QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
B1 = BOD dilution water is over specifications . The reported result may be biased high.
D = Surrogate recoveries are not calculated due to sample dilution.
E = Estimated value; Value exceeds calibration level of instrument.
H = Analyte was prepared and/or analyzed outside of the analytical method holding time
I = Matrix Interference.
J = Analyte concentration detected between RL and MDL.
Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
RL = Reporting Limit, Adjusted by DF
MDL = Method Detection Limit, Adjusted by DF
Qual = Qualifier
Tech = Technician

As regulatory limits change frequently, A & R Laboratories advises the recipient of this report to confirm such limits with the appropriate federal, state, or local authorities before acting in reliance on the regulatory limits provided.

For any feedback concerning our services, please contact Jenny Jiang, Project Manager at 951.779.0310. You may also contact Ken Zheng, President at office@arlaboratories.com.

The data and information on this, and other accompanying documents, represent only the sample(s) analyzed and is rendered upon condition that it is not to be reproduced, wholly or in part, for advertising or other purposes without approval from the laboratory.

COOLER RECEIPT FORM

Client Name: TetraTech
Project Name:
AETL Job Number: 94142, 94143
Date Received: 09/24/18 Received by: Antin
Carrier: ☒ AETL Courier ☐ Client ☐ GSO ☐ FedEx ☐ UPS
☐ Others:

Samples were received in: ☒ Cooler (/) ☐ Other (Specify):
Inside temperature of shipping container No 1: 3.2°C, No 2: ____, No 3: ____
Type of sample containers: ☐ VOA, ☐ Glass bottles, ☐ ☒ Wide mouth jars, ☐ ☐ HDPE bottles, ☐ Metal sleeves, ☐ Others (Specify): ____
How are samples preserved: ☐ None, ☐ Ice , ☒ Blue Ice, ☐ Dry Ice
☒ None, ☐ HNO_3, ☐ NaOH, ☐ ZnOAc, ☐ HCl, ☐ $Na_2S_2O_3$, _MeOH
☐ Other (Specify):

	Yes	No, explain below	Name, if client was notified.
1. Are the COCs Correct?	✓		
2. Are the Sample labels legible?	✓		
3. Do samples match the COC?	✓		
4. Are the required analyses clear?	✓		
5. Is there enough samples for required analysis?	✓		
6. Are samples sealed with evidence tape?		✓	
7. Are sample containers in good condition?	✓		
8. Are samples preserved?	✓		
9. Are samples preserved properly for the intended analysis?	✓		
10. Are the VOAs free of headspace?	N/A		
11. Are the jars free of headspace?	✓		

Explain all "No" answers for above questions:

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

Tel: (888) 288-AETL • (818) 845-8200 • Fax: (818) 845-8840 • www.aetlab.com

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

	Yes	No, explain below	Name, if client was notified.
1. Are the COCs Correct?	✓		
2. Are the Sample labels legible?	✓		
3. Do samples match the COC?	✓		
4. Are the required analyses clear?	✓		
5. Is there enough samples for required analysis?	✓		
6. Are samples sealed with evidence tape?		✓	
7. Are sample containers in good condition?	✓		
8. Are samples preserved?	✓		
9. Are samples preserved properly for the intended analysis?	✓		
10. Are the VOAs free of headspace?	N/A		
11. Are the jars free of headspace?	2		

Explain all "No" answers for above questions:

The samples were analyzed as specified on the enclosed chain of custody.
No analytical non-conformances were encountered.

Unless otherwise noted, all results of soil and solid samples are based on wet weight.

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

American Environmental Testing Laboratory Inc.
2834 & 2908 North Naomi Street, Burbank, CA 91504 • DOHS NO: 1541, LACSD NO: 10181
Tel: (888) 288-AETL • (818) 845-8200 • Fax: (818) 845-8840 • www.aetlab.com

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

COOLER RECEIPT FORM

Client Name: Tetra Tech
Project Name:
AETL Job Number: 94144
Date Received: 09/24/18 Received by: Alin
Carrier: ☒ AETL Courier ☐ Client ☐ GSO ☐ FedEx ☐ UPS
☐ Others:

Samples were received in: ☒ Cooler (2) ☐ Other (Specify):
Inside temperature of shipping container No 1: 3.3°C, No 2: 3.4°C, No 3:
Type of sample containers: ☒ VOA, ☒ Glass bottles, ☐ ☐Wide mouth jars, ☐ ☐HDPE bottles, ☐ Metal sleeves, ☐ Others (Specify): 11x 5035 kits
How are samples preserved: ☐ None, ☐ Ice, ☒ Blue Ice, ☐ Dry Ice
☐ None, ☐ HNO_3, ☐ NaOH, ☐ ZnOAc, ☒ HCl, ☐ $Na_2S_2O_3$,
☒ MeOH $NaHSO_4$ H_2O
☐ Other (Specify):

	Yes	No, explain below	Name, if client was notified.
1. Are the COCs Correct?	Y		
2. Are the Sample labels legible?	Y		
3. Do samples match the COC?	Y		
4. Are the required analyses clear?	Y		
5. Is there enough samples for required analysis?	Y		
6. Are samples sealed with evidence tape?		N	
7. Are sample containers in good condition?	Y		
8. Are samples preserved?	Y		
9. Are samples preserved properly for the intended analysis?	Y		
10. Are the VOAs free of headspace?	N/A		
11. Are the jars free of headspace?	2		

Explain all "No" answers for above questions:

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

American Environmental Testing Laboratory Inc.
2834 & 2908 North Naomi Street, Burbank, CA 91504 • DOHS NO: 1541, LACSD NO: 10181

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

N DATA VALIDATION MEMORANDUM

This page intentionally left blank.

TETRA TECH, INC.
DATA VALIDATION MEMORANDUM
FOR THE OXNARD UNION HIGH SCHOOL DISTRICT HIGH SCHOOL NO. 8 PROJECT

1.0 INTRODUCTION

This memorandum summarizes the findings of validation effort conducted on the soil gas and soil sample data results from the Oxnard Union High School Site Project, Preliminary Environmental Assessment (PEA). A typical PEA validation effort consists of a review of 10 percent of the analytical data; however, due to the limited number of analytical batches associated with the subject investigation, 100 percent of the data were reviewed. The validation guidance used in evaluating the data is presented in *USEPA National Functional Guidelines for Inorganic Data Review (2016)* and *USEPA National Functional Guidelines for Organic Data Review (2016).* The data review consisted of an evaluation of all applicable Quality Control (QC) sample results as they relate to the field data under review. Raw data were not reviewed. The review determines the usability of the data based on the Data Quality Objectives (DQOs) for the project.

The data reviewed were generated by two different laboratories. The soil gas data from Tedlar polymer bags came from A & R Laboratories Inc from Ontario, California. The soil data came American Environmental Testing Laboratories, Inc. (AETL) located in Burbank, California.

2.0 EVALUATION CRITERIA

The data were evaluated by results from the following QC elements:

- Holding Times
- Method Blanks
- Laboratory Control Samples
- Surrogate Recovery (Organic Methods)
- Field Replicate Analysis
- Spiked Duplicate Analysis
- Relative Percent Difference (RPD) Compliance

3.0 A & R LABORATORIES

The A & R Laboratory data were contained in three Sample Delivery Groups (SDGs) which were 1809-00132, 1809-00133, and 1809-00134. The SDGs contained a total of 66 total soil gas samples were analyzed with the following subset of samples analyzed for the following methods/compounds:

1. Fixed Gases Oxygen, Carbon Dioxide, Carbon Monoxide, Nitrogen) by Method ASTM D-1946 (66 samples)

2. Methane by Method SW8015M (55 samples)

3. Hydrogen Sulfide by Method Hach HS-C

4. Volatile Organic Compounds by Method SW8260B (11 samples)

5. TPHg (C_4-C_{12} carbon range) by Method LUFT GCMS (11 samples)

The data were logged into the laboratory under compliant Chain-Of-Custody documentation. Several volatile organic compounds, fixed gases were detected in many of the samples. Both carbon dioxide and oxygen were detected within reasonable ranges.

A HACH field instrument analyzed hydrogen sulfide. The quality control and calibration of the field instrument met established field procedures.

3.1 Fixed Gases by Method ASTM-1946

3.1.1 Holding Time

The samples were analyzed within the specified holding time.

3.1.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified method reporting limits.

3.1.3 Laboratory Control Sample

Standard LCS analyses are not conducted from Tedlar bags but the calibration of analytes were within acceptance levels.

3.1.4 Surrogate Recovery

Surrogate are not used in this method

3.1.5 Field Duplicate Analysis

All field duplicate results were within control limits

3.1.6 Spiked Duplicate Analysis

All spiked duplicate results were within control limits

3.1.7 Relative Percent Difference (RPD) Compliance

All duplicate results had compliant RPD values.

3.2 Methane by EPA method SW8015M

3.2.1 Holding Time

The samples were analyzed within the method specified holding time.

3.2.2 Method Blank

The results for the method blank were non-detect for Methane at the specified MDL.

3.2.3 Laboratory Control Sample

The LCS recovery was within the specified acceptance limits for extractable TPH.

3.2.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

3.2.5 Field Duplicate Analysis

No field duplicate samples had errors.

3.2.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

3.2.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for extractable TPH.

3.3 Hydrogen Sulfide by H_2S a Jerome H_2S Analyzer Model 631-X Field Meter

3.3.1 Data Results

Hydrogen Sulfide were analyzed by H_2S a Jerome H_2S Analyzer Model 631-X field meter and the data does not meet the definitive data protocols used for other data in this data set. Therefore, no definitive data QC results are available to determine the true data quality. These data are usable as qualitatively determined data only.

3.4 Volatile Organic Compounds (VOCs) by EPA method SW8260B

3.4.1 Holding Time

The samples were analyzed within the method specified holding time.

3.4.2 Method Blank

The results for the method blank were non-detect for VOCs at the specified MDL.

3.4.3 Laboratory Control Sample

The LCS recovery was within the specified acceptance limits for VOCs.

3.4.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

3.4.5 Field Duplicate Analysis

No field duplicate samples had errors.

3.4.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

3.4.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for VOCs.

3.5 TPHg (C_4-C_{12} carbon range) by LUFT GCMS

3.5.1 Holding Time

The samples were analyzed within the method specified holding time.

3.5.2 Method Blank

The results for the method blank were non-detect for TPHg (C_4-C_{12} carbon range) at the specified MDL.

3.5.3 Laboratory Control Sample

The LCS recovery was within the specified acceptance limits for TPHg (C_4-C_{12} carbon range).

3.5.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

3.5.5 Field Duplicate Analysis

No field duplicate samples had errors.

3.5.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

3.5.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for TPHg (C_4-C_{12} carbon range).

3.6 A & R Laboratories Data Summary

Based on the results of this data validation review, it is concluded that the A & R Laboratory's soil gas data are usable as reported. The results are considered correct and reliable The DQOs were satisfied per the Work Plan and the data are usable for their intended purpose.

4.0 AMERICAN ENVIRONMENTAL TESTING LABORATORY

The AETL data consisted of three SDG designated as 94142, 94143, and 94144. The samples were analyzed in multiple batch per method. A total of 86 soil samples and six groundwater samples were analyzed by AETL for a variety of methods as follows:

1. Arsenic using EPA methods SW6010B (17 samples);
2. Extractable TPH (>C12) using EPA method SW8015B (34 samples);
3. Low Level PAHs using EPA method SW8310 (18 samples);
4. SVOCs using EPA method SW8270C (18 samples);
5. PCBs using EPA method SW8082 (2 sample).
6. Volatile TPH (C4-C12) using EPA method SW8015B (17 samples)
7. Organochlorine Pesticides using EPA method SW8081A (69 samples);
8. Volatile Organic Compounds (VOCs) using method SW8260B (18 samples)

The data were logged into the laboratory under compliant Chain-Of-Custody documentation. The samples were shipped in one iced cooler by FedEx overnight delivery.

The sample were received at the lab in good condition and with no exceptions noted. Foe each parameters/methods listed above there are individual method headers listed below that explain the data validation and data quality.

4.1 Arsenic by EPA methods SW6010B

4.1.1 Holding Time

The samples were analyzed within the method specified holding time.

4.1.2 Method Blank

The results for the method blanks were non-detect for all metals at the specified MDL.

4.1.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all metals.

4.1.4 Surrogate Recovery

Not applicable.

4.1.5 Field Duplicate Analysis

No field duplicates errors were noted for the duplicates analyzed.

4.1.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for Arsenic.

4.1.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for Arsenic

4.2 Extractable (C8-C40) TPH by EPA method SW8015B

4.2.1 Holding Time

The samples were analyzed within the method specified holding time.

4.2.2 Method Blank

The results for the method blank were non-detect for extractable TPH at the specified MDL.

4.2.3 Laboratory Control Sample

The LCS recovery was within the specified acceptance limits for extractable TPH.

4.2.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.2.5 Field Duplicate Analysis

No field duplicate samples had errors.

4.2.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.2.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for extractable TPH.

4.3 Polycyclic Aromatic Hydrocarbons by EPA method SW8310

4.3.1 Holding Time

The samples were analyzed within the method specified holding time.

4.3.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified MDL.

4.3.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all compounds.

4.3.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.3.5 Field Duplicate Analysis

No field duplicate samples reported errors.

4.3.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.3.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.4 Semivolatile Organic Compounds by EPA method SW8270C

4.4.1 Holding Time

The samples were analyzed within the method specified holding time.

4.4.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified MDL.

4.4.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all compounds.

4.4.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.4.5 Field Duplicate Analysis

No field duplicate samples reported errors.

4.4.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.4.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.5 Polychlorinated Biphenyls by EPA method SW8082

4.5.1 Holding Time

The samples were analyzed within the method specified holding time.

4.5.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified MDL.

4.5.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all compounds.

4.5.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.5.5 Field Duplicate Analysis

No field duplicate samples reported errors.

4.5.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.5.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.6 Volatile (C4-C12) TPH by EPA method SW8015B

4.6.1 Holding Time

The samples were analyzed within the method specified holding time.

4.6.2 Method Blank

The results for the method blank were non-detect for volatile TPH at the specified MDL.

4.6.3 Laboratory Control Sample

The LCS recovery was within the specified acceptance limits for volatile TPH.

4.6.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.6.5 Field Duplicate Analysis

No field duplicate samples had errors.

4.6.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.6.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for volatile TPH.

4.7 Organochlorine Pesticides by EPA method SW8081A

4.7.1 Holding Time

The samples were analyzed within the method specified holding time.

4.7.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified MDL.

4.7.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all compounds.

4.7.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.7.5 Field Duplicate Analysis

No field duplicate samples reported errors.

4.7.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds except as listed below.

Field sample ss-38-0 samples' DDT result was qualified for the DDT being outside recovery criteria in the MS/MSD. The DDT was qualified as estimated and assigned a "J" qualifier. The estimated data are usable for the intended purpose.

4.7.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.8 Volatile Organic Compounds by EPA method SW8260B

4.8.1 Holding Time

The samples were analyzed within the method specified holding time.

4.8.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified MDL.

4.8.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all compounds.

4.8.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.8.5 Field Duplicate Analysis

No field duplicate samples reported errors.

4.8.6 Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.8.7 Relative Percent Difference Compliance

The RPDs between the MS and MSD recoveries were within the specified acceptance limits for all compounds.

4.9 American Environmental Testing Laboratory Data Summary

Based on the results of this data validation review, it is concluded that the AETL soil data are usable as stated and qualified The results are considered correct and reliable The DQOs were satisfied per the Work Plan and the data are usable for their intended purpose.

1.0 INTRODUCTION

This Technical Memorandum Supplemental Site Investigation Field Sampling Plan (SSIFSP) has been prepared by Tetra Tech and is being submitted to the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC), School Evaluation and Cleanup Branch on behalf of the Oxnard Union High School District (OUHSD) for their proposed High School No. 8 Supplemental Site Investigation (SSI). The scope of services for this SSI have been developed to assist the OUHSD in further assessing the nature and extent of organochlorine pesticides (OCPs) in soil at concentrations above Screening Levels that were identified in soil samples collected for the *Draft Preliminary Environmental Assessment High School No. 8. APN 214-002-059 on North Rose Avenue, Oxnard California* (Tetra Tech 2018b). The SSIFSP is based on the scope of work agreed on by DTSC, Tetra Tech, OUHSD, and Sage Realty (Sage) at the SSI scoping telephone conference conducted on January 4, 2019. The proposed High School No. 8 site (hereinafter referred to as the Site) comprises approximately 48.6-acres in the southern portion of the Maulhardt Ranch at 1853 Camino Del Sol in the City of Oxnard, California in the 93030-zip code area (Figure 1). The OUHSD proposes to construct High School No. 8 at the Site to provide classroom space for students (Grades 9-12) living in the surrounding area and proposed Maulhardt Ranch Development (currently in the planning stage). The proposed Maulhardt Ranch Development is a planned development that will consist of medium and high-density multi-family residential properties to the north of the Site.

This Technical Memorandum SSIFSP includes limited background and historical use information regarding the Site. A detailed summary of Site background and historical use information for the Site is presented in the *Final Phase I Environmental Site Assessment Proposed Oxnard High School No., 8* (Tetra Tech 2018a) (High School No. 8 Phase I ESA). This Technical Memorandum is intended to provide details of the proposed SSI sampling and analytical work proposed for the Site in the SSI Scoping Meeting conducted on January 4, 2019. Details regarding quality assurance, risk assessment procedures, and the scope of the SSI report will conform to the *PEA Guidance Manual* (DTSC 2015) and will present findings from human health screening evaluations for the Site based upon the potential contaminants of concern identified through field sampling program proposed here.

1.1 DESIGNATED CONTACT PERSONS

The primary designated contact persons for Tetra Tech are Jim Steele and Randy Westhaus. Jim Steele is the Project Manager and Randy Westhaus is Tetra Tech's California Schools Director. Their contact information is:

James R. (Jim) Steele, P.G., C.E.G., C.Hg.
Tetra Tech, Inc.
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 681-6302
Fax (805) 681-3108

Randy Westhaus, P.E.
Tetra Tech, Inc.
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 681-3101
Fax (805) 681-3108

The designated contact person for the OUHSD is Jeff Weinstein. Mr. Weinstein is the Assistant Superintendent Business Services for the OUHSD. The contact information for Mr. Weinstein is:

Jeffery Weinstein
Assistant Superintendent Business Services
Oxnard Union High School District
309 South K Street
Oxnard, California 93030
Phone (805) 834-1461

2.0 SITE DATA

2.1 SITE LOCATION AND DESCRIPTION

The Site located within the Maulhardt Ranch at 1853 Camino Del Sol in the City of Oxnard, California in the 93030-zip code area (Figure 1). The Site is a 48.6-acre (approximate) portion of the Maulhardt Ranch (APN 214-002-059), a 107.25-acre property in the City of Oxnard, California (Figures 1 and 2). Book 214 page 2 of the County of Ventura's Assessor Map indicates that the Site comprises approximately the southernmost 45 Acres of Parcel 59, within the Rancho El Rio Santa Clara O'La Colonia Portion A of Subdivision 26 in the City of Oxnard.

The Site is located in an area that is developed for commercial, residential, park, and agricultural land use (Figure 2). The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas (Figure 2). The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. The entire Maulhardt Ranch (APN 214-002-059) is bound by Camino Del Sol on the South, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site.

3.0 PHYSICAL SETTING AND CONDITIONS

The Site is depicted on the Oxnard, California Quadrangle U.S. Geological Survey (USGS) 7.5-minute topographic series map (USGS 2015) (Figure 1). The geographic coordinates of the Site are approximately Latitude 34° 12' 23.08" North, Longitude 119° 9' 31.40" West. The USGS 7.5 topographic series map indicates that the Site is at an elevation between 60 and 70 feet above mean sea level (amsl). The Site elevation is approximately 63 feet amsl with a topographic gradient that is generally flat with a gentle slope to the south-southwest (Environmental Data Resources [EDR] 2017).

3.1 REGIONAL GEOLOGY

The Site is located on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. The Transverse Ranges Province is a series of ranges and intervening valleys that extends for 325 miles "directly across the structural grain of California" (Oakeshott 1978). The province extends from Point Arguello and San Miguel Island eastward to the Pinto and Eagle Mountains which end in the Mojave and Colorado Deserts respectively. The province ranges in width from 10 to 50 miles. The narrowest points are at the western extreme in the Santa Ynez Mountains and at the Cajon Pass which separates the San Gabriel and San Bernardino Mountains. The province's broadest point is the distance from the Santa Monica coast, across the Santa Monica, Topatopa and Pine Mountains, to the Tehachapi Mountains.

The Ventura Basin is large synclinal structure situated between the Santa Ynez Range and Topatopa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (California Geological Survey [CGS] 2002).

3.2 LOCAL GEOLOGY

The Site is located in the Oxnard Plain of the Ventura Basin. The Ventura Basin, including its offshore continuation into the Santa Barbara Channel, is filled with a thick sequence of Cenozoic sedimentary rocks estimated to be more than 20,000 feet in total thickness. Major east trending folds and reverse faults reflect regional north-south compression and are characteristic of the basin (Norris and Webb 1990). The Oxnard Plain is underlain by several thousand feet of Pleistocene-age sediments of the San Pedro Formation. The San Pedro Formation consists of marine and continental deposits of clay, silt, and gravel (Turner, et al 1975). The predominant surface materials in this region include Pleistocene to Recent age alluvial, floodplain, and near-shore deposits, some of which have been uplifted, folded, and faulted.

Based on the Geologic Map of the Oxnard 7.5’ Quadrangle, Ventura County, California the Site is underlain at the ground surface by Holocene deltaic alluvial fan deposits composed predominantly of clay with interbeds of sand and occasional gravel that were deposited by the Santa Clara River and extend to approximately 70 feet below ground surface (bgs) (Clahan, et al 2003; Turner, et al 1975). These are conformably underlain by upper Pleistocene alluvial sand and gravel deposits to approximately 400 feet bgs, and the marine – non marine clays and gravels of the Lower Pleistocene San Pedro formation to approximately 2,000 feet bgs.

3.3 HYDROLOGY

3.3.1 Hydrogeology

The Site is located in the northern portion of the Oxnard Plain Pressure Groundwater Basin within the Santa Clara River Hydrologic Unit (Turner, et al 1975). The Oxnard Plain Groundwater Basin is a relatively flat alluviated area, which ranges in elevation from sea level to approximately 100 feet. The water bearing zones of the Oxnard Plain Groundwater Basin are grouped into three major units including 1) the semi-perched aquifer and clay cap, 2) the Upper Aquifer System, and 3) the Lower Aquifer System.

The semi-perched aquifer and clay cap consists of all of the alluvial materials above the Oxnard aquifer zone. The semi-perched aquifer extends to a depth of approximately 75 feet bgs and is underlain by the clay cap that extends from approximately 75 to 150 feet bgs in the Site area (Turner, et al 1975). This aquifer consists primarily of geologically Recent-aged stream deposited sands and gravels with minor silt and clay interbeds. Sand and gravel deposits are generally parallel to the Santa Clara River and form lenses perpendicular to the Santa Clara River. Groundwater in the semi-perched zone is generally considered to be of poorer quality and of limited beneficial use. Groundwater was encountered at approximately 20 feet bgs at the Site in geotechnical drilling during May and July 2018. Historically groundwater has been as shallow as approximately 10 bgs at the Site (CGS 2002). The "clay cap" underlies the semi-perched groundwater zone separating it from the underlying Upper Aquifer System. This clay cap acts as an aquitard. Based on topographic controls, the groundwater in the semi-perched zone in the site vicinity is expected to flow toward the south to south-southwest.

4.0 SITE BACKGROUND

The review of historical aerial photographs and maps, and interviews with the current owner, indicate the Site and adjacent areas have been used for agricultural production (row crops) since at least 1869. The Site is currently being used for strawberry cultivation. Tetra Tech reviewed California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR) Map 214 (DOGGR 2001), the online DOGGR Well Finder (DOGGR 2017), and associated well history documents to evaluate potential presence of oil fields or wells within the Site vicinity. Records indicate that the site is located within the Oxnard Oil Field, however no known active or abandoned oil wells are present on the Site. Additionally, no oil wells are present on 107.25-acre Maulhardt Ranch (APN 214-002-059) where the Site is located. The oil well located nearest to the Site is the Maulhardt Community No. 11A, located approximately 850 feet south of the Site. The Maulhardt Ranch farm yard and residential area are located adjacent to the south and west of the Site (Figures 2 and 3). Formerly, above ground and underground storage tanks were located in the Maulhardt Ranch farm yard and residential area. A more complete description of the historical land use of the Site and surrounding area is provided in the High School No. 8 Phase I ESA (Tetra Tech 2018a).

5.0 HIGH SCHOOL NO. 8 PEA SUMMARY

On behalf of the OUHSD, Tetra Tech completed the Draft PEA on November 9, 2018 and submitted it to DTSC for review (Tetra Tech 2018b). The PEA field sampling program included the collection of surface soil samples from 60 locations at depths of 0 to 0.5 feet below ground surface (bgs) to assess potential OCPs. OCPs were detected at concentrations exceeding the Screening Levels presented in the Draft PEA Report at 34 sample locations including toxaphene in all 34 and dieldrin at three locations (Figure 3 and Table 1). The Draft PEA human health screening evaluation found that assumed exposures at the Site result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors. The estimated cumulative cancer risk associated with potential exposures to soil based on the 95% UCLs for pesticide maximum detected concentrations for other chemicals is 4×10^{-6}, which is within the low end of the United States Environmental Protection Agency (USEPA) target risk range of 10^{-4} to 10^{-6} and exceeds the point of departure of 1×10^{-6} for potential residential receptors. The PEA concluded that the surface soil sampling performed for the PEA has adequately defined the lateral extent of OCP-impacted soil at concentrations exceeding Screening Levels and recommended that a SSI Workplan be developed and implemented at the Site under DTSC oversight to assess the depth of OCP-impacted soil at the Site at concentrations exceeding Screening Levels (specifically toxaphene and dieldrin). A remedy for the OCP-impacted soil at the Site will be developed following completion of the SSI.

In a letter dated December 27, 2018, the DTSC concurred with the adequacy of the Draft PEA (Reference a) pending review of public comment (DTSC 2018b).

A SSI scoping telephone conference was conducted on January 4, 2019 between DTSC, Tetra Tech, OUHSD, and Sage. The SSI scope of work presented below is based on the scope of work agreed on by DTSC, Tetra Tech, OUHSD, and Sage Realty at the SSI scoping telephone conference.

6.0 SSI FIELD SAMPLING PLAN

6.1 SAMPLING STRATEGY AND APPROACH

The field sampling assessment will consist of a subsurface soil sample collection program using hand auger sampling methods. The following subsections describe the rationale and scope of sampling. The Site ground surface is relatively flat and will be planted in strawberries during implementation of the SSI sampling program.

6.1.1 Rationale

The SSI is being performed to further assess the vertical extent of OCPs at concentrations above the Screening Levels that were identified in the Draft PEA (Tetra Tech 2018b).

6.1.2 Field Coordination

The Site is under active strawberry cultivation with West Coast Berry Farms under lease to the Site owners, the Maulhardt Family. Tetra Tech will conduct one meeting onsite with representatives of the Maulhardt Family and West Coast Berry Farms prior to performing the SSI field sampling to review the SSI sampling plan and coordinate the field sampling effort. The soil sample locations are laid out so that they will be collected from in between the rows of strawberry plants. The soil samples will be collected using hand auger sampling methods that will be executed in a manner that avoids damaging crops and Site infrastructure.

6.1.3 Subsurface Soil Sampling Program

At the January 4, 2019 SSI scoping telephone conference, it was agreed that the lateral extent of OCPs in surface soils at concentrations that exceeded the PEA screening levels had been delineated in the Draft PEA sampling program (Tetra Tech 2018b). To delineate the vertical extent of OCPs in soil at concentrations that exceeded the Draft PEA screening levels, subsurface soil samples will be collected from the PEA surface soil sample locations where the 10 highest surface soil OCP concentrations were detected, at PEA sample locations SS-41, SS-43, SS-45, SS-48, SS-49, SS-50, SS-51, SS-53, SS-56, and SS-59 (Figure 4).

6.2 SAMPLING METHODS AND PROCEDURES

This section describes the methods and procedures that will be used to collect and analyze soil samples.

6.2.1 Sample Site Location and Utility Clearance

The soil sample locations where the 10 highest surface soil OCP concentrations were detected in the PEA sampling program (sample locations SS-41, SS-43, SS-45, SS-48, SS-49, SS-50, SS-51, SS-53, SS-56, and SS-59) were previously mapped in the field using a hand held global positioning system (GPS) unit.

These GPS sample location coordinates will be used to locate the SSI sample locations and sample depths in feet bgs will be recorded on a hand sketched map in our field notes. These data will be presented on figures and in tables in the SSI report. The utility clearance for these soil sample locations will be performed by meeting with representatives of the Maulhardt family and Westcoast Berry Farms as part of the field coordination that will be performed prior to conducting the SSI field sampling. The soil samples will be collected using hand auger sampling methods that will be executed in a manner that avoids damaging crops and Site infrastructure.

6.2.2 Subsurface Soil Sampling Methods

The subsurface soil samples will be collected from 10 locations (sample locations SS-41, SS-43, SS-45, SS-48, SS-49, SS-50, SS-51, SS-53, SS-56, and SS-59) at depths of 1.0 feet bgs, 1.5 feet bgs, and 2.0 feet bgs (Figure 4) using hand auger sampling methods. A total of 30 discrete soil samples will be collected. The subsurface soil samples will be collected using hand auger methods with a hand driven split-spoon sampler. Subsurface soil will be directly transferred from the split-spoon sampler into pre-cleaned glass sample containers provided by the analytical laboratory fitted with Teflon-lined screw-caps. The hand auger sampling equipment, including the split spoon sampler, will be decontaminated between the collection of each soil sample using a phosphate-free detergent wash and successive rinses with potable and deionized water.

The borings will be logged using the Unified Soil Classification System (USCS) as defined in the ASTM methods D 2487-90 (ASTM 1990a) and D 2488-90 (ASTM 1990b). During sampling, a photoionization detector (PID) calibrated with isobutylene gas will be used to monitor the potential presence and concentrations of organic vapors in the breathing zone for workers at each sample location and to screen soil samples. These organic vapor readings will be recorded on field logs prepared by the field geologist/engineer during soil sampling activities. The drill cuttings and soil samples will be evaluated in the field for staining and odor. The labeled samples will be placed in an ice chest containing pre-cooled artificial ice pending delivery to the analytical laboratory with chain-of-custody (COC) records.

