A detailed Stormwater BMP Operation and Maintenance Plan will be prepared as part of each final Project-Specific WQMP that sets forth a maintenance schedule for each of the Stormwater BMPs built on the site. An agreement assigning responsibility for maintenance and providing for inspections and certification may also be required. Details of these requirements and instructions for preparing a Stormwater BMP Operation and Maintenance Plan are in Chapter 5 of the WQMP Guidance Document and will be included in each final Project-Specific WQMP.

The table below describes the preliminary inspection and maintenance activities for each BMP. At the time of final design, an Operation and Maintenance (O&M) Plan will be prepared clearly stating the maintenance activities highlighted in the table, including the designated party to manage the BMPs, self-inspections and record-keeping requirements for BMPs, start-up dates, operating schedule, maintenance frequency, routine service schedule, specific maintenance activities, and any other necessary activities.

### Operation and Maintenance Plan

| BMP Requiring Maintenance | Visual Inspection Frequency | Responsible Party | Maintenance Frequency | Maintenance Tasks |
|---|---|---|---|---|
| Infiltration Basins | Ongoing, including just before wet season | Project owner | As needed | • Maintain vegetation.<br>• Remove debris and litter.<br>• Check for erosion and sediment laden areas.<br>• Revegetate side slopes where needed. |
| | Within 72 hours following storm event | Project owner | As needed | • Check for standing water. No water should be present 72 hours after an event. Correct problem as needed. |

| BMP Requiring Maintenance | Visual Inspection Frequency | Responsible Party | Maintenance Frequency | Maintenance Tasks |
|---|---|---|---|---|
| | Annually | Project owner | Annually | • Inspect hydraulic and structural facilities.<br>• Check for erosion, slumping and overgrowth.<br>• Check for sediment build up. Scrape bottom as needed and remove sediment. Replant basin vegetation. |
| Bioretention Facilities | Ongoing, including just before wet season | Project owner | As needed | • Maintain vegetation.<br>• Remove debris and litter.<br>• Replace damaged grass and/or plants.<br>• Replace surface mulch layer as needed to maintain a 2-3 inch soil cover. |
| | Within 72 hours following storm event | Project owner | As needed | • Check for standing water. No water should be present 72 hours after an event. Correct problem as needed. |
| | Annually | Project owner | Annually | • Inspect/clean inlets and outlets. |
| Extended Detention Basins | Ongoing, including just before wet season | Project owner | As needed | • Maintain vegetation.<br>• Remove debris and litter. |
| | Within 72 hours following storm event | Project owner | As needed | • Check for standing water. No water should be present 72 hours after an event. Correct problem as needed. |
| | Annually | Project owner | Annually | • Inspect hydraulic and structural facilities.<br>• Check for erosion, slumping and overgrowth.<br>• Inspect sand media at the filter drain. Scarify top 3 inches by raking the filter drain's sand surface.<br>• Check media filter underdrains (via the cleanout) for damage or clogging.<br>• Remove accumulated sediment and debris from the forebay.<br>• Check gravel filled low flow and collector trenches for sediment buildup and repair as needed. |
| Irrigation System | Weekly as part of landscape maintenance activities | Project owner | As needed | • Repair broken sprinkler heads<br>• Redirect heads where needed<br>• Adjust irrigation interval and schedule as needed |
| Landscaped Areas | Weekly as part of landscape maintenance activities | Project owner | Weekly | • Mow, weed, trim, and remove accumulated dead vegetation, pet waste, trash and debris. |
| Parking Lot Sweeping | Monthly | Project owner | Monthly | • Sweep parking lots to remove litter, dust, and debris. |

| BMP Requiring Maintenance | Visual Inspection Frequency | Responsible Party | Maintenance Frequency | Maintenance Tasks |
|---|---|---|---|---|
| Catch Basin Signage | Annually | Project owner | As needed | • Refresh or replace as needed. |

Will the proposed BMPs be maintained by a Home Owners' Association (HOA) or Property Owners Association (POA)?

☒ Y ☐ N

Only those BMPs proposed in common areas will be maintained by a HOA or POA. Otherwise, the BMPs will be maintained by the Leasee or Owner. The Operation and Maintenance Plan and Maintenance Mechanism will be included in Appendix 9 of each final Project-Specific WQMP. Pertinent forms of educational materials for those personnel that will be maintaining the proposed BMPs within this Project-Specific WQMP are included in Appendix 10.

**Operation and Maintenance Responsibility**

Until construction is completed, the project owner will be responsible for the operation and maintenance for all structural Source Control and Treatment Control BMPs. Contact information for the project owner is as follows:

Highland Fairview
14225 Corporate Way
Moreno Valley, California 92553
(951) 867-5300
Contact: Brian Hixson

**Funding**

A funding source or sources for the O&M of each BMP identified in each Project-Specific WQMP must be identified. By certifying each Project-Specific WQMP, the Project applicant is certifying that the funding responsibilities have been addressed and will be transferred to future owners. One example of how to adhere to the requirement to transfer O&M responsibilities is to record the Project-Specific WQMP against the title to the property.

The project owner certifies that a funding source will be made available to support the operation and maintenance of each Treatment Control BMP included in the project. The O&M funding will be determined at a future date in the entitlement process. The project owner will have ultimate responsibility for funding all operation and maintenance.

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

**How to use this worksheet (also see instructions in Section G of the WQMP Template):**

1. Review Column 1 and identify which of these potential sources of stormwater pollutants apply to your site. Check each box that applies.
2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your WQMP Exhibit.
3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in your WQMP. Use the format shown in Table G.1on page 23 of this WQMP Template. Describe your specific BMPs in an accompanying narrative, and explain any special conditions or situations that required omitting BMPs or substituting alternative BMPs for those shown here.

| **IF THESE SOURCES WILL BE ON THE PROJECT SITE ...** | **... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE** | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on WQMP Drawings** | **3**<br>**Permanent Controls—List in WQMP Table and Narrative** | **4**<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☑ **A.** On-site storm drain inlets | ☐ Locations of inlets. | ☐ Mark all inlets with the words "Only Rain Down the Storm Drain" or similar. Catch Basin Markers may be available from the Riverside County Flood Control and Water Conservation District, call 951.955.1200 to verify. | ☐ Maintain and periodically repaint or replace inlet markings.<br>☐ Provide stormwater pollution prevention information to new site owners, lessees, or operators.<br>☐ See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com<br>☐ Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains." |
| ☐ **B.** Interior floor drains and elevator shaft sump pumps | | ☐ State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer. | ☐ Inspect and maintain drains to prevent blockages and overflow. |
| ☐ **C.** Interior parking garages | | ☐ State that parking garage floor drains will be plumbed to the sanitary sewer. | ☐ Inspect and maintain drains to prevent blockages and overflow. |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on WQMP Drawings** | 3<br>**Permanent Controls—List in WQMP Table and Narrative** | 4<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☐ **D1.** Need for future indoor & structural pest control | | ☐ Note building design features that discourage entry of pests. | ☐ Provide Integrated Pest Management information to owners, lessees, and operators. |
| ☑ **D2.** Landscape/ Outdoor Pesticide Use | ☐ Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained.<br>☐ Show self-retaining landscape areas, if any.<br>☐ Show stormwater treatment and hydrograph modification management BMPs. (See instructions in Chapter 3, Step 5 and guidance in Chapter 5.) | State that final landscape plans will accomplish all of the following.<br>☐ Preserve existing native trees, shrubs, and ground cover to the maximum extent possible.<br>☐ Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution.<br>☐ Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions.<br>☐ Consider using pest-resistant plants, especially adjacent to hardscape.<br>To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions. | ☐ Maintain landscaping using minimum or no pesticides.<br>☐ See applicable operational BMPs in "What you should know for.....Landscape and Gardening" at http://rcflood.org/stormwater/Error! Hyperlink reference not valid.<br>☐ Provide IPM information to new owners, lessees and operators. |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on WQMP Drawings** | **3**<br>**Permanent Controls—List in WQMP Table and Narrative** | **4**<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☑ **E.** Pools, spas, ponds, decorative fountains, and other water features. | ☐ Show location of water feature and a sanitary sewer cleanout in an accessible area within 10 feet. (Exception: Public pools must be plumbed according to County Department of Environmental Health Guidelines.) | If the Co-Permittee requires pools to be plumbed to the sanitary sewer, place a note on the plans and state in the narrative that this connection will be made according to local requirements. | ☐ See applicable operational BMPs in "Guidelines for Maintaining Your Swimming Pool, Jacuzzi and Garden Fountain" at http://rcflood.org/stormwater/ |
| ☐ **F.** Food service | ☐ For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment.<br>☐ On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer. | ☐ Describe the location and features of the designated cleaning area.<br>☐ Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated. | ☐ See the brochure, "The Food Service Industry Best Management Practices for: Restaurants, Grocery Stores, Delicatessens and Bakeries" at http://rcflood.org/stormwater/<br>Provide this brochure to new site owners, lessees, and operators. |
| ☑ **G.** Refuse areas | ☐ Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas.<br>☐ If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area.<br>☐ Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer. | ☐ State how site refuse will be handled and provide supporting detail to what is shown on plans.<br>☐ State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar. | ☐ State how the following will be implemented:<br>Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on WQMP Drawings** | 3<br>**Permanent Controls—List in WQMP Table and Narrative** | 4<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☐ **H.** Industrial processes. | ☐ Show process area. | ☐ If industrial processes are to be located on site, state: "All process activities to be performed indoors. No processes to drain to exterior or to storm drain system." | ☐ See Fact Sheet SC-10, "Non-Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com<br>See the brochure "Industrial & Commercial Facilities Best Management Practices for: Industrial, Commercial Facilities" at http://rcflood.org/stormwater/ |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on WQMP Drawings** | **3**<br>**Permanent Controls—List in WQMP Table and Narrative** | **4**<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☑ **I.** Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.) | ☐ Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area.<br>☐ Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults.<br>☐ Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site. | Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains.<br>Where appropriate, reference documentation of compliance with the requirements of Hazardous Materials Programs for:<br>▪ Hazardous Waste Generation<br>▪ Hazardous Materials Release Response and Inventory<br>▪ California Accidental Release (CalARP)<br>▪ Aboveground Storage Tank<br>▪ Uniform Fire Code Article 80 Section 103(b) & (c) 1991<br>▪ Underground Storage Tank<br>www.cchealth.org/groups/hazmat/ | ☐ See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on WQMP Drawings** | **3**<br>**Permanent Controls—List in WQMP Table and Narrative** | **4**<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☐ **J.** Vehicle and Equipment Cleaning | ☐ Show on drawings as appropriate:<br>(1) Commercial/industrial facilities having vehicle/equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses.<br>(2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use).<br>(3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer.<br>(4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed. | ☐ If a car wash area is not provided, describe any measures taken to discourage on-site car washing and explain how these will be enforced. | Describe operational measures to implement the following (if applicable):<br>☐ Washwater from vehicle and equipment washing operations shall not be discharged to the storm drain system. Refer to "Outdoor Cleaning Activities and Professional Mobile Service Providers" for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/<br>☐ Car dealerships and similar may rinse cars with water only. |

# STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on WQMP Drawings** | 3<br>**Permanent Controls—List in WQMP Table and Narrative** | 4<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☐ **K.** Vehicle/Equipment Repair and Maintenance | ☐ Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of stormwater.<br>☐ Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas.<br>☐ Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained. | ☐ State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area.<br>☐ State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.<br>☐ State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements. | In the Stormwater Control Plan, note that all of the following restrictions apply to use the site:<br>☐ No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinsewater from parts cleaning into storm drains.<br>☐ No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately.<br>☐ No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.<br>Refer to "Automotive Maintenance & Car Care Best Management Practices for Auto Body Shops, Auto Repair Shops, Car Dealerships, Gas Stations and Fleet Service Operations". Brochure can be found at http://rcflood.org/stormwater/<br>Refer to Outdoor Cleaning Activities and Professional Mobile Service Providers for many of the Potential Sources of Runoff Pollutants categories below. Brochure can be found at http://rcflood.org/stormwater/ |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on WQMP Drawings** | 3<br>**Permanent Controls—List in WQMP Table and Narrative** | 4<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☑ L. Fuel Dispensing Areas | ☐ Fueling areas[6] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of stormwater to the maximum extent practicable.<br>☐ Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area. | | ☐ The property owner shall dry sweep the fueling area routinely.<br>☐ See the Fact Sheet SD-30 , "Fueling Areas" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

[6] The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on WQMP Drawings** | 3<br>**Permanent Controls—List in WQMP Table and Narrative** | 4<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☑ **M.** Loading Docks | ☐ Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas shall be drained to the sanitary sewer, or diverted and collected for ultimate discharge to the sanitary sewer.<br>☐ Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation.<br>☐ Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer. | | ☐ Move loaded and unloaded items indoors as soon as possible.<br>☐ See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on WQMP Drawings** | **3**<br>**Permanent Controls—List in WQMP Table and Narrative** | **4**<br>**Operational BMPs—Include in WQMP Table and Narrative** |
| ☑ **N.** Fire Sprinkler Test Water | | ☐ Provide a means to drain fire sprinkler test water to the sanitary sewer. | ☐ See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |
| **O.** Miscellaneous Drain or Wash Water or Other Sources<br>☐ Boiler drain lines<br>☑ Condensate drain lines<br>☑ Rooftop equipment<br>☐ Drainage sumps<br>☑ Roofing, gutters, and trim.<br>☐ Other sources | | ☐ Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system.<br>☐ Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system.<br>☐ Rooftop equipment with potential to produce pollutants shall be roofed and/or have secondary containment.<br>☐ Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water.<br>☐ Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.<br>Include controls for other sources as specified by local reviewer. | |

## STORMWATER POLLUTANT SOURCES/SOURCE CONTROL CHECKLIST

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR WQMP SHOULD INCLUDE THESE SOURCE CONTROL BMPs, AS APPLICABLE | | |
|---|---|---|---|

# StormWater Pollution

*What you should know for...*

## GENERAL CONSTRUCTION & SITE SUPERVISION

## Best Management Practices (BMPs) for:

- Developers
- General Contractors
- Home Builders
- Construction Inspectors
- Anyone in the construction business

## StormWater Pollution . . . What You Should Know

Riverside County has two drainage systems - sewers and storm drains. The storm drain system was designed to reduce flooding by carrying excess rainwater away from streets and developed areas. Since the storm drain system does not provide for water treatment, it also serves the *unintended* function of transporting pollutants directly to our local waterways.

*Unlike sanitary sewers, storm drains are not connected to a wastewater treatment plant – they flow directly to our local streams, rivers and lakes.*

Stormwater runoff is a part of the natural hydrologic process. However, land development and construction activities can significantly alter natural drainage processes and introduce pollutants into stormwater runoff. Polluted stormwater runoff from construction sites has been identified as a major source of water pollution in California. It jeopardizes the quality of our local waterways and can pose a serious threat to the health of our aquatic ecosystems.

## The Cities and County of Riverside StormWater/CleanWater Protection Program

Because preventing pollution is much easier and less costly than cleaning up "after the fact," the Cities and County of Riverside StormWater/CleanWater Protection Program informs residents and businesses on pollution prevention activities. This pamphlet describes various Best Management Practices (BMPs) that construction site operators can use to prevent stormwater pollution.

In accordance with applicable federal and state law, the Cities and County of Riverside have adopted ordinances for stormwater management and discharge control that **prohibit** the discharge of pollutants into the storm drain system or local surface water. This includes discharges from construction sites containing sediment, concrete, mortar, paint, solvents, lubricants, vehicle fluids, fuel, pesticides, and construction debris.

**PLEASE NOTE:** The Federal, State and local regulations strictly prohibit the discharge of sediment and pollutants into the streets, the storm drain system or waterways. As an owner, operator or supervisor of a construction site, you may be held financially responsible for any environmental damage caused by your subcontractors or employees.

## Stormwater Pollution from Construction Activities

The two most common sources of stormwater pollution problems associated with construction activities are ***erosion*** and ***sedimentation***. Failure to maintain adequate erosion and sediment controls at construction sites often results in sediment discharges into the storm drain system, creating multiple problems once it enters local waterways.

Construction vehicles and heavy equipment can also track significant amounts of mud and sediment onto adjacent streets. Additionally, wind may transport construction materials and wastes into streets storm drains, or directly into our local waterways.

## What Should You Do?
## Advance Planning to Prevent Pollution

- ❑ Remove existing vegetation only as needed.
- ❑ Schedule excavation, grading, and paving operations for dry weather periods, if possible.
- ❑ Designate a specific area of the construction site, well away from storm drain inlets or watercourses, for material storage and equipment maintenance.
- ❑ Develop and implement an effective combination of erosion and sediment controls for the construction site.
- ❑ Practice source reduction by ordering only the amount of materials that are needed to finish the project.
- ❑ Educate your employees and subcontractors about stormwater management requirements and their pollution prevention responsibilities.
- ❑ Control the amount of surface runoff at the construction site by impeding internally generated flows and using berms or drainage ditches to direct incoming offsite flows to go around the site. ***Note:*** *Consult local drainage policies for more information.*

# Best Management Practices

The following Best Management Practices (BMPs) can significantly reduce pollutant discharges from your construction site. Compliance with stormwater regulations can be as simple as minimizing stormwater contact with potential pollutants by providing covers and secondary containment for construction materials, designating areas away from storm drain systems for storing equipment and materials and implementing good housekeeping practices at the construction site.

- ❑ Protect all storm drain inlets and streams located near the construction site to prevent sediment-laden water from entering the storm drain system.
- ❑ Limit access to and from the site. Stabilize construction entrances/exits to minimize the track out of dirt and mud onto adjacent streets. Conduct frequent street sweeping.
- ❑ Protect stockpiles and construction materials from winds and rain by storing them under a roof, secured impermeable tarp or plastic sheeting.
- ❑ Avoid storing or stockpiling materials near storm drain inlets, gullies or streams.
- ❑ Phase grading operations to limit disturbed areas and duration of exposure.
- ❑ Perform major maintenance and repairs of vehicles and equipment offsite.
- ❑ Wash out concrete mixers only in designated washout areas at the construction site.
- ❑ Set-up and operate small concrete mixers on tarps or heavy plastic drop cloths.
- ❑ Keep construction sites clean by removing trash, debris, wastes, etc. on a regular basis.
- ❑ Clean-up spills immediately using dry clean-up methods (e.g., absorbent materials such as cat litter, sand or rags for liquid spills; sweeping for dry spills such as cement, mortar or fertilizer) and by removing the contaminated soil from spills on dirt areas. .
- ❑ Prevent erosion by implementing any or a combination of soil stabilization practices such as mulching, surface roughening, permanent or temporary seeding.
- ❑ Maintain all vehicles and equipment in good working condition. Inspect frequently for leaks, and repair promptly.
- ❑ Practice proper waste disposal. Many construction materials and wastes, including solvents, water-based paint, vehicle fluids, broken asphalt and concrete, wood, and cleared vegetation can be recycled. Materials that cannot be recycled must be taken to an appropriate landfill or disposed of as hazardous waste.
- ❑ Cover open dumpsters with secured tarps or plastic sheeting. Never clean out a dumpster by washing it down on the construction site.
- ❑ Arrange for an adequate debris disposal schedule to insure that dumpsters do not overflow.

# General Construction Activities Stormwater Permit

## *(Construction Activities General Permit)*

The State Water Resources Control Board (SWRCB) adopted a new Construction Activities General Permit (WQ Order No. 99-08DWQ) on August 19, 1999, superseding the now expired SWRCB statewide General Permit (WQ Order No. 92-08DWQ). This permit is administered and enforced by the SWRCB and the local Regional Water Quality Control Boards (RWQCB). The updated Construction Activities General Permit establishes a number of new stormwater management requirements for construction site operator.

***NOTE:*** *Some construction activies stormwater permits are issued on a regional basis. Consult your local RWQCB to find out if your project requires coverage under any of these permits.*

## Frequently Asked Questions:

### *Does my construction site require coverage under the Construction Activities General Permit?*

Yes, if construction activity results in the disturbance of five or more acres of total land area or is part of a common plan of development that results in the disturbance of five or more acres.

### *How do I obtain coverage under the Construction Activities General Permit?*

Obtain the permit package and submit the completed Notice of Intent (NOI) form to the SWRCB prior to grading or disturbing soil at the construction site. For ongoing construction activity involving a change of ownership, the new owner must submit a new NOI within 30 days of the date of change of ownership. The completed NOI along with the required fee should be mailed to the SWRCB.

### *What must I do to comply with the requirements of the Construction Activities General Permit?*

- ● Implement BMPs for non-stormwater discharges year-round.
- ● Prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) prior to commencing construction activities.
- ● Keep a copy of the SWPPP at the construction site for the entire duration of the project.
- ● Calculate the anticipated stormwater run-off.
- ● Implement an effective combination of erosion and sediment control on all soil disturbed areas.
- ● Conduct site inspections prior to anticipated storm events, every 24-hours during extended storm events, and after actual storm event.
- ● Perform repair and maintenance of BMPs as soon as possible after storm events depending upon worker safety.
- ● Update the SWPPP as needed, to manage pollutants or reflect changes in site conditions.
- ● Include description of post construction BMPs at the construction site, including parties responsible for long-term maintenance.

***NOTE:*** *Please refer to the Construction Activities General Permit for detailed information. You may contact the SWRCB, your local RWQCB, or visit the SWRCB website at www.swrcb.ca.gov/stormwtr/ to obtain a State Construction Activities Stormwater General Permit packet.*

### *How long is this Construction Activities General Permit in effect?*

The Permit coverage stays in effect untilyou submit a Notice of Termination (NOT) to the SWRCB. For the purpose of submitting a NOT, all soil disturbing activities have to be completed and one of the three following criteria has to be met:

1. Change of ownership;
2. A uniform vegetative cover with 70 percent coverage has been established; or,
3. Equivalent stabilization measures such as the use of reinforced channel liners, soil cement, fiber matrices, geotextiles, etc., have been employed.

# Stormwater Pollution

*What you should know for...*

## Outdoor Cleaning Activities and Professional Mobile Service Providers

**Storm drain pollution prevention information for:**

- Car Washing / Mobile Detailers
- Window and Carpet Cleaners
- Power Washers
- Waterproofers / Street Sweepers
- Equipment cleaners or degreasers and all mobile service providers

## Do you know where street flows actually go?

**Storm drains are NOT connected to sanitary sewer systems and treatment plants!**

The primary purpose of storm drains is to carry rain water away from developed areas to prevent flooding. Pollutants discharged to storm drains are transported directly into rivers, lakes and streams. Soaps, degreasers, automotive fluids, litter and a host of materials are washed off buildings, sidewalks, plazas and parking areas. Vehicles and equipment must be properly managed to prevent the pollution of local waterways.

Unintentional spills by mobile service operators can flow into storm drains and pollute our waterways. **Avoid mishaps.** *Always* have a **Spill Response Kit** on hand to clean up unintentional spills. Only emergency **Mechanical** repairs should be done in City streets, using drip pans for spills. **Plumbing** should be done on private property. Always store chemicals in a leak-proof container and keep covered when not in use. **Window/Power Washing** waste water shouldn't be released into the streets, but should be disposed of in a sanitary sewer, landscaped area or in the soil. Soiled **Carpet Cleaning** wash water should be filtered before being discharged into the sanitary sewer. Dispose of all filter debris properly. **Car Washing/Detailing** operators should wash cars on private property and use a regulated hose nozzle for water flow control and runoff prevention. Capture and dispose of waste water and chemicals properly. Remember, storm drains are for receiving rain water runoff only.

**REPORT ILLEGAL STORM DRAIN DISPOSAL 1-800-506-2555**

# Help Protect Our Waterways!

## Use these guidelines for Outdoor Cleaning Activities and Wash Water Disposal

**Did you know that disposing of pollutants into the street, gutter, storm drain or body of water is *PROHIBITED* by law and can result in stiff penalties?**

## Best Management Practices

Waste wash water from Mechanics, Plumbers, Window/Power Washers, Carpet Cleaners, Car Washing and Mobile Detailing activities may contain significant quantities of motor oil, grease, chemicals, dirt, detergents, brake pad dust, litter and other materials.

Best Management Practices, or BMPs as they are known, are guides to prevent pollutants from entering the storm drains. ***Each of us*** can do our part to keep storm water clean by using the suggested BMPs below:

## Simple solutions for both light and heavy duty jobs:

**Do...**consider dry cleaning methods first such as a mop, broom, rag or wire brush. Always keep a spill response kit on site.

**Do...**prepare the work area before power cleaning by using sand bags, rubber mats, vacuum booms, containment pads or temporary berms to keep wash water away from the gutters and storm drains.

**Do...**use vacuums or other machines to remove and collect loose debris or litter before applying water.

**Do...**obtain the property owner's permission to dispose of ***small amounts*** of power washing waste water on to landscaped, gravel or unpaved surfaces.

**Do...**check your local sanitary sewer agency's policies on wash water disposal regulations before disposing wash water to the sewer. (See list on reverse side)

**Do...**be aware that if discharging to landscape areas, soapy wash water may damage landscaping. Residual wash water may remain on paved surfaces to evaporate. Sweep up solid residuals and dispose of properly. Vacuum booms are another option for capturing and collecting wash water.

**Do...**check to see if local ordinances prevent certain activities.

**Do not let...**wash or waste water from sidewalk, plaza or building cleaning go into a street or storm drain.

**Report illegal storm drain disposal,**
**Call Toll Free**
**1-800-506-2555**

## Using Cleaning Agents

Try using biodegradable/phosphate-free products. They are easier on the environment, but don't confuse them for being toxic free. Soapy water entering the storm drain system can impact the delicate aquatic environment.

When cleaning surfaces with a ***high-pressure washer*** or ***steam cleaner***, additional precautions should be taken to prevent the discharge of pollutants into the storm drain system. These two methods of surface cleaning can loosen additional material that can contaminate local waterways.

## Think Water Conservation

Minimize water use by using high pressure, low volume nozzles. Be sure to check all hoses for leaks. Water is a precious resource, don't let it flow freely and be sure to shut it off in between uses.

## Screening Wash Water

Conduct thorough dry cleanup before washing exterior surfaces, such as buildings and decks ***with loose paint***, sidewalks or plaza areas. Keep debris from entering the storm drain after cleaning by first passing the wash water through a "20 mesh" or finer screen to catch the solid materials, then dispose of the mesh in a refuse container. Do not let the remaining wash water enter a street, gutter or storm drain.

## Drain Inlet Protection & Collection of Wash Water

- Prior to any washing, block all storm drains with an impervious barrier such as sandbags or berms, or seal the storm drain with plugs or other appropriate materials.
- Create a containment area with berms and traps or take advantage of a low spot to keep wash water contained.
- Wash vehicles and equipment on grassy or gravel areas so that the wash water can seep into the ground.
- Pump or vacuum up all wash water in the contained area.

## Concrete/Coring/Saw Cutting and Drilling Projects

Protect any down-gradient inlet by using dry activity techniques whenever possible. If water is used, minimize the amount of water used during the coring/drilling or saw cutting process. Place a barrier of sandbags and/or absorbent berms to protect the storm drain inlet or watercourse. Use a shovel or wet vacuum to remove the residue from the pavement. Do not wash residue or particulate matter into a storm drain inlet or watercourse.

# Stormwater and the Construction Industry

## Protect Natural Features

Bad

Good

- Minimize clearing.
- Minimize the amount of exposed soil.
- Identify and protect areas where existing vegetation, such as trees, will not be disturbed by construction activity.
- Protect streams, stream buffers, wild woodlands, wetlands, or other sensitive areas from any disturbance or construction activity by fencing or otherwise clearly marking these areas.

## Construction Phasing

- Sequence construction activities so that the soil is not exposed for long periods of time.
- Schedule or limit grading to small areas.
- Install key sediment control practices before site grading begins.
- Schedule site stabilization activities, such as landscaping, to be completed immediately after the land has been graded to its final contour.

## Vegetative Buffers

Bad

Good

- Protect and install vegetative buffers along waterbodies to slow and filter stormwater runoff.
- Maintain buffers by mowing or replanting periodically to ensure their effectiveness.

## Silt Fencing

Bad

Good

- Inspect and maintain silt fences after each rainstorm.
- Make sure the bottom of the silt fence is buried in the ground.
- Securely attach the material to the stakes.
- Don't place silt fences in the middle of a waterway or use them as a check dam.
- Make sure stormwater is not flowing around the silt fence.

# Maintain your BMPs!

**IN RIVERSIDE COUNTY....Call 1-800-506-2555**

**TO REPORT ILLEGAL STORMDRAIN DISPOSAL**

E-mail: Flood.fcnpdes@co.riverside.ca.us

Visit our website: www.floodcontrol.co.riverside.ca.us

Brought to you by the Storm Water/Clean Water Pollution Protection Program.....

**REMEMBER, ONLY RAIN IN THE STORMDRAIN!**

## Site Stabilization

Bad

Good

- Vegetate, mulch, or otherwise stabilize all exposed areas as soon as land alterations have been completed.

## Construction Entrances

Bad

Good

- Remove mud and dirt from the tires of construction vehicles before they enter a paved roadway.
- Properly size entrance BMPs for all anticipated vehicles.
- Make sure that the construction entrance does not become buried in soil.

## Slopes

Bad

Good

- Rough grade or terrace slopes.
- Break up long slopes with sediment barriers, or under drain, or divert stormwater away from slopes.

## Dirt Stockpiles

Bad

Good

- Cover or seed all dirt stockpiles.

## Storm Drain Inlet Protection

Bad

Good

- Use rock or other appropriate material to cover the storm drain inlet to filter out trash and debris.
- Make sure the rock size is appropriate (usually 1 to 2 inches in diameter).
- If you use inlet filters, maintain them regularly.

*www.epa.gov/npdes/menuofbmps*

# Stormwater and the Construction Industry

## *Planning and Implementing Erosion and Sediment Control Practices*

The construction industry is a critical participant in the nation's efforts to protect streams, rivers, lakes, wetlands, and oceans. Through the use of best management practices (BMPs), construction site operators are the key defense against erosion and sedimentation.

As stormwater flows over a construction site, it picks up pollutants like sediment, debris, and chemicals. High volumes of stormwater can also cause stream bank erosion, and destroy downstream aquatic habitat. Preventing soil erosion and sedimentation is an important responsibility at all construction sites.

In addition to the environmental impact, uncontrolled erosion can have a significant financial impact on a construction project. It costs money and time to repair gullies, replace vegetation, clean sediment-clogged storm drains, replace poorly installed BMPs, and mitigate damage to other people's property or to natural resources.

**Best Management Practice (BMP)**
A BMP is a method used to prevent or control stormwater runoff and the discharge of pollutants, including sediment, into local waterbodies. Silt fences, inlet protection, and site-stabilization techniques are typical BMPs on a construction site.

**Operator**
An operator is someone who has control over and the ability to modify construction plans and specifications (e.g. owner, general contractor)

or

Someone who has control over the day-to-day operations at a site (e.g., owner, general contractor) that are necessary to ensure compliance with the permit requirements. It is the responsibility of a construction site owner or operator to contain stormwater runoff and prevent erosion during **all** stages of a project.

There may be more than one person at a site who meets these definitions and must apply for permit coverage. (States may have different definitions of the term "operator.")

### So what's being done about polluted runoff?

The Clean Water Act includes the National Pollutant Discharge Elimination System (NPDES) permitting program. As of January 2003, 44 states and territories are authorized to issue NPDES stormwater permits. If your state isn't authorized to operate the NPDES stormwater permit program, EPA issues the permits. Permits vary from state to state, so contact your state or EPA for specific information. Your permitting authority has specific information on your state's NPDES stormwater permit program. In general, construction permits require construction operators to do all of the following:

- Develop and implement a stormwater pollution prevention plan
- Submit a permit application or notice of intent (NOI)
- Comply with the permit, including maintaining BMPs and inspecting the site

Under the NPDES program, construction activities that disturb 1 or more acres are required to obtain stormwater permit coverage. States have different names for the plans that construction operators must develop, such as

- Stormwater pollution prevention plan
- Erosion and sediment control plan
- Erosion control and stormwater management plan
- Stormwater management plan
- Water pollution control plan
- Pollution prevention plan

This document uses the term "*Plan*."

### I think I need a permit... Where do I start?

All land-disturbing activities, including clearing, grading, and excavation, that disturb **1 or more acres** are required to be covered under a state or EPA-issued NPDES construction stormwater permit **prior to land disturbance**. Permit requirements vary by state. Begin by researching the specific requirements in your state. You might already be subject to local erosion and sediment control requirements, but that doesn't release you from the requirements of the NPDES program at the state or EPA level. Although you must comply with both sets of requirements, in most cases they have been designed to be complementary. Contact your permitting authority to find out exactly what you need to do. A good place to start your search is the Construction Industry Compliance Assistance web site at http://www.envcap.org/cica.

The NPDES permit requirements include small construction activities that are part of a larger common plan of development or sale, such as a single lot within a larger subdivision. For developments with multiple operators, all operators must have permit coverage for their individual parts of the larger development, no matter how large or small each operation happens to be. When there are multiple operators at one site, they're encouraged to develop and share one comprehensive Plan and obtain permit coverage as co-permitees.

The **owner or operator** of the construction site is responsible for complying with the requirements of the permit. Responsibilities include developing a Plan, obtaining permit coverage, implementing BMPs, and stabilizing the site at the end of the construction activity.

**Construction sites that discharge unpermitted stormwater are in violation of the Clean Water Act and may be subject to fines of up to $27,500 a day per violation.**

#### Determine your eligibility
All construction activity that disturbs 1 or more acres of land, as well as activity that disturbs less than 1 acre but is part of a larger common plan of development, must obtain permit coverage.

#### Read and understand your stormwater permit requirements
Get a copy of the permit for construction activities and a permit application (or notice of intent form) from your state or EPA permitting authority.

#### Develop a Plan
Most states do not require you to submit your Plan. However, you do need to keep the Plan on site. If that's impractical, you may post a notice that tells where the Plan is kept so it can be accessed by the permitting authority and other interested parties.

You'll need to post a copy of your completed application on site. Put it in a place where the public can see it so they'll know your site is covered by an NPDES permit!

#### Apply for permit coverage
Once you understand your permit requirements and have developed a Plan, you can submit a stormwater permit application (or notice of intent) to your permitting authority. This must be done before beginning any land disturbance on the site. Some states require a few days of lead time, so check with your permitting authority. Once you've submitted the application, you must satisfy the conditions of the permit.

#### Implement the Plan
Be prepared to implement the BMPs in your Plan before construction begins. Ensure that BMPs are properly maintained, and upgrade and repair them as necessary.

## Developing and Implementing a Plan

You must have a Plan that includes erosion and sediment control and pollution prevention BMPs. These Plans require

- Advance planning and training to ensure proper implementation of the BMPs
- Erosion and sediment control BMPs in place until the area is permanently stabilized
- Pollution prevention BMPs to keep the construction site "clean"
- Regular inspection of the construction site to ensure proper installation and maintenance of BMPs

Fortunately, the practices and measures that must be included in your Plan are already part of the standard operating procedures at many construction sites.

Six steps are associated with developing and implementing a stormwater Plan. There's a wealth of information available on developing pollution prevention plans. Please contact your permitting authority for help in finding additional guidance materials, or visit www.epa.gov/npdes/stormwater. A sample construction plan is available at www.epa.gov/npdes/pubs/sample_swppp.pdf.

### *1. Site Evaluation and Design Development*

- **Collect site information**
- **Develop site plan design**
- **Prepare pollution prevention site map**

The first step in preparing a Plan is to define the characteristics of the site and the type of construction that will occur. This involves collecting site information, identifying natural features that should be protected, developing a site plan design, describing the nature of the construction activity, and preparing a pollution prevention site map.

### *2. Assessment*

- **Measure the site area**
- **Determine the drainage areas**
- **Calculate the runoff coefficient**

The next step is assessing the impact the project will have on stormwater runoff. Determine the drainage areas and estimate the runoff amounts and velocities. For more information on calculating the runoff coefficient, go to www.epa.gov/npdes/pubs/chap02_conguide.pdf, page 11.

### *3. Control Selection and Plan Design*

- **Review and incorporate state or local requirements**
- **Select erosion and sediment controls**
- **Select other controls**
- **Select stormwater management controls**
- **Indicate the location of controls on the site map**
- **Prepare an inspection and maintenance plan**
- **Coordinate controls with construction activity**
- **Prepare sequence of major activities**

In the third step you'll actually document your procedures to prevent and control polluted stormwater runoff. You must delineate areas that will not be disturbed, including critical natural areas like streamside areas, floodplains, and trees. You must also identify the measures (or BMPs) you'll use to protect these areas.

**Soil erosion control tips...**

- Design the site to infiltrate stormwater into the ground and to keep it out of storm drains. Eliminate or minimize the use of stormwater collection and conveyance systems while maximizing the use of stormwater infiltration and homestention techniques.
- Minimize the amount of exposed soil on site.
  - To the extent possible, plan the project in stages to minimize the amount of area that is bare and subject to erosion. The less soil exposed, the easier and cheaper it will be to control erosion.
  - Vegetate disturbed areas with permanent or temporary seeding immediately upon reaching final grade.
  - Vegetate or cover stockpiles that will not be used immediately.
- Reduce the velocity of stormwater both onto and away from the project area.
  - Interceptors, diversions, vegetated buffers, and check dams are a few of the BMPs that can be used to slow down stormwater as it travels across and away from the project site.
  - Diversion measures can also be used to direct flow away from exposed areas toward stable portions of the site.
  - Silt fences and other types of perimeter filters should never be used to reduce the velocity of runoff.
- Protect defined channels immediately with measures adequate to handle the storm flows expected.
  - Sod, geotextile, natural fiber, riprap, or other stabilization measures should be used to allow the channels to carry water without causing erosion. Use softer measures like geotextile or vegetation where possible to prevent downstream impacts.
- Keep sediment on site.
  - Place aggregate or stone at construction site vehicle exits to accommodate at least two tire revolutions of large construction vehicles. Much of the dirt on the tires will fall off before the vehicle gets to the street.
  - Regular street sweeping at the construction entrance will prevent dirt from entering storm drains. Do not hose paved areas.
  - Sediment traps and basins are temporary structures and should be used in conjunction with other measures to reduce the amount of erosion.
- Maintaining all BMPs is critical to ensure their effectiveness during the life of the project.
  - Regularly remove collected sediment from silt fences, berms, traps, and other BMPs.
  - Ensure that geotextiles and mulch remain in place until vegetation is well established.
  - Maintain fences that protect sensitive areas, silt fences, diversion structures, and other BMPs.

Phasing your project to minimize the amount of exposed soil at any given time is a highly effective way to prevent erosion. Erosion control measures designed to prevent soil from being mobilized include diversions to route stormwater away from exposed soils and stabilization with vegetation, mulch, and geotextiles. Sedimentation control measures designed to remove sediment from stormwater or prevent it from leaving the site include silt fences, sediment traps, and diversions.

You'll need to select erosion and sediment controls—including stabilization measures for protecting disturbed areas and structural controls for diverting run-off and removing sediment—that are appropriate for your particular site. The appropriateness of the control measures will depend on several factors, but will be influenced most directly by the site characteristics. Some stabilization measures you might consider are temporary seeding, permanent seeding, and mulching. Structural control measures include earth dikes, silt fences, and sediment traps. No single BMP will meet all of the erosion and sedimentation control needs of a construction site. A combination of BMPs is necessary. For more information on the types of BMPs appropriate for your construction site, see the BMP fact sheet series available at www.epa.gov/npdes/menuofbmps.

**Other BMPs and Activities to Control Polluted Runoff**
You'll need to select other controls to address potential pollutant sources on your site. Construction materials, debris, trash, fuel, paint, and stockpiles become pollution sources when it rains. Basic pollution prevention practices can significantly reduce the amount of pollution leaving construction sites. The following are some simple practices that should be included in the Plan and implemented on site:

- Keep potential sources of pollution out of the rain as practicable (e.g., inside a building, covered with plastic or tarps, or sealed tightly in a leak-proof container).
- Clearly identify a protected, lined area for concrete truck washouts. This area should be located away from streams, storm drain inlets, or ditches and should be cleaned out periodically.
- Park, refuel, and maintain vehicles and equipment in one area of the site to minimize the area exposed to possible spills and fuel storage. This area should be well away from streams, storm drain inlets, or ditches. Keep spill kits close by and clean up any spills or leaks immediately, including spills on pavement or earthen surfaces.
- Practice good housekeeping. Keep the construction site free of litter, construction debris, and leaking containers. Keep all waste in one area to minimize cleaning.
- Never hose down paved surfaces to clean dust, debris, or trash. This water could wash directly into storm drains or streams. Sweep up materials and dispose of them in the trash. Never bury trash or debris!
- Dispose of hazardous materials properly.

### *4. Certification and Notification*

- **Certify the Plan**
- **Submit permit application or notice of intent**

Once the Plan has been developed, an authorized representative must sign it. Now is the time to submit the permit application or notice of intent. Your permit might require that the Plan be kept on site, so be sure to keep it available for the staff implementing the Plan.

***Erosion and sedimentation control practices are only as good as their installation and maintenance.***

### *5. Implementing and Maintaining a Plan*

- **Implement controls**
- **Inspect and maintain controls**
- **Update/change the Plan**
- **Report releases of hazardous materials**

A Plan describes the practices and activities you'll use to prevent stormwater contamination and meet the NPDES permit requirements. Make sure that the Plan is implemented and that the Plan is updated as necessary to reflect changes on the site.

Erosion and sedimentation control practices are only as good as their installation and maintenance. Train the contractors that will install the BMPs and inspect immediately to ensure that the BMPs have been installed correctly.

Regularly inspect the BMPs (especially before and after rain events) and perform any necessary repairs or maintenance immediately. Many BMPs are designed to handle a limited amount of sediment. If not maintained, they'll become ineffective and a source of sediment pollution.

It's also important to keep records of BMP installation, implementation, and maintenance. Keep track of major grading activities that occur on the site, when construction activities cease (temporarily or permanently), and when a site is temporarily or permanently stabilized.

If construction plans change at any time, or if more appropriate BMPs are chosen for the site, update the Plan accordingly.

### *6. Completing the Project: Final Stabilization and Termination of the Permit*

- **Final stabilization**
- **Notice of Termination**
- **Record retention**

Many states and EPA require a Notice of Termination (NOT) or other notification signifying that the construction activity is completed. An NOT is required when

- Final stabilization has been achieved on all portions of the site for which the permittee is responsible.
- Another operator has assumed control over all areas of the site that have not been finally stabilized. That operator would need to submit a new permit application to the permitting authority.
- For residential construction only, temporary stabilization of a lot has been completed prior to transference of ownership to the homeowner, with the homeowner being made aware of the need to perform final stabilization.

Permittees must keep a copy of their permit application and their Plan for at least 3 years following final stabilization. This period may be longer depending on state and local requirements.

**Preconstruction Checklist**

- A site description, including
  - Nature of the activity
  - Intended sequence of major construction activities
  - Total area of the site
  - Existing soil type and rainfall runoff data
  - A site map with:
    - Drainage patterns
    - Approximate slopes after major grading
    - Area of soil disturbance
    - Outline of areas which will not be disturbed
    - Location of major structural and nonstructural soil erosion controls
    - Areas where stabilization practices are expected to occur
    - Surface waters
    - Stormwater discharge locations
  - Name of the receiving water(s)
- A description of controls:
  - Erosion and sediment controls, including
    - Stabilization practices for all areas disturbed by construction
    - Structural practices for all drainage/discharge locations
  - Stormwater management controls, including
    - Measures used to control pollutants occurring in stormwater discharges after construction activities are complete
    - Velocity dissipation devices to provide nonerosive flow conditions from the discharge point along the length of any outfall channel
  - Other controls, including
    - Waste disposal practices that prevent discharge of solid materials
    - Measures to minimize offsite tracking of sediments by construction vehicles
    - Measures to ensure compliance with state or local waste disposal, sanitary sewer, or septic system regulations
  - Description of the timing during the construction when measures will be implemented
- State or local requirements incorporated into the Plan
- Inspection and maintenance procedures for control measures identified in the Plan
- Contractor certification and Plan certification

**Implementation Checklist**

- Maintain records of construction activities, including
  - Dates when major grading activities occur
  - Dates when construction activities temporarily cease on the site or a portion of the site
  - Dates when construction activities permanently cease on the site or a portion of the site
  - Dates when stabilization measures are completed on the site
- Prepare inspection reports summarizing
  - Name of person conducting BMP inspections
  - Qualifications of person conducting BMP inspections
  - BMPs/areas inspected
  - Observed conditions
  - Necessary changes to the Plan
- Report releases of reportable quantities of oil or hazardous materials
  - Notify the National Response Center at 800-424-8802 immediately
  - Report releases to your permitting authority immediately, or as specified in your permit. You must also provide a written report within 14 days.
  - Modify the Plan to include
    - The date of release
    - Circumstances leading to the release
    - Steps taken to prevent reoccurrence of the release
- Modify Plan as necessary
  - Incorporate requests of the permitting authority to bring the Plan into compliance
  - Address changes in design, construction operation, or maintenance that affect the potential for discharge of pollutants

***An ounce of prevention is worth a pound of cure! It's far more efficient and cost-effective to prevent pollution than it is to try to correct problems later. Installing and maintaining simple BMPs and pollution prevention techniques on site can greatly reduce the potential for stormwater pollution and can also save you money!***

***Visit www.epa.gov/npdes/stormwater for more information.***

StormWater CleanWater PROTECTION PROGRAM

## What is stormwater runoff?

Stormwater runoff occurs when precipitation from rain or snowmelt flows over the ground. Impervious surfaces like driveways, sidewalks, and streets prevent stormwater from naturally soaking into the ground.

