases of fuel, water, and other supplies.

4. Site Arrival Tasks

4.1. Let client know you have arrived and ask about parking or safety issues.

4.2. Confirm the requested analysis and matrices then go check the daily calibration.

4.3. Record the arrival time on the excursion log.

4.4. Analyze a method or ambient blank.

4.5. Assign the project an A & R Laboratories mobile lab job number and enter this into the excursion log/sample log.

4.6. Enter the lab and refrigerator temperatures.

4.7. Plug in the scale if needed and record the weight of the test masses into the excursion log/sample log.

4.8. Start a new chain of custody (COC)

4.8.1. Enter the mobile lab job number onto the top right hand corner.

4.8.2. Have the client enter the billing and reporting addresses.

4.8.3. Have the client log in samples to the chain of custody.

4.8.4. If the client provides samples to be run at the fixed lab do the following.

4.8.4.1. Mark the fixed lab analysis clearly and differently (e.g. X vs. *.)

4.8.4.2. Mark the turn around time needed.

4.8.4.3. Check that hold times can be met with the fixed lab, especially for 24hr or less hold times such as Methane and H2S Gas.

4.8.4.4. Call the fixed lab and request a fixed lab job number then place this number on the COC before giving the COC to the client.

4.8.4.5. Upon arrival to the lab place the samples in the appropriate fridge and photocopy the COC for the log in person.

4.8.4.6. This also applies to a pending analysis (i.e. run lead on the highest TPH)

4.8.4.7. If it is unknown if a fixed lab analysis will be added these steps will be taken care of by the fixed lab.

4.8.4.8. If a client knows that some samples will be only for the fixed lab, these samples can be logged on a separate COC with the fixed lab job number only.

4.9. Enter the project, sample, and analysis information into the excursion log/sample log as samples are added to the COC.

4.10. Proceed with sample analysis and/or sampling. Follow DTSC 2015 guidelines for vapor analysis, keep a copy of these guidelines in the mobile laboratory for reference. For water analysis use the in-house VOC SOP if you have an autosampler, if not, put your samples directly on the concentrator for analysis.

4.10.1. Ask the client or driller for the bore size, screen size, and well depths, open the soil gas purge time file and enter the screen size, bore radius, well depth(s), bulb volume, flow rate, tubing radius and any other appropriate information.

4.10.2. Shut-In Test: Prior to purge or sampling, a shut-in test should be conducted to check for leaks. Connect the vacuum pump system with the 250 ML sampling glass bulb, vacuum, then close the valve. Observe the vacuum gauge for at least one minute or longer. If there is any observable loss of vacuum, the fittings are adjusted until the vacuum in the sample train does not have noticeable dissipate.

4.10.3. Collect the sample at least 2 hours after the well was placed. Take your pump, glass bulb, and tracer compound and connect the bulb to the well

4.10.4. Make sure sampling pump flows at the appropriate rate, connect the pump to the bulb, turn pump on, open bulb and well. Place glove with tracer compound at the site of the well. Pump for the amount of time calculated for 3 purge volumes unless a different purge volume is requested by the client. Close well and bulb, turn off pump and bring sample glass bulb back to the mobile laboratory

4.10.5. Analyze the sample by using a syringe to collect 5cc or 50cc (the amount of sample volume taken depends on the contamination level of the site) from the sampling glass bulb and push that onto the concentrator during purging.

4.10.6. Keep track of time sampled, the time injected onto concentrator, and the volume injected for each sample on your sample log/excursion log. Note any dilutions made on your sample log/excursion log as well.

4.11. Provide the client printed results as needed. Make sure to double check every result and stamp any printouts “preliminary results.” Do not discuss results with anyone but the client unless told otherwise by the client

4.12. Without approval, do not provide the clients with chromatograms or any additional information that does not appear on the normal sample report.

5. Site Departure Tasks

5.1. Provide the client with a preliminary lab report of all the results. If they are not all finished yet then do one of the following.

5.1.1. If the project continues the next day this could be provided the following morning.

5.1.2. If you are not returning on the following day get a fax or email address to send the remaining results.

5.1.3. Let the client know when to expect the remaining results.

5.2. Provide the client with a business card in case they need to contact you.

5.3. Prepare any samples or ending QA/QC samples to be run on the drive back or at fixed lab arrival.

5.4. Record the departure time in the excursion log/sample log.

6. Fixed Lab Arrival Tasks

6.1. Turn off air conditioners or heaters.

6.2. Connect power, network and phone lines.

6.3. Turn on breakers at the main panel to the mobile lab power.

6.4. Turn air conditioners or heaters back on.

6.5. Continue to run any remaining samples or QA/QC samples.

6.6. Fax, call or email the client any additional sample data acquired during the travel time.

6.7. Transfer soil and/or water samples to the fixed lab refrigerator

6.8. Photocopy and place COCs in the login area for the fixed lab analysis if needed.

6.9. Restock the mobile lab with supplies if needed for the next day.

6.10. Synchronize the briefcase with the network server.

1.0 Introduction

This document presents the health and safety procedures that are intended to guide field activities conducted on behalf of the Oxnard Union High School District (OUHSD) for the Proposed Oxnard High School District High School No. 8 (the Site). The Site is located within the Maulhardt Ranch at 1853 Camino Del Sol in the City of Oxnard, California in the 93030 zip code area. The Site is a 50 acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25 acre property in the City of Oxnard, California. The provisions of this Site-Specific Health and Safety Plan (HASP) apply to employees of Tetra Tech, Inc. (Tetra Tech) and its subcontractors. Employees of the Federal, State, and local agencies, and the client are expected to observe the safety rules and regulations as established by their respective organizations, in addition to the requirements of this document (Tetra Tech is not responsible for enforcement of the conditions of this plan on these employees). The HASP is intended to provide health and safety procedures for work conducted as a part of the Tetra Tech work plan and/or standard procedures.

2.0 Key Personnel, Responsibilities, and Training

2.1 Key Personnel and Responsibilities

Project Manager: Jim Steele, Tetra Tech

Tetra Tech shall approve the HASP and ensure its implementation in the field. Tetra Tech is responsible for distributing the plan to all field personnel and to an authorized representative of each firm that has a subcontract with Tetra Tech to conduct onsite work. The PM is also responsible for implementing the provisions of this plan and its addenda. Implementation includes review of HASP requirements, review of field personnel compliance with Tetra Tech medical examination requirements, review of the provisions of this plan with Tetra Tech (and its subcontractors) field personnel involved with the project, provision for safety equipment, and submission of the requisite health and safety documents, including the forms in Attachment A, to the PM and Site Safety and Health Officer (SSHO) upon request.

Site Manager: Jason Dane, Tetra Tech

Tetra Tech will be responsible for the overall coordination and management of the field activities.

Site Safety and Health Officer: Jason Dane, Tetra Tech

The Tetra Tech SSHO is responsible for developing, onsite implementation, and enforcing this HASP. The SSHO's responsibilities include, but are not limited to, (1) maintaining safety equipment supplies, (2) verifying that all project personnel have met the training and medical surveillance requirements, (3) periodically inspecting the work area to ensure HASP compliance, (4) performing air quality measurements, (5) directing decontamination operations and emergency response operations until public emergency personnel arrive onsite, (6) setting up work zone limits, and (7) reporting all accidents, incidents, and infractions of safety rules and requirements to the PM and the Project Health and Safety Manager.

Alternate Site Safety and Health Officer: Jim Steele, Tetra Tech

The Tetra Tech alternate SSHO will perform the requirements of the SSHO when the primary SSHO is not onsite during project work.

2.2 Training and Medical Surveillance

All Tetra Tech and subcontractor personnel assigned to the project have, or will have, completed all training and medical surveillance requirements as required by 29 CFR 1910.120 and company policy.

No visitors will be allowed to enter the working zones without approval of the Site Manager (SM). The SM will be informed of all visitors expected to enter the working zones. Visitors who have no specific responsibility in the work zone will be restricted from entering the work zones.

Visitors and observers to the Site will receive the same information that is discussed at the daily tailgate meeting or an equivalent overview by the SSHO or designee. Visitors/observers will stay outside the exclusion zone and remain within the boundaries of the clear zone. Any visitor requesting to observe work within the exclusion zone must wear the appropriate PPE and fully comply with the HASP. If respiratory protection is necessary within the exclusion zone, visitors must provide documentation that they have been given medical clearances and respiratory fit testing within the past year.

3.0 Work and Site Description

3.1 WORK DESCRIPTION

This Preliminary Environmental Assessment (PEA) is being performed for the OUHSD for the Proposed High School No. 8 construction project (Figure 1). The field sampling assessment will consist of two parts: a direct push drilling program to collect soil gas, soil, and groundwater samples, and a surface soil sampling assessment. The direct push drilling program and surface sampling assessment will be conducted simultaneously. This approach will allow the soil sampling strategy to be modified based on the results of the soil gas sampling, if appropriate. The sampling strategy will not be modified without the approval of California Department of Toxic Substances Control (DTSC). The following subsections describe the rationale and scope of sampling for each item of environmental concern identified for the Site. The Site ground surface is relatively flat and will be in the process of being planted in strawberries during implementation of the PEA sampling program.

Tetra Tech will install soil gas monitoring probes at 25 locations at the Site (SV-1 through SV-25) as shown on Figure 2 to assess potential leakage of hydrogen sulfide and methane gas from the underlying oil bearing zones of the Oxnard Oil Field. There is a potential that volatile organic compound (VOCs) and gasoline range total petroleum hydrocarbons (TPHg) from motor fuel formerly stored in ASTs and USTs in the adjacent Maulhardt Ranch farm yard and residence area and in the Tin Shed have impacted soil gas at the Site. Tetra Tech will install soil gas monitoring probes at 5 locations at the Site (SV-26 through SV-30) as shown on Figure 2 to assess potential VOC and TPHg impacts to soil gas at the Site. Each soil gas location will include nested probe stations to sample soil gas from 5 feet and 15 feet below ground surface (bgs).