The following sampling information will be recorded on the field logs: sample number and location, date and time, sample depth, lithologic description in accordance with the USCS (ASTM 1990a, 1990b), description of any visible evidence of soil contamination (i.e., odor, staining), and PID readings.

6.2.3 Subsurface Soil Sample Analysis Methods

The subsurface soil sample analysis schedule is presented in Table 2. The soil sample analyses will be performed by American Environmental Testing Laboratory, Inc. (AETL), a California State Certified laboratory. The subsurface soil samples will be analyzed for OCPs by United States Environmental Protection Agency (EPA) method 8081A.

For each of the ten sample locations, the subsurface soil collected from 1.0 foot bgs plus one duplicate soil sample will be initially analyzed. These are identified as soil samples SS-41-1, SS-43-1, SS-45-1, SS-48-1, SS-49-1, SS-50-1, SS-51-1, SS-53-1, SS-56-1, SS-59-1, and Sol Dup 1 on Table 2. The samples collected at 1.5 feet bgs will be analyzed if the corresponding sample from 1.0 foot bgs contains OCPs at concentrations that exceed the PEA screening levels, and the samples from 2.0 feet bgs will be analyzed if the corresponding sample from 1.5 feet bgs contains OCPs at concentrations that exceed the PEA screening levels. Up to 33 samples will be analyzed with a minimum of ten discrete and one duplicate sample and a maximum of 30 discrete and 3 duplicate soil samples analyzed. The sample volume from each soil sample collected will be large enough to run a duplicate sample so that one to three duplicate samples can be analyzed depending on the number of discrete samples analyzed. If more than 10 and less

than 21 discrete subsurface soil samples are analyzed, then an additional duplicate soil sample, Sol Dup 2, will be selected from these soil samples. If more than 20 discrete subsurface soil samples are analyzed, then an additional duplicate soil sample, Sol Dup 3, will be selected from these soil samples.

The laboratory reporting limits and soil sample screening levels for subsurface soil samples are provided in Table 3. The soil samples will be screened by comparison to Residential Soil Screening Levels (RSLs) for OCPs in the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended in *Human Health Risk Assessment (HHRA) NOTE, HERO HHRA NOTE NUMBER: 3, DTSC-modified Screening Levels (DTSC-SLs)* (DTSC 2018a).

7.0 SSI REPORT

Tetra Tech will prepare and submit a SSI Report to DTSC. The report will be prepared in letter format. The SSI report will provide background information about the Site, a description of field assessment activities including any deviations to the SSI Technical Memorandum sampling plan, tabulated analytical data, maps showing sample locations, a comparison of Site data to the EPA Regional Screening Levels (RSLs) with modifications as discussed in the DTSC's HERO Note 3 (DTSC 2018a) and conclusions and recommendations.

At the January 4, 2019 SSI scoping telephone conference, DTSC requested that the SSI Human Health Risk Evaluation include the following four scenarios:

- Maximum cumulative carcinogenic risk estimate;
- 95% upper confidence limit (95% UCL) of the arithmetic mean;
- Unrestricted Land Use; and
- School Based.

It was agreed by DTSC, Tetra Tech, OUHSD, and Sage that the SSI Human Health Risk Evaluation in the SSI Report will include these four scenarios.

A draft and final SSI Report will be prepared for this project and submitted to the DTSC for review and approval.

8.0 SCHEDULE

Tetra Tech proposes to perform the field sampling (combined with the laboratory analysis) from February 18 through 20, 2019. DTSC will be notified at least one week before any field work takes place and will be notified immediately of any schedule changes or revisions to the SSIFSP.

The proposed project schedule key milestones are as follows:

- Submit SSI Field Sampling Plan (Technical Memorandum) to DTSC: January 31, 2019
- DTSC Approval of Field Sampling Plan February 15, 2019
- Conduct SSI Field Work February 18 - 20, 2019
- Submit Draft SSI Report to DTSC March 8, 2019
- Receive DTSC Comments on Draft SSI Report March 29, 2019
- Submit Final SSI Report to DTSC April 5, 2019

- DTSC Approval of Final SSI Report April 19, 2019

9.0 CERTIFICATION

None of the work performed hereunder shall constitute or be represented as a legal opinion of any kind or nature, but shall be a representation of findings of fact from records examined.

Respectfully submitted,

Table 1
Organochlorine Pesticides in Soil
High School No. 8
Oxnard, California

Notes:
a - Organochlorine pesticides analyzed by EPA method 8081A.
b - non carcinogenic
c - carcinogenic
d - Residential Soil Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).
e - Table 3 lists compound-specific MDLs and PQLs for analytes that were not detected.
MDL - method detection limit
ND - not detected
PQL - practical quantitation limit
SL - Screening Level
The analytical results in red font are J-flagged, where concentration of the analyte detected is between MDL and PQL.
The analyte concentrations in yellow highlighted cells exceed their relevant screening level.

SS-59	SS-59-1.5	1.5	Subsurface soil	EPA method 8081A for OCPs	Discrete	Subsurface Soil SSI. Analyze if sample from 1 ft. bgs contains OCPs ≥ DTSC Screening Levels.
SS-59	SS-59-2.0	2	Subsurface soil	EPA method 8081A for OCPs	Discrete	Subsurface Soil SSI. Analyze if sample from 1.5 ft. bgs contains OCPs ≥ DTSC Screening Levels.

Notes:

1 - The sample locations are shown on Figure 4.

2 - For each of the ten sample locations, the subsurface soil collected from 1.0 foot bgs plus one duplicate soil sample will be initially analyzed. These are identified as soil samples SS-41-1, SS-43-1, SS-45-1, SS-48-1, SS-49-1, SS-50-1, SS-51-1, SS-53-1, SS-56-1, SS-59-1, and Sol Dup 1 on Table 2. The samples collected at 1.5 feet bgs will be analyzed if the corresponding sample from 1.0 foot bgs contains OCPs at concentrations that exceed the PEA screening levels, and the samples from 2.0 feet bgs will be analyzed if the corresponding sample from 1.5 feet bgs contains OCPs at concentrations that exceed the PEA screening levels. Up to 33 samples will be analyzed with a minimum of ten discrete and one duplicate sample and a maximum of 30 discrete and 3 duplicate soil samples analyzed. The sample volume from each soil sample collected will be large enough to run a duplicate sample so that one to three duplicate samples can be analyzed depending on the number of discrete samples analyzed. If more than 10 and less than 21 discrete subsurface soil samples are analyzed, then an additional duplicate soil sample, Sol Dup 2, will be selected from these soil samples. If more than 20 discrete subsurface soil samples are analyzed, then an additional duplicate soil sample, Sol Dup 3, will be selected from these soil samples.

bgs - below ground surface
EPA - U. S. Environmental Protection Agency
OCP - organochlorine pesticide

1.0 INTRODUCTION

1.1 BACKGROUND

This Supplemental Site Investigation (SSI) Report was prepared by Tetra Tech for submittal to the California Environmental Protection Agency (Cal/EPA), Department of Toxic Substances Control (DTSC), School Evaluation and Cleanup Branch on behalf of the Oxnard Union High School District (OUHSD) for their proposed High School No. 8 (hereinafter referred to as the Site) (Figure 1). The scope of services for this SSI were developed to assist the OUHSD in further assessing the nature and extent of organochlorine pesticides (OCPs) in soil at concentrations above screening levels that were identified in soil samples collected for the *Draft Preliminary Environmental Assessment High School No. 8. APN 214-002-059 on North Rose Avenue, Oxnard California* (Tetra Tech 2018d) (Draft PEA Report). The surface soil sampling performed for the PEA adequately defined the lateral extent of OCP-impacted soil at the Site at concentrations exceeding screening levels. The Draft PEA Report recommended that a SSI workplan be developed and implemented at the Site under DTSC oversight to assess the depth of OCP-impacted soil at the Site at concentrations exceeding screening levels (specifically toxaphene and dieldrin). In a letter dated December 27, 2018, the DTSC concurred with the adequacy of the Draft PEA pending review of public comment (DTSC 2018b).

A SSI scoping telephone conference was conducted on January 4, 2019 between by DTSC, Tetra Tech, OUHSD, and Sage Realty (Sage). The *Technical Work Plan Proposed High School No. 8 APN 214-002-059, on North Rose Avenue, Oxnard, California 93030* (Tetra Tech 2019) (SSIFSP) was prepared in accordance with the scope of work agreed on by DTSC, Tetra Tech, OUHSD, and Sage at the January 4. 2019 SSI scoping telephone conference. The SSIFSP was reviewed and approved by DTSC in their letter dated February 13, 2019 (DTSC 2019a) (Appendix A).

This SSI Report includes limited background and historical use information regarding the Site. A detailed summary of Site background and historical use information for the Site is presented in the *Final Phase I Environmental Site Assessment Proposed Oxnard High School No., 8* (Tetra Tech 2018a) (Phase I ESA) and the High School No. 8 Draft PEA Report (Tetra Tech 2018d). This SSI Report presents the details of the SSI sampling, analytical work, a human health screening evaluation, and conclusions and recommendations for the OCP-impacted soils at the Site based upon the potential contaminants of concern identified through SSI field sampling program and the results of the SSI Human Health Risk Evaluation.

1.2 DESIGNATED CONTACT PERSONS

The primary designated contact persons for Tetra Tech are Jim Steele and Randy Westhaus. Jim Steele is the Project Manager and Randy Westhaus is Tetra Tech's California Schools Director. Their contact information is:

James R. (Jim) Steele, P.G., C.E.G., C.Hg.
Tetra Tech, Inc.
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 681-6302
Fax (805) 681-3108

Randy Westhaus, P.E.
Tetra Tech, Inc.

5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111
Phone (805) 681-3101
Fax (805) 681-3108

The designated contact person for the OUHSD is Jeff Weinstein. Mr. Weinstein is the Assistant Superintendent Business Services for the OUHSD. The contact information for Mr. Weinstein is:

Jeffery Weinstein
Assistant Superintendent Business Services
Oxnard Union High School District

2.0 SITE LOCATION AND DESCRIPTION

The Site located within the Maulhardt Ranch at 1853 Camino Del Sol in the City of Oxnard, California in the 93030-zip code area (Figure 1). The proposed High School No. 8 site comprises approximately 48.6-acres in the southern portion of the Maulhardt Ranch at 1853 Camino Del Sol in the City of Oxnard, California in the 93030-zip code area (Figure 1). The Maulhardt Ranch (APN 214-002-059), is a 107.25-acre property in the City of Oxnard, California (Figure 2).

The OUHSD proposes to construct High School No. 8 at the Site to provide classroom space for students (Grades 9-12) living in the surrounding area and proposed Maulhardt Ranch Development (currently in the planning stage). The proposed Maulhardt Ranch Development is a planned development that will consist of medium and high-density multi-family residential properties to the north of the Site.

The Site is located in an area that is developed for commercial, residential, park, and agricultural land use (Figure 2). The Site is situated in the southern portion of the Maulhardt Ranch excluding the 11.59 acre residential and farmyard areas. The Site is bounded by Camino Del Sol on the south with residential and commercial development on the south side of Camino Del Sol, North Rose Avenue on the west with residential development to the west of North Rose Avenue, the residential and farmyard portions of Maulhardt Ranch to the southwest, and areas developed in strawberry cultivation on the Maulhardt Ranch to the north. A residential neighborhood is located to the east of the Site. Del Sol Park is located southwest of the Site across the intersection of Camino Del Sol and North Rose Avenue. The entire Maulhardt Ranch is bound by Camino Del Sol on the South, North Rose Avenue on the west, Cesar Chavez Drive on the north, and Gibraltar Street, the park adjacent to the west side of Rio Rosales Elementary School, and a residential neighborhood on the east. Commercial development consisting of a Carl's Jr. restaurant, 4-Way Meat Market, and the Trinity Community Church is located at the southeast corner of the of Camino Del Sol and North Rose Avenue. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol immediately south of the Site, and neighborhoods of single family housing are located to the east and west of the Site.

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 PHYSICAL SETTING, GEOLOGY, AND HYDROLOGY

3.1 PHYSICAL SETTING

The Site is depicted on the Oxnard, California Quadrangle U.S. Geological Survey (USGS) 7.5-minute topographic series map (USGS 2015) (Figure 1). The geographic coordinates of the Site are approximately Latitude 34° 12' 23.08" North, Longitude 119° 9' 31.40" West. The USGS 7.5 topographic series map indicates that the Site is at an elevation between 60 and 70 feet above mean sea level (amsl). The Site elevation is approximately 63 feet amsl with a topographic gradient that is generally flat with a gentle slope to the south-southwest (Environmental Data Resources [EDR] 2017).

3.2 REGIONAL GEOLOGY

The Site is located on the Oxnard Plain of the central Ventura Basin within the Western Transverse Ranges geomorphic province of California. The Transverse Ranges Province is a series of ranges and intervening valleys that extends for 325 miles "directly across the structural grain of California" (Oakeshott 1978). The province extends from Point Arguello and San Miguel Island eastward to the Pinto and Eagle Mountains which end in the Mojave and Colorado Deserts respectively. The province ranges in width from 10 to 50 miles. The narrowest points are at the western extreme in the Santa Ynez Mountains and at the Cajon Pass which separates the San Gabriel and San Bernardino Mountains. The province's broadest point is the distance from the Santa Monica coast, across the Santa Monica, Topatopa and Pine Mountains, to the Tehachapi Mountains.

The Ventura Basin is large synclinal structure situated between the Santa Ynez Range and Topatopa Mountains on the north, the Channel Islands and Santa Monica Mountains on the south, the San Gabriel Fault on the east, and extending to the western end of the Santa Barbara Channel (Norris and Webb 1990). Structure in the Oxnard Plain is characterized by a series of broadly folded west-trending and east-northeast–trending anticlines and synclines associated with thrust and reverse faults that formed in the Saugus Formation and may have also deformed the overlying older alluvium (California Geological Survey [CGS] 2002).

3.3 LOCAL GEOLOGY

The Site is located in the Oxnard Plain of the Ventura Basin. The Ventura Basin, including its offshore continuation into the Santa Barbara Channel, is filled with a thick sequence of Cenozoic sedimentary rocks estimated to be more than 20,000 feet in total thickness. Major east trending folds and reverse faults reflect regional north-south compression and are characteristic of the basin (Norris and Webb 1990). The Oxnard Plain is underlain by several thousand feet of Pleistocene-age sediments of the San Pedro Formation. The San Pedro Formation consists of marine and continental deposits of clay, silt, and gravel (Turner, et al 1975). The predominant surface materials in this region include Pleistocene to Recent age alluvial, floodplain, and near-shore deposits, some of which have been uplifted, folded, and faulted.

3.4 EARTH MATERIALS

3.4.1 Stratigraphy

Based on the Geologic Map of the Oxnard 7.5' Quadrangle, Ventura County, California the Site is underlain at the ground surface by Holocene deltaic alluvial fan deposits composed predominantly of clay

with interbeds of sand and occasional gravel that were deposited by the Santa Clara River and extend to approximately 70 feet below ground surface (bgs) (Clahan, et al 2003; Turner, et al 1975). These are conformably underlain by upper Pleistocene alluvial sand and gravel deposits to approximately 400 feet bgs, and the marine – non marine clays and gravels of the Lower Pleistocene San Pedro formation to approximately 2,000 feet bgs.

3.4.2 U.S. Department of Agriculture, Soil Conservation Service Data

The U.S. Department of Agriculture, Soil Conservation Service (USDA) data identifies the native soil types at the Site to be Mocho loam, Pico sandy loam and sandy loam substratum, Hueneme sandy loam, and Camarillo sandy loam. These soils are nearly level and occur on alluvial fans and flood plains. Permeability is rapid and surface runoff is very slow, such that there is no hazard of erosion by water (U.S. Department of Agriculture [USDA], Soil Conservation Service 1970).

3.4.3 High School No 8 Geohazard Assessment/Geotechnical Investigation Soil Boring Data

Fifty three geotechnical soil borings were completed to depths ranging from 10 feet bgs to 51.5 feet bgs during April and July 2018 for the High School No. 8 Geohazard Assessment/Geotechnical Investigation (Tetra Tech 2018c; Earth Systems Pacific 2018a and 2018b). The general subsurface profile observed in the borings consisted of silty sand at the ground surface extending to approximately 3 to 8 feet bgs, underlain by interbedded poorly to well graded sand and occasional gravel with clay and silt layers that are exposed in the borings completed for this project to 51.5 feet bgs. These alluvium and wash deposits were deposited by the ancestral Santa Clara River (Turner, et al 1975). Groundwater was encountered at depths ranging from approximately 20 to 25 feet bgs in the deeper borings completed for this project. The soils were in a slightly moist to moist condition above the water table and wet below the water table. The sandy soils have a loose to very dense consistency while the silt and clay soils were medium stiff to stiff. Several of these soil layers also had varying amounts of fine to coarse gravel and cobbles.

3.5 HYDROLOGY

3.5.1 Hydrogeology

The Site is located in the northern portion of the Oxnard Plain Pressure Groundwater Basin within the Santa Clara River Hydrologic Unit (Turner, et al 1975). The Oxnard Plain Groundwater Basin is a relatively flat alluviated area, which ranges in elevation from sea level to approximately 100 feet. The water bearing zones of the Oxnard Plain Groundwater Basin are grouped into three major units including 1) the semi-perched aquifer and clay cap, 2) the Upper Aquifer System, and 3) the Lower Aquifer System.

The semi-perched aquifer and clay cap consists of all of the alluvial materials above the Oxnard aquifer zone. The semi-perched aquifer extends to a depth of approximately 75 feet bgs and is underlain by the clay cap that extends from approximately 75 to 150 feet bgs in the Site area (Turner, et al 1975). This aquifer consists primarily of geologically Recent-aged stream deposited sands and gravels with minor silt and clay interbeds. Sand and gravel deposits are generally parallel to the Santa Clara River and form lenses perpendicular to the Santa Clara River. Groundwater in the semi-perched zone is generally considered to be of poorer quality and of limited beneficial use. Groundwater was encountered at approximately 20 feet bgs at the Site in geotechnical drilling during May and July 2018. Historically groundwater has been as shallow as approximately 10 bgs at the Site (CGS 2002). The "clay cap" underlies the semi-perched groundwater zone separating it from the underlying Upper Aquifer System.

This clay cap acts as an aquitard. Based on topographic controls, the groundwater in the semi-perched zone in the site vicinity is expected to flow toward the south to south-southwest.

3.5.2 Surface Water

No surface water was observed at the Site during the reconnaissance performed on July 2, 2018. It is likely that during periods of moderate rainfall, free surface water that accumulates on the Site may flow south and southwest and possibly into gutters along Camino Del Sol and North Rose Avenue (Figures 1 and 2). However, the U.S. Department of Agriculture, Soil Conservation Service report indicates that soil permeability at the Site is moderate to rapidly moderate and surface runoff is very slow, such that there is a low hazard of erosion by water (USDA 1970).

THIS PAGE INTENTIONALLY LEFT BLANK

4.0 SITE BACKGROUND

The review of historical aerial photographs and maps, and interviews with the current owner, indicate the Site and adjacent areas have been used for agricultural production (row crops) since at least 1869. The Site is currently being used for strawberry cultivation. Tetra Tech reviewed California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR) Map 214 (DOGGR 2001), the online DOGGR Well Finder (DOGGR 2017), and associated well history documents to evaluate potential presence of oil fields or wells within the Site vicinity. Records indicate that the site is located within the Oxnard Oil Field, however no known active or abandoned oil wells are present on the Site. Additionally, no oil wells are present on 107.25-acre Maulhardt Ranch (APN 214-002-059) where the Site is located. The oil well located nearest to the Site is the Maulhardt Community No. 11A, located approximately 850 feet south of the Site. The Maulhardt Ranch farm yard and residential area are located adjacent to the south and west of the Site (Figures 2 and 3). Formerly, above ground and underground storage tanks were located in the Maulhardt Ranch farm yard and residential area. A more complete description of the historical land use of the Site and surrounding area is provided in the High School No. 8 Phase I ESA (Tetra Tech 2018a).

THIS PAGE INTENTIONALLY LEFT BLANK

5.0 HIGH SCHOOL NO. 8 PEA SUMMARY

On behalf of the OUHSD, Tetra Tech completed the Draft PEA Report on November 9, 2018 and submitted it to DTSC for review (Tetra Tech 2018d). The PEA field sampling program included the collection of surface soil samples from 60 locations at depths of 0 to 0.5 feet below ground surface (bgs) to assess potential OCPs. OCPs were detected at concentrations exceeding the screening levels presented in the Draft PEA Report at 34 sample locations including toxaphene in all 34 and dieldrin at three locations (Figure 3 and Table 1). The Draft PEA Report human health screening evaluation found that assumed exposures at the Site result in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors. The estimated cumulative cancer risk associated with potential exposures to soil based on the 95% UCLs for pesticide maximum detected concentrations for other chemicals is 4×10^{-6}, which is within the low end of the United States Environmental Protection Agency (USEPA) target risk range of 10^{-4} to 10^{-6} and exceeds the point of departure of 1×10^{-6} for potential residential receptors. The PEA concluded that the surface soil sampling performed for the Draft PEA Report had adequately defined the lateral extent of OCP-impacted soil at concentrations exceeding screening levels and recommended that a SSI Workplan be developed and implemented at the Site under DTSC oversight to assess the depth of OCP-impacted soil at the Site at concentrations exceeding screening levels (specifically toxaphene and dieldrin).

In the letter dated December 27, 2018, the DTSC concurred with the adequacy of the Draft PEA Report pending review of public comment (DTSC 2018b).

The Public Review Period for the Draft PEA Report was held from February 1 through March 4, 2019. The Public Hearing for the Draft PEA Report was held by the OUHSD on February 13, 2019 at the OUHSD District Office Board Room at 220 South K Street in Oxnard, California. No public comments were received by the OUHSD at the Public Hearing and during the Public Review Period on the subject Draft PEA Report.In the letter dated March 12, 2019, the DTSC approved the Draft PEA Report and concurred with the recommendation in the Draft PEA Report to perform a SSI to determine the nature and extent of OCP-impacted soil at the Site (DTSC 2019b).

THIS PAGE INTENTIONALLY LEFT BLANK

6.0 SSI FIELD WORK

6.1 SAMPLING STRATEGY AND APPROACH

The field sampling assessment consisted of a subsurface soil sample collection program using hand auger sampling methods. The following subsections describe the rationale and scope of sampling. The Site ground surface is relatively flat and was planted in strawberries during implementation of the SSI sampling program.

6.1.1 Rationale

The SSI was performed to further assess the vertical extent of OCPs at concentrations above the screening levels that were identified in the Draft PEA (Tetra Tech 2018d).

6.1.2 Field Coordination

The Site is under active strawberry cultivation with West Coast Berry Farms under lease to the Site owners, the Maulhardt Family. Tetra Tech conducted a meeting onsite with representatives of the Maulhardt Family prior to performing the SSI field sampling on February 13, 2019 to review the SSI sampling plan and coordinate the field sampling effort. The soil sample locations were laid out so that the samples were collected from in between the rows of strawberry plants.

6.1.3 Subsurface Soil Sampling Program

At the January 4, 2019 SSI scoping telephone conference, it was agreed that the lateral extent of OCPs in surface soils at concentrations that exceeded the screening levels had been delineated in the Draft PEA sampling program (Tetra Tech 2018b; 2018d). To delineate the vertical extent of OCPs in soil at concentrations that exceeded the screening levels, subsurface soil samples were collected from the PEA surface soil sample locations where the 10 highest surface soil OCP concentrations were detected, at PEA sample locations SS-41, SS-43, SS-45, SS-48, SS-49, SS-50, SS-51, SS-53, SS-56, and SS-59 (Figure 4).

6.2 SAMPLING METHODS AND PROCEDURES

This section describes the methods and procedures that were used to collect and analyze soil samples.

6.2.1 Sample Site Location and Utility Clearance

The soil sample locations where the 10 highest surface soil OCP concentrations were detected in the PEA sampling program (sample locations SS-41, SS-43, SS-45, SS-48, SS-49, SS-50, SS-51, SS-53, SS-56, and SS-59) were previously mapped in the field using a hand held global positioning system (GPS) unit (Figure 4). These GPS sample location coordinates were used to locate the SSI sample locations. The sample collection depths were recorded in feet bgs in our field notes. The utility clearance for these soil sample locations was performed by meeting with representatives of the Maulhardt family on February 13, 2019. The soil samples were collected using hand auger sampling methods in a manner that avoided damaging crops and Site infrastructure.

6.2.2 Subsurface Soil Sampling Methods

The SSI field sampling was performed on February 18, 2019. The subsurface soil samples were collected from 10 locations (sample locations SS-41, SS-43, SS-45, SS-48, SS-49, SS-50, SS-51, SS-53, SS-56, and

SS-59) at depths of 1.0 feet bgs, 1.5 feet bgs, and 2.0 feet bgs (Figure 4) using hand auger sampling methods. A total of 21 discrete and three duplicate soil samples were collected. The subsurface soil samples were collected using hand auger methods directly from the hand auger bucket. Subsurface soil was directly transferred from the hand auger bucket into pre-cleaned glass sample containers provided by the analytical laboratory fitted with Teflon-lined screw-caps. The hand auger sampling equipment, including the hand auger bucket, were decontaminated between the collection of each soil sample using a phosphate-free detergent wash and successive rinses with potable and deionized water.

The borings were logged using the Unified Soil Classification System (USCS) as defined in the ASTM methods D 2487-90 (ASTM 1990a) and D 2488-90 (ASTM 1990b). The SSI boring logs are included in in Appendix B. During sampling, a photoionization detector (PID) calibrated with isobutylene gas was used to monitor the potential presence and concentrations of volatile organic compound (VOC) vapors in the breathing zone for workers at each sample location and to screen soil samples. These organic vapor readings were recorded in field notes prepared by the field geologist/engineer during soil sampling activities. The drill cuttings and soil samples were evaluated in the field for staining and odor. The labeled samples were placed in an ice chest containing pre-cooled artificial ice pending delivery to the analytical laboratory with chain-of-custody (COC) records.

The following sampling information was recorded on the field logs: sample number and location, date and time, sample depth, lithologic description in accordance with the USCS (ASTM 1990a, 1990b), description of any visible evidence of soil contamination (i.e., odor, staining), and PID readings.

7.0 SSI FIELD ASSESSMENT RESULTS

7.1 EARTH MATERIALS

The Site geology and soil types are described in Sections 3.2 through 3.4.3. Ten soil borings (borings SS-41, SS-43, SS-45, SS-48, SS-49, SS-50, SS-51, SS-53, SS-56, and SS-59) were completed to 2 feet bgs for the SSI at the locations shown on Figure 4. The boring logs are included in Appendix B. The general subsurface profile observed in the borings consisted of silt, silty sand, and sand at the ground surface extending to the total depth of each boring at 2.0 feet bgs. No VOC vapors, soil staining, or odors indicative of contamination were noted in the soils logged in the ten SSI soil borings.

7.2 GROUNDWATER

The Site area hydrogeology is described in Section 3.5.1. No groundwater was encountered to two feet bgs in the ten borings completed for the SSI. The shallowest groundwater at the Site occurs in the semi-perched aquifer and clay cap of the Oxnard Plain Pressure Basin within the Santa Clara River Hydrologic Unit (Turner, et al 1975; Ventura County Public Works Department [VCPWA] 1975). Groundwater was encountered at depths ranging from approximately 20 to 25 feet bgs in the borings completed for the Geohazard Assessment/Geotechnical Report project during April and July 2018 (Tetra Tech 2018c; ESP 2018a and 2018b).

7.3 SUBSURFACE SOIL SAMPLE ANALYSIS RATIONALE AND METHODS

The subsurface soil sample analysis schedule is presented in Table 2 and their locations are shown on Figure 4. The soil sample analysis was performed by American Environmental Testing Laboratory, Inc. (AETL), a California State Certified laboratory. The subsurface soil samples were analyzed for OCPs by United States Environmental Protection Agency (EPA) method 8081A.

The laboratory reporting limits and soil sample screening levels for subsurface soil samples are provided in Table 3. The soil samples were screened by comparison to Residential Soil Screening Levels (RSLs) for OCPs in the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended in *Human Health Risk Assessment (HHRA) NOTE, HERO HHRA NOTE NUMBER: 3, DTSC-modified Screening Levels (DTSC-SLs)* (DTSC 2018a).

A total of 21 discrete soil samples and three duplicate soil samples (24 samples total) were analyzed for OCPs by EPA method 8081A as summarized below.

For each of the ten sample locations, the subsurface soil collected from 1.0 foot bgs plus one duplicate soil sample was initially analyzed. These are identified as soil samples SS-41-1, SS-43-1, SS-45-1, SS-48-1, SS-49-1, SS-50-1, SS-51-1, SS-53-1, SS-56-1, SS-59-1, and Soil Dup 1 on Table 2. Soil Dup 1 was collected at the same location as discrete soil sample SS-56-1.

The soil samples collected at 1.5 feet bgs were analyzed if the corresponding sample from 1.0 foot bgs contained OCPs at concentrations that exceed the screening levels. Nine of the discrete soil samples and a duplicate soil sample collected at 1.0 foot bgs contained toxaphene at concentrations that exceeded the screening levels (soil samples SS-41-1, SS-43-1, SS-48-1, SS-49-1, SS-50-1, SS-51-1, SS-53-1, SS-56-1, SS-59-1, and Soil Dup 1). The corresponding discrete soil samples collected at 1.5 feet bgs were analyzed for OCPs (soil samples SS-41-1.5, SS-43-1.5, SS-48-1.5, SS-49-1.5, SS-50-1.5, SS-51-1.5, SS-53-1.5, SS-56-1.5, and SS-59-1.5 [Table 2]). Soil Dup 2 was prepared from sample SS-56-1.5 and analyzed for OCPs.

The soil samples collected at 2.0 feet bgs were analyzed if the corresponding sample from 1.5 feet bgs contained toxaphene at concentrations that exceed the screening levels. Two of the discrete soil samples collected from 1.5 feet bgs contained OCPs at concentrations that exceeded the screening levels (soil samples SS-43-1.5 and SS-53-1.5). The corresponding discrete samples collected at 2.0 feet bgs were analyzed for OCPs (soil samples SS-43-2 and SS-53-2 [Table 2]). Soil Dup 3 was prepared from sample SS-53-2 and analyzed for OCPs.