## Why is stormwater runoff a problem?

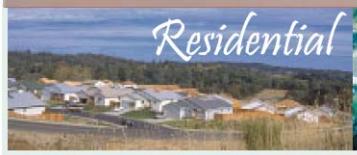
Stormwater can pick up debris, chemicals, dirt, and other pollutants and flow into a storm sewer system or directly to a lake, stream, river, wetland, or coastal water. Anything that enters a storm sewer system is discharged untreated into the waterbodies we use for swimming, fishing, and providing drinking water.

## The effects of pollution

Polluted stormwater runoff can have many adverse effects on plants, fish, animals, and people.

- Sediment can cloud the water and make it difficult or impossible for aquatic plants to grow. Sediment also can destroy aquatic habitats.

- Excess nutrients can cause algae blooms. When algae die, they sink to the bottom and decompose in a process that removes oxygen from the water. Fish and other aquatic organisms can't exist in water with low dissolved oxygen levels.



- Bacteria and other pathogens can wash into swimming areas and create health hazards, often making beach closures necessary.
- Debris—plastic bags, six-pack rings, bottles, and cigarette butts—washed into waterbodies can choke, suffocate, or disable aquatic life like ducks, fish, turtles, and birds.
- Household hazardous wastes like insecticides, pesticides, paint, solvents, used motor oil, and other auto fluids can poison aquatic life. Land animals and people can become sick or die from eating diseased fish and shellfish or ingesting polluted water.
- Polluted stormwater often affects drinking water sources. This, in turn, can affect human health and increase drinking water treatment costs.

# Stormwater Pollution Solutions

*Education is essential to changing people's behavior. Signs and markers near storm drains warn residents that pollutants entering the drains will be carried untreated into a local waterbody.*

## Residential

*Recycle or properly dispose of household products that contain chemicals, such as insecticides, pesticides, paint, solvents, and used motor oil and other auto fluids. Don't pour them onto the ground or into storm drains.*

### Auto care

Washing your car and degreasing auto parts at home can send detergents and other contaminants through the storm sewer system. Dumping automotive fluids into storm drains has the same result as dumping the materials directly into a waterbody.

- Use a commercial car wash that treats or recycles its wastewater, or wash your car on your yard so the water infiltrates into the ground.
- Repair leaks and dispose of used auto fluids and batteries at designated drop-off or recycling locations.

### Lawn care

Excess fertilizers and pesticides applied to lawns and gardens wash off and pollute streams. In addition, yard clippings and leaves can wash into storm drains and contribute nutrients and organic matter to streams.

- Don't overwater your lawn. Consider using a soaker hose instead of a sprinkler.
- Use pesticides and fertilizers sparingly. When use is necessary, use these chemicals in the recommended amounts. Use organic mulch or safer pest control methods whenever possible.
- Compost or mulch yard waste. Don't leave it in the street or sweep it into storm drains or streams.
- Cover piles of dirt or mulch being used in landscaping projects.

### Septic systems

Leaking and poorly maintained septic systems release nutrients and pathogens (bacteria and viruses) that can be picked up by stormwater and discharged into nearby waterbodies. Pathogens can cause public health problems and environmental concerns.

- Inspect your system every 3 years and pump your tank as necessary (every 3 to 5 years).
- Don't dispose of household hazardous waste in sinks or toilets.

### Pet waste

Pet waste can be a major source of bacteria and excess nutrients in local waters.

- When walking your pet, remember to pick up the waste and dispose of it properly. Flushing pet waste is the best disposal method. Leaving pet waste on the ground increases public health risks by allowing harmful bacteria and nutrients to wash into the storm drain and eventually into local waterbodies.

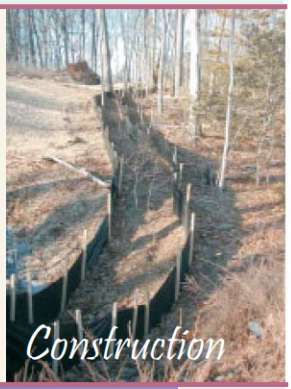
### Residential landscaping

**Permeable Pavement**—Traditional concrete and asphalt don't allow water to soak into the ground. Instead these surfaces rely on storm drains to divert unwanted water. Permeable pavement systems allow rain and snowmelt to soak through, decreasing stormwater runoff.

**Rain Barrels**—You can collect rainwater from rooftops in mosquito-proof containers. The water can be used later on lawn or garden areas.

**Rain Gardens and Grassy Swales**—Specially designed areas planted with native plants can provide natural places for rainwater to collect and soak into the ground. Rain from rooftop areas or paved areas can be diverted into these areas rather than into storm drains.

**Vegetated Filter Strips**—Filter strips are areas of native grass or plants created along roadways or streams. They trap the pollutants stormwater picks up as it flows across driveways and streets.



## Commercial

Dirt, oil, and debris that collect in parking lots and paved areas can be washed into the storm sewer system and eventually enter local waterbodies.

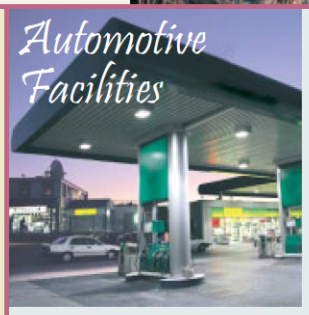
- Sweep up litter and debris from sidewalks, driveways and parking lots, especially around storm drains.
- Cover grease storage and dumpsters and keep them clean to avoid leaks.
- Report any chemical spill to the local hazardous waste cleanup team. They'll know the best way to keep spills from harming the environment.

## Construction

Erosion controls that aren't maintained can cause excessive amounts of sediment and debris to be carried into the stormwater system. Construction vehicles can leak fuel, oil, and other harmful fluids that can be picked up by stormwater and deposited into local waterbodies.

- Divert stormwater away from disturbed or exposed areas of the construction site.
- Install silt fences, vehicle mud removal areas, vegetative cover, and other sediment and erosion controls and properly maintain them, especially after rainstorms.
- Prevent soil erosion by minimizing disturbed areas during construction projects, and seed and mulch bare areas as soon as possible.

## Agriculture



Lack of vegetation on streambanks can lead to erosion. Overgrazed pastures can also contribute excessive amounts of sediment to local waterbodies. Excess fertilizers and pesticides can poison aquatic animals and lead to destructive algae blooms. Livestock in streams can contaminate waterways with bacteria, making them unsafe for human contact.

- Keep livestock away from streambanks and provide them a water source away from waterbodies.
- Store and apply manure away from waterbodies and in accordance with a nutrient management plan.
- Vegetate riparian areas along waterways.
- Rotate animal grazing to prevent soil erosion in fields.
- Apply fertilizers and pesticides according to label instructions to save money and minimize pollution.

## Automotive Facilities

Uncovered fueling stations allow spills to be washed into storm drains. Cars waiting to be repaired can leak fuel, oil, and other harmful fluids that can be picked up by stormwater.

- Clean up spills immediately and properly dispose of cleanup materials.
- Provide cover over fueling stations and design or retrofit facilities for spill containment.
- Properly maintain fleet vehicles to prevent oil, gas, and other discharges from being washed into local waterbodies.
- Install and maintain oil/water separators.

## Forestry

Improperly managed logging operations can result in erosion and sedimentation.

- Conduct preharvest planning to prevent erosion and lower costs.
- Use logging methods and equipment that minimize soil disturbance.
- Plan and design skid trails, yard areas, and truck access roads to minimize stream crossings and avoid disturbing the forest floor.
- Construct stream crossings so that they minimize erosion and physical changes to streams.
- Expedite revegetation of cleared areas.

## 6 What can a business expect when inspected by the city?

The inspection will include a meeting with the business representative, a walk-through of the facility, evaluation of current storm water best management practices and recommendations for additional measures that may be required to comply with the 2002 MS4 Permit and the city's storm water ordinance. Educational material will also be provided to the business representative. If a follow-up inspection is required the city's inspector will schedule one for a later date.

## 7 What will happen if I do not comply with the city inspector's recommendations?

The city is mandated by the State to establish sanctions for non-compliance. Sanctions may include:

- Verbal or written warnings
- Notice of violation or non-compliance
- Administrative Order
- Stop work or Cease and Desist Order
- Imposition of monetary penalties or criminal prosecution (infraction or misdemeanor)

## 8 Will the city charge a fee for these inspections?

The State of California has not provided any funding to Moreno Valley for this mandated inspection program, therefore the city is required to charge a fee to recover its costs. If the city ignores the State mandate it will be subject to significant monetary penalties, potentially up to and possibly greater than $27,500 per day. The city has adopted inspection fees for restaurants, commercial and industrial businesses and will be evaluating them this fiscal year.

## 9 Businesses are not the only cause of storm water and non-storm water pollution. What is the city doing in those other areas?

Storm water and non-storm water pollution comes from a variety of sources. The city is committed to improving water quality and reducing the amount of pollutants that enter our precious waterways. For example, the city already performs construction site inspections to address erosion and prevent sediment from entering our streets and storm drains. Also, the city is enforcing urban runoff requirements on new and significant redevelopment projects whereby developers must incorporate a variety of BMPs into their projects.

**The City of Moreno Valley looks forward to working with you to help keep our waterways clean.**

MORENO VALLEY

City of Moreno Valley

# Pollution Abatement

## Business Inspection Program

National Pollutant Discharge Elimination System Permit

In order to comply with the 2002 Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) Permit for the Santa Ana River Watershed Region issued by the Santa Ana Regional Water Quality Control Board for the State of California, the

**City of Moreno Valley**

**is mandated**

to perform storm water and non-storm water compliance inspections of local businesses to ensure the businesses are complying with the MS4 Permit and the city's storm water ordinance.

# Questions & Answers

Below are some frequently asked questions about the NPDES Pollution Abatement Program

## 1 *Runoff from my business goes to a storm drain inlet in my parking lot or it flows to the city street. Doesn't this runoff eventually go the sewer treatment plant to be cleaned?*

The water that drains down the sink or toilet drains to the sanitary sewer and is treated at the sewer treatment plant, but storm water and non-storm water runoff from parking lots and landscape areas enter our streets and storm drains. This water does not receive any treatment and flows directly to our channels, rivers, lakes and finally the ocean. It is essential that this urban runoff be cleaned to the *"maximum extent practicable."*

## 2 *The County Department of Environmental Health Compliance Assistance Program (CAP) already comes to my business and performs a storm water compliance survey. Does this mean I will not be inspected by the city?*

The city is responsible for the inspection program. CAP provides a valuable service that the city will utilize. The city will evaluate the results of the most recent CAP survey to determine if the facility is in compliance with the MS4 Permit and its storm water ordinance. If the facility is in compliance, the city will not perform the currently scheduled inspection. If the facility is not in compliance, the city will contact the business and schedule a follow-up inspection using a city inspector.

## 3 *What businesses will be inspected?*

All food service facilities, and many existing commercial and industrial businesses must be inspected. If you are already being inspected by CAP you fall under this program. Other businesses not being inspected by CAP will fall under this program if they are the following types of businesses:

- Nurseries and green houses
- Mobile automobile or other vehicle washing - (base of operations)
- Mobile carpet and drapery cleaners - (base of operations)
- Mobile high pressure or steam cleaning - (base of operations)
- Landscape and hardscape installation - (base of operations)
- Painting and coating
- Pool, lake and fountain cleaning - (base of operations)
- Automotive related businesses
- Others that the city determines may contribute a significant pollutant load to the streets and storm drains

## 4 *How often will a business be inspected?*

Businesses will be prioritized according to their threat to water quality. A number of factors will be used to set the priority. Once the priority is set a business will be inspected annually, bi-annually or once every five years (city inspections may or may not coincide with the county's CAP inspections).

## 5 *What can I do before the inspection?*

There are many things you can do. Best Management Practices (BMPs) are procedures and practices you can implement with little or no cost to prevent pollutants and other hazardous materials from leaving your site. The city has a number of free brochures that address storm water and non-storm water pollution BMPs.

### Some BMPs include:

- Good Housekeeping
- Safe Materials & Handling
- Preventative Maintenance
- Employee Training

# *PREFACE – CHANGES SINCE THE DRAFT NOISE ASSESSMENT*

*Since the draft Noise Assessment that was issued in January 2013, comments were received from various public and private groups and individuals. The report has been modified in response to these comments and to clarify the descriptions of the analysis. In addition, some modifications were made to the project. Readers of the draft report will find that a number of updates and clarifications have been made, the most important of which are:*

- *The WLC implementation schedule was revised so that Phase 1 is scheduled for completion in 2022 rather than in 2017, as was assumed in the draft report. The scenarios for 2017 were therefore dropped and the scenario for 2022 was revised to analyze Phase 1 only, not full build-out of the WLC.*
- *A new analysis was added to analyze Existing Plus Phase 1 Only conditions.*
- *An area of land in the southwest corner of the WLC site is no longer part of the WLC project and instead will maintain its current zoning for residential development. This update reduces the planned amount of high-cube warehouse development in the WLC by one million square feet and increases the amount of background (i.e., non-project related development in 2035 by 220 dwelling units.*
- *The traffic noise analysis was completely revised to reflect the updated Traffic Impact Analysis which is based on the reduced project. Many areas that were previously identified as being impacted are no longer impacted (refer to Sections 2.3.1 and 2.3.2).*
- *Various grammatical corrections were made, and in places the text and tables were revised to provide greater clarity to readers.*

# 1.0 EXISTING SETTING

## 1.1 Project Description

The World Logistic Center project site covers 3,818 acres in the Rancho Belago area of the City of Moreno Valley. It includes 3,714 acres of land which is the subject of various entitlements, plus 104 acres of land affected by off-site improvements needed to support the proposed development. Exhibit 1 depicts the location of the proposed project in the region. The proposed entitlements are summarized below.

A General Plan Amendment is proposed covering 3,714 acres which redesignates approximately 70% of the area (2,610 acres) for logistics warehousing (the World Logistics Center project), and the remaining 30% (1,104 acres) for permanent open space and public facilities. The following elements of the General Plan are included in the proposed Amendment: Community Development (land use), Circulation, Parks, Recreation, and Open Space, Safety, Conservation, and the General Plan Goals and Objectives.

A new Specific Plan (Exhibit 2) will be adopted to govern development of the World Logistics Center for the 2,610 acres that will be governed by the Specific Plan. The Specific Plan permits the construction of up to 40.6 million square feet of building area within the World Logistics Center. A separate zoning amendment will also be processed and adopted to re-zone 1,104 acres for open space and public facilities uses and to incorporate the Specific Plan into the City's Zoning Map.

In addition to the General Plan Amendment, Specific Plan, and Zone Change, the project includes a development agreement and a Tentative Parcel Map covering a 1,539-acre site (property owned by the project applicant, Highland Fairview) within the project site. This subdivision map is for financing purposes only and will not confer any development rights to the property owner. The project includes pre-annexation zoning for an 85-acre parcel of land within the project area.

## 1.2 Background Information on Noise

### *1.2.1 Noise Criteria Background*

Sound is technically described in terms of the loudness (amplitude) of the sound and frequency (pitch) of the sound. The standard unit of measurement of the loudness of sound is the decibel (dB). Decibels are based on the logarithmic scale. The logarithmic scale compresses the wide range in sound pressure levels to a more usable range of numbers in a manner similar to the Richter scale used to measure earthquakes. In terms of human response to noise, a sound 10 dB higher than another is judged to be twice as loud; and 20 dB higher four times as loud; and so forth. Everyday sounds normally range from 30 dB (very quiet) to 100 dB (very loud).

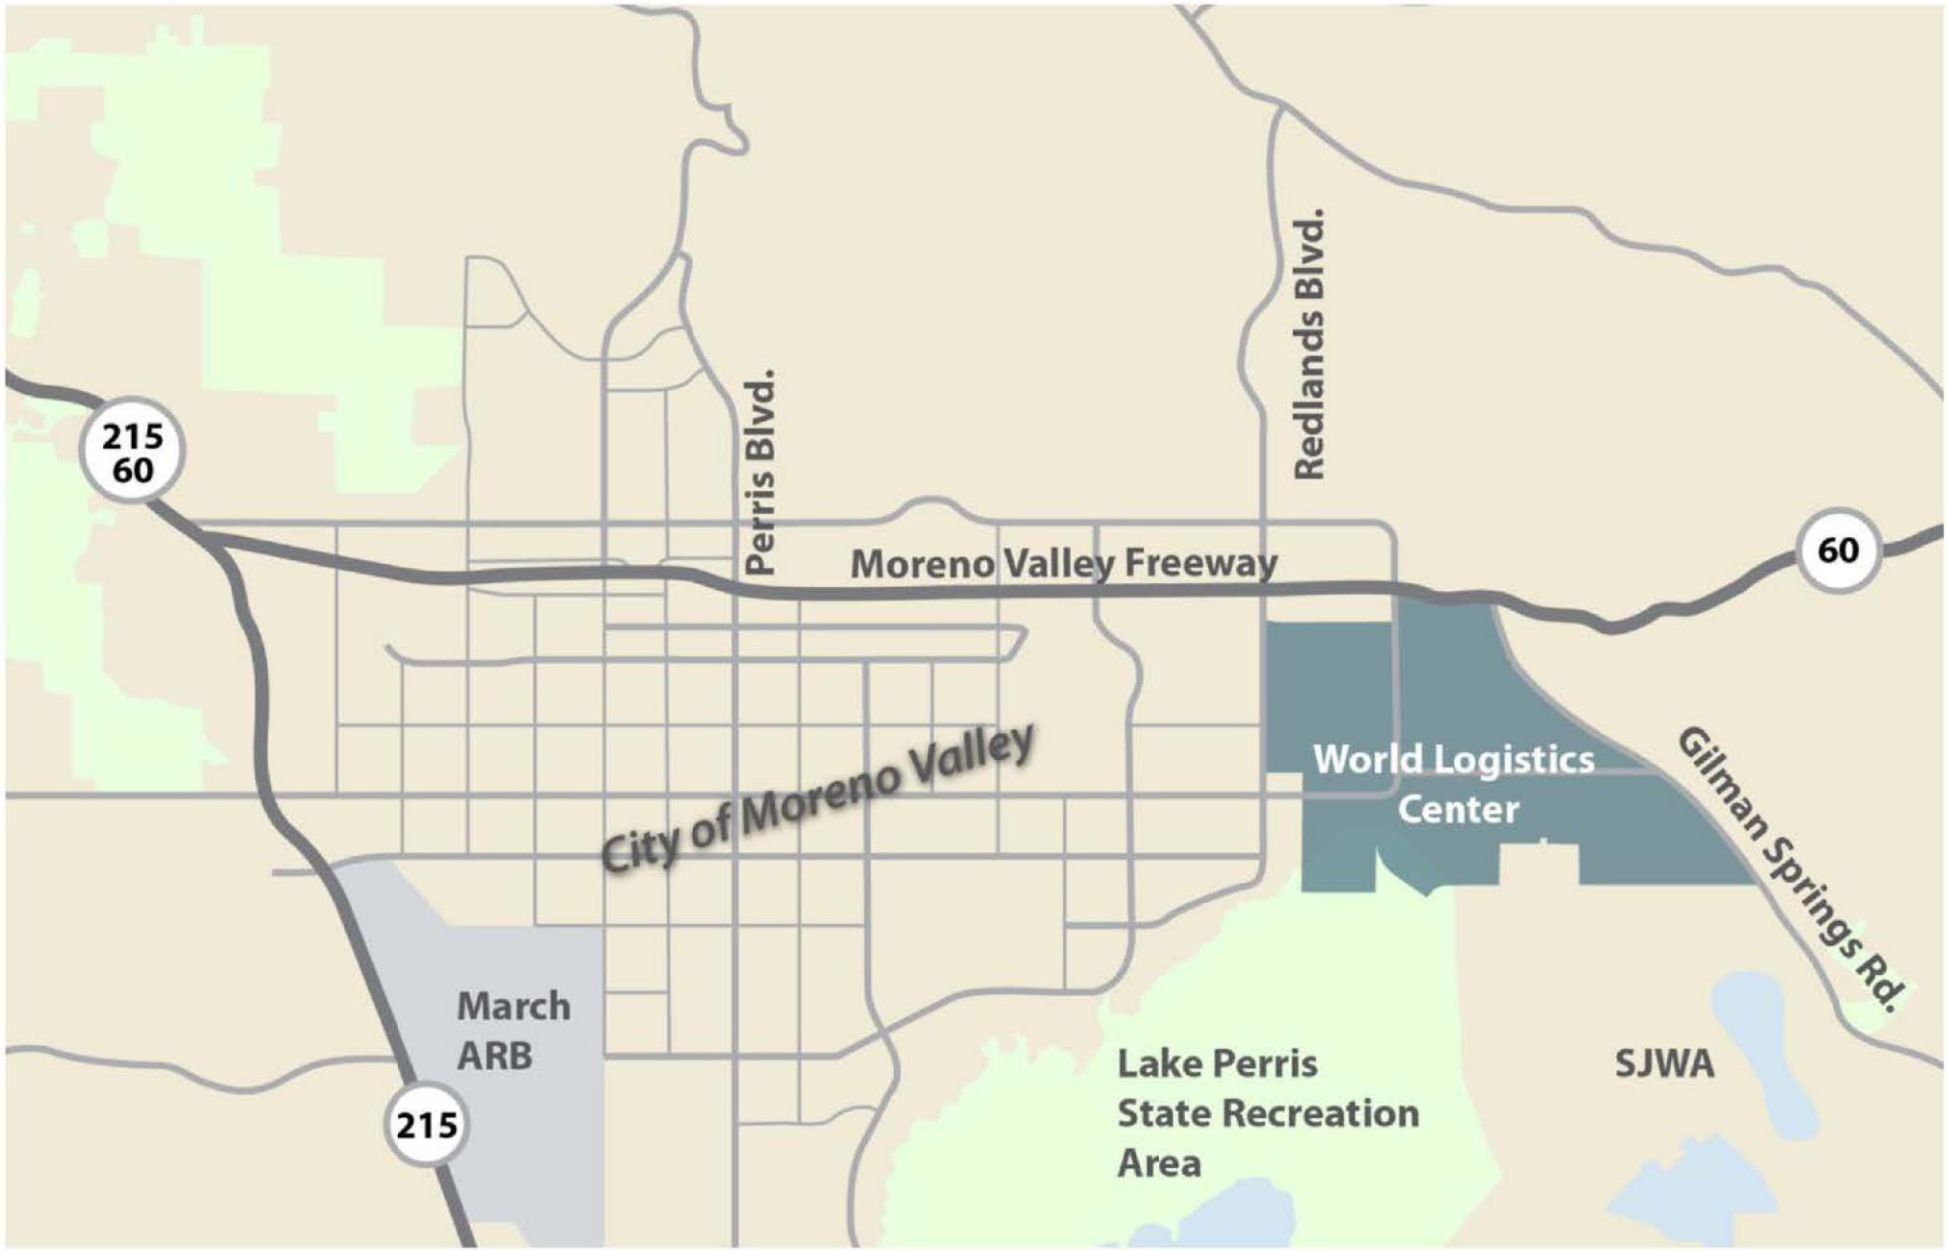

*Exhibit 1*

# Vicinity Map

*Mestre Greve Associates*
*Division of Landrum & Brown*

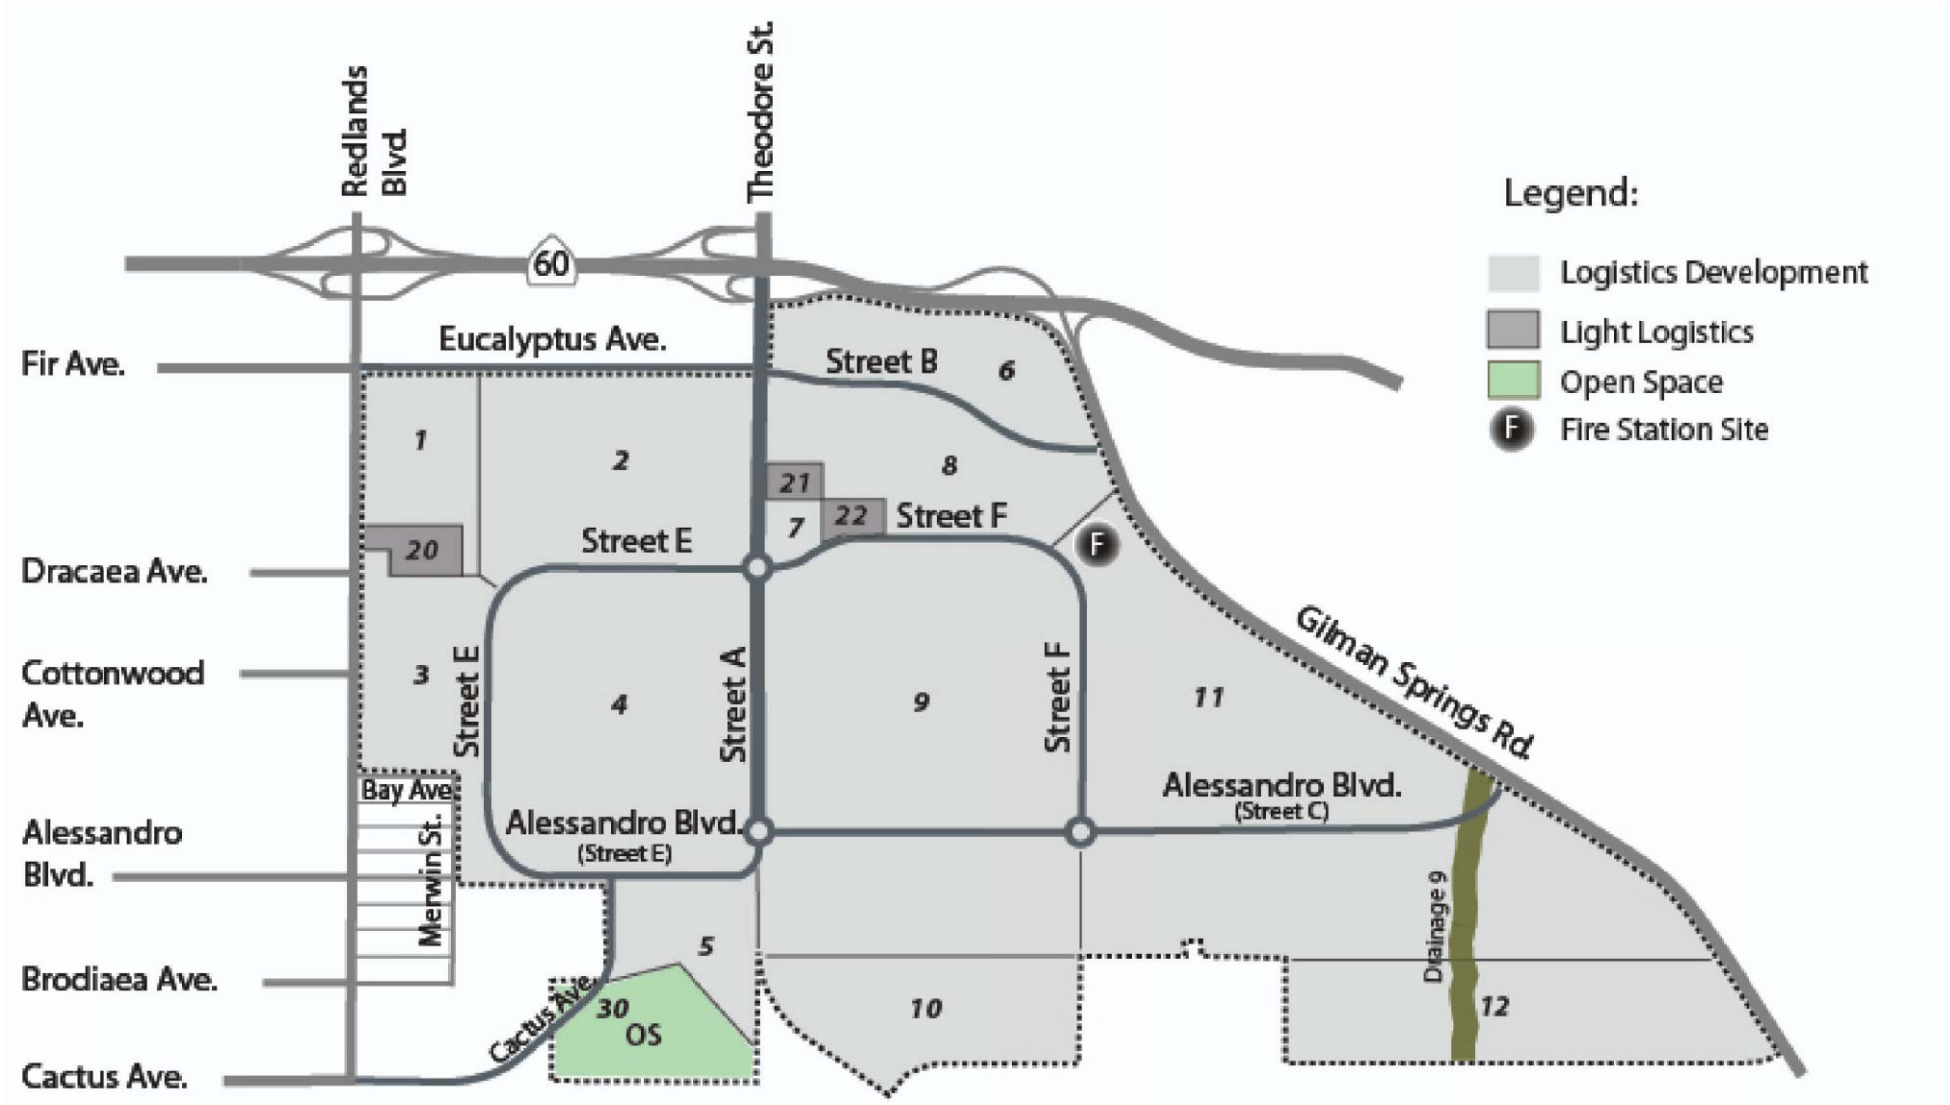

*Exhibit 2*

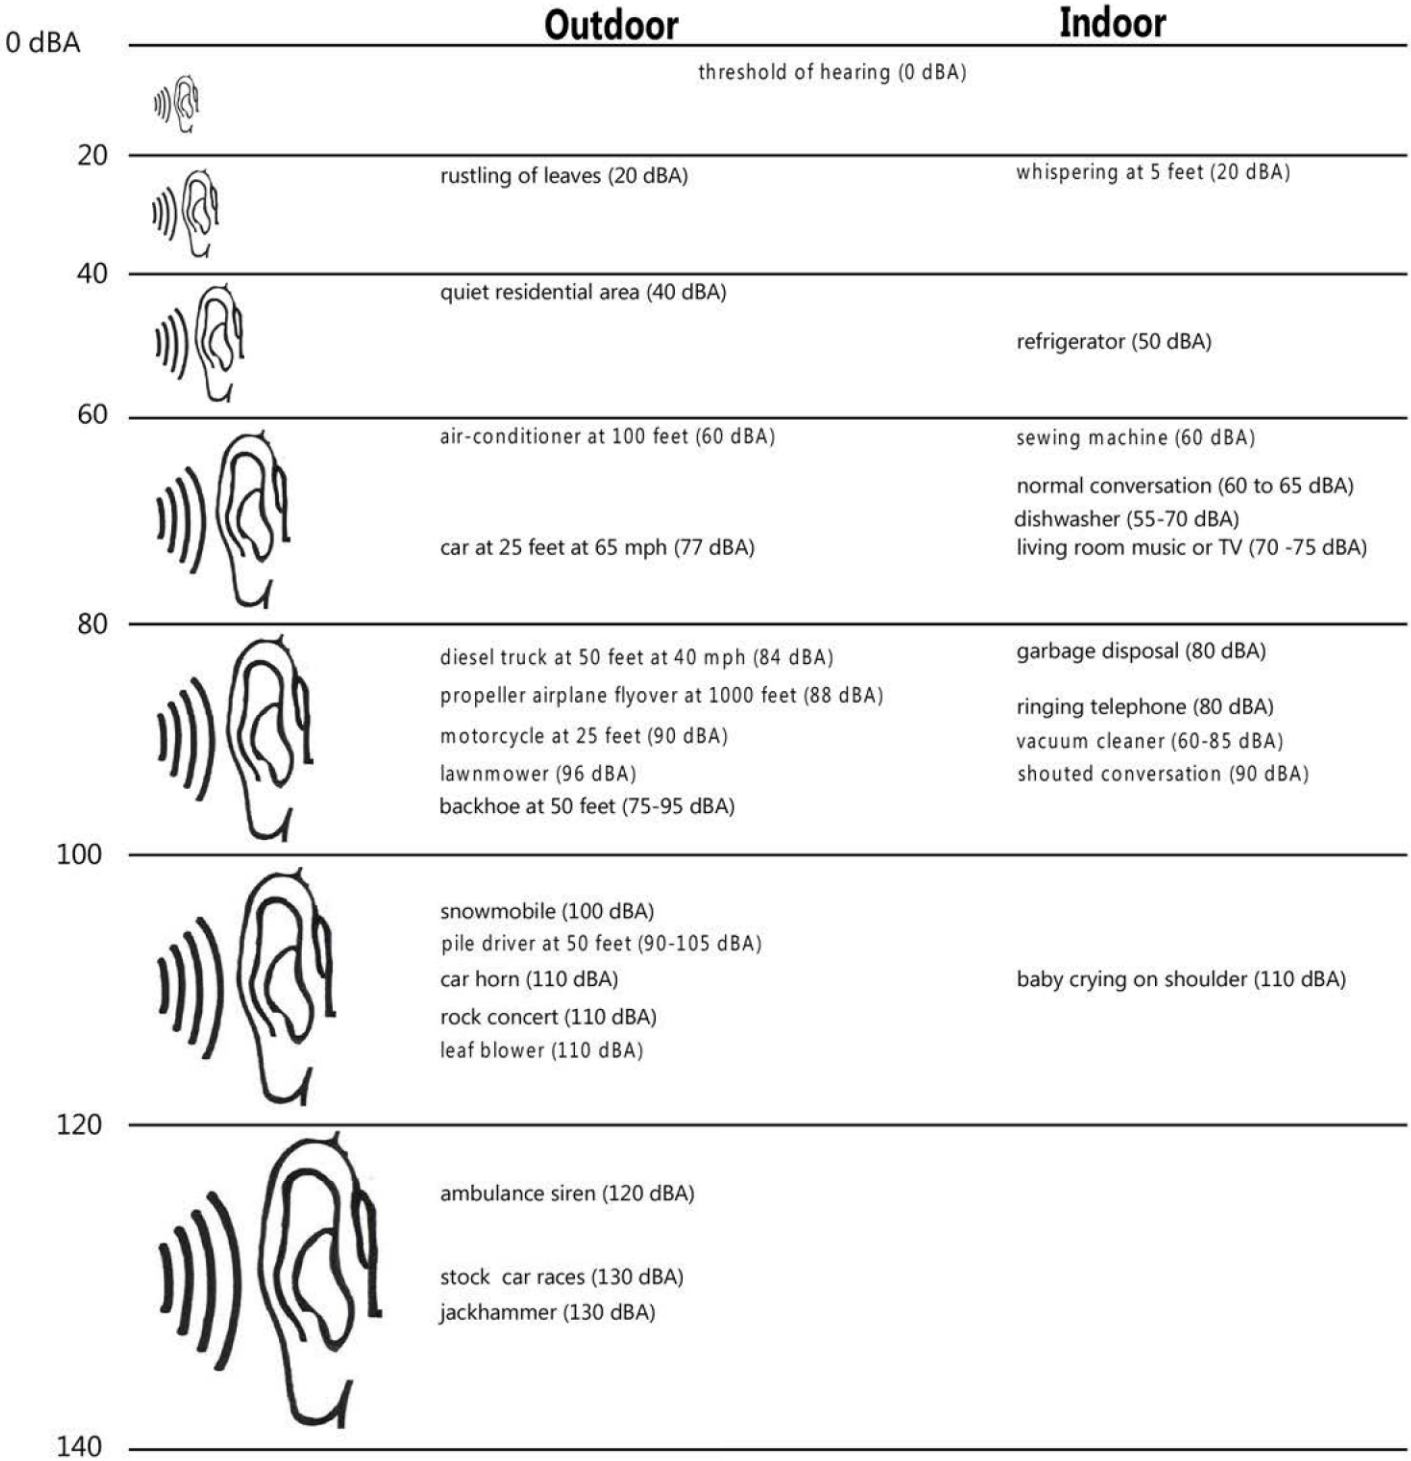
# Land Use Plan

*Mestre Greve Associates*
*Division of Landrum & Brown*

Since the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear. Community noise levels are measured in terms of the "A-weighted decibel," abbreviated dBA. Exhibit 3 provides examples of various noises and their typical A-weighted noise level.

Sound levels decrease as a function of distance from the source as a result of wave divergence, atmospheric absorption and ground attenuation. As the sound wave form travels away from the source, the sound energy is dispersed over a greater area, thereby dispersing the sound power of the wave. Atmospheric absorption also influences the levels that are received by the observer. The greater the distance traveled, the greater the influence and the resultant fluctuations. The degree of absorption is a function of the frequency of the sound as well as the humidity and temperature of the air. Turbulence and gradients of wind, temperature and humidity also play a significant role in determining the degree of attenuation. Intervening topography can also have a substantial effect on the effective perceived noise levels.



Noise has been defined as unwanted sound and it is known to have several adverse effects on people. From these known effects of noise, criteria have been established to help protect the public health and safety and prevent disruption of certain human activities. This criteria is based on such known impacts of noise on people as hearing loss, speech interference, sleep interference, physiological responses and annoyance. Each of these potential noise impacts on people are briefly discussed in the following narratives:

**HEARING LOSS** is not a concern in community noise situations of this type. The potential for noise induced hearing loss is more commonly associated with occupational noise exposures in heavy industry or very noisy work environments. Noise levels in neighborhoods, even in very noisy airport environs, are not sufficiently loud to cause hearing loss.

**SPEECH INTERFERENCE** is one of the primary concerns in environmental noise problems. Normal conversational speech is in the range of 60 to 65 dBA and any noise in this range or louder may interfere with speech. There are specific methods of describing speech interference as a function of distance between speaker and listener and voice level.

**SLEEP INTERFERENCE** is a major noise concern for traffic noise. Sleep disturbance studies have identified interior noise levels that have the potential to cause sleep disturbance. Note that sleep disturbance does not necessarily mean awakening from sleep, but can refer to altering the pattern and stages of sleep.

**PHYSIOLOGICAL RESPONSES** are those measurable effects of noise on people that are realized as changes in pulse rate, blood pressure, etc. While such effects can be induced and observed, the extent is not known to which these physiological responses cause harm or are sign of harm.

**Measurements by Mestre Greve Associates**

*Exhibit 3*

# Typical A-Weighted Noise Levels

*Mestre Greve Associates*
*Division of Landrum & Brown*

**ANNOYANCE** is the most difficult of all noise responses to describe. Annoyance is a very individual characteristic and can vary widely from person to person. What one person considers tolerable can be quite unbearable to another of equal hearing capability.

### *1.2.2 Noise Assessment Metrics*

The description, analysis and reporting of community noise levels around communities is made difficult by the complexity of human response to noise and the myriad of noise metrics that have been developed for describing noise impacts. Each of these metrics attempts to quantify noise levels with respect to community response. Most of the metrics use the A-Weighted noise level to quantify noise impacts on humans. A-Weighting is a frequency weighting that accounts for human sensitivity to different frequencies.

Noise metrics can be divided into two categories: single event and cumulative. Single-event metrics describe the noise levels from an individual event such as an aircraft fly over or perhaps a heavy equipment pass-by. Cumulative metrics average the total noise over a specific time period, which is typically 1 or 24-hours for community noise problems. For this type of analysis, cumulative noise metrics will be used.

Several rating scales have been developed for measurement of community noise. These account for: (1) the parameters of noise that have been shown to contribute to the effects of noise on man, (2) the variety of noises found in the environment, (3) the variations in noise levels that occur as a person moves through the environment, and (4) the variations associated with the time of day. They are designed to account for the known health effects of noise on people described previously. Based on these effects, the observation has been made that the potential for a noise to impact people is dependent on the total acoustical energy content of the noise. A number of noise scales have been developed to account for this observation. Two of the predominate noise scales are the: Equivalent Noise Level (Leq) and the Community Noise Equivalent Level (CNEL). These scales are described in the following paragraphs.

**Leq** is the sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period. Leq is the "energy" average noise level during the time period of the sample. Leq can be measured for any time period, but is typically measured for 1 hour. This 1-hour noise level can also be referred to as the Hourly Noise Level (HNL). It is the energy sum of all the events and background noise levels that occur during that time period.

**CNEL**, Community Noise Equivalent Level, is the predominant rating scale now in use in California for land use compatibility assessment. The CNEL scale represents a time weighted 24-hour average noise level based on the A-weighted decibel. Time weighted refers to the fact that noise that occurs during certain sensitive time periods is penalized for occurring at these times. The evening time period (7 p.m. to 10 p.m.) penalizes noises by 5 dBA, while nighttime (10 p.m. to 7 a.m.) noises are penalized by 10 dBA. These time periods and penalties were

selected to reflect people's increased sensitivity to noise during these time periods. A CNEL noise level may be reported as a "CNEL of 60 dBA," "60 dBA CNEL," or simply "60 CNEL."

**L(%)** is a statistical method of describing noise which accounts for variance in noise levels throughout a given measurement period. L(%) is a way of expressing the noise level exceeded for a percentage of time in a given measurement period. For example, since 5 minutes is 25% of 20 minutes, L(25) is the noise level that is equal to or exceeded for five minutes in a twenty-minute measurement period. It is L(%) that is used for most Noise Ordinance standards. For example most daytime County, state and City noise ordinances use a standard of 55 dBA for 30 minutes per hour, or an L(50) level of 55 dBA. In other words, the noise ordinance may state that no noise level should exceed 55 dBA for more that fifty percent of a given period.

## 1.3 Noise Criteria

The Noise Element of the General Plan and City's Noise Ordinance contain the City's policies on noise. The Noise Element of the General Plan presents limits on noise levels from transportation noise sources, vehicles on public roadways, railroads and aircraft. These limits are imposed on new developments. The new developments must incorporate measures to ensure that the limits are not exceeded.

The Noise Ordinance applies to noise on one property impacting a neighboring property. It sets limits on noise levels that can be experienced at the neighboring property. The Noise Ordinance is part of the City's Municipal Code (Chapter 11.80 Noise Regulation) and is enforceable throughout the City. The City Noise Ordinance and Noise Element policies are presented below.

### *1.3.1 Noise Element*

The City of Moreno Valley has not adopted noise standards for public noise sources (e.g., roadway, railroad, and aircraft noise). The City, as part of their Safety Element of the General Plan, does include a discussion of noise and projections of noise in the City. However, the document does not contain specific noise standards or significance thresholds. When a City has not adopted specific development noise standards, the County's criteria is often consulted to determine relevant criteria that is reflective of appropriate standards for the area for use in the environmental assessment. The County of Riverside Plan Noise Element specifies outdoor and indoor noise standards for various land uses impacted by transportation noise sources. The County's noise standards are consistent with the State of California's noise standards. The interior and exterior noise standards are in terms of the Community Noise Equivalent Level (CNEL). The standards state that for residential land use, the exterior noise exposure level shall not exceed 65 dBA and the interior noise exposure level shall not exceed 45 dBA.