Following guidelines recommended in *Interim Guidance for Sampling Agricultural Fields for School Sites* (Ag Guidance) (DTSC 2008), surface soil samples will be collected on an approximate grid pattern at a density of approximately 1.2 sample locations per acre for a total of 60 locations: SS-1 through SS-60 (Figure 2). The 60 surface soil samples collected for organochlorine pesticides (OCP) analysis will be combined into 15 composite samples. Fifteen of the 60 surface soil samples will be selected for arsenic analysis in accordance with the Ag Guidance (DTSC 2008). In addition, 15 of the 60 surface soil samples will be selected for semivolatile organic compounds (SVOCs), poloyaromatic hydrocarbons (PAHs), and total petroleum hydrocarbons diesel extended (TPHde) analysis. The surface soil samples will be collected from 0 to 0.5 foot bgs. Surface soil sample SS-61 will be collected from 0 to 0.5 foot bgs from the soil beneath the pole-mounted electrical transformer located onsite adjacent to Camino Del Sol for polychlorinated biphenyl (PCB) analysis (Figure 2).

One hydropunch direct push groundwater sample will be collected from the upper two feet of the water table in each of the 5 direct-push borings (SV-26 through SV-30) located in the area of the Site adjacent to the Maulhardt Ranch residential and farmyard areas to assess for potential VOC and TPHg impacted groundwater (Figure 2). For this FSP it was assumed that groundwater will be encountered at 20 feet bgs.

3.2 SITE DESCRIPTION

Type: Spill ☐ Fire ☐ HW Site ☐ Industrial Facility ☐ Other ☑

Physical Description and Location: The Site is a 50 acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25 acre property in the City of Oxnard, California. The geographic coordinates of the Site are approximately Latitude 34° 12′ 23.08″ North, Longitude 119° 9′ 31.40″ West. Surface elevations at the Site are approximately 63 feet above mean sea level.

The Site is located in an area that is developed for commercial, residential, park, and agricultural land use. The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas (Figure 2). The Site is bounded by Camino Del Sol on the south with residential and commercial

development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. The entire Maulhardt Ranch (APN 214-002-059) is bound by Camino Del Sol on the South, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site.

The Site is located on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. The Transverse Ranges Province is a series of ranges and intervening valleys that extends for 325 miles "directly across the structural grain of California" (Oakeshott 1978).

Based on the Geologic Map of the Oxnard 7.5' Quadrangle, Ventura County, California the Site is underlain at the ground surface by Holocene deltaic alluvial fan deposits composed predominantly of clay with interbeds of sand and occasional gravel that were deposited by the Santa Clara River and extend to approximately 70 feet bgs. These are conformably underlain by upper Pleistocene alluvial sand and gravel deposits to approximately 400 feet bgs, and the marine – non marine clays and gravels of the Lower Pleistocene San Pedro formation to approximately 2,000 feet bgs.

The Site is located in the northern portion of the Oxnard Plain Pressure Basin within the Santa Clara River Hydrologic Unit. The Oxnard Plain Basin is a relatively flat alluviated area, which ranges in elevation from sea level to approximately 100 feet. The water bearing zones of the Oxnard Plain Basin are grouped into three major units including 1) the semi-perched aquifer and clay cap, 2) the Upper Aquifer System, and 3) the Lower Aquifer System. The semi-perched aquifer and clay cap consists of all of the alluvial materials above the Oxnard aquifer zone and extends to depths of approximately 75 feet bgs. Groundwater is generally expected within approximately 10 feet of the surface. However, groundwater may be shallower during periods of high precipitation or in heavily irrigated areas.

History: The current site owners of the Site are Maulhard Family as represented by Lynn and Richard Maulhardt. The OUHSD is in the process of negotiating acquisition of the school site with transfer of ownership. The review of historical aerial photographs and maps, and interviews with the current owners, indicate the Site and adjacent areas have been used for agricultural production (row crops) since at least the 1860s. The site is located within the Oxnard Oil Field, however no known active or abandoned oil wells are present on the Site. Additionally, no oil wells are present on 107.25-acre Maulhardt Ranch (APN 214-002-059) where the Site is located. The Oxnard Oil Field produces oil from depths of over 2,000 feet. Several plugged abandoned oil wells are located within one quarter mile of the Site. The nearest plugged and abandoned well is Maulhardt Community No. 11A, located approximately 850 feet south southwest of the Site on Imperial Street near the intersection of San Luis Street. Plugged and abandoned well Maulhardt Community No. 10 is located approximately 870 feet west of the Site just north of Camino Del Sol. Plugged and abandoned well Maulhardt Community No. 3 is located approximately 1,350 feet west southwest of the Site on North Lombard Street. Plugged and abandoned well Maulhardt Community No. 7 is located approximately 1,500 feet west northwest of the Site. Plugged and dry well Standard Schoelle No. 1 is located approximately 1,570 feet north east of the Site on Ribera Place. Plugged dry well A. Pfeiler Est. No. 1 is located approximately 1,600 feet northwest of the Site in West Village Park. Plugged and abandoned well Maulhardt No. 9 is located approximately 1,750 feet east of the Site. Numerous other abandoned wells are present further south and east of the site but were not described in this report.

Tetra Tech completed a Phase I Environmental Site Assessment (Phase I ESA) for the Site in March 2017 (Tetra Tech 2018) under California Department of Toxic Substances Control (DTSC) oversight to identify Recognized Environmental Concerns (RECs) with the objective of obtaining a "No Further Action" designation from DTSC for the Site. The following three RECs were identified for assessment in this PEA:

- Potential methane, and hydrogen sulfide (H_2S) toxic gas in near surface soil due to the underlying Oxnard Oil Field; and
- Potential OCPs, toxic metal (arsenic), and semi-volatile organic compounds in surface soil (approximately 0 – 2 feet bgs) due to former crop production activities.

Planned Development: A Site Plan prepared by WLC Architects dated February 19, 2018. The Site Plan shows the proposed new school site improvements as:

- An Administrative/Library Media Building occupying a foot print of 33,257 square feet (ft2);
- A Performing Arts Center occupying a foot print of 27,182 ft2;
- A Gymnasium Facility occupying a foot print of 42,638 ft2;
- A Multi-Purpose Building occupying a foot print of 15,773 ft2;
- An Academic Classrooms and Labs occupying a foot print of 37,438 ft2;
- A Pool Facility Shower and Lockers occupying a foot print of 1,387 ft2;
- A 162,100 ft2 Stadium, Stadium Team Rooms & Support Space occupying a foot print of 5,700 ft2 with 17,300 ft2 of home bleachers space and 10,600 ft2 of visitor bleacher space;
- A Child Care Facility occupying a foot print of 3,000 ft2;
- Approximately 269,800 ft2 of paved parking and access road along Camino Del Sol;
- Two Baseball Athletic Fields;
- Two Softball Athletic Fields;
- A Soccer Field;
- Paved Basketball Courts; and
- Paved Tennis Courts.

The proposed buildings will be of wood, metal frame, or concrete tilt-up construction with concrete slab-on-grade foundations. No other structures are planned. The proposed grading plan for the project and finish floor elevations were not provided to Tetra Tech for the preparation of this proposal. It is anticipated that the final grade will be similar to the existing grade and that the grading required to achieve the building pad subgrade will be minor and necessary only to provide adequate foundation and slab support and positive drainage away from the structures.

Status: Active ☑ Inactive ☐

Surrounding Population: The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood

is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue.

Have Nearby People Been Evacuated? Yes ☐ No ☑

Evacuation Initiated By: N/A

Evacuation Distance: N/A

Topography: Low Relief

Receiving Waters: Santa Clara River

Site Plan/Sketch Attached: Yes ☑ No ☐

Background Material Attached: Yes ☐ No ☑

4.0 Hazard Evaluation

The following subsections include potential hazards that may be present at the Site or created as a result of the operations being conducted at the site. The hazard evaluation shall be applied to the PEA field work as listed in Table 4.1.

4.1 KNOWN OR SUSPECTED PHYSICAL HAZARDS

There are a variety of physical hazards that may be present during the field activities. These hazards are described in greater detail in Table 4-1 below.

Table 4-1
Hazard Evaluation

Task	Hazards	Preventive Measures
PHYSICAL HAZARDS		
Drilling	Contact with heavy machinery, drill rig	Trained experienced operator, equipment inspected prior to use; when necessary, appropriate work methods and water mist will be utilized to keep dust down. Borehole locations may need to be relocated in the field based on their proximity to subsurface utilities. Underground Service Alert (dial "811") will be contacted and a service ticket will be acquired 48 hours in advance of any intrusive work to be performed at the site. Only project personnel in work area. Keep hands and feet away from moving machinery. Loose clothing or jewelry will not be worn in areas where it could get caught in moving machinery. Modified level D PPE, including steel-toed boots, will be worn during sampling activities. Hard hats will be worn whenever an overhead hazard is present. Use spotters. Review and comply with Tetra Tech's Safe Drilling Practices (Attachment B) and 8 CCR 2946.
Soil and groundwater sample collection / handling	Physical contact with soil and groundwater	Level D PPE with nitrile gloves during sampling tasks, adhere to good personal hygiene and work methods to prevent dermal contact and keep hands clean.
Heat stress	Heat stress	Personnel should take rest breaks, as necessary, and drink electrolyte-replacement fluids. Review and comply with Attachment C, Tetra Tech Heat Stress Safe Work Practices and Prevention of Sun Exposure.
Cold stress	Cold stress	The SSHO will take steps to reduce cold exposure including a designated area/shelter to warm up during breaks and implementing a work/warm-up schedule, minimizing the length of time of exposure and maximizing the work activities during the warmest parts of the day. Personnel should take adequate rest breaks and drink warm, replacement fluids. Review and comply with Tetra Tech's General Safe Work Practices for Cold Stress provided in Attachment C.