7.4 SUBSURFACE SOIL SAMPLE ANALYTICAL RESULTS

The laboratory reporting limits and soil sample screening levels for subsurface soil samples are provided in Table 3, the laboratory analytical results are presented in Table 4, and the laboratory reports are included in Appendix C. Ten of the 22 OCPs in the EPA method 8081A list were detected in all the samples that were analyzed (21 discrete surface soil samples and three duplicate soil samples). The detected OCPs were Chlordane (total) (20 discrete and 3 duplicate samples), Chlordane (alpha) (18 discrete and 3 duplicate samples), 4,4'-DDD (DDD) (17 discrete and 3 duplicate samples), 4,4'-DDE (DDE) (21 discrete and 3 duplicate samples), 4,4'-DDT (DDT) (21 discrete and 3 duplicate samples), Dieldrin (20 discrete and 3 duplicate samples), Endrin (21 discrete and 3 duplicate samples), Endrin Aldehyde (18 discrete and 3 duplicate samples), Chlordane (gamma) (18 discrete and 2 duplicate samples), and Toxaphene (21 discrete and 3 duplicate samples). Chlordane (total), Chlordane (alpha), DDD, DDE. DDT, Dieldrin, Endrin, Endrin Aldehyde, and Chlordane (gamma), were detected at concentrations below their respective screening levels. Toxaphene was detected at concentrations above the screening level (490 µg/kg) in 12 of the 24 samples that were analyzed at concentrations ranging from 898 µg/kg in sample SS-53-1.5 to 3,110 µg/kg in the duplicate sample for SS-56-1, Soil Dup 1. The locations of the soil samples that contain toxaphene at concentrations above the screening level are shown on Figure 5.

In the 11 samples analyzed from 1.0 foot bgs, toxaphene was detected in nine discrete and one duplicate sample at concentrations above the screening level (490 µg/kg) (soil samples SS-41-1, SS-43-1, SS-48-1, SS-49-1, SS-50-1, SS-51-1, SS-53-1, SS-56-1, SS-59-1, and Soil Dup 1). In the 11 samples collected from 1.0 foot bgs with toxaphene at concentrations above the screening level, the toxaphene concentrations ranged from 992 µg/kg in sample SS-51-1 to 3,110 µg/kg in the duplicate sample for SS-56-1, Soil Dup 1 (Table 4 and Figure 5).

For the nine discrete and one duplicate soil sample analyzed from 1.5 feet bgs, (soil samples SS-41-1.5, SS-43-1.5, SS-48-1.5, SS-49-1.5, SS-50-1.5, SS-51-1.5, SS-53-1.5, SS-56-1.5, SS-59-1.5, and Soil Dup 2), two soil samples (soil samples SS-43-1.5 and SS-53-1.5) contained toxaphene at concentrations above the screening level (490 µg/kg). Soil sample SS-43-1.5 contained 2,240 µg/kg toxaphene and soil sample SS-53-1.5 contained 898 µg/kg toxaphene (Table 4 and Figure 5).

Toxaphene was not detected at concentrations above the screening level in the two discrete and one duplicate soil sample analyzed from 2.0 feet bgs (soil samples SS-43-2, SS-53-2, and Soil Dup 3) (Table 4 and Figure 5).

The maximum depth of OCP-impacted soil at the Site at concentrations exceeding screening levels in the ten SSI soil borings is shown schematically on Figure 6. The maximum depth of toxaphene in soil at concentrations exceeding screening levels was defined to be between 0.0 and 1.0 feet bgs boring SS-45, between 1.0 and 1.5 feet bgs in borings SS-41, SS-48, SS-49, SS-50, SS-51, SS-56, and SS-59, and between 1.5 and 2.0 feet bgs in borings SS-43, and SS-53. The maximum depth of dieldrin in soil at concentrations exceeding screening levels was defined to be between 0.0 and 1.0 feet bgs in borings SS-

49, SS-51, and SS-59. No other OCPs were detected at concentrations that exceeded the screening levels in the soil samples collected for the PEA or SSI.

THIS PAGE INTENTIONALLY LEFT BLANK

8.0 HUMAN HEALTH RISK EVALUATION

8.1 INTRODUCTION

The High School No. 8 PEA human health screening evaluation (Tetra Tech 2018d) was conducted for residential exposures to the chemicals of potential concern (COPCs) identified in soil gas, groundwater, and soils at the proposed High School No. 8 Site through sample data collected for the PEA sampling program. The COPCs identified in soils at the Site include OCPs, total petroleum hydrocarbons – diesel range (TPHd), total petroleum hydrocarbons – gasoline range (TPHg), and VOCs. Exposures to these COPCs were evaluated for direct dermal contact with soils, incidental ingestion of soils, inhalation of airborne dusts from soils, and inhalation of vapors migrating from soil gas into indoor air. Receptors were evaluated for: (1) carcinogenic risks and (2) noncarcinogenic hazards. Assumed exposures at the Site resulted in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors. Noncarcinogenic hazard from assumed exposures to the COPCs in soil and soil gas at the Site (HI = 0.2) is well below the threshold level of 1.

The estimated risk identified in the High School No. 8 PEA human health screening evaluation (Tetra Tech 2018d) is primarily attributable to toxaphene (71%) and dieldrin (16%). No other chemicals were detected at concentrations that exceeded the corresponding screening levels. Toxaphene was detected at 34 sampling locations at levels that exceeded the corresponding residential screening level of 490 µg/kg. Dieldrin was detected at three sampling locations (SS-49, SS-51, and SS-59) with concentrations ranging from (34.7 µg/kg to 40.4 µg/kg) that slightly exceeded the corresponding residential screening level of 34 µg/kg.

The High School No. 8 SSI Human Health Risk Evaluation uses the combined sample data from the PEA and SSI field sampling programs. As agreed to by DTSC at the January 4, 2019 SSI scoping telephone conference, the SSI Human Health Risk Evaluation includes the following four scenarios:

- Maximum cumulative carcinogenic risk estimate;
- 95% upper confidence limit (95% UCL) of the arithmetic mean;
- Unrestricted Land Use; and
- School-Based (Students and Teachers).

The High School No. 8 SSI Human Health Risk Evaluation consists of three steps: (1) identifying potentially complete exposure pathways based on the conceptual site model, (2) identifying COPCs, and (3) estimating exposures to the COPCs and the associated potential health risks. The findings of the human health screening evaluation are summarized in the Risk Characterization (Section 8.5).

8.2 EXPOSURE PATHWAYS AND MEDIA OF CONCERN

8.2.1 Conceptual Site Model

A conceptual site model (CSM) provides a description of the links between contaminant sources at a site, the chemicals detected at the Site, the mechanisms by which chemical transport or migration may occur in the environment, and the persons potentially exposed to environmental media at the Site. The CSM (Figure 7) identifies the potential sources, mechanisms of transport, environmental media of concern, and exposure routes for current and future human receptors at this Site. The CSM presented in Figure 7 was modified based on DTSC Comment No. 1 in the letter dated December 27, 2018 that concurred with the adequacy of the Draft PEA (DTSC 2018b)

As discussed in Sections 2.0 and 4.0, the Site is a 48.6-acre (approximate) portion of the 107.25-acre Maulhardt Ranch property in the City of Oxnard, California. The Site is bounded by Camino Del Sol on the south, North Rose Avenue on the west, Cesar Chavez Drive on the north, and a residential neighborhood to the east. High density residential development consisting of blocks of apartment buildings are located on the south side of Camino Del Sol, and neighborhoods of single family housing are located to the east and west of the Site.

The Site and adjacent areas have been used for agricultural production (row crops) since at least 1869. The Site is currently being used for strawberry cultivation. Records indicate that the Site is located within the Oxnard Oil Field; however, no known active or abandoned oil wells are present on the Site. Additionally, no oil wells are present on the 107.25-acre Maulhardt Ranch where the Site is located. The oil well located nearest to the site is the Maulhardt Community No. 11A, located approximately 850 feet south of the Site. Formerly, ASTs and USTs were located in the Maulhardt Ranch farm yard and residential area.

Organochlorine pesticides came into wide use in the late 1950s, and prior to that, arsenic-based pesticides were commonly used. Therefore, OCPs and arsenic-based compounds may have been used at the Site during agricultural production activities. Oil production activities and the underlying Oxnard Oil Field may have resulted in the release of contaminants to Site soils and soil gas, including metals, semi-volatile organic compounds (SVOCs), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), VOCs, TPHd and TPHg. As shown in the CSM (Figure 7), five potential sources of chemicals have been identified at this Site: (1) pesticide and fuel oil releases from former agricultural operations (2), soil gas impacts from the underlying Oxnard Oil Field), (3) petroleum fuel releases from the ASTs and USTs formerly located in the adjacent Maulhardt Ranch farmyard and residential areas, (4), potentially hazardous substances and petroleum products that contained VOCs and TPHg used and stored in the Tin Shed, Horse Barn, Garage, and Storage Shed on the Maulhardt Ranch that may have impacted shallow soil, soil gas, and groundwater in the areas of the Site adjacent to the Maulhardt Ranch farmyard area, and (5) PCB soil contamination from the pole-mounted electrical transformer located onsite along the southern Site boundary along Camino Del Sol. As a result of these findings, soil gas samples were collected at the Site and analyzed for VOCs, methane, and hydrogen sulfide. Soil samples were collected at the Site and analyzed for OCPs, metals, SVOCs, PAHs, PCBs, VOCs, TPHd, and TPHg, and groundwater samples were collected at the Site and analyzed for VOCs, TPHg, and TPHd.

School children and staff at the proposed High School are the receptor groups most likely to be exposed to any chemicals potentially present at the Site. PEA guidance (DTSC 2015) indicates that sites should be evaluated assuming unrestricted residential land use, regardless of current and future uses. Therefore, the unrestricted land use scenario (i.e., residential land use) was evaluated for this Site, which is protective of future school use since the exposure assumptions for a residential scenario are more conservative than those for a school scenario. In addition to the unrestricted land use scenario, DTSC also requested that school-based receptors be evaluated for potential exposures to chemicals in soil. As the proposed site is intended to serve as a high school (grades 9-12), students associated grades 9-12 and teachers have also been evaluated in the human health screening evaluation. For this evaluation, it was conservatively assumed that students attended school on a year-round basis (233 days per year) rather than a 9-month school year (180 days per year).

8.2.2 Soil Exposure Pathways

Currently, the Site is unpaved and bare soils may be contacted directly. Chemicals of potential concern (COPCs) have been detected in soils at the Site. Therefore, the potential exists for humans to be exposed to COPCs through direct dermal contact with soil and by incidental soil ingestion. In the future, it is

likely buildings will be constructed at the Site. These buildings will act to limit exposures to soils by onsite receptors. However, in accordance with PEA guidance, all soils at the Site were considered available for dermal contact, incidental ingestion, and the generation of dusts (DTSC 2015). Additionally, the school-based exposure guidance (Cal/EPA [Office of Environmental Health Hazard Assessment] OEHHA 2004) assumes that dusts may be tracked indoors where receptors may incidentally ingest them and have dermal contact.

8.2.3 Water Exposure Pathways

Hydrogeologic data from the vicinity of the Site indicate the water table is approximately 20 feet bgs or deeper (Section 3.5.1). Groundwater does not come to the surface at this Site and groundwater at the Site will not be used as a potable water source for the planned high school. Direct exposure to groundwater beneath the Site is, therefore, not likely to occur. The potential release of petroleum products to groundwater from ASTs and USTs formerly located in the Maulhardt Ranch farmyard and residential areas, and from farm maintenance activities in the farmyard areas was assessed as part of the PEA. No evidence for release of petroleum products to groundwater beneath the Site from the adjacent areas of the Maulhardt Ranch farmyard and residential areas was identified in the samples collected for the PEA. Contamination of groundwater beneath the Site from off-site sources is considered unlikely. Therefore, potential groundwater exposure pathways are considered incomplete and were not evaluated in this human health screening evaluation.

No permanent surface water bodies occur on the Site (Section 3.5.2). Therefore, surface water exposure pathways are likely to be incomplete and were not evaluated.

8.2.4 Air Exposure Pathways

There is no documented evidence of releases of hazardous substances to the atmosphere from the Site. Based on the graded agricultural Site land use documented in aerial photographs and images dating from 1943 to 2015 (Tetra Tech 2018), there is a potential for releases to the air from fugitive dust emissions of potentially contaminated surface soils. Nonvolatile chemicals may also sorb to soils. Wind erosion and dispersion of soil particulates could potentially result in exposure to these nonvolatile chemicals associated with airborne soil particulates (i.e., dusts). Therefore, it was assumed that receptors could potentially be exposed to COPCs by the inhalation of airborne dusts.

The prevailing wind direction for the Site area is from the west from April through October and the north from October through April. The average wind speeds are 6.6 miles per hour (mph) from November through May and 4.8 mph from June through October (Weather Spark 2018).

The Site overlies the Oxnard Oil Field and oil wells and oil production activities occurred in the vicinity of the Site area. There is a potential for methane and hydrogen sulfide toxic gas to occur in near surface soil due to former oil production activities in the Site area and the presence of the underlying Oxnard Oil Field. Therefore, it was assumed that receptors could potentially be exposed to COPCs in groundwater and/or soil gas migrating into indoor and ambient air (Tetra Tech 2018d).

The Site is adjacent to the Maulhardt Ranch farmyard and residential areas where ASTs and USTs were formerly used for fuel storage. In addition, farm vehicle and equipment maintenance occurred in the farmyard area and various petroleum containing products have been stored there. There is a potential for VOC gas to occur in near surface soil due to the former ASTs and USTs fuel storage, equipment maintenance, and petroleum containing product storage in the Maulhardt Ranch farmyard and residential

areas. Therefore, it was assumed that receptors could potentially be exposed to COPCs in groundwater and/or soil gas migrating into indoor and ambient air (Tetra Tech 2018d).

8.2.5 Summary of Selected Exposure Pathways

Although the Site is planned as a high school, for the purpose of this screening evaluation, a residential/unrestricted land use scenario was assumed as well as high school student and teacher exposure scenarios. Receptors were assumed to be potentially exposed to chemicals at the Site by direct dermal contact with soils, incidental ingestion of soils, the inhalation of airborne dusts, and the inhalation of volatiles emitted from soil gas to indoor and outdoor air. These potentially complete exposure pathways are shown in the CSM for planned future Site conditions (Figure 7).

8.3 CHEMICALS AND EXPOSURE POINT CONCENTRATIONS

Tables 9 through 12 of the PEA Report present the results of chemical analyses for soil, soil gas, and groundwater samples collected at the Site during the PEA (Tetra Tech 2018d).

8.3.1 Volatile Organic Compounds and H_2S

Soil gas samples collected at the Site were analyzed for VOCs potentially emitted from the Maulhardt Ranch farmyard and residential areas (Tetra Tech 2018d, Table 10). In accordance with *Advisory – Active Soil Gas Investigations* (DTSC and Los Angeles Regional Water Quality Control Board [LARWQCB] 2015), soil gas samples were analyzed for VOCs using EPA method 8260B. All chemicals detected in soil gas were selected as COPCs and are summarized in Table 10 of the PEA Report (Tetra Tech 2018d).

Methane and H_2S were not detected in soil gas and were therefore not selected as COPCs. The methane and H_2S sampling results are presented in Table 9 of the PEA Report (Tetra Tech 2018d).

Groundwater samples collected at the Site were analyzed for VOCs, TPHg, and TPHd associated with potential fuel and petroleum product releases from the ASTs, USTs, and activities in the adjacent Maulhardt Ranch farmyard and residential areas. The groundwater sampling results are presented in Appendix M of the PEA Report (Tetra Tech 2018d).

8.3.2 Total Metals

Consistent with the Tetra Tech PEA Field Sampling Plan (Tetra Tech 2018b), only arsenic was analyzed for in soil during the PEA. This was done based on a review of the Ventura County Agricultural Commissioner's information, which indicated that recently used pesticides are restricted to those with relatively short half-lives (hours to months). Historically, arsenical pesticides may have been used. To determine the presence of arsenic and ensure a health-protective assessment, soil samples were analyzed for arsenic using EPA method 6010B.

Metals present at concentrations equivalent to (or lower than) background concentrations do not need to be considered in the screening evaluation (DTSC 2015). Arsenic was detected at a maximum concentration of 2.65 mg/kg, which is well below the screening level of 12 mg/kg. As indicated in the DTSC *Interim Guidance for Sampling Agricultural Properties* (DTSC 2008), if all arsenic data are equal to or less than 12 mg/kg, then arsenic does not need to be considered a COPC and this determination does not require collection and comparison to a background data set. Therefore, arsenic was not selected as a COPC and was not evaluated.

8.3.3 Pesticides

The OCP soil sample results are summarized in Table 1 for the 66 surface soil samples collected during the PEA and in Table 4 for the 24 subsurface soil samples collected for the SSI. The Site has been used for agricultural production since at least 1869; therefore, it is assumed that OCPs were applied at the Site in the row crop areas.

To determine the presence of pesticides and ensure a health-protective assessment, soil samples collected at the Site were analyzed for OCPs using EPA method 8081A. The following ten organochlorine pesticides were detected in soils at the Site:

- DDD;
- DDE;
- DDT;
- Chlordane (total);
- Chlordane (gamma);
- Chlordane (alpha);
- Dieldrin;
- Endrin;
- Endrin aldehyde; and
- Toxaphene.

All of the detected pesticides were selected as COPCs and evaluated. For chlordane, only the chlordane (total) results were evaluated since these results included gamma-chlordane and alpha-chlordane. This was done so that gamma-chlordane and alpha-chlordane were not double counted in the risk evaluation.

8.3.4 Chemicals of Potential Concern Summary

All of the detected organic chemicals at the Site associated with the PEA and the SSI were selected as COPCs and are evaluated in this screening-level evaluation. As previously indicated, arsenic was the only metal analyzed for in soil and was only detected in one sample at a concentration well below the screening leveling level of 12 mg/kg. Based on this data, arsenic was not selected as a COPC. Soil and soil gas COPCs were identified at the Site as follows:

Soil

- **No Metals**;
- **Eight Organochlorine pesticides** (DDD, DDE, DDT, chlordane (total), dieldrin, endrin, endrin aldehyde, and toxaphene); and

- **Two PAHs** (fluoranthene and phenanthrene).

Soil Gas

- **Two VOCs** (toluene and naphthalene).

Groundwater

- **None** (VOCs, TPHg, and TPHd reported as not detected).

All 12 of the COPCs were included in the human health risk evaluation.

8.3.5 Exposure Point Concentrations

For this evaluation, the maximum detected concentration was used as the exposure point concentration (EPC) in accordance with DTSC's PEA guidance (DTSC 2015). The EPCs used in this screening assessment are summarized in Tables 5 through 9.

In the event that detected concentrations exceeded the corresponding screening level, risk was also calculated based on the 95% upper confidence limit (95% UCL) of the arithmetic mean. 95% UCLs were calculated for the detected OCPs. The 95% UCLs used in this screening are summarized in Tables 10, 12, and 14.

8.4 RISK-BASED SCREENING LEVELS

VOCs found in soil gas may migrate to indoor air. Although the proposed future use of the Site is a school, for this evaluation, a residential/unrestricted land use scenario is included to provide a conservative evaluation in addition to school-based receptors. As the residential scenario provides the most conservative screen of potential receptors (i.e., is protective of school-based exposure scenarios), it is evaluated first. If the estimated risks and hazards for the residential scenario are below target risk and hazard levels, the school-based scenarios are not evaluated.

For COPCs in soil, potential residential and school-based receptors could be exposed via ingestion, dermal contact, and inhalation of dusts and vapors. For this evaluation, soil screening levels were developed to be protective of potential exposures to COPCS in soil through these exposure pathways.

In accordance with the Human and Ecological Risk Office's (HERO's) Human Health Risk Assessment (HHRA) Note 3 (DTSC 2018a), DTSC-modified air and soil screening levels and USEPA regional screening levels (RSLs) for air and soil were used as the basis for developing soil gas and soil screening levels protective of residential receptors potentially exposed via vapor intrusion into indoor air and contact with soil (USEPA 2018). DTSC-modified screening levels were used if available, otherwise USEPA RSLs were used.

For the school-based receptors, risk-based screening levels (RBSLs) were developed using the Schools Risk Screening Model (SCHOOLSCREEN) developed by DTSC (Cal/EPA OEHHA 2010). This model was developed as part of the DTSC guidance for school site risk assessment at proposed and existing school sites (Cal/EPA OEHHA 2004). Toxicity criteria used in the model were updated as needed to be consistent with currently recommended toxicity criteria. As indicated above, for this evaluation, it was conservatively assumed that students attended school on a year-round basis (233 days per year) rather than a 9-month school year (180 days per year).

Target Risk Levels

For this evaluation, target risk levels were determined according to USEPA and Cal/EPA guidance. USEPA's 1990 guidance indicates that a carcinogenic risk probability between 1 in 1,000,000 and 1 in 10,000 (1×10^{-6} to 1×10^{-4}) are generally acceptable. The lower end of the target risk range is typically applied to residential scenarios, whereas the higher range is typically considered appropriate for commercial/industrial situations. Thus, for this evaluation, carcinogenic air and soil screening levels were developed based on a target risk of 1×10^{-6} for residential receptors and school-based students. For this evaluation, teachers are considered to be consistent with a commercial scenario, so carcinogenic screening levels were developed based on a target risk of 1×10^{-5}. For potential non-carcinogenic effects, (USEPA 1990) indicates that non-carcinogenic chemicals should not be present at levels expected to cause adverse health effects. Therefore, for this evaluation, potential hazards for the residential scenario and school-based receptors are evaluated based on a target hazard index (HI) of 1. Individual chemical exposures that yield HIs of less than one is not expected to result in adverse non-cancer health effects (USEPA 1989).

Soil Gas Risk-Based Screening Levels (RBSLs)

Soil gas screening levels were derived from the DTSC-modified air screening levels and USEPA air RSLs in accordance with HHRA Note Number 3 (DTSC 2018a) using the DTSC default soil gas to indoor air attenuation factor for a future building of 0.001 (DTSC 2011). The soil gas to indoor attenuation factor represents the relationship between soil gas concentrations and the resulting indoor air concentrations. Since the DTSC default soil gas attenuation factor was developed to be applied to soil gas samples collected at a depth of 5 feet bgs, it provides a conservative screening for soil gas samples collected at a depth of 15 feet bgs that would be associated with greater attenuation.

The soil gas RBSLs for this evaluation were derived by dividing the DTSC and USEPA residential air screening levels by the DTSC default soil gas attenuation factor of 0.001 (USEPA 2018). The derivation of the residential soil gas screening levels is summarized in Table 5 of the Tetra Tech PEA Field Sampling Plan (Tetra Tech 2018b), which was approved by DTSC.

Currently, there are no default soil gas attenuation factors for a school scenario. In lieu of conducting site-specific soil gas modeling to derive a school-specific soil gas attenuation factor, a school-specific soil gas attenuation factor was conservatively derived by adjusting the default residential soil gas attenuation factor based on the difference in the DTSC recommended air exchange rates for a residential building and a school building. The DTSC residential default soil gas attenuation factor of 0.001 is based on the DTSC recommended air exchange rate of 0.5 exchanges per hour for a residential building (Cal/EPA OEHHA 2005). For school buildings, the Cal/EPA recommended air exchange rate is 4.7 exchanges per hour (Cal/EPA OEHHA 2004). This means that the recommended air exchange rate for a school building is 9.4-fold greater than the recommended air exchange rate for a residential building. Thus, for a school building, the soil gas attenuation factor will be 9.4-fold lower (0.000106), which will result in school-specific soil gas screening levels that are 9.4-fold higher than residential soil gas screening levels. It is noteworthy, that this is a conservative adjustment since it does not account for the lower exposure frequencies associated with a school scenario (233 to 250 days per year) versus a residential scenario (350 days per year).

Soil Risk-Based Screening Levels (RBSLs)

For this evaluation, DTSC-modified soil screening levels and USEPA soil RSLs protective of residential exposures were conservatively used to evaluate potential residential exposures to soil. The residential screening levels are conservative since they are based on exposure parameters that assume higher levels

of exposure than would be associated with a school site. For example, the exposure frequency and exposure time in a residential scenario are 350 days per year and 24 hours per day, respectively. For a school scenario, the maximum exposure frequency and exposure time are 250 days per year and 10.3 hours per day, respectively.

For the school-based receptors, soil screening levels were developed using the DTSC SCHOOLSCREEN model (Cal/EPA OEHHA 2010). This was done by iteratively entering soil exposure concentrations until the estimated risks and hazards were equal to the target risk and hazard levels identified for the residential and school-based receptors. The school-based receptors are represented by a school-based student scenario who are assumed to be at the school for four years (grades 9-12) and a teacher scenario that is assumed to be present at the school for 40 years. The exposure parameters for the school-based receptor scenarios are those recommended in the DTSC school risk assessment guidance (Cal/EPA OEHHA 2004). For this evaluation, it was conservatively assumed that students attended school on a year-round basis (233 days per year) rather than a 9-month school year (180 days per year).

8.5 RISK CHARACTERIZATION

Risks were characterized for potential residential and school-based student receptors using the ratio of concentrations measured at the Site to the RBSLs identified for each environmental medium. This evaluation consisted of three steps: (1) specifying the target risk and hazard quotient to use in calculating the RBSLs; (2) estimating EPCs for each environmental medium (i.e., the maximum detected concentration or the 95% upper confidence limit (95% UCL) of the arithmetic mean concentration; and (3) comparing the EPCs to the RBSLs to estimate risks and hazards for potential receptors. Each of these steps is described below.

8.5.1 Risk Estimation Procedures

The RBSLs were calculated for a specified target risk (i.e., a carcinogenic risk of 1 x 10^{-6} for residential receptors and school-based students and 1 x 10^{-5} for teachers) and concentrations greater than the RBSLs represent carcinogenic risks proportionally greater than the target risk. Similarly, concentrations less than the RBSLs represent carcinogenic risks proportionally less than the target risk. Risks were calculated as follows, using the ratio of each COPC's EPC and its media-specific RBSL:

Risk for residential and school-based students:

$$Risk = \frac{\text{EPC}}{\text{carcinogenic RBSL}} \times 10^{-6}$$

Risk for school-based teachers:

$$Risk = \frac{\text{EPC}}{\text{carcinogenic RBSL}} \times 10^{-5}$$

Hazard quotient (HQ) for residential and school-based receptors:

$$HQ = \frac{\text{EPC}}{\text{non - cancer RBSL}}$$

In accordance with USEPA and DTSC guidance, the risk and hazard ratios for each chemical and potentially complete exposure pathway were summed to determine the multi-pathway cumulative carcinogenic risk estimates and noncarcinogenic HI for potential receptors.

8.5.2 Site-Specific Cancer Risk and Hazard Estimates for Soil Gas

8.5.2.1 Soil Gas Sampling Depth of 5 Feet Below Ground Surface

Residential Scenario

As shown in Table 5, based on the maximum detected results for chemicals detected in soil gas at a sampling depth of 5 feet bgs, the estimated cancer risk for potential residential receptors exposed to indoor vapors based on the residential soil gas RBSLs is 5×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for residential and school-based student receptors (1×10^{-6}). The maximum estimated non-carcinogenic HI is 0.007, which is well below the target HI of 1.

School Scenario

As shown in Table 6, based on the maximum detected results for chemicals detected in soil gas at a sampling depth of 5 feet bgs, the estimated cancer risk for potential school receptors exposed to indoor vapors based on the school soil gas RBSLs is 5×10^{-8}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk levels for school-based student receptors (1×10^{-6}) and teachers (1×10^{-5}). The maximum estimated non-carcinogenic HI is 0.0007, which is well below the target HI of 1.

8.5.2.2 Soil Gas Sampling Depth of 15 Feet Below Ground Surface

Residential Scenario

As shown in Table 7, based on the maximum detected results for chemicals detected in soil gas at a sampling depth of 15 feet bgs, the estimated cancer risk for potential residential receptors exposed to indoor vapors based on the soil gas RBSLs is 5×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for residential and school-based student receptors (1×10^{-6}). The maximum estimated non-carcinogenic HI is 0.007, which is well below the target HI of 1.

School Scenario

As shown in Table 8, based on the maximum detected results for chemicals detected in soil gas at a sampling depth of 15 feet bgs, the estimated cancer risk for potential school receptors exposed to indoor vapors based on the school soil gas RBSLs is 5×10^{-8}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk levels for school-based student receptors (1×10^{-6}) and teachers (1×10^{-5}). The maximum estimated non-carcinogenic HI is 0.0007, which is well below the target HI of 1.

8.5.3 Cancer Risk and Hazard Estimates for Soil

Residential Scenario

As shown in Table 9, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for potential residential receptors exposed to COPCs in soil based on the residential soil RBSLs is 8×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6}, but exceeds the target risk level for residential receptors (1×10^{-6}). The maximum estimated non-carcinogenic HI is 0.7, which is below the target HI of 1.

The primary contributors to the estimated risk for residential receptors exposed to soil are toxaphene (75%) and dieldrin (15%). No other chemicals were detected at levels exceeding the corresponding soil screening level. Risks estimated for all other COPCs is 8×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk of 1×10^{-6} established for residents. Toxaphene was detected at 43 sampling locations at levels that exceeded the corresponding residential screening level of 490 µg/kg. Dieldrin was detected at three sampling locations (SS-49, SS-51, and SS-59) with concentrations ranging from (34.7 µg/kg to 40.4 µg/kg) that exceeded the corresponding residential screening level of 34 µg/kg.

The estimated cancer risks summarized in Table 9 are conservative as they are based on the maximum detected concentrations for each chemical rather than a representative exposure concentration such as the 95% UCL of the arithmetic mean concentration.

Table 10 provides a risk estimate based on the 95% UCLs for all pesticides detected in soil. The pesticides are the primary contributors to risk at the Site. As shown in Table 10, the estimated cancer risk for potential residential receptors exposed to COPCs in soil based on the 95% UCLs for pesticides and residential soil RBSLs is 4×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} but exceeds the target risk level for residential receptors (1×10^{-6}). The estimated non-carcinogenic HI based on the 95% UCLs for pesticides is 0.3, which is below the target HI of 1. Only toxaphene is associated with a 95% UCL that exceeds the corresponding screening level. Risks estimated for all other COPCs is 7×10^{-7}, which is below the low end of the of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk of 1×10^{-6} established for residents.

School-Based Student Scenario

As shown in Table 11, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for potential school-based student receptors exposed to COPCs in soil is 4×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6}, and below the target risk level for school-based student receptors (1×10^{-6}). The maximum estimated non-carcinogenic HI is 0.1, which is below the target HI of 1. No detected pesticide is associated with a maximum concentration that exceeds the corresponding screening levels.