### *1.3.2 City of Moreno Valley Noise Ordinance*

A noise ordinance is designed to control unnecessary, excessive and annoying sounds from stationary (non-transportation) noise sources. Noise ordinance requirements cannot be applied to mobile noise sources such as heavy trucks when traveling on public roadways. Federal and state laws preempt control of mobile noise sources on public roads. Noise ordinance standards

typically apply to industrial and commercial noise sources impacting residential areas. They are also applicable to noise generated at parks and schools impacting residential areas.

The City of Moreno Valley has established a noise ordinance as a part of its Municipal Code. Table 1 and Table 2 show the maximum sound levels that are permitted in the city for continuous and impulsive sounds respectively.

**Table 1**
**City of Moreno Valley Maximum Continuous Sound Levels (dBA)**

| Duration Per Day Continuous Hours | Sound Level (dBA) |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1.5 | 102 |
| 1 | 105 |
| 0.5 | 110 |
| 0.25 | 115 |

**Table 2**
**City of Moreno Valley Maximum Impulsive Sound Levels (dBA)**

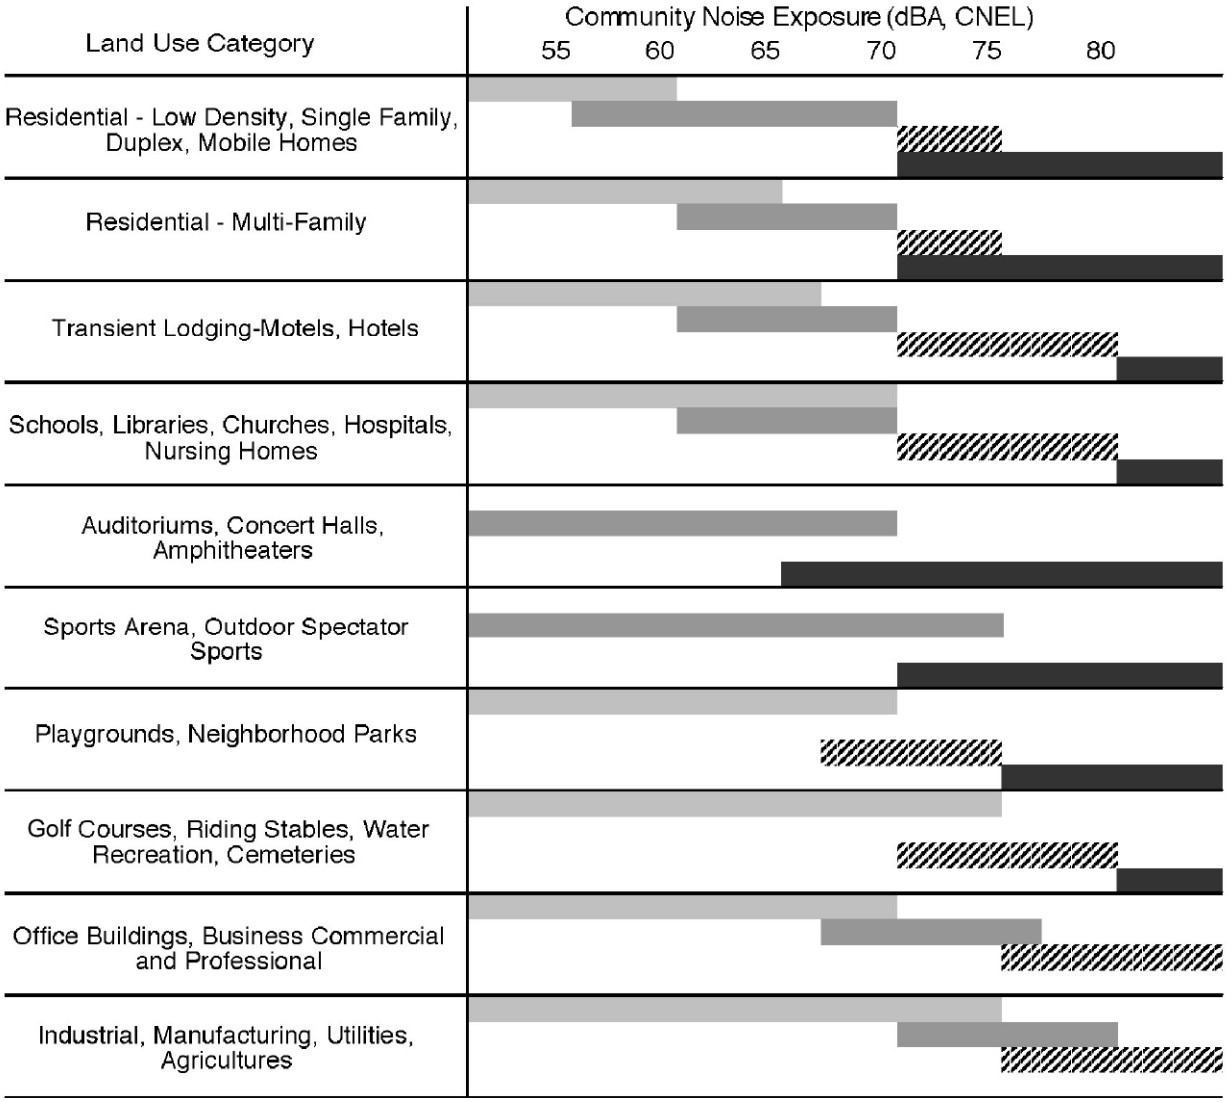
| Number Of Repetitions Per 24 Hour Period | Sound Level (dBA) |
|---|---|
| 1 | 145 |
| 10 | 135 |
| 100 | 125 |

The City also restricts the sound levels for non-impulsive sound on lands designated for residential and commercial land uses during the daytime and nighttime time periods. These levels are shown in Table 3. Section 11.80.050 (3) identifies the measurement as an "average" noise level, and therefore, the noise limits shown in the table below are interpreted as the Leq noise level.

**Table 3 Maximum Non-impulsive Sound Levels (dBA)**

| Land Use | Daytime 8 am – 10 pm | Nighttime 10:01 pm – 7:59 am |
|---|---|---|
| Residential | 60 dBA | 55 dBA |
| Commercial | 65 dBA | 60 dBA |

For all construction activities, Moreno Valley prohibits construction during the hours of 8:00 p.m. to 7:00 a.m. the following day that creates a noise disturbance (i.e. disturbs a reasonable person of normal sensitivities, or exceeds the sound level limits, or is plainly audible at a distance of 200 feet from the property line or the source of the sound if the sound occurs on private or public property respectively).



### *1.3.3 State Compatibility Guidelines*

The City of Moreno Valley General Plan has not established any compatibility guidelines for land uses impacted by transportation noise sources. The State of California Guidelines, published by the Department of Health, provide guidance for the acceptability of different land uses. The compatibility guidelines are reproduced here in Exhibit 4. The guidelines will be used to evaluate the compatibility of the proposed land uses with the noise environment. The guidelines show compatibility of various land uses with different noise environments. The guidelines show that industrial uses are normally acceptable in noise environments up to 75 CNEL.

## 1.4 Existing Noise Measurements

The existing noise levels in the vicinity of the World Logistic Center project are determined to establish current baseline noise levels in key areas. A noise measurement survey of the project site and the surrounding area was conducted in March 2012. The sites were selected to provide coverage of the project area including those most likely to be affected by traffic generated by the project. The measurement sites are displayed in Exhibit 5. In addition to these noise measurement sites, noise levels have been determined for roadways and freeways potentially affected by the project. These traffic noise levels are presented in Section 1.5.

## Land Use/Noise Compatibility Guidelines

**Normally Acceptable** Specified land use is satisfactory based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

**Conditionally Acceptable**- New construction or development shall be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply system of air conditioning, will normally suffice.

**Normally Unacceptable** New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

**Clearly Unacceptable** New construction or development should generally not be undertaken.

# Noise Measurement Locations

*Mestre Greve Associates*
*Division of Landrum & Brown*

Short-term noise measurements were taken at sixteen sites in the project vicinity. The measurements were taken during the daytime hours (between 7 a.m. and 10 p.m.), and were repeated during nighttime hours (between 10 p.m. and 7 a.m.). All the measurements were performed using a Brüel & Kjær Model 2236 sound level meter mounted on a tripod. During the measurements, a large windscreen covered the microphone to reduce the effect of unwanted wind-generated noise. For each measurement site, noise levels were measured for 15 minutes. Before and after the measurements were taken, a Brüel & Kjær 4231 calibrator with certification traceable to the National Institute of Standards and Technology was used to calibrate the sound meter to ensure that the measured sound level readings were accurate. At the conclusion of each set of measurements, the Leq, Lmin, Lmax, L1.7, L8.3, L25 and L50 values for the full time period were recorded on a data sheet. The average noise level (Leq), the maximum sound level (Lmax), and the minimum sound level (Lmin) are probably the most useful in understanding the noise environment. The other noise metrics are commonly reported and can be useful in understanding in more detail the noise environment. Table 4 shows the results for the daytime measurements, and Table 5 presents the nighttime measurements.

**Table 4 Existing Daytime Noise Measurements (dBA)**

| Site | Date | Start Time | Leq | Lmax | L1.7 | L8.3 | L25 | L50 | Lmin |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 1-25-12 | 9:38 a.m. | 55.4 | 72.0 | 63.0 | 56.5 | 54.0 | 53.0 | 48.7 |
| 2 | 1-25-12 | 10:15 a.m. | 53.6 | 68.8 | 61.0 | 57.0 | 53.5 | 50.5 | 44.0 |
| 3 | 1-25-12 | 10:42 a.m. | 66.3 | 73.7 | 73.0 | 71.5 | 68.0 | 61.5 | 43.5 |
| 4 | 1-25-12 | 11:04 a.m. | 40.8 | 50.3 | 46.0 | 43.5 | 41.0 | 39.5 | 35.9 |
| 5 | 1-25-12 | 11:27 a.m. | 40.4 | 56.9 | 48.0 | 44.5 | 39.5 | 36.0 | 31.4 |
| 6 | 1-25-12 | 11:48 a.m. | 46.1 | 68.3 | 51.5 | 41.0 | 37.5 | 34.0 | 30.0 |
| 7 | 1-25-12 | 12:08 p.m. | 57.7 | 75.3 | 66.5 | 63.0 | 55.5 | 47.5 | 34.8 |
| 8 | 1-25-12 | 12:30 p.m. | 65.1 | 85.5 | 73.5 | 70.0 | 63.0 | 56.5 | 39.0 |
| 9 | 1-25-12 | 12:50 p.m. | 42.9 | 55.8 | 53.0 | 46.0 | 41.5 | 37.5 | 33.5 |
| 10 | 1-25-12 | 1:48 p.m. | 49.2 | 68.0 | 56.0 | 48.0 | 46.5 | 45.0 | 40.5 |
| 11 | 1-25-12 | 2:10 p.m. | 60.4 | 73.0 | 66.5 | 64.5 | 61.0 | 58.0 | 47.2 |
| 12 | 1-25-12 | 2:32 p.m. | 51.2 | 58.4 | 55.5 | 53.5 | 51.5 | 50.5 | 44.7 |

| 15 | 2-9-12 | 2:56 a.m. | 48.2 | 59.9 | 54.5 | 52.5 | 49.0 | 45.0 | 35.4 |
| 16 | 2-9-12 | 3:20 a.m. | 54.3 | 62.7 | 60.0 | 58.5 | 55.5 | 52.0 | 38.8 |

**Site 1: Near Corner of Theodore Street and Eucalyptus Street**

Site 1 is located on the south side of the eastern extension of Eucalyptus Street, approximately 74 feet from the centerline of Theodore Street. This site is representative of an area with scattered rural residences that initially will be non-conforming uses. The primary noise source was the traffic on Theodore Street. Traffic on State Route 60 (SR-60) was also audible in the distance. The daytime Lmax was 72.0 dBA, and the nighttime Lmax was 64.5 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 53.0 dBA, and the nighttime L50 measured 45.5 dBA. These levels are representative of a residential area.

**Site 2: Home Northeast of Gilman Springs Road**

There are a few scattered rural residences located northeasterly of Gilman Springs Road. Site 2 is located approximately 700 feet east of Gilman Springs Road, on the west side of McGehee Drive, just north of Jerry Street. The primary noise source at this location was the traffic on Gilman Springs Road. The daytime Lmax was 68.8 dBA, and the nighttime Lmax was 65.1 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 50.5

dBA, and the nighttime L50 measured 45.5 dBA. These levels are representative of a residential area.

**Site 3: Residence Along Redlands Boulevard North of Eucalyptus Avenue**

Site 3 is located on the west side of Redlands Boulevard, approximately 37 feet from the centerline of the roadway. This site is representative of the few scattered residences along Redlands Boulevard between Eucalyptus Avenue and the freeway to the north. The primary noise source was the traffic on Redlands Boulevard. The daytime Lmax was 73.7 dBA, and the nighttime Lmax was 75.9 dBA. These noise levels were caused primarily by traffic on Redlands Boulevard. The daytime L50 at this site measured 61.5 dBA, and the nighttime L50 measured 54.0 dBA. These levels are representative of a residential area fairly close to a roadway.

**Site 4: Near Current Eastern Terminus of Cactus Avenue**

Site 4 is located on the south side of Cactus Avenue, approximately 28 feet from the centerline of the roadway. The measurement location is at the east end of the roadway, just before the street dead-ends at an EMWD water tank site. This location is near the southwest corner of the project site. The primary noise source was the distant traffic on Redlands Boulevard, Theodore Street, and SR-60. The daytime Lmax was 50.3 dBA, and the nighttime Lmax was 51.1 dBA. The daytime Lmax was caused by traffic. The nighttime Lmax was due to a jet passing overhead. The daytime L50 at this site measured 39.5 dBA, and the nighttime L50 measured 32.0 dBA. These levels are representative of a quiet residential area.

**Site 5: Southwest Corner of Project Site**

Site 5 is located on Merwin Street, just north of Campbell Avenue, near the east edge of the roadway. The primary noise source was the traffic on Redlands Boulevard. Aircraft noise and distant dogs barking were also heard. The daytime Lmax was 56.9 dBA, and the nighttime Lmax was 46.6 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 36.0 dBA, and the nighttime L50 measured 35.0 dBA. These levels are representative of a residential area.

**Site 6: Western Edge of Project Site Along Merwin Street**

Site 6 is located on Merwin Street, just south of Bay Avenue, near the east edge of the roadway. The primary noise source was the traffic on Redlands Boulevard. Aircraft noise and distant dogs barking were also heard. The daytime Lmax was 68.3 dBA, and the nighttime Lmax was 51.0 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 34.0 dBA, and the nighttime L50 measured 41.5 dBA. These levels are representative of a quiet residential area.

**Site 7: Western Edge of Project Site Along Redlands Boulevard**

Site 7 is located on the west side of Redlands Boulevard, south of Cottonwood Avenue, approximately 61 feet from the centerline of the roadway. The primary noise source was the traffic on Redlands Boulevard. Aircraft noise was also heard. The daytime Lmax was 75.3 dBA, and the nighttime Lmax was 66.9 dBA. These noise levels were caused by traffic. The

daytime L50 at this site measured 47.5 dBA, and the nighttime L50 measured 37.5 dBA. These levels are representative of a quiet residential area.

**Site 8: Western Edge of Project Site Along Redlands Boulevard**

Site 8 is located on the west side of Redlands Boulevard, south of Dracaea Avenue, approximately 63 feet from the centerline of the roadway. This site is about a 1/3 mile north of Site 7. The primary noise source was the traffic on Redlands Boulevard. The daytime Lmax was 85.5 dBA, and the nighttime Lmax was 74.1 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 56.5 dBA, and the nighttime L50 measured 38.5 dBA. These levels are representative of a residential area fairly close to a roadway.

**Site 9: Residences Along Shubert Street**

Site 9 is located on the west side of Shubert Street, just south of Brahms Lane near the west side of the project. This site is representative of the residential homes between Eucalyptus Avenue and Dracaea Avenue. These homes are setback from Redlands Boulevard by about 700 feet. The primary noise source was distant traffic on Redlands Boulevard. Aircraft noise was also heard. The daytime Lmax was 55.8 dBA, and the nighttime Lmax was 57.1 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 37.5 dBA, and the nighttime L50 measured 36.0 dBA. These levels are representative of a quiet residential area.

**Site 10: Homes Along Mesa Top Trail**

Site 10 is located on the south side of Mesa Top Trail, just west of Cloudburst Trail, approximately 310 feet from the centerline of SR-60 (with a row of homes intervening). The primary noise source was the traffic on SR-60. Aircraft noise was also heard. The daytime Lmax was 68.0 dBA, and the nighttime Lmax was 63.8 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 45.0 dBA, and the nighttime L50 also measured 45.0 dBA. These levels are representative of a residential area fairly close to a major roadway.

**Site 11: Residence Along Spruce Avenue North of Freeway**

Site 11 is located on the west side of Spruce Avenue, approximately 554 feet from the centerline of SR-60 (with some homes intervening). The measurement location is also approximately 120 feet from the centerline of Redlands Boulevard. The primary noise sources were the traffic on SR-60 and Redlands Boulevard. The daytime Lmax was 73.0 dBA, and the nighttime Lmax was 68.3 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 58.0 dBA, and the nighttime L50 measured 54.0 dBA. These levels are representative of a residential area fairly close to a freeway.

**Site 12: Residence Near South End of Pettit Street North of SR-60**

Site 12 is located at the south end of Pettit Street, south of Ironwood, approximately 630 feet from the centerline of SR-60. This site has a clear line of sight to the freeway. The primary noise source was the traffic on SR-60. The daytime Lmax was 58.4 dBA, and the nighttime Lmax was 63.9 dBA. These noise levels were caused by traffic. The daytime L50 at this site

measured 50.5 dBA, and the nighttime L50 measured 50.0 dBA. These levels are representative of a residential area fairly close to a freeway.

**Site 13: Residence on Carol Place North of SR-60**

Site 13 is located on the north side of Carol Place, west of Oliver Street, approximately 1,295 feet from the centerline of SR-60. The primary noise source was the traffic on SR-60. The daytime Lmax was 59.8 dBA, and the nighttime Lmax was 59.7 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 44.0 dBA, and the nighttime L50 measured 45.0 dBA. These levels are representative of a residential area fairly close to a freeway.

**Site 14: Residence on Sage Grouse Lane North of SR-60**

Site 14 is located on the east side of Sage Grouse Lane, just north of Elder Avenue, approximately 224 feet from the centerline of SR-60. The location has a clear line of sight to the freeway. The primary noise source was the traffic on SR-60. The daytime Lmax was 73.3 dBA, and the nighttime Lmax was 72.3 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 64.5 dBA, and the nighttime L50 measured 57.5 dBA. These levels are representative of a residential area fairly close to a freeway.

**Site 15: Residence on Primrose Way South of SR-60**

Site 15 is located on the north side of Primrose Way, just west of Willowbrook Lane, approximately 268 feet from the centerline of SR-60 (with a row of homes intervening). The homes in this area are substantially depressed with respect to the freeway grade and a soundwall is present along the freeway. The primary noise source was the traffic on SR-60. The daytime Lmax was 72.1 dBA, and the nighttime Lmax was 59.9 dBA. The daytime Lmax was caused by a neighbor yelling at his dog. The nighttime Lmax was caused by traffic on the freeway. The daytime L50 at this site measured 49.5 dBA, and the nighttime L50 measured 45.0 dBA. Although close to the freeway, these levels are representative of a quiet residential area.

**Site 16: Area Along Theodore Street North of SR-60**

Site 16 is located on the west side of Theodore Street, just north of SR-60, approximately 600 feet from the centerline of SR-60. There is a residence about 430 feet from this site. The primary noise source was the traffic on SR-60. The daytime Lmax was 75.2 dBA, and the nighttime Lmax was 62.7 dBA. These noise levels were caused by traffic. The daytime L50 at this site measured 55.0 dBA, and the nighttime L50 measured 52.0 dBA.

## 1.5 Existing Roadway Noise Levels

The highway noise levels projected in this report were computed using the Highway Noise Model published by the Federal Highway Administration ("FHWA Highway Traffic Noise Prediction Model," FHWA-RD-77-108, December, 1978). The FHWA Model uses traffic volume, vehicle mix, vehicle speed, and roadway geometry to compute the "equivalent noise level." A computer code has been written which computes equivalent noise levels for each of the time periods used in the calculation of CNEL. Weighting these noise levels and summing

them results in the CNEL for the traffic projections used. CNEL contours are found by iterating over many distances until the distances to the 60, 65, and 70 CNEL contours are found. Traffic volumes and estimated speeds were used with the FHWA Model to estimate the noise levels in terms of CNEL. Existing traffic volumes were provided by the traffic consultants to the project. The data provided included the splits between autos, medium trucks, and heavy trucks. (The data used for the projections are provided in the Appendix.)

The CNEL noise levels for receptors along critical roadways are given in Table 6. Three hundred and thirty nine (339) arterial roadway links and eighty nine (89) freeway segments were provided for the noise analysis by the traffic engineer. The 44 most critical links from a noise impact perspective are presented below. Essentially, the 44 roadway links represent areas with noise sensitive land uses adjacent to them with traffic noise increases sufficient to be considered as a possible significant noise impact. (See Sections 2.3.1 and 2.3.2 for more discussion on the selection of critical links.) The noise levels for all roadway links can be found in the Appendix. These CNEL noise levels represent the noise levels at the residential receptors along the roadway link. The distance to the receptors was measured on Google Earth maps. The values given in Table 6 account for the effect of any noise barriers that may reduce existing traffic noise levels. (The usage of the name "Street D" in the following table and the rest of the report is consistent with the traffic data and report upon which this study is based. However, in other parts of the EIR Street D is also referred to as the Cactus Avenue Extension.)

## 1.6 SDG&E and SCG Facilities

The following section summarizes the existing noise conditions generated by the San Diego Gas and Electric Company (SDG&E) Compressor Station and Southern California Gas Company (SCG) facilities which are located within the project area, immediately south of the proposed development area in the World Logistic Center. More complete information can be found in the "SDG&E and SCG Facilities Noise Impact Assessment for the World Logistics Center," (prepared by Mestre Greve Associates, updated December 17, 2012), which is included as an appendix to this report.

These facilities are located as shown in Exhibit 6. The SDG&E Compressor Station takes in natural gas from interstate gas pipelines and recompresses the gas into new pipelines to deliver the gas to customers in Southern California. The two SCG facilities house flow valve and metering facilities as well as maintenance functions at the southern facility. There are gas

pipeline blow-down facilities at the compressor station and at the two SCG locations where exhaust stacks allow for the venting of high pressure gas to the atmosphere that only occur during emergencies, maintenance, and testing of the blow-down systems.

The SDG&E and SCG facilities represent three different noise sources that potentially impact the World Logistics Center project; (1) the operation of the compressor station, (2) blow-down events at the compressor station, and (3) blow-downs at the SCG facilities. The blow-down events generate infrequent high noise levels for short periods. The operation of the compressor station generates a relatively constant noise level with levels varying slightly as compressors are turned on and off as needed to supply natural gas to Southern California.

Compressors in the SDG&E facility are the primary source of typical operational noise generated by the station. There are two sets of three reciprocating natural gas combustion engines and one set of four natural gas fired turbines for a total of ten compressor units with power ranging from 995 to 3,400 horsepower each. The reciprocating engines and compressors are located within acoustically treated structures and are equipped with intake and exhaust mufflers. The turbines are housed in weather protection shelters. At times the facility operates at maximum capacity 24 hours per day. Demand on the compressor station will increase in the future.

The CNEL levels for the compressor station are presented in Exhibit 7, and assume the compressor station is in full operation 24 hours a day. Exhibit 8 presents the average (Leq) noise levels generated by the compressor station during full operation. Both the CNEL and Leq metrics are use to assess the noise impacts from the facility.

There are three blow-down points within the SDG&E Compressor Station. These blow-down points allow for the release of pressurized gas during emergency events. These systems are also tested on an annual basis. Blow-downs at the SDG&E Station vent gas within the facility and last between 30 and 90 seconds. The maximum sound levels (Lmax dBA) generated by the blow-down events is presented in Exhibit 9.

There are also four blow-down points in the SCG facilities, three in the southern facility and one in the northern facility. Blow-downs at the SCG facilities vent gas from miles of pipeline and can last up to 90 minutes. These events are much longer than the blow-downs at the SDG&E Compressor Station. An average of four blow-down events occur annually at the SCG facility. Lmax noise levels (dBA) are shown in Exhibit 10. The noise level will be at or near the Lmax level during the entire blow-down event.

SCG and SDG&E have a portable silencer that they use for blow-down events near sensitive receptors. The silencer is located in Beaumont, and additional silencers can be brought in from other areas when needed. The silencer is hauled on a dedicated truck. A crane accompanies the truck to aid in the installation of the silencer. The silencers are used for all planned blow-downs and even most un-planned blow-downs when located near sensitive receptors. Currently, silencers are not used at the Moreno Valley facilities due to the lack of sensitive receptors in the area. However, the silencers would be used as development gets close to the blow-down points.

# 2.0 POTENTIAL NOISE IMPACTS

Potential noise impacts are commonly divided into two groups; temporary and long term. Temporary impacts are usually associated with noise generated by construction activities. Long-term impacts are impacts on surrounding land uses generated by the operation of the proposed project. This may include noise generated on-site by trucking and loading activities, as well as off-site by project generated traffic on public roadways. Additionally, the compatibility of the proposed uses with the existing and future noise environment is assessed.

## 2.1 Noise Impact Criteria

Off-site impacts due to construction are measured against the Noise Ordinance criteria discussed in Section 1.3.2. Construction activities for the proposed project will be required to meet the Noise Ordinance standards or a significant impact will occur.

The following thresholds are based on the Federal Transit Authority's impact criteria ("Transit Noise and Vibration Impact Assessment") and have been used on at least one other project that has withstood a court challenge. Long-term impacts from the project's traffic noise that affect existing sensitive land uses are considered to be substantial, and therefore, constitute a significant noise impact if it would:

- Increase noise levels by 5 dB or more where the no project noise level is less than 60 CNEL;
- Increase noise level by 3 dB or more where the no project noise level is 60 CNEL to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the no project noise level is greater than 65 CNEL.

The project's incremental contribution to a cumulative noise increase would normally be considered cumulatively considerable and significant when ambient noise levels affect noise sensitive land uses and when the following occurs:

A project increase of the ambient (cumulative without project) noise level by 1 dB or more, and the predicted future cumulative with project noise levels cause the following cumulative increases:

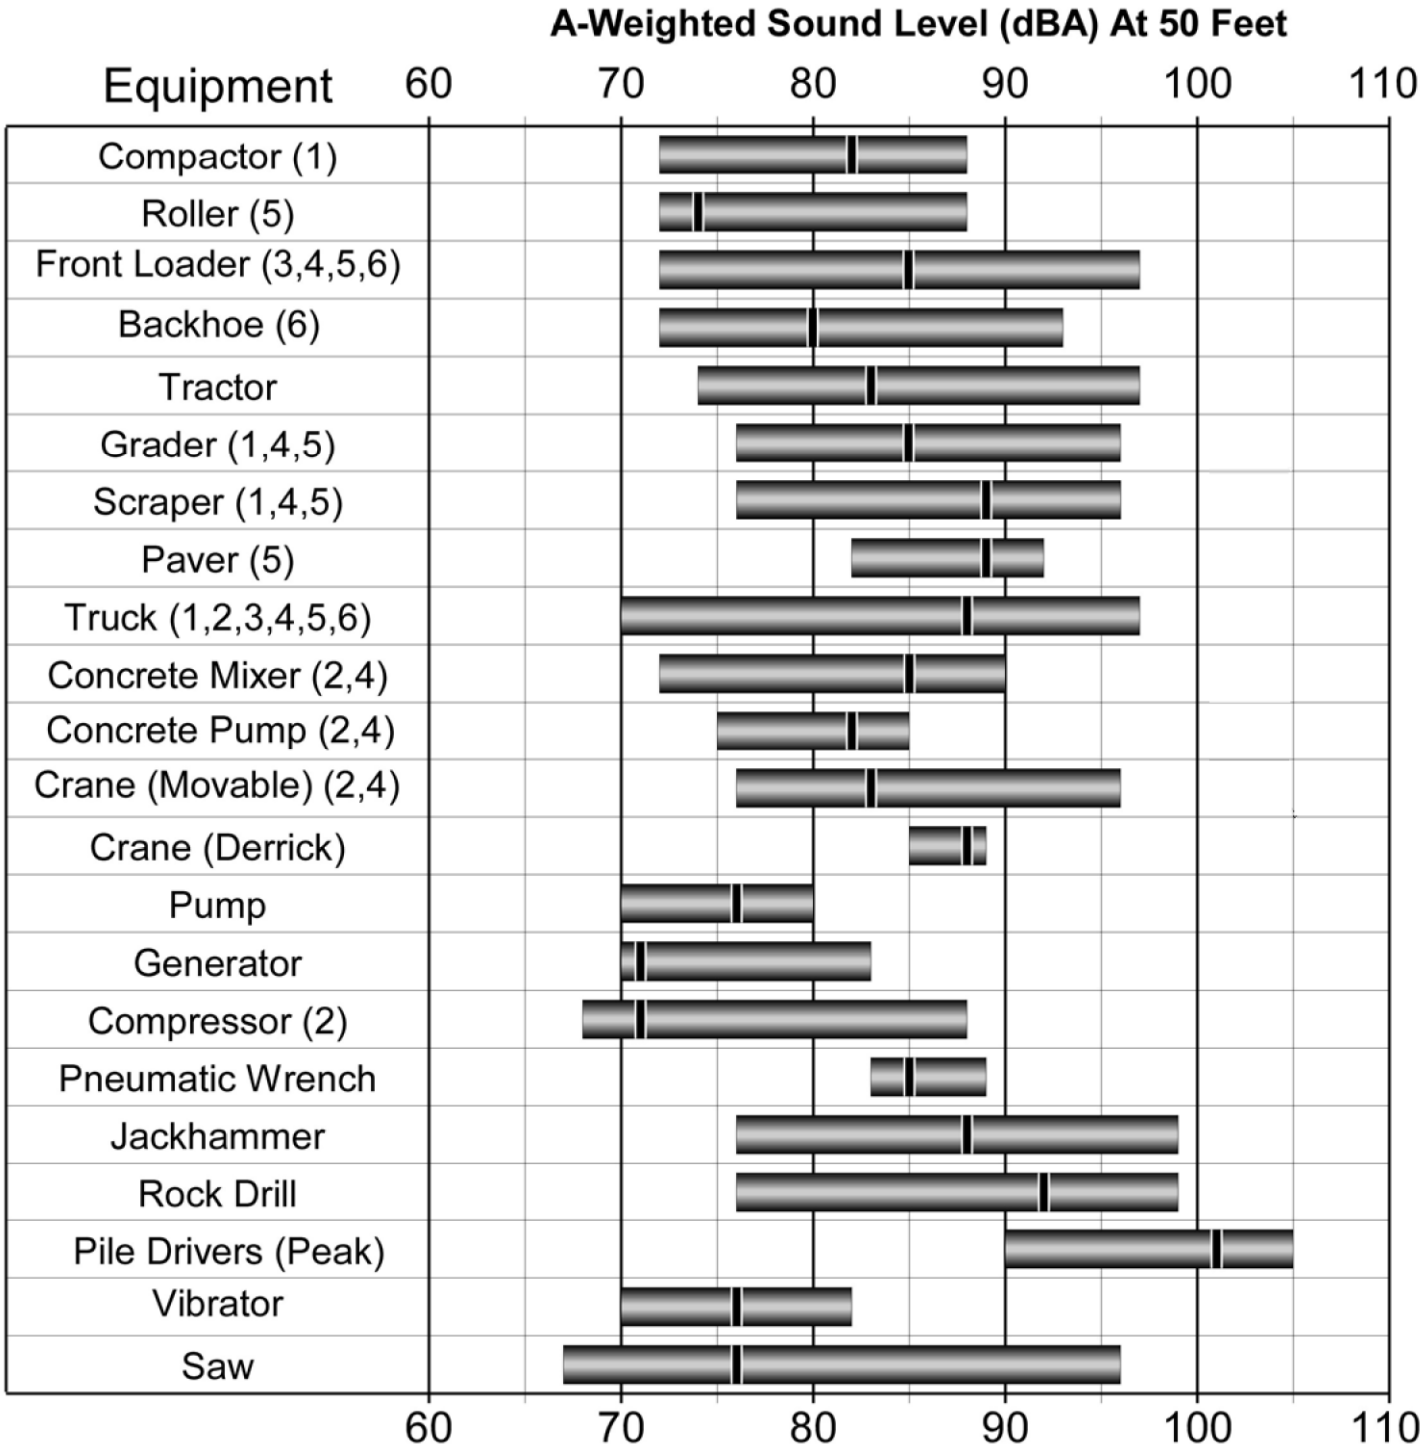
- Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;
- Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or
- Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.

Off-site impacts due to on-site activities (i.e., loading yards) are measured against the Noise Ordinance criteria discussed in Section 1.3.2. Loading yard activities for the proposed project will be required to meet the Noise Ordinance standards or a significant impact will occur.

Proposed land uses in high noise impact zones that are not compatible per the State Guidelines (Section 1.3.3) will be identified as a significant impact. In other words, if a proposed land use is in an area that is identified as being "normally unacceptable" or "clearly unacceptable" then it must be shown how that land use can be made compatible with the noise environment. Possible approaches may be to construct noise barriers to reduce the noise environment or to provide a high level of sound insulation. If mitigation is not feasible then this would be identified as a land use conflict with the proposed land use, and a significant impact would result.

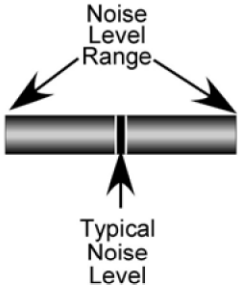
## 2.2 Construction Noise

Construction noise often represents a short-term impact on ambient noise levels. However, due to the magnitude of this project, construction will occur on a routine basis from 2015 through 2030. Noise generated by construction equipment, including trucks, graders, bulldozers, concrete mixers and portable generators can reach high levels.



Worst-case examples of construction noise at 50 feet are presented in Exhibit 11. The peak noise level for most of the equipment that will be used during the construction is 70 to 95 dBA at a distance of 50 feet. Noise levels at further distances are less. For example, at 200 feet, the peak construction noise levels range from 58 to 83 dBA. Note that these noise levels are based upon worst-case conditions. Noise measurements made by Mestre Greve Associates demonstrate that the noise levels generated by commonly used grading equipment (i.e. loaders, graders and trucks) generate noise levels that typically do not exceed the middle of the range shown in Exhibit 11. However, the noise levels shown in Exhibit 11 will be used as the basis for the estimates presented here and represent a worst-case estimate. Also included in Exhibit 11 is an indication of which phases of construction will use what equipment. For example, Exhibit 11 indicates that front loaders will be used in constructing utilities, interchange improvements, and paving/curbing, and landscaping. This is a preliminary estimate of the equipment to be used and may be modified when construction is underway.

Construction operations will occur in two general areas; on-site and off-site. The on-site construction activities will be more intense. Some phases of the on-site construction are expected to occur for 24 hours a day, 7 days per week. The on-site construction will occur periodically over a 15-year period possibly beginning in 2015. Off-site construction will be much less intense and consist of some minor grading, drainage, interchange, utility and roadway improvements. The off-site construction will be of shorter duration and will only occur during the daytime weekday hours. Both on-site and off-site construction are discussed in more detail below.



### *2.2.1 On-Site Construction*

Work within the project site will consist of mass grading, fine grading, building construction, utilities installation, interchange improvements, paving and curbing, and landscaping. Work within the project area may be done on a 24-hour/7-days per week schedule. Construction activities would occur at varying locations on-site, but may last for an extended period of time. For instance, grading activities for each phase are anticipated to last one year. However, the

grading may be concentrated in one area for a while and then move on to another area, and so on. In other words, grading noise will not impact one area for an entire year. Building construction will occur from time to time over a 15-year period lasting from 2015 through 2030.

6 - Landscaping

*Exhibit 11*

# Construction Noise Levels

*Mestre Greve Associates*
*Division of Landrum & Brown*

Construction noise levels at a receptor are primarily due to how close the equipment operates to a receptor. For example, one scraper operating 50 feet from a receptor will have about the same noise level as four scrapers operating at 100 feet from the receptor or sixteen scrapers operating at 200 feet from the receptor. Another important factor, is that the louder types of equipment are much more important than the quieter pieces of equipment. For example, a scraper will have a typical noise level of 89 dBA (see Exhibit 11) at 50 feet. Four compactors, which have typical noise levels of 83 dBA at 50 feet, will result in the same noise level as one scraper at the same distance. Therefore, a construction noise analysis usually focuses on the loudest pieces of equipment that are going to operate near the receptor.

**Residences north of the freeway.** Homes are located on the north side of State Route 60. For homes on the north side of the freeway, noise generated by the freeway will dominate the noise environment and construction noise generated on the project site will be inconsequential. Even at night, the peak noise levels due to trucks traveling on State Route 60 will be louder than peak noise levels generated by project construction. Certain conditions at night, such as low inversions and very calm conditions, can increase the ability of construction noise to travel to the residences north of the freeway. However, these same conditions would also amplify the traffic noise generated on the freeway. The residents north of the freeway will not be significantly impacted by project construction noise because the freeway noise will continue to dominate the immediate noise environment.

**Residences within the Specific Plan area.** Three pockets of homes are located within the Specific Plan area, and construction noise will be an issue for occupants of these residences. While these areas are to be designated for Light Logistics development under the proposed Specific Plan, they may remain in residential use indefinitely. Future Light Logistics uses would not be sensitive to noise, but as long as these sites remain in residential use, they will need to be considered as noise sensitive uses. These homes may be located adjacent to areas where intense construction activities could occur. These homes may experience worst-case unmitigated peak construction noise levels (Lmax) up to 97 dBA. The average noise levels are typically 5 to 15 dB lower than the peak noise levels. Average noise levels (Leq) at 50 feet from the residence could be in the range of 82 to 92 dBA during most phases of construction.

The City of Moreno Valley Municipal Code does not include any exemptions for construction noise. Therefore, construction would be subject to the limitations of 60 dBA during the daytime and 55 dBA at the nighttime measured at occupied residential locations. Exceeding these limits would result in a significant noise impact. Based on information in the previous paragraph these noise levels would regularly be exceeded during the daytime and nighttime hours at residences within the Specific Plan area. Based on an Leq noise level of 90 dBA at 50 feet, an observer would need to be 1580 feet from the construction to experience a noise level of 60 dBA (Leq), or 2,800 feet for a noise level of 55 dBA (Leq). A residence within 1,580 feet during active construction during the daytime would be impacted, or within 2,800 feet during the nighttime would be impacted. Mitigation is discussed in Section 3.1.1.

**Residences Adjacent to the Specific Plan area.** Residences are located adjacent to the project in the areas along Redlands Boulevard, Merwin Street, Bay Avenue, Cactus Avenue, and Gilman

Springs Road. The potential for noise impacts will be similar to those impacts for residents within the Specific Plan area. Specifically, a receptor would need to be more than 1,580 feet from the construction to experience a noise level less than 60 dBA (Leq), or more than 2,800 feet for a noise level less than 55 dBA (Leq). A residence within 1,580 feet during active construction during the daytime would be impacted, or within 2,800 feet during the nighttime would be impacted. Mitigation is discussed in Section 3.1.1.

### *2.2.2 Off-Site Construction*

Off-site construction will be necessary for the project. Off-site improvements include road improvements along Cactus Avenue and Redlands Boulevard, water and utility improvements, construction of detention basins, debris basins, and interchange improvements. Areas of off-site construction are shown in Exhibit 12. At this time the duration of construction and the equipment to be used for these improvements are not known.

Roadway and interchange improvements are planned along Cactus Avenue, Redlands Boulevard, and State Route 60. Often the loudest pieces of equipment associated with this type of construction are the graders/scrapers. Peak noise levels at 50 feet can reach 96 dBA, with average noise levels (Leq) in the 85 dBA range. Noise levels of 60 dBA (Leq) could be exceeded for up to 900 feet from the construction area. Residences are commonly located within 900 feet of these areas and are exposed to noise levels in exceedance of the Moreno Valley noise criteria. Mitigation measures are recommended in Section 3.1.2.

Drainage improvements, sewer improvements, water and utility improvements, and construction of detention/debris basins are other off-site construction activities that will be a part of the project. Construction of these improvements generally use fewer and smaller pieces of equipment, which results in lower noise levels. For example, at these construction a single backhoe may likely be loudest piece of equipment. A backhoe may have a peak noise level that exceeds 90 dBA at 50 feet, but has an average noise level around 80 dBA (Leq) at 50 feet. At this noise level one would need to be more than 500 feet away to experience a noise level (Leq) of less than 60 dBA. This noise level exceed the City's daytime criteria and therefore, even for these construction activities significant noise impacts could occur. Mitigation measures are recommended in Section 3.1.2.

## 2.3 Long-Term Off-Site Impacts

This section examines the long-term off-site noise impacts from the proposed project. Specifically traffic noise increases due to the project and its cumulative impacts are examined. Increased traffic caused by the project will result in increased traffic noise levels along the roadways in the vicinity of the project. Noise impacts generated on-site by truck circulation and loading/unloading activities are also assessed. Finally, although not specifically proposed as part of this project, the interchange with State Route 60 at Theodore Street will be improved at some point in the future. The noise constraints of this work, particularly as they relate to the California Department of Transportation (Caltrans) requirements are discussed.

### *2.3.1 Traffic Noise Impacts Due To The Project*

The project will generate significant traffic, particularly truck traffic, and therefore, has the potential to generate noise impacts along the roadways serving the project site. The traffic study for the project provided the project data for the noise analysis. The traffic study area for surface streets covered all intersections in Moreno Valley of a collector or higher classification street with another collector or higher classification street, at which the proposed project will add 50 or more peak hour trips. The study area also included the main routes between the project and the neighboring communities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area for freeways was selected to cover the freeway routes radiating from the project site to the north, south, east, and west. The analysis covered SR-60 from SR-62 (Twenty-nine Palms Highway) in the east to SR-71 (Chino Valley Freeway) in the west, SR-91 from I-215 in the east to I-15 in the west, and I-215 from SR-210 in the north to the Scott Road interchange in the south. Additional analysis was done by the traffic engineer to confirm that significant truck impacts would not occur extending all of the way to the Ports of Los Angeles and Long Beach. Beyond these limits project traffic would be so small in absolute terms or as a percentage of background traffic that it would no longer be discernable from random error in modeling protocols or the normal daily variation in traffic, and routing of the small amounts of remaining traffic would be influenced by minor local factors (e.g. stop signs, lane widths) that cannot practicably be represented in a regional model.

Three hundred and thirty nine (339) arterial roadway links and eighty (89) freeway segments were provided for the noise analysis. The noise increase (or decrease) for each roadway link due to the project was calculated for every link and can be found in the Appendix. The change in noise level was calculated for all 428 roadway links with and without the project for the existing case (2012), 2022, and 2035. Additionally, Phase 1 plus existing traffic was evaluated. Based on the threshold criteria presented in Section 2.1, roadway links with noise increases less than 1.5 dB would not have a substantial noise increase and are not presented in the main body of the this report. Similarly, any roadway links that do not have sensitive receptors (e.g., residential, schools, and churches) are also not presented in the main body of this report. Therefore, of the the 428 links analyzed, 44 links have sensitive receptors and an increase of 1.5 dB for at least one case, and are presented in the following exhibits.

Exhibit 13 presents noise data for 2012 for the 44 links. The table shows a roadway ID number which corresponds to the traffic study ID number. The roadway name and roadway segment are then presented, followed by whether a soundwall is present or not. The CNEL noise level at the residential property is shown for the No Project and With Project cases. The change in noise level and whether it is a substantial increase are presented in the final two columns. The significance thresholds for project impacts presented previously in Section 2.1 were used to determine whether the increase was a substantial increase or not. Fourteen (14) links are identified as having a substantial increase and these represent potentially significant impacts.

The noise increases in Exhibit 13 represent the noise increase directly caused by the project. Exhibit 13 represents the hypothetical existing plus entire project case, and essentially represents the entire project placed into existence in the 2012 timeframe. Exhibits 14, 15, and 16 present the noise levels and whether a substantial increase will occur for 2012 with Phase 1, 2022 with

Phase 1, and 2035 with entire project. The noise increases shown in these three exhibits represents the increase that is directly attributable to the project.

Note that there are some roadway links listed with a "0.0" traffic noise level. These links represent roadway links that are not yet constructed and therefore, there is no traffic noise generated yet on these roadway links.