Table 4-1
Hazard Evaluation

Task	Hazards	Preventive Measures
General	Noise hazards	Prior to any noise-producing activities onsite, such as operation of heavy equipment (drill rig), the SSHO will notify all personnel of the potential exposure to high noise levels. Hearing protection such as earplugs will be available at the Site for use by personnel working in high noise areas. This protection will be mandatory for all personnel who are exposed to noise levels in excess of 85 decibels during Site activities. The SSHO will designate appropriate hearing protection based on noise levels and length of exposure.
General	Back pains and strains	Proper lifting techniques shall be used when lifting objects. In addition, the SSHO will reiterate proper procedures for lifting heavy objects.
	Slip/trip/fall, vehicles	Good housekeeping practices. Clear area before working. Level D PPE at all times. Equipment and working personnel will not be allowed to encroach the control boundary. Establish traffic and Site control protocols. Place traffic cones when working in traffic areas and a person to direct traffic around the work zone, if necessary. Review and comply with Attachment D, Tetra Tech General Safe Work Practices for Field Work.
	Dermal/eye hazards	All personnel are required to wear the appropriate PPE protection level to prevent dermal/eye hazards from dust and soil.

4.2 KNOWN OR SUSPECTED CHEMICAL HAZARDS

Conditions Identified in the Phase I ESA

According to the Proposed Highschool No. 8 Phase I ESA (Tetra Tech 2018) the following potential chemical hazards were identified in the area of the Site where the Geotechnical drilling will occur:

1. Potential toxic soil gas (methane and H_2S) from potential formation leakage from the Oxnard Oil Field;
2. Potential residual organochlorine pesticides (OCPs) absorbed in soil from former agricultural production activities;
3. Potential arsenic in pesticides formerly used in agricultural production activities; and
4. Potential VOCs absorbed in soil from former use of fuel oil in smudge posts for frost abatement agricultural production activities.
5. Potential SVOCs, VOCs, and TPH dissolved in groundwater from former storage of fuels in former aboveground and underground storage tanks.

Maulhardt Ranch Operations

The Maulhardt Ranch and Site area will be undergoing preparation to plant strawberries fumigation by Westcoast Berry Farms at the same time that the drilling field work is performed. This poses a potential physical hazard to field operations. It was agreed at a planning meeting at the Site on July 2, 2018, that the farm work would be sequenced so that it would not be performed concurrently in areas where field sampling operations were being performed, and that the drilling operations would be only on existing site roads at the location shown Figure 2. The Tetra Tech Health and Safety Officer shall coordinate Westcoast Berry Farms daily to insure that proper field coordination occurs to ensure that field operations are performed in manner that does not conflict with farm operations

General

Other hazards and safety-related issues, such as Site conditions and planned daily activities, will be discussed and documented in the daily tailgate safety meeting (Appendix A). The initial tailgate safety meeting will include a discussion of the requirements outline in this HASP.

Hazard Level:	High	☐	Moderate	☐	Low	☑	Unknown	☐

MSDS Sheets attached for informational purposes only: Yes ☐ No ☑

Methane Gas

Methane is a colorless, odorless gas that may be present in oil fields. It is not a toxicological hazard; however, it can potentially represent a safety concern for potential fire or explosion hazard and in confined spaces pose an asphyxiation hazard. Fire or explosion hazards are greatest at methane concentrations between the lower explosive limit (LEL) of 5 percent (%) by volume and upper explosive limit (UEL) of 15%. Methane can cause suffocation by simple asphyxiation at high concentrations by displacing available oxygen in the atmosphere. Initial effects of oxygen deficiency can be observed in individuals exposed to atmospheres containing 4% methane, which may reduce available oxygen to 17%. Earliest observed effects include deteriorated night vision, increased breathing volume, and accelerated heartbeat (ATSDR 2001). This methane concentration assumes that no other asphyxiants, such as carbon dioxide, are present to further reduce available oxygen. The recommended exposure limit is 10 ppm. Based on review of the soil vapor assessment performed for the adjacent Rio Rosales PEA in 2002 (ENSR International [ENSR] 2002) that assessed the same potential methane gas hazard posed by the Oxnard Oil Field, it is not likely that methane gas will be encountered at hazardous concentrations at the Site.

Hydrogen Sulfide Gas (H_2S)

Hydrogen sulfide (H_2S) is a colorless gas that has a strong rotten egg-like odor at low non-life threatening concentrations that can be encountered in oil fields. H_2S gas causes a wide range of health effects. Workers are primarily exposed to H_2S by breathing it. The effects depend on how much H_2S you breathe and for how long. Exposure to very high concentrations can quickly lead to death. H_2S is a highly flammable, explosive gas, and can cause possible life-threatening situations if not properly handled. In addition, H_2S gas burns and produces other toxic vapors and gases, such as sulfur dioxide. The NIOSH Recommended Exposure Limit (REL) for H_2S is 10 ppm and the NIOSH Immediately Dangerous to Life and Health (IDLH) level is 100 ppm.

The OSHA PELs are 20 ppm (General Industry Ceiling Limit), 50 ppm (General Industry Peak Limit), 10 ppm (Construction 8-hour Limit), and 10 ppm (Shipyard 8-hour Limit). The LEL for H_2S gas is 4.5 percent (%) by volume and UEL is 45.5 %. Based on review of the soil vapor assessment performed for the adjacent Rio Rosales PEA in 2002 (ENSR 2002) that assessed the same potential H_2S gas hazard posed by the Oxnard Oil Field, it is not likely that H_2S gas will be encountered at hazardous concentrations at the Site.

Organochlorine Pesticides

This class of compounds causes irritation of the upper respiratory tract and tongue, lips, and face, may cause tremor, apprehension, dizziness, or confusion by skin absorption, and malaise, fatigue, headache, and convulsions if ingested. The permissible exposure limit (PEL, Cal-OSHA) for these compounds is as low as 0.1 milligram per cubic meter (mg/m^3). These compounds may have been released to the Site for crop production prior to 1972. Some of these compounds are known or suspected human carcinogens. They have a low vapor pressure and will not likely be volatilized if contacted during assessment activities. The likely exposure route is through dermal contact and inhalation of soil dust. Based on experience at similar sites, any OCPs used at the Site were applied to plants at the ground surface and will be limited to the soil encountered from the ground surface to approximately 2 feet below ground surface.

Arsenic

Arsenic as an example of metals – Acute lead exposure can lead include vomiting, abdominal pain and diarrhea. These are followed by numbness and tingling of the extremities, muscle cramping and death, in extreme cases. Long-term exposure to high levels of inorganic arsenic (e.g. through drinking-water and food) are usually observed in the skin, and include pigmentation changes, skin lesions and hard patches on the palms and soles of the feet (hyperkeratosis) and may be a precursor to skin cancer. In addition to skin cancer, long-term exposure to arsenic may also cause cancers of the bladder and lungs. There is no NIOSH REL for arsenic. The OSHA PEL is a time weighted average of 0.5 milligrams per cubic meter. The likely exposure route is through dermal contact and inhalation of soil dust. Based on experience at similar sites, any arsenic used at the Site was applied to plants at the ground surface and will be limited to the soil encountered from the ground surface to approximately 2 feet below ground surface.

TPH

Petroleum hydrocarbons such as diesel, lube oil, and hydraulic oil may cause irritation of the eyes, skin, and mucous membranes. Symptoms include headache, fatigue, blurred vision, dizziness, slurred speech, confusion, and convulsions. Exposure may lead to possible liver and kidney damage.

VOCs

VOCs in general cause irritation to eyes, skin, and upper respiratory system. If inhaled, they may cause dizziness, headache, nausea, or difficulty in breathing. Acute vapor exposures to VOCs can cause symptoms ranging from coughing to transient anesthesia and central nervous system depression.

SVOCs

Long-term exposure to SVOCs can lead to cancer. The mean air odor threshold for naphthalene is 0.084 ppm. Because of the low odor threshold, respirator breakthrough may occur even when concentrations are below the PEL. The potential source for these SVOCs is from fuel oil formerly used in smudge pots for periodic frost abatement in citrus orchards that formerly occupied the Site (prior to the 1970s). The entire Site was regraded between 2001 and 2003 when strawberry cultivation was initiated. Therefore, any residual fuel oil SVOCs in the Site soils are likely to be degraded, dispersed, and adsorbed onto soil. The likely exposure route is through dermal contact and inhalation of soil dust. Based on experience at similar sites, any smudge pot fuel oil used

at the Site was released to the ground surface in limited quantities and will be limited to the soil encountered from the ground surface to approximately 2 feet below ground surface.

4.3 POTENTIAL EXPOSURE LIMITS

The following exposure limits are based upon some of the compounds potentially present at the Site.

Table 4-2

Exposure Limits for Compounds Potentially Present at the Site

Compounds	10 % Lower Explosive Limit	OSHA		Immediately Dangerous to Life or Health (IDLH)	NIOSH	
		Permissible Exposure Limit (PEL, 8-hr TWA)	Ceiling (C) or Short-Term Exposure Limit (STEL)		Recommended Exposure Limit (REL, 10-hr TWA)	Ceiling (C) or Short-Term Exposure Limit (STEL)
TPH	-	-	-	-	-	-
Arochlor 1254 (PCBs)	-	0.5 mg/m^3 (skin)*	-	5 mg/m^3	0.001 mg/m^3	-
Endosulfan (OCP)	-	-	-		0.1 mg/m^3	-
Benzene (VOC)	-	1 ppm	5 ppm (STEL)	500 ppm	0.1 ppm	1 ppm (STEL)
Toluene (VOC)	-	10 ppm*	300 ppm (C)	500 ppm	100 ppm	150 ppm (STEL)
PCE (VOC)	-	25 ppm*	100 ppm (STEL)*	150 ppm	-	-
TCE(VOC)	-	25 ppm*	200 ppm (C)	200 ppm	25 ppm	-
1,2-DCE (VOC)	-	200 ppm	-	1,000 ppm	200 ppm	-
Naphthalene (SVOC)	-	10 ppm	-	250 ppm	10 ppm	15 ppm (STEL)
Arsenic	-	0.50 mg/m^3	-	-	-	-
Methane	0.5%	0.10 ppm	-	100 ppm	10 ppm	
H_2S	0.45%	0.10 ppm	-	100 ppm	10 ppm	-

Notes:

* = California OSHA measurement

- = not established

mg/m^3 = milligrams per cubic meter

NIOSH = National Institute for Occupational Safety and Health

OSHA = Occupational Safety and Health Administration

PCBs = polychlorinated biphenyl

ppm = parts per million

SVOC = semivolatile organic compound

TWA = time-weighted average

5.0 Monitoring

Various types of monitoring, including air, noise, and heat stress monitoring will be conducted during field work, as appropriate.