Table 12 provides a risk estimate for the school-based student scenario based on the 95% UCLs for all pesticides detected in soil. The pesticides are the primary contributors to risk at the Site. As shown in Table 12, the estimated cancer risk for potential student receptors exposed to COPCs in soil based on the 95% UCLs for pesticides and school-based student soil RBSLs is 2×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for school-based student receptors (1×10^{-6}). The estimated non-carcinogenic HI based on the 95% UCLs for pesticides is 0.06, which is below the target HI of 1. No detected pesticide is associated with a 95% UCL that exceeds the corresponding screening levels.

School-Based Teacher Scenario

As shown in Table 13, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for potential school-based teacher receptors exposed to COPCs in soil is 2×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6}, and below the target risk level for school-based teacher receptors (1×10^{-5}). The maximum estimated non-carcinogenic HI is 0.09, which is below the target HI of 1.

Table 14 provides a risk estimate for the school-based teacher scenario based on the 95% UCLs for all pesticides detected in soil. The pesticides are the primary contributors to risk at the Site. As shown in Table 14, the estimated cancer risk for potential teacher receptors exposed to COPCs in soil based on the 95% UCLs for pesticides and school-based teacher soil RBSLs is 1×10^{-6}, which is equal to the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for school-based teacher receptors (1×10^{-5}). The estimated non-carcinogenic HI based on the 95% UCLs for pesticides is 0.06, which is below the target HI of 1.

8.5.4 Recommended Update to Toxaphene Screening Levels

Cancer Slope Factor (Toxaphene)

USEPA released its quantitative risk assessment of the carcinogenicity of toxaphene in 1988 (USEPA 1988), which was conducted in accordance with USEPA's guidelines for carcinogen risk assessments published in 1986 (USEPA 1986). The current cancer slope factor (CSF) for toxaphene listed in USEPA's Integrated Risk Information System (IRIS), which was used to derive the soil screening levels used in this evaluation, is still based on the 1988 risk assessment. In 1996, USEPA published a draft document of proposed guidelines for carcinogen risk assessment, which incorporated revisions to the 1986 guidelines (USEPA 1996). In 2005, USEPA published the final version of the updated guidelines for carcinogen risk assessment (USEPA 2005). The 2005 guidelines for carcinogen risk assessment indicate that the USEPA recommended rationale and methods for developing cancer risk assessments have evolved substantially since 1988. USEPA's 2005 guidelines provide the most scientifically appropriate options for evaluating the carcinogenic potential of chemicals to reflect what is currently known about the mechanisms by which chemicals cause cancer.

Application of USEPA's 2005 guidelines would result in a CSF for toxaphene that is lower than the current toxaphene CSF obtained from the 1988 carcinogen risk assessment conducted for toxaphene. Thus, the soil screening levels for toxaphene used in this evaluation that are based on the current toxaphene CSF obtained from USEPA's 1988 carcinogen risk assessment are likely much lower (i.e., more conservative) than those that would be estimated if the 1988 slope factor was updated to be consistent with current USEPA (USEPA 2005) guidelines. This means that the current toxaphene screening levels used in this evaluation are likely lower than required to be protective of public health.

As part of this evaluation, the toxaphene CSF will be modified to incorporate an update that is consistent with USEPA's 2005 guidelines for carcinogen risk assessment. This modification entails updating the mathematical approach used by USEPA for scaling experimental doses from rodents to humans. This modification is described briefly below.

Inter-Species Scaling

Inter-species scaling factors are used to account for differences in body size between laboratory test species (mice in the case of toxaphene) and potential receptor species (e.g., humans) (USEPA 1992) and

is common practice in human health risk assessment (USEPA 2005). The current toxaphene CSF used by EPA, which was developed in 1988, is based on human equivalent doses calculated using a body weight ratio (rodent to human) to the 1/3 power (USEPA EPA 1988). However, in 1992 an updated methodology for calculating inter-species scaling factors was adopted by USEPA, the Food and Drug Administration (FDA), and the Consumer Products Safety Commission (CPSC) as a consensus approach for risk assessment of carcinogens (USEPA 1992). The updated scaling factor is based on a rodent to human body weight ratio to the 1/4 power and is the default approach for inter-species scaling as per USEPA's 2005 Guidelines for Carcinogen Risk Assessment (USEPA 2005).

The derivation of the updated CSF for toxaphene based on the current inter-species scaling factor recommended in EPA guidance (USEPA 2005) was developed using the same toxicological data used by USEPA in its 1988 cancer risk assessment (i.e., those reported in EPA's IRIS). The CSF for toxaphene decreased 1.9-fold from 1.1 to 0.576 $(mg/kg\text{-}day)^{-1}$ using the current inter-species scaling factor recommended in EPA guidance (USEPA 2005) of animal to human body weight ratio to the 1/4 power. The use of the updated CSFs would decrease estimated risks for potentially exposed residents and school-based receptors by a factor of 1.9 for toxaphene. The derivation of the updated CSF for toxaphene is summarized in Table 15.

8.5.5 Cancer Risk and Hazard Estimates for Soil Based on Modified Screening Levels for Toxaphene

Residential Scenario

As shown in Table 16, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for potential residential receptors exposed to COPCs in soil based on the modified residential soil RBSL for toxaphene is 5×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6}, but exceeds the target risk level for residential receptors (1×10^{-6}). The maximum estimated non-carcinogenic HI is 0.7, which is below the target HI of 1.

Table 17 provides a risk estimate based on the 95% UCLs for all pesticides detected in soil based on the modified soil RBSL for toxaphene. As shown in Table 17, the estimated cancer risk for potential residential receptors exposed to COPCs in soil based on the 95% UCLs for pesticides and the adjusted residential soil RBSL for toxaphene is 2×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} but exceeds the target risk level for residential receptors (1×10^{-6}). The estimated non-carcinogenic HI based on the 95% UCLs for pesticides is 0.3, which is below the target HI of 1.

School-Based Student Scenario

As shown in Table 18, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for potential school-based student receptors exposed to COPCs in soil based on the modified residential soil RBSL for toxaphene is 2×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6}, and below the target risk level for school-based student receptors (1×10^{-6}). The maximum estimated non-carcinogenic HI is 0.1, which is below the target HI of 1. No detected pesticide is associated with a maximum concentration that exceeds the corresponding screening levels.

Table 19 provides a risk estimate for the school-based student scenario based on the 95% UCLs for all pesticides detected in soil based on the modified soil RBSL for toxaphene. As shown in Table 19, the estimated cancer risk for potential student receptors exposed to COPCs in soil based on the 95% UCLs for pesticides and the modified school-based student soil RBSL for toxaphene is 1×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for school-based

student receptors (1×10^{-6}). The estimated non-carcinogenic HI based on the 95% UCLs for pesticides is 0.06, which is below the target HI of 1.

School-Based Teacher Scenario

As shown in Table 20, based on the maximum detected results for chemicals detected in soil, the estimated cancer risk for potential school-based teacher receptors exposed to COPCs in soil based on the modified residential soil RBSL for toxaphene is 1×10^{-6}, which is at the low end of the USEPA target risk range of 10^{-4} to 10^{-6}, and below the target risk level for school-based teacher receptors (1×10^{-5}). The maximum estimated non-carcinogenic HI is 0.09, which is below the target HI of 1.

Table 21 provides a risk estimate for the school-based teacher scenario based on the 95% UCLs for all pesticides detected in soil based on the modified soil RBSL for toxaphene. As shown in Table 21, the estimated cancer risk for potential teacher receptors exposed to COPCs in soil based on the 95% UCLs for pesticides and the modified school-based teacher soil RBSL for toxaphene is 6×10^{-7}, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for school-based teacher receptors (1×10^{-5}). The estimated non-carcinogenic HI based on the 95% UCLs for pesticides is 0.06, which is below the target HI of 1.

8.5.6 Cumulative Risk and Hazard Estimates for Soil Gas and Soil

Residential Scenario

The maximum estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the residential scenario based on the maximum detected concentrations is 9×10^{-6}, for both soil gas sampling depths, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the target risk level for residential receptors (1×10^{-6}). Based on the modified residential soil RBSL for toxaphene, the maximum estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the residential scenario based on the maximum detected concentrations is 6×10^{-6}, for both soil gas sampling depths, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the target risk level for residential receptors (1×10^{-6}). The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.7, which is below the target HI of 1.

The estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the residential scenario based on the 95% UCLs for pesticides and maximum detected concentrations for other chemicals is 4×10^{-6}, for both soil gas sampling depths, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the target risk level for residential receptors (1×10^{-6}). Based on the modified residential soil RBSL for toxaphene, the estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the residential scenario based on the 95% UCLs for pesticides and maximum detected concentrations for other chemicals is 3×10^{-6}, for both soil gas sampling depths, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the target risk level for residential receptors (1×10^{-6}). The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.4, which is below the target HI of 1.

School-Based Student Scenario

The maximum estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based student scenario based on the maximum detected concentrations is 4×10^{-7}, for both soil gas sampling depths, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for residential receptors (1×10^{-6}). Based on the modified student soil RBSL

for toxaphene, the maximum estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based student scenario based on the maximum detected concentrations is 3×10^{-7}, for both soil gas sampling depths, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for residential receptors (1×10^{-6}). The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.1, which is below the target HI of 1.

The estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based student scenario based on the 95% UCLs for pesticides and maximum detected concentrations for other chemicals is 2×10^{-7}, for both soil gas sampling depths, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for student receptors (1×10^{-6}). Based on the modified student soil RBSL for toxaphene, the estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based student scenario based on the 95% UCLs for pesticides and maximum detected concentrations for other chemicals is 2×10^{-7}, for both soil gas sampling depths, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for student receptors (1×10^{-6}).The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.07, which is below the target HI of 1.

School-Based Teacher Scenario

The maximum estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based teacher scenario based on the maximum detected concentrations is 2×10^{-6}, for both soil gas sampling depths, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for teachers (1×10^{-5}). Based on the modified teacher soil RBSL for toxaphene, the maximum estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based teacher scenario based on the maximum detected concentrations is 1×10^{-6}, for both soil gas sampling depths, which is equal to the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for teachers (1×10^{-5}). The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.09, which is below the target HI of 1.

The estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based teacher scenario based on the 95% UCLs for pesticides and maximum detected concentrations for other chemicals is 1×10^{-6}, for both soil gas sampling depths, which is equal to the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for teachers (1×10^{-5}). Based on the modified teacher soil RBSL for toxaphene, the estimated cumulative cancer risk associated with potential exposures to soil gas and soil for the school-based teacher scenario based on the 95% UCLs for pesticides and maximum detected concentrations for other chemicals is 7×10^{-7}, for both soil gas sampling depths, which is below the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and below the target risk level for teachers (1×10^{-5}). The estimated cumulative HIs associated with potential exposures to soil gas and soil is 0.06, which is below the target HI of 1.

8.5.7 Risk Characterization Summary

School children and staff at the proposed High School are the receptor groups most likely to be exposed to any chemicals potentially present at the Site. The human health risk was evaluated assuming unrestricted residential land use (residential scenario), regardless of current and future uses. As requested by DTSC at the January 4, 2019 SSI scoping conference, school-based receptors (students and teachers) were also evaluated for potential exposures to chemicals in soil. As the proposed site is intended to serve as a high school (grades 9-12), students associated with grades 9-12 and teachers were evaluated in the human health screening evaluation. For this evaluation, it was conservatively assumed that students

attended school on a year-round basis (233 days per year) rather than a 9-month school year (180 days per year).

The results of the risk characterization for the residential scenario based on the maximum detected concentrations indicate that toxaphene levels detected in soil result in an estimated risk that exceed the residential target risk level (1×10^{-6}). However, the estimated cumulative risks for the school-based student scenario (range from 2×10^{-7} to 4×10^{-7}) were well below the student target risk level (1×10^{-6}). For the school-based teacher scenario, the estimated cumulative risks ranged from 7×10^{7} to 2×10^{-6}, which are well below the target risk level for teachers (1×10^{-5}). It is noteworthy, that for the teacher scenario, only the estimated risk based on the maximum detected concentrations (2×10^{-6}) exceeded the low end of the USEPA target risk range of 10^{-6} to 10^{-4}. The estimated risks based on the 95% UCL concentrations and modified soil screening level for toxaphene were equal to, or lower than the low end of the USPEA target risk range of 10^{-6} to 10^{-4}. The school-based scenarios best represent the conditions that will be encountered by students and teachers at the High School site. Therefore, the results of this human health risk evaluation indicate that it is unlikely that the COPCs detected in soil gas and soil are present at levels that would be expected to result in adverse health effects under the school-based scenarios evaluated in this SSI report.

THIS PAGE INTENTIONALLY LEFT BLANK

9.0 QUALITY ASSURANCE PROJECT PLAN IMPLEMENTATION

An integral part of the SSI sampling and analysis plan is the QA/QC program to ensure the reliability and compatibility of all data generated during the SSI. The QAPP presented in Appendix A of the Draft PEA Report (Tetra Tech 2018d) was used for the SSI. The QAPP provides specific descriptions of the field and laboratory procedures to be used for verifying and maintaining performance quality for collection of environmental samples and subsequent chemical analysis. The QAPP sets forth the policies, procedures, and activities for the identification and documentation of the precision, accuracy, completeness, and representativeness of the data during the performance of the SSI.

During the SSI, subsurface soil sample data were collected. Each sample was analyzed for a number of OCPs, in accordance with the rationale for sample collection. Data collected were evaluated to determine which of the chemicals identified are likely to be site-related and to assess whether the reported concentrations for these chemicals are of acceptable quality for use in the screening evaluation.

9.1 EVALUATION OF ANALYTICAL METHODS

The analytical methodology used for data collection was assessed for appropriateness for use in the screening evaluation. Analytical results that are not specific for a particular compound or results of screening analytical methods (e.g., PID readings) were not used for the Human Health Screening Evaluation.

9.2 EVALUATION OF DETECTION LIMITS

Detection limits associated with the analytical data were reviewed before eliminating chemicals because they were not detected. In some cases, the detection limit for a chemical may be greater than the corresponding standards, criteria, or concentrations derived from toxicity reference values; therefore, the chemical may be present at levels greater than these corresponding reference concentrations, which may result in undetected risk. In other cases, a particular detection limit may be significantly higher than positively detected values in other samples in a data set. After considering these cases and any other reasonable explanations why contaminants may not have been detected, chemicals that were not detected in any medium were eliminated.

9.3 EVALUATION OF QUALIFIED DATA

For analytical results, various qualifiers pertaining to the quality of the data are attached to certain data points by either the laboratories conducting the analysis or by persons conducting the data validation (procedures for data validation are discussed in Section 8.3 of the QAPP (Tetra Tech 2018d). All qualifiers will be discussed prior to utilizing the chemical data for the screening evaluation. A number of data points were qualified as estimated ("J" flagged) because the detected concentration was below the MRL for the analyte.

No data were rejected as unusable.

9.4 DATA VALIDATION RESULTS

The data validation memorandum for the SSI is provided in Appendix D.

A typical SSI validation effort consists of a review of 10% of the analytical data; however, due to the limited number of analytical batches associated with the subject investigation, 100% of the data were

reviewed. The validation guidance used in evaluating the data is presented in *USEPA National Functional Guidelines for Inorganic Data Review* (U.S. EPA 2014a) and *USEPA National Functional Guidelines for Organic Data Review* (U.S. EPA 2014b). The data review consisted of an evaluation of all applicable Quality Control (QC) sample results as they relate to the field data under review. Raw data were not reviewed. The review determines the usability of the data based on the Data Quality Objectives (DQOs) for the project.

The American Environmental Testing Laboratory (AETL) data were contained in data package 96370. The samples were analyzed in multiple batches for Organochlorine Pesticides using EPA method SW8081A (33 total samples).

The data were logged into the laboratory under compliant Chain-Of-Custody documentation. The samples were shipped in one iced cooler delivered to the laboratory.

The samples were received at the laboratory in good condition and with no exceptions noted. For each parameters/method listed above there are individual method headers listed below that explain the data validation and data quality.

9.4.1 Organochlorine Pesticides by EPA Method SW8081A

The data were evaluated by results from the following QC elements:

9.4.1.1 Holding Time

The samples were analyzed within the method specified holding time.

9.4.1.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified MDL.

9.4.1.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all compounds.

9.4.1.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

9.4.1.5 Field Duplicate Analysis

No field duplicate samples reported errors except as listed below

Field duplicates Soil Dup 1 had RPD errors that qualified samples SS-56-1. Analytes 4,4'-DDE, 4,4'-DDT, and Dieldren in sample SS-56-1 were qualified as estimated and assigned a "J" qualifier. The estimated data are usable as estimated values.

9.4.1.6 Matrix Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds except as listed below. The MS/MSD RPD values were in control.

Field sample SS-41-1 and SS-43-2 were qualified as estimated and assigned a "J" qualifier due to MS/MSD recovery errors. In each sample, the DDT and Endrin analytes were qualified. The estimated data are usable for the intended purpose.

9.4.1.7 Compound Identification

All compounds were identified by the correct retention as compared to the standard's retention time and the method guidelines for identification were met.

9.4.1.8 Analytical Method Compliance

The data review showed the data to be method compliant and followed the criteria stated in method SW8081A.

9.4.2 Overall Analytical Evaluation

The AETL data for the subsurface soil sample analyses had compliant QC results for all QC samples. Based on the results of this data validation review, it is concluded that the AETL soil data are usable as stated and qualified. The results are considered correct and reliable The DQOs were satisfied per the Work Plan and the data are usable for their intended purpose. The overall analytical evaluation indicates all analytical criteria met for this data set.

10.0 HEALTH AND SAFETY PLAN IMPLEMENTATION

Tetra Tech prepared a site-specific Health and Safety Plan (HASP) pursuant to Health and Safety Code 1910.120. The HASP is included in Appendix B of the Draft PEA (Tetra Tech 2018d). The plan:

- Identified and described potentially hazardous substances that may be encountered during field operations;
- Specified PPE and clothing for Site activities; and
- Outlined measures to be implemented in the event of an emergency.

Tetra Tech field personnel reviewed the HASP prior to commencing field work. Prior to initiation of field activities each day, a site safety briefing was conducted to identify potential physical and chemical hazards and outline measures to be taken in event of an emergency. All onsite personnel were required to sign the site safety briefing form.

During field activities, appropriate Level D PPE was worn by all personnel within the exclusion zone. Operator breathing zone PID readings were obtained on a regular basis as required by the HASP. All PID readings during field activities were 0.0 ppm. Based on these measurements, an upgrade to Level C PPE was not required.

Potential hazards to public health and safety were minimal due to the nature of the sampling activities and the absence of detectable vapors in the exclusion zone. No incidents or emergency actions occurred during the field program.

THIS PAGE INTENTIONALLY LEFT BLANK

11.0 FIELD VARIANCES

There were no field variances to the implementation of the SSIFSP (Tetra Tech 2019).

THIS PAGE INTENTIONALLY LEFT BLANK

12.0 PUBLIC PARTICIPATION

California Education Code (CEC) 17210.1(b) requires that residents in line-of-sight of the Site be notified, in writing, of the proposed field sampling. The residents nearest to the Site are located along west side of Festivo Street to the east, on the south side of Camino Del Sol to the south, on the west side of North Rose Avenue to west, and the north side of Cesar Chavez Drive to the North (Figure 2). Similar to the PEA, the proposed SSI sample locations are located approximately 150 feet west of residences on Festivo Street, 150 feet north of the residences on Camino Del Sol, 960 feet east of the residences on North Rose Avenue, and over 1,200 feet south of the residences on Cesar Chavez Drive. A covered six-foot-high chain link fence surrounds the entire Maulhardt Ranch, including the Site, and prevents the visual examination of the Site by the residents in the neighborhoods surrounding the Maulhardt Ranch. Given the distance from the surrounding residential properties to the SSI sample locations, and that the Site is not within the line-of-site of the surrounding residential properties, public notification is not necessary for these residences and was not performed. Not performing public notification was approved by DTSC for the PEA field investigation.

THIS PAGE INTENTIONALLY LEFT BLANK

13.0 CONCLUSIONS AND RECOMMENDATIONS

The lateral extent of OCPs in surface soils at the Site at concentrations exceeding Screening Levels was defined in the PEA sampling event and comprises approximately 24 acres (Tetra Tech 2018d). This SSI was performed to assess the depth of OCP-impacted soil at the Site at concentrations exceeding screening levels (specifically toxaphene and dieldrin). Based on the results of the SSI sampling program, the maximum depth of OCP-impacted soil at the Site at concentrations exceeding screening levels has been defined and is between approximately 1.5 and 2.0 feet bgs.

The PEA (Tetra Tech 20108d) concluded that OCPs detected at the Site (primarily toxaphene) appear to be present at concentrations that pose a threat to likely human receptors, including residential/unrestricted land use. Assumed exposures at the Site resulted in a maximum cumulative carcinogenic risk estimate (8×10^{-6}) that exceeds the point of departure of 1×10^{-6} for potential residential receptors. The estimated cumulative cancer risk associated with potential exposures to soil based on the 95% UCLs for pesticides maximum detected concentrations for other chemicals is 4×10^{-6}, which is within the low end of the USEPA target risk range of 10^{-4} to 10^{-6} and exceeds the point of departure of 1×10^{-6} for potential residential receptors.

School children and staff at the proposed High School are the receptor groups most likely to be exposed to any chemicals potentially present at the Site. The human health risk was evaluated assuming unrestricted residential land use (residential scenario), regardless of current and future uses. As requested by DTSC at the January 4, 2019 SSI scoping conference, school-based receptors (students and teachers) were also evaluated for potential exposures to chemicals in soil. As the proposed site is intended to serve as a high school (grades 9-12), students associated with grades 9-12 and teachers were evaluated in the human health screening evaluation. For this evaluation, it was conservatively assumed that students attended school on a year-round basis (233 days per year) rather than a 9-month school year (180 days per year).

The results of the SSI risk characterization for the residential scenario based on the maximum detected concentrations indicate that toxaphene levels detected in soil result in estimated risk that exceed the residential target risk level (1×10^{-6}). However, the estimated cumulative risks for the school-based student scenario (range from 2×10^{-7} to 4×10^{-7}) were well below the student target risk level (1×10^{-6}). For the school-based teacher scenario, the estimated cumulative risks ranged from 7×10^{-7} to 2×10^{-6}, which are well below the target risk level for teachers (1×10^{-5}). It is noteworthy, that for the teacher scenario, only the estimated risk based on the maximum detected concentrations (2×10^{-6}) exceeded the low end of the USEPA target risk range of 10^{-6} to 10^{-4}. The estimated risks based on the 95% UCL concentrations and modified soil screening level for toxaphene were equal to, or lower than the low end of the USPEA target risk range of 10^{-6} to 10^{-4}. The school-based scenarios best represent the conditions that will be encountered by students and teachers at the High School site. Therefore, the results of this human health risk evaluation indicate that it is unlikely that the COPCs detected in soil gas and soil are present at levels that would be expected to result in adverse health effects under the school-based scenarios evaluated in this SSI report.

Based on the results of the SSI risk characterization, Tetra Tech recommends a No Further Action determination by DTSC for the High School No. 8 site.

Site Features

- Building
- Parcel Boundary
- Orchard
- Strawberries
- Approximate Site Boundary *(Source, Site Plan, WLC Architects 2018)*
- 16 kV Pole Mounted Power Lines
- Pole Mounted Transformer
- Former Pole Mounted Transformer
- Drainage Ditch
- City of Oxnard 12-inch PVC Water Pipeline
- City of Oxnard 12-inch Asbestos Concrete Water Pipeline
- United Water Conservation District 42-inch Water Pipeline
- 12-Inch OD Water Pipeline Seving the Farmyard, Residence, and Orchard
- Farmyard, Residence, and Orchard PVC Water Pipelines
- Strawberry Irrigation PVC Pipelines

Proposed PEA Sample Locations

- Surface Soil Sample (0 to 0.5 ft bgs) (OCP analysis only)
- Surface Soil Sample (0 to 0.5 ft bgs) (OCP, As, SVOC PAH, and TPHde analyses)
- Surface Soil Sample (0 to 0.5 ft bgs) (PCB analysis only)
- Soil Gas Well (0 to 10 to 15 ft bgs)
- Soil/Groundwater Sample Boring and Soil Gas Well (0 to 10 to 15 ft bgs)

Notes:

1.) All features, including PEA sample, building, utility, and boundary locations are approximate.

2.) The maximum concentrations are show where duplicate soil samples were collected.

Definitions:

As - Arsenic

DTSC - California Department of Toxic Substances Control

ft bgs - feet below ground surface

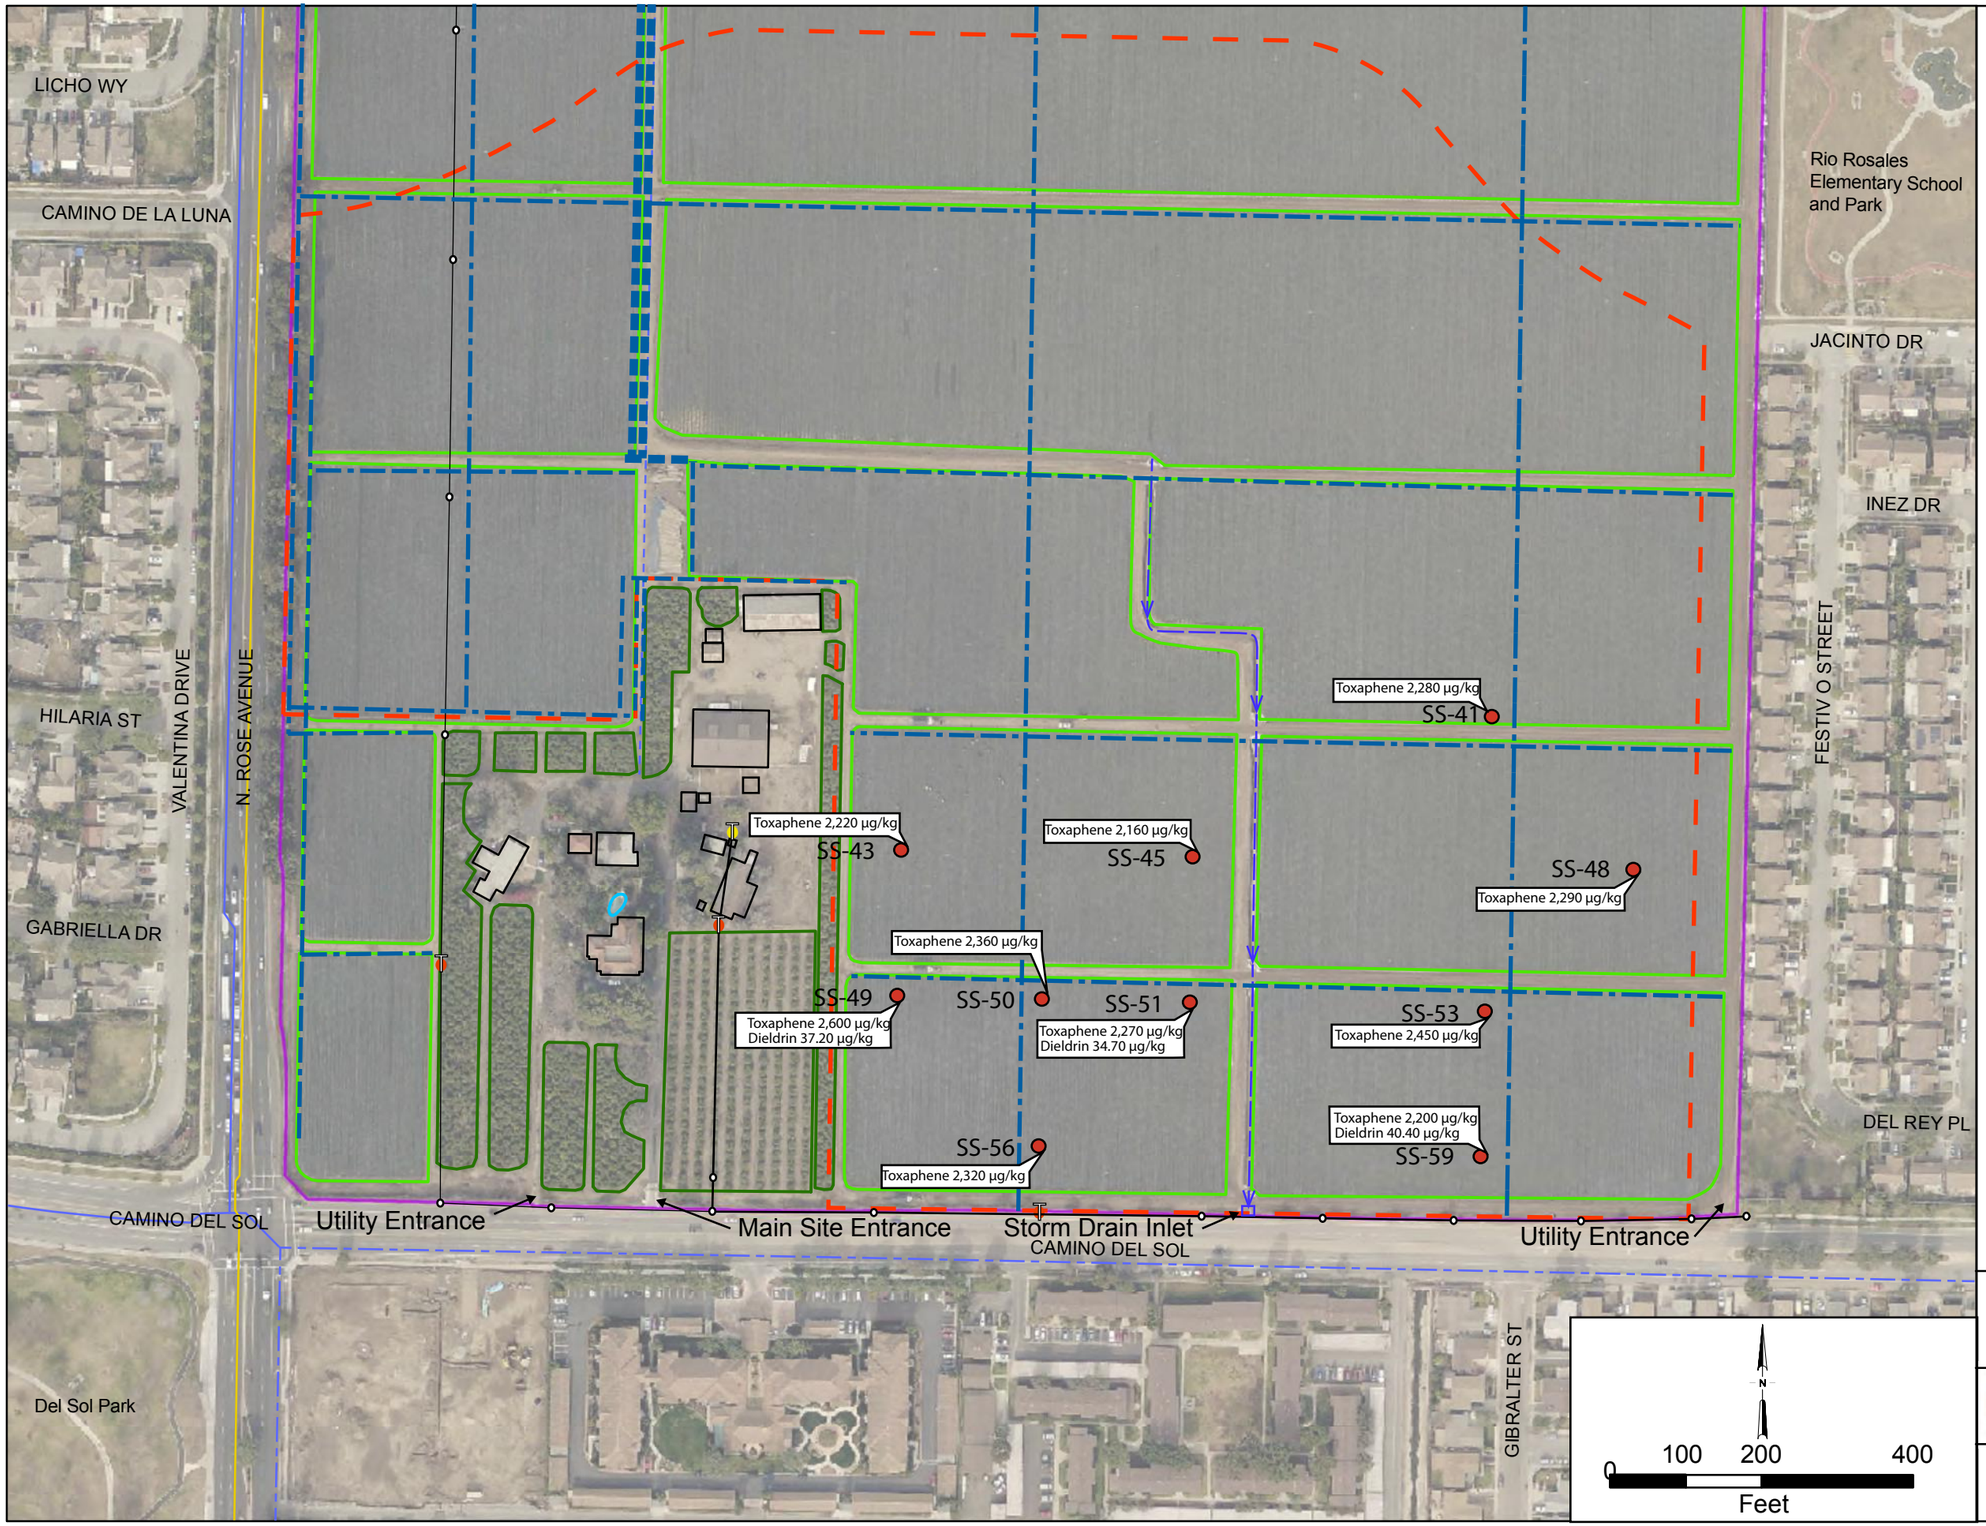
OCP - Oganochlorine Pesticide

PAH - Polyaromatic Hydrocarbon

PCB - Polychlorinated Biphenyl

µg/L - Micrograms per Kilogram

SVOC - Semivolatile Organic Compond



TPHde - Diesel and Heavy Oil Range Total Petroleum Hydrocarbons

Background imagery: Ventura County, 2016

Proposed SSI Soil Sample Locations

- Proposed SSI subsurface soil sample locations at the PEA surface soil sample locations with the 10 highest OCP results at concentrations greater than the PEA Screening Levels. The SSI soil samples will be collected at 1 ft bgs, 1.5 ft bgs, and 2.0 ft bgs.