*Exhibit 16*

# Traffic Noise Levels for 2035

*Mestre Greve Associates*
*Division of Landrum & Brown*

Twenty-one (21) roadway segments are identified in Exhibits 13, 14, 15, and 16 where a significant noise impact will occur for at least one case. Each area is discussed below. Some contiguous roadway segments are grouped into one discussion. Link ID numbers are provided in parenthesis so that the roadway segments can be correlated with the traffic study. Unless mitigated, a significant noise impact will occur along all 21 roadway segments. Mitigation for each area is discussed in Section 3.2.1.

**Cactus Avenue West of Redlands Boulevard (32).** This area is identified in the traffic analysis as "Cactus Avenue West of Redlands Boulevard," but would extend from Redlands Boulevard to Moreno Beach Drive at which point the traffic would disperse further. This area shows noise increases ranging from 0.7 dB to 4.2 dB depending on the study year. Only the 2035 case results in a significant noise increase. Single-family residences back up to this street with rear yards adjacent to Cactus Avenue. Soundwalls are located along the residences that are approximately 6 foot high. Rear yard areas are approximately 60 feet from the centerline of the roadway. In 2035, the noise levels projected for the yard area, including the effects of the soundwall, will be 66.2 CNEL.

**Cactus Avenue Redlands Boulevard to Cactus Avenue Extension (50).** This area is a small group of single-family homes along Cactus Avenue between the future Cactus Avenue Extension (Street D) and Redlands Boulevard. A significant noise increase is projected for all four case years. Currently there is no soundwall in this area.

**Gilman Springs Road between Eucalyptus Avenue and Street C (30) and Jack Rabbit Trail and Bridge Street (191).** There are three single-family homes scattered along these roadway segments. All of the houses are setback from the roadway, and none have soundwalls.

**Ironwood Avenue between Redlands Boulevard and Highland Boulevard (36).** A significant noise increase is projected for 2012 with Phase 1 and with full project study years. In 2035, the noise level is projected to be 60.8 CNEL. There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway.

**John F. Kennedy Drive South of Cactus Avenue (9).** The homes along John F. Kennedy Drive south of Cactus Avenue will experience significant noise increases for all four study years. Similar to the area along Cactus Avenue, this noise increase will be due to cars and light vehicles, and not heavy trucks. The homes along the west side of the roadway are generally depressed with respect to the road and have a roughly 6 foot soundwall. The homes on the east side of the roadway do not have any soundwalls and are elevated with respect to the roadway. Rear yards areas on both sides of the street generally are in the range of 60 to 90 feet from the centerline of the roadway. Without any sound barrier, the noise levels at the residences along John F. Kennedy Drive will be 67.5 CNEL. The homes on the west side of the roadway have soundwalls and slope conditions that will reduce noise levels 6 to 10 dB, putting these homes under the City criteria. Homes on the west side of the street will not be impacted. Homes on the east side of the street do not have soundwalls, and there will be a significant impact unless adequately mitigated.

**Locust Avenue between Moreno Beach Drive and Smiley Boulevard (54).** Only the 2035 case results in a significant noise increase for this area. In 2035, the project will result in a 1.5 dB increase raising the noise level to 66.9 CNEL. There are three single-family homes along this roadway and they front onto the roadway.

**Redlands Boulevard from Eucalyptus Avenue to State Route 60 (13).** The noise analysis shows significant noise increases along this roadway segment for the 2012 and 2035 cases. There are scattered homes in this area that face Redlands Boulevard.

**Redlands Boulevard from State Route 60 to San Timoteo Canyon Road (35, 42).** The noise analysis shows significant noise increases along this roadway segment for the 2012 and 2035 cases. The increases in noise are approximately 2 dB with a resultant noise level around 71 CNEL range. There are 28 homes along this roadway that would be affected. The single-family homes are scattered and generally front the roadway.

**San Timoteo Canyon Road from Alessandro Road to Live Oak Canyon Road to Redlands Boulevard (177, 179).** The roadways impacts only show a significant noise impact in the existing (2012) to existing plus project comparison. The noise increases by about 3 dB with resultant noise levels in the 65 to 66 CNEL range. There are four scattered residences along the is roadway that would be impacted.

**Theodore Street from State Route 60 to Highland Boulevard (38).** The noise analysis indicates that with project in the year 2035 the resulting noise level will be 65.2 CNEL. There are four homes on Theodore Street that front onto the roadway.

**Street A from Eucalyptus Avenue to Street F; Street E north of Alessandro Boulevard; and Street F east of Street A (2, 4, 19).** There are three groups of homes that may remain within the project area. The analysis shows significant noise increases for all four cases. The proposed Specific Plan designates these properties for Light Logistics uses, but the residences may remain indefinitely. The future Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain as a non-conforming use, must be considered as a sensitive land use. The first group of homes is east of Redlands Boulevard north of the intersection with Brodiaea Avenue. Street E will be constructed west of these homes. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways.

The second group of homes is on the east side of Street A (Theodore Street) midway between the future Street B and Street F. There are two homes in this area. Their noise environment will be changed significantly. The exact alignment of the roadway is to be determined, but noise levels could exceed 70 CNEL at the residences. The noise levels at these homes would be unacceptable to the residents, and a significant impact would occur.

The third area is a single home and lies east of Street A and along Street F. Currently there is essentially no traffic on this street. There is one residence in this area. Depending on the alignment for the street noise levels could exceed 70 CNEL. Since this home will experience a substantial noise increase, this is considered a significant impact.

**Cactus Avenue Extension from Street E to Cactus Avenue (8).** Cactus Avenue Extension (Street D), as shown in the Specific Plan, serves as a connection between the project's westerly loop street (Street E) and Cactus Avenue. The road will come down the western side of the project parallel to Merwin Street and roughly 1,250 feet east of Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. There would be essentially no heavy trucks using this roadway. There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic on Cactus Avenue Extension. There are no soundwalls along these homes. The noise forecast shows that the 65 CNEL contour will lie 114 feet from the centerline of Cactus Avenue Extension. If the centerline of Cactus Avenue Extension is located closer than 114 feet to the property line of the residences, then a significant impact would occur. However, this appears to be unlikely since the current plan shows Cactus Avenue Extension more than 1,000 feet from the homes.

**State Route 60 from Pigeon Pass Road to Perris Boulevard (29, 30).** This area will only have a substantial noise increase in the 2012 case. The noise levels are projected to increase by 1.5 to 1.7 dB in this area with resultant noise levels in the 66.9 to 68.0 CNEL range. All residential areas along this stretch of freeway have soundwalls in place.

**State Route 60 from Moreno Beach Drive to Redlands Boulevard (33).** A substantial increase is shown for the existing case and for 2035. There are soundwalls in place for all residences in this area. Noise levels will reach 67.1 CNEL by 2035.

**State Route 60 from Redlands Boulevard to Theodore Street (34).** A substantial noise increase is identified for this roadway for the existing case only. The resultant noise level will be 63.5 CNEL with an increase due to the project of 3.4 dB. No soundwalls are present in this area. The residential area is setback from the freeway and is clustered along Redlands Boulevard north of the freeway.

#### *2.3.1.1 Changes from January 24, 2013 Noise Analysis*

The traffic analysis was revised to reflect a downsizing of the project and other factors. Most significantly was the fact that the project was reduced by one million square feet of high-cube warehousing. The updated traffic assessment was of course used for this analysis. In the January 2013 noise analysis, 33 roadway segments were identified where a significant noise impact directly attributable to the project would occur for at least one of the impact scenarios. In this analysis 21 roadway segments have been identified as having a potentially significant noise impact that is directly attributable to the project. The reduction in impacted areas is a direct result of the revised traffic analysis which reflects a downsizing of the project. The noise analysis procedures and significance thresholds have not been changed from the January 2013 noise assessment. The roadway links that were previously identified as being impacted and are not now impacted are listed below.

- Day Street between Cottonwood Avenue and Alessandro Boulevard (109)
- Fir Avenue between Quincy Drive and Redlands Boulevard (62)

- Moreno Beach Drive between Locust Avenue and Ironwood Avenue (56)
- Perris Boulevard between John F. Kennedy Drive and Iris Avenue (303)
- Placentia Avenue from El Nido Avenue to Evans Road and on to Water Avenue (431, 432)
- Quincy Drive from Cactus Avenue to Alessandro Boulevard and to Cottonwood Avenue (502, 503)
- Reche Canyon Road from Keissel Road to Reche Vista Drive and on to High Country Drive (205, 206)
- Redlands Boulevard from Eucalyptus Avenue to Dracaea Avenue (12)
- State Route 60 from Perris Boulevard to Nason Street (31)

There are five roadway segments that do not now have a direct impact but still have a cumulative impact. These roadways are as follows.

- Fir Avenue between Quincy Drive and Redlands Boulevard (62)
- Gilman Springs Road between Eucalyptus Avenue and Street C (31) and Jack Rabbit Trail and Bridge Street (191)
- Moreno Beach Drive between Locust Avenue and Ironwood Avenue (56)
- State Route 60 from Perris Boulevard to Nason Street (31)

Additionally, the following roadway was previously identified as being impacted, and mitigation was identified as not being feasible. Now mitigation for this roadway is considered feasible, mitigation is proposed that will reduce the impact to less than significant.

- Cactus Avenue west of Redlands Boulevard (32)

### *2.3.2 Cumulative Noise Impacts*

The cumulative noise increases represent the increase that will occur due to the project plus the other projects in the area and general growth in the region. Three hundred and thirty nine (339) arterial roadway links and eighty (89) freeway segments were provided for the noise analysis; a total of 428 roadway links. The noise levels for each roadway link can be found in the Appendix.

The project's incremental contribution to a cumulative noise increase would be considered cumulatively considerable and significant when ambient noise levels affect noise sensitive land uses and when the following occurs:

A project increase of the ambient (cumulative without project) noise level by 1 dB or more, and the predicted future cumulative with project noise levels cause the following cumulative increases:

- Increase noise levels by 5 dB or more where the existing noise level is less than 60 CNEL;
- Increase noise levels by 3 dB or more where the existing noise level is 60 to 65 CNEL; or

- Increase noise levels by 1.5 dB or more where the existing noise level is greater than 65 CNEL.

The change in noise level was calculated for all 428 roadway links to determine the increase in ambient noise level (2035 No Project compared to 2035 With Project). Roadway links with noise increases less than 1.0 dB would not have a substantial noise increase and are not presented in the main body of the this report. (Noise levels for all roadways can be found in the appendix.) Similarly, any roadway links that do not have sensitive receptors (e.g., residential, schools, and churches) are also not presented in the main body of this report, because without sensitive receptors there cannot be a significant impact. Therefore, of the 428 links analyzed, 44 links have sensitive receptors and an increase in the ambient of 1.0 dB or more are presented in the following exhibits.

Exhibit 17 presents noise data for 44 links. The table shows a roadway ID number which corresponds to the traffic study ID number. The roadway name and roadway segment are then presented, followed by whether a soundwall is present or not. The baseline CNEL noise level at the residential property is shown for the Existing case (2012), followed by 2035 No Project, and 2035 With Project cases. The change in noise level from baseline is presented in the following column. That is, the noise level difference between Existing (2012) and With Project (2035) is presented. Next the change from No Project (2035) is presented which represents the difference in noise level between the No Project and With Project cases. The last column identifies whether it is a substantial increase based on the thresholds listed above. Thirty (30) links are identified as having a substantial increase and these represent potentially significant cumulative impacts. All of these areas represent residential areas. Mitigation is discussed in Section 3.2.2.

Note that there are some roadway links listed with a “N/A” for the traffic noise level. These links represent roadway links that are not yet constructed for the timeframe being considered, and therefore, there is no traffic noise generated yet on these roadway links.

| ID | Arterial | From | Soundwall? | Baseline | No Project | With Project | Change from Baseline | Change from No Project | Substantial Increase? |

*Exhibit 17*

# Cumulative Noise Increases

### *2.3.3 Off-Site Impacts From Warehousing Activities*

The project is proposing warehouse uses that would have loading docks and other accessory equipment operating on-site. In addition to loading dock activities, the project site will have air conditioning systems for the offices and parking lot activities associated with the warehouse uses. When directly adjacent to residential and other sensitive land uses, these activities can result in noise impacts.

Noise levels were measured at similar facilities to determine representative noise levels that might be generated by this type of activity. Noise measurements were made at two facilities; specifically, Lowes Distribution Center (3984 Indian Avenue, Perris, CA) and Ross Distribution Center (3404 Indian Avenue, Perris, CA). The Lowes facility is over 1.6 million square feet and the Ross facility is over 1.3 million square feet. The Lowes facility was very busy during the time of our measurements while the Ross facility had much less activity. Therefore, only the Lowes facility measurements are presented in this report and used for the analysis since they represent a worst case.

Noise measurements were taken 30 feet outside the property line of the Lowe's facility and 300 feet from the warehousing building. The measurement site was elevated with a clear line of sight into the warehousing area. The measurements were taken during the afternoon hours of March 13, 2012. All the measurements were performed using a Brüel & Kjær Model 2236 sound level meter mounted on a tripod. During the measurements, a large windscreen covered the microphone to eliminate the effect of unwanted wind-generated noise. Three 15-minute noise measurements were taken. Before and after the measurements were taken, a Brüel & Kjær 4231 calibrator with certification traceable to the National Institute of Standards and Technology was used to calibrate the sound meter to ensure that the measured sound level readings were accurate. At the conclusion of each set of measurements, the Leq, Lmin, and Lmax values were recorded on a data sheet. Table 7 shows the results of the measurements.

**Table 7**
**Warehousing Activity Noise (dBA)**

| Site | Lmax | Leq | Lmin |
|---|---|---|---|
| 1 | 69.0 | 56.0 | 45.4 |
| 2 | 68.9 | 55.2 | 45.9 |
| 3 | 74.2 | 57.3 | 46.4 |

The noise meter was facing the side of the Lowe's distribution center where approximately 111 loading bays were counted. Between the loading bays and the property line, truck trailers were parked. Almost all of the loading bays had trailers backed up to them, and forklifts loading the trailers could be heard. A truck would backup to a trailer once it was loaded and move it to the parking area between the building and the property line. It would then unhitch. Trucks would also move empty trailers to the loading docks, and other trucks would hitch to loaded trailers and drive them away.

The average noise level (Leq) was consistent for each of the three measurement periods, indicating that the activity level is about the same for each period. The minimum noise levels (Lmin) represent the ambient noise level in the area when no activity could be heard from Lowe's. The Lmax noise level for each of the three periods was due to truck activity. A truck air brake caused the Lmax in the first period, a truck hauling away a loaded trailer caused the Lmax in the second period, and a truck hitching into a trailer caused the Lmax in the third period.

Using the measurement from the third period, which had the highest noise levels, potential noise exposure levels can be calculated for various distances. Table 8 shows the noise levels for various distances from the warehouse property line with no noise barrier in place and with an assumed 12 foot noise barrier.

**Table 8**
**Noise Levels for Warehousing Activities**

| Distance from Facility (ft.) | Noise Level (dBA Leq) No Barrier | With 12' Barrier |
|---|---|---|
| 50 | 56.9 | 48.6 |
| 100 | 54.9 | 47.8 |
| 250 | 50.8 | 44.7 |
| 500 | 46.6 | 40.9 |

The City of Moreno Valley Noise Ordinance requires that noise levels remain below 55 dBA (Leq) during nighttime hours. To achieve this noise level the warehouse property line would only need to be 100 feet from the nearest residential property and no soundwall would need to be present.

Another consideration is whether the proposed activity will be substantially higher than current ambient conditions. No matter what is developed in the area, ambient conditions will be higher in future years due to higher levels of traffic and activity. Ambient noise levels were measured at seven sites that could border the World Logistics Center (i.e., Measurement Sites 3 through 9). The nighttime ambient noise levels (Leq) ranged from 35.8 to 61.8 dBA with an average for the sites of 46.6 dBA. To keep the noise levels at nearby residential areas less than typical ambient conditions, the warehousing property line should be located a minimum 250 feet and a 12 foot soundwall should be located along the perimeter of the property that faces any residential areas. This would include the approximately 220 residential units that are zoned for development near the southwest corner of the World Logistics Center. This would keep the warehouse noise to less than 45 dBA (Leq) at the residences. This would completely eliminate any conflicts between warehousing operations and residential land uses, and is recommended as a mitigation measure (see Section 3.2.3).

Another consideration for the warehousing activities are the potential noise impacts on the open space to the south of the project. Wildlife impacts are covered in the biological assessment and

are not addressed here. However, the open space area may be used by the public for walking and other leisurely activities. The State compatibility guidelines were presented previously in Exhibit 4. Open space is not specifically called out in the guidelines. However, playgrounds and neighborhood parks are identified as being "normally acceptable" for noise levels up to 65 CNEL. The warehousing activity will be less than 57 dBA at 50 feet and will be much less than 65 CNEL at 50 feet and less without mitigation. Therefore, the warehousing activities will be compatible with the open space area south of the project, and no mitigation is needed.

### *2.3.4 Interchange Improvements*

Interchange improvements will be needed for the interchange of State Route 60 at Theodore Street. Caltrans has completed a Project Study Report for the interchange and is underway with planning and environmental phase of the interchange. At this time the intersection designs and funding sources are not known, both of which will affect the future noise analysis requirements for these improvements.

Although the interchange design has not been undertaken, preliminary or conceptual designs have been considered. The most likely configuration would eliminate the existing westbound ramps in the northeast quadrant. The only sensitive receptors are in the northeast quadrant, and therefore, removing these ramps would have beneficial noise impact on this receptor. New ramps would be constructed in the northwest quadrant (westbound on-ramp and a loop off-ramp). The existing eastbound ramps would be removed in the southwest quadrant and replaced with new eastbound off-ramp and eastbound loop on-ramp. Currently, no ramps are located in the southeast quadrant; however, an eastbound on-ramp would be added under the most likely configuration. Since all the construction would occur in quadrants not occupied by sensitive receptors, construction impacts would be insignificant. The traffic noise from the SR-60 will be louder than the construction noise at the sensitive receptor in the northeast quadrant. Noise from traffic ramps is usually insignificant in comparison to the mainline traffic noise generation. Elimination of the ramp in the northeast quadrant would have a benefit to the sensitive receptor, but it would only be a minimal benefit. Opening ramps in the other quadrants would not have any noise impact on the sensitive receptor in the northeast quadrant.

Noise analysis requirements are identified in the California Department of Transportation document "Traffic Noise Analysis Protocol," (May 2011). Projects defined as "Type 1" require a full noise analysis per Caltrans protocol. If federal funds are also involved, then the Federal Highway Administration under 23CFR772.13 also requires that noise abatement be considered and evaluated for feasibility and reasonableness. In general, projects that add a through traffic lane (not an auxiliary lane) to the freeway will be considered as a Type 1 project. Projects that also substantially modify the horizontal or vertical alignment of the freeway would be considered a Type 1 project. For interchange projects, per the Caltrans Protocol and 23CFR772, a project would be considered as Type 1 when there is an "addition or relocation of interchange lanes or ramps added to a quadrant to complete an existing partial interchange…" Although there is no proposed final design for the interchange improvements available at this time, it is likely that the project will be classified as a Type 1 project since ramps are being added. A full noise analysis will likely be required based on the final design of the ramp. However, given the lack of

receptors in the affected quadrants it is highly unlikely that there would be a noise impact nor mitigation (e.g., soundwalls) required.

### *2.3.5 Ground Borne Vibration*

Vibration is a trembling, quivering, or oscillating motion of the earth. Vibration is similar to noise in its transmission. Vibration is transmitted in noise-like waves through the earth and solid objects.

There are several ways to categorize vibration sources. One way is to divide vibration into natural and human sources. Natural sources include earthquakes, volcanic eruptions, sea waves, and landslides. Human sources of vibration include explosions, machinery, traffic, trains, and construction equipment. However, vibration sources can also be described as continuous, such as operating factory machinery, or transient, such as explosions.

As with noise, vibrations can be described by amplitude and frequency. The vibration amplitude in the earth is characterized in three ways: displacement, velocity, and acceleration. Particle displacement is the distance the soil particles travel from their original location in inches or millimeters. Particle velocity is the velocity of the soil particles in inches per second or millimeters per second. Particle acceleration is the acceleration of the soil particles in inches per second per second or millimeters per second per second. Typically, particle velocity is used to describe vibration. Table 9 presents the human reaction to various levels of peak particle velocity. Vibrations also vary in frequency. Traffic vibrations generally range in frequencies from 10 to 30 Hz, and tend to average around 15 Hz. However, due to their suspension systems, city buses often generate frequencies around 3 Hz at high vehicle speeds. It is more uncommon, but possible, to measure traffic frequencies above 30 Hz.

**Table 9**
**Human Reaction to Typical Vibration Levels**

| Vibration Level Peak Particle Velocity (inches/second) | Human Reaction |
|---|---|
| 0.0059 - 0.0188 | Threshold of perception, possibility of intrusion. |
| 0.0787 | Vibrations readily perceptible. |
| 0.0984 | Level at which continuous vibrations begin to annoy people. |
| 0.1968 | Vibrations annoying to people in buildings. |
| 0.3937 - 0.5905 | Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges. |

Source: Caltrans 1992.

The way vibration is transmitted through the earth is called propagation. Propagation of earthborn vibrations is complicated because of the endless variations in the soil through which waves travel. As vibration waves propagate from a source, the energy is spread over an ever-increasing area. The spreading of energy over an ever-increasing area is called geometric

spreading or geometric attenuation. Geometric attenuation reduces the amplitude of the vibration wave with distance. Material damping also results in amplitude reduction due to internal friction, soil layering, and voids. The amount of attenuation by material damping varies with soil type, condition, and frequency of the source.

There are no Federal Highway Administration (FHWA), state, or local standards for vibration. According to the FHWA, highway traffic and construction vibrations pose no threat to buildings and structures; annoyance to people is not considered any worse than other discomforts experienced from living near highways. However, a substantial amount of research has been completed to compare vibrations from single events such as dynamite blasts with architectural and structural damage. The U.S. Bureau of Mines has set a safe limit of 0.5 inches per second peak particle velocity to avoid structure damage in residential structures (U.S. Bureau of Mines 1980). Below this level, there is virtually no risk of building damage.

Typical ambient vibration sources consist primarily of roadway traffic on major roadways. With normal roadway traffic, heavy trucks and buses generate the highest earthborn vibrations. Vibrations from these vary with pavement conditions. Potholes, pavement joints, and differences in the settlement of pavement all increase vibration levels from traffic. Well maintained, roads typically do not result in substantial vibration levels. Even roads with irregularities typically only generate substantial levels of vibration very near, less than 50 feet from the irregularity.

Roadway vibrations are typically not perceptible more than 50 feet from the roadway except in very unusual circumstances. Generally, the interface between the soft tire of a truck or automobile will not generate significant vibration unless the road is in poor shape (e.g., potholes, pavement joints, etc.) Therefore, the project is not projected to generate significant levels of vibration.

## 2.4 Compatibility of Proposed Uses With Noise Environment

### *2.4.1 Traffic Noise*

Compatibility with traffic noise is based on the CNEL noise scale. The State compatibility matrix, presented previously as Exhibit 4, shows that industrial uses are compatible with noise environments up to 75 CNEL. (The industrial category is the closest to the proposed Logistics Development and Light Logistics shown in the matrix.) Noise zones of 75 CNEL or greater would only occur right next to State Route 60. For ultimate traffic noise levels, the 75 CNEL contour lies 140 feet from the centerline of the State Route 60, which falls just past the shoulder of the current alignment. Therefore, none of the area proposed for Logistics Development or Light Logistics would be exposed to noise levels greater than 75 CNEL, and there would be no incompatibilities between the traffic noise environment and the proposed land uses.

### *2.4.2 SDG&E and SCG Operations*

Exhibit 7 shows that the worst-case compressor station operational characteristics will result in a maximum noise level just above 65 CNEL within the project area proposed for development

(i.e., not open space). Typical commercial construction results in buildings that achieve at least a 20 dB reduction of outdoor noise levels. Therefore, an office use exposed to the highest noise level from the compressor station will be just above 45 CNEL and below the 50 CNEL limit prescribed by the City's General Plan. Exhibit 8 shows that the Leq noise level generated by the compressor station does not exceed 60 dBA Leq beyond the property lines of the facility. Therefore, the compressor station is not considered a noise disturbance based on City criteria. Operation of the compressor station will not result in any interior noise levels exceeding the limits established by the City in the General Plan. Further, operation of the compressor station is not considered a noise disturbance. Therefore, the project will not be significantly impacted by the operation of the compressor station.

Exhibit 9 shows that the maximum noise level from a blow-down at the SDG&E compressor station within the area proposed for development (i.e., the Logistics Development land use) is 100 dBA. A person would need to be exposed to this level for more than a cumulative two hours in a day before permanent hearing loss would be expected. As discussed above, blow-down events at the SDG&E compressor station typically do not last longer than 90 seconds. Therefore, the SDG&E blow-down events will not significantly impact the proposed project.

Exhibit 10 shows that the SCG blow-down events will result in noise levels as high as 130 dBA just outside the fence line of the southern facility and noise levels in excess of 135 dB just outside the fence line of the northern facility. In fact, observers within approximately 250 feet of the blow-down points would be exposed to noise levels greater than 115 dBA which would likely cause permanent hearing damage regardless of the exposure time. The SCG blow-downs could last as long as 90 minutes. Observers exposed to noise levels greater than 102 dBA, within approximately 1,300 feet from the blow-down point could experience permanent hearing loss based on this event duration.

Because noise generated by SCG blow-down events could result in permanent hearing damage in areas proposed for development by the project, the project will be significantly impacted by the SCG blow-downs. Mitigation is discussed in Section 3.3.

# 3.0 MITIGATION MEASURES

## 3.1 Construction Noise

### *3.1.1 Impacts Due to On-Site Construction*

The analysis presented in Section 2.2 shows that on-site project construction could result in significant noise impacts to nearby residences if uncontrolled. The usual method of controlling construction noise is through limiting construction hours to daytime and weekday time periods only. However, the proposed project includes construction that could occur 24 hours per day for 7 days per week for these construction activities.

Elimination of nighttime construction within 2,800 feet of residences would lower the noise levels to 55 dBA (Leq) at the closest residences. The noise levels would meet the 55 dBA (Leq) nighttime criteria contained in the Moreno Valley Noise Ordinance. The Noise Ordinance identifies the nighttime period as the hours between 10 p.m. and 8 a.m. This restriction should only be applied to residential areas south of State Route 60. Residences north of the freeway experience high enough noise levels due to the freeway that the freeway would remain the dominant noise source and construction noise would be masked by the freeway noise.

The following mitigation measures are identified for significant construction noise impacts:

**N-1. No Construction Vehicles on Redlands Boulevard South of Fir Avenue.** No construction vehicles of any type for on-site construction shall be permitted on Redlands Boulevard south of Fern Avenue. The prohibition for construction traffic should occur for all phases of the proposed project. This measure will eliminate any construction traffic impact on the residential areas adjacent to Redlands Boulevard.

**N-2. No Nighttime Grading Within 2800 Feet of Residences South of the Freeway.** Construction grading shall not be allowed within 2,800 feet of residences south of SR-60 between 8 p.m. and 7 a.m. Prior to the issuance of a grading permit, the developer shall submit a Noise Reduction Compliance Plan (NRCP) to the City as part of the grading permit submittal showing the limits of nighttime construction based on the currently occupied residential dwellings. The limits of nighttime grading shall be shown on the NRCP and grading plan submitted to the City. The limits of construction allowed at night shall be staked or posted on site, and contractors will be provided with a copy of the plan showing the limits of nighttime construction.

With the implementation of this mitigation measure the loudest noise level that would be experienced at any developed residential parcel would be less than 55 dBA (Leq) during the nighttime and these levels would be consistent with the limits established in the City's Noise Ordinance.

If grading is to occur at night within 2,800 feet of residences south of SR-60, then construction of a 12 foot temporary sound barrier will be required. A temporary barrier will reduce noise levels by approximately 10 dB. If an appropriate temporary sound barrier is constructed, then

the buffer area can be reduced from 2,800 feet to 1,580 feet. The temporary sound barrier may be constructed of plywood with a total thickness of 1-1//2 inches, or a sound blanket wall may be used. If sound blankets are used the curtains must have a Sound Transmission Class (STC) rating of 27. Examples of acceptable blankets can be found at the following websites; www.enoisecontrol.com/outdoor-sound-blankets.html and www.acousticalsurfaces.com/curtan_stop/curt_absorb.htm?d=12. Other blankets are acceptable as long as they have the required STC rating. Many unrated blankets are available, but their acoustic performance is generally unacceptable.

Noise measurements of construction activities often reveal that the construction noise levels are less than predicted. At the discretion of the builder, a Registered Professional Engineer can be hired to measure construction noise. Noise measurements over a three hour period on two consecutive nights can be used to modify the required buffer area. A Registered Professional Engineer with an expertise in acoustics shall prepare a report documenting the noise measurements and recommending a specific buffer distance. Once the report is submitted to and approved by the City, the buffer distance may be reduced to the distance recommended in the report.

**N-3. Install temporary sound barrier.** Construction within 1,580 feet of residential areas south of the freeway has the potential to exceed the daytime Moreno Valley Noise Ordinance criteria of 60 dBA (Leq). Any construction within 1,580 feet of a residence should be shielded from the residence with a 12 foot temporary sound barrier. A sound barrier will reduce the noise levels by about 10 dB. Residences within 500 feet may still be exposed to noise levels greater than 60 dBA (Leq), but the noise levels for residences greater than 500 feet from the construction area will experience noise levels consistent with the City's ordinance.

**N-4. Require Residential Grade Mufflers.** The grading contractor shall be required to certify that all equipment to be used will have residential grade mufflers or better on their equipment. All stationary construction equipment shall be placed so that emitted noise is directed away from noise sensitive receptors nearest the site. Additionally, stationary construction equipment if standardly fitted with an acoustic cover by the manufacturer shall have the acoustic cover in place during operation. This measure will eliminate any unnecessary construction equipment noise generation due to the use of sub-standard equipment.

**N-5. Locate Material Stockpiles 1,200 Feet from Residences South of the Freeway.** Material stockpiles shall be located at least 1,200 feet from the residences. Remotely locating the stockpiles reduces the noise at the residences from equipment traveling to and from the stockpiles, and the noise that is sometimes associated with stacking materials.

With these measures in place the impacts from on-site construction will be reduced to an extent. Specifically, nighttime impacts from on-site construction will be completely eliminated. However, daytime impacts to residents within 500 feet of construction will remain significant. Unavoidable adverse impacts due to construction that cannot be mitigated are identified in Section 4.0.

### *3.1.2 Impacts Due To Off-Site Construction*

Off-site construction generally is shorter term than on-site construction, uses smaller/quieter equipment, and will only operate during daytime hours. Due to the short-term nature of off-site construction, it generally is not feasible to construct temporary sound barriers.

**N-6. Limit off-site construction to daytime hours.** All off-site construction shall be limited to daytime hours between 7 a.m. and 8 p.m. on weekdays only. Weekend construction and construction during City holidays shall not be permitted.

**N-7. Install temporary sound barriers for off-site construction lasting more than 1 month.** Any off-site construction area that is anticipated to last one month or longer and within 900 feet of any residence shall have a 12 foot temporary sound barrier installed. The sound barrier will reduce noise levels by approximately 10 dB. The temporary sound barrier may be constructed of plywood with a total thickness of 1-1//2 inches, or a sound blanket wall may be used. If sound blankets are used the curtains must have a Sound Transmission Class (STC) rating of 27. Examples of acceptable blankets can be found at the following websites; www.enoisecontrol.com/outdoor-sound-blankets.html and www.acousticalsurfaces.com/curtan_stop/curt_absorb.htm?d=12. Other blankets are acceptable as long as they have the required STC rating. Many unrated blankets are available, but their acoustic performance is generally unacceptable.

With the above measures in place, residences within 500 to 900 feet (depending on the loudness of the construction equipment) could experience noise levels greater than 60 dBA (Leq) for off-site construction lasting less than one month. For construction lasting more than one month the potentially impacted area would be reduced to 160 to 300 feet. These impacts would only occur during weekday, daytime hours. No off-site construction would be allowed during nighttime or anytime during weekends and City holidays except for emergencies.

## 3.2 Long Term Impacts

### *3.2.1 Traffic Noise Impacts Due to Project*

Nineteen (19) roadway segments were identified in Section 2.3.1 where a significant noise impact will occur. *[Note: The traffic data has been revised since the previous study. In many areas the traffic noise impacts decreased in comparison to the previous study. The project has been reduced in size since the previous report. Fewer areas of impact are identified in this study due to the changes in the traffic forecasts.]* As described below many, but not all, of the impacted areas can be mitigated with a soundwall. The measure below recommends that the City establish a fair share plan, similar to that employed for traffic mitigation, to collect fees and to install the needed soundwalls.

**N-8. Provide Soundwalls As Mitigation.** When processing future individual buildings under the World Logistics Center Specific Plan, as part of the City's approval process, the City shall require the Applicant to take the following three actions for each building prior to the issuance of certificate of occupancy for the requested development:

***Action 1:*** Perform a building-specific noise study to ensure that the assumptions set forth in the FEIR prepared for the programmatic level entitlement remain valid. These procedure used to conduct these noise analyses shall be consistent with the noise analysis conducted in the programmatic FEIR and shall be used to impose building-specific mitigation on the individually-proposed buildings.

***Action 2:*** If the building-specific analyses identify that the proposed development triggers the need for mitigation from the proposed building, including all preceding developments in the specific plan area, the Applicant shall implement the mitigation identified in the WLC FEIR. Prior to implementing the mitigation, the Applicant shall send letters by registered mail to all property owners and non-owner occupants of properties that would benefit from the proposed mitigation asking them to provide a position either in favor of or in opposition to the proposed noise abatement mitigation within 45 days. Each property shall be entitled to one vote on behalf of owners and one vote per dwelling on behalf of non-owner occupants.

If more than 50% of the votes from responding benefited receptors oppose the abatement, the abatement will not be considered reasonable. Additionally, for noise abatement to be located on private property, 100% of owners of property upon which the abatement is to be placed must support the proposed abatement. In the case of proposed noise abatement on private property, no response from a property owner, after three attempts by registered mail, is considered a *no* vote.

At the completion of the vote at the end of the 45 day period, the Applicant shall provide the tentative results of the vote to all property owners by registered mail. During the next 15 calendar days following the date of the mailing, property owners may change their vote. Following the 15-day period, the results of the vote will be finalized and made public.

***Action 3:*** Upon consent from benefited receptors and property owners, the Applicant shall post a bond for the cost of the construction of the necessary mitigation as estimated by the City Engineer to ensure completion of the mitigation. The certificate of occupancy permits shall be issued upon posting of the bond or demonstration that 50% of the votes from responding benefited receptors oppose the abatement or, if the abatement is located on private property, any property owners oppose the abatement.

Mitigation is considered for each of the 19 areas identified in Section 2.3.1 and is discussed below. (Some contiguous roadway segments are grouped into one discussion.) In general mitigation by way of a soundwall is not feasible for certain types of cases. Where homes front onto a street a soundwall will not be effective. The driveway will cause a large gap in the soundwall making it ineffective. It should also be noted that for homes facing a roadway, the homes will usually have a backyard space on the rear side of the home that will be protected from noise since the house acts as a large noise barrier. These rear yards will experience noise levels less than 65 CNEL. A second case that is usually considered infeasible is an isolated single family that is not adjacent to any other lots with houses. A soundwall would have to extend across their property and onto adjacent lots to be effective. Otherwise the noise will wrap around the ends of the soundwall. Generally it is not feasible to construct a soundwall on

adjacent undeveloped parcels, and therefore, this case is also considered infeasible. A discussion of the feasibility of mitigation for each area is presented below.

**Cactus Avenue from Redlands Boulevard to Cactus Avenue Extension (50).** This area is a small group of single-family homes along Cactus Avenue between the future Cactus Avenue Extension (Street D) and Redlands Boulevard. A significant noise increase is projected for all studies. Currently there is no soundwall along these homes. The homes along Cactus Avenue are elevated above the roadway. A soundwall will need to be located at the top of the slope along the residents rear yards. At the top of slope the residents currently have wrought iron fencing. The wrought iron fencing would need to be replaced with a masonry wall or retrofitted with a glass barrier. The walls would need to be 6 feet tall with respect to the rear yard. Roughly 1,000 feet of barrier would need to be provided depending on where Cactus Avenue Extension intersects Cactus Avenue. With the retrofit the noise levels would drop at least 5 dB, with the resultant noise levels around 63 CNEL in rear yard areas. A new 6 foot high wall at the top of slope for the existing residences that are on the south side of Cactus Avenue between Cactus Avenue Extension and Redlands Boulevard is needed for mitigation. The 6 foot wall will need to extend roughly 1,000 feet. Prior to the opening of Cactus Avenue Extension, the soundwall should be in place.

**Cactus Avenue West of Redlands Boulevard (32).** This area shows noise increases ranging from 1.5 dB to 5.1 dB depending on the study year. Only the 2035 case results in a significant noise increase. Single-family residences back up to this street with rear yards facing Cactus Avenue. Soundwalls are located along the residences that are approximately 6 foot high. Rear yard areas are approximately 60 feet from the centerline of the roadway. In 2035, the noise levels projected for the yard area, including the effects of the soundwall, will be 66.2 CNEL which will be above the City standard of 65 CNEL. The significant impact is creating noise levels above the noise standard. It will be necessary to increase the height of the existing residential block wall, or to remove and replace the wall to lower the increase in project generated noise. The final wall height needs to be approximately 8 feet. (Calculations should be done specifically for this area when the measure is implemented.) With an approximately 8 foot noise barrier in place the noise impacts will be mitigated to less than significant. The impacted area extends from Redlands Boulevard to Moreno Beach Drive, and this entire area would need to be mitigated.

**Gilman Springs Road between Eucalyptus Avenue and Street C (30) and Jack Rabbit Trail and Bridge Street (190).** There are three single-family homes scattered along these roadway segments. All of the houses are setback from the roadway, but none have soundwalls. As discussed above, homes that are widely separated from other homes cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**Ironwood Avenue between Redlands Boulevard and Highland Boulevard (36).** A significant noise increase is projected for 2012 on this roadway link. In 2035, the noise level will be 60.8 CNEL. There are two single-family homes that front onto Ironwood Avenue. There are also two churches along this roadway, however, the churches are setback from the roadway far enough that no significant impacts will occur. Although the noise levels remain below the

City's 65 CNEL standard, the noise levels will increase substantially above those without the project. As discussed above, homes that front onto a street cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**John F. Kennedy Drive South of Cactus Avenue (9).** The homes along John F. Kennedy Drive south of Cactus Avenue will experience significant noise increases for all four studies. Similar to the area along Cactus Avenue, this noise increase will be due to cars and light trucks, and not heavy trucks. The homes along the west side of the roadway are generally lower than the adjacent roadway have a roughly 6 foot soundwall. The homes on the east side of the roadway do not have any soundwalls and are elevated with respect to the roadway. Rear yards areas on both sides of the street generally are in the range of 60 to 90 feet from the centerline of the roadway. Without any sound barrier exterior noise levels at the residences along John F. Kennedy Drive will be 67.5 CNEL. The residential noise criteria for traffic noise is 65 CNEL. The homes on the west side of the roadway have soundwalls and slope conditions that will reduce noise levels 6 to 10 dB, putting these homes well under the City criteria. Homes on the west side of the street will not be impacted. Homes on the east side of the street do not have soundwalls, and there will be a significant impact unless adequately mitigated.

The homes on the east side of John F. Kennedy Drive are elevated with respect to the road. Their rear yard area sits above the roadway, so there is a slope going up to their yards. At the top of slope the residents have wrought iron fencing. The wrought iron fencing would need to be replaced with a masonry wall or retrofitted with a glass barrier. The walls would need to 6 feet tall with respect to the rear yard. Roughly 5,000 feet of barrier would need to be provided. With the retrofit the noise levels would drop at least 5 dB, with the resultant noise levels around 62.5 CNEL in rear yard areas. A new 6 foot high wall at the top of slope for the existing residences that are on the east side of John F. Kennedy Drive between Cactus Avenue and Bay Hill Drive will be needed for mitigation. The 6 foot wall will need to extend roughly 5,000 feet.

**Locust Avenue between Moreno Beach Drive and Smiley Boulevard (54).** Only the 2035 case results in a significant noise increase for this area. In 2035 the project will result in a 1.5 dB increase raising the noise level up to 66.9 CNEL. There are three single-family homes along this roadway and they front onto the roadway. As discussed above, homes that front onto a street cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**Redlands Boulevard from Eucalyptus Avenue to State Route 60 (13).** The noise analysis shows significant noise increases along this roadway segment for the 2012 and 2035 cases. There are scattered homes in this area that either face Redlands Boulevard (actually on Shubert Street) or are on Redlands Boulevard. As discussed above, homes that front onto a street cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**Redlands Boulevard from State Route 60 to San Timoteo Canyon Road (35, 42).** The noise analysis shows significant noise increases along this roadway segment for the 2012 and 2035 cases. The increases in noise are around 2 dB with a resultant noise level in the 71 CNEL range. There are 28 homes along this roadway that would be affected. The single-family homes are

scattered and generally front the roadway. As discussed above, homes that front onto a street cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**San Timoteo Canyon Road from Alessandro Road to Live Oak Canyon Road to Redlands Boulevard (177, 179).** The noise analysis shows a significant impact in the existing (2012) to existing plus project comparison. The noise increases by a little over 3 dB with resultant noise levels in the 65 to 66 CNEL range. There are four scattered residences along the roadway that would be impacted. As discussed above, homes that are scattered cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**Theodore Street from State Route 60 to Highland Boulevard (38).** The noise analysis indicates that the project will cause a 1.2 dB increase in the year 2035 with a resulting noise level of 66.3 CNEL. There are 4 homes on Theodore Street that front onto the roadway. As discussed above, homes that front onto a street cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**Street A from Eucalyptus Avenue to Street F; Street E north of Alessandro Boulevard; and Street F east of Street A (2, 4, 19).** There are three groups of homes that may remain within the project area. The analysis shows significant noise increases for all four cases. The project would rezone these residences as Light Logistics, but the residences may remain for some time. The Light Logistics use is not sensitive to noise. However, the existing residences, as long as they remain, must be considered as a sensitive land use. The first homes are east of Redlands Boulevard north of the intersection with Brodiaea Avenue. Street E will be constructed west of these homes. It is likely that there will be intervening buildings and that the distance from Street E will be so great that these homes will not experience significant noise from public roadways.

The second group of homes is on the east side of Street A (Theodore Street) midway between the future Street B and Street F. There are two homes in this area. Their noise environment will be changed significantly. The exact alignment of the roadway is to be determined. The noise levels at these homes would be unacceptable to the residents, and a significant impact would occur.

The third area is a single home and lies east of Street A and along Street F. Currently there is essentially no traffic on this street. There is one residence in this area. Since this home will experience a substantial noise increase, this is considered a significant impact.

All of these homes will either front onto the roadway or are scattered. As discussed above homes that front onto a street or scattered homes cannot be effectively mitigated with a soundwall. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**Cactus Avenue Extension (Street D) from Street E to Cactus Avenue (8).** Cactus Avenue Extension, as shown in the Specific Plan, will come down the western side of the project parallel to Merwin Street and roughly 1,250 feet from Merwin Street. It then merges with Cactus Avenue traveling to the west until Redlands Boulevard. A specific alignment has not been determined for this roadway. There would be essentially no heavy trucks using this roadway. There are approximately 14 homes that side-on to Merwin Street that could be affected by traffic

on Cactus Avenue Extension. There are no soundwalls along these homes. The noise forecast shows that the 65 CNEL contour will lie 114 feet from the centerline of Cactus Avenue Extension. If the centerline of Cactus Avenue Extension is located closer than 114 feet to the residences, then a significant impact would occur. Outdoor living spaces for homes along Merwin Street would experience noise levels greater than 65 CNEL, and this would not be consistent with City criteria. Due to the distance from the currently envisioned between Merwin Street and Cactus Avenue Extension, it is most likely that no soundwall will be needed. If a soundwall was needed, a preliminary estimate indicates that the soundwall along Cactus Avenue Extension would need to be roughly 2,000 feet. The following mitigation strategy could be used:

> *Locate the centerline of Cactus Avenue Extension (Street D) no closer than 114 feet to the residential property lines along Merwin Street. (Locating the roadway more than 114 feet from the residences is the most likely alternative.) An alternative is to locate the roadway closer to the residences and provide a soundwall along* Cactus Avenue Extension. *The soundwall location and height should be determined by a Registered Engineer, and the soundwall shall be designed to reduce noise levels to less than 65 CNEL at the residences. The Engineer shall provide calculations and supporting information in a report that will be required to be submitted and approved by the City prior to issuing permits to construct the road.*

**State Route 60 from Pigeon Pass Road to Perris Boulevard (29, 30).** This area will only have a substantial noise increase in the 2012 case. The noise levels are projected to increase by 1.5 to 1.7 dB in this area with resultant noise levels in the 66.9 to 68.0 CNEL range. All residential areas along this stretch of freeway have soundwalls in place. It is not feasible to modify the existing residential block wall to lower the increase in project generated noise because block walls are designed for the height that they are built. It is also infeasible for the Lead Agency to demolish the existing walls on private property and build new ones of increased height so that the noise level increases are lowered. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**State Route 60 from Perris Boulevard to Nason Street (31).** The area along the freeway is only projected to have a significant noise increase for the 2022 case. The noise level will go up by 1.6 dB with the project up to a level of 67.2 CNEL. There is a soundwall in place for residences in this area. The existing residential block wall will need to be modified, or removed and replaced to lower the noise levels to acceptable levels.