5.1 AIR MONITORING

The results of the Tetra Tech Phase I ESA for the Site (Tetra Tech 2018) indicates that the surficial soil (from the ground surface to approximately 2 feet bgs) may be impacted with OCPs, arsenic, and SVOCs absorbed onto it. During drilling activities, the ambient air within the breathing zones of the workers will be monitored for dust generation by drilling and other activities to mitigate the inhalation hazard posed by OCPs, arsenic, and SVOCs absorbed onto soil. If dust generation occurs, the soils in the work area will be moistened with the potable carried by the HSA and CPT drilling rigs to suppress it. Groundwater occurs between 5 and 10 feet bgs and the surface and near surface soils at the Site are generally moist due to crop irrigation. It is anticipated that HSA drilling soil dust generation will be minimal.

During field activities, the ambient air within the breathing zones of the workers will be monitored. Air monitoring will be conducted in the field using an organic vapor analyzer, equipped with a photo-ionization detector (PID) (MicroPID/Minirae 3000 or equivalent). The PID will be calibrated with isobutylene and zeroed with hydrocarbon free air following the manufacturer's instructions. Since benzene has the most stringent PEL (1 ppm), benzene will provide the criteria for PPE upgrade activities. Since these benzene has the most stringent action level, and has the potential to be detected, it has been chosen for field monitoring to be conservative. VOCs in the breathing zone during drilling and soil sampling will be monitored and recorded at a minimum frequency of one reading approximately every 15 minutes.

During field activities, the ambient air within the breathing zones of the workers will be monitored for the percentage of methane and H_2S a Lantec GEM 2000 and compared to 5 percent the Lower Explosive Limits for these gases. If 5 percent the Lower Explosive Limit for either methane and H_2S is encountered, work will cease, the area will be evacuated, and vapor suppression controls will be implemented until the gas concentrations are reduced to less than 5 percent the LEL. The methane and H_2S concentrations will be monitored breathing zone during drilling and soil sampling at a minimum frequency of one reading approximately every 15 minutes.

5.2 NOISE MONITORING

In most cases, high noise levels at a work site are caused by heavy equipment (drill rigs) or sources associated with the work site, such as factory equipment and vehicles. When noise levels are suspected to equal or exceed an 8-hour time-weighted average (TWA) of 85 decibels on an A-weighted scale in slow response mode (85 dBA), the SSHO will evaluate the work area to characterize the noise source and exposure levels. A sound level meter may be used for the evaluation or the SSHO may use the simple rule-of-thumb test to determine if noise levels are in excess of 85 dBA. The test requires the SSHO to determine how loud he or she must speak to be heard at an arm's length from another person. If the SSHO must raise his or her voice to be heard, the average noise level likely exceeds 85 dBA.

When employees are exposed to sound levels that exceed the action level of 85 dBA, hearing protection must be worn and will be available onsite. The protection may be ear plugs or muffs and must provide sufficient attenuation to limit noise.

5.3 HEAT STRESS MONITORING

The stress of working in a hot environment can cause a variety of illnesses, including heat exhaustion or heatstroke, which can be fatal. PPE can significantly increase heat stress. To reduce or prevent heat stress,

frequent rest periods and controlled beverage consumption to replace body fluids and salts will be provided as required under 8 CCR 3395. At least one or more areas with shade will be available to employees when temperatures exceed 85 degrees Fahrenheit for direct blockage of sunlight. A heat illness prevention checklist (provided as Attachment E) will be utilized to determine the shade and water requirements for personnel. Additionally, quantitative physiological monitoring for heat stress will be conducted. Physiological monitoring for heat stress includes heart rate as a primary indicator and oral temperature as a secondary indicator. Monitoring will begin when the ambient air temperatures reach 70°F. To determine the initial monitoring frequency for Levels C and D protection, after a work period of moderate exertion, use the following guidelines provided in Table 5-1.

Table 5-1
Heat Stress Monitoring Frequencies

Adjusted Temperature[1]	Level D PPE	Level C PPE
90°F or above	After 45 minutes	after 15 minutes
87.5° to 90°F	After 60 minutes	after 30 minutes
82.5° to 87.5°	After 90 minutes	after 60 minutes
77.5° to 82.5°F	After 120 minutes	after 90 minutes
72.5° to 77.5°F	After 150 minutes	after 120 minutes

[1]Adjusted air temperature (°F) = observed temp + (13 x percent sunshine)

The following procedures and action levels are to be used for the physiological monitoring of heat stress:

Heart rate: Heart rate (HR) will be measured by the radial pulse during 30 seconds as early as possible in the resting period. The heart rate at the beginning of the rest period should not exceed 110 beats per minute (bpm). If the HR is in excess of the above value, the next work period will be shortened by 33% while the length of the rest period stays the same. If the heart rate is in excess of 110 bpm at the beginning of the next rest period, the following work cycle will be further shortened by 33%.

Personnel will be trained to recognize the symptoms of heat stress and the appropriate action to take. Even though physiological monitoring is not always necessary, it is essential that personnel understand the significance of heat stress and how to recognize it.

Some of the symptoms that indicate heat exhaustion are:

- Clammy skin
- Weakness, fatigue
- Lightheadedness
- Confusion
- Slurred speech
- Fainting
- Rapid pulse

- Nausea (vomiting)

If these conditions are noted, the following steps should be performed:

1. Remove the victim to a cool and uncontaminated area;
2. Remove protective clothing; and
3. Give water to drink, if conscious.

Symptoms that indicate heat stroke include:

- Staggering walk;
- Mental confusion;
- Hot, dry skin, temperature rise (yet person may feel chilled);
- Convulsions;
- Incoherent, delirious; and
- Unconsciousness.

If heat stroke conditions are noted, immediately perform the following steps:

1. Remove victim to a cool, uncontaminated area.
2. Cool the victim, whole body, with water, compresses and/or rapid fanning.
3. Give water to drink, if conscious.

Transport the victim to the designated medical facility for further cooling and monitoring of body functions. **HEAT STROKE IS A MEDICAL EMERGENCY**!

Radioactivity: N/A Total Organic Vapors: N/A

Dust Monitoring: Yes ☑ No ☐ Note: Visual evaluation of potential soil cuttings dust generation during HSA drilling in surface and near surface soils. CPD sounding does not generate significant air-born soil particle dust.

5.4 ACTION LEVELS

Table 5-2
Monitoring Action Levels

Contaminant	**Activity**	**Monitoring Device**	**Minimum Frequency**	Action Level	**Action**
Benzene	Drilling and all sampling activities	PID	15 min	1 -25 ppm	Modified Level D
		PID	15 min	25 - 50 ppm	Upgrade to Level C PPE and monitor for Benzene with the PID.
		PID	15 min	> 50 ppm	Stop work, evacuate area, implement vapor suppression controls.

Table 5-2
Monitoring Action Levels

Contaminant	Activity	Monitoring Device	Minimum Frequency	Action Level	Action
Methane	Drilling and all sampling activities	Lantech 2000	15 min	0.5% LEL	Stop work, evacuate area, implement vapor suppression controls.
H_2S	Drilling and all sampling activities	Lantech 2000	15 min	0.45% LEL	Stop work, evacuate area, implement vapor suppression controls.
Noise	Heavy equipment activities	Noise Level Meter	As deemed necessary by SSHO	> 85 dBA	Don hearing protection.
Heat	All field activities	Heart rate and air temperature	Monitor at start of rest periods	Air temp > 70°F Heart rate at 110 beats per minute	Follow work/rest regimens as necessary and drink liquids (water/electrolyte-replacement fluids) throughout the workday.

Notes:
ºF = degrees Fahrenheit
dBA = decibels
min = minutes
LEL = Lower Explosive Limit
PID = photo-ionization detector
PPE = personal protective equipment
ppm = parts per million

5.5 MONITORING RECORD-KEEPING

The SSHO and PM will be responsible for establishing and maintaining records of all required monitoring as described below:

- Employee name and task description;
- The date, time, pertinent task information, such as drilling location and meter reading, and relevant comments written in an instrument logbook that will be available for inspection at all times;
- A description of the analytical methods and equipment used and calibration data;
- Type of personal protective equipment worn; and
- Any engineering controls used to reduce exposure.

5.6 EQUIPMENT CALIBRATION

All monitoring equipment will be calibrated daily in accordance with manufacturer's recommendations before use by the SSHO or designee. Re-calibration will take place if the monitoring equipment becomes contaminated from high levels of methane gas or other COPC's.

6.0 Personnel Protection

Use of personal protective equipment will be required for protection of Site personnel during the implementation of specific tasks. A summary of the required PPE is provided in Table 6-1 below.

Minimum Level of Protection: A ☐ B ☐ C ☐ D ☑

Respiratory Protection: SCBA ☐ Airline ☐ Air-Purifying ☐ Not Required ☑

If Air-Purifying: Canister ☐ Cartridge ☑

Canister/Cartridge Type: Organic Vapor/Acid Gases Cartridges/P100 Filter (cartridges must be changed daily) if upgrade to Level C occurs.

Suit Type: Work Clothes Boot Type: Steel-Toe

Protection Type: Level D Eye Protection Type: Safety Glasses

Glove Type(s): Nitrile gloves

Other Protective Dress: Hard hat and high-visibility vest.

Justification for Level of Protection (state decision criteria): Based on hazard level.