Relevant PEA Soil Screening Levels

Toxaphene - 490 µg/kg
Dieldrin - 34 µg/kg

Notes:
1.) All features, including SSI sample, building, utility, and boundary locations are approximate.
2.) The maximum concentrations are shown for the PEA surface soil samples where duplicate soil samples were collected.

● Potentially complete exposure route.

1 Students and Staff are assumed to be exposed via inhalation of vapors and dust, ingestion of soil, and dermal contact with soil indoors and outdoors.

2 Groundwater at depth of 20 feet below ground surface.

→ Potentially complete exposure pathway

- - - → Likely Incomplete exposure pathway

- - X - → Incomplete exposure pathway

Table 1
Preliminary Environmental Assessment
Organochlorine Pesticides in Soil
High School No. 8
Oxnard, California

Notes:

a - Organochlorine pesticides analyzed by EPA method 8081A.
b - non carcinogenic
c - carcinogenic
d - Residential Soil Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).
e - Table 3 lists compound-specific MDLs and PQLs for analytes that were not detected.
MDL - method detection limit
ND - not detected
PQL - practical quantitation limit
SL - Screening Level
The analytical results in red font are J-flagged, where concentration of the analyte detected is between MDL and PQL.
The analyte concentrations in yellow highlighted cells exceed their relevant screening level.

SS-59	SS-59-1.5	1.5	Subsurface soil	EPA method 8081A for OCPs	Discrete	Subsurface Soil SSI. Analyze if sample from 1 ft. bgs contains OCPs ≥ DTSC Screening Levels.
SS-59	SS-59-2.0	2	Subsurface soil	EPA method 8081A for OCPs	Discrete	Subsurface Soil SSI. Analyze if sample from 1.5 ft. bgs contains OCPs ≥ DTSC Screening Levels.

Notes:

1 - The sample locations are shown on Figure 4.

2 - A total of 31 subsurface soil samples were collected (30 discrete and one duplicate samples). For each of the ten sample locations, the subsurface soil collected from 1.0 foot bgs plus one duplicate soil sample was initially analyzed. These are identified as soil samples SS-41-1, SS-43-1, SS-45-1, SS-48-1, SS-49-1, SS-50-1, SS-51-1, SS-53-1, SS-56-1, SS-59-1, and Sol Dup 1 on Table 2. The samples collected at 1.5 feet bgs were analyzed if the corresponding sample from 1.0 foot bgs contains OCPs at concentrations that exceed the PEA screening levels, and the samples from 2.0 feet bgs were analyzed if the corresponding sample from 1.5 feet bgs contains OCPs at concentrations that exceed the PEA screening levels. A total of 24 samples were analyzed with 21 discrete and three duplicate samples. The sample volume from each soil sample collected was large enough to run a duplicate sample so that three duplicate samples were analyzed. The laboratory analytical reports for the samples analyzed are presented in Table 4.

bgs - below ground surface

EPA - U. S. Environmental Protection Agency

OCP - organochlorine pesticide

SSI - Supplemental Site Investigation

Notes:
a - Organochlorine pesticides analyzed by EPA method 8081A.
b - non carcinogenic
bgs - below ground surface
c - carcinogenic
d - Residential Soil Screening Level is the USEPA Region 9 Soil RSLs (USEPA 2018) as recommended by DTSC HHRA Note 3 (DTSC 2018).
e - Table 3 lists compound-specific MDLs, PQLs, and Screening Levels for analytes that were not detected.
ft - feet
MDL - method detection limit
ND - not detected
PQL - practical quantitation limit
SL - Screening Level
The analytical results in red font are J-flagged, where concentration of the analyte detected is between MDL and PQL.
The analyte concentrations in yellow highlighted cells exceed their relevant screening level.

Table 5
Maximum Estimated Risk for Potential Residential Vapor Intrusion Exposures from Soil Gas
(Sampling Depth = 5 feet)
Proposed High School No. 8
Oxnard, California

Chemical	Maximum Detect (µg/L)	Residential Soil Gas Screening Levels (µg/L)[1]		Residential Risk Screen	
		Carcinogenic	Non-carcinogenic	Maximum Estimated Risk[2]	Maximum Estimated Hazard Quotient[3]
Naphthalene	0.020	0.042	3.1	4.8E-07	6.5E-03
Toluene	0.070	----	310	----	2.3E-04
Maximum Estimated Cumulative Risk and Hazard Index[4]				5.E-07	0.007

Definitions:

µg/L - micrograms per liter

---- = screening criteria not calculated as appropriate toxicity data is not available.

Notes:

[1] Screening levels are derived by dividing residential DTSC-Modified Air Screening Levels, if available, or USEPA Region 9 residential Air RSLs (USEPA 2018) by the DTSC default future residential soil gas attenuation factor of 0.001 (DTSC 2011).

[2] Estimated cancer risk = (soil gas concentration/cancer soil gas screening level) x 10^{-6}.

[3] Estimated hazard = (soil gas concentration/non-cancer soil gas screening level).

[4] Cumulative risk and hazard index represent the sum of chemical-specific cancer risks and hazard quotients.

Table 6
Maximum Estimated Risk for Potential School Vapor Intrusion Exposures from Soil Gas
(Sampling Depth = 5 feet)
Proposed High School No. 8
Oxnard, California

Chemical	Maximum Detect (µg/L)	School-Based Soil Gas Screening Levels (µg/L)[1]		School-Based Risk Screen	
		Carcinogenic	Non-carcinogenic	Maximum Estimated Risk[2]	Maximum Estimated Hazard Quotient[3]
Naphthalene	0.020	0.390	29.1	5.1E-08	6.9E-04
Toluene	0.070	----	2,914	----	2.4E-05
Maximum Estimated Cumulative Risk and Hazard Index[4]				5.E-08	0.0007

Definitions:

µg/L - micrograms per liter

---- = screening criteria not calculated as appropriate toxicity data is not available.

Notes:

[1] Screening levels are derived by dividing residential DTSC-Modified Air Screening Levels, if available, or USEPA Region 9 residential Air RSLs (USEPA 2018) by a school-specific soil gas attenuation factor of 0.000106. Refer to Section 8.4 (Soil Gas Screening Levels) of the text for an explanation of how the school-specific soil gas attenuation factor was derived.

[2] Estimated cancer risk = (soil gas concentration/cancer soil gas screening level) x 10^{-6}.

[3] Estimated hazard = (soil gas concentration/non-cancer soil gas screening level).

[4] Cumulative risk and hazard index represent the sum of chemical-specific cancer risks and hazard quotients.

Definitions:

mg/kg - milligrams per kilogram

---- = screening criteria not calculated as appropriate toxicity data is not available.

Notes:

[1] Listed screening levels for Pesticides and PAHs were derived using the DTSC SCHOOLSCREEN model (DTSC 2010) for teacher assumed to be at the high school for forty years. TPHs were not included in the SCHOOLSCREEN model. Therefore, TPHs were conservatively evaluated using residential risk-based environmental screening levels (ESL) from the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB 2019).

[2] Estimated cancer risk = (soil concentration/cancer soil screening level) x 10^{-5}.

[3] Estimated hazard = (soil concentration/non-cancer soil screening level).

[4] Screening value for pyrene used as a surrogate.

[5] Cumulative risk and hazard index represent the sum of chemical-specific cancer risks and hazard quotients.

[5] Screening value for pyrene used as a surrogate.

[6] Cumulative risk and hazard index represent the sum of chemical-specific cancer risks and hazard quotients.

Table 15
Summary of Toxaphene Cancer Slope Factor Adjustment Using Current Inter-Species Scaling Methodology
Based on a Animal to Human Body Weight Ratio to the 1/4 Power

Toxicity Study	Test Animal	Gender	Experimental Dose (PPM)[1]	Adminstered Dose mg/kg/day[1]	Human Equivalent Dose $BW^{1/3}$ mg/kg/day[2,3]	Human Equivalent Dose $BW^{1/4}$ mg/kg/day[4]	Human Equivalent Dose Ratio $BW^{1/4}$ to $BW^{1/3}$	IRIS CSF (mg/kg-day) Reported	Adjusted CSF (mg/kg-day)[5]
Litton Bionetics, 1978	Mice	Male	0	0	0.000	0.000	0.00	1.1	0.576
	Mice	Male	7	0.91	0.069	0.131	1.91		
	Mice	Male	20	2.6	0.20	0.374	1.91		
	Mice	Male	50	6.5	0.49	0.935	1.91		

Notes:

[1] Reported in IRIS carcinogenicity summary for toxaphene.

[2] The Litton Bionetics 1978 carcinogenicity assessment cited by IRIS is an unpublished report. For this reason, it was not possible to determine how the reported human equivalent dose (HED) was calculated. However, whatever parameters that were applied to determine the HED based on the body weight to the 1/3 power would also apply to the HED based on body weight to the 1/4 power. For the purposes of this summary, the body weight scaling factors have been applied to the administered dose for mice reported in the IRIS summary for toxaphene to determine what the ratio would be.

[3] HED calculated using the following equation: administered dose * (mouse body weight kg / human body weight kg)^^1/3
weight of mouse = 0.03 kilogram (kg); weight of human = 70 kg

[4] HED calculated using the following equation: administered dose * (mouse body weight kg / human body weight kg)^^1/4
weight of mouse = 0.03 kilogram (kg); weight of human = 70 kg

[5] Adjusted CSF calculated by dividing the reported IRIS CSF by 1.91.

APPROVAL OF SUPPLEMENTAL SITE INVESTIGATION TECHNICAL MEMORANDUM, OXNARD UNION HIGH SCHOOL DISTRICT, PROPOSED OXNARD HIGH SCHOOL NO. 8, NORTH ROSE AVENUE, OXNARD (SITE CODE 304669)

Dear Dr. DeLeon:

The Department of Toxic Substances Control (DTSC) reviewed the "Supplemental Site Investigation Technical Memorandum (TM)", prepared by Tetratech, dated and received on January 31, 2019. The TM includes Site background information and proposed investigation activities.

According to the TM, the 48.6-acre vacant Site is located within the Oxnard oil field, and the Maulhardt Ranch. The Site is bounded by Camino Del Sol to the south, North Rose Avenue to the west, residential neighborhood to the east, and strawberry farm to the north. The Site is surrounded by residential neighborhood to the south, east, and west. A commercial plaza is located to the south-east corner of N. Rose and Camino Del Sol Street intersection. Currently, the Site is being used for the cultivation of strawberries. Historically, it was used for cultivation of row crops from as early as 1927 through 2017. To assess the potential impacts to the Site, a Preliminary Environmental Assessment (PEA) was conducted to investigate metals, organochlorine pesticides (OCPs), total petroleum hydrocarbons (TPHs), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polyaromatic hydrocarbons (PAHs), and polycyclic biphenyls (PCBs). The PEA Report indicated elevated levels of OCPs in shallow soils

Printed on Recycled Paper

beneath the Site. Consequently, DTSC requested a Supplemental Site Investigation to delineate the extent of contamination.

DTSC hereby approves the TM. If Site conditions differ from those presented in the approved TM, additional work may be necessary. Please provide a notice approved in form by DTSC, to residents in the immediate area prior to the commencement of field work and notify DTSC a minimum of 48 hours in advance of field work or schedule changes.

If you have any questions please contact Mr. Aslam Shareef, Project Manager, at (714)484-5472 or by email at Aslam.Shareef@dtsc.ca.gov, or me at (714)484-5368 or by email at Shahir.Haddad@dtsc.ca.gov.

Sincerely,

Shahir Haddad, P.E.

ANALYSIS REQUESTED

TEST INSTRUCTIONS & COMMENTS

*For each of the ten sample locations, the subsurface soil collected from 1.0 foot bgs plus one duplicate sample will be analyzed. These are identified as soil samples SS-41-1, SS-43-1, SS-45-1, SS-48-1, SS-49-1, SS-50-1, SS-51-1, SS-53-1, SS-56-1, SS-57-1 and Soil Dup 1. The samples collected at 1.5 feet bgs will be analyzed IF the corresponding sample from 1.0 foot bgs contains OCP's at concentrations exceeding the PEA screening levels, and the samples from 2.0 feet bgs will be analyzed if the corresponding sample collected from 1.5 feet bgs, exceeds the PEA screening levels. Tetra Tech with direct lab which additional sample will be run after the initial samples are analyzed.

ANALYSIS REQUESTED

TEST INSTRUCTIONS & COMMENTS

* For each of the ten sample locations, the subsurface soil collected from 1.0 feet bgs plus one duplicate sample will be analyzed. These are identified as soil samples SS-41-1, SS-43-1, SS-45-1, SS-48-1, SS-49-1, SS-51-1, SS-53-1, SS-56-1, SS-57 and Soil Dup 1. The sample collected at 1.5 feet bgs will be analyzed if the corresponding sample from 1.0 feet bgs contains OCPs at concentrations exceeding the PEA screening levels, and the samples from 2.0 feet bgs will be analyzed if the corresponding sample collected from 1.5 feet bgs exceeds the PEA screening levels. Tetra Tech will direct in the additional samples will be collected after the initial samples are analyzed.

Subject: RE: Summary Table Results of Samples from "Proposed High School #8, Oxnard, CA"
Attachments: 96370-so_8081a_Rev.pdf; 96370-COC.pdf

Hello Jim.

Nine out of the ten soils samples analyzed collected at 1.0 foot bgs contained toxaphene at concentrations that exceed the screening levels. I have highlighted the results that exceed the screening levels and compared them to the surface soil sample results from the PEA in the attached table.

Please analyze samples SS-41-1.5, SS-43-1.5, SS-48-1.5, SS-49-1.5, SS-50-1.5, SS-51-1.5, SS-53-1.5, SS-56-1.5, and SS-59-1.5 for organochlorine pesticides using EPA method 8081A. Please use sample SS-56-1.5 to make duplicate sample Soil Dup 2 and also analyze it for organochlorine pesticides using EPA method 8081A.

Tetra Tech will review the results from the 1.5 foot samples and provide AETL with instructions on which samples collected from 2.0 feet bgs need to be analyzed. The samples were collected on February 18th, so the holding times expire on March 3rd, a Sunday. If the sample results are not available for review by Tetra Tech by Friday March 1st, please extract samples SS-41-2.0, SS-43-2.0, SS-48-2.0, SS-49-2.0, SS-50-2.0, SS-51-2.0, SS-53-2.0, SS-56-2.0, and SS-59-2.0 to meet the extraction holding time if analysis is required.

Thanks,

Jim

Hello Jim.

Two out of the nine soils samples analyzed collected at 1.5 foot bgs contained toxaphene at concentrations that exceed the screening levels. I have highlighted the results that exceed the screening levels from the PEA in the attached table.

Please analyze samples SS-43-2 and SS-53-2 for organochlorine pesticides using EPA method 8081A. Please use sample SS-53-2 to make duplicate sample Soil Dup 3 and also analyze it for organochlorine pesticides using EPA method 8081A.

The samples were collected on February 18th, so the holding times expire on March 3rd, a Sunday. Please extract samples SS-43-2 and SS-53-2to meet the extraction holding time.

Thanks,

Jim

The samples were analyzed as specified on the enclosed chain of custody. Analytical non-conformances have been noted on the report.

Unless otherwise noted, all results of soil and solid samples are based on wet weight.

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

American Environmental Testing Laboratory Inc.

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

D - DATA VALIDATION MEMORANDUM

TETRA TECH, INC.
DATA VALIDATION MEMORANDUM
FOR THE OXNARD UNION SCHOOL SITE PROJECT

1.0 INTRODUCTION

This memorandum summarizes the findings of validation effort conducted on the soil gas and soil sample data results from the Oxnard Union High School Site Project, Supplemental Site Investigation (SSI). A typical PEA validation effort consists of a review of 10 percent of the analytical data; however, due to the limited number of analytical batches associated with the subject investigation, 100 percent of the data were reviewed. The validation guidance used in evaluating the data is presented in *USEPA National Functional Guidelines for Inorganic Data Review (2017)* and *USEPA National Functional Guidelines for Organic Data Review (2017).* The data review consisted of an evaluation of all applicable Quality Control (QC) sample results as they relate to the field data under review. Raw data were not reviewed. The review determines the usability of the data based on the Data Quality Objectives (DQOs) for the project.

2.0 EXECUTIVE SUMMARY

The data reviewed were generated by American Environmental Testing Laboratories, Inc. (AETL) located in Burbank, California and were contained in one data package named 96370. Analyses were conducted on 30 normal environmental soil samples and three field duplicates using EPA method SW8081A for organochlorine pesticides. The results of the data validation indicate all data are usable and some data were qualified as estimated due to matrix spike recovery and duplicate imprecision errors. The errors and qualified data are denoted in section 4.1. The Data Quality Indicators (DQOs) of accuracy, precision, representativeness, comparability, and sensitivity all met their criteria.

3.0 EVALUATION CRITERIA

The data were evaluated by results from the following QC elements:

- Holding Times
- Method Blanks
- Laboratory Control Samples
- Surrogate Recovery (Organic Methods)
- Field Replicate Analysis
- Spiked Duplicate Analysis
- Compound Identification
- Analytical Method Compliance

4.0 AMERICAN ENVIRONMENTAL TESTING LABORATORY

The AETL data were contained in data package 96370.The samples were analyzed in multiple batches for the method(s) as listed below.

1. Organochlorine Pesticides using EPA method SW8081A (33 total samples)

The data were logged into the laboratory under compliant Chain-Of-Custody documentation. The samples were shipped in one iced cooler delivered to the lab.

The sample were received at the lab in good condition and with no exceptions noted. For each parameters/method listed above there are individual method headers listed below that explain the data validation and data quality.

4.1 Organochlorine Pesticides by EPA method SW8081A

4.1.1 Holding Time

The samples were analyzed within the method specified holding time.

4.1.2 Method Blank

The results for the method blank were non-detect for all compounds at the specified MDL.

4.1.3 Laboratory Control Sample

The LCS recoveries were within the specified acceptance limits for all compounds.

4.1.4 Surrogate Recovery

The surrogate recoveries were within the specified acceptance limits for all samples.

4.1.5 Field Duplicate Analysis

No field duplicate samples reported errors except as listed below

Field duplicates Soil Dup 1 had RPD errors that qualified samples SS-56-1. Analytes 4,4'-DDE, 4,4'-DDT, and Dieldren in sample SS-56-1 were qualified as estimated and assigned a "J" qualifier. The estimated data are usable as estimated values.

4.1.6 Matrix Spiked Duplicate Analysis

The MS and MSD recoveries were within the specified acceptance limits for all compounds except as listed below. The MS/MSD RPD values were in control.

Field sample SS-41-1 and SS-43-2 were qualified as estimated and assigned a "J" qualifier due to MS/MSD recovery errors. In each sample the DDT and Endrin analytes were qualified. The estimated data are usable for the intended purpose.

4.1.7 Compound Identification

All compounds were identified by the correct retention as compared to the standard's retention time and the method guidelines for identification were met.

4.1.8 Analytical Method Compliance

The data review showed the data to be method compliant and followed the criteria stated in method SW8081A.

4.2 Overall Analytical Evaluation

Based on the results of this data validation review, it is concluded that the AETL soil data are usable as stated and qualified. The results are considered correct and reliable The DQOs were satisfied per the Work Plan and the data are usable for their intended purpose. The overall analytical evaluation indicates all analytical criteria met for this data set.

TECHNICAL MEMORANDUM

DATE January 14, 2019

TO James R. Steele, P.G., C.E.G., C.H.G.
Associate Director

Tetra Tech, Inc.
5383 Hollister Avenue, Suite 130
Santa Barbara, CA 93111

FROM Steve Bush, P.E., Senior Engineer

SUBJECT Maulhardt Ranch High School No. 8
Water Pipeline Safety Hazard Assessment
TETR-02.0

Introduction

PlaceWorks was retained by Tetra Tech Inc. on behalf of the Oxnard Union High School District (District) to conduct a Water Pipeline Safety Hazard Assessment (WPSHA) for Maulhardt Ranch High School No. 8. The District proposes to develop a new high school on an approximately 48.2-acre site within the 108-acre Maulhardt Ranch property at 1853 Camino Del Sol in the City of Oxnard. Four large volume (12-inch diameter and larger) water pipelines were identified within 1,500 feet of the project site. The WPSHA evaluates potential flooding impacts to the project site, and was conducted as required by California Code of Regulations (CCR), Title 5, Section 14010(h).

1.1 PROJECT LOCATION

The project site is located at the northeast corner of N. Rose Avenue and Camino Del Sol in the City of Oxnard, Ventura County, California (Figure 1). The site is relatively flat; gently sloping from northeast to southwest. Site elevations are between approximately 60 and 70 feet above mean sea level (amsl). The property is bounded by Camino Del Sol to the south, N. Rose Avenue to the west, and predominately residences to the north and east. Rio Rosales Elementary School is also located east of the proposed school site. Commercial and residential uses are located to the south across from Camino Del Sol. The remaining land uses within the Maulhardt Ranch property include residences, open space, parks, and neighborhood commercial. US Route 101 is approximately 1 mile to the north of the school site.

2. Water Pipeline Safety Hazard Assessment

2.1 REGULATORY REQUIREMENTS

Under Education Code Section 17251, the California Department of Education (CDE) has authority to approve the acquisition of proposed school sites. The school district must obtain CDE approval for sites to receive state funds under the state's School Facilities Program administered by the State Allocation Board. CDE standards and regulations for this process are presented in CCR, Title 5, Sections 14010, 14011, and 14012. Information on assessing safety hazard related to pipelines is discussed in Section 14010 (h):

> *The site shall not be located near an above-ground water or fuel storage tank or within 1,500 feet of the easement of an above-ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission.*

No high pressure natural gas pipelines or hazardous liquid pipelines were identified within 1,500 feet of the project site.[1] The CDE School Site Selection and Approval Guide also contains provisions for evaluating high-pressure water pipelines:[2]

> *To ensure the protection of students, faculty, and school property if the proposed school site is within 1,500 feet of the easement of an aboveground or underground pipeline that can pose a safety hazard, the school district should obtain the following information from the pipeline owner and operator:*
>
> - *Pipeline alignment, size, type of pipe, depth of cover,*
> - *Operating water pressures in pipelines near the proposed school site,*
> - *Estimated volume of water that might be released from the pipeline should a rupture occur on the site, and*
> - *Owner's assessment of the structural condition of the pipeline.*

[1] National Pipeline Mapping System (NPMS), 2018. Hazardous liquids pipeline map produced by the NPMS Public Viewer at https://pvnpms.phmsa.dot.gov/PublicViewer/. Accessed on January 4, 2019.

[2] California Department of Education (CDE), 2000. Resources for School Facilities Planning, School Selection and Approval Guide. Prepared by School Facilities Planning Division, CDE, Sacramento, CA.

2.2 ASSESSMENT METHODOLOGY

To meet the requirements of CCR Title 5 Sections 14010 (d) and (h) and CDE's policy on pipelines, this WPSHA is designed to meet the following objectives:

» Identify all high pressure/high volume water pipelines within 1,500 feet of the proposed school site and evaluate the potential for flooding, and
» Where appropriate, identify and develop mitigation measures to reduce flooding impacts to acceptable levels.

The CDE has developed risk analysis procedures for evaluating flooding associated with releases from large diameter water pipelines, as described in CDE's Guidance Protocol for School Site Pipeline Risk Analysis.[3] A safety issue associated with large diameter water pipelines is the potential for flooding. Also, releases from underground water pipelines can cause subterranean erosion of saturated soil, leading to subsidence or formation of a sinkhole. The most likely cause of failure is a large magnitude earthquake and associated strong ground shaking.

Although no specific criteria have been established by the CDE as a threshold of significance for flooding at a project site, a water depth of 12 inches or greater is a trigger that could warrant further evaluation.[4]

2.3 PIPELINE LOCATION AND OPERATIONAL DATA

Based on maps provided by Tetra Tech and United Water Conservation District (UWCD), there are four high volume (≥12 inch diameter) water pipelines within 1,500 feet of the project site, as summarized in Table 1. The alignments of the pipelines are shown on Figure 1.

Table 1 Water Pipelines

PIPELINE DIAMETER	PIPELINE LOCATION	OWNER	MATERIAL OF CONSTRUCTION
12- inch	N. Rose Avenue	City of Oxnard	Polyvinyl chloride (PVC)
12- inch	Camino Del Sol	City of Oxnard	Asbestos Cement Pipe (ACP)
12- inch	Kohala Street	City of Oxnard	ACP
42-inch	N. Rose Avenue	United Water Conservation District	Cement Mortar Lined and Coated (CCLC) Steel Pipe

[3] California Department of Education (CDE), 2007. Guidance Protocol for School Site Pipeline Risk Analysis, Prepared by URS Corporation. Dated February 2007.

[4] Ibid.

2.4 WATER PIPELINE FLOODING ANALYSIS

The CDE requires that the risk of releases from large volume (≥12 inches) water pipelines be evaluated. The CDE Guidance Protocol for School Pipeline Risk Analysis provides a methodology for evaluating the potential for flooding. A probability analysis is not required.

All water pipelines listed in Table 1 are located beneath streets. According to the preliminary grading and site plan for the project, curbing will be installed on all the streets surrounding the development, including the east side of N. Rose Avenue. Additionally, N. Rose Avenue will undergo improvements and street widening with project implementation.

A pipeline flooding analysis was conducted for these pipelines to determine the depth and location of water flow within the street in the event of a pipeline leak or rupture. For this worst-case analysis, it was conservatively assumed that all of the water flowing through the pipelines at their maximum capacity would reach the surface. In addition, no credit was taken for the presence of storm drains along these streets. Release impacts were calculated based on the procedures specified in the CDE manual. The release rate was determined by multiplying the pipe area by an assumed velocity of 5 feet per second (fps). Then the release rate was compared to the carrying capacity of the street, taking into account longitudinal slope, to determine if the water would be contained within the confines of the street curbing.[5] The result is provided in Table 2.

Table 2 Street Flow

PIPELINE DIAMETER	PIPELINE LOCATION	RELEASE RATE (CFS)	STREET WIDTH (FT)	DEPTH OF FLOW IN STREET (IN)	EXCEEDS STREET CARRYING CAPACITY?[1]
12- inch	N. Rose Avenue	3.93	104	3.8	No
12- inch	Camino Del Sol	3.93	72	4.1	No
12- inch	Kohala Street	3.93	40	4.1	No
42-inch	N. Rose Avenue	48.1	104	9.8	Yes

[1] Assuming 8-inch curbing for arterial streets and 6-inch curbing for residential streets.