**State Route 60 from Moreno Beach Drive to Redlands Boulevard (33).** A significant increase is shown for the existing case and for 2035. There are soundwalls in place for all residences in this area. Noise levels will reach 67.1 CNEL by 2035. It is not feasible to modify the existing residential block wall to lower the increase in project generated noise because block walls are designed for the height that they are built. It is also infeasible for the Lead Agency to demolish the existing walls on private property and build new ones of increased height so that the noise level increases are lowered. *Therefore, this potentially significant impact feasibly cannot be mitigated.*

**State Route 60 from Redlands Boulevard to Theodore Street (34).** A substantial noise increase is identified for this roadway for the existing case only. The resultant noise level will be 63.5 CNEL with an increase due to the project of 3.4 dB. No soundwalls are present in this area. The residential area is setback from the freeway and is clustered along Redlands Boulevard north of the freeway. Although the projected noise levels are less than the City criteria of 65 CNEL, and the impact only occurs for the existing compared to the existing plus project case, it is still considered an impact based on the significance thresholds being employed. The soundwall would need to be 6 feet tall with respect to the rear yard. Roughly 580 feet of barrier would need to be provided as shown in Exhibit 18. With the soundwall the noise levels would drop at least 5 dB, with the resultant noise levels around 59 CNEL in rear yard areas. A new 6 foot high wall is needed for mitigation as shown in Exhibit 18. The 6 foot wall will need to extend roughly 580 feet.

# Potential Soundwall Along SR-60

*Mestre Greve Associates*
*Division of Landrum & Brown*

**Use of Specialty Asphalts for Noise Reduction.** The use of rubberized asphalts and other asphalts received considerable attention for reducing noise levels along roadways instead of the use of soundwalls. The City may want to monitor the use of quieter asphalts as the soundwall fee plan progress. Although, rubberized asphalt is not widely accepted for mitigation, the science is progressing and it may be a more cost-effective mitigation solution in future years. Early studies indicated that the effectiveness of alternate asphalts may have a short span of effectiveness. However, two studies were released last year that shed additional light on the potential for noise reduction.

The first study is the "I-80 Davis OGAC Pavement Noise Study, Traffic Noise Levels Associated With Aging Open Grade Asphalt Concrete Overlay," (by Illingworth and Rodkin, Inc., for the California Department of Transportation, May 13, 2011). Two asphalt types were used for this study; an open grade asphalt concrete (OGAC) pavement overlay and an aged dense graded asphalt concrete (DGAC). The OGAC pavement resulted in noise levels that were about 6 to 7 dBA below those measured for the baseline DGAC pavement. This is roughly equivalent to the noise reduction achieved with an 8 foot high noise barrier. The OGAC has continued to maintain its acoustical characteristics and performance after a period of 10 years with only a slight 1.5 dB loss in performance.

The second study, which was also sponsored by Caltrans, is the "Eight Year Evaluation of the Noise Performance of the Caltrans Asphalt Research Pavements on LA 138," (by Illingworth & Rodkin, Inc., May 2, 2011. This study compared five pavements; dense grade asphalt concrete (DGAC), two overlay sections of open graded asphalt (OGAC) (75 mm in thickness and 30 mm in thickness), a rubberized asphalt concrete open graded Type O pavement (RAC(O)), and a bonded wearing course (BWC). Initially the both of the OGAC and the RAC(O) were about 4 dB quieter than the DGAC. The BWC was only about 1 dB quieter. Over 6 years the noise levels generated by the DGAC have remained fairly constant. However, the OGACs and RAC(O) have steadily increased in noise levels. After 6 years the OGACs and the RAC(O) are all about 1 to 2 dB quieter than the DGAC.

Caltrans has not used specialty asphalt for mitigation on their projects. The Federal Highway Administration has also not allowed the use of specialty asphalts for mitigation. However, the research to date does show that noise levels can be reduced by 4 to 7 dB in the early years. Any program that uses a specialty asphalt for mitigation should be monitored, at least on an annual basis, to confirm its continual effectiveness. Once the noise benefits of the specialty asphalt is lost, the road will need to be repaved to restore its noise mitigation properties.

### *3.2.2 Cumulative Traffic Noise Impacts*

The analysis presented in Section 2.3.2 shows that the project will result in significant cumulative traffic noise impacts. Thirty (30) areas were identified that could have significant cumulative impacts unless properly mitigated. Exhibit 19 lists all 30 links and identifies if there is an existing soundwall or not in the fourth column. Column 5 identifies the 2035 CNEL noise level with the project. The next column identifies whether this area was also identified as an area directly impacted by the project in which case it would have been discussed in more depth in Section 2.3.1 and Section 3.2.1. Column 7 identifies whether mitigation is feasible and either why mitigation is not feasible or what the appropriate mitigation will be. The final column identifies whether there will be an unavoidable adverse impact or not. Twenty-three (23) areas are identified as having a significant cumulative impact as identified by a "Yes" in the final column.

Mitigation may not be feasible for many locations due to homes fronting the roadway or homes that are isolated (see Section 3.2.1 for a more detailed discussion). One additional location, that was not impacted directly due to the project, can be mitigated with soundwalls. The area that would eliminate the cumulative noise impacts would be Iris Avenue from Nason Street to Oliver Street. Six (6) foot walls are recommended for this area. Approximately 3,000 feet of soundwall would be needed along Iris Avenue. Cumulative impacts typically not fully realized until the out years of the project. Therefore, construction of the soundwalls is not required until 2022.

**N-9. Include cumulative impacted areas in soundwall mitigation program.** Include the residential areas identified above in the fee plan for soundwall mitigation identified in Mitigation Measures N-9 and N-10.

### *3.2.3 On-Site Warehousing Activities*

The following mitigation measure is designed to eliminate noise impacts on residential areas due to warehousing activities.

**N-10. Maintain buffer with soundwall at residential/warehousing interface.** To keep the noise levels at nearby residential areas less than typical ambient conditions, the warehousing property line should be located a minimum of 250 feet from residential property lines, and a 12 foot noise barrier should be located along the perimeter of the property that faces any residential areas. The 12 foot noise barrier may be a soundwall, berm, or combination of the two. The height should be measured relative to the pad of the warehouse. This requirement should be implemented anytime residential areas are within 600 feet of the warehousing property line to insure that a noise level of 45 dBA (Leq) will not be exceeded at the residential zone.

This requirement is consistent with Item 10 of Municipal Code Section 9.16.160 Business park/industrial that states, "All manufacturing and industrial uses adjacent to residential land uses shall include a buffer zone and/or noise attenuation wall to reduce outside noise levels."

| ID | Arterial | From | Existing Soundwall? | CNEL With Project | Project Impact? | Mitigation Feasible? | Adverse Impact? |

# Cumulative Noise Mitigation Feasibility

## 3.3 Long Term On-Site Impacts

The analysis presented in Section 2.4.2 showed that neither the operation of the SDG&E Compressor Station nor the blow-down events from that facility generate noise levels that will significantly impact the proposed project. However, noise generated by SCG blow-down events has the potential to cause permanent hearing loss in persons within 1,300 feet of SCG blow-down points. This is a significant impact and mitigation is required.

The SCG blow-down equipment does not currently utilizer a silencer system. However, SCG does have silencers that reduce noise that will be fitted for planned and most un-planned blow-down events. The reduction provided by the SCG silencers is not known at this time. However, the silencers seem to be effective given the anecdotal information that they tend to eliminate residential complaints during blow-down events.

With a silencer system providing 40 dB of noise reduction, blow-down noise levels would be less than 102 dBA approximately 30 feet from the blow-down point which is within the fence line of these facilities. One hundred and two (102) dBA is the noise level that could be experienced for up to 90 minutes without causing permanent hearing loss. Therefore, while occupants of the project in the vicinity of the SCG facilities would be subject to high noise levels during these infrequent noise events, they would not be subject to any permanent hearing damage. Exhibit 20 presents the Lmax noise contours when the SCG blow-downs are mitigated with silencers. Highland Fairview has reportedly agreed to provide silencers on the SCG blowdown equipment at the two blow-down locations.

**N-11. Develop blow-down event plan.** The project applicant shall provide to the City a written agreement with SCG to provide silencers on the two blow-down locations. The agreement should be provided to the City and the silencers installed prior to the issuance of any building permits for parcels within 1,300 feet of the SCG blow-down points.

# 4.0 UNAVOIDABLE SIGNIFICANT IMPACTS

The mitigation measures described above will mitigate impacts to some extent, but the following significant impacts will remain.

1. On-site construction noise may still exceed 60 dBA (Leq) for residences within 500 feet of the construction zone during daytime hours.
2. Short term (i.e., less than 1 month) off-site construction may cause noise levels to exceed 60 dBA (Leq) during daytime hours at residences within 500 to 900 feet. This impact could only occur during non-holiday weekdays. Off-site construction noise impacts would not occur during nighttime, weekends, and City holidays.
3. Longer term (i.e., 1 month or more) off-site construction could potentially impact residences within 160 to 300 feet. Residences in this zone may experience noise levels greater than 60 dBA (Leq). No off-site construction noise impacts would occur during nighttime, weekends, and City holidays.
4. Significant traffic noise impacts due to the project will occur in the following areas:
    a. Gilman Springs Road between Eucalyptus Avenue and Street C (30) and Jack Rabbit Trail and Bridge Street (190)
    b. Ironwood Avenue between Redlands Boulevard and Highland Boulevard (36)
    c. Locust Avenue between Moreno Beach Drive and Smiley Boulevard (54)
    d. Redlands Boulevard from Eucalyptus Avenue to State Route 60 (13)
    e. Redlands Boulevard from State Route 60 to San Timoteo Canyon Road (35, 42)
    f. San Timoteo Canyon Road from Alessandro Road to Live Oak Canyon Road to Redlands Boulevard (177, 179)
    g. Theodore Street from State Route 60 to Highland Boulevard (38)
    h. Street A from Eucalyptus Avenue to Street F; Street E north of Alessandro Boulevard; and Street F east of Street A (2, 4, 19).
    i. State Route 60 from Pigeon Pass Road to Perris Boulevard (29, 30)
    j. State Route 60 from Moreno Beach Drive to Redlands Boulevard (33)
5. Significant cumulative traffic noise impacts with the project substantially contributing that cannot be adequately mitigated will occur along 36 roadway links. The links have been identified previously in Exhibit 19.

# 1.0 Introduction

The purpose of this document is to assess the potential noise impacts of the San Diego Gas and Electric Company (SDG&E) Compressor Station and Southern California Gas Company (SCG) facilities on the proposed World Logistics Center Specific Plan. These facilities are located within the boundaries of the Specific Plan as shown in Exhibit 1. The SDG&E Compressor Station takes in natural gas from interstate gas pipelines and recompresses the gas into new pipelines to deliver the gas to customers in Southern California. The two SCG facilities house flow valve and metering facilities as well as maintenance functions at the southern facility. There are gas pipeline blow-down facilities at the compressor station as well as the two SCG locations where exhaust stacks allow for the venting of high pressure gas to the atmosphere that only occur during emergencies, maintenance, and testing of the blow-down systems.

The SDG&E and SCG facilities represent three different noise sources that potentially impact the World Logistics Center project; (1) the operation of the compressor station, (2) blow-down events at the compressor station, and (3) blow-downs at the SCG facilities. The blow-down events generate infrequent high noise levels for relatively short periods. The operation of the compressor station generates a relatively constant noise level with levels varying slightly as compressors are turned on and off as needed to supply natural gas to Southern California.

In 1992 a Specific Plan and EIR were prepared for the project site that analyzed the noise impacts generated by these facilities on the proposed Specific Plan. Mestre Greve Associates prepared the noise impact analysis for the EIR. The impacts from the compressor station operation and blow-down events were based on previous measurement studies of noise generated by these activities prepared by other firms.

In 2006, Mestre Greve Associates was hired by Highland Fairview to perform measurements of a demonstration blow-down event at the compressor station. The data from this event has been evaluated and is compared to the 1992 data in Section 2.2. In December 2012, Mestre Greve Associates was hired by Highland Fairview to update the noise measurements of the compressor station. The results of the measurements supported the noise projections of the compressor station previously made and are discussed in Section 2.1

Section 2.0 presents a description of the operational characteristics and noise levels generated by of each of the noise sources associated with the SDG&E and SCG operations. Section 3.0 discusses the potential impacts from noise generated by these facilities on the proposed project. Section 4.0 presents mitigation measures required to reduce potential noise impacts from these facilities to a level of insignificance.

CEQA requires an analysis of the proposed project's impacts on the existing environment; not an analysis on the existing environment's impacts on the proposed project. The occasional blow downs that occur at the Southern California Gas Company are part of the existing conditions and have been part of the existing conditions for over 30 years. Thus, for purposes of clarity, it should be noted that the impact analysis below goes beyond the requirements of CEQA but is instead provided as part of an analysis to ensure worker safety. All mitigation measures imposed in this analysis are the responsibility of future developers and not the Gas Company.

# 2.0 Noise Source Characteristics

The following sections describe the noise related information for the SDG&E Compressor Station and SCG facilities. Noise generated during typical operation of the Compressor Station is discussed first in Section 2.1, followed by noise generated by blow-down events at the SDG&E facility in Section 2.2 and the SCG Facilities in Section 2.3.

## 2.1 Compressor Station Operation

Compressors in the SDG&E facility are the primary source of typical operational noise generated by the station. There are two sets of three reciprocating natural gas combustion engines and one set of four natural gas fired turbines for a total of ten compressors with power ranging from 995 to 3,400 horsepower each. The reciprocating engines and compressor units are located within acoustically treated structures and are equipped with intake and exhaust mufflers. The turbines are housed in weather protected shelters. The facility operates on a demand basis. When there is a high demand of natural gas, as during wintertime, the facility operates at maximum capacity. At times the facility operates at maximum capacity 24 hours per day. Demand on the compressor station will increase in the future.

In 1992 a Specific Plan and EIR were prepared for the project site that analyzed the noise impacts generated by the Compressor Station on the proposed Specific Plan. Noise data used in the 1992 Specific Plan EIR were based on measurements of the compressor station noise and noise contours developed by Illingworth & Rodkin, Inc. who had done several studies of noise generated by activities at the compressor station. Noise contours developed by Illingworth & Rodkin, Inc. used in the 1992 EIR are shown graphically in Exhibit 2. These CNEL contours reportedly represent conditions where the facility is operating at essentially a constant noise level. Since that time one natural gas fired turbine has been added to the facility. Therefore, the 1992 contours presented in Exhibit 2 are representative of conditions with two sets of three reciprocating natural gas combustion engines and one set of three natural gas fired turbines.

Table 1 shows the estimated distances to various noise levels for the Moreno Compressor station under full operation based on a worst-case noise level of 63 dBA Leq at 500 feet and a drop off rate of 4.5 dB per doubling of distance that corresponded with the measured data. The Leq levels represent the average noise level with the station in full operation. These levels are approximately 5 dB louder than the 1992 noise measurements. The 5 dB adjustment was added because a fourth natural gas fired turbine was added and to account for all compressors operating at full capacity 24-hours per day. (Measurements were repeated in December 2012 during a busy morning at the compressor station. Noise measurements were made north, east, south and west of the compressor station. When the measurement results were normalized to 500 feet the Leq values ranged from 51.5 to 63.6 dBA with an average of 57.5 dBA. This indicates that the previous projection of 63 dBA Leq at 500 feet is still valid, and probably represents a worst case assumption for most directions around the compressor station.)

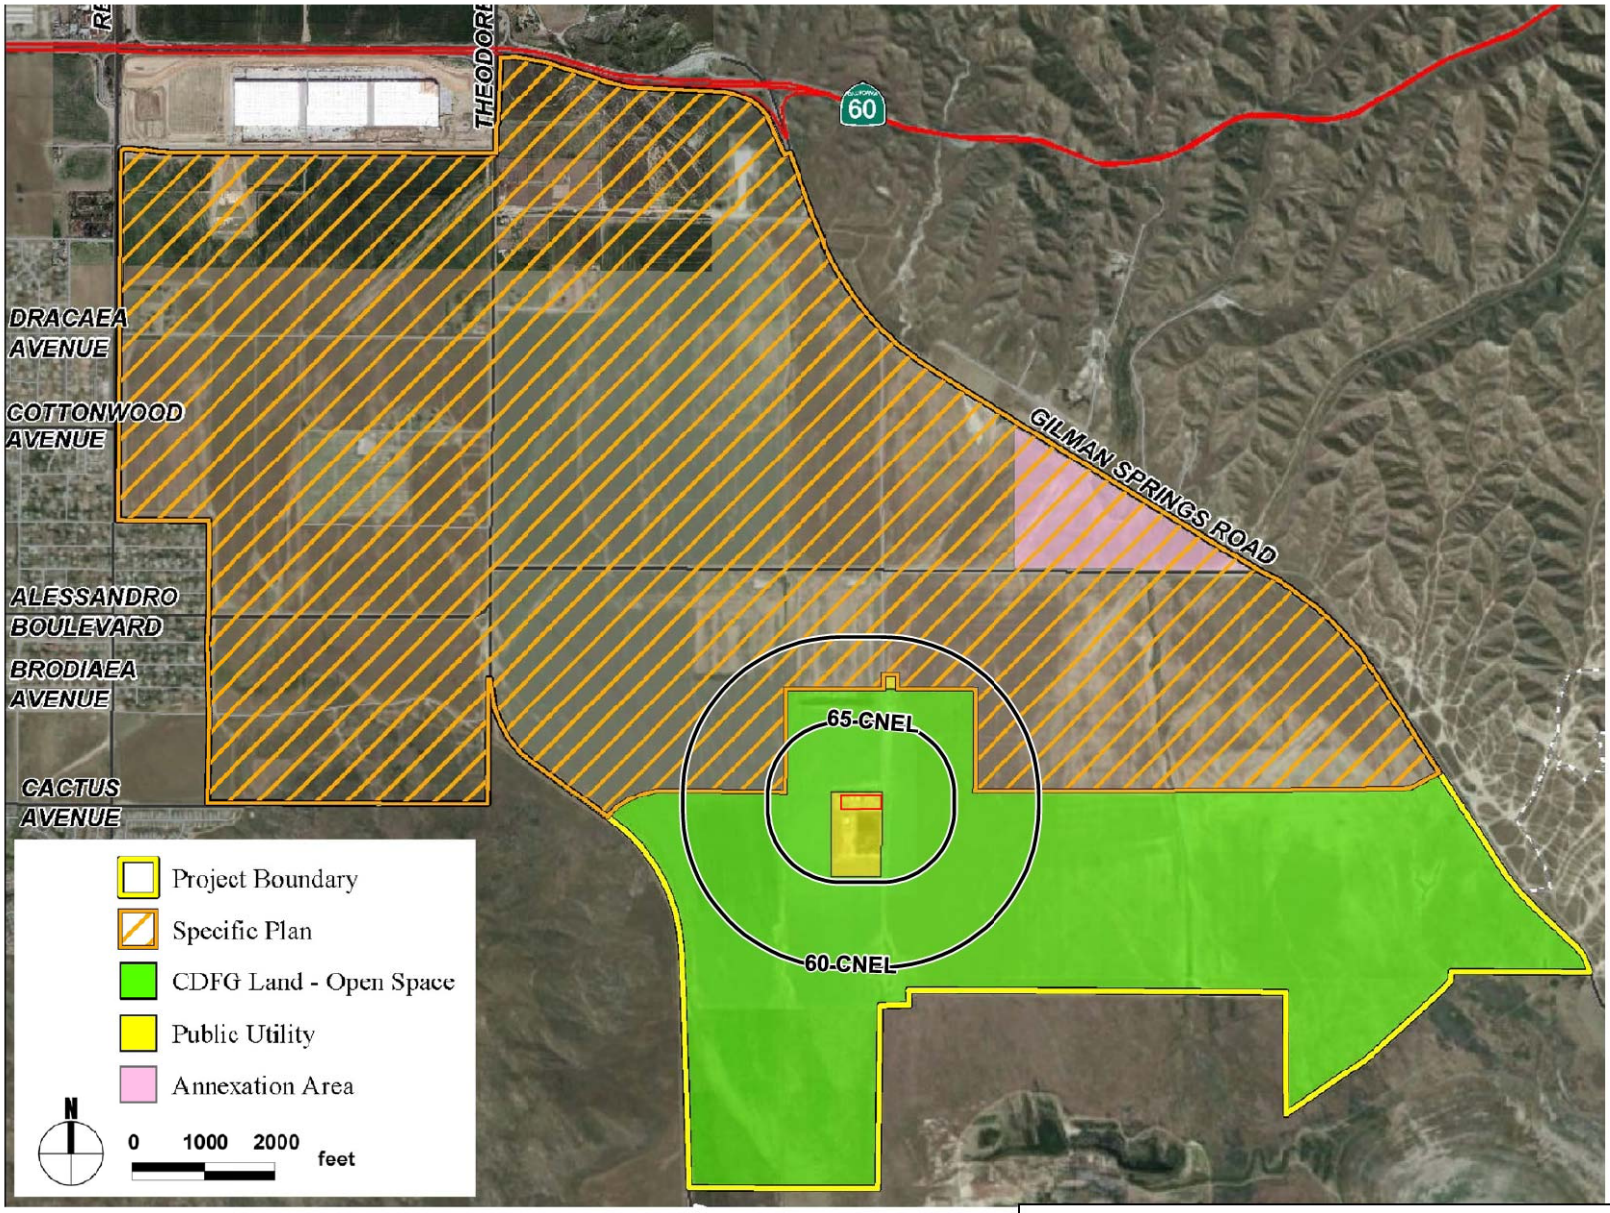

*Exhibit 2*

CNEL Noise Contours for Compressor Station

*Mestre Greve Associates*
*Division of Landrum & Brown*

The CNEL (Community Noise Equivalent Level) levels assume the compressor station is in full operation 24 hours a day. The distances are from the edge of the operational area. The operational area is the rectangle that encloses the three buildings with the compressors. These contours are represented graphically in Exhibit 2.

**Table 1**
**Estimated Worst Case Compressor Station Noise Levels**

| Leq (dBA) | CNEL | Distance* |
|---|---|---|
| 65.0 | 72.7 | 367’ |
| 60.0 | 66.7 | 794' |
| 58.3 | 65.0 | 1,031' |
| 55.0 | 61.7 | 1,714' |
| 53.3 | 60.0 | 2,228' |
| 50.0 | 56.7 | 3,703' |
| 45.0 | 51.7 | 8,000' |
| 40.0 | 46.7 | 17,281' |

* From edge of station operational area

Exhibit 3 presents the average (Leq) noise levels generated by the compressor station during full operation. As discussed in Section 3.2, both the CNEL and Leq metrics are use to assess the noise impacts from the facility.

## 2.2 SDG&E Compressor Station Blow-Downs

There are three blow-down points within the SDG&E Compressor Station. As discussed previously, these blow-down points allow for the release of pressurized gas during emergency events. These systems are also tested on an annual basis. Blow-downs at the SDG&E Station just vent gas within the facility and last between 30 and 90 seconds. The 1992 Specific Plan EIR stated that there were an average of four blow-down events annually at the compressor station and that these events could occur at any time.

Table 2 presents the distance to maximum noise level contours from the blow-down point for the SDG&E compressor station blow-down events used in the 1992 EIR. These contour distances were taken from the Illingworth & Rodkin, Inc. report that was the source for the compressor station operational noise levels discussed above. Table 2 shows that the blow-down events generate extremely high noise levels. Note that these Lmax levels are equivalent to the noise level that is sustained during the blow-down events.

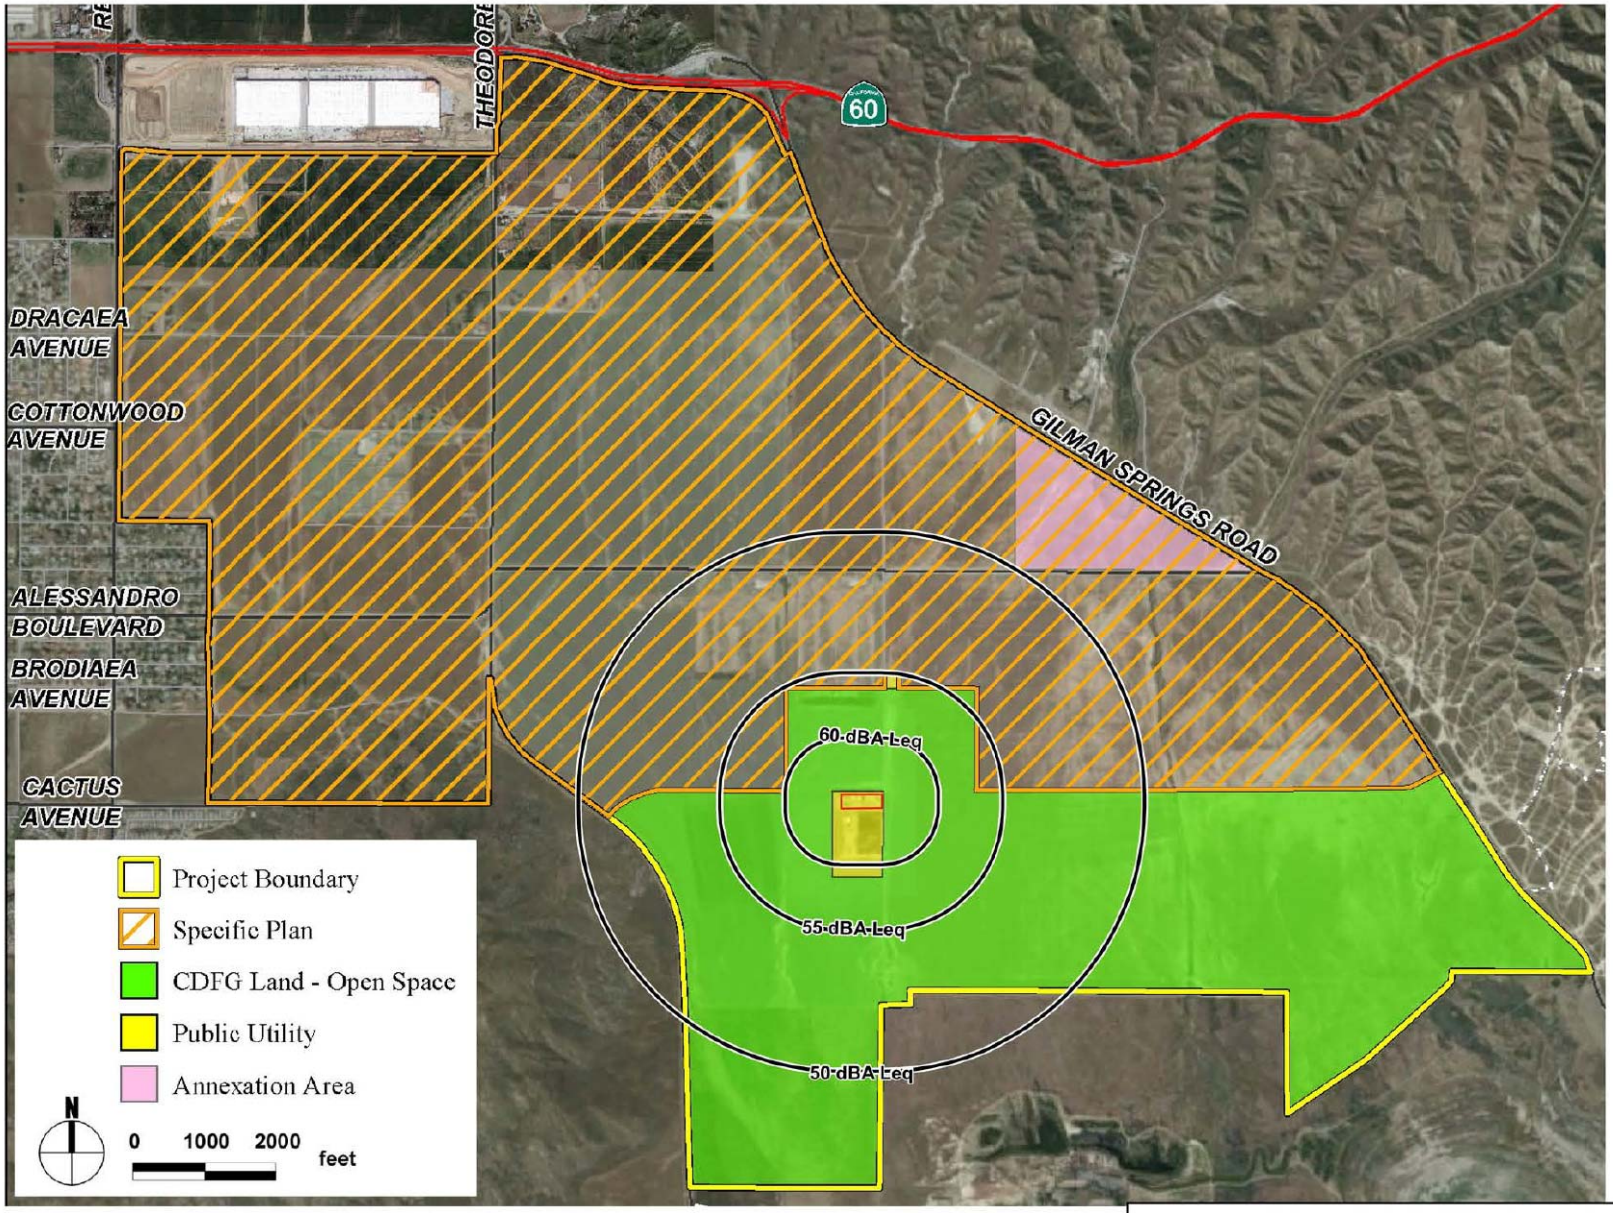

*Exhibit 3*

Leq Noise Levels for Compressor Station

*Mestre Greve Associates*
*Division of Landrum & Brown*

In 2006, Mestre Greve Associates performed noise measurements of a demonstration blow-down event at the compressor station. Noise measurements were performed at eight locations around the compressor station at distances ranging from 600 feet to 4,900 feet from the blow-down stack. Noise levels from two 30-second blow-down events in immediate succession were recorded. This data was used to determine the noise level generated by the blow-down event and how the noise level dropped off with distance. This results of the measurements and analysis is presented in Table 2.

**Table 2**
**Distance To Lmax Contours For SDG&E Compressor Station Blow-Down Events**

| Lmax Noise Level (dBA) | Distance from Blow-Down Point (Feet) 1992 EIR | 2006 Measurements | Used for Analysis |
|---|---|---|---|
| 135 | 50 | 48 | 49 |
| 130 | 76 | 72 | 74 |
| 120 | 178 | 163 | 170 |
| 110 | 416 | 370 | 393 |
| 100 | 969 | 841 | 905 |
| 90 | 2,262 | 1,910 | 2,086 |
| 80 | 5,277 | 4,340 | 4,808 |

Table 2 shows that the 2006 measurements agreed well with the 1992 EIR data near the source but showed a more rapid drop off resulting in an approximate 3 dB difference at the furthest distances assessed, approximately 5,000 feet. This difference could have been due to different atmospheric conditions during the measurements or different ground conditions. During the 2006 measurements the ground around the facility was freshly plowed dirt which absorbs sound, resulting in a more rapid drop-off in sound than hard packed soil. Because of this the average of the two data sets, shown in the last column of Table 2 will be used to analyze the potential noise impacts. The noise contours are presented graphically in Exhibit 4.

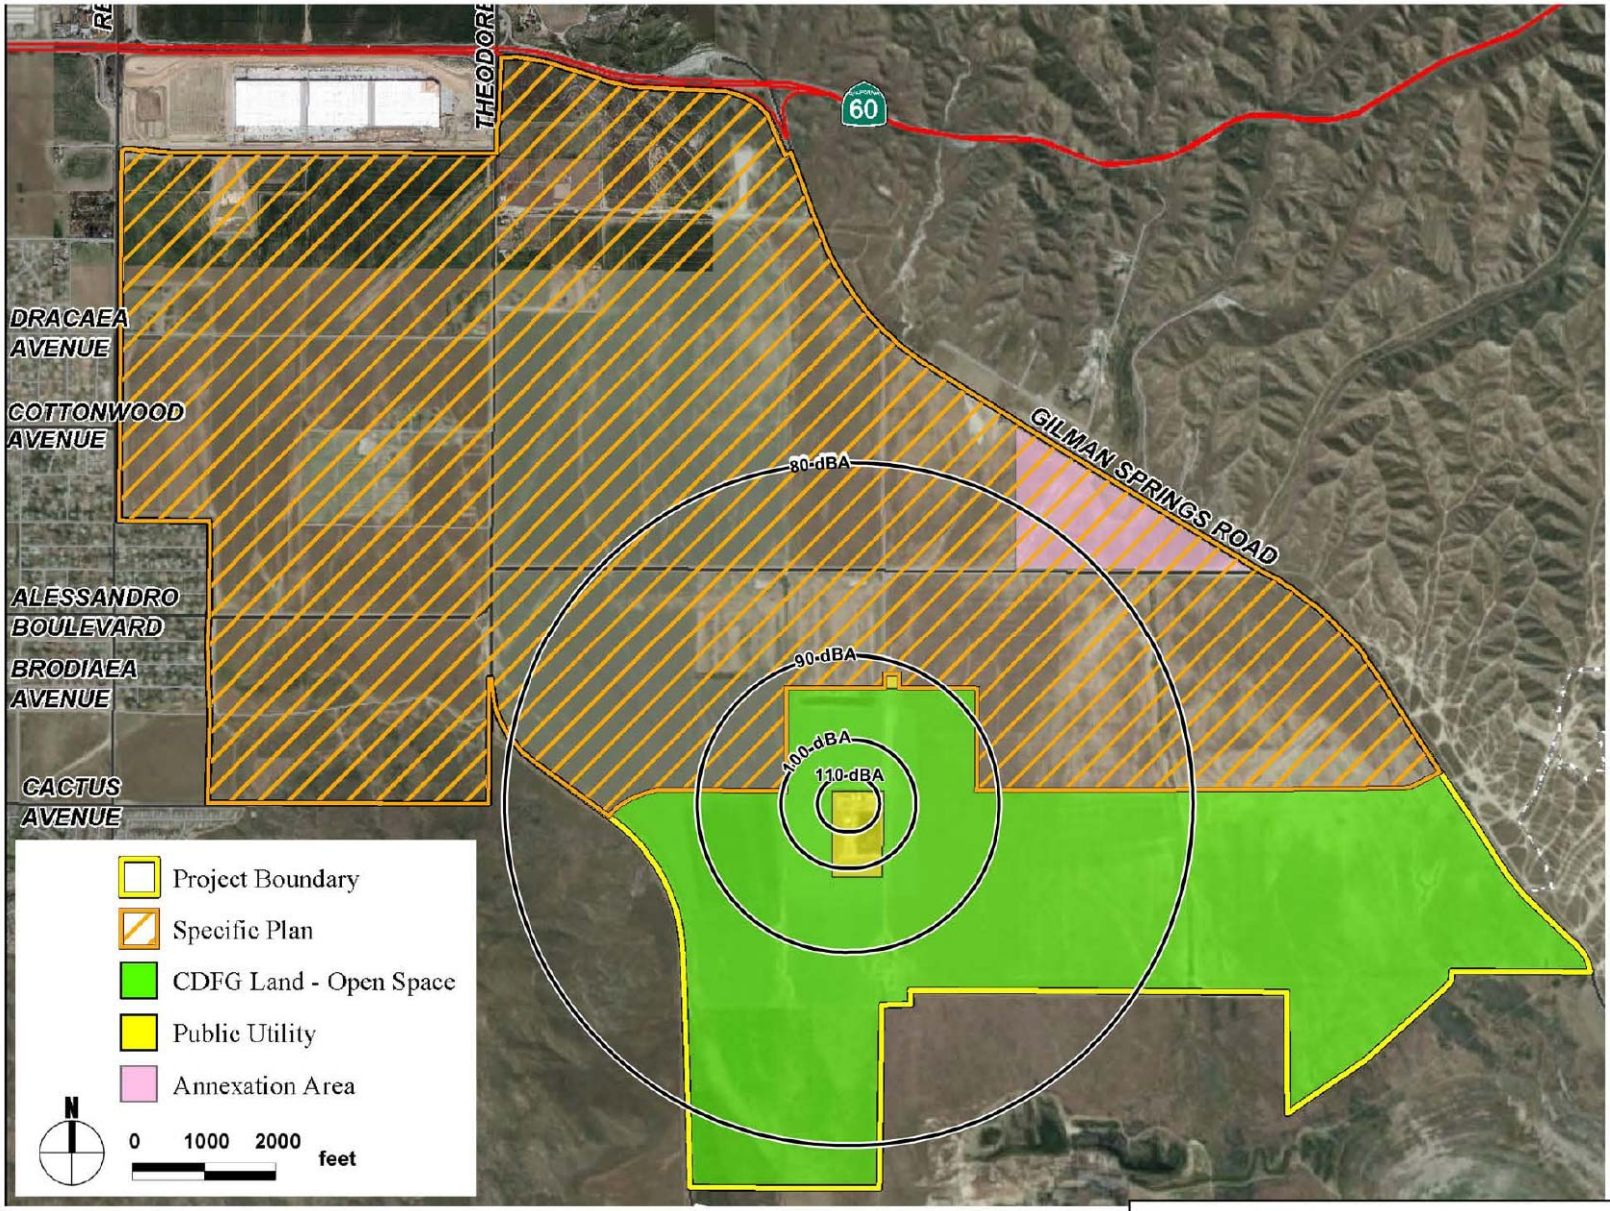

*Exhibit 4*

Lmax Levels for SDG&E Blow-Down

*Mestre Greve Associates*
*Division of Landrum & Brown*

## 2.3 SCG Blow-Downs

There are also four blow-down points in the SCG facilities, three in the southern facility and one in the northern facility. Blow-downs at the SCG facilities vent gas from miles of pipeline and can last up to 90 minutes. The 1992 Specific Plan EIR stated that there were an average of four blow-down events annually at the SCG facility.

Noise levels from the SCG blow-downs in the 1992 Specific Plan EIR were based on measurements of a demonstration SCG blow-down made by Acoustical Analysis Associates, Inc. (AAAI) and noise contours developed in the report "Moreno Highlands Specific Plan: Southern California Gas Co. and San Diego Gas & Electric Co. Operational and Blow-Down Noise Impact Assessment," dated July, 1989 (AAAI Report # 1041, Appendix G in "Screencheck Moreno Highlands Specific Plan," by Michael Brandman Associates, dated July 20, 1989.). Table 3 presents the distance to maximum noise level contours from the blow-down point for the SCG blow-down events used in the 1992 EIR. These contours are presented graphically in Exhibit 5.

Noise levels generated by the SCG and SDG&E blow-downs are the same at a distance of 50 feet but differences in drop-off rate assumptions result in slightly higher noise levels for the SDG&E blow-downs at distances between approximately 200 feet to 3,000 feet with a maximum difference of approximately 6 dB at approximately 1,000 feet. Because this difference may be due to different characteristics of the blow-downs from the two facilities and the 1992 data results in higher noise levels, this data will be used for the impact analysis.

**Table 3**
**Distance To Lmax Contours For SCG Blow-Down Events**

| Lmax Noise Level (dBA) | Distance from Blow-Down Point (Feet) |
|---|---|
| 135 | 50 |
| 130 | 85 |
| 120 | 230 |
| 110 | 600 |
| 100 | 1,500 |
| 90 | 2,900 |
| 80 | 5,000 |

# 3.0 Noise Impacts

Potential noise impacts from the SDG&E and SCG facilities on the proposed World Logistics Center are assessed below. Section 3.2 assesses the impacts from the operation of the SDG&E Compressor Station and Section 3.3 assesses the impacts from the blow-down events at both facilities. Section 3.1 discusses the criteria used to assess the impacts. Section 3.1.1 discusses the noise related objectives and policies in the City of Moreno Valley General Plan. Section 3.1.2 discusses the provision of the Moreno Valley Noise Ordinance. Significance thresholds used to assess the impacts are described in Section 3.1.3.

## 3.1 Noise Impact Criteria

### *3.1.1 City of Moreno Valley General Plan*

The City of Moreno Valley General Plan presents three objectives relative to noise. Objective 6.3 is to "provide noise compatible land use relationships by establishing noise standards utilized for design and siting purposes." There are six policies presented to achieve this objective which include the indoor noise level standards presented in Table 4.

**Table 4**
**Moreno Valley Interior Noise Standards**

| Use | Interior Noise Level Limit |
|---|---|
| Single and Multiple Family Residential, New Schools | 45 CNEL |
| New Libraries, Hospitals and Extended Medical Care Facilities, Places of Worship, and Office Uses | 50 CNEL |

Objective 6.4 is to "review noise issues during the planning process and require noise attenuation measures to minimize acoustic impacts to existing and future land uses." The only policy directed to this objective is to use site, landscape, and architectural features to mitigate noise impacts for new developments and prefer noise barriers that avoid freeway sound barrier walls.

Objective 6.5 is to "minimize noise impacts from significant noise generators such as, but not limited, to motor vehicles, trains, aircraft, commercial, industrial, construction, and other activities." Two policies are presented to support this objective. New commercial and industrial activities are to be evaluated and designed to mitigate noise impacts on adjacent uses and construction activities are to be conducted in a manner that limits noise impacts on surrounding uses.

The City's interior noise standard for offices, 50 CNEL, is the only policy directly related to the assessment of the impacts of the SDG&E and SCG operations on the proposed project. Analysis of the impacts using this standard supports all three objectives.

### *3.1.2 City of Moreno Valley Noise Ordinance*

The City of Moreno Valley Noise Ordinance is presented in Title 11, Peace, Morals and Safety, Chapter 11.80 Noise Regulation of the City's Municipal Code. Section 11.80.030(A) prohibits the generation of sound that causes a noise disturbance. A noise disturbance is defined as any sound that:

> Disturbs a reasonable person of normal sensitivities
>
> Exceeds the sound level limits set forth in Chapter 11.80 (presented below)
>
> Is clearly distinguished from ambient noise by a person using their normal hearing facilities at a distance of two hundred feet from the real property line of the source of the sound generated on private property or from the source of the sound if it occurs on the public right of way, public space, or other publically owned property.

Sections 11.80.030(B) and 11.80.030(C) present the ordinance's sound level limits. Section 11.80.030(B) prohibits sound that could cause permanent hearing loss. Hearing loss is dependent on the level of noise and duration of noise. Table 5 presents the maximum noise level and exposure durations allowed to prevent permanent hearing loss reproduced from Table 11.80.030-1 from the City's Noise Ordinance. The ordinance also presents maximum impulsive sound levels in a separate table. However, these limits on impulsive sound are not applicable to the potential impacts from the SDG&E and SCG operations.

**Table 5**
**Noise Level Limits to Prevent Hearing Loss**

| Cumulative Hours of Exposure per Day | Sound Level (dBA) |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1.5 | 102 |
| 1 | 105 |
| .5 | 110 |
| 0.25 or less | 115 |

Section 11.80.030(C) presents the maximum non-impulsive sound level limits from noise generated on private property when measured 200 feet or more from the real property line of the source of the sound. These sound level limits are presented in Table 6. Any sources of sound that exceed these noise levels are deemed prima facie to be a noise disturbance by the ordinance.