Change in Level of Protection: Upgraded ☑ Downgraded ☐

Up or Downgraded to: B ☐ C ☑ D ☐

Reason Upgrade to Level C if PCE/TCE is greater than 25 ppm in the Breathing Zone as determined by PID monitoring (Refer to Action Levels in Table 5-2).

Specific Changes Made: Wear air-purifying respirator with combination cartridges for upgrades due to VOCs, Tyvek suit, North Silver shield gloves or equivalent, and boot covers or rubber boots with a boot wash-station.

Heat/Cold Stress Monitoring: Yes ☑ No ☐

Additional Site-Specific Procedures: Utilize Tetra Tech's Heat Stress Safe Work Practices (from Tetra Tech's Corporate Health and Safety Manual, October 2008) which is included as Attachment C. Ensure employees drink plenty of water and take breaks during work activities.

Table 6-1
Summary of Required PPE

Equipment Type	Level C Protection	Level D Protection
Respiratory Protection	No	No
Air Purifying	N/A	N/A
Canister/Cartridge Type	N/A	N/A
Suit Type	Tyvek	Work clothes
Boot Type	Steel-toe/shank	Steel-toe/shank
Head Protection	Hard hat when overhead hazards present	Hard hat when overhead hazards present
Glove Type	North Silvershield (or equivalent)	Leather/latex/nitrile
Eye Protection Type	Safety glasses/goggles	Safety glasses/goggles
Hearing Protection	Muff type or foam inserts	Muff type or foam inserts when warranted

7.0 Decontamination / Site Control Procedures

If necessary, decontamination will be performed for personnel and/or equipment to prevent contaminant migration and to protect project personnel.

7.1 DECONTAMINATION

Sketch of Site Zones Attached: Yes ☐ No ☑

Will be established in the field: Exclusion, decontamination, and support zones will be established at the Site. Work zones will be delineated using traffic cones and barrier tape. Only authorized employees will be allowed to enter the work area.

Decontamination Equipment: Material for the decontamination of hands and sampling equipment will include non-phosphate detergent (Liquinox), water, buckets, drums, and scrubbers.

Personnel Decontamination Procedures: Personnel will be required to properly remove and dispose of contaminated gloves. Hands and arms will be washed after each sampling event, prior to any break, and at the end of each shift.

Equipment Decontamination Procedures: Reusable sampling equipment will be decontaminated between sampling events to prevent cross contamination.

7.2 RESIDUALS MANAGEMENT

Type of Residuals: Disposable Gear/Clothing ☑ Decon. Materials ☐ Soils ☑ Water ☐

Wastes: Solid ☑ Liquid ☐ Gas ☐

Type of Containers: Drums ☐ Bags ☐ Tank ☐ Cylinders ☐ 5-Gallon Bucket☐

Disposal Methods: Only the HSA drilling will generate soil cuttings. The results of the Tetra Tech Phase I ESA for the Site (Tetra Tech 2018) indicates that the surficial soil (from the ground surface to approximately 2 feet bgs) may be impacted with OCPs, arsenic, and SVOCs. The soil beneath the surface soils is considered to be noncontaminated. Unless field logging indicates contaminated soil conditions have been encountered in soils below 2 feet depth, the soil cuttings from below approximately 2 feet bgs will be considered to be noncontaminated and suitable for backfilling the HSA borings in accordance with the boring permit obtained from the City of Oxnard (City of Oxnard 2018) from the total boring depth to approximately 2 feet bgs. The soil cuttings generated from above 2 feet bgs will be used to backfill the boring from 0 to 2 feet bgs. Disposable PPE and equipment will be bagged, sealed, and properly disposed.

8.0 Emergency Information and Emergency/Contingency Plan

Although it is unlikely that a catastrophic event (fire, explosion, chemical release) or severe medical emergency will occur during field investigation activities, this emergency action plan has been prepared and will be implemented by the PM and SSHO, if such critical situations arise.

The SSHO will be onsite during Site activities. The PM and the SSHO will be responsible for initiating the emergency action plan and alerting any required medical and emergency services. When emergency situations occur, which are handled onsite without the assistance of offsite personnel, the SM will be informed immediately of the emergency at hand, no matter how insignificant it may seem to personnel involved.

All emergency actions as well as emergency and non-emergency accidents/injuries will be documented by the SM, or other competent individual under the direction of the PM, in accordance with all applicable regulations. The regulatory agency PM will be notified and a written report will be provided to the regulatory agency. Additional onsite requirements will include, but not be limited to:

- All field personnel will be instructed regarding the use of all field safety equipment prior to the start of work.
- All personnel will be instructed in emergency communication procedures appropriate to the project.
- A first aid kit will be onsite during any field operations.
- A cellular phone will be available at the Site.
- At least one of the field crew (Site Safety Officer/Manager) will be trained to perform First Aid and CPR.

8.1 CONTINGENCY PLAN FOR EMERGENCIES

Emergency routes and meeting locations are onsite, in various locations depending upon work areas, and will be finalized by the SSHO in the field and conveyed to all field personnel during the daily tailgate safety meeting (Attachment A) prior to the start of work.

In the event of an illness or accident resulting in physical injury, call 911 immediately and perform first aid commensurate with training and seriousness of the injury only in the event of a life threatening injury. Severely injured personnel are to be transported only by emergency service personnel and/or by ambulance personnel, unless a life-threatening condition is judged to exist that must be addressed immediately. If emergency or ambulance personnel transport injured personnel to the hospital, the hospital will be selected at the discretion of the emergency or ambulance personnel. The hospital selected may or may not be the hospital listed in *Subsection 8.4* of this document. At the hospital, a physician's attention is mandatory regardless of how serious the injury appears.

The PM and SSHO are to be notified by the field inspector, as soon after the injury as practical, regarding the nature of the accident. A written report is also to be prepared and submitted by the field inspector to the PM and SSHO within 24 hours of the accident. If the field inspector is unable to make the report (due to injury), an individual designated by the SSHO shall make the report.

In the event of a fire or explosion, notify the fire department immediately by dialing 911.

In the event of any accident involving serious injury of sufficient magnitude, work at the site shall *cease* until the PM and SSHO (or a designee) has completed a review of the events and site conditions and has authorized work to resume.

8.2 SPILL CONTAINMENT PROCEDURES

Any spills/leaks from drilling equipment or sampling equipment will be properly contained with absorbent and cleaned up immediately. The OUHSD will be notified of any impacts. General housekeeping activities will be used to minimize any potential for spillage of soils or water from investigation activities on site.

8.3 EMERGENCY CONTACT NUMBERS

Contact information for emergency medical, fire, and other agency and support to be used at this Site in the event of a catastrophic event or emergency are provided below.

Police/Fire Department	911
Poison Control Center	(800) 222-1222
Underground Service Alert	(800) 227-2600
Centers for Disease Control	(800) 311-3435
National Response Center	(800) 424-8802
St. John's Regional Medical Center	(805) 988-2500

8.4 MEDICAL FACILITY INFORMATION:

The closest Medical Center is St. John's Regional Medical Center, 1600 N Rose Ave, Oxnard, CA 93030. A route to hospital map is provided in Attachment F. The directions from the Site to the St. John's Regional Medical Center are:

1. Depart Site by turning right and proceed approximately 500 feet west on Camino Del Sol and turn right onto Rose Avenue;
2. Proceed approximately 0.6 mile north on Rose Avenue, turn right onto Socorro Way;
3. Proceed approximately 0.1 mile East on Socorro Way, turn left onto the St. John's Regional Medical Center property and proceed approximately 0.1 mile north and
4. Turn right into the to the St. John's Regional Center Emergency Room entrance driveway. Follow signs in the driveway to the emergency room e.

DAILY TAILGATE SAFETY MEETING AND SITE LOG FORM

TETRA TECH, INC.

DAILY TAILGATE SAFETY MEETING FORM

This form describes the requirements and responsibilities for implementing an incident and injury-free workplace by providing guidance on the daily tailgate safety meeting discussion.

Daily tailgate safety meetings shall be held in a safe location at the start of each work day, shift or task change. The daily tailgate safety meetings shall review the planned work activities for the day, discuss and resolve the risks and mitigations, discuss any health, safety, security and environment (HSSE) concerns and raise the HSSE consciousness of each worker before they start work.

The Site Manager (SM) or Site Safety and Health Officer (SSHO) will decide on the location of the daily tailgate safety meetings based on the overall safety of the individuals attending the meeting. Maintaining minimal background noise and establishing more comfortable areas for the meeting location is also preferred. Ultimately, the weather and surrounding environment could be the most limiting factor on the location of the meeting.

For this project, the Project Manager (PM) will:

- Verify that all work activities for this project are consistent with Document Control Number (DCN) 01-05, Health and Safety Management System, as well as any associated practices and permit requirements.
- Carry out all duties specified in the Health and Safety Management System.
- Ensure that all site personnel involved in a work activity are competent and correctly prepared for the work they will perform.
- Verify or delegate the responsibility to verify that the daily toolbox meeting is carried out.

For this project, the SM will:

- Carry out all duties specified by the PM, as consistent with DCN 01-05.
- Conduct or supervise all work identified and agreed upon in the scope of work.
- Participate in the daily tailgate safety meeting whenever the scope of work requires a permit to work.
- Verify in the daily tailgate safety meeting, the specific roles and responsibilities of the SM and SSHO are clearly understood by all members of the workforce.

For this project, the SSHO will:

- Carry out all duties specified by the PM, as consistent with DCN 01-05.
- Be accountable for the safe, responsible and reliable delivery of all work activities.
- Lead or designate an alternative conductor to lead the daily tailgate safety meeting.
- Verify in the daily tailgate safety meeting that workers have a clear understanding of the scope of work, hazards, controls and mitigations of the project.
- Verify in the daily tailgate safety meeting, the specific procedures and policies relevant to the project and are clearly understood by all members of the workforce.

Either the SSHO or SM will facilitate the daily tailgate safety meeting each day. At least one, if not both individuals shall have a thorough understanding of the following:

- Tetra Tech's hazard/risk assessment process
- The site-specific HASP.