Assuming a standard 8-inch curb for arterial roadways (e.g., N. Rose Avenue and Camino Del Sol) and 6-inch curb for all residential streets (e.g., Kohala Street), the water released from a full-flow rupture of the 12-inch water mains would be entirely contained within the confines of the curbing and would not result in flooding at the school site. However, a release from the 42-inch UWCD pipeline along N. Rose Avenue would exceed the carrying capacity of the street, and could potentially impact the project site.

The predicted worst-case depth of flow in the street was 9.8 inches for a full release of the 42-inch water line. Assuming a standard 8-inch curb for N. Rose Avenue, released water from the 42-inch

[5] Jeffers & Associates, 2006. Modified Manning's Equation Solver. Version 3.0.

water line would exceed the carrying capacity of the street by 1.8 inches. However, the CDE has postulated a level of concern as a water depth of 12 inches or greater at the school site. Therefore, the calculated water depth of 1.8 inches would be less than CDE's level of concern and would not pose a significant risk to occupants at the project site in the unlikely event of a water pipeline break.

For this worst-case analysis, it was conservatively assumed that all of the water flowing through the pipelines at their maximum capacity would reach the surface. Given that the pipeline is buried approximately 2 to 3 feet bgs, only a portion of the water released from the pipeline would reach the surface.[6] In addition, no credit was taken for the existing surface topography and the presence of storm drains along the streets.

3. Conclusions

In summary, a potential break in any of the water pipelines located within 1,500 feet of the site would not result in significant flooding at the project site.

Respectfully submitted,

PlaceWorks

Hello Ms. Chammas,

I am responding to your inquiry regarding the 42-inch UWCD-owned pipeline on Rose Ave. The pipeline material is cement mortar lined and coated cylindrical steel with spirally wound reinforcing rods. Attached are drawings for your reference. If you have any additional questions, please do not hesitate to contact me.

Thank you and respectfully,

Robert Richardson, PE

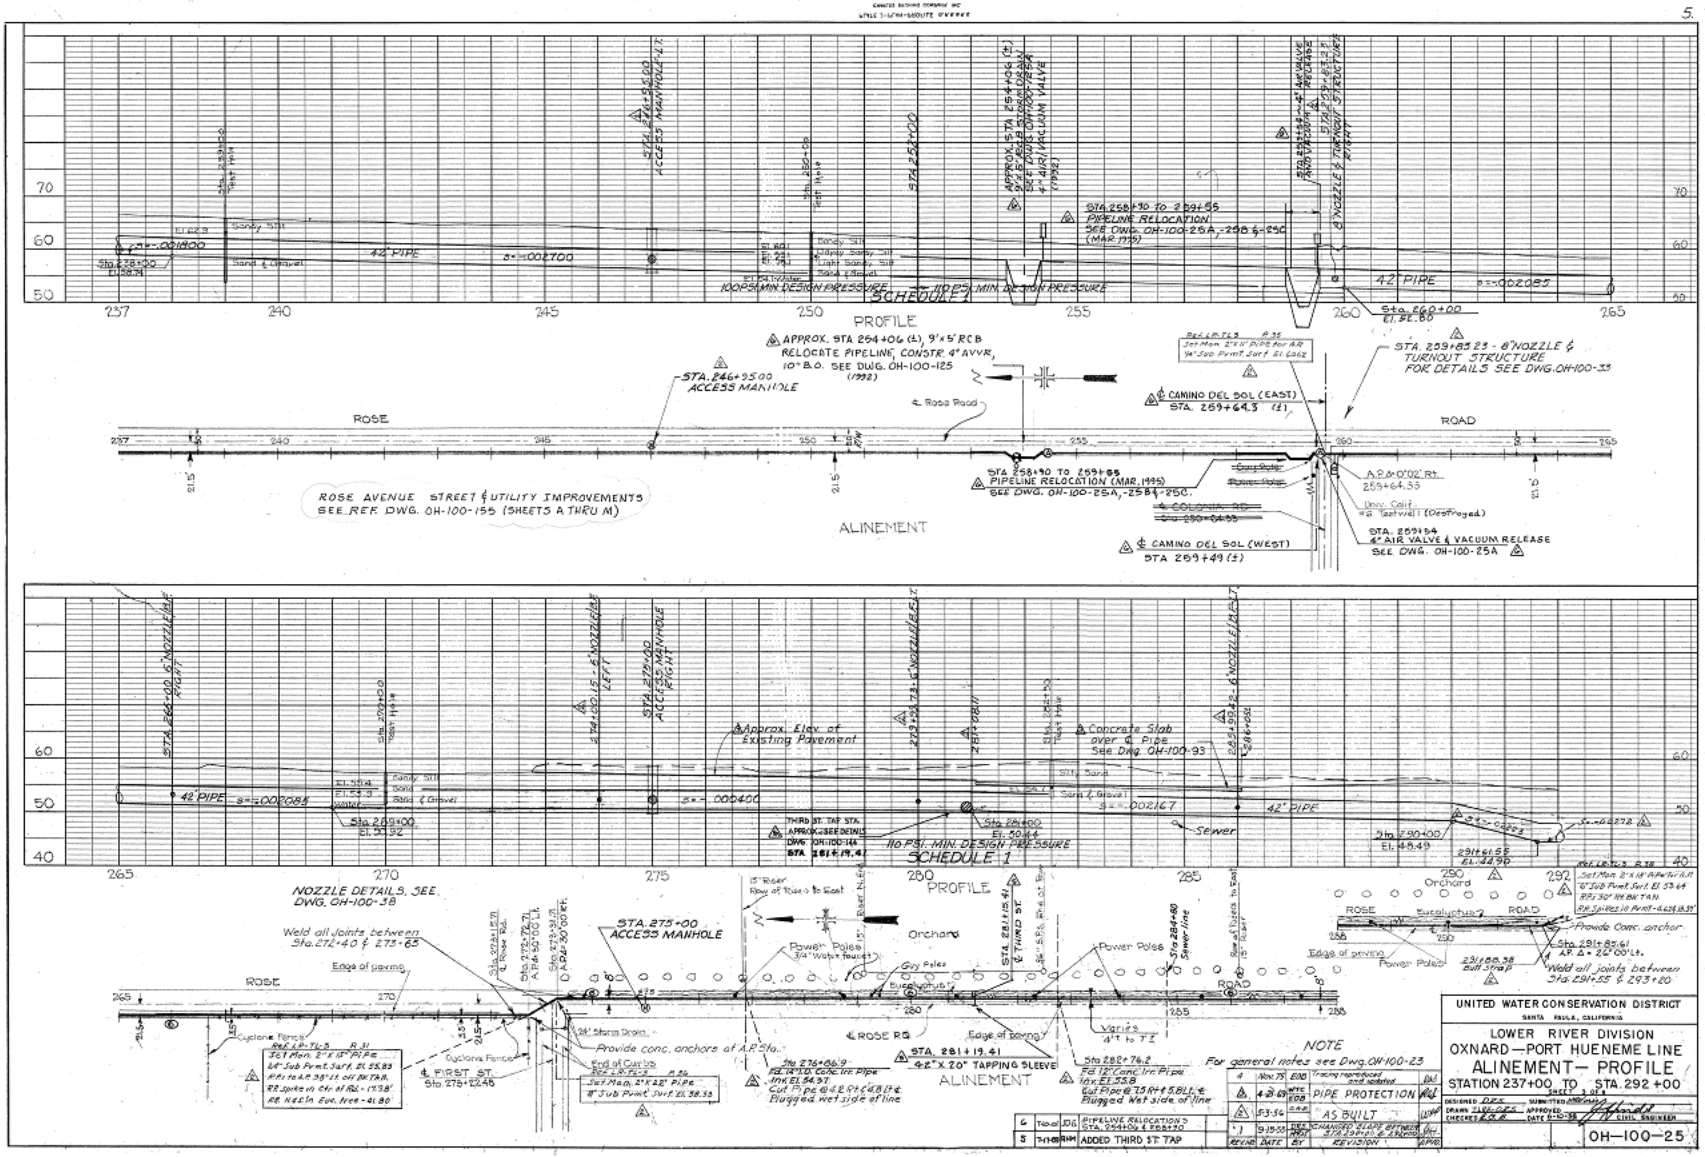
>
> Good morning,

The Oxnard Union High School District is evaluating a site for a proposed school campus, located at 1853 Camino Del Sol in the City of Oxnard. In compliance with CCR Title V Section 14010 (h), the District has contracted the services of PlaceWorks to complete a safety hazard assessment related to water pipelines 12-inches in diameter or greater located within a 1,500-foot radius of the school site. The water atlas attached shows a UWCD 42" water pipeline in North Rose Avenue directly west of the proposed school site.

Would it be possible to get more information regarding the pipeline material?



Thank you in advance,

DINA EL CHAMMAS GASS

Oxnard, CA 93030

Subject: Sewer Calculations
Northeast Corner of Rose Avenue and Camino del Sol

Dear Mr. Withanage,

The approximately 100 acre property at the northeast corner of Rose Avenue and Camino del Sol, commonly called the Maulhardt property, is the proposed site of a new high school, a residential development, and a smaller commercial development. This letter is an update to the previous site plan and calculations that were submitted in June 2018.

Updated calculations for the proposed sewer flows from the site are included for your review and use. We understand the City of Oxnard will run the City's sewer model with these new flows to determine whether the existing downstream facilities can accommodate the proposed sewer flows.

The calculations reflect two options for sewering the proposed site. See attached exhibits for the proposed layouts and peak flows. Option 1 has half of the residential development and all of the commercial development draining to Rose Ave sewer; and the other half of the residential and all of the high school site draining to Camino del Sol sewer. Option 2 shows all of the residential and all of the commercial directed to Rose Ave and all of the high school directed to Camino del Sol. Also attached are the calculations for determining sewer flow rates for the site.

Your analysis of these flows through the City's sewer model will allow us to determine how best to proceed with design of the project site. We look forward to your input. Feel free to contact us with any questions or concerns.

Sincerely,
Jensen Design & Survey, Inc.

Ava Ediger, P.E.
Senior Civil Engineer

RE: Maulhardt Property & Oxnard High School #8 Overall Hydrology Concept

Dear Paul,

In an effort to streamline the design and plan checking process for Oxnard High School #8, I have outlined the overall drainage concepts for the entire 107.9 acre Maulhardt Property. Two existing City owned RCB systems in Camino del Sol, were designed for conveyance of stormwater from nearly 1,000 acres. This area spans from the Rose Shopping Center to Rice Road and south to Camino del Sol and is part of the Rice Road Drain Watershed. The Rice Road Drain is County Redline Channel. Allowable discharge rates for the property stem from the 1987 Rice Road Watershed Agreement between the City of Oxnard and the County of Ventura Watershed Protection District (formerly Flood Control District). Developed properties north of 5th Street are allowed to discharge 1 cfs/acre in all storm events and must detain the balance of developed runoff. Improvement Plans and Reports for the RCB Construction are consistent with agreement and show that the system was designed to convey 1cfs/acre from the Maulhardt Property. I confirmed with Sergio Vargas, Deputy Director of VCWPD by phone and email between April 4 and April 9, 2019 that the District will hold the project to the 1 cfs/ac discharge rate.

Reference Material and Historical Hydrologic Data

I have reviewed the following reference material to determine how the Maulhardt Property was intended to join the existing storm drain system.

- West Camino del Sol RCB System: Improvement Plans 87-2A. Tract 4827 Hydrologic and Hydraulic Drainage Report for Rose Ave./Colonia Rd. Storm Drain (SUP 1489, 1992, Charles Hilsmann) with Improvement Plans 92-43A.
- East Camino del Sol RCB System: Improvement Plans 88-50A. Tract 4021 and Tract 4373 Drainage Study (1989, William J. Ghormley Consulting). Improvement Plans 98-72A with Tract 5136 Hydrology Report (1999, DH Civil Engineering, Inc.).

The Tract 4827 Report accounts for 88 acres of the Maulhardt Property as tributary to the West RCB System. An additional 11 acres contributes to the East RCB system. This accounts for 99 acres of the 108 acre property. Referenced from the County Rice road Drain Report from June, 1992, subarea 97D (33 acres) contains the 11 acres plus the balance of the Maulhardt Property (9 acres) to reach the total 108 acres. The Report for Tract 4021 (East RCB) shows location 110 BD as the most downstream subarea of 32 acres, which seems to match the County subarea 97D. Even with 1-acre difference, it is clear that the

entire Maulhardt Property has been accounted for in the design and construction of the City RCB systems. Both Subareas 97D and 11BD seem to include about 23 acres of the Maulhardt Property, so the 20 acres is conservative. In the developed condition, 88 acres should drain to the West RCB and 20 acres to the East RCB, each with 1cfs/ac maximum discharge.

Developed Hydrologic Concept

The PROPERTY BOUNDARIES EXHIBIT shows the breakdown of what will be the Maulhardt Development, Oxnard High School #8, and the respective dedications for public street right-of-way. Each development will be responsible for the treatment and detention of the respective gross areas so public street dedication areas are included. I have also shown the proposed public storm drain alignments that will convey the developed runoff to the Camino del Sol RCBs. The East SD will convey flow from the northeast portion of Planning Area A with 20 cfs max. The West SD will convey rest of Planning Area A with 24.55 cfs max (gross 44.55 acres at 1 cfs/ac – 20 cfs in the East).

Two main drainage areas make up the High School site (Planning Area B) – North Campus (33.44 acres) and South Campus (18.35 acres), each with their own pre-treatment, infiltration, and detention systems. The West SD line will run south through the school (with an easement to the City of Oxnard) and pick up the North Campus discharge. Although the North Campus are is much larger, the two subareas each account for about 50% of the discharge. So the public West SD will carry the 24.55 cfs from Planning Area A and 23 cfs from North Campus. South Campus will discharge about 23 cfs to a 24" stub directly north of the Rice Road Drain beginning. There will be approximately 5 cfs of undetained flow from 1.5 acres to account for within the HS design. All three connections will utilize existing laterals to minimize the costly construction of new connections to the RCB systems. (The High School discharge rates are not finalized as of the writing of this letter.) The remaining 10.6 acre Planning Area C and 0.95 acre Barn Parcel will contribute their respective flows, also at 1 cfs/ac, bringing the total to 107.9 acres. The table below summarizes the overall hydrology.

Overall SD Concept

	Area (Ac)	Q (1 cfs/ac)
Public East SD		
Maulhardt	20	20
Public West		
Maulhardt	24.55	24.55
North Campus	33.4	23
South Campus	18.4	23
Campus Undetained	-	5
Area C & Barn Parcel	11.55	11.55
Total	**107.9**	**107.1**

Developed Hydraulics on Existing System

On the West box, the Maulhardt Property is intended to connect in two locations: 33" stub at Station 1+02.76 (23 cfs) and a 45" stub at 11+05.48 (53 cfs). These flows are routed values, slightly lower than the actual allowable discharge. The proposed connections to the systems will be adjusted to fit design needs. South Campus will use a 24" stub just downstream of the 33" connection. Runoff here will be about 23-25 cfs. North Campus and the public line from the northern Maulhardt development will join

downstream of the modeled connection at Station 6+77, where a 24" stub was constructed. Discharge here will be about 50 cfs. The remaining 11.5 acres (and cfs) will likely join Station 10+47. This is one of the existing Maulhardt catch basins that ties into the RCB. The datum difference to this plan set is 2.28' (52.35 inv at RCB outlet vs 50.07 inv plan set 92-43A). HGL for the South Campus connection is 58.1, North Campus is 58.7, and Planning Area C & Barn is 59.34. These values come directly from the Tract 4827 WSPG run for the West Box.

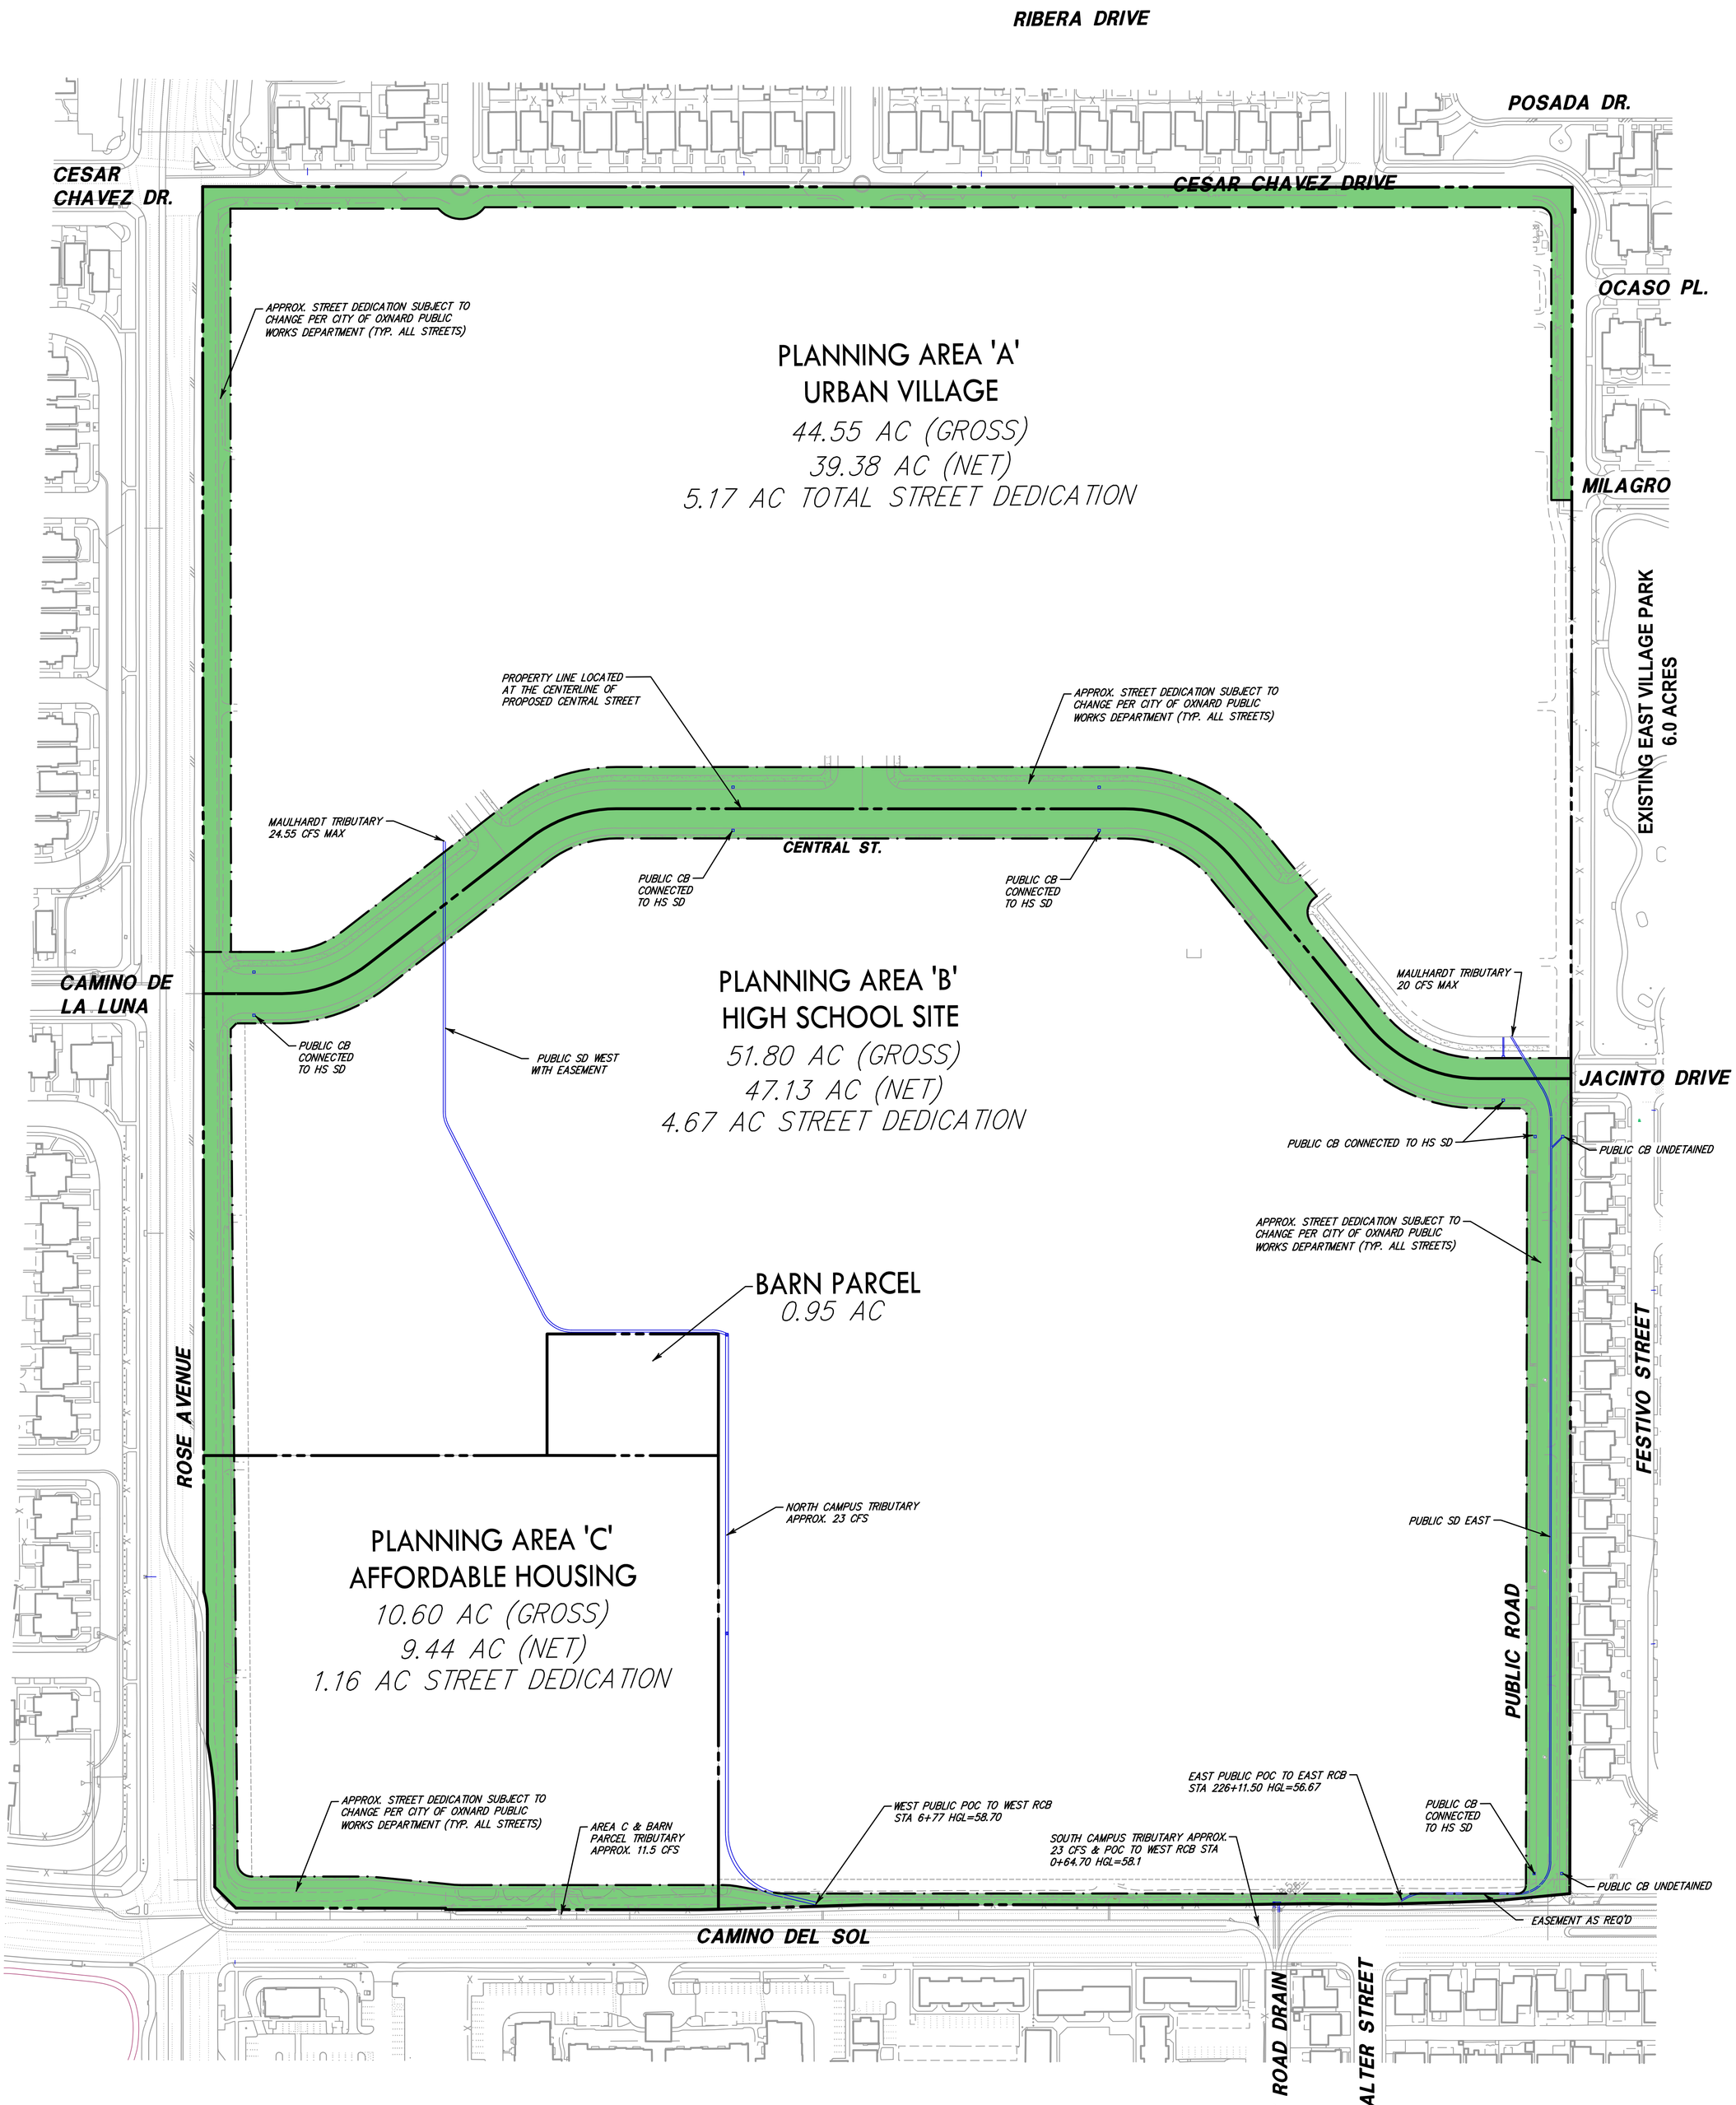
The Tract 4021 hydrology report included a WSPG run for the east box. I have duplicated that run and adjusted to our datum to provide a check in the developed model. The datum difference is 1.9' and the duplicated run matches the original report. The allowable 20 cfs to the east box was intended to join at Station 226+11.50. The Tract 4021 report and plans show different HGL information. The WSPG run has a WSE of 54.77 (56.67 adjusted for the datum difference) and the plans show 54.37 at the same location. I have used the higher HGL as the tailwater for the east public SD line to the Maulhardt property.

Two catch basin locations are planned along the easterly Public Road. One set near Camino del Sol to catch street runoff before entering the existing SD system, and a second set near Central Street at a design low point. The westerly catch basins will direct street runoff into the High School site storm drain system for infiltration and detention. Given design grades, the easterly catch basins cannot cross the main SD line so will tie directly in the public SD. Detention will be accounted for in the High School design and treatment will be mitigated with a grass swale or other option acceptable to the City. Several catch basins along Central Street will also tie into the High School North Campus SD system. Inlets on the north side of Central will be tied into the Maulhardt System where possible.

Attachments

The exhibits and data in order are:

1. Property Boundaries Exhibit – shows the breakdown of Maulhardt Development and High School land areas, and public SD alignments.
2. Tract 4827 West Box Plans and Report Excerpts.
3. Tract 4021 East Box Plans and Report Excerpts.



The proposed development of the Maulhardt Site with the new Oxnard High School will join the existing storm drain system as intended. Each project will deal with infiltration and detention as they come to the design phase. The High School is the first portion to go to final design. A detailed report for the storm drain connections will be available in the coming weeks.

Please feel free to call and discuss if you have questions.

Regards,

Ava Ediger, P.E.
Senior Civil Engineer

9. Northeast Industrial Assessment District No. 86-3, Contract No. 2, Drawing No. 88-50A, Sheets 33 through 35.
10. Tract No. 3147 - Offsite Drainage, Drawing No. 79-62A, Sheet 10 & 11A.

PROCEDURE

Hydrology

The runoff rates used in the design of the storm drain facilities were determined using two different criteria; ultimate and interim watershed development. Refer to 1"=500' hydrology maps at the end of this report.

For ultimate conditions, the VCFCD data provided in Appendix B was utilized. The maximum peak flow in the system was determined to be 427 CFS just before the junction with Rice Road Drain.

For interim conditions, the V.T.N. West Drainage Report was used for reference upstream of the intersection of Rose Avenue and Colonia Road. The 10-year interim peak flow in that study had been determined to be 148.8 CFS (See Appendix A). Due to the proposed "Shopping at the Rose" development, an increase of 64.9 CFS will occur (67 ac. x 1 CFS/acre -2.1 CFS). V.T.N. had estimated that 2.1 CFS would be released from the proposed site before development. In addition, the Maulhardt property will convey 0.4 CFS/Acre for the interim condition for a 10-year storm. The V.T.N. study had estimated the contributing Maulhardt area to be 77.6 acres. The VCFCD Hydrology Study shows the area to be 88 acres. Based on a field review, it appears that an additional 11 acres could drain to the facility until the property to the East is developed and runoff is conveyed to the final collection points as designed and shown on drawing # 88-50A. Therefore, the total maximum interim peak flow is expected to be 224.1 CFS (150.6 -2.1 +67 + (88 + 11 - 77.6) 0.4 CFS/acre) just before the junction with Rice Road Drain.

Hydraulics

The Los Angeles County Flood Control District's WSPG Computer Program was used to generate the hydraulic grade line in the storm drain. The input data and computer output is included in Appendix

R.C. Box at 200 foot intervals for pickup of drainage from the future landscaped center median.

DETENTION

This drainage facility does not provide detention in itself but is designed to convey runoff for a 100-year event from a fully developed watershed with each developing property intercepting all runoff and limiting the discharge to 1 CFS/Acre into the facility. However, the limitation on conveyance size would serve somewhat to reduce the magnitude of direct discharge into the Rice Road Drain if individual project detention were not being provided.