**Table 6**
**Maximum Sound Levels for Source Land Uses**

| Source Land Use | Maximum Sound Level 200' from Real Property Line Daytime (8:00 a.m. to 10:00 p.m.) | Nighttime (10:01 p.m. to 7:59 a.m.) |
|---|---|---|
| Residential | 60 dBA | 55 dBA |
| Commercial | 65 dBA | 60 dBA |

Section 11.080.030(D) of Moreno Valley Noise Ordinance presents source specific prohibitions and Section 11.080.030(E) presents uses and activities that are exempt from the Noise Ordinance. None of these prohibitions or exemptions are applicable to the SDG&E and SCG operations.

### *3.1.3 Thresholds of Significance*

Based on the noise criteria specified by the City of Moreno Valley, the operation of the compressor station will result in a significant impact on the project if it results in interior office noise levels at the Logistics Development greater than 50 CNEL, or if the noise levels generated by the compressor station exceed 65 dBA Leq during the daytime or 60 dBA Leq during the nighttime more than 200 feet from its property line.

Due to the infrequent nature of the blow-down events and the high noise levels generated by these events, the noise standard applicable to these events is the noise level limits to prevent hearing loss. An exceedance of the noise levels presented above in Table 5 from blow-down events within the project where persons would typically be present would result in a significant impact.

## 3.2 SDG&E Compressor Station Operational Noise Impacts

Exhibit 2 shows that the worst-case compressor station operational characteristics will result in a maximum noise level just above 65 CNEL within the project area proposed for development (i.e., not open space). Typical commercial construction results in buildings that achieve at least a 20 dB reduction of outdoor noise levels. Therefore, an office use exposed to the highest noise level from the compressor station will be just above 45 CNEL and below the 50 CNEL limit prescribed by the City's General Plan.

Exhibit 3 shows that the Leq noise level generated by the compressor station does not exceed 60 dBA Leq beyond the property lines of the facility. Therefore, the compressor station is not considered a noise disturbance based on City criteria.

Operation of the compressor station will not result in any interior noise levels exceeding the limits established by the City in the General Plan. Further, operation of the compressor station is not considered a noise disturbance. Therefore, the project will not be significantly impacted by the operation of the compressor station.

## 3.3 Blow-Down Noise Impacts

### *3.3.1 SDG&E Blow-Down Impacts*

Exhibit 4 shows that the maximum noise level from a blow-down at the SDG&E compressor station within the area proposed for development (i.e., the Logistics Development land use) is 100 dBA. A person would need to be exposed to this level for more than a cumulative two hours in a day before permanent hearing loss would be expected. As discussed above, blow-down events at the SDG&E compressor station typically do not last longer than 90 seconds. Therefore, the SDG&E blow-down events will not significantly impact the proposed project.

### *3.3.2 SCG Blow-Down Impacts*

Exhibit 5 shows that the SCG blow-down events will result in noise levels as high as approximately 130 dBA just outside the fence line of the southern facility and noise levels in excess of 135 dB just outside the fence line of the northern facility. In fact, observers within approximately 250 feet of the blow-down points would be exposed to noise levels greater than 115 dBA which would likely cause permanent hearing damage regardless of the exposure time. The SCG blow-downs could last as long as 90 minutes. Observers exposed to noise levels greater than 102 dBA, within approximately 1,300 feet from the blow-down point could experience permanent hearing loss based on this event duration.

Because noise generated by SCG blow-down events could clearly result in permanent hearing damage in areas proposed for development by the project, the project will be significantly impacted by the SCG blow-downs. Mitigation is discussed in Section 4.0.

## 4.0 Mitigation

The analysis presented above showed that neither the operation of the SDG&E Compressor Station nor the blow-down events from that facility generate noise levels that will significantly impact the proposed project. Noise generated by SCG blow-down events have the potential to cause permanent hearing loss in persons in the developed area of the project. This is a significant impact and mitigation is required.

The SCG blow-down equipment does not currently include a silencer system. A review of the literature of a leading manufacturer of specialty silencer systems (Industrial Acoustics Company) determined that a silencer system installed on the blow-down equipment could reduce noise levels by about 40 dB.

With a silencer system providing 40 dB of noise reduction, blow-down noise levels would be less than 102 dBA approximately 30 feet from the blow-down point which is within the fence line of these facilities. 102 dBA is the noise level that could be experienced for up to 90 minutes without causing permanent hearing loss. Therefore, while occupants of the project in the vicinity of the SCG facilities would be subject to high noise levels during these infrequent noise events, they would not be subject to any permanent hearing damage.

Table 7 presents the distances to the mitigated Lmax noise levels with the silencers. These contours are shown graphically in Exhibit 6.

**Table 7**
**Distance To Mitigated Lmax Contours For SCG Blow-Down Events**

| Lmax Noise Level (dBA) | Distance from Blow-Down Point (Feet) |
|---|---|
| 95 | 50 |
| 90 | 85 |
| 80 | 230 |
| 70 | 600 |
| 60 | 1,500 |
| 50 | 2,900 |

With the mitigation specified above, SCG blow-down events would not result in noise levels that could cause hearing loss and introduction of the project near the existing SCG facility would not result in significant noise impacts.

# 1. INTRODUCTION

## A. PURPOSE OF THE TRAFFIC IMPACT ANALYSIS

The purpose of this Traffic Impact Analysis (TIA) is to fully analyze the local and regional traffic impacts of the proposed World Logistics Center (WLC) located in Moreno Valley, California. The TIA identifies the specific near-term and longer-term circulation improvements that would be required to mitigate project impacts and maintain acceptable peak hour and daily levels of service (LOS) on surface streets and freeways affected by the project. As part of this comprehensive analysis special attention was paid to analyzing truck access routes, safety issues relating to trucks, and the effects of truck traffic on traffic operations.

## B. SCOPE OF STUDY

The study considers seven development scenarios, namely:

1) Existing baseline conditions (2012) without the WLC project
2) Existing baseline conditions plus Phase 1 (only) of the WLC project
3) Existing baseline conditions plus the Full Build-out of the WLC project
4) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2022, without the WLC project
5) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2022, plus Phase 1 (only) of the WLC project
6) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2035, including full build-out of the City of Moreno Valley General Plan, except that existing conditions remain on the site of the WLC project. The horizon year 2035 corresponds with the long-term planning horizon in the Southern California Association of Governments (SCAG) regional forecasts.
7) Existing baseline conditions plus other past, present, and reasonably foreseeable projects expected to be constructed by 2035, including full build-out of the City of Moreno Valley General Plan except for the WLC site, where full build-out of the WLC project was assumed.

Most of the LOS analyses focused on the morning and evening peak hours because that is when capacity problems most frequently occur. The project includes a general plan amendment that will change the configuration of some roads in and adjacent to the project site. An analysis was performed using daily

traffic volumes to determine if the proposed circulation element amendment would achieve City LOS goals.

The study area for surface streets covered all intersections in Moreno Valley of collector or higher functional classification with another collector or higher classification street, at which the proposed project would add 50 or more peak hour trips. The study area also included the main routes between the project and the neighboring communities of Riverside, Perris, Beaumont, San Jacinto, and Redlands. The study area also extended west to the nearest ramps to SR-91 and as far south as the I-215 ramps at Redlands Ave. in Perris. These limits represent the extreme range of the RivTAM model's capacity to accurately predict real differences between the No-Project and Plus-Project scenarios. Figure 1 shows the study area for surface street intersections.

The study area for freeways was selected to encompass the freeway routes extending from the project site to the north, south, east, and west. The analysis covered SR-60 from I-10 in the east to SR-71 in the west, SR-91/I-215 from I-210 in the east to I-15 in the west, I-215 from Redlands Ave. in the north to the Scott Rd. interchange in the south, and I-10 from SR-62 in the east to SR-60 in the west. (see Figure 2). These limits represent the extreme range of the RivTAM model's capacity to accurately predict differences between No-Project and Plus-Project scenarios. In addition, the two main routes to the ports of Los Angeles and Long Beach were studied (see Figure 3). For these corridors, trips from the WLC were manually added to forecasts for the No-Project condition taken from the SCAG model[1].

Any freeway ramp where the project added 100 or more peak-hour trips was also studied. These included:

- All ramps of the SR-60/Theodore Interchange
- All ramps of the SR-60/Gilman Springs Rd. Interchange
- All ramps of the SR-60/Redlands Blvd. Interchange
- Westbound off- and eastbound on-ramps to the SR-60/Central Ave. Interchange, and
- Westbound off- and eastbound on-ramps to the SR-60/Martin Luther King Blvd. interchange.

[1] The modeling data in the SCAG model is based upon modeling information originally developed by the Southern California Association of Governments (SCAG), which has been modified by Parsons Brinckerhoff. The modeling data used in this study does not necessarily reflect the official views or policies of SCAG. Parsons Brinckerhoff is wholly responsible for the modeling results and the content of the documentation.

## C. CHANGES SINCE THE DRAFT TIA

Since the draft Traffic Impact Analysis (TIA) that was issued in February 2013, comments were received from various public and private groups and individuals. The report has been modified in response to these comments and to clarify the description of the analysis. In addition, some modifications were also made to the project. Readers of the draft report will find that a number of updates and clarifications have been made, the most important of which are:

- In response to comments, the analysis of freeway impacts from WLC trucks was extended to the Ports of Los Angeles and Long Beach. The extended analysis, covering more than 60 additional centerline miles of freeway, did not find any new impacts that were not already identified in the Draft TIA. See Chapter 12 Section F of this report.

- In response to comments, an analysis was performed of the feasibility of shipping cargos between the WLC and the Ports of Los Angeles and Long Beach by rail instead of by truck. The analysis found that this was not feasible for a variety of reasons, including the cost and environmental impacts of a new rail alignment, the high fixed handling costs for rail cargo that makes short hauls uneconomical, and system constraints with the rail system itself. See Chapter 4 Section F of this report.

- In response to comments, an analysis was performed of the potential safety impacts of WLC traffic on local schools. The analysis found that the project would pose little safety risk and that appropriate safety features were already present on roads near local schools. See Chapter 12 Section B of this report.

- In response to comments, a figure was added showing the designated Truck Routes in the vicinity of the WLC. See Figure 14.

- The WLC implementation schedule was revised so that Phase 1 is scheduled for completion in 2022 rather than in 2017, as was assumed in the draft report. The scenarios for 2017 were therefore dropped and the scenario for 2022 was revised to analyze Phase 1 only, not full build-out of the WLC. See Chapter 8 of this report.

- A new chapter was added to analyze Existing Plus Phase 1 (only) conditions. See Chapter 5 of this report.

- An area of land in the southwest corner of the WLC site (as described in the draft TIA) is no longer part of the WLC project and instead will maintain its current zoning for residential

development. This update reduces the planned amount of high-cube warehouse development in the WLC by one million square feet and increases the amount of background (i.e. non-project-related) development in 2035 by 220 dwelling units.

- Some internal roads were re-aligned, and a fire station has been added.
- Various grammatical and reference corrections were made, and in places the text and tables were revised to provide greater clarity to readers.
- A list of references has been added.
- Alessandro Boulevard will retain its name, ROW width, and current alignment as an undivided roadway running east-west through the World Logistics Center, intersecting with Gilman Springs Rd. on the east and the Cactus Avenue Extension on the west. An existing section of Alessandro Blvd. between Merwin Street and the Cactus Avenue Extension would be closed to vehicular traffic, except for emergency vehicles and bicycles and pedestrians access. This is to prevent project traffic from traveling through existing residential neighborhoods.

In addition to the changes listed above, a *Responses to Comments* section has been added to the FEIR that responds to traffic-related public comments and provides clarification on how the technical documents, including this traffic report, provide the information needed to enable the City to make an informed decision regarding this project.

# 2. METHODOLOGY

This chapter describes the methodology used in the traffic impact analysis.

## A. ASSUMPTIONS

***Land Use Assumptions***

The Existing Conditions scenario was based on the land uses as they existed when the Notice of Preparation was issued (February 2012). The Existing Plus Build-out scenarios were also based on the land uses as they existed at that time and with either Phase 1 or the full build-out of the WLC.

The scenarios analyzing future conditions required the use of forecasts for land use in the Inland Empire. The most well-researched and officially accepted source of longer-term land use forecasts is the Southern California Association of Governments (SCAG), which is the designated Regional Transportation Planning Agency under state law. In April 2012, SCAG adopted its 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) for use in regional planning. The RTP/SCS was the result of a multi-year effort involving consultation with numerous agencies including work through the Transportation Conformity Working Group (a forum for implementing the interagency consultation requirements) as well as input from members of the public. The RTP/SCS forecasts include an update of existing land uses based on the 2010 U.S. Census and address the effects of the recent recession on employment and residential uses. The forecasts reflect regional birth, death, and migration rates, household formation, and expected changes in employment by economic sector.

The land use assumptions for the WLC 2022 scenarios were derived through interpolation of the 2020 and 2035 RTP/SCS regional population and employment forecasts. In addition, other past, present, and reasonably foreseeable projects in the study area were added to the 2022 scenario based on their likely timeline for development. These projects are listed in Table 1 with their locations shown in Figure 4 (the numbers on the figure corresponds with the identifying numbers in the table).

The land use assumptions for the cumulative (2035) scenarios were taken from the RTP/SCS 2035 regional population and employment forecasts for all areas outside of the City of Moreno Valley. Within Moreno Valley, the cumulative-year analysis assumed build-out of the City's General Plan, as required by the City's TIA guidelines[2]. As with the other scenarios, other past, present, and reasonably foreseeable projects in the study area (see Table 2) were added to this scenario. Because it is unlikely that the city will fully build out by 2035, the cumulative impact analysis set forth in this TIA assumes worse background traffic than is likely to occur and is therefore conservative in the sense that it would tend to over-state project impacts.

**Table 2: Other Development Projects Assumed to be Completed by 2035**

***Network Assumptions***

The scenarios analyzing future conditions required the use of assumptions regarding changes in the road network that may occur between now and the study year. The most well-researched and officially accepted source of longer-term land use forecasts is the SCAG 2012-2035 Regional Transportation Plan (RTP), which was adopted in April 2012 along with the SCS land use forecasts. The RTP was developed through a bottom-up process where agency projects were reviewed, prioritized, and matched against federal, state, and local funding sources. The result was three lists of approved projects, namely:

- The Federal Transportation Improvement Program, which covers the first four years of the program including projects that are already funded and are either already under construction or are in an advanced stage of development.

[2] *Traffic Impact Analysis Preparation Guide*, City of Moreno Valley, August 2007

- A second project list for 2016-2035, the financially constrained project list, that includes only transportation projects that have committed, available, or reasonably available revenue sources, and thus are probable for implementation.
- The Strategic Plan, which is an illustrative list of additional transportation investments that the region would pursue if additional funding and regional commitment were secured. Such investments are potential candidates for inclusion in the constrained RTP/SCS through future amendments or updates.

For this study, only the projects in the Federal Transportation Improvement Program and the financially constrained[3] project list were assumed to be completed (see Figure 5). The projects in the Strategic Plan were not assumed completed because funding for them was considered to be too uncertain. Also, the proposed East-West Freight Corridor that was included in the financially constrained plan was not assumed to be implemented. This is because unlike the other projects which are based on funding mechanisms with a clear track record, the freight corridor is expected to be funded through tolls to be collected by a process that has not yet been established and whose future efficacy is unknown. If it is constructed, then traffic impacts would be less than those described herein.

The network for the 2035 study year was also based on the RTP. However, within the City of Moreno Valley the General Plan road network was incorporated into the study (see Figure 6). The General Plan network includes future planned improvements that are funded through the City's Development Impact Fee (DIF), Western Riverside Council of Governments' Transportation Uniform Mitigation Fee (TUMF), and improvements made directly by developers. The expectation that these improvements will be in place is therefore consistent with and based upon the assumption of build-out of the General Plan land uses, since most of the improvements will be funded through fees on the new developments. If other sites do not fully build out per the General Plan, then the LOS on the study streets and intersection would likely be better than shown in this report.

The truck routes assumed for roads in Moreno Valley were based on the current Municipal Code. They included the City's recent decision to allow truck traffic on Redlands Blvd. only on the portion north of Fir (future Eucalyptus) Ave.[4]. Within the project site all roads would be truck routes, but trucks would not be permitted to enter or leave the site through the Cactus Ave. Extension.

---

[3] These are the projects for which funds are committed or reasonably available.

[4] City Council Ordinance 836, dated January 2012, rescinded the designation of Redlands Blvd. as a truck route south of Fir Avenue.Blvd..

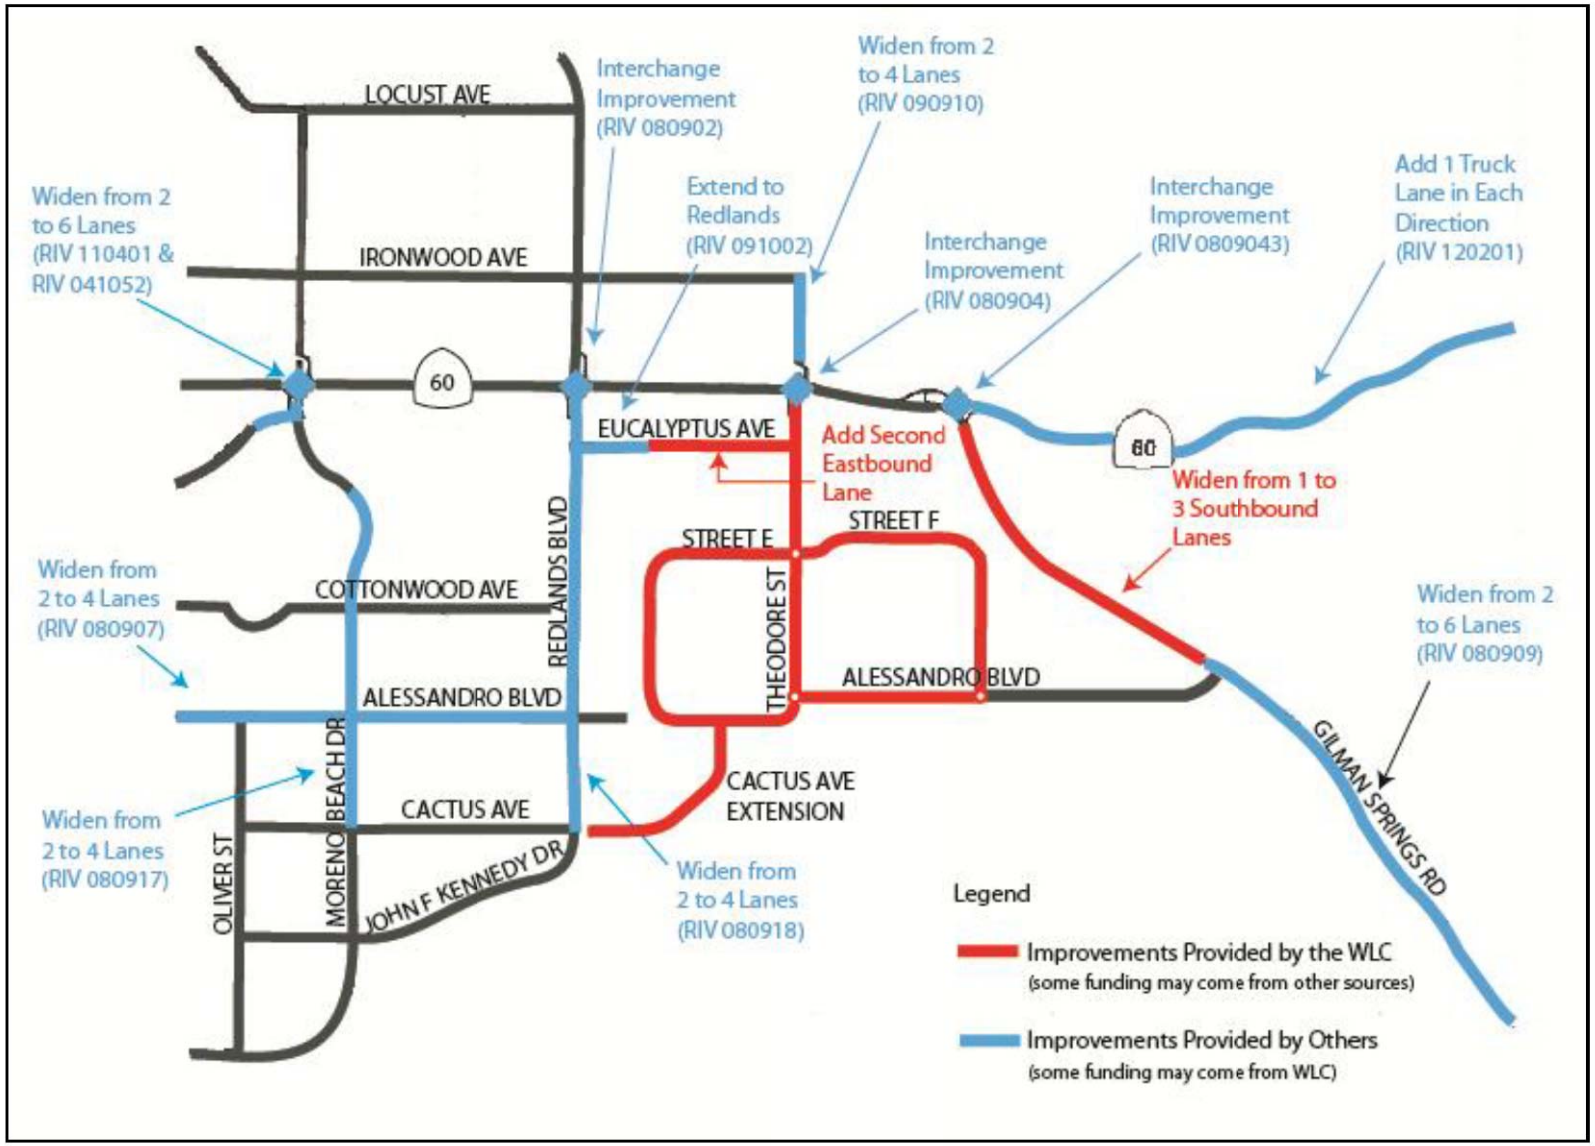

**Figure 5: Roadway Improvements Assumed for 2022**

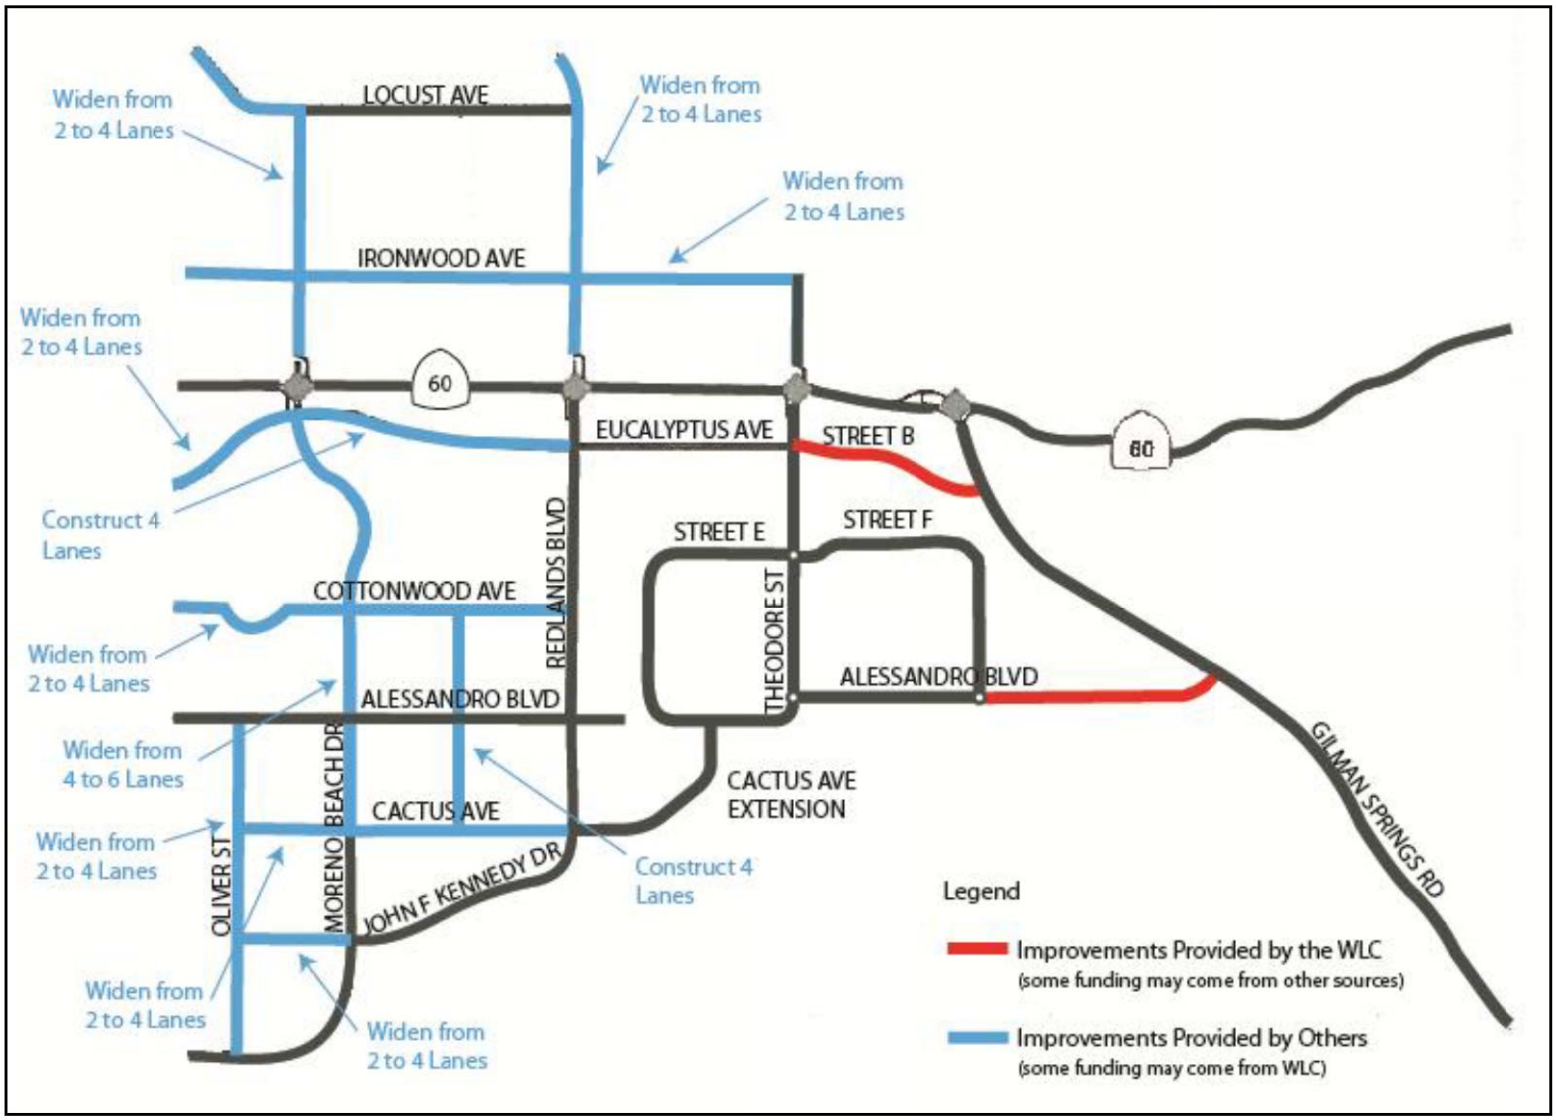

**Figure 6: Roadway Improvements Assumed for 2035**

***Trip Generation Assumptions for High-Cube Warehouses***

Based on the proposed WLC Specific Plan, high-cube logistics warehousing would comprise 99.4% of the floor space of the WLC, so a considerable amount of deliberation and study went into the selection of the most appropriate trip generation rate for this particular type of building. Four possible sources of trip generation rates were identified and evaluated, as described below. The City's TIA guidelines specify that a combination of the first two sources be used, with the Institute of Transportation Engineers (ITE) *Trip Generation Manual* being the source of the overall trip generation rate and the City of Fontana *Truck Trip Generation Study* being the source of the vehicle mix percentages.

*1. ITE Trip Generation Manual*

The most widely-recognized source for data on how much traffic various types of land uses generate is the ITE *Trip Generation Manual*. The report is a compilation of results from surveys performed at sites across the country representing different land use types. The *Trip Generation Manual* is periodically updated to include new building types as they enter the market and subdividing previous categories as the accumulated data allows for greater specificity of definition.

The 5th edition of Trip Generation, published in 1991, introduced High-Cube Warehouse (category 152) as a new land use category distinct from Warehousing (category 150). The new category was described as,

> "*High-cube warehouses are a new type of warehouse used for the storage of manufactured goods prior to their distribution to retail outlets. These facilities consist of large shells of steel buildings and large halls, often sub-divided for individual tenants, with a typical ceiling height of 24 to 26 feet; they are also characterized by a small employment count due to a high level of mechanization, truck activities frequently outside the peak hour of the adjacent street system, and good freeway access. A related land use is warehousing (land use 150).*"

The most recent, 9th, edition of the Trip Generation Manual was released in September 2012. The average trip generation rate for high-cube warehouses was estimated to be 1.680 vehicle-trips/day per 1,000 square feet of floor space (VT/KSF), 0.110 VT/KSF for the AM peak hour, and 0.120 VT/KSF for the PM peak hour.

The ITE trip generation rates are intended to represent a national average and thus do not account for regional and local variations in building age, degree of automation, and the specific operational aspects taking place in high-cube warehouses. Three studies conducted to provide guidance on local trip generation rates, described below, indicate that high-cube warehouses in the Inland Empire have significantly lower trip generation rates than those found in the ITE *Trip Generation Manual*.

*2. Fontana Truck Trip Generation Study*

In 2003, the City of Fontana commissioned a study of trip generation at warehouses and industrial sites with the stated purpose that, "*This study will be a primary tool in the preparation of Traffic Impact Analysis (TIA's) for Congestion Management Plan (CMP) compliance in southern California, since it reflects trip making with local characteristics*." (City of Fontana, page 1) This study is widely used in transportation impact studies in the Inland Empire and is cited in the City of Moreno Valley's traffic impact guidelines as a data source (City of Moreno Valley, page 10). The peak hour trip generation rates measured for large warehouses in the study are shown in Table 3 along with the ITE rates.

**Table 3: Comparison of ITE and Fontana Trip Generation Rates (per KSF)**

| Source of Trip Generation Rates | AM Peak Hour | | | PM Peak Hour | | | Daily |
|---|---|---|---|---|---|---|---|
| | In | Out | Total | In | Out | Total | |
| ITE *Trip Generation Manual* | 0.0759 | 0.0341 | 0.1100 | 0.0372 | 0.0828 | 0.1200 | 1.6800 |
| Fontana *Truck Trip Generation Study* | 0.0357 | 0.0343 | 0.0700 | 0.0224 | 0.0506 | 0.0730 | 1.9700 |
| Fontana Rate as a Percent of ITE Rate | 47% | 101% | 64% | 60% | 61% | 61% | 117% |

This source found that the overall amount of peak-hour trips generated by large warehouses in Fontana is about 36%-39% less than the ITE rates.

The Fontana study involved relatively few survey sites (five). However, this study's conclusions were later found to be supported by a much larger study, as described below.

*3. The 2011 NAIOP Trip Generation Study of High-Cube Warehouses*

The Commercial Real Estate Development Association, also known by its former acronym NAIOP, commissioned a study of high-cube warehouses in the Inland Empire focused on the type of large highly-automated warehouses that are being proposed for the WLC. The NAIOP study is particularly relevant to the WLC because it is:

- Specific – The study was focused on a narrowly-defined type of warehouse development. Like the proposed WLC buildings, the sampled buildings were at least 500,000 square feet each, had no non-warehouse tenants, did not share driveways with other buildings, had been occupied for at least a year, and had no rail access.
- Local – The NAIOP study restricted its sample sites to the Inland Empire, which strengthens the relevance to the WLC. In contrast, the studies used in ITE's general high-cube category relied on data from other parts of the country where port operations, the labor market, and the industrial base may differ markedly from those in the Inland Empire.
- Recent – Many of the studies used in the general ITE high-cube rate were based on relatively old data that do not reflect current operating practices. In contrast, the NAIOP study is based on data

collected in 2008.

- Large –The NAIOP 2011 study covered 31 sites with a very specific type of warehouse building resulting in greater statistical validity for that building type.
- Objective and Comprehensive –The greater Inland Empire region was scanned for large buildings and their locations were annotated using Google Earth. All buildings meeting the specifications described above were considered (i.e. a 100% sample), which eliminated the possibility that the sample was biased ("cherry picked") to support a pre-determined result.
- Overseen by Experts – The NAIOP study was overseen by a Technical Advisory Group with representatives from the City of Moreno Valley, the Western Riverside Council of Governments, the Riverside County Transportation Commission (RCTC), the San Bernardino (County) Associated Governments, and UC Riverside.
- Peer-Reviewed – In 2012 the consulting company Urban Crossroads (UC) was contracted to perform a peer review of the 2011 NAIOP study. Their conclusions were summarized as follows,

  *"SUMMARY OF CONCLUSIONS*

  *Based on our review of a number of trip generation rate sources used by engineers and planners throughout the Inland Empire to analyze the impacts of warehouse and light industrial type of projects, it is clear that no single trip generation rate is uniformly applicable to all warehouse projects. A number of variables affect the applicability of any particular recommended trip generation rate to any particular project. Based on our review, it appears that warehouse size and type are both important variables. The Inland Empire area also provides a unique staging opportunity for goods being shipped into, out of, and through Southern California.*

  *In this specific instance, it is our recommendation that for new high-cube warehouse distribution buildings of at least 500,000 square feet in size in the Inland Empire, the 2011 NAIOP Study provides the most comprehensive collection of survey data compiled to date, and its recommended trip generation rates can be used with confidence to analyze the transportation impacts of modern, high-cube warehouse facilities greater than 500,000 square feet. Our recommendation is based on the fact that this study was broad-based, professionally conducted, validated by an independent Technical Advisory Group (TAG) and followed the trip generation rate methodologies of the Institute of Transportation Engineers (ITE). Based on our assessment of other trip rate studies and the underlying data sources, UC also finds that none of the other trip rate studies that are either currently used by public agencies, or (at times) sought to be imposed by third parties, are appropriate with respect to providing trip generation rates for modern high-cube distribution warehouse projects greater*

*than 500,000 square feet in the Inland Empire. The data supporting these rates include numerous smaller (less than 500,000 square feet) warehouses that are not of the modern high-cube design and are also not located in the Inland Empire area."* (Urban Crossroads, page 1)

Table 4 compares the ITE trip generation rates and the rates from the NAIOP study. This large and focused study found that the trips generated by large warehouses in the Inland Empire are less than half (43%) of the national average rate in the AM peak hour, and 42% less than the ITE rates in the PM peak hour.

**Table 4: Comparison of ITE and NAIOP Trip Generation Rates (per KSF)**

| Source of Trip Generation Rates | AM Peak Hour | | | PM Peak Hour | | | Daily |
|---|---|---|---|---|---|---|---|
| | In | Out | Total | In | Out | Total | |
| ITE *Trip Generation Manual* | 0.076 | 0.034 | 0.110 | 0.037 | 0.083 | 0.120 | 1.680 |
| NAIOP 2011 *Trip Generation Study* | 0.030 | 0.017 | 0.047 | 0.022 | 0.048 | 0.070 | 0.990 |
| NAIOP Rate as a Percent of ITE Rate | 40% | 50% | 43% | 58% | 58% | 58% | 59% |

*4. Skechers Trip Generation*

The best match to the proposed WLC buildings is the existing Skechers building, a very large (1.8 million square-foot) logistics center and factory outlet store built by Highland Fairview and located directly adjacent to the WLC site. It can be considered the prototype for the type of buildings planned for the WLC, except that the WLC buildings will be prohibited from having factory outlet stores[5]. Traffic counts were conducted in November 2012 after the building had been in full operation for over a year. The counts showed that for all time periods the traffic generated by the Skechers building was only about one-third of what the ITE trip generation rates would have predicted (see Table 5)[6]. The actual truck traffic was less than half (41%) of what the methodology mandated in the City of Moreno Valley's traffic impact guidelines (ITE trip generation rates with the vehicle mix from the Fontana truck study) would have predicted (see Table 6).

**Table 5: Comparison of ITE and Skechers Trip Generation Rates (per KSF)**

| Source of Trip Generation Rates | AM Peak Hour | | | PM Peak Hour | | | Daily |
|---|---|---|---|---|---|---|---|
| | In | Out | Total | In | Out | Total | |
| ITE *Trip Generation Manual* | 0.076 | 0.034 | 0.110 | 0.037 | 0.083 | 0.120 | 1.680 |
| Skechers Traffic Counts | 0.022 | 0.013 | 0.035 | 0.004 | 0.033 | 0.037 | 0.567 |
| Skechers Rate as a Percent of ITE Rate | 29% | 38% | 32% | 11% | 40% | 31% | 34% |

[5] Skechers is located directly along the freeway and so was considered an appropriate location for retail sales.

[6] The counts were performed in a way that allowed the traffic to and from the warehouse portion of the site to be distinguished from traffic to and from the outlet store. The rates shown in the tables are for the warehouse portion only.

**Table 6: Comparison of ITE/Fontana Trip Generation Rates to Skechers Rates (per KSF)**

| Vehicle Type | ITE Trip-Gen + Fontana Vehicle Mix (City TIA Methodology) | | Skechers Warehouse Trip-Gen Rates | | Skechers Trip-Gen Rate as a % of City TIA Methodology |
|---|---|---|---|---|---|
| | Trip-Gen Rate | % of Vehicles | Trip-Gen Rate | % of Vehicles | |
| Passenger Vehicles | 1.337 | 79.6% | 0.449 | 79.2% | 34% |
| Light Trucks | 0.058 | 3.5% | 0.019 | 3.3% | 32% |
| Medium Trucks | 0.078 | 4.6% | 0.014 | 2.4% | 17% |
| Heavy Trucks | 0.207 | 12.3% | 0.086 | 15.1% | 41% |
| Total | 1.68 | 100.0% | 0.567 | 100.0% | 34% |

Some DEIR commenters noted the fact that the Fontana study found 12.3% of trips entering or leaving high-cube warehouses were heavy trucks, while some other sources have a higher percentage of heavy trucks (the NAIOP study, for example, had 20.8% heavy trucks). They wrongly concluded that this meant that the WLC analysis forecasted too few trucks. In fact, because the WLC analysis utilized a very high overall trip generation rate the number of truck trips assumed is actually slightly higher than in the NAIOP survey and much higher than the Skechers data indicates would be appropriate (see Table 7 and Figure 7). The figures used in this analysis can therefore be considered a high estimate of truck traffic and a very high estimate of car traffic compared to conditions actually found at the most comparable sites.

**Table 7: Comparison of Truck Trip Generation from Southern California Sources**

| Source | Total Vehicle Trips /Day/KSF | % trucks | Heavy Truck Trips/Day /KSF | Other Trips/Day /KSF |
|---|---|---|---|---|
| WLC | 1.68 | 12.3% | 0.207 | 1.473 |
| NAIOP | 0.99 | 20.8% | 0.206 | 0.784 |
| Skechers | 0.57 | 15.2% | 0.086 | 0.481 |

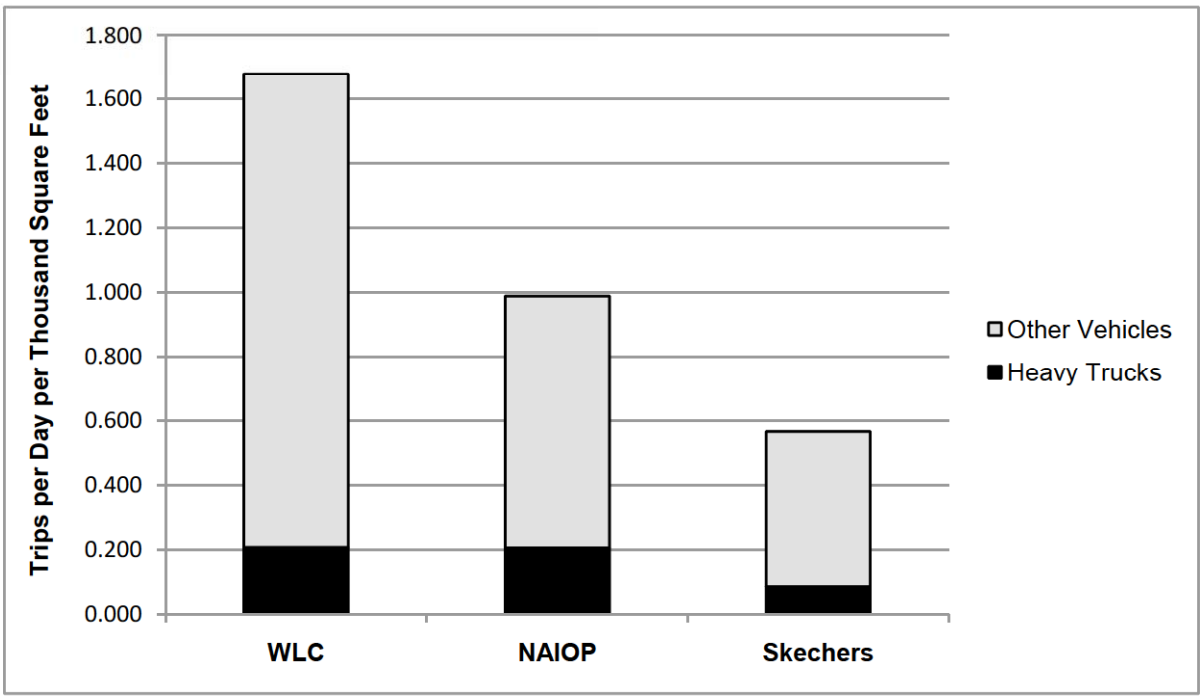

**Figure 7: Comparison of Trip Generation from Southern California Sources**

Some DEIR commenters suggested that this analysis should use a combination of a very high overall trip generation rate with a high heavy truck percentage to estimate the number of project truck trips. The problem with this approach is that the City has used it before in previous analyses and found that it produced results that were unreasonable when compared to actual field conditions. For example, this approach was used in the EIR for the Skechers high-cube warehouse building and resulted in forecasts that were three times the actual post-construction trip generation for car trips and nearly eight times the actual trip generation for trucks[7]. This approach is misleading to decision makers and could result in oversized infrastructure which itself would have environmental consequences, creates an undue burden on development, and could ultimately discredit the City's project review process in the eyes of the business community and members of the public. For these reasons it was not used in the current analysis and the formula in the City's Traffic Impact Guidelines was used instead. The results, which are quite high compared to survey data (as shown in Figure 7), thus meet CEQA's standard of substantial evidence.

[7] These figures are based on traffic counts taken at the Skechers building after it had been fully operational for over a year. See Technical Memorandum *Traffic Generated by the Skechers Warehouse*, Parsons Brinckerhoff to the City of Moreno Valley, November 14, 2012.

*City of Moreno Valley Survey of Trip Generation from High-Cube Warehouses*

Concerns over unrealistically high trip generation forecasts prompted the City of Moreno Valley Transportation Engineering Division to perform their own survey of trip generation at six warehouses in the city. This study[8] used counts collected in Fall 2013, i.e. well after the WLC DEIR had been sent out for public review. The City study confirmed that the vehicle mix for the Heavy Warehouse category in the Fontana *Truck Trip Generation Study* (i.e. the data used for the WLC TIA) produces a good, but conservative (i.e. somewhat high), estimate of truck trips percentages for high-cube warehouses while the Fontana the Truck Terminal category produces an obvious over-estimate of truck traffic (see Figure 8).