- The contract scope of work.
- The subcontractors on site and their health and safety officer.
- Site requirements of the client.

These meetings prior to starting work shall include, but are not limited to:

- The completion of the daily tailgate safety meeting form.
- A review of relevant Health and Safety Plan (HASP) elements.
    - Reviews of the HASP shall be performed when updated, modified or when deemed necessary by the SSO or FTL.
- A review of all applicable permits.
- Any applicable Hazard Communication (HAZCOM) information review, including MSDSs, and labels.
- A review of 'Stop Work' procedures and responsibilities.
- Address any risks arising from the site walk, including but not limited to, equipment and materials use and location.
- Complete and review a Job Safety Analysis (JSA), appropriate Safe Work Practices (SWP) and applicable Activity Hazard Analysis (AHA) for the tasks to be completed.
- Implement the controls set forth in the JSA, SWP and AHA. Verify that all parties on site have a complete understanding of the work plan and controls that are in place.
- In addition, allocate resources and complete permits.

TETRA TECH, INC.

DAILY TAILGATE SAFETY MEETING FORM (Continued)

Date: _____ Time: _____ Project No.: _____

Client: _____ Site Location: _____

Site activities planned for today: _____

Does each job and task have a valid SWP, AHA, or JSA associated with it? Yes ☐ No ☐

Has everyone signed off on the HASP? Yes ☐ No ☐

Have newly identified risks been controlled and documented? Yes ☐ No ☐

Do not proceed unless the answer to all the above questions is Yes.

Current weather conditions: _____

Safety Topics Discussed
Review of Stop Work Authority
Are there multiple operations on site? Yes ☐ No ☐ If yes, describe.
Does the work activity require a MoC? Yes ☐ No ☐ If yes, has the MoC been authorized by the PM? Yes ☐ No ☐
Permits required? Yes ☐ No ☐ If yes, list permits covered in safety meeting.
Protective clothing and equipment for activities planned for today:
Chemical, physical, and biological hazards identified for activities planned for today:
Equipment hazards identified for activities planned for today:
Review of emergency procedures from HASP (including muster point locations):

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/31/2017 has revealed that there are 11 ENVIROSTOR sites within approximately 1 mile of the target property.

SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the SLIC list, as provided by EDR, has revealed that there are 2 SLIC sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there is 1 UST site within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

SCH: This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category. depending on the level of threat to public health and safety or the. environment they pose.

A review of the SCH list, as provided by EDR, and dated 07/31/2017 has revealed that there is 1 SCH site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 2 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

SIC Code 2:	Not reported
Primary Waste Type:	Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils, rubble and concrete are examples of this category.
Primary Waste:	STORMS
Waste Type2:	Not reported
Waste2:	Stormwater Runoff
Primary Waste Type:	Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils,

SA RECYCLING (Continued) **S101482916**

rubble and concrete are examples of this category.
Secondary Waste: Not reported
Secondary Waste Type: Not reported
Design Flow: 0
Baseline Flow: 0
Reclamation: No reclamation requirements associated with this facility.
POTW: The facility is not a POTW.
Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

FINDS:

Registry ID: 110012221513

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 05/30/2017

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 05/30/2017

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/30/2013

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

OXNARD HIGH SCHOOL #8
1853 CAMINO DEL SOL
OXNARD, CA 93030

TARGET PROPERTY COORDINATES

Latitude (North):	34.206412 - 34° 12' 23.08''
Longitude (West):	119.158724 - 119° 9' 31.41''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	301108.0
UTM Y (Meters):	3786954.8
Elevation:	63 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5619402 OXNARD, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

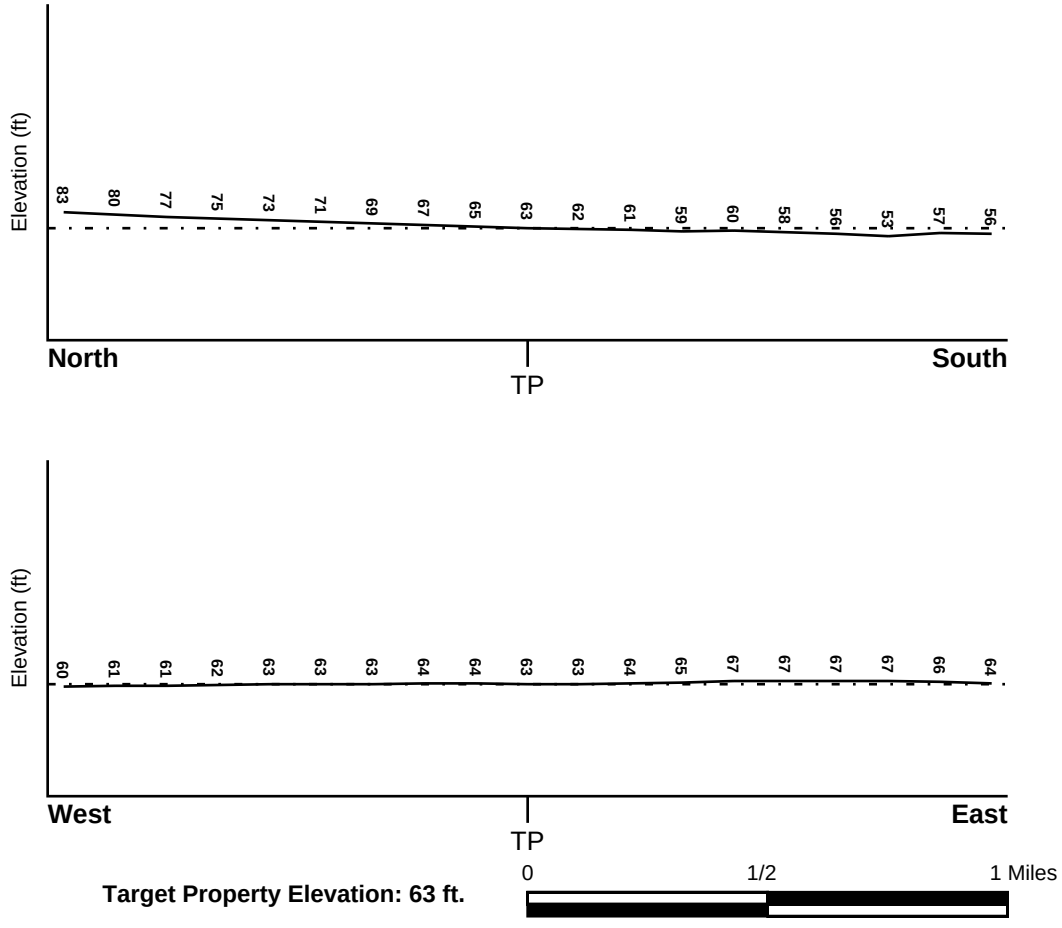
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06111C0910E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
Not Reported	

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
OXNARD	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: PICO

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
2	14 inches	29 inches	stratified sandy loam to loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
3	29 inches	59 inches	stratified gravelly sand to stony sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.9

Soil Map ID: 2

Soil Component Name: MOCHO

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 7.9
2	16 inches	59 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 7.9

Soil Map ID: 3

Soil Component Name: HUENEME

Soil Surface Texture: sandy loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 107 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.4
2	16 inches	64 inches	stratified sand to silt loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 7.4

Soil Map ID: 4

Soil Component Name: METZ

Soil Surface Texture: loamy sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4
2	7 inches	59 inches	stratified sand to sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4

Soil Map ID: 5

Soil Component Name: PICO

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

2	14 inches	53 inches	stratified sandy loam to loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 42 Min: 14	Max: 8.4 Min: 7.9
3	53 inches	59 inches	stratified gravelly sand to gravelly loamy coarse sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.9

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

Water System Information:

Prime Station Code:	01N/22W-03F08 S	User ID:	TAP
FRDS Number:	5610007021	County:	Ventura
District Number:	06	Station Type:	WELL/AMBNT/MUN/INTAKE
Water Type:	Well/Groundwater	Well Status:	Active Raw
Source Lat/Long:	341203.8 1190927.5	Precision:	1,000 Feet (10 Seconds)
Source Name:	WELL 23 (1990)		
System Number:	5610007		
System Name:	OXNARD WATER DEPT		
Organization That Operates System:			
	251 SOUTH HAYES AVE. OXNARD, CA 93030		
Pop Served:	151500	Connections:	30588
Area Served:	OXNARD CITY		
Sample Collected:	05-JAN-11	Findings:	240. MG/L
Chemical:	ALKALINITY (TOTAL) AS CACO3		
Sample Collected:	05-JAN-11	Findings:	240. MG/L
Chemical:	BICARBONATE ALKALINITY		
Sample Collected:	05-JAN-11	Findings:	660. MG/L
Chemical:	HARDNESS (TOTAL) AS CACO3		
Sample Collected:	05-JAN-11	Findings:	170. MG/L
Chemical:	CALCIUM		
Sample Collected:	05-JAN-11	Findings:	58. MG/L
Chemical:	MAGNESIUM		
Sample Collected:	05-JAN-11	Findings:	560. MG/L
Chemical:	SULFATE		
Sample Collected:	05-JAN-11	Findings:	0.51 MG/L
Chemical:	FLUORIDE (F) (NATURAL-SOURCE)		
Sample Collected:	05-JAN-11	Findings:	95. UG/L
Chemical:	MANGANESE		
Sample Collected:	05-JAN-11	Findings:	1200. MG/L
Chemical:	TOTAL DISSOLVED SOLIDS		
Sample Collected:	05-JAN-11	Findings:	13. MG/L
Chemical:	NITRATE (AS NO3)		
Sample Collected:	03-FEB-11	Findings:	240. MG/L
Chemical:	ALKALINITY (TOTAL) AS CACO3		
Sample Collected:	03-FEB-11	Findings:	240. MG/L
Chemical:	BICARBONATE ALKALINITY		
Sample Collected:	03-FEB-11	Findings:	630. MG/L
Chemical:	HARDNESS (TOTAL) AS CACO3		