Ultimate Conditions

The VCFCD modified rational hydrology contained in Appendix B assumes a maximum release rate of 1 CFS/Acre from the watershed areas that were to be developed since the formation of the plan to limit discharge into Rice Road Drain. For older areas of development, 1.1 CFS/Acre was assumed (10-year runoff for high density areas per City of Oxnard Master Plan of Drainage). This latest VCFCD hydrology includes an additional area of 33 acres west of Rose Avenue requested to be added by the City since the earlier Hydrology Studies were completed in 1986. In addition, approximately 15 acres have been added to the contributing watershed (subarea 49B) to the westerly drain in Colonia Road and 15 acres reduced from the contributing watershed to the easterly drain, based on more detailed drainage review and analysis by V.T.N.

Some routings have been revised to more accurately reflect the scheme for intercepting and conveying runoff. The net result after routing is that 427 CFS will contribute to the Rice Road Drain from 440 acres. A summary of the hydrology is shown in the following table. The figures assume an ultimate release of 1 CFS/Acre from the St. Johns medical center site. Presently the runoff from 73 acres is being routed through a detention basin which results in a discharge of 32.8 CFS.

Total Area from 59B/60BE & 62B/63BE = 88 Acres. Remaining 11 acres tributary to East RCB.

It appears the 55.5 acres was broken up into 23 acres in 62B/63BE and the remaining 32.5 acres applied to node 59B/60BE.

100AB	923	---	884	COMBINED FLOW IN RICE ROAD DRAIN

Interim Conditions

The VCFCD has not developed hydrology for the present watershed development conditions with the St. John's Project completed. However, the V.T.N. West Report covers the situation on a conservative basis since no reduction from routing was assumed or calculated. The interim runoff being picked up at the intersection of Colonia & Rose was calculated to be 6.4 cfs by V.T.N. No contributing flow was assumed from the force main due to different peaking times.

A Field Review of the Maulhardt property indicates that approximately 21.8 acres will drain to the entrance road and interim catch basin at Sta.12+03. See Interim Condition Hydrology Map. The 10-year flow would be 8.7 CFS (21.8 AC x 0.4 CFS/Acre). Approximately 10.7 acres, contributing 4.3 CFS, drains to a concrete lined field outlet at Sta. 11+58 which is conveyed in a new ditch/lining to the inlet at Sta. 10+85.48. A catch basin is being placed in the entrance road at Sta. 10+47.25. However, the basin is intended for pickup of nuisance road flow and as a safety factor for possible overflow due to poor grade conditions in the field. The remaining flow from 55.5 acres (22.2 CFS) will drain to a new lined ditch and enter the system at Sta. 6+77 and 1+02.76. Presently the field is graded so that all of the runoff drains to an existing 24" CMP which will be connected to the new facilities at Sta. 6+77. The inlet in the bulkhead at Sta. 1+02.76 has been provided in case there is some overflow from the field drainage. Finally, a 24" CMP has been provided at Sta. 0+64.70 to intercept excess field runoff estimated at 4.4 CFS from 11 acres east of the project. However, the pipe could accept 31 CFS. A CMP has been provided instead of a RCP because it is an interim connection and will eventually be abandoned.

Peak flow in Rice Road Drain for the interim condition assumes ultimate development from the watershed east of Rice Road Drain.

Maulhardt Areas highlighted above equal 99 acres. 88 Acres (21.8+10.7 +55.5) is tributary to West RCB. Remaining 11 acres tributary to East RCB.

Subject: Water Demand Projections
Maulhardt Property – Northeast Corner of Rose Avenue and Camino del Sol
Oxnard, CA

Dear Mr. Steele,

The approximately 100 acre property at the northeast corner of Rose Avenue and Camino del Sol, commonly called the Maulhardt property, is the proposed site of a new high school, a residential development, and a smaller commercial development. This letter is to provide water projection calculations for the proposed development.

The proposed project consists of 900-1100 units of a mixture of single family, multi family, and low income housing; a two acre commercial component; and a 49 acre high school for Oxnard Union High School District (OUHSD). Projected water demands for this report are based on the City of Oxnard Water Master Plan and actual water usage for two other high schools in the OUHSD.

Land Use		Demand Factor	Projected Water Demand (Acre-Feet/Year
Residential	900-1100 DU	0.37 AFY/DU*	333-407 AFY
Commercial	2.0 Acres	3.4 AFY/AC*	6.8 AFY
Park	11.9 Acres	0.1 AFY/AC*	1.2 AFY
High School	49.4 Acres		67.0 AFY**
Total Demand Range			**408-482 AFY**

References
* City of Oxnard Water Master Plan
** Average of CIHS and OHS Water Bills (including irrigation)

The property was annexed to the City of Oxnard and Calleguas Municipal Water District in 2014. The City's 2015 Urban Water Master Plan includes this project, but does not specify specific projected water usage. So it is unknown how the demand calculations noted above relate to the City's expected water usage for the site. However, it is known that with the annexation, 161 acre-feet of ground water was allocated to the City of Oxnard.

The above info is provided for preliminary use. Further coordination with the City of Oxnard and further definition of the specific development, particularly as it relates to the residential portion, will be required to more accurately determine the water demands for the project.

Sincerely,
Jensen Design & Survey, Inc.

INTRODUCTION

Stantec has prepared the following traffic and circulation study for the Oxnard Union High School District (OUHSD) High School no. 8. The traffic and circulation study provides an assessment of the existing and future traffic conditions within the study area, determines the trip generation and trip distribution for the proposed development, evaluates the potential traffic impacts to the vicinity roadways and intersections, and provides feasible mitigations where applicable. A discussion of the site access and circulation plan is also provided.

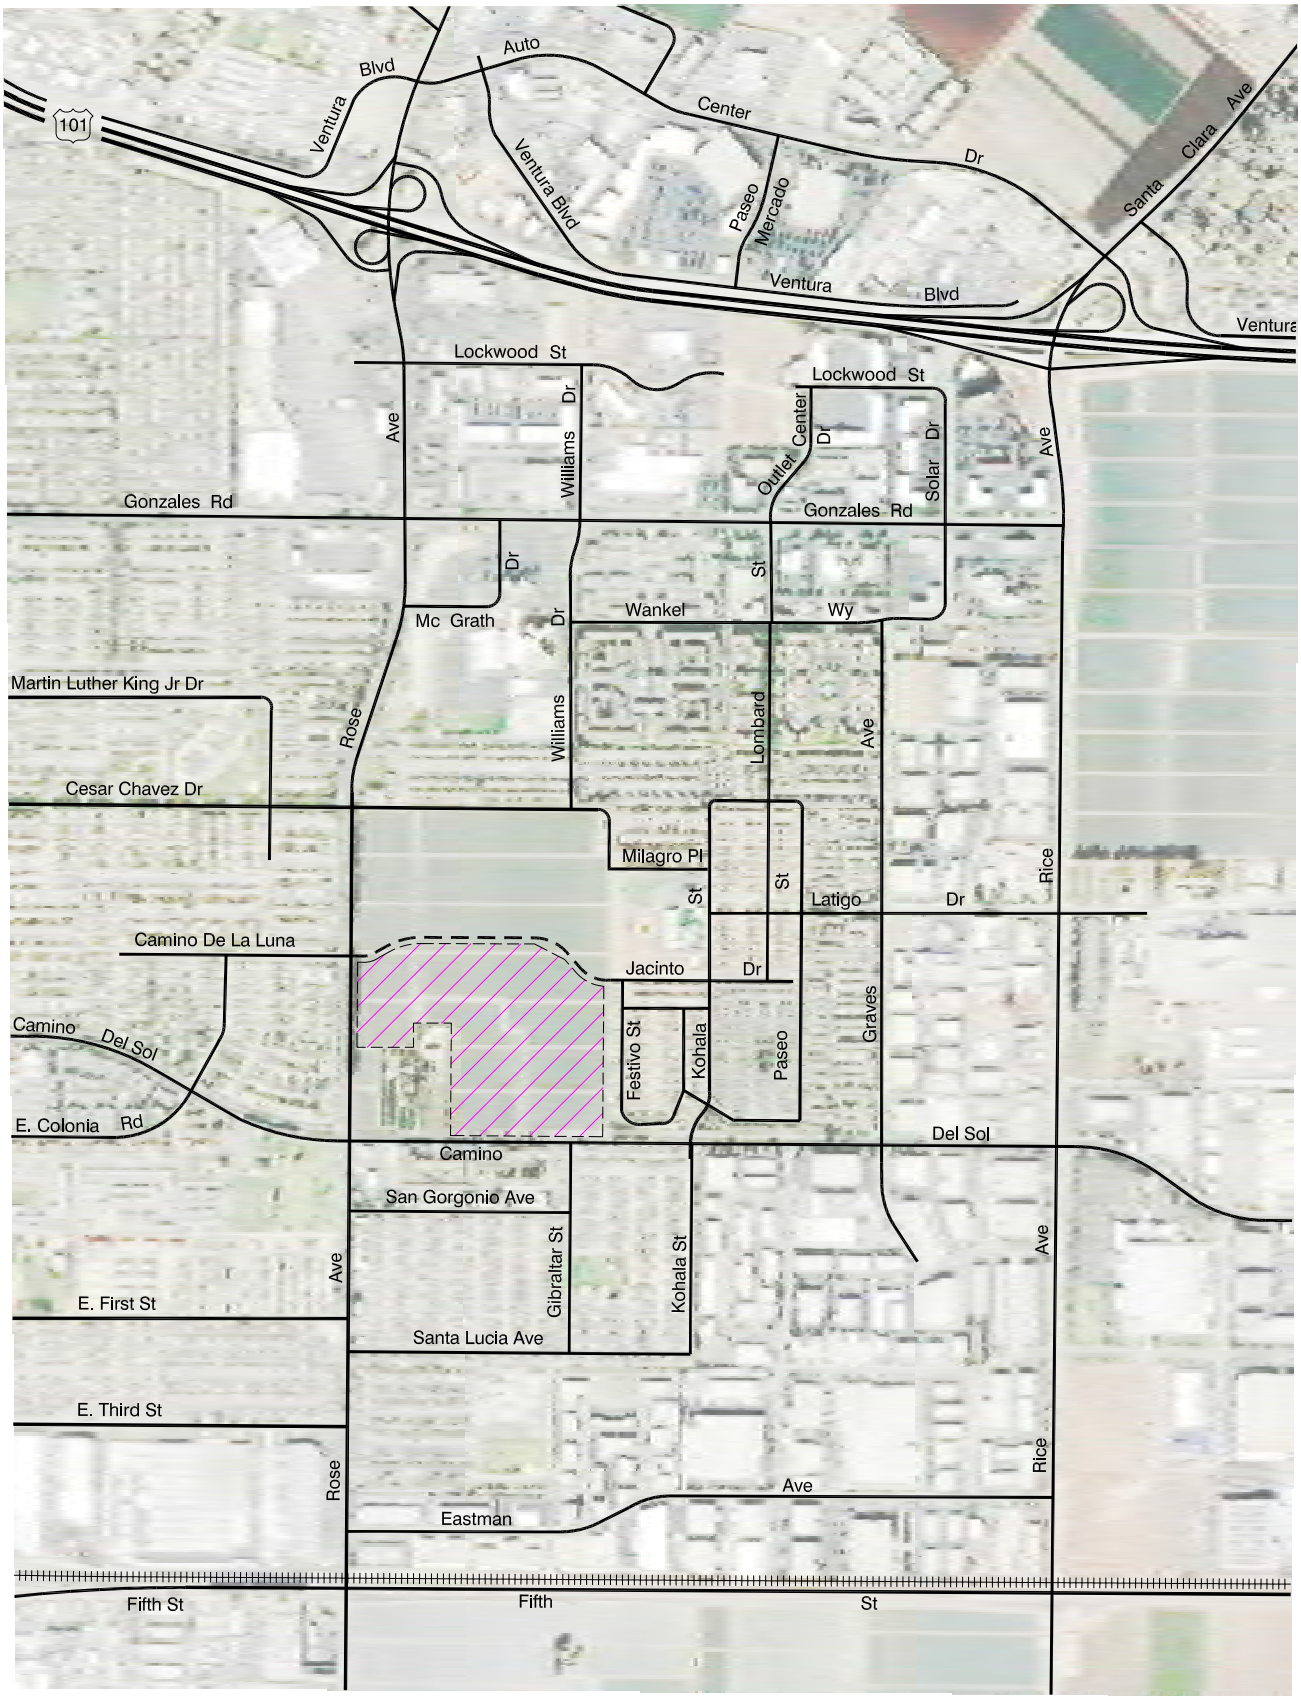
PROJECT DESCRIPTION

The OUHSD proposes a new senior high school on the Maulhardt property located along Camino Del Sol in the East Village Specific Plan of the City of Oxnard. The maximum enrollment at buildout would be 2,500 students.

Proposed improvements include the widening of Camino Del Sol and Rose Avenue to General Plan arterial standards, and the extension of Jacinto Drive from its existing terminus at the eastern site boundary to the Rose Avenue/Camino De La Luna intersection. The Rose Avenue/Camino Del La Luna intersection and the Camino Del Sol/Gibraltar Street intersection will be signalized. Exhibit 1 shows the location of the proposed high school site in the eastern portion of City of Oxnard and Exhibit 2 shows the conceptual site plan.

Access is proposed via three new driveways on the north side of Camino Del Sol and three driveways on the south side of the new segment of Jacinto Drive. The driveway connection to the Camino Del Sol/Gibraltar Street intersection will be full access. The remaining two driveways on Camino Del Sol, located west and east of Gibraltar Road, will be restricted to right-turns only. The three driveways on Jacinto Drive will be full access.

STUDY METHODOLOGY



Traffic Analysis Scenarios

Pursuant to CEQA and City traffic impact study requirements, The traffic analysis includes the following traffic scenarios:

- Existing Conditions
- Existing plus Project Conditions
- Cumulative (Existing plus approved and pending projects) Conditions
- Cumulative plus Project Conditions
- Buildout Conditions
- Buildout plus Project Conditions

Level of Service Criteria

The traffic analysis focuses on key intersections within the study area during the AM and PM commute periods, when peak traffic volumes typically occur. A level of service (LOS) ranking scale is used to identify the operating condition at intersections. This scale compares traffic volumes to intersection capacity and assigns a letter value to this relationship.

EXHIBIT 2

PROJECT SITE PLAN

The letter scale ranges from A to F with LOS A representing free flow conditions and LOS F representing congested conditions. The level of service criteria are summarized in Table 1.

Table1
Intersection Level of Service Criteria

LOS	Signalized Intersections (V/C Ratio)	Signalized Intersections (Sec. of Delay)	Unsignalized Intersections (Sec. of Delay)	Definition
A	< 0.60	≤ 10	≤ 10	Conditions of free unobstructed flow, no delays and all signal phases sufficient in duration to clear all approaching vehicles.
B	0.61 – 0.70	> 10 and ≤ 20	> 10 and ≤ 15	Conditions of stable flow, very little delay, a few phases are unable to handle all approaching vehicles.
C	0.71- 0.80	> 20 and ≤ 35	> 15 and ≤ 25	Conditions of stable flow, delays are low to moderate, full use of peak direction signal phases is experienced.
D	0.81 – 0.90	> 35 and ≤ 55	> 25 and ≤ 35	Conditions approaching unstable flow, delays are moderate to heavy, significant signal time deficiencies are experienced for short durations during the peak traffic period.
E	0.91 – 1.00	> 55 and ≤ 80	> 35 and ≤ 50	Conditions of unstable flow, delays are significant, signal phase timing is generally insufficient, congestion exists for extended duration throughout the peak period.
F	> 1.00	> 80	> 50	Conditions of forced flow, travel speeds are low and volumes are well above capacity. This condition is often caused when vehicles released by an upstream signal are unable to proceed because of back-ups from a downstream signal

Source: Highway Capacity Manual, 6th Edition.

The City of Oxnard considers LOS C or better acceptable for intersection operations, with LOS D acceptable at the following intersections only:

- Oxnard Boulevard with Gonzales Road;
- Oxnard Boulevard with Vineyard Avenue;
- Rose Avenue with Gonzales Road;
- Wooley Road with Oxnard Blvd/Saviers Rd (Five Points) and;
- Wooley Road with C Street.

Caltrans has established the cusp of the LOS C/D range as the target level of service standard for State Highway facilities.

Level of Service Calculation Methodology

City of Oxnard. Pursuant to Oxnard Traffic Study Guidelines, the Intersection Capacity Utilization Methodology (ICU) was used to determine levels of service for signalized intersections, and the results are shown as a volume-to-capacity (V/C) ratio. Level of service for the unsignalized intersections in the study area were calculated using the methodologies outlined in the Highway Capacity Manual (HCM)[1].

[1] Highway Capacity Manual, 6th Edition: A Guide for Multi-Modal Mobility Analysis, Transportation Research Board, 2016.

Levels of service for unsignalized intersections were determined using *HCS software*[2], and the results are presented as seconds of delay.

Caltrans. Levels of service for State intersections were analyzed based on the HCM methodologies. Intersection levels of service were calculated using Synchro[3] software, which implements the HCM methodology to determine intersection levels of service, control delays and queue lengths for each approach.

EXISTING CONDITIONS

Roadway Network

The roadway system in the study area is comprised of a network of freeways, arterials and collectors. The study area roadway network is shown in Exhibit 3 and a brief description of the major components is provided below.

U.S. Highway 101 (U.S. 101) extends along the Pacific Coast between Los Angeles and San Francisco. Within the City of Oxnard, the six to eight-lane freeway is the principal route between Oxnard and the cities of Ventura and Santa Barbara to the north, and the cities of Camarillo, Thousand Oaks and Los Angeles to the south. Regional access from U.S. 101 to the project site is provided via the interchanges with Rose Avenue and Rice Avenue.

Rose Avenue is a north-south primary arterial that extends from Pleasant Valley Road to Los Angeles Avenue located north of Oxnard. The roadway generally contains six travel lanes with a raised median and signals at all full access intersections. The segment between Camino Del Sol and Cesar Chavez Drive contains four travel lanes and a painted median, and will be widened as part of redevelopment of the Maulhardt property. It provides regional access to the project site via its intersections with Camino De La Luna and Camino Del Sol.

Rice Avenue is a north-south arterial that provides regional access to the project site from the east. In addition, it serves the Nyeland Acres Community, the Northeast Industrial Area and the southeast residential areas. The segment between the U.S. 101 interchange and the Oxnard Boulevard interchange has been include in the Highway System (SR 1), however signals are operated by the City. South of Gonzales Road, the roadway contains three southbound, a raised median and two northbound lanes. The roadway will be widened as part of redevelopment of the Sakioka Farms Specific Plan. All major intersections are signalized.

Camino Del Sol is an east-west secondary arterial that extends from Victoria Boulevard to Del Norte Boulevard. The posted speed limit on Camino Del Sol is 40 miles per hour through most of its stretch and on-street parking is permitted in certain areas. Camino Del Sol contains four lanes with a divided median from North Garfield Avenue to Rose Avenue, and from Gibraltar Street to Rice Avenue. The segment between Rose Avenue to Gibraltar Street contains four lanes and a painted median. This segment will be widened as part of project frontage improvements.

[2] Highway Capacity Software 7, McTrans, 2016.
[3] Synchro plus SimTraffic 10, Trafficware Ltd., 2018.

Gonzales Road is a main east-west primary arterial that serves the central and north-central portions of the City of Oxnard. This roadway extends from Harbor Boulevard to Rice Avenue, and contains six lanes and a raised median in the study area.

Fifth Street is the principal east-west street serving the Central Business District of the City and the mid-City region on both the east and west sides of Oxnard. It is currently designated State Route 34 east of Oxnard Boulevard. Fifth Street functions as a secondary arterial except for the segments from Victoria Avenue to H Street and Oxnard Boulevard to Rose Avenue, which function as primary arterials.

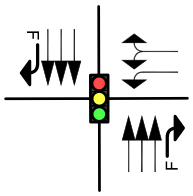
Alternative Transportation

Public Transit. The City of Oxnard is served by rail service and fixed route buses including Gold Coast Transit and VISTA, or general public Dial a Ride (DAR) services. The major transit centers include the Oxnard Transit Center (OTC) that provides transfers between Gold Coast Transit, Metrolink, Amtrak, and VISTA along with the C Street Transfer Center at the Centerpoint Mall in Oxnard.

Metrolink Ventura County Line provides rail service to Camarillo and Simi Valley into the City of Los Angeles to the L.A. Union Station with approximately 45-minute headways during commute periods.

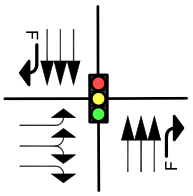
Gold Coast Transit Routes 4 and 17 provide service to the project area with stops along Rose Avenue. Route 2 provides local service from the OTC via Colonia Road to Gibraltar Street and return via First Street. Transfers to Routes 15, 19, 20 and 22 are provided at the St. John's Regional Medical Center located at Rose Avenue and Gonzales Road.

Vista routes provide regional transit connection with service from Oxnard to Ventura, Santa Barbara and UCSB to the north, and service along SR 34, SR 126 and U.S. 101 to all cities in Ventura County, and the San Fernando Valley.



Bicycle Network. Class II bicycle lanes are provided on Rose Avenue north of Camino Del Sol and, Camino Del Sol from Garfield Avenue to Del Norte Boulevard, and on Gonzales Road from Victoria Avenue to Rice Avenue. The City's *Bicycle & Pedestrian Master Plan*[4] proposed bicycle facilities includes new Class II bicycle lanes on Rose Avenue south of Camino De Sol and a bicycle boulevard on Cesar Chavez Drive from Juanita Avenue to Rice Avenue.

Existing Intersection Operations



A total of 21 intersections were selected for analysis in consultation with City of Oxnard Traffic Engineering and Planning staff. Existing intersection turning volumes for the AM and PM peak commute periods (7am to 9am and 4pm to 6pm) were derived from counts collected in November 2018 and January 2019. Intersection turning counts are included in the Technical Appendix for reference. The existing lane geometry and control for the intersections within the study area are shown in Exhibit 3 and the AM and PM peak hour volumes are illustrated in Exhibit 4.

TWSC: two-way stop control. AWSC: all-way stop control.
All intersections controlled by City of Oxnard except:
(CT): Caltrans controlled intersection.
Caltrans intersections and unsignalized intersections analyzed using the HCM methodology. LOS determined by vehicle delay in seconds.

As shown, the majority of intersections currently operate at LOS C or better during both peak hours, which is considered acceptable based on City and Caltrans standards. The Rose Ave/Camino De La Luna intersection, which is unsignalized, operates below the City's LOS C standard.

PROJECT SPECIFIC CONDITIONS

Traffic Impact Thresholds

City of Oxnard. The City has adopted level of service C as the threshold of significance for intersections during environmental review.

The City of Oxnard's criteria for evaluating project impacts at intersections is based upon the change in volume-to-capacity ratio attributable to the project. The City of Oxnard has adopted the following guidelines to prepare a traffic study and determine a project's effects on intersections (per City Resolution No. 10,453);

Traffic studies shall include a list of intersections where the project will worsen the Intersection Capacity Utilization (ICU) numeric value of Level of Service (LOS) by V/C 0.02 or more. This ICU list shall include intersections projected to be at LOS C with background traffic (existing plus approved plus pending projects) and LOS D, E, or F with background traffic plus project generated traffic.

At intersections where the project increases the ICU by .02 to .039, a list shall be prepared that identifies the improvements necessary to mitigate the identified project impact. City staff will then determine the amount of participation from the project for the necessary improvements. The developer shall mitigate the project's impacts to the circulation system by:

(A) Construction of all master-planned facilities within the project area, consisting of half the master planned roadways abutting the project area, plus one lane. "Roadways" include related improvements, such as sidewalks, curbs, gutters, and drainage facilities. "Project Area" means the area shown on the approved plans.
(B) Construction of all improvements necessary to mitigate impacts to intersections that the ICU list shows will be worsened by .02 or more (subject to mitigation fee limit).

The City of Oxnard Public Works Division collects traffic impact fees based on project generated traffic that would impact roadways within the City's jurisdiction. Standard conditions of permit issuance initiate collection of these fees for all projects within the City of Oxnard, regardless of whether the project is a private or a public project.

Caltrans. Caltrans has established the cusp of the LOS C/D range as the target level of service standard for State Highway intersections. If an existing State Highway facility is operating at less than the target LOS, the existing Measure of Effectiveness (MOE) should be maintained.

Project Trip Generation

The OUHSD proposes a new senior high school with a maximum enrollment at buildout of 2,500 students. Trip generation estimates for the proposed high school were developed based on the rates presented in the Institute of Transportation Engineers *Trip Generation Manual*[5] for *Land Use #530 – High School*. Table 3 summarizes the trip generation estimates for the project.

[5] Trip Generation Manual, Institute of Transportation Engineers, 10th Edition, 2017.

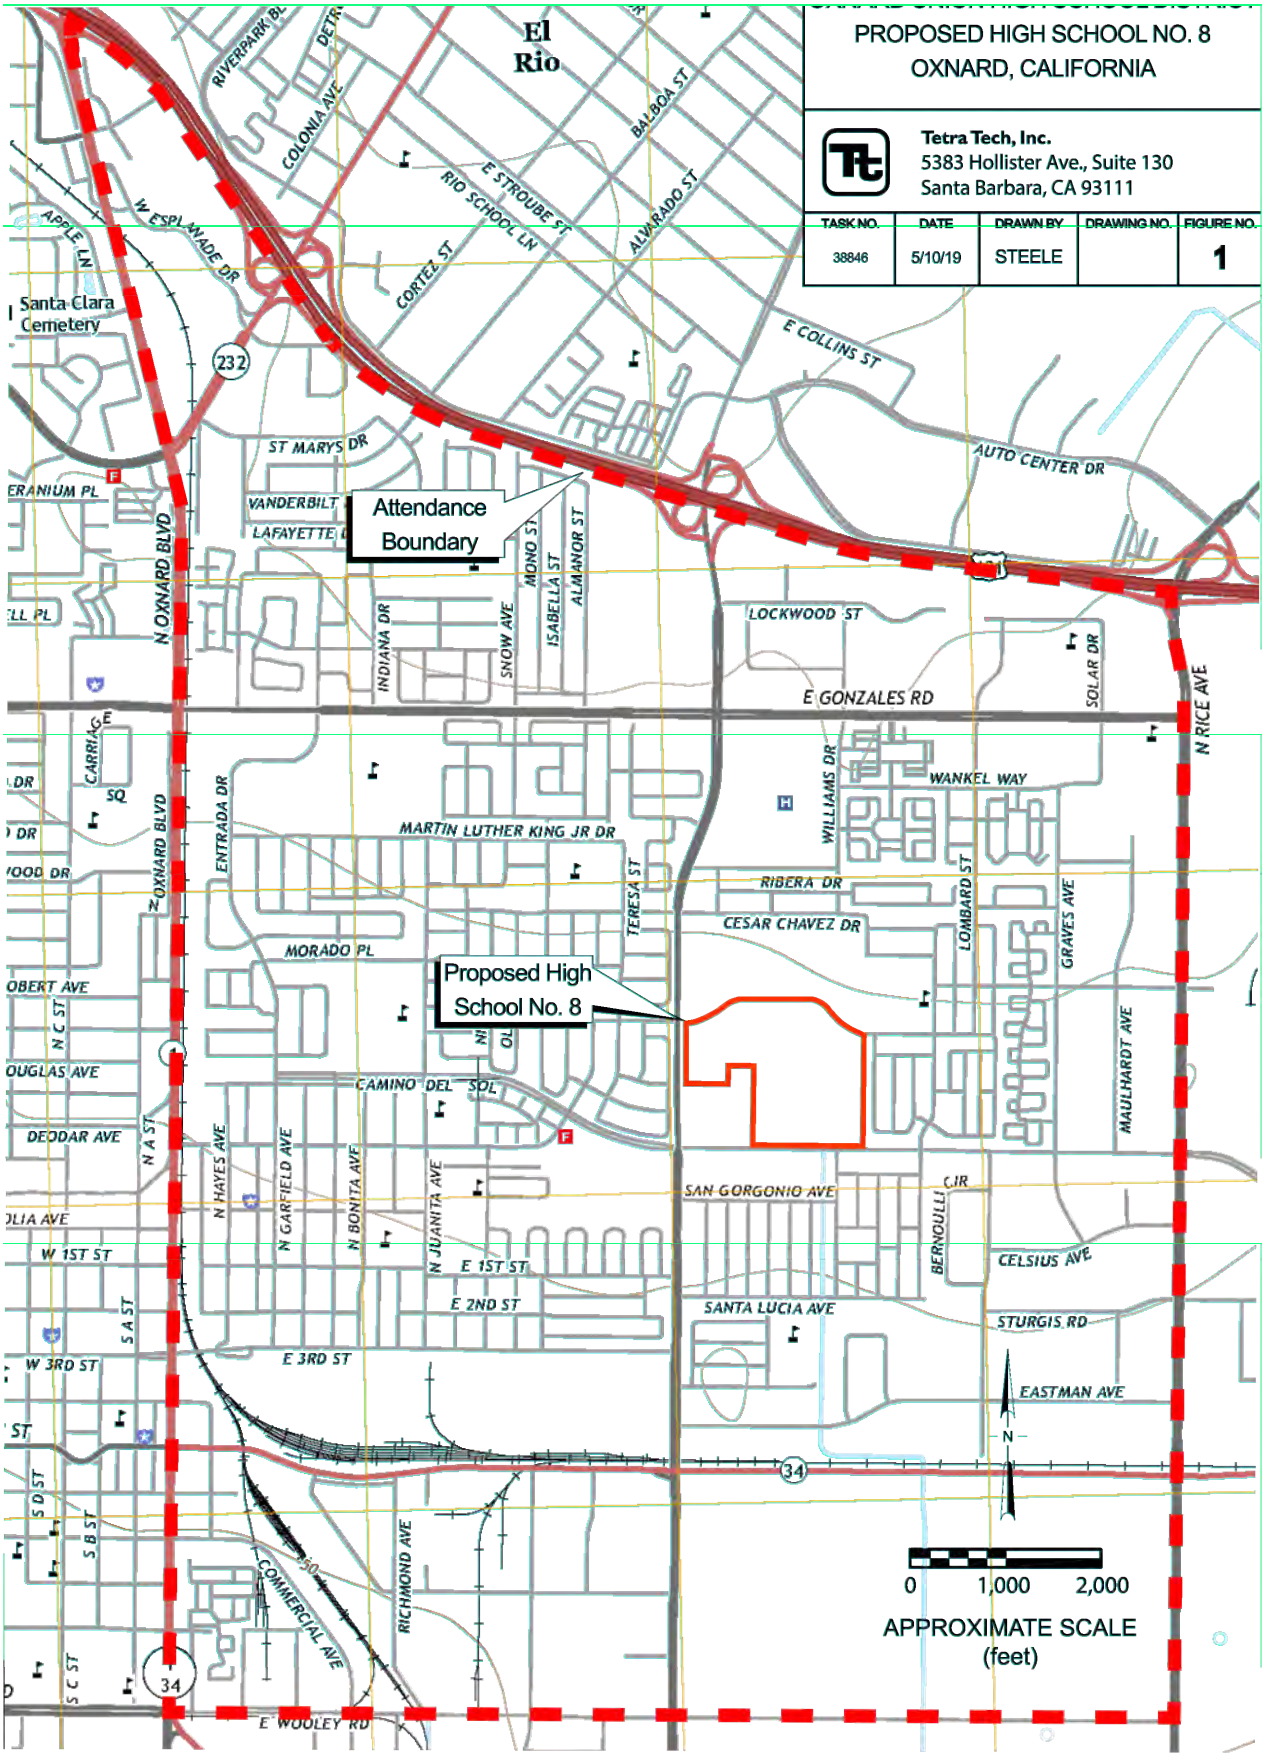
Table 3
Project Trip Generation

Land Use	Size	ADT		A.M. PHT		P.M. PHT	
		Rate	Trips	Rate	Trips	Rate	Trips
High School	2,500 students	2.03	5,075	0.52	1,300 (871/429)	0.14	350 (168/182)

ADT = average daily trips.
PHT = peak hour trips.
(X/X) = inbound trips/outbound trips.