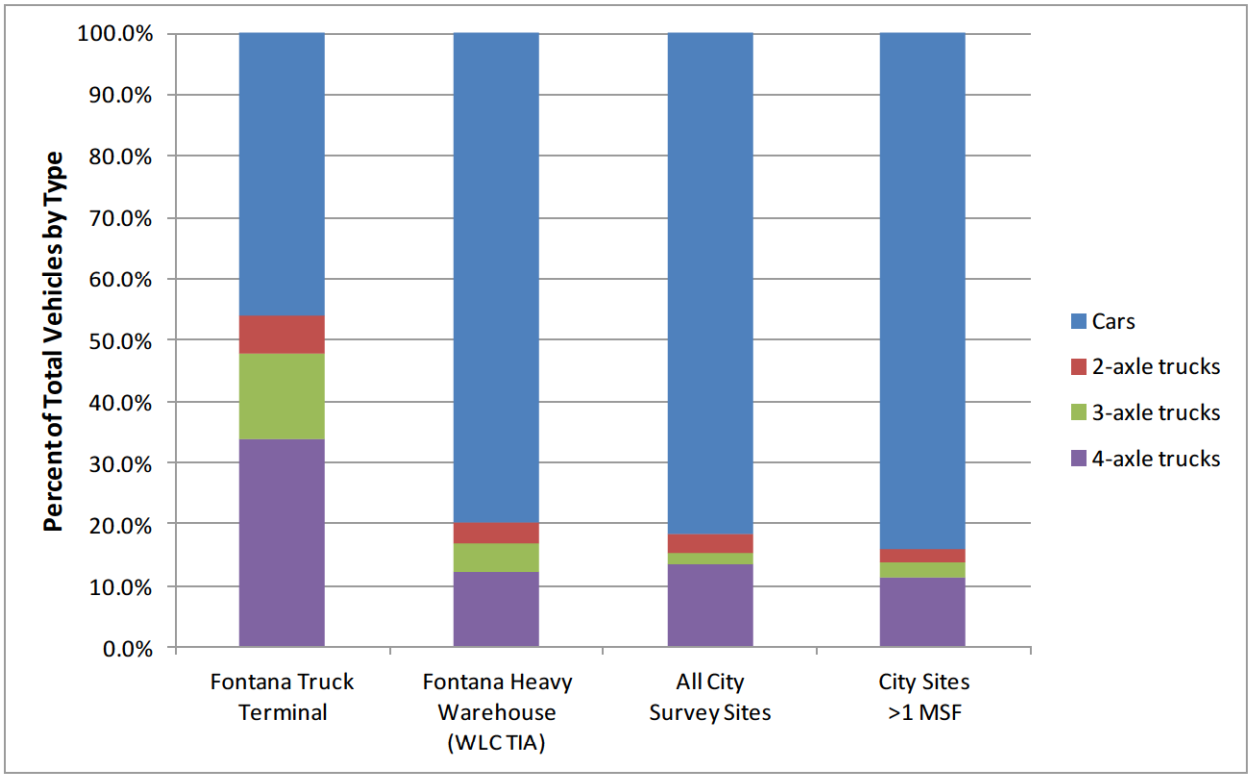

**Figure 8: Comparison of Vehicle Mixes from the City Survey and the Fontana Study**

Besides vehicle mixes, the City study data was also used to calculate the overall trip generation rates for different categories of vehicles. Figure 9 compares the assumed trip generation using the ITE trip-generation rates in combination with the Fontana vehicle mixes to the measured rates in the City survey. Figure 9 presents the same information with the heavy vehicles converted into passenger car equivalents. Figure 8 and Figure 9show the data for peak-hour conditions, which is used in the LOS analysis to identify potential traffic impacts. The data from the City's surveys confirm that the trip generation rates

[8] *Vehicle Mix Assumption for High-Cube Warehouse*, memorandum from Michael Lloyd to Eric Lewis, September 27, 2013.

used in the WLC TIA are high compared to the measured rates at existing high-cube warehouses in Moreno Valley.

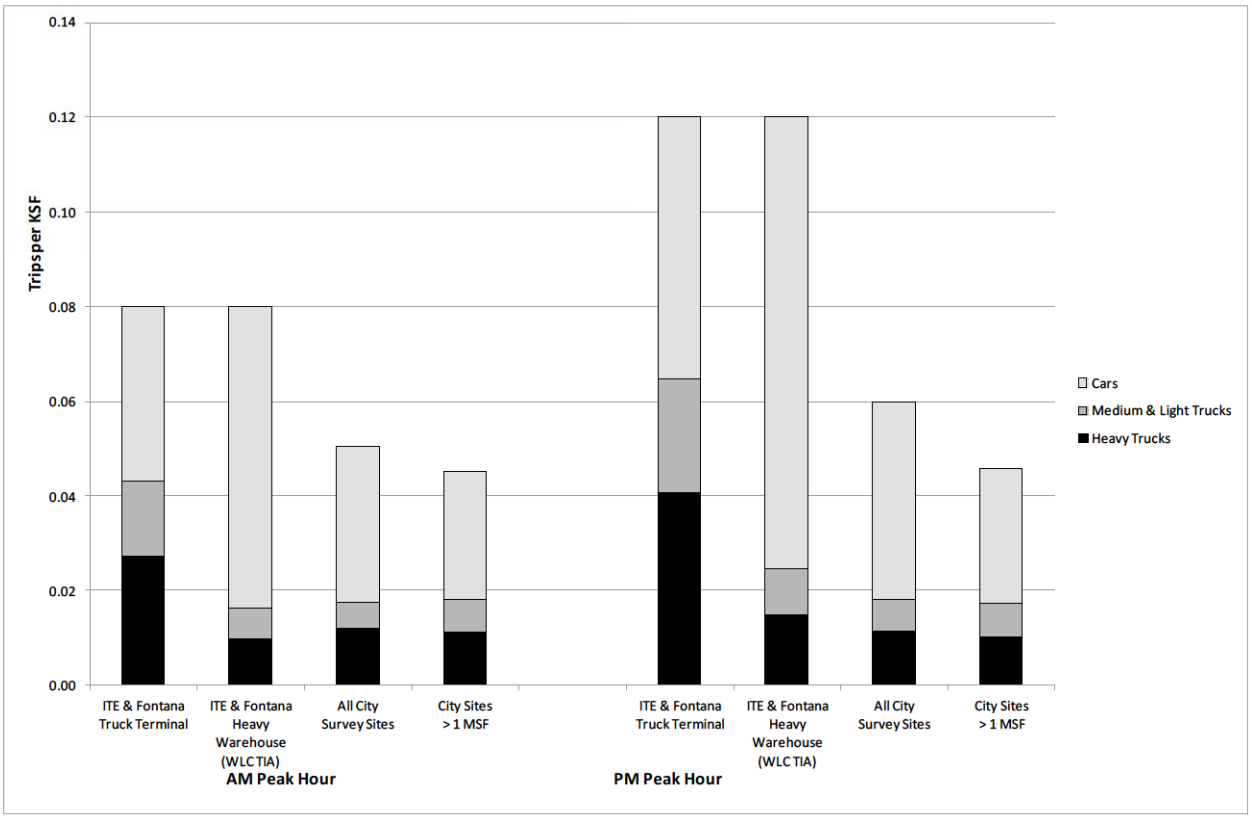

**Figure 9: Peak-Hour Trip Generation from ITE compared to City Surveys (Trips)**

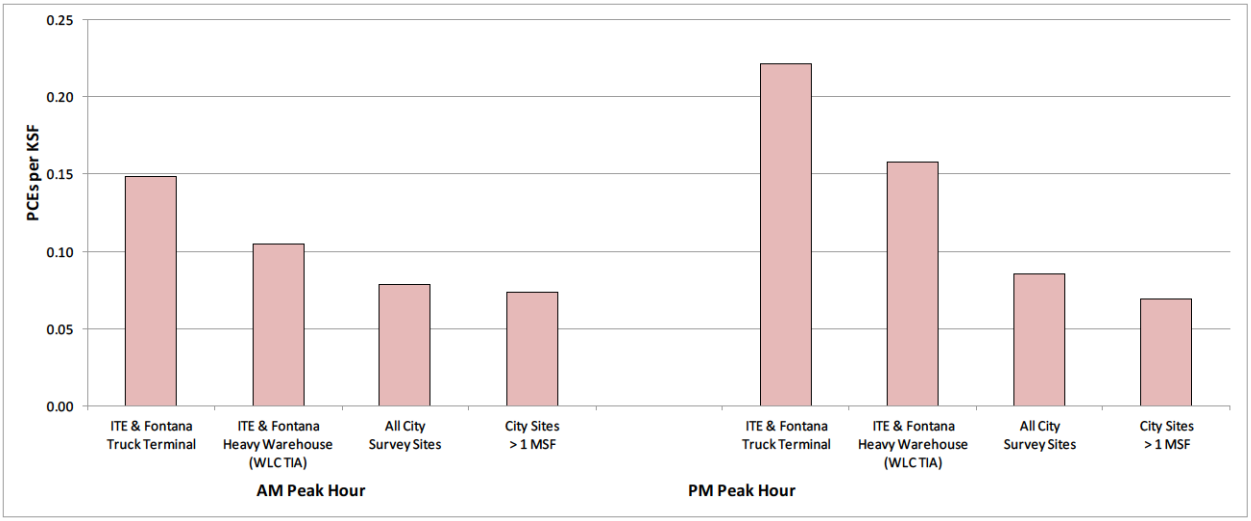

**Figure 10: Peak-Hour Trip Generation from ITE compared to City Surveys (PCEs)**

The City study data was also used to calculate the overall trip generation rates for different categories of vehicles on a daily basis (see Figure 11). This is the time period of most interest for the air quality analysis. The data from the City's surveys confirm that the overall daily trip generation rates used in the WLC TIA are accurate compared to the measured rates at existing high-cube warehouses in Moreno Valley, while the percentage of trucks used in the WLC TIA are high compared to the locally-measured rates.

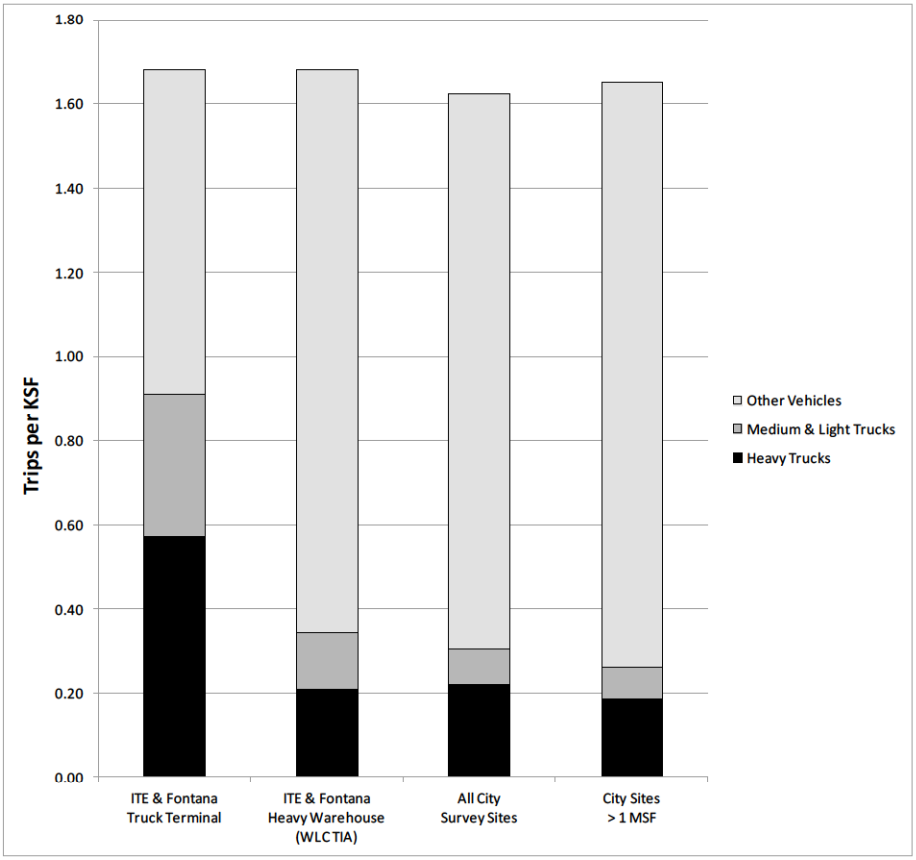

**Figure 11: Daily Trip Generation from ITE compared to City Surveys (Trips)**

*Conclusions from the Comparisons*

The trip generation rates from the ITE Trip Generation Manual and the four local sources are compared in Table 8.

**Table 8: Comparison of Trip Generation Rates for High-Cube Logistics Warehouses**

| Data Source | AM Peak Hour | As % of ITE Rate | Ratio ITE/Other | PM Peak Hour | As % of ITE Rate | Ratio ITE/Other |
|---|---|---|---|---|---|---|
| ITE 9th Edition (Code 152) | 0.110 | | | 0.120 | | |
| Fontana Truck Study | 0.070 | 64% | 1.57 | 0.073 | 61% | 1.64 |
| 2011 NAIOP Study | 0.047 | 43% | 2.34 | 0.070 | 58% | 1.71 |
| Skechers Counts | 0.035 | 32% | 3.14 | 0.037 | 31% | 3.24 |
| City Survey | 0.051 | 46% | 2.16 | 0.060 | 50% | 2.00 |

As shown in the table, the ITE trip generation rate is at a minimum 57% higher than any of the locally-measured rates, and is two or three times higher than some of the locally-measured rates. Based on this data, a decision was made to use the ITE rate as a conservative scenario for the WLC project. Readers should therefore bear in mind that because the rate used in the WLC analysis is very high in comparison with all locally-measured rates, and the Project traffic impacts analysis reflects these high rates, the actual traffic impacts of the WLC project are expected to be much less than those identified in this study.

***Trip Generation Assumptions for Other WLC Land Uses***

The trip generation rates used for other land uses on the WLC site were taken from the ITE *Trip Generation Manual*. The existing homes, which occur in the No-Project scenario, used the rates for ITE land use code 210, Single Family Dwellings. For light logistics uses, ITE code 150, Warehousing, was used, and for the existing utilities servicing stations ITE code 170, Utilities, was used. *Trip Generation Manual* does not have trip generation rates for a fire station so for that use an average rate from three studies was used[9].

***Passenger Car Equivalents (PCEs)***

The analytical methods used to forecast traffic impacts must take into account the driving characteristics of different classes of vehicles. This is typically done through the use of Passenger Car Equivalents (PCE) factors, which convert the number of heavy vehicles in the traffic stream into an equivalent number of passenger cars. The term PCE was first used in the 1965 *Highway Capacity Manual* (HCM), and was determined by comparing the number of times cars passed trucks to the number of times trucks pass cars. According to the *HCM 2000*:

[9] LLG Engineers, *Peaceful Valley Ranch*, County of San Diego, 2007. Fehr and Peers, *Loyola Marymount University Master Plan Project*, City of Los Angeles Department of Transportation, 2009. McMahon, *Upper Dublin Fire House*, Montgomery County, Pennsylvania, 2010. These were the only recent studies found that offered rates for fire stations.

*"The entry of heavy vehicles-that is, vehicles other than passenger cars (a category that includes small trucks and vans)-into the traffic stream affects the number of vehicles that can be served. Heavy vehicles are vehicles that have more than four tires touching the pavement.*

*Trucks, buses, and recreational vehicles (RVs) are the three groups of heavy vehicles addressed by the methods in this manual. Heavy vehicles adversely affect traffic in two ways:*

- *They are larger than passenger cars and occupy more roadway space; and*
- *They have poorer operating capabilities than passenger cars, particularly with respect to acceleration, deceleration, and the ability to maintain speed on upgrades.*

*The second impact is more critical. The inability of heavy vehicles to keep pace with passenger cars in many situations creates large gaps in the traffic stream, which are difficult to fill by passing maneuvers. The resulting inefficiencies in the use of roadway space cannot be completely overcome. This effect is particularly harmful on sustained, steep upgrades, where the difference in operating capabilities is most pronounced, and on two-lane highways, where passing requires use of the opposing travel lane." (*Transportation Research Board, *Highway Capacity Manual 2000*, page 2-5)

Grade is by far the most important determinant in the PCE factor to be used. The HCM's recommended PCE for trucks ranges from 1.5 for places with slopes of less than 2% up to 7.0 for places with steep grades more than a mile long[10]. HCM's recommended PCE factors were used for the WLC freeway analysis.

For the analysis of surface streets, the City's TIA guidelines mandate the use of PCE factors taken from the San Bernardino County CMP, 2003 Update. These are somewhat higher than the HCM rates; for example, HCM recommends two PCEs per heavy truck while the San Bernardino County CMP uses three. This means that the San Bernardino County CMP PCE rates used in the WLC analysis represent a deliberately conservative approach in the sense that the analysis will tend to over-state the impact of trucks on traffic conditions.

## B. ANALYTICAL TOOLS

***Regional Model***

The macro-level traffic forecasting was conducted using the Riverside County Transportation and Analysis Model (RivTAM). RivTAM is a version of the SCAG's latest six-county model with additional detail (traffic analysis zones and local roads) added within Riverside County. It was developed for TIAs in

[10] A PCE factor of 7.0 means that under the stated conditions each truck takes up 7 times as much road capacity as a car would use in level terrain.

Riverside County as a replacement for several older models that covered different portions of the county. RivTAM has both the geographic scope needed to capture all likely impacts and conformity with regional planning assumptions. There is a memorandum of understanding[11] among the jurisdictions of Riverside County that encourages the use of the RivTAM model for TIAs. The MOU reads, in part,

> *"RivTAM was designed to address most city and county level modeling needs in Riverside County. The model inputs and zone system were designed with sufficient detail to support most city/county planning applications. The modeling methodology can support evaluation of a range of highway, HOV, and transit scenarios. The Agencies encourage the use of RivTAM by Cities, other governmental jurisdictions, and private entities for their own transportation planning purposes. Universal use of RivTAM by the Agencies, Cities, other governmental jurisdictions, and private entities, and their consultants will ensure that planning decisions in Riverside County are made on accurate and consistent travel forecasts."* (*MOU for RIVTAM Model Maintenance, Update, and Usage*, page 4)

The use of RivTAM for the analysis in this TIA[12] included the following refinements:

- The traffic analysis zones (TAZs) within the project site were subdivided to allow for a detailed analysis of internal traffic patterns, and the proposed internal road network was substituted for the existing road network for all "with-project" scenarios.
- RivTAM forecasts traffic for two peak periods; a three-hour period in the morning and a four-hour period in the evening. These were converted into forecasts for single peak hours using conversion factors in the *San Bernardino County CMP Appendix H – Post Processed Traffic Volume Guidelines* in accordance with the City's TIA guidelines.
- RivTAM quantifies non-residential developments in units of employees rather than acres or square feet of building space. For developments in the City of Moreno Valley, future developments' acreage was converted into square feet of development using the existing developmental densities in Moreno Valley, and then the square footage was used to estimate the number of employees using the conversion factors in the City's General Plan. For areas outside Moreno Valley the conversion factors used in the Riverside County General Plan were used.

---

11 *MOU for RIVTAM Model Maintenance, Update, and Usage*. Not dated, but signed by various parties between June and September, 2010. The signatories were Riverside County Transportation Department, Riverside County Transportation Commission, Western Riverside Council of Governments, Coachella Valley Association of Governments, Southern California Association of Governments, and Caltrans.

12 The modeling data in RIVTAM is based upon modeling information originally developed by the Southern California Association of Governments (SCAG), which has been modified by Parsons Brinckerhoff. The modeling data used in this study does not necessarily reflect the official views or policies of SCAG. Parsons Brinckerhoff is wholly responsible for the modeling results and the content of the documentation.

- In the trip distribution stage of RivTAM the model assigns destinations to the trucks trips originating in the WLC warehouses. Since WLC warehouses are attractors of truck trips as well as generators of truck trips, the model assigns approximately 10% of WLC truck trips to destinations that are other warehouses within the project site. As this does not reflect the WLC's expected operations and might result in an under-estimation of truck trips entering and leaving the WLC site, these internal trips were replaced with an equal number of external trips that were distributed among the routes available to trucks leaving the site. Since some trucks may in fact have deliveries or pick-ups at more than one warehouse within the WLC site this represents a conservative assumption.
- Like other regional travel demand models, RivTAM is designed to forecast movements along paths consisting of links between trip origins and destinations. Therefore post-processing is required to convert the link-level forecasts from RivTAM into turning movements for the intersection-level analysis. The Furness method[13] was used to allocate approach volumes among the possible turning movements based on traffic counts of existing traffic patterns.
- The RivTAM model was calibrated to ensure that its forecasts are reasonable. Nevertheless, a model covering a six-county area cannot be expected to be perfectly accurate on each of the hundreds of thousands of links in the model. For that reason, best industry practice is to use the model to forecast the change in traffic volumes and add this change to existing traffic volumes, rather than using the forecast volumes directly from the model. This technique, called the "difference method", was used in this TIA[14]. The difference method eliminates certain types of imperfections in the forecast of background traffic and so improves the accuracy of traffic forecasts.
- To ensure that vehicle trips were not under-estimated, it was also assumed that no trips would be taken by transit. This is another conservative assumption since the WLC would be designed to accommodate bus routes and it is expected that transit service would be provided once the project reaches a transit-supportable level of development.

In summary, RivTAM was used to provide accurate forecasts of project impacts on the regional road network. Several highly conservative assumptions were used to ensure that the TIA over-estimated rather than under-estimated impacts.

---

[13] The Furness method is a technique for balancing the forecast turning movements in such a way as to match both the total approach volume and the total departure volume for each leg predicted in the traffic model. Furness K.P. *Time Function Interaction*. Traffic Engineering and Control, Vol. 7, No. 7, 1970, pp. 19-36

[14] This is the "difference method" described in NCHRP Report 255 *Highway Traffic Data for Urbanized Area Project Planning and Design*, Transportation Research Board, 1982.

***Manual Trip Generation and Assignment for Fueling Station***

The project includes a fueling station and convenience store intended to serve the needs of truckers picking up or delivering cargos at the WLC site. Traffic to the fueling station/convenience store was estimated using the ITE trip generation rates separately for the refueling function (ITE code 945, Gas Station with Convenience Store, measured in pumps) and the convenience store function (ITE code 851, Convenience Store, measured in square feet). In accordance with industry practice a 30% reduction was made for trips going to both the refueling pumps and the convenience store, and 84% of traffic to the facility was categorized as either pass-by trips or diverted linked trips[15]. These are trips that stop at the fueling station as a side trip during the course of a primary trip or from their primary destination in the WLC. Figure 12 shows examples of diverted linked trip paths for inbound trucks going to WLC destinations at the north and south end of the WLC site. All of the trips to and from the fueling station were manually added to the traffic forecast produced by RivTAM.

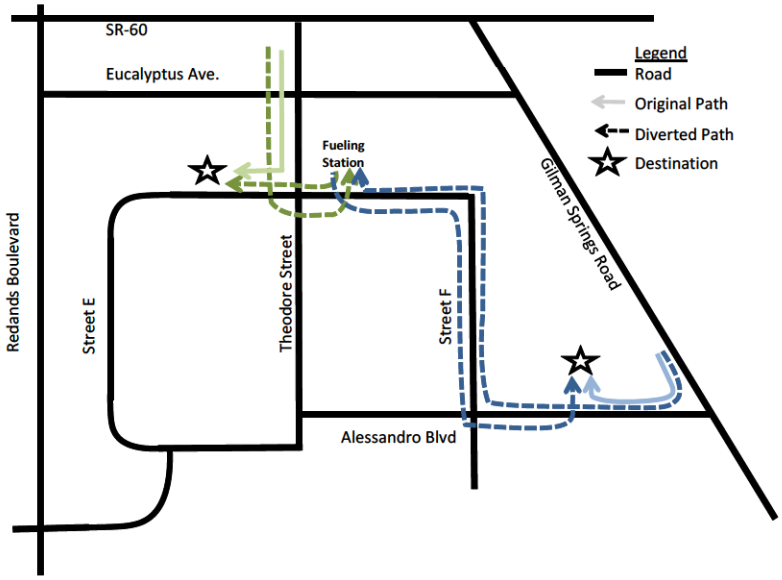

**Figure 12: Examples of Routes Taken by Diverted Linked Trips**

***Definition of LOS***

The HCM defines level of service as a quality measure describing operational conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, and comfort and convenience. Six LOS are defined for each type of facility, ranging from "A" for the best operating conditions to "F" for the worst, based on driver's perceptions of those conditions. Most jurisdictions have adopted policies that set target levels of LOS for road facilities under their control.

[15] See ITE *Trip Generation Handbook 2nd Edition*, page 29.

***Daily Roadway LOS***

For the road segments affected by the proposed General Plan amendment, a roadway segment analysis was performed consistent with the City of Moreno Valley *Traffic Impact Analysis Preparation Guide* using the daily capacity standards identified in the Guide and shown in Table 9.

**Table 9: Level of Service (LOS) Thresholds for Surface Streets in Moreno Valley**

| Type of Roadway | Level of Service* | | | | |
|---|---|---|---|---|---|
| | LOS A | LOS B | LOS C | LOS D | LOS E |
| 6-Lane Divided Arterial | 33,900 | 39,400 | 45,000 | 50,600 | 56,300 |
| 4-Lane Divided Arterial | 22,500 | 26,300 | 30,000 | 33,800 | 37,500 |
| 4-Lane Undivided Arterial | 15,000 | 17,500 | 20,000 | 22,500 | 25,000 |
| 2-Lane Industrial Collector | 7,500 | 8,800 | 10,000 | 11,300 | 12,500 |
| 2-Lane Undivided Residential | N/A | N/A | N/A | N/A | 2,000 |
| * Maximum Average Daily Traffic (ADT) | | | | | |
| Source: City of Moreno Valley *Traffic Impact Analysis Preparation Guide* , 2007 | | | | | |
| Note: These roadway capacities are "rule of thumb" estimates for planning purposes. The LOS "E" service volumes are estimated maximum daily capacity for respective classifications. Capacity is affected by such factors as intersections (spacing, configuration, and control features), degree of access control, roadway grades, design geometrics (horizontal and vertical alignment standards), sight distance, vehicle mix (truck and bus traffic), and pedestrian and bicycle traffic. | | | | | |

Gilman Springs Road is a Riverside County facility and so the County LOS thresholds would apply for this study road segment. These thresholds are shown on Table 10[16].

**Table 10: Riverside County LOS Thresholds for Surface Streets**

| Type of Roadway | Level of Service(1) | | |
|---|---|---|---|
| | LOS C | LOS D | LOS E |
| 8-Lane Urban Arterial | 57,400 | 64,600 | 71,800 |
| 6-Lane Urban Arterial | 43,100 | 48,500 | 53,900 |
| 4-Lane Urban Arterial | 28,700 | 32,300 | 35,900 |
| 2-Lane Collector | 10400 | 11700 | 13,000 |
| Notes: All capacity figures are based on optimum conditions and are intended as guidelines for planning purpose only.<br>(1) Maximum two-way ADT values are based on the 1999 Modified Highway Capacity Manual Level of Service Tables as defined in the Riverside County Congestion Management Program. | | | |
| Source: County of Riverside General Plan, Circulation Element, 2008 | | | |

[16] Road types not relevant to this study are not shown.

***Intersection LOS***

The LOS analysis of study intersections was performed using the methodology described in the Highway Capacity Manual (HCM) 2010 Chapter 16, for signalized intersections, and Chapter 17 for unsignalized intersections. The computations were performed using Synchro computer software with the settings specified in the City's *Traffic Impact Analysis Preparation Guide*. Synchro defaults were used as appropriate with the standard saturation flow rate of 1900 vehicles/hour and zero percent grade for the signalized intersections. Signal timings were optimized within Synchro and considered uncoordinated except for the following corridors which were identified by the City of Moreno Valley to be coordinated:

- Alessandro Blvd. from Old 215 Frontage Rd. to Kitching St.
- Cactus Ave. from SR 215 Ramps to Lasselle St.
- Ironwood Ave. from Moreno Beach Dr to Redland Blvd.
- Perris Blvd. from Iris Ave. to Krameria Ave.
- Arlington Blvd. from SR-91 WB Ramps to Victoria Ave
- Alessandro Blvd from Sycamore Canyon Blvd to SR-215 NB Ramps
- Martin Luther King Jr. Blvd. from Canyon Crest Dr to SR-60 EB Ramp
- Central Ave. from Lochmoor Dr to SR-60 WB Ramps
- The Ramona Expressway in the City of Perris
- Perris Blvd. in the City of Perris

A cycle length of 120 seconds was used for all coordinated signals. Cycle lengths were maintained at 120 seconds or less with a 3 second yellow and a one-second all red for consistency. Except for the existing conditions scenario which uses actual traffic and truck counts, all future scenario volumes were calculated in PCEs therefore the heavy truck percentage in Synchro was set to zero to avoid double-counting truck trips.

The HCM LOS thresholds for signalized and unsignalized intersections are shown in Table 11. Note that a lower boundary is defined for LOS "F" but no upper boundary is defined. In cases where the forecast delay is greater than 180 seconds drivers would tend to divert to other routes, change their time of travel, select an alternate destination (for example choose to shop at a different store) or change their behavior in other ways that are not well represented in the HCM methodology. For that reason results over 180 seconds are not meaningful and so the results are shown simply as ">180".

**Table 11: LOS Thresholds for Signalized and Unsignalized Intersections**

| Level of Service | Description | Average Control Delay (seconds/vehicle) | |
|---|---|---|---|
| | | Signalized | Unsignalized & Roundabouts |
| A | Very low control delay. Progression is very favorable; most vehicles do not stop. | ≤ 10 | ≤ 10 |
| B | Low delay with good progression and/or short cycle lengths. | > 10 to 20 | > 10 to 15 |
| C | Moderate delay resulting from fair progression and/or longer cycle times. Some vehicles may not clear intersection in one green phase. | > 20 to 35 | > 15 to 25 |
| D | Longer control delays with noticeable congestion. Many vehicles stop and the proportion not served by the first green phase rises. | > 35 to 55 | > 25 to 35 |
| E | High delay due to poor progression, long cycle lengths, or both. | > 55 to 80 | > 35 to 50 |
| F | Intersection oversaturated; arrival rates exceed intersection capacity so queues build up. | > 80 | > 50 |
| Source: *Highway Capacity Manual 2000* , Transportation Research Board, 2000 | | | |
| Note: For signalized intersections and roundabouts the LOS is based on the average for all vehicles entering the intersection. For unsignalized intersections the LOS is based on the delay for the worst-performing approach. | | | |

***Freeway LOS***

The freeway LOS was determined using the density analysis methodology in the HCM. The capacities are based on information contained in the HCM and the Caltrans Ramp Meter Design Manual. Freeway terrains were determined by comparing the grades found in Google Earth Pro to the HCM definitions for level, rolling and mountainous terrain. Existing count data were obtained from Caltrans for the freeway mainline volumes. Three types of freeway facilities were analyzed, namely:

- Freeway mainline levels of service are determined from segment density.
- Freeway weaving is defined as the crossing of two streams of traffic traveling in the same direction along a significant length of highway without the aid of traffic control devices. The weaving analysis used the most current version of the HCM to find the density for the weaving area within the freeway segment and the corresponding LOS.

- The ramp merge and diverge analysis was performed by applying Highway Capacity Software (HCS), the electronic version of the HCM for freeway-to-arterial interchanges. The HCM methodology for ramp areas focused on an influence area of 1,500 feet, including the acceleration or deceleration lane and adjacent freeway lanes.

Table 12 presents the correlation between LOS and density in terms of passenger cars per mile per lane (pc/mi/ln) for various types of freeway facilities.

**Table 12: Caltrans Freeway LOS Criteria**

| LOS | Basic Freeway Segment Denstiy | Freeway Weaving Segment Density | Freeway Ramp Density |
|---|---|---|---|
| | (pc/mi/ln) | (pc/mi/ln) | (pc/mi/ln) |
| A | 0-11.0 | ≤ 10.0 | ≤ 10.0 |
| B | 11.0 – 18.0 | > 10.0 and ≤ 20.0 | > 10.0 and ≤ 20.0 |
| C | 18.0 – 26.0 | > 20.0 and ≤ 28.0 | > 20.0 and ≤ 28.0 |
| D | 26.0 – 35.0 | > 28.0 and ≤ 35.0 | > 28.0 and ≤ 35.0 |
| E | 35.0 – 45.0 | >35.0 and ≤ 43.0 | > 35.0 |
| F | > 45.0 | > 43.0 | Demand Exceeds Capacity |

## C. PERFORMANCE CRITERIA

The study area for surface streets includes intersections located in seven jurisdictions. Each of these jurisdictions has established a target level of service for use in traffic impact studies, which are shown in Table 13.

**Table 13: Intersection LOS Standards by Jurisdiction**

| Jurisdiction | Type of Facility | # of Study Intersections | LOS Standard |
|---|---|---|---|
| Moreno Valley | Intersections adjacent to freeways or employment centers | 57 | D |
| | All other intersections | 14 | C |
| Beaumont | Most intersections | 2 | C |
| | Intersections with major highways | 2 | D |
| Perris | Intersections with SR-74, Ramona Exp, or I-215 | 5 | E |
| | Expressway/arterial intersections | 10 | D |
| | All other intersections | 6 | C |
| Redlands | Intersections currently operating at "D" or worse | 1 | Existing LOS |
| | All other intersections | 2 | C |
| Riverside (County) | Most intersections* | 7 | C |
| | Intersections with Ramona Expressway | 2 | D |
| Riverside (City) | Intersections of collectors or higher roads | 27 | D |
| San Jacinto | Arterial intersections | 1 | D |
| Caltrans | State highway facilities currently operating at LOS "E" or "F" | | Existing Density |
| | State highway facilities | | D |

* Intersections between arterials, highways, expressways, and freeway ramps within community development areas are allowed LOS "D" as an exception.

A project's impact on an intersection is considered significant if the project adds more than 50 peak-hour trips to a surface street or 100 peak-hour trips to a freeway and it would either cause the LOS to exceed the target level set by the jurisdiction or, if the LOS in the no-project condition would already exceed the target LOS level, if the project causes an increase in traffic delay beyond the no-project condition.

Caltrans has established LOS D as the threshold of significance for freeway mainline segments and freeway ramps in the corridors relevant to this study. It is Caltrans policy that if an existing state facility is operating at less than the appropriate target LOS, the existing measure of effectiveness should be maintained. Caltrans uses traffic density (passenger-cars per mile per lane) as the measure of effectiveness for freeways, so if a freeway facility currently operates at LOS "E" or "F" then a project that would increase the traffic density on that facility would be deemed to have a significant impact.

# 3. TRANSPORTATION SETTING

## A. PROJECT SITE

The World Logistics Center (WLC) project area is located in the northwestern Riverside County in the Rancho Belago area, within the eastern portion of the City of Moreno Valley. The proposed project is situated south of State Route 60 (SR-60), between Redlands Blvd. and Gilman Springs Rd. (the easterly City limit), extending to the southerly City limit. Figure 13 depicts the location of the proposed project within the region.

### *Existing Land Uses*

At the present time, the project area is largely undeveloped land. There are seven single-family homes in various locations along with associated ranch/farm buildings within the area. Most of the area has been used intermittently for dry farming since the early 1900s, and much of it continues to be used for dry farming. San Diego Gas & Electric operates a natural gas compressor station, known as the Moreno Compressor Station, on 19 acres in the southern portion of the project area. Southern California Gas Company operates a valving, metering, and pipe cleaning station on a one-acre parcel in the south-central portion of the project area.

The major roadways that currently provide access to the project area are SR-60, Redlands Blvd., Alessandro Blvd., Gilman Springs Rd. and Theodore St. SR-60 is a highway running in a 70-mile-long east-west alignment from Beaumont to Los Angeles. The portion of SR-60 that forms the northern boundary of the project currently has two lanes in each direction of travel. Redlands Blvd. and Theodore St. are north-south collector roadways that intersect with SR-60. Alessandro Blvd. is an east-west thoroughfare that runs through Moreno Valley from Interstate-215 on the west end to Gilman Springs Rd. on the east end. Gilman Springs Rd. runs in a northwesterly-southeasterly direction connecting SR-60 to the Hemet-San Jacinto area and beyond. Redlands Blvd., Theodore St., Alessandro Blvd., and Gilman Springs Rd. all currently have one lane for each direction of travel.

The areas adjacent to the east and south boundaries of the project area are mostly undeveloped. The area east of the project, commonly referred to as the Badlands, is a rugged area that separates the City of Moreno Valley from San Timoteo Canyon and the City of Beaumont. Due to its steep slopes and canyons, the Badlands area has had little development; however there are several single-family homes in this area east of Gilman Springs Rd. The Badlands Sanitary Landfill, operated by the County of Riverside Waste Management Department, is located approximately 1.5 miles northeast of the project area.

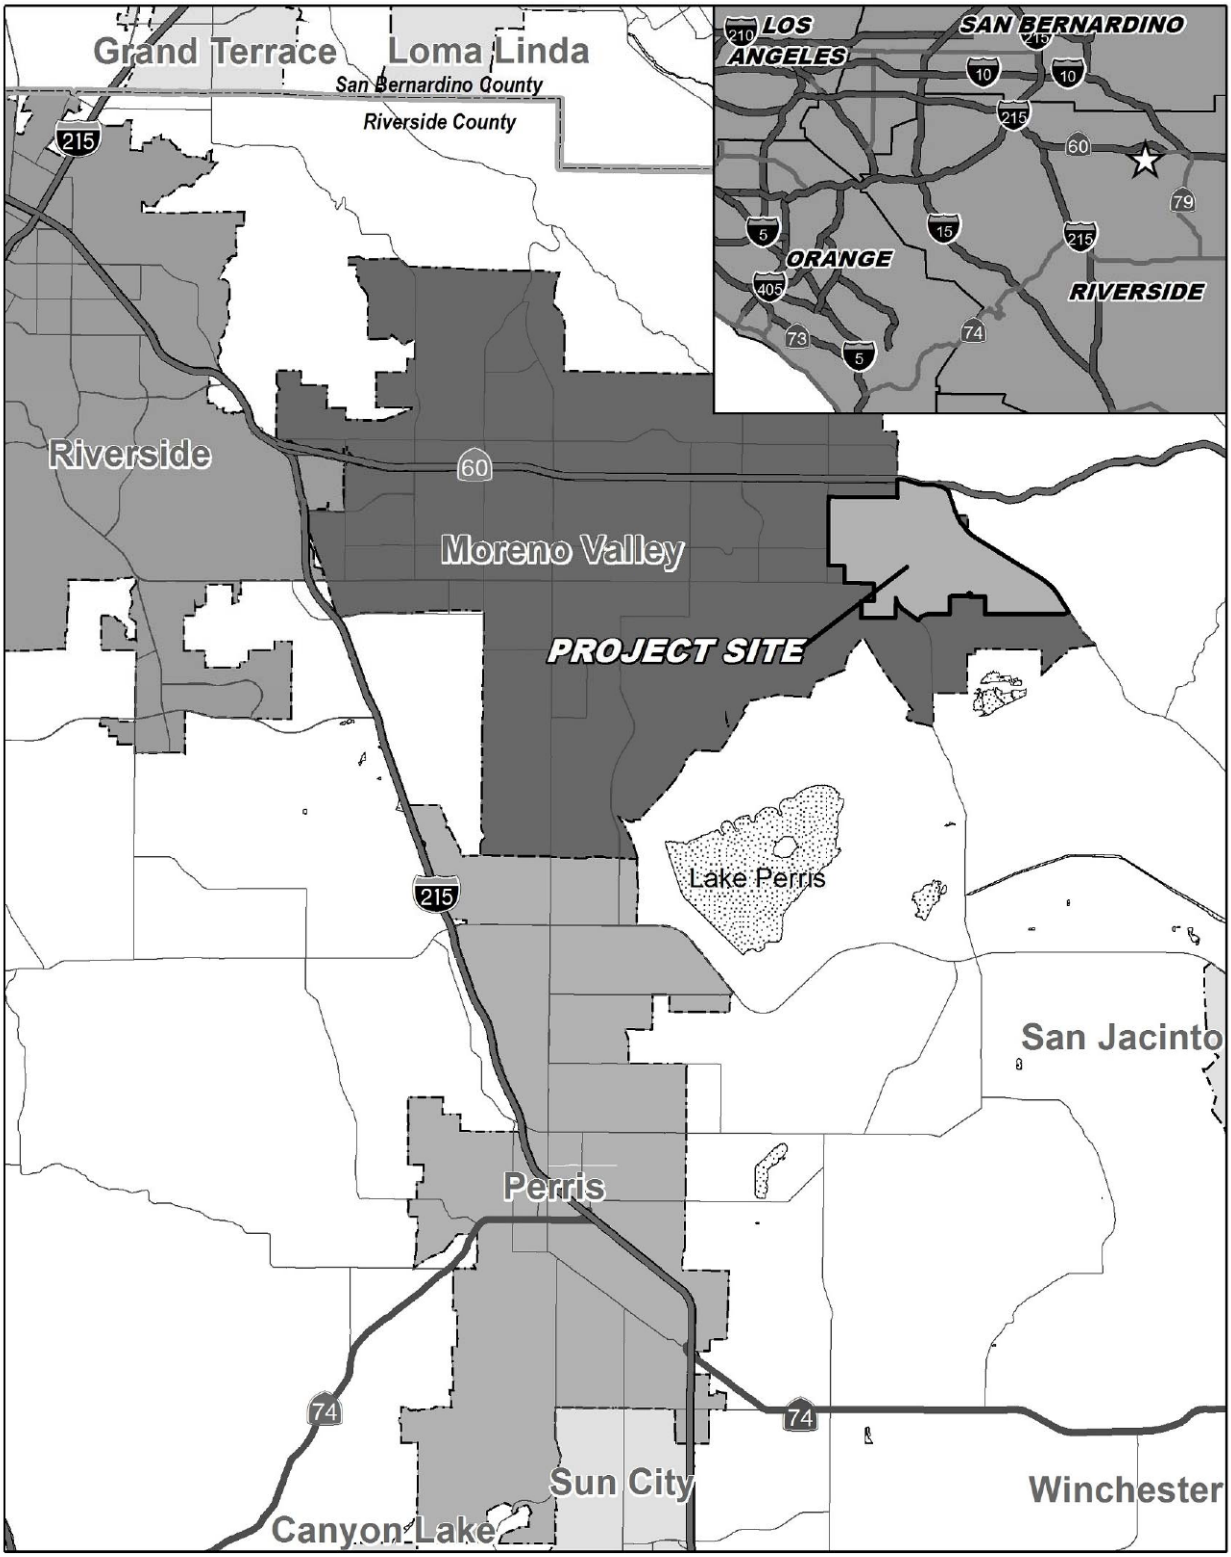

**Figure 13: Project Location**

Directly south of the proposed project is the San Jacinto Wildlife Area (SJWA), which includes the Upland Game Hunting Area and the Lake Perris State Recreation Area. These are state-owned lands and access to these areas is restricted. The SJWA is owned and operated by the California Department of Fish and Wildlife and comprises approximately 20,000 acres of restored wetland and ponds. The Lake Perris State Recreation Area is owned and operated by the California State Parks Department and comprises approximately 9,000 acres of open space land, which is used both for recreation and for the preservation of the native southern California landscape.

Highland Fairview Corporate Park (HFCP), located north and west of the project area between Redlands Blvd. and Theodore St., is currently under development, with the first phase (the Skechers building) completed in late 2011. The area north of SR-60 is largely undeveloped, with clusters of low density residential uses within the Moreno Valley city limits.

To the west of the proposed project is the more developed portion of the City of Moreno Valley. There are existing single family homes located west of Redlands Blvd. Near the southwest corner of the proposed project there is an existing residential neighborhood at the intersection of Redlands Blvd. and Alessandro Blvd.; a small market and a post office are also located near this intersection. The Moreno Valley Ranch and Golf Club residential community is approximately one mile southwest of the project area.

## B. EXISTING TRANSPORTATION FACILITIES

The analysis of existing conditions provides a basis for comparison with the forecasted future conditions with the proposed project.

The existing road system serving the project site consists of:

- Theodore St., a 2-lane undivided arterial running in a north-south direction through the center of the project.
- Alessandro Blvd., a 2-lane undivided arterial running in an east-west direction through the southern half of the project. Alessandro Blvd. has a discontinuity at Theodore St., with its eastern portion intersecting Theodore St. approximately 600 feet north of where the western section intersects Theodore St.
- State Route 60 (SR-60), which runs in a generally east-west alignment from the I-110 in Los Angeles to I-10 in Beaumont. The portion of SR-60 running along the northern edge of the project has two travel lanes per direction.

- Fir (future Eucalyptus) Ave. is part-way through the process of conversion from a 2-lane minor arterial into a portion of Eucalyptus Ave., which would ultimately be a 4-lane arterial. The westbound direction along the HFCP (Skechers) site currently has two lanes while the eastbound direction has one. Fir (future Eucalyptus) is closed between HFCP and Redlands Blvd. with a gate allowing only emergency vehicles to pass.
- Redlands Blvd. is a 2-lane minor arterial running in a north-south direction along a portion of the western edge of the project.
- Gilman Springs Rd. is a 2-lane undivided arterial running in a northwest-southeast direction alongside the eastern edge of the project.
- Dracaea Ave. is a discontinuous east-west residential street providing access to several existing houses on the project site.
- Cottonwood Ave. is a short east-west residential street providing access to several houses on the project site.
- Virginia St. is a north-south access road serving a utilities site. The portion south of Alessandro Blvd. is paved while the portion north of Alessandro Blvd. is unpaved.
- Eucalyptus Ave. is an unpaved service road running east-west between Theodore St. and Gilman Springs Rd.
- Sinclair St. is currently an unimproved right-of-way running north-south between Theodore St. and Redlands Blvd.