Sample Collected:	03-FEB-11	Findings:	160. MG/L
Chemical:	CALCIUM		
Sample Collected:	03-FEB-11	Findings:	54. MG/L
Chemical:	MAGNESIUM		
Sample Collected:	03-FEB-11	Findings:	540. MG/L
Chemical:	SULFATE		
Sample Collected:	03-FEB-11	Findings:	0.58 MG/L
Chemical:	FLUORIDE (F) (NATURAL-SOURCE)		
Sample Collected:	03-FEB-11	Findings:	54. UG/L
Chemical:	MANGANESE		
Sample Collected:	03-FEB-11	Findings:	1100. MG/L
Chemical:	TOTAL DISSOLVED SOLIDS		
Sample Collected:	03-FEB-11	Findings:	15. MG/L
Chemical:	NITRATE (AS NO3)		
Sample Collected:	02-MAR-11	Findings:	260. MG/L
Chemical:	ALKALINITY (TOTAL) AS CACO3		
Sample Collected:	02-MAR-11	Findings:	260. MG/L
Chemical:	BICARBONATE ALKALINITY		
Sample Collected:	02-MAR-11	Findings:	660. MG/L
Chemical:	HARDNESS (TOTAL) AS CACO3

CA WELLS **683**

Water System Information:

Prime Station Code:	01N/22W-03F05 S	User ID:	TAP
FRDS Number:	5610007018	County:	Ventura
District Number:	06	Station Type:	WELL/AMBNT/MUN/INTAKE
Water Type:	Well/Groundwater	Well Status:	Active Raw
Source Lat/Long:	341214.0 1191028.0	Precision:	1,000 Feet (10 Seconds)
Source Name:	WELL 20		

GEOCHECK® - PHYSICAL SETTING SOURCE MAP FINDINGS

System Number: 5610007
System Name: OXNARD WATER DEPT
Organization That Operates System:
251 SOUTH HAYES AVE.
OXNARD, CA 93030
Pop Served: 151500 Connections: 30588
Area Served: OXNARD CITY

Sample Collected:	01-FEB-12	Findings:	140. MG/L
Chemical:	CALCIUM		
Sample Collected:	01-FEB-12	Findings:	45. MG/L
Chemical:	MAGNESIUM

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Tetra Tech, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

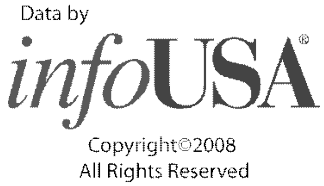
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1926 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Search Results:

Year	Scale	Details	Source
2012	1"=500'	Flight Year: 2012	USDA/NAIP

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by Tetra Tech, Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDRs Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Box No 40678

PROJECT DESCRIPTION QUESTIONNAIRE
(Residential/Agricultural)

A. EXISTING PROJECT SITE

1. Assessors Parcel No(s): 214-020-450

2. Location (nearest public road, cross street, community, etc.):
1853 CAMINO DEL SOL
CROSS STREET — ROSE AVE.

3. Existing Land Use(s): AGRICULTURAL ~ AVOCADO TREES AND LEMON TREES

4. LCA Contract No. 49-1,1 Contract-specified agricultural use(s) (illegible)

Assessor Parcel Numbers Within Contract

5. Distinctive Physical Features on the Property (rock outcroppings, barrancas, etc.): LEVEL FARM LAND PLANTED TO ORCHARDS

6. Has the property been surveyed by an archaeologist? Yes___ No✓ Unknown___ If yes, what was the result?

7. Existing Drainage Direction(s): SOUTH

8. Existing Drainage/Flood Control Facilities (culverts, retention basins, etc.): NO DRAINAGE FACILITIES

9. Existing Water Supply (if any): WELL

10. Existing Sanitation (Sewage Disposal) Facilities (if any):
SEPIC TANK WITH LEACH LINE

11. Describe the type and size of all existing signs (if any):
N/A

12. Is your property on the State's list of identified hazardous waste and/or hazardous substance sites? (Copy of list is kept at Planning Division public counter.) NO

B. SURROUNDING PROPERTY

1. Land Uses

North: FARM LAND East: FARM LAND
South: OPEN FIELD/LOW INCOME HOUSING West: ROSE AVE. / FARM LAND

2. Distinctive Physical Features

North: OPEN FIELDS, FARMING
South: OPEN LOT, APARTMENTS
East: STRAWBERRY FIELDS
West: ROSE AVE, STRAWBERRIES

3. Vegetation

North: CELERY East: STRAWBERRIES
South: OPEN LOT West: STRAWBERRIES

C. PROJECT DESCRIPTION

1. Describe in detail the proposed use(s):
EXTENSION OF EXISTING PERMIT

2. Describe access to site from a public road:
PRIVATE GATE ON CAMINO DEL SOL

3. Will project be developed in phases? _____ If so, describe each phase in detail:
N/A

4. Describe type and size of all proposed signs: NONE

5. If applicable, will existing signs be removed? N/A If so, describe:

6. Describe any potential noise sources associated with the project. If applicable, also describe what methods would be used to reduce the noise such that it would not be objectionable to surrounding uses (attach sheets if necessary):
N/A

7. Describe any uses or operations producing significant light or glare. If applicable, describe what methods would be used to shield, enclose or otherwise control light or glare such that it would not be objectionable to surrounding uses (attach sheets if necessary):
N/A

8. Grading

Area to be graded: N/A sq.ft./acres

Total volume to be moved: N/A cu. yds.

Slope ratio of steepest finished slope (horiz. feet/ea. vert. foot):
N/A

Height of highest finished slope (from toe to top): N/A feet

Disposition of excavated material:

9. Number of trees to be removed (count trees with 5" dia. or more at 3' above root crown) by species: N/A

10. Drainage

Describe how increased runoff will be handled both onsite and offsite:
N/A

Will the project require the installation or replacement of storm drains or channels? NO If yes, indicate length _____, size _____ and capacity _____.

D. PROPOSED SERVICES

1. Water Supply

Water Source (check): _____ Well ✓ Water Purveyor

Will the project necessitate the installation or replacement of new water service mains? N/A If yes, indicate length _____, size _____, and capacity _____.

2. Sanitation

Sanitation will be provided by (check):

Private onsite septic system ✓ Public sewers _____

3. Fire Protection

Indicate number and capacity of existing and/or proposed fire hydrants and distance from proposed buildings:
PRIVATE WELL / SWIMMING POOL WITHIN 200 FT.

I certify that the foregoing information is complete and correct to the best of my knowledge.

CUPA FILE REVIEW REQUEST

CUPA is an acronym for Certified Unified Program Agency. CUPA files contain information for: hazardous materials, hazardous wastes, underground storage tanks, aboveground storage tanks and the California Accidental Release Prevention (Cal-ARP) Program. ***There is no fee assessed for reviewing the program files. Allow for 48 hour advanced notice for appointments to review files.***

Site Information
Business name/Property Owner: Maulhardt Ranch
Site Address: 1825 Camino Del Sol Oxnard CA, 93030

Party Requesting File Review
Requestor's Name: Jason Dane
Requestor's Business or Organization Name: Tetra Tech
Requestor's Business, Organization, or Home Address: 5383 Hollister Avenue, Suite 130, Santa Barbara, CA 93111
Requestor's Business, Organization, or Home Phone Number: 805-681-1527
Requestor's Fax Number: 805-681-3108

CUPA Program Files Requested:

- ☑ ***Business Plan***
- ☑ ***Hazardous Waste***
- ☑ ***Underground Storage Tanks***
- ☑ ***Cal-ARP***

Contact Ventura County Environmental Health for Information regarding UST Closures and site cleanups. Electronic files may be found at http://www.vcenvhealth.org or by phone: 805/654-2813.

Instruction for file review:

1. Information or documents must not be removed from the files (except for photocopy purposes).
2. If you would like us to make photocopies of any documents in the files, please request this service from the City of Oxnard Fire Department administrative staff. Please note there is a fee for photocopies.
3. Fax copy of completed file review request to (805) 385-8009, Attention CUPA.

I certify that I will comply with the aforementioned file review procedures and that no documents will be removed from the file(s) reviewed (except for photocopy purposes).

Applicant Signature: Jason Dane Date: 09/13/2017

CUPA Representative Findings: ☑ No CUPA records found. ☐ Records available for review.

CUPA Representative Signature Julie Maulhardt Date: 9/18/17

Subject: Ventura County Request to Inspect Public Records
Attachments: Maulhardt Ranch.xlsx

Good morning Jason,

Please find the attached information which you requested on September 18, 2017. This is the information that is currently in our Calagpermits system.

If recent paper pesticide use reports have been submitted, those reports may not have been reflected at the time of your request. Also, our county may be possibly a couple of months behind in entering this submitted paper pesticide use reports since that information must be enter manually.

Should you have any questions please do not hesitate to contact me.

Best Regards,
Blanca Enriquez-Pratt

Subject: FW: 17-P-750 FW: Public Records Request for Phase 1 ESA

Good Afternoon Mr. Dane:

The Department of Forestry and Fire Protection, CAL FIRE, has searched its records and has found no documents in response to your request.

Sincerely,

Anne Henigan
CAL FIRE Legal Office

Subject: Public Records Request for Phase 1 ESA

Good morning,

I am currently conducting a Phase 1 Environmental Site Assessment for a property located in Oxnard, CA . I am writing to request information on any pipelines that are located near the property listed below within 1,500 feet:

1825 Camino Del Sol Oxnard, CA, 93030
APN: 214-002-059

Any additional information including distance, direction from the property, direction the pipeline is running, whether the pipeline is active, and pipeline size/ depth would be greatly appreciated. Feel free to contact me with any questions.