Table 3 indicates that the project is expected to generate 5,075 ADT, with 1,300 trips occurring during the AM peak hour and 350 trips occurring during the PM peak hour. It should be noted that the trip generation estimate is considered conservative. A significant portion of students that will attend the new high school currently attend other schools, and trips generated by these existing students will not be new to the study area, but be trips diverted from its original route to the new school.

Project Trip Distribution



Project trips were distributed and assigned to the local street network based on high school attendance boundary limits provided by the District and the distribution of residential areas within this boundary, and existing travel patterns in the study-area. The high school attendance boundary is shown in Exhibit 5, and the distribution percentages and project-added traffic volumes are shown in Exhibits 6 and 7, respectively. Exhibit 8 illustrates the school driveway volumes.

Project Frontage Improvements

Consistent with the 2030 General Plan, Rose Avenue will be built out to Primary Arterial standards, with the project improvement limits extending from Camino De La Luna to Camino Del Sol. Roadway widening easterly will provide three northbound and southbound travel lanes and a raised median, and add a sidewalk to the east side. Additional intersection capacity will be provided at Camino De La Luna and Camino Del Sol, and the intersection with Camino De La Luna will be signalized.

Camino Del Sol will be widened to a add westbound travel lanes on the north side, and eastbound left-turn lane at Gibraltar Street, and a raised median. Additional intersection capacity will be provided at Camino Del Sol and Gibraltar Street, and the intersection with Gibraltar Street will be signalized.

Jacinto Drive, located directly north of the project site, will be extended westerly from its existing terminus at Festivo Street to Rose Avenue as the new east leg of the Rose Avenue/Camino De La Luna intersection. The roadway will be designed to collector standards (80' ROW) with one lane in each direction, a raised media, on-street parking and a sidewalk on the south side.

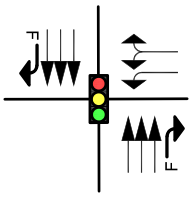
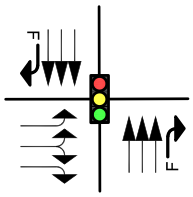
EXHIBIT 8
PROJECT ACCESS TRAFFIC VOLUMES



Existing plus Project Intersection Operations

Project generated traffic was added to the existing peak hour traffic volumes and levels of service were recalculated for existing plus project conditions assuming the proposed frontage improvements discussed previously. The improvements would result in increased capacity at the intersections of Rose Avenue with Camino De La Luna and Camino Del Sol and at the Camino Del Sol/Gibraltar Street intersection, by adding turning lanes and through lanes at intersection approaches. The intersection geometries under project-specific conditions are shown in Exhibit 9 and the existing plus project traffic volumes are illustrated in Exhibit 10. Table 4 summarizes the level of service calculations for project-specific conditions.



As shown in Table 4, the most intersections will continue to operate at LOS C or better during both peak hours. The Rose Ave/Camino De La Luna intersection, which would be widened and signalized, would experience improved operations. Similarly, operations at the Rose Ave/Camino Del Sol intersection would also improve as a result of additional capacity under project-specific conditions. The Camino Del Sol/Gibraltar Street intersection, which would provide main access to the high school, is expected to operate acceptably based on the City's ICU calculation method. A site access analysis that evaluates delays and queue lengths during the AM peak hour is provided in the Site Access and Circulation section of this report.

The project would degrade the level of service at the Rose Ave/Cesar Chavez Drive intersection and the Camino Del Sol/Colonia Road intersection from LOS C to LOS D during the AM peak Hour, thereby generating a project-specific impact at these locations. Improvement measures that would mitigate these impacts are outlined in the Mitigations section of this report.

[1] Intersection widening and geometry improvements under project-specific conditions.
[2] Intersection signalized under project-specific conditions.

CUMULATIVE CONDITIONS

The City of Oxnard requires that the study-area intersections are analyzed assuming cumulative traffic conditions, which include traffic that could be generated by other developments in the study area that are expected to be constructed in the near future. The following section discusses the cumulative (existing conditions plus approved and pending projects) conditions.

Street Network Improvements

Review of roadway or intersection improvements associated with approved projects included in the cumulative analysis and the City's Five-Year Capital Improvement Plan[6] indicates that the following improvements are expected to be constructed under cumulative conditions (without the proposed high school):

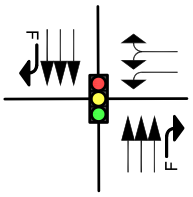
Rose Avenue from Cesar Chavez Drive to Camino Del Sol. The residential/commercial development proposed on the northern and southwest portions of the Maulhardt property (Urban Village) will widen Rose Avenue to Primary Arterial standards, resulting in three northbound and southbound travel lanes and a raised median, and add a sidewalk to the east side. Additional intersection capacity will be provided at Cesar Chavez Drive, Camino De La Luna and Camino Del Sol.

Cesar Chavez Drive from Rose Avenue to Gibraltar Street. The residential/commercial development proposed on the northern portion of the Maulhardt property (Urban Village) will widen Cesar Chavez Drive along its frontage to residential street standards.

San Gorgonio & First Street Realignment: This CIP project will construct an extension of San Gorgonio Avenue and a new connection at Rose Avenue at a four-leg intersection. The signal at First Street will be removed and the intersection will be restricted to right-turn in-and-out only movements.

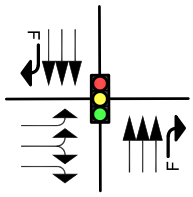
Rice Avenue/Fifth Street Grade Separation. This project will construct a six-lane overcrossing on Rice Avenue over Fifth Street/SR 34 and ramp connections to Fifth Street/SR 34.

Exhibit 11 shows the intersection geometries under cumulative conditions. No changes were applied to San Gorgonio Avenue as realignment information was not available.



Cumulative Traffic Volumes

Cumulative traffic volumes were developed using a list of approved and pending development projects in the City of Oxnard provided by City staff[7]. In addition, traffic generated by the adjacent residential/commercial development (Urban Village) was included in the cumulative forecasts. A map showing the pending projects within the study area is included in the Technical Appendix.



Trip generation estimates were developed for the pending projects based on rates contained in the Institute of Transportation Engineers (ITE) *Trip Generation* for the respective land uses. A trip generation worksheet is also included in the Technical Appendix. The cumulative projects traffic volumes were distributed onto the study-area street network based on each individual project's location, existing traffic patterns, and a general knowledge of the residential and commercial lay-out of the Oxnard area. The cumulative projects AM and PM peak turning volumes were assigned to the study area intersections and added to the existing peak hour volumes. The resulting cumulative peak hour volumes are shown in Exhibit 12 and the cumulative plus project peak hour volumes are illustrated in Exhibit 13.

[1] Intersection widening and geometry improvements under cumulative conditions.
[2] Intersection signalized under cumulative conditions.
[3] Intersection signalized under cumulative + project conditions.

Table 5 indicates that the project would generate a cumulative impact based on City of Oxnard impact thresholds at the Camino Del Sol/Colonia Road intersection, which is forecast to operate in the LOS E range with cumulative plus project traffic. Cumulative mitigation measures are discussed in the Mitigation section of this report.

BUILDOUT CONDITIONS

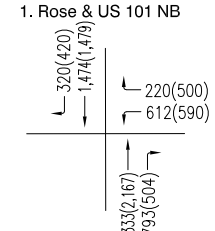
Buildout Traffic Volumes

Traffic volumes for City of Oxnard General Plan buildout conditions are derived from the City of Oxnard Traffic Model (OTM) Year 2030 volumes, which were provided by City staff. The Buildout plus Project volumes generated by the Model include traffic generated by the proposed High School No. 8 and the adjacent residential/commercial development (Urban Village). Buildout without Project volumes were developed by removing project traffic from the forecasts, and adding traffic generated by the site's development as included in the *East Village Phase III Annexation*[8]. It is noted that the OTM generated volumes for 11 intersections. Stantec developed buildout volumes for the remaining 10 intersections by extrapolating buildout additions through the study area corridors. The school site is included in the *East Village Phase III Annexation* as 36.5 acres with a density of 4.5 dwelling units per acre, resulting in a total of 164 single family dwellings. The project trip generation adjustments under buildout plus project conditions are shown in Table 6.

Table 6
Project Trip Generation – Buildout Conditions

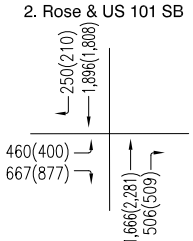
Land Use	Size	ADT Trips	AM PHT Trips	PM PHT Trips
East Village Single Family Dwelling	164 DU	1,548	121 (30/91)	162 (102/60)
Proposed Project High School	2,500 students	5,075	1,300 (871/429)	350 (168/182)
Net Difference		**3,527**	**1,179 (841/338)**	**188 (66/122)**

ADT = average daily trips. PHT = peak hour trips. (X/X) = inbound trips/outbound trips.



The 2030 Oxnard Traffic Model peak hour traffic volumes without and with the OUHSD High School No. 8 are shown in Exhibits 14 and 15, respectively.

Street Network Improvements



The City's buildout network in the traffic model includes the extension of Camino Del Sol to Oxnard Boulevard, which will divert traffic from Colonia Road to Camino Del Sol. Further, the *City of Oxnard 2030 General Plan Circulation Diagram* indicates that Camino Del Sol between Rose Avenue and Del Norte Boulevard is programmed to become a Primary Arterial (six lanes). The Rose Avenue/Fifth Street intersection will be reconfigured to a an Arterial Interchange and the Rice Avenue/Camino Del Sol intersection will be reconfigured to a Freeway Interchange. Given that improvement plans or construction timing information are not available, the buildout analysis does not assume these network changes.

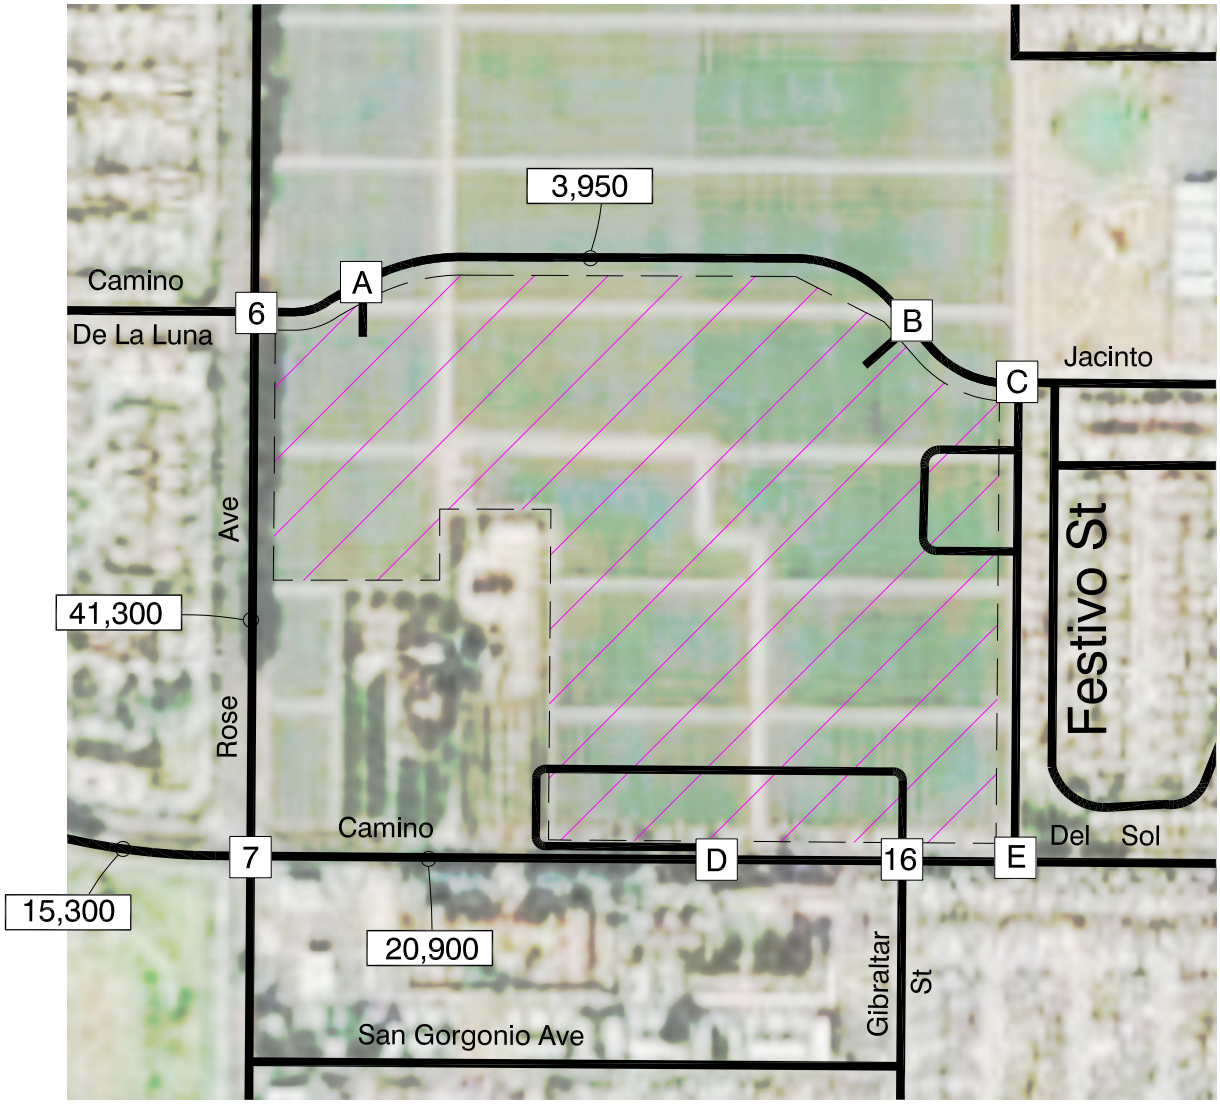
[1] Intersection widening and geometry improvements under buildout conditions.
[2] Intersection signalized under buildout conditions.
[3] Intersection signalized under buildout + project conditions.

As shown, nine intersections are forecast to operate below the City's and Caltrans LOS C standard under buildout plus project conditions. The project would generate a buildout impact

at the intersections of Camino Del Sol with Juanita Avenue and Colonia Road, which are assumed to be all-way stop controlled. The project would not exceed the City's impact threshold of V/C 0.02 at the remaining intersections that would operate below LOS C.

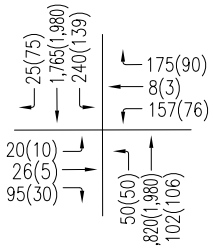
It is noted that the buildout analysis does not incorporate the 2030 General Plan Circulation Element improvements discussed previously. Camino Del Sol between Rose Avenue and Del Norte Boulevard is programmed to become a Primary Arterial (six lanes). The Rose Avenue/Fifth Street intersection will be reconfigured to an Arterial Interchange and the Rice Avenue/Camino Del Sol intersection will be reconfigured to a Freeway Interchange. Given that Rice Avenue will be configured to freeway standards between the U.S. 101 and Wooley Road, the Rice Avenue/Gonzales Road intersection would also need to be reconfigured to a Freeway Interchange.

PROJECT SITE ACCESS, CIRCULATION AND PARKING



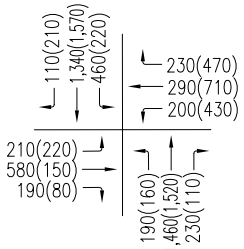
Site Access

Vehicular Access. The site plan illustrated in Exhibit 2 shows that access is proposed via three new driveways on the north side of Camino Del Sol and three driveways on the south side of the extended segment of Jacinto Drive. Exhibit 16 shows the buildout plus project access traffic volumes,



The driveway connection to the Camino Del Sol/Gibraltar Street intersection will be signalized and will provide full access to the school main drop-off and pick-up loop and parking areas. An analysis was completed using Synchro software for the AM commute period, during which the majority of school traffic will be generated during a peak 5-minute period. The analysis, which was completed using cumulative and buildout turning volumes, indicates that the eastbound left-turn lane should be extended to the maximum length available to accommodate the eastbound left-turn movement into the school main driveway (461 AM PHT), The peak queue is shown as 880' during the 25-minute AM peak period. Given that the spacing between Gibraltar Street and the Camino Del Sol Senior Apartments driveway to the west is approximately 950', back to back left-turn lanes could be provided to adequately accommodate left-turns into the senior center and the high school.

It is noted that the 2030 General Plan Circulation Element includes Camino Del Sol between Rose Avenue and Del Norte Boulevard as a Primary Arterial (six lanes), and capacity and intersection signal timing may therefore change under buildout conditions.



The driveway on Camino Del Sol located west of Gibraltar Street will be restricted to right-turns only. The driveway on Camino Del Sol proposed east of Gibraltar Road will be restricted to right-turns only. These driveways are expected to operate acceptably based on the turn restrictions.

EXHIBIT 16
BUILDOUT + PROJECT
PROJECT ACCESS
TRAFFIC VOLUMES

Stantec
111 East Victoria Street, Santa Barbara, CA 93101
Phone: (805) 963-9532 Fax: (805) 966-9801

Two driveways on Jacinto Drive will provide access to parking areas for the athletic facilities. The driveway proposed along the eastern boundary of the site will provide access to a secondary drop-off/pick-up loop and school parking areas. Based on the forecast traffic volumes on Jacinto Drive and the turning volumes at the school driveways, it is expected that these driveways will operate acceptably.

Bicycle Access. Class II bicycle lanes are provided on Rose Avenue north of Camino Del Sol and, Camino Del Sol from Garfield Avenue to Del Norte Boulevard, and on Gonzales Road from Victoria Avenue to Rice Avenue. Buildout of Rose Avenue and Camino Del Sol along the project's frontage will include provision of Class II bicycle lanes, and a bicycle path along the north side of the new segment of Jacinto Drive along the project's northern boundary. These new bicycle facilities should be designed to connect to the surrounding bicycle network. Consideration should be given to install buffered bicycle lanes where feasible to provide increased separation between vehicle and bike lanes.

As discussed previously, the City's *Bicycle & Pedestrian Master Plan* proposed bicycle facilities includes new Class II bicycle lanes on Rose Avenue south of Camino De Sol and a bicycle boulevard on Cesar Chavez Drive from Juanita Avenue to Rice Avenue. These bicycle facility additions will further enhance the study area bicycle network.

Pedestrian Access. Pedestrian access to the high school is provided via existing and future sidewalks along Rose Avenue, Camino Del Sol and Jacinto Drive. Project improvements will include new sidewalks along its frontage and new crosswalks at the Rose Avenue/Camino De La Luna intersection and Camino Del Sol/Gibraltar Street intersection, which will be signalized. The existing crosswalks at the Rose Avenue/Camino Del Sol intersection will be modified to school crosswalk markings.

To provide a pedestrian connection between the high school and the Urban Village, crosswalks are proposed at the three Urban Village roadway intersections with Jacinto Drive. Because these intersection will be unsignalized, the appropriate school crosswalk markings and signage should be installed.

Pedestrian connections will be provided between the frontage sidewalks and the school's internal sidewalk and walkway circulation system. Pedestrian connections should be provided at or nearby each school driveway intersection with Camino Del Sol and Jacinto Drive, in order to ensure a clear and direct pathway into the site.

Existing Gold Coast Transit (GCT) bus stops are located on Rose Avenue at Socorro Way in both directions and south of Camino Del Sol in both directions (northbound bus stop is located in the right-turn lane). A new bus stop will be constructed on Rose Avenue north of Camino Del Sol in the northbound direction. This new bus stop would replace the existing bus stop located south of Camino Del Sol. The school district and developer of the Urban Village should coordinate construction of other locations, such as bus stops at Camino De La Luna, with Gold Coast Transit.

Circulation

The on-site circulation system is comprised of four driveways which provide access to three drop-off/pick-up loops and the parking areas. The driveway on Camino Del Sol proposed opposite

Gibraltar Street provides access to the main drop-off and pick-up loop. The ingress driveway and loop contain two lanes with approximately 850 feet of curb length for student drop-off and pick-up. The inside lane will be used as curb drop-off/pick-up and the outside lane will be used to progress traffic. The length of the main loop, in combination with the secondary drop-off/pick-up loops along the school's east side, are expected to provide sufficient vehicle queue storage to accommodate the expected peak traffic movements. Egress from the main loop is provided via the driveway on Camino Del Sol proposed opposite Gibraltar Street or the driveway proposed opposite the Camino Del Sol Senior Apartments driveway. This driveway will initially will be restricted to right-turn egress only.

Bicycle lanes should be provided along the main driveway and an on-site bicycle circulation plan should be developed to indicate the travel paths to the bike parking areas. Bike racks should be provided at designated locations near the school buildings.

Parking

The site plan indicates that the proposed parking supply consists of 700 regular spaces and 22 accessible spaces, for a total of 722 spaces. The parking area between Camino Del Sol and the main drop-off/pick-up loop contains 290 spaces and is designated for staff and visitors. The student parking area is located along the site's eastern boundary and contains 294 spaces. A separate parking lot with 61 spaces is located between the stadium and Jacinto Drive, and a community parking lot, located east of Rose Avenue and south of Jacinto Drive provides 77 spaces. The City of Oxnard parking requirement for high schools is five spaces per class room, plus one space for each five seats utilized for auditorium purposes. Based on this requirement, a total of 465 spaces are required for 93 teaching spaces, with 257 spaces remaining for the auditorium.

VEHICLE MILES TRAVELED (VMT)

State Senate Bill 743 (2013), which was codified in Public Resources Code section 21099, required changes to the guidelines implementing CEQA (CEQA Guidelines) (Cal. Code Regs., Title 14, Div. 6, Ch. 3, § 15000 et seq.) regarding the analysis of transportation impacts. Pursuant to Section 21099, the criteria for determining the significance of transportation impacts must "promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses." (*Id.*, subd. (b)(1); see generally, adopted CEQA Guidelines, §15064.3, subd. (b) [Criteria for Analyzing Transportation Impacts].) To that end, in developing the criteria, Office of Planning and Research (OPR) has proposed, and the California Natural Resources Agency (Agency) has certified and adopted, changes to the CEQA Guidelines that identify vehicle miles traveled (VMT) as the most appropriate metric to evaluate a project's transportation impacts.

A project would have a significant effect on the environment if it would cause substantial additional VMT. The OPR *Technical Advisory on Evaluating Transportation Impacts in CEQA* (December 2018) recommends screening criteria to identify types, characteristics, or locations of projects that would not result in significant impacts to VMT. If a project meets screening criteria, then it is presumed that VMT impacts would be less than significant for the project and a detailed VMT analysis is not required.

Of land use projects, residential, office, and retail projects tend to have the greatest influence on VMT. For that reason, OPR recommends quantified thresholds for these land uses for purposes of analysis and mitigation. Lead agencies, using more location-specific information, may develop their own more specific thresholds, which may include other land use types. in general, the recommended "Threshold of Significance" is if a proposed project exceeds a level of 15 percent below existing regional VMT for that type of project, a significant transportation impact may be generated. However, for other uses (i.e. retail projects), a net increase in total VMT may indicate a significant transportation impact.

VMT analysis

The VCTC is in the process of updating the County-wide traffic model (VCTM) so regional household and non-household VMT levels can be determined. The City of Oxnard has not yet started this process . At this time, no VMT data for residential, office, retail or other land uses is available, and no threshold of significance can be applied to school related VMT.

While the proposed school site is expected to add traffic within the study-area, the new school will also capture school related trips within the study-area (tour-based VMT), resulting in an overall reduction of school related trip lengths for parents and students. Therefore, potential impacts would be less than significant.

Induced Automobile Travel analysis

A project would have a significant effect on the environment if it would substantially induce additional automobile travel by increasing physical roadway capacity in congested areas (i.e., by adding new mixed-flow lanes) or by adding new roadways to the network. OPR's proposed transportation impact guidelines includes a list of transportation project types that would not likely lead to a substantial or measurable increase in VMT. If a project fits within the general types of projects (including combinations of types), then it is presumed that VMT impacts would be less than significant and a detailed VMT analysis is not required.

The proposed project is not a transportation project. While the project would improve or reconstruct existing facilities, no new capacity or network changes are anticipated, and impacts would be less than significant.

MITIGATION MEASURES

Project-Specific Mitigations

Rose Ave/Cesar Chavez Drive intersection. The project-specific analysis found that the project would generate a project-specific impact based on City of Oxnard impact thresholds at the Rose Ave/Cesar Chavez Drive intersection. The project would degrade the level of service from LOS C to LOS D during the AM peak Hour. The project-specific analysis includes the widening of Rose Avenue from Camino De La Luna to Camino Del Sol. Construction of the Urban Village development will widen Rose Avenue from Cesar Chavez Drive to Camino Del Luna, thereby adding a third NB and SB travel lane to the Rose Ave/Cesar Chavez Drive intersection. As shown in table 5, the intersection is forecast to operate in the LOS B range after widening is completed.

To mitigate the project-specific impact, the project would need to construct the intersection improvements at the Rose Ave/Cesar Chavez Drive intersection. The addition of a third NB and SB travel lane would result in LOS B during the AM peak hour (V/C 0.68).

Camino Del Sol/Colonia Road intersection. The intersection would operate at the cusp of LOS C/D under project-specific conditions. The intersection is controlled by an all-way stop. While existing plus project traffic volumes would satisfy *Warrant 3 – Peak Hour* contained in *Chapter 4C. Traffic Control Signal Needs Studies* of the CAMUTCD, the current CAMUTCD guidelines indicate that *Warrant 3 – Peak Hour* shall be applied "only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time."

It is recommended that the intersection be monitored through a yearly count program and signal warrant analysis as the school attendance increases, to determine if a traffic signal is warranted under future conditions.

Camino Del Sol/Gibraltar Street intersection. The site analysis indicated that the eastbound left-turn lane should be extended to the maximum length available to accommodate the eastbound left-turn movement into the school main driveway (461 AM PHT), The peak queue was shown as 880' during the 25-minute AM peak period. Given that the spacing between Gibraltar Street and the Camino Del Sol Senior Apartments driveway to the west is approximately 950', back to back left-turn lanes could be provided to adequately accommodate left-turns into the senior center and the high school.

Cumulative Mitigations

The cumulative analysis indicated that the project would generate a cumulative impact based on City of Oxnard impact at the Camino Del Sol/Colonia Road intersection.

Camino Del Sol/Colonia Road intersection. The intersection would operate at LOS E under cumulative conditions. As discussed in the Project-Specific Mitigation section, the intersection is controlled by an all-way stop. While cumulative plus project traffic volumes would satisfy *Warrant 3 – Peak Hour* contained in *Chapter 4C. Traffic Control Signal Needs Studies* of the CAMUTCD, the current CAMUTCD guidelines indicate that *Warrant 3 – Peak Hour* shall be applied "only in unusual cases, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time."

It is recommended that the intersection be monitored through a yearly count program and signal warrant analysis as the school attendance increases, to determine if a traffic signal or is warranted under future conditions. The project's proportionate share to the cumulative traffic is 77%.

Buildout Mitigations

The cumulative analysis indicated that the project would generate a buildout impact based on City of Oxnard impact thresholds at the intersections of Camino Del Sol with Juanita Avenue and Colonia Road, which are all-way stop controlled. The project would not exceed the City's impact threshold of V/C 0.02 at the remaining intersections that would operate below LOS C.

Similarly to the project-specific and cumulative plus project impact discussion, the currently stop controlled intersections could be signalized when conditions warrant. The programmed extension of Camino Del Sol to Oxnard Boulevard will result in traffic pattern changes, and intersection improvements as part of Camino Del Sol redesign should be evaluated through an ICE process to determine the appropriate improvements.

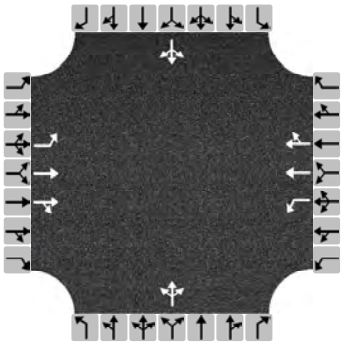
HCS7 All-Way Stop Control Report



General Information

Analyst	16. DJL
Agency/Co.	Stantec
Date Performed	2/18/2019
Analysis Year	BO
Analysis Time Period (hrs)	1.00
Time Analyzed	PM Peak hour
Project Description	OUHSD HS No. 8

Site Information

Intersection	Cam Del Sol/Gibraltar St
Jurisdiction	Oxnard
East/West Street	Camino Del Sol
North/South Street	Colonia Rd
Peak Hour Factor	1.00

Lanes

Intersection Summary		
HCM 6th Ctrl Delay		16.2
HCM 6th LOS		B

Notes

User approved volume balancing among the lanes for turning movement.

Unsignalized Delay for [EBR] is excluded from calculations of the approach delay and intersection delay.