Sincerely,

Jason Dane | Environmental Engineer II

Standard Facility Information Request

Facility Name:		
Facility Address:		
City:	State:	Zip Code:
Facility Number(s):		

Information Requested (Check All That Are Applicable):

- ☐ Copy of Current Facility Permit to Operate with Facility Permitted Emissions
- ☐ Inspection Summary (1996 to Present)
- ☐ Notice of Violation Summary (1996 to Present)
- ☐ Notice to Comply Summary (1996 to Present)
- ☐ Complaint Summary (1996 to Present)
- ☐ Other (Describe Below)

Requests for records must be for clearly identifiable records in the District's possession, and for facilities within the District's jurisdiction. The District is not required by law to create a new record or list from an already existing record.

Copying costs are $0.17 per page for requests that are 10 pages or more in length. If the "Other" box is checked, an additional charge for labor may be added to the invoice for the information requested.

Hello Jason,

Nothing was found for the address:

1853 Camino Del Sol, Oxnard CA 93030.

I have attached our Public Records Request Form which is required for each request for your future use.
Please let me know if you have any questions.
Thank you.

Subject: Request for Public information under the Public Records Act

Good morning,

I am currently conducting a Phase 1 Environmental Site Assessment for a property located in Oxnard, CA . I am writing to request any records pertaining to the property listed below:

1825 Camino Del Sol Oxnard, CA, 93030
APN: 214-002-059
Historical and current use of the property is agricultural.

Any and all records on this property would be greatly appreciated. In addition we are only concerned with this property and not surrounding properties. Feel free to contact me with any questions.

Sincerely,

Jason Dane | Environmental Engineer II

I CHECKLIST FOR PHASE I SITE VISIT

This page intentionally left blank.

PHASE I ENVIRONMENTAL SITE ASSESSMENT CHECKLIST

Project Name: Oxnard High School No. 8

Address: 1853 Camino Del Sol, Oxnard, CA 93030

General Site Description: Residential Property surrounded by private orchards, farm building and compound surrounded by strawberry fields

I. Pre-arrival Background Information

1. **Current Owner(s):** Maulhardt Family
   Owner Since: 1869

2. **Current Occupants:** Ruth Maulhardt, Sean Maulhardt
   Occupant Since: 1952

3. **Year Buildings Constructed :** Main Residence (1917), Barn (~~1908~~ 1908), Pesticide Storage shed (1890), Mobile homes (1970's)

4. **Site Zoning:** Residential Planned Development/General Commercial Planned Development /Community Resource

5. **Land Use(s):** Residential / Agricultural

II. Site Observations:

A. Lot/Property Observations:

1. **Current Groundcover (%):** Estimated from aerial photograph review.

Orchards	9 %	Buildings	2 %		
Strawberry Fields	83 %	Dirt	6 %		

Any concrete staining, soil staining or stressed vegetation? yes shown in Figure

2. **Is there any evidence of pesticide/herbicide use, storage or disposal on the property?** Yes
   If yes, describe: Agricultural Areas, Pesticide use and Storage shed
   Have any pesticides/herbicides been used on the property at any time?* Yes, Pesticide and herbicides used historically for agricultural activities

3. **Are there any electrical transformers or capacitors on the property?** Yes
   If yes, location: 2 identified at property, 3 have been removed
   Evidence of leaks? No
   Have they been tested for PCBs*? No
   Transformers owned by utility company, owner, or tenant?* Utility, So Cal Edison

* Indicates question that requires follow-up during site owner/occupant interview.

4a. Are there any visible aboveground or underground storage tanks on the property? Yes

If yes, location: 2 propane storage tanks, Abandoned heating oil tank

Currently in use? Propane tanks in use, heating oil tank no longer used

Contents: Propane, heating oil

Size (gallons): ~500 gallons

Evidence of leaks? No

When was the tank installed?* NA

Is there a permit for the tank? If so, who is the listed owner?* NA, AAA

Have any leak tests been performed?* N/A

If not in use, has the tank been "abandoned"? Documentation?* No

4b. Is there any evidence that an AST or UST has been removed from the site? Yes

If yes, describe: Property owners disclosed several former ASTs and UST that have been removed

When was the tank removed?* 25-30+ years ago

Documentation?* None

5. Are there any visible storage drums on the property? If yes, how many? Yes

If yes, location: One drum in pesticide use area, Drum in shed

Describe size and contents (if known): 25 gallons unknown contents, 25 gallons unknown contents

Evidence of spills/leaks? Stained areas in shed

Are they stored in a bermed area (any secondary containment)? No

6. Any evidence of solid waste disposal on the property? Yes

If yes, location: Miscellaneous solid waste present across site, shed and barn

Describe: old cars stored, miscellaneous trash

Evidence of any hazardous materials? Yes

7. Are there any ponds, pits, sumps, or ditches on the property? Yes

If yes, location: Sump inside garage / gas house

Describe: used historically for auto repair and oil changes

Evidence of any hazardous materials? Yes strong petroleum odors, abandoned gas tank piping

8. Describe the general air quality at the site: Good Air Quality

Are there activities on the site which produce air emissions (painting, printing, venting, exhaust): No

If yes, describe:

Are the emissions monitored or permitted?*

Documentation?*

9. Are there any curb cuts, footings, or other signs of former buildings on the property? Yes

If yes, location: Former bunkhouse west of the Farm yard

When was the former building built/demolished?* 1970's

* Indicates question that requires follow-up during site owner/occupant interview.

B. Buildings

1. **Is a building(s) present on site?** Yes
   If yes, when was it built?* 1880's - 1970's

2. **Are there any cracks or openings (drains or sumps) on the first floor?** N/A
   If yes, location: NA
   Are they connected to storm drains, sewer lines or discharged into the ground? NA

   Is there any evidence of spills or stains on the ground? NA

   Is there a possibility of hazardous waste spills or leaks?* NA

3. **Are there painted surfaces on the exterior or interior of the building?** Yes
   Evidence of lead based paint? Yes
   If yes, location: exteriors of building have chipped paint
   When were the walls painted?* Unknown painted multiple times, multiple layers
   Have they been tested for lead?* No

4. **Are there any electrical transformers or capacitors inside the building?** NA
   If yes, location:
   Evidence of leaks?
   Have they been tested for PCBs?*
   Transformers owned by utility company, owner, or tenant?*

5. **Is there any evidence of the presence of asbestos?** Unknown
   If yes, location:
   Friable?
   If no evidence of asbestos, but the building was built before 1979, has an asbestos survey been completed?*

6. **Are there any chemicals or drums stored or used in the building?** Yes
   If yes, location: sheds
   Evidence of leaks/spills? Yes, stained areas in shed
   If drums, secondary containment? No
   Have there been any documented leaks or spills of hazardous materials*? No
   If yes, describe and list documentation:

* Indicates question that requires follow-up during site owner/occupant interview.

III. Surrounding Properties

1. Describe generally the current use(s) of the adjacent properties (%):

Residential: 75 %, Agricultural: 25 %, Industrial: ____

Office: ____ Commercial: ____ Manufacturing: ____

Other (specify) ____

Describe any adjacent propertied used for industrial, manufacturing, or refining purposes: NA

Do they pose a possible threat to groundwater or air quality at the site? NO

If yes, explain: ____

Checklist completed by: Jason Dane

Date: 10/23/2017

Checked by: ____

Date: ____

* Indicates question that requires follow-up during site owner/occupant interview.

J USER QUESTIONNAIRE

This page intentionally left blank.

URGENT and CONFIDENTIAL

USER QUESTIONNAIRE for PHASE I ESA

AS REQUIRED by ASTM Standard E1527-05

Site Name: Portion of Maulhardt Ranch (approximately ~~45~~ 55 acres) proposed to be developed as Oxnard High School No. 8. MTH

Address: 1853 Camino Del Sol, Oxnard, CA 93030

Completed By: MR. SID ALBAUGH, ASST SUPT

The person who will use the Phase One should provide the following information. Please fill in this form to the best of your ability, explaining any Yes answers on a separate sheet of paper. Without these answers, our report would have to note that the Phase One is incomplete, and your Landowner Liability Protections could be at risk. We need these answers before we conduct the site visit.

* 1. **Environmental Cleanup Liens.** ASTM requires the User to check for environmental liens that may be filed or recorded against the subject property under federal, tribal, state or local law. Such liens might be listed in the "exceptions to coverage" in the property's title insurance commitment or policy. Failure to check for these liens could put your Landowner Liability Protections at risk.

Have you checked for these environmental cleanup liens? ☐ Yes ☑ No

Are you aware of any such liens against the subject property? ☐ Yes ☑ No

* 2. **Activity and Use Limitations (AULs).** These include engineering controls (e.g., slurry walls, caps) and land use restrictions or institutional controls (e.g., deed restrictions, covenants) that may be in place at the site or filed under federal, tribal, state or local law. The title commitment or policy might also list AULs.

Are you aware of any possible AULs involving the subject site? ☐ Yes ☑ No

3. **Specialized Knowledge.** This involves personal knowledge or experience related to the subject property or nearby properties. For example, if you are involved in the same line of business as the current or former occupants of the property or an adjoining property, you would probably know of any chemicals, oil, degreasers, gasoline, or other hazardous substances commonly used in that type of business.

Do you have any specialized knowledge that might indicate the past or present use or release of such substances on the subject or nearby properties? ☐ Yes ☑ No

4. **Fair Market Value (FMV).** A purchase price significantly below FMV may indicate an environmental problem. Please note that this question does not require an appraisal of the property. If the price is significantly below FMV, the User should consider whether it might be because contamination may be present at the property.

Is the purchase price significantly below fair market value? ☐ Yes ☑ No

5. **Obvious Indicators.** This involves past or present spills, stains, releases, cleanups, etc. on or near the site.

Do you know of any obvious indicators of possible contamination on or near the site? ☐ Yes ☑ No

6. **Common Knowledge.** Please use a separate sheet if necessary.

Describe the past uses of the property: RESIDENT, AGRICULTURE, BARN

Describe any specific chemicals that may have been present at the property: TBD.

Describe any other information that may help us identify possible contamination:

# of separate sheets attached: ____

Your Signature _____ **Date** 10-19-17

Explain Yes answers on a separate sheet.

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.