A short section of Redlands Blvd. from Dracaea Ave. to McAbee Ave. has sidewalks and a bicycle lane, as does the westbound portion of Fir (Eucalyptus) Ave. fronting HFCP. A class 1 mixed-use trail runs along the east side of Redlands Blvd. from McAbee Ave. to Dracaea Ave. These are the only roads with sidewalks or bicycle lanes. At the present time there is no bus or other transit service to the project site.

***Truck Routes***

Cities and counties in California have the authority to adopt codes that restrict the use of trucks on public roadways, though not all jurisdictions choose to do so. Figure 14 shows the designated truck routes in the vicinity of the WLC. The Cities of Moreno Valley and Perris have designated specific routes while the County of Riverside does not (i.e. trucks may use any County road, though truck parking restrictions may apply). The City of Riverside does not designate truck routes but instead identifies roadways where trucks are not allowed (mostly residential streets). There are no restrictions on truck usage of the state highway system.

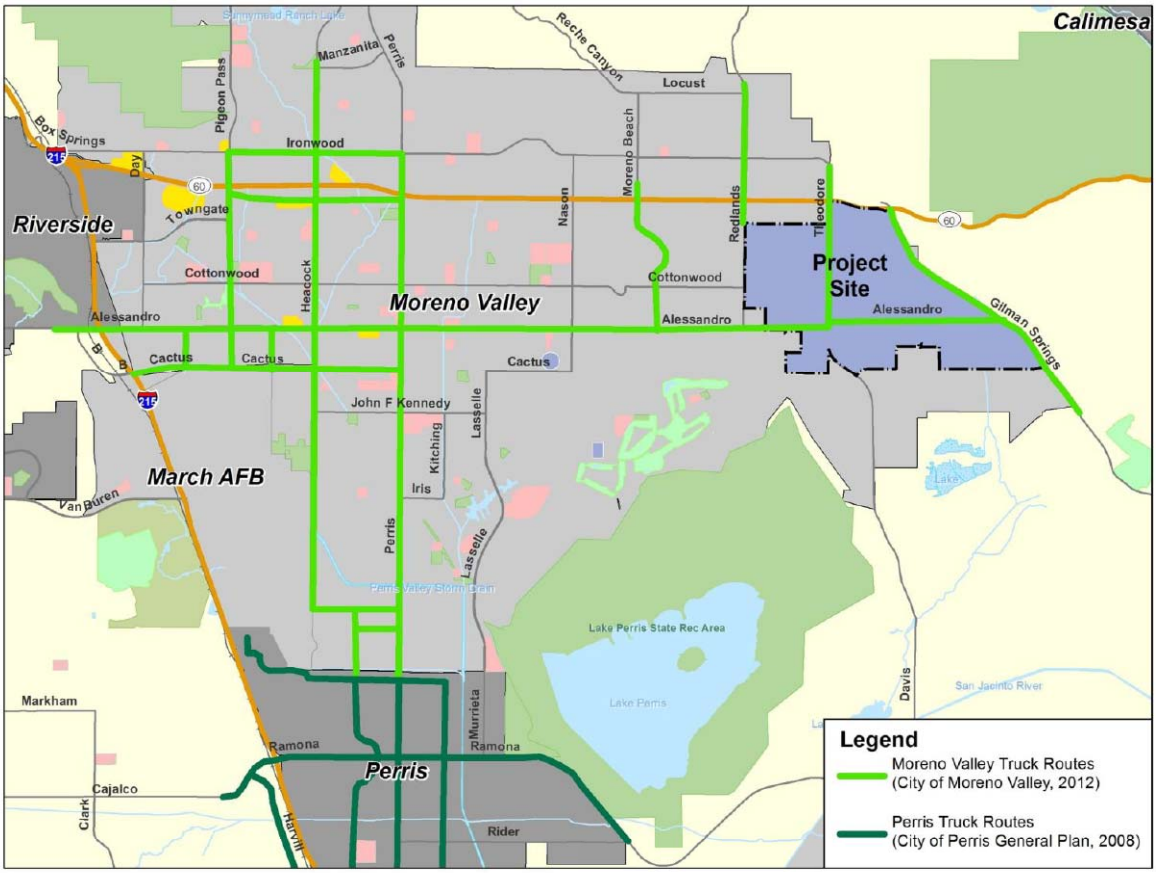

**Figure 14: Existing Designated Truck Routes**

***Transit Services***

Transit services in the area are provided by the Riverside Transit Agency, which operates several bus routes in the City of Moreno Valley. Figure 15 displays the Riverside Transit Agency's existing routes in the area. The bus routes do not currently provide service in the vicinity of the project site.

**Figure 15: Existing Transit Services in Moreno Valley**
(Source: Riverside Transit Agency System Map)

## C. EXISTING TRAFFIC VOLUMES

Traffic counts for turning movements in the AM and PM peak hours were collected for study intersections during typical workdays in 2011 and 2012. Figure 16 provides a key diagram for the location of each study intersection in the intersection turning volume graphics, including Figure 17 (and similar figures for other scenarios) which shows the turning movement volumes under Existing Conditions. The traffic counts are reported in detail in Appendix A. In situations where an intersection does not exist in the scenario the intersection is marked “Future”, if it will be built later, or “Non-Existent” if had existed but has been replaced by an intersection in a different location.

## D. EXISTING LEVELS OF SERVICE

***Roadway Segment Analysis***

Part of the project involves a proposed change to the circulation element of the General Plan. The roads that would be affected by the change are shown in Figure 18, which is the key map for the tables reporting sectional traffic volumes.

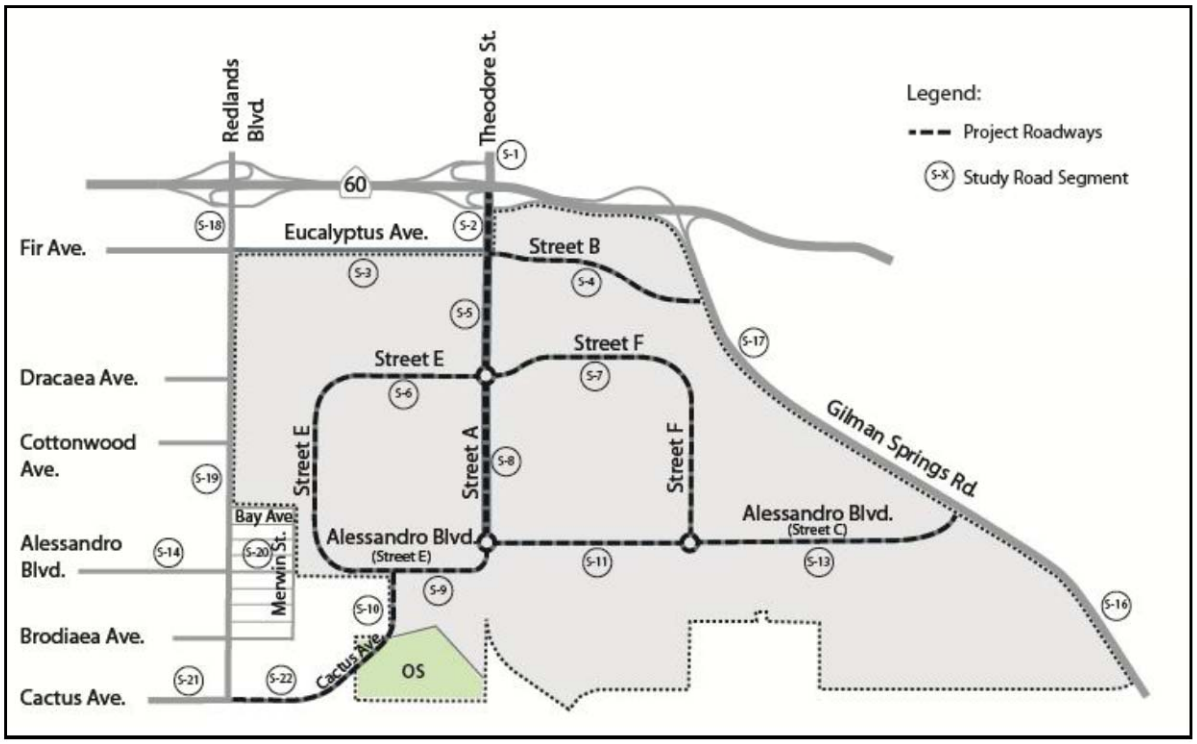

**Figure 18: Study Road Segments**

24-Hour traffic counts were collected on the study road segments. Table 14 shows the existing LOS for the study road segments. As shown in the table, Gilman Springs Rd. north and south of Alessandro Blvd. (road segments S-16 and S-17) currently exceeds the target LOS established in the General Plan. The existing traffic volumes on all other study roadway segments meet the LOS target in the General Plan.

**Table 14: LOS of Study Road Segments under Existing Conditions**

| | Roadway | From | To | LOS Standard* | Roadway Section** | Daily Volume | LOS |
|---|---|---|---|---|---|---|---|
| S-1 | Theodore Street (A) | SR-60 WB Ramps | Ironwood Avenue | D | 2U | 771 | A |
| S-2 | Theodore Street (A) | SR-60 EB Ramps | Fir (Eucalyptus) Ave. | D | 2U | 2,046 | A |
| S-3 | Fir (Eucalyptus) Ave. | Redlands Blvd | Theodore Street (A) | D | 2U*** | 1,339 | A |

| S-22 | Cactus Ave. | Redlands Blvd | Cactus Ave Extension | C | 2U*** | 472 | A |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.
** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.
*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.
Indicates LOS exceeds the target level

***Intersection Level of Service (LOS)***

Table 15 shows the existing LOS for the study intersections in the AM and PM peak hours. Detailed worksheets are presented in Appendix B. Of the 136 study intersections that were studied, 12 intersections failed to meet the General Plan target under Existing Conditions in the AM peak hour, the PM peak hour, or both. These intersections were:

- Redlands Blvd./Locust Ave. (AM, PM)
- Redlands Blvd./SR-60 WB ramps (AM, PM)
- Oliver St./Alessandro Blvd. (AM)
- Moreno Beach Dr./SR-60 EB Ramps (PM)
- Lasselle St./Cactus Ave. (AM, PM)
- Alessandro Blvd./Chicago Ave. (PM)
- Gilman Springs Rd./Bridge St. (AM)
- SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. (AM, PM)
- SR-79 (Sanderson Ave.) SB/Gilman Springs Rd. (AM, PM)
- San Timoteo Canyon Rd./Alessandro Rd. (AM)
- San Timoteo Canyon Rd./Live Oak Canyon Rd. (AM, PM)
- Redlands Blvd./San Timoteo Canyon Rd. (AM, PM)

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

**Freeway LOS**

The LOS for freeway mainline sections under existing conditions is shown in Table 16 (for basic freeway sections[17]) and Table 17 (for weaving sections[18])[19]. The target LOS is currently exceeded in 17 mainline sections as follows:

North or Eastbound

- SR-60 Ramona Ave. to Central Ave. (PM)
- SR-60 Central Ave. to Mountain Ave. (PM)
- SR-60 Euclid Ave. to Grove Ave. (PM)
- SR-60 Grove Ave. to Vineyard Ave. (PM)
- SR-60 Vineyard Ave. to Archibald Ave. (PM)
- SR-60 Market St. to Main St. (PM)
- SR-60 Martin Luther King Blvd. to Central Ave. (PM)
- SR-91 I-15 to McKinley St. (PM)
- I-215 SR-74 to Redlands Ave. (PM)
- I-215 Barton Rd. to Mt. Vernon Ave./Washington St. (AM)

Southbound or Westbound

- SR-60 Reservoir St. to Ramona Ave. (AM)
- SR-60 Ramona Ave. to Central Ave. (AM)
- SR-60 I-215 to Day St. (AM)
- SR-91 Pierce St. to Magnolia Ave. (PM)
- SR-91 Magnolia Ave. to La Sierra Ave. (PM)

---

[17] A basic freeway segment is one that is outside the influence of ramps and weaving areas. Basic freeway segments exist between interchanges that are not closely spaced. Note that segment numbers are not always consecutive in the table because weaving sections may occur between basic freeway segments, and because the two directions of travel may be different in terms of where ramps are provided.

[18] A weaving section occurs when one traffic movement must cross the path of another along a relatively short length of roadway without the aid of signals or other traffic control devices. Such cases typically occur where merge junction is followed closely by a diverge junction.

[19] In addition to the analysis shown here, there is a supplemental analysis of truck trips to the Ports of Los Angeles and Long Beach found in Chapter 12, Section F of this report.

- I-215 SR-74 to Redlands Ave. (AM)
- I-215 Baseline Rd. to Highland Ave. (AM, PM)

The target LOS is currently exceeded in six weave sections as follows:

North or Eastbound

- SR-60 SR-71/Garey Ave. to Reservoir St. (PM)
- SR-60 SR-91 to Blaine St./3rd St. (PM)
- SR-60 Blaine St./3rd St. to University Ave. (PM)
- SR-91 Arlington Ave. to Central Ave. (AM)

North or Eastbound

- SR-60 Central Ave. to Fair Isle Dr./Box Springs Rd. (AM)
- SR-91 14th St. to University Ave. (PM)

Of the 23 freeway sections currently exceeding the target LOS, 20 (90%) involve congestion in the peak direction. That is why regional agencies stress the importance of promoting reverse commuting; to move some traffic from the congested side of the freeway to the uncongested side. To the extent that the WLC can encourage this shift, it can help reduce congestion for all travelers, including those not directly associated with the WLC. This is discussed further in Section D of the next chapter.

Table 18 shows the existing level of service (LOS) at the study freeway ramps. One study ramp currently operates below the LOS “D” target, namely the SR-60 eastbound on-ramp from Central Ave. in the PM peak hour.

Details of the LOS calculations for freeways under Existing Conditions can be found in Appendix I.

## Table 16: Existing Freeway Mainline Level of Service

| ID | Freeway | Segment | Northbound / Eastbound | | | | | | Southbound / Westbound | | | | | |

## E. REGIONAL CONTEXT

This chapter discusses the regional context of the proposed World Logistics Center (WLC) project.

***Moreno Valley's Economy***

Moreno Valley is a predominantly residential community, with one of the lowest jobs-to-housing ratios in the six-county SCAG region[20]. More than 70%[21] of jobs in the city are in education, retail, public administration and other services with local client bases. Moreno Valley has relatively few jobs that bring in revenue from outside the city. For example, the manufacturing sector is both quite small (3.7% of jobs in Moreno Valley) and is shrinking[22] .

One consequence of the existing imbalance between jobs and housing is that a large majority (70%) of Moreno Valley workers commute to jobs outside the city, and in many cases far outside the city. According to the U.S. Census Bureau[23], 20.2% of Moreno Valley workers commute more than 50 miles one way to work, and another 22.2% drive 25 to 50 miles one way. Nearly four out of five Moreno Valley workers drive to work alone[24]. Since other Inland Empire cities have similar commute characteristics, the resulting transportation pattern is one of heavy westbound flows in the morning and eastbound flows in the evening, overwhelming the freeway system during peak commuting hours. Another consequence is the high cost of commuting both in terms of out-of-pocket expenses and reduced quality of life for the commuters and their families.

***The Moreno Highlands Specific Plan***

The Community Development Element of the City's General Plan currently designates the project site as the Moreno Highlands Specific Pan (MHSP). The Specific Plan, approved by the City in 1992, envisioned the 3,038-acre site as a master planned, mixed use community, with up to 7,763 residential dwelling units (on approximately 2,435 acres) and approximately 603 acres of business, retail, institutional, and other uses.

Figure 19 shows the land use plan, and a summary of uses by acreage is presented in Table 19.

---

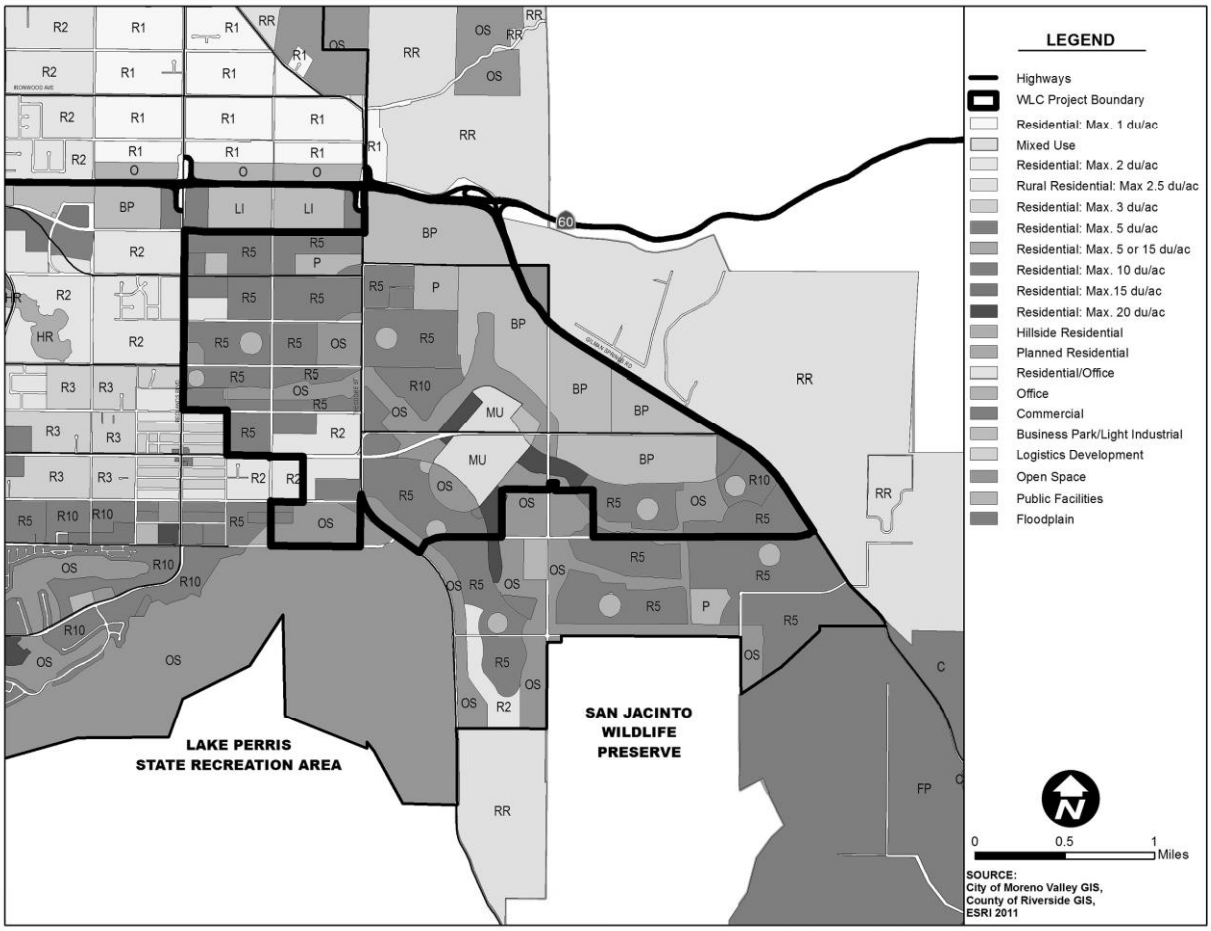

**Figure 19: General Plan Land Use Designations in the Project Area**

**Table 19: Moreno Highlands Specific Plan (Current Land Use Designations)**

| Land Use | Acreage |
|---|---|
| **Residential Community** | |
| Residential (7,283 du) | 1,359 |
| Parks and Open Space | 702 |
| Neighborhood Commercial | 10 |
| Cemetery | 17 |
| Public Facilities | 348 |
| **Planned Business Center** | |
| Business Park | 361 |
| Mixed Use | 81 |
| Community Commercial | 16 |
| Parks and Open Space | 78 |
| Public Facilities | 67 |
| **Project Total** | **3,038** |

Adopted by City Council March 17, 1992

The MHSP had two serious weaknesses. The first is that the SCAG region has had an over-abundance of land designated for business park uses, which means that only the most attractive locations are likely to be developed. Since the Specific Plan was adopted, most business park development has taken place in the coastal counties rather than in the Inland Empire. Within Moreno Valley, sites at the eastern end of the city have not been successful. Sites at the western end of town closer to I-215 had very limited success and are struggling. Therefore, despite being designated for business park development for the last 20 years, no such development actually occurred in the MHSP.

The second weakness that the Specific Plan faced was the general decline in the housing market, which impacted Moreno Valley particularly hard. Without the business park jobs there has been little demand for the residential component of the MHSP. Moreover, if housing had been developed pursuant to the Specific Plan without the jobs component, it would have further exacerbated Moreno Valley's jobs/housing imbalance.

As a result, neither the commercial nor the residential component of the Specific Plan proved marketable, even during the prolonged real estate boom in the late 1990s and early 2000s. The MHSP has never come to fruition and the site remains today much the same as it was in 1992[25].

***Policy Updates***

An updated Housing Element, adopted by the City in February 2011, identified the Moreno Highlands area as a potential location for future jobs-producing land uses[26]. In April 2011, the City adopted its Economic Development Action Plan which identified eastern Moreno Valley as a potential area for major job-producing land uses[27]. The proposed World Logistics Center project is consistent with this planning objective, as it provides a comprehensive plan for jobs-producing land uses.

***General Plan Road Network***

The current General Plan, based on the MHSP, treats the western side of the project area as a continuation of the city street grid (see Figure 20). On the eastern side of the project area, Eucalyptus Ave. and Alessandro Blvd. would curve south and then east to connect with Gilman Springs Rd. at new intersections south of where the existing intersections are located. There is also a proposed Spine Rd. on a southwest-to-northeast alignment. Virginia Ave. would curve on a northwest-to-southeast alignment that would cross Eucalyptus Ave. twice.

---

[25] The exception being the Skechers facility, which is outside the boundaries of the MHSP.

[27] *Economic Development Action Plan, April 2011*, page 10

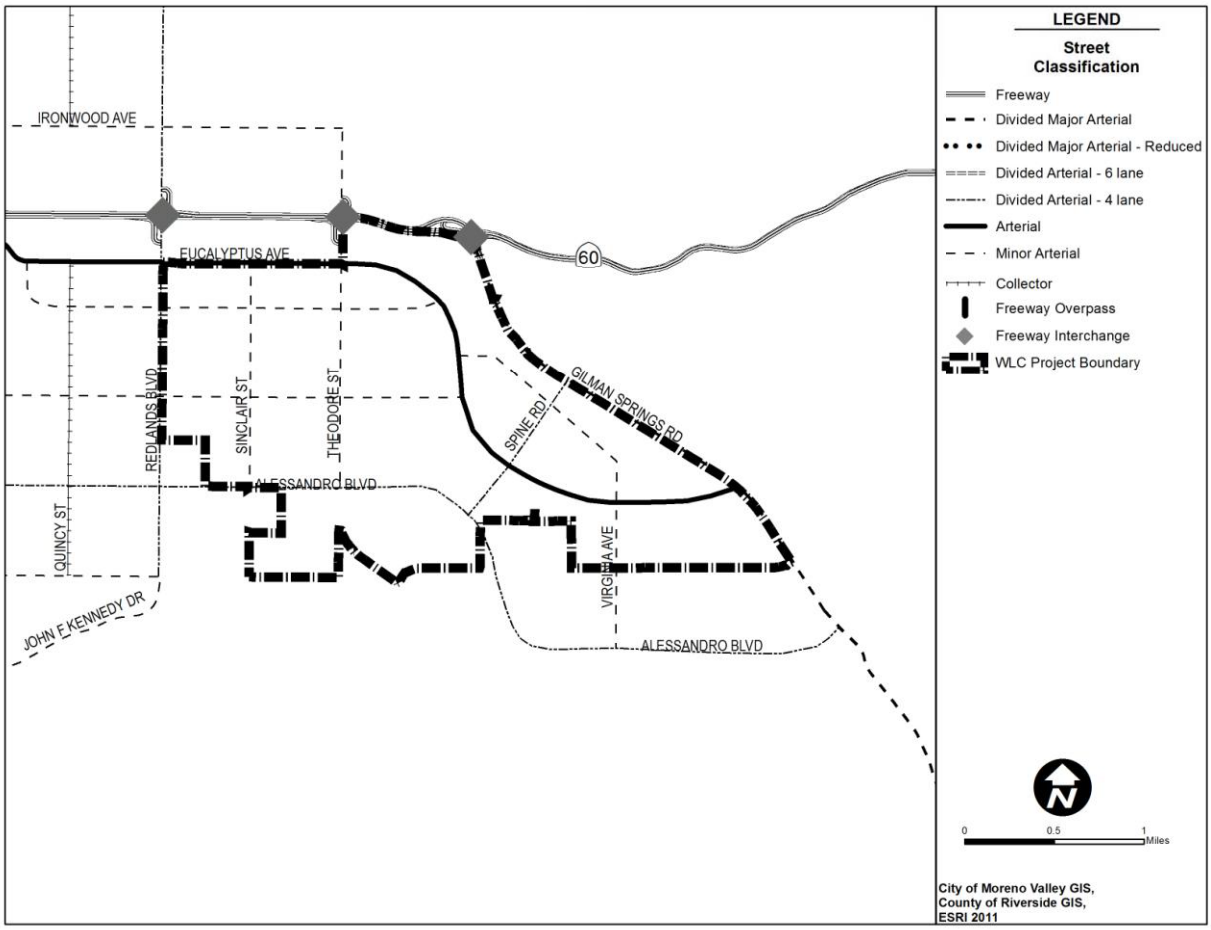

**Figure 20: Roadway System in Current General Plan**

***Regional Truck Traffic Patterns***

Truck traffic in the SCAG region is comprised of four major components. These are:

- Internal Trips – Truck trips that begin and end within the SCAG region. These include trips between industries, warehouses, and retail businesses within the region, excluding port-related cargo trips.
- External Trips – Truck trips with either the origin or destination in the SCAG region, and the other end of the trips outside the region, excluding port-related cargo trips. These include agricultural products brought into the region and industrial goods made in southern California and shipped to other parts of the U.S.
- Port Trips – Truck trips that begin or end at the Ports of Los Angeles or Long Beach, or secondary trips involving cargos transloaded from trucks from the port.

- Intermodal Trips – Truck trips involving cargos transferred to or from trains that are not port-related.

Table 20 shows the relative sizes of these components[28]. In Riverside County, 88% of the truck trips are internal to the region. Another 10% are external trips, while port-related trips and intermodal trips account for less than 2% of truck traffic.

**Table 20: Daily Truck Trips by Major Category**

| | SCAG Region | | Riverside County | |
|---|---|---|---|---|
| | Truck Trips | % of Truck Trips | Truck Trips | % of Truck Trips |
| **Internal** | 1,011,993 | 87.3% | 94,469 | 87.9% |
| **External** | 81,019 | 7.0% | 11,183 | 10.4% |
| **Port-Related** | 59,645 | 5.1% | 1,569 | 1.5% |
| **Intermodal** | 7,170 | 0.6% | 271 | 0.3% |
| **Total** | 1,159,827 | 100.0% | 107,492 | 100.0% |

The truck traffic associated with the WLC and other logistics centers is expected to follow this general pattern. Most of the warehouse occupants in the NAIOP survey of logistics centers in southern California (Lowe's, Target, Big5, Walgreen's, Home Depot, Costco, Toys "R" Us, Staples, etc.) have extensive business interests in southern California. Thus, it is reasonable to assume that a future warehouse logistics center located in this region would be used in part to support operations within the region; i.e. some of the truck trips they generate would be internal to the region. It is also reasonable to assume that the external trips would follow the overall regional pattern, which is as follows (also see Figure 21)[29]:

- I-5 and US-101 are the main truck routes for cargos transported north of the SCAG region, accounting for 38% of external truck trips
- I-15 is the main route for cargos going northeast (Salt Lake City, Chicago, etc.) , accounting for 10% of external truck trips
- I-40 is the main route for cargos going east (Albuquerque, St. Louis, Atlanta, New York, etc.), accounting for 11% of external truck trips
- I-10 is the main route for cargos going southeast (Phoenix, Houston, New Orleans, etc.), accounting for 12% of external truck trips

# 4. PROPOSED PROJECT

## A. POTENTIAL ROLE OF LOGISTICS

The type of development envisioned in the Moreno Highland Specific Plan has proven to be infeasible at this location; since the plan's approval more than twenty years ago no development has occurred on the site. This raises the question of whether a different type of development would be more feasible and so would provide more scope for benefits to Moreno Valley. SCAG has studied this issue in the larger context of the region's relative standard of living. In the period from 1987 to 2001, the SCAG region slipped from 4th place to 17th (last) place in per capita income among the 17 consolidated metropolitan areas in the United States[30]. Among the chief reasons for this decline was the loss in manufacturing jobs, which reduced the earning potential for the region's large and growing number of workers who lack a college education. One possibility for replacing these lost jobs is the logistics sector, since:

- Logistics has shown steady growth due to the adoption of "just-in-time" inventory systems, which rely on rapid-response warehouses as a substitute for goods stored on-site.
- The growth in trade with Asia has increased the volume of cargos while the introduction of post-Panamax container ships[31] limits the choice of west coast ports to L.A./Long Beach, Seattle/Tacoma, and Vancouver. Consequently they all have good prospects for continuing long-term growth.
- Logistics jobs offer better-than-average wages. These wages are better t han the wages of the blue-collar jobs in the declining sectors of manufacturing and construction[32].

Within the Inland Empire context, logistics development would bring high-paying blue collar jobs into an area with an under-employed labor force, including many workers lacking a college education[33]. Also, since modern logistics warehouses are very large buildings requiring large vacant parcels of land near freeways, it gives the Inland Empire region a comparative advantage over the coastal counties that do not have such parcels readily available or regions further inland that are not as easily accessible from the Ports of Los Angeles and Long Beach. Forecasts suggest that the regional demand for warehouse space

---

30 *Logistics & Distribution: An Answer to Regional Upward Social Mobility*, Dr. John Husing for SCAG, June 2004, page 1.

31 Post-Panamax vessels are too large to go through the Panama Canal.

32 In 2003 the average pay was $45,314/yr for logistics jobs compared to $43,871 for manufacturing and $40,439 for construction (from *Logistics & Distribution: An Answer to Regional Upward Social Mobility*, Dr. John Husing for SCAG, June 2004, page 12.)

33 In 2010 only 14.1% of adults aged 25 or older in Moreno Valley had a bachelor's degree or higher. This compares to 36.5% in Orange County. Source: American Fact Finder, U.S. Census Bureau.

will triple over the next 25 years, from approximately 1.5 billion square feet to 4.5 billion square feet, and that half of this space will be built in the Inland Empire[34].

## B. PROJECT DESCRIPTION

The proposed World Logistics Center is a plan for the development of modern high-cube logistics warehouse distribution facilities on land in eastern Moreno Valley. The project includes the development of up to 40.6 million square feet of modern high-cube logistics facilities within the 2,610-acre World Logistics Center Specific Plan, while designating 1,084 acres as "open space," and 19 acres as "public facility."

### *Proposed Land Uses*

The project includes a Specific Plan to implement a proposed General Plan Amendment and to set forth comprehensive land use regulations governing the proposed World Logistics Center. The Specific Plan provides for a master planned development of up to 40.6 million square feet of modern high-cube logistics warehouse distribution facilities.

The Specific Plan includes development standards and use regulations, a master plan for circulation and infrastructure, architectural, landscape and design guidelines, and sustainability goals which would be applicable to all future development within the project area.

Table 21 lists the acreage associated with the proposed Logistics Development, Light Logistics, Public Utility, and Open Space uses within the project site.

**Table 21: The World Logistics Center Land Use Summary**

| Land Use | Acreage |
|---|---|
| **Specific Plan Area** | |
| Logistics Development (includes Logistics Support site) | 2,383 |
| Light Logistics | 37 |
| Open Space | 74 |
| Street ROW | 116 |
| **Outside Specific Plan** | |
| Open Space (CDFW) | 1,084 |
| Public (SDGE, SCG) | 20 |
| **Total** | **3,714** |

[34] Source: *Multi-County Goods Movement Action Plan*, Wilbur Smith Associates, August 2008.

Within the Specific Plan, the primary land use category is Logistics Development. This land use designation would provide for development of high-cube logistics warehouse uses consisting of warehouse buildings at least 500,000 square feet in size. Warehousing and logistics activities, consistent with the storage and processing of manufactured goods and materials prior to their distribution to other facilities and retail outlets, would be permitted within this category. Ancillary office and maintenance space would be permitted, along with the outdoor storage of trucks, trailers, and shipping containers.

A smaller area would be devoted to Light Logistics. The light logistics land use designation is for conventional warehouse buildings smaller than 500,000 square feet in floor area.

In consultation with the South Coast Air Quality Management District (SCAQMD) a combined fueling station and convenience store was been added to the plans for the WLC which would be developed within the Logistics Support (LS) land use area. The purpose of the fueling station/convenience store is to provide an on-site location to purchase alternative fuels such as compressed/liquefied natural gas (CNG) / (LNG), diesel fuel, snacks, soft drinks, toiletries, cigarettes, etc. for WLC truck drivers. The station is not intended to attract customers from outside of the WLC and would only have driveway access onto a side street in the WLC; no driveway access to external roads would be provided. The facility would have restrooms and operate on a 24/7 basis. There would be no shower facilities, stand-alone food uses, drive-through food operations, alcohol products, vehicle maintenance, vehicle washing, or long-term parking.

***Proposed Road Network***

The proposed network is shown in Figure 22 and the lane configurations are summarized in Table 22. As in the current General Plan, the proposed road network would feature two major east-west connections for through traffic between Redlands Blvd. and Gilman Springs Rd. Theodore St. would remain the main north-south road but would be changed from a minor arterial (in the current plan) to a major arterial. The other project streets are designed to provide internal access to project buildings and are not expected to serve external traffic. The overall density of streets is low because the very large size of the WLC buildings can only be accommodated in large blocks.

**Table 22: Lane Configurations for WLC Internal Roads**

| Road | Lane Configuration |
|---|---|
| Street A (Theodore St.) | 6 lanes and 4 lanes, wide median |
| Street B (Eucalyptus Ave.) | 4 lanes, standard median |
| Street C (Alessandro Blvd.) | 4 lanes, undivided |
| Cactus Ave. Extension | 4 lanes, undivided |
| Street E (Alessandro Blvd.) | 4 lanes, undivided |
| Street F | 2 lanes, undivided |

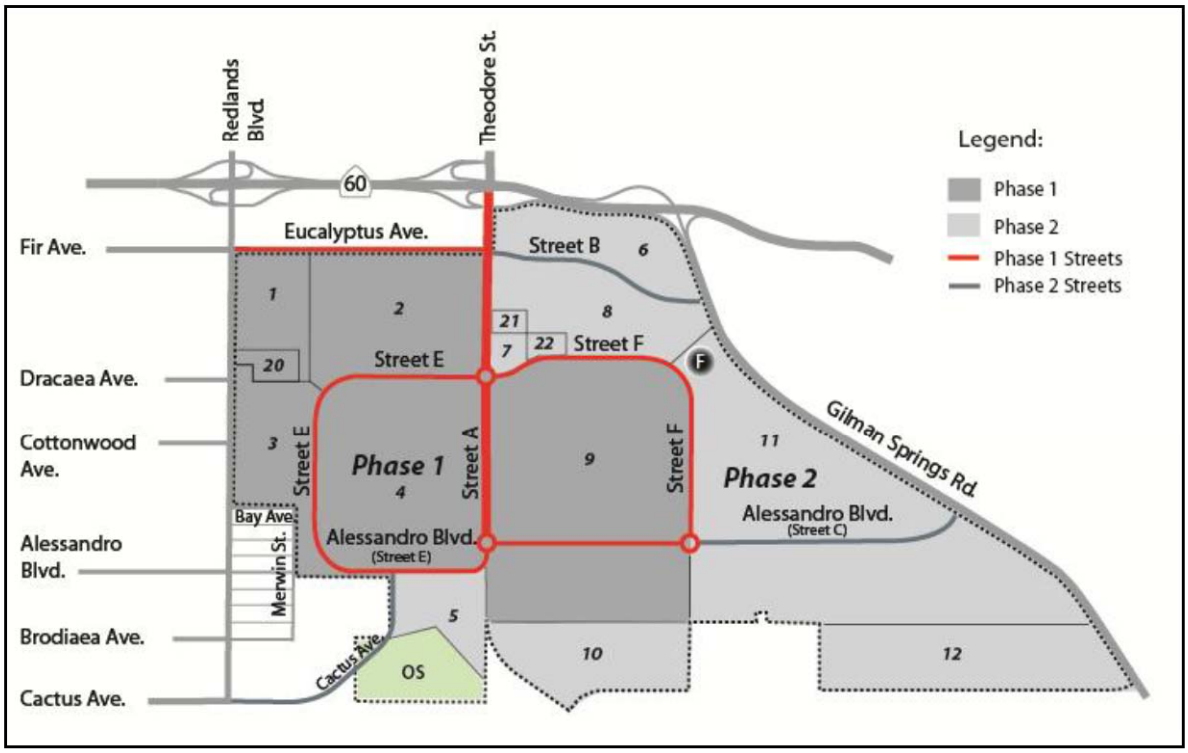

**Figure 22: Proposed Roadways and Phasing**

The WLC's internal streets are proposed as follows:

**Street "A"** (Theodore St.) would run on its present alignment north-south through the World Logistics Center. It is planned to be a 6-lane divided roadway north of Street E/F (see Figure 23) and 4-lane divided roadway south of Street E/F (see Figure 24), with additional widening and lane improvements at its intersections with SR-60, Eucalyptus Ave. and local interior collector streets. Two interior intersections would be roundabouts to provide for efficient traffic flow.

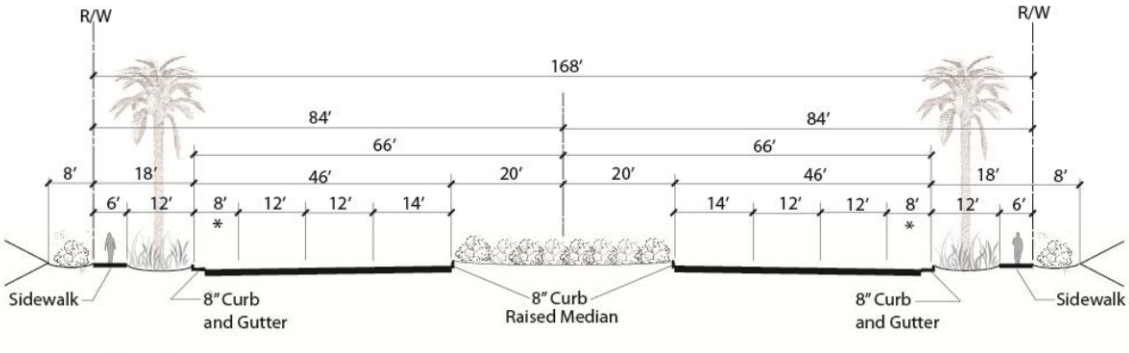

**Figure 23: Street A Typical 6-Lane Section**

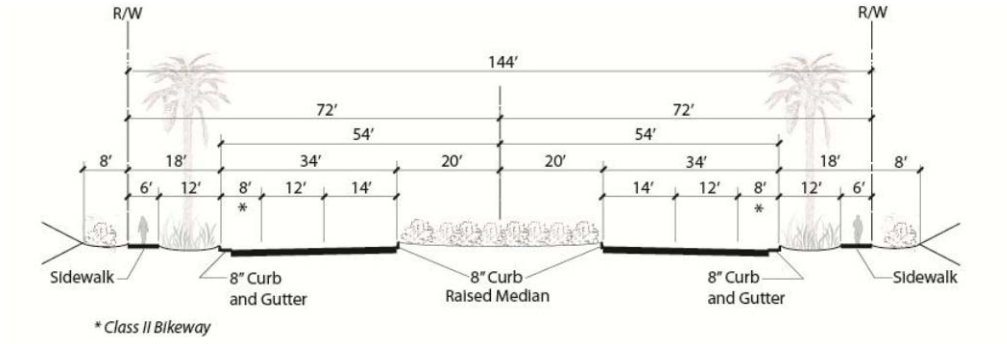

**Figure 24: Street A Typical 4-Lane Section**

**Street "B"** is proposed to be a 4-lane divided roadway running east-west through the northerly portion of the World Logistics Center from Gilman Springs Rd. on the east to existing Eucalyptus Ave. at Street "A" on the west (see Figure 25). The City's General Plan shows this street ultimately extending westerly across the City.

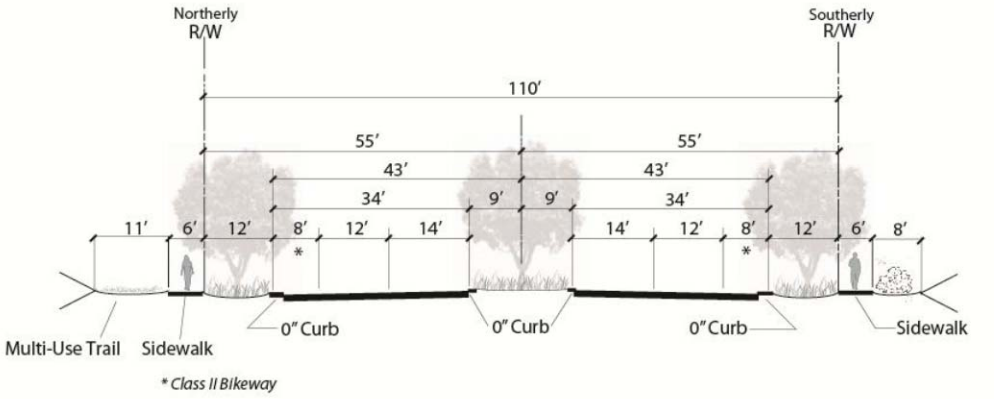

**Figure 25: Street B Typical Section**

**Alessandro Boulevard**[35] would retain its name. ROW width, and current alignment as an undivided roadway running east-west through the World Logistics Center, intersecting with Gilman Springs Rd. on the east (see Figure 26) and the Cactus Avenue Extension on the west. An existing section of Alessandro Blvd. between Merwin Street and the Cactus Avenue Extension would be closed to vehicular traffic except for emergency vehicles and bicycles and pedestrians. This is to prevent project traffic from traveling through existing residential neighborhoods. Passenger cars and light trucks heading west through the site would use Cactus Ave. Extension.

---

[35] Alessandro Boulevard was labeled “Street C” and “Street E” (the western portion) in some draft reports discussing the WLC internal road network.

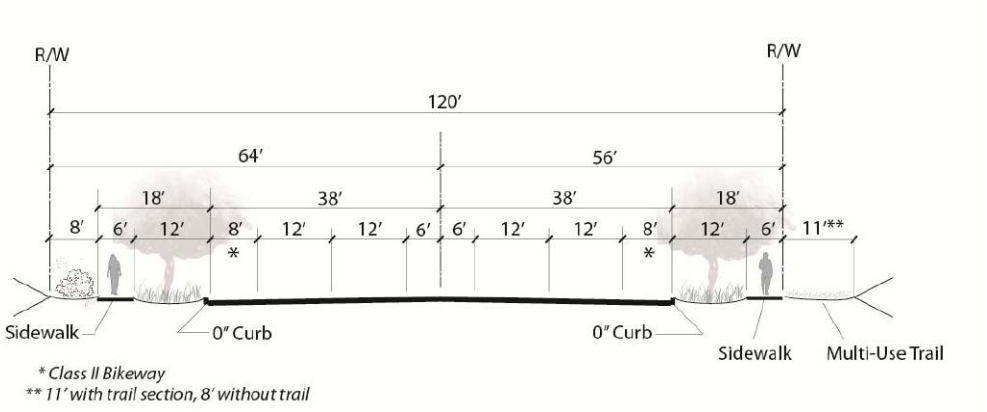

**Figure 26: Alessandro Boulevard Typical Section**

**Cactus Avenue Extension** is proposed to be a 4-lane undivided north-south roadway (see Figure 27) connecting existing Cactus Ave. with the westerly internal loop street (Street "E"). The intersection with Street "E" would be designed to prohibit large trucks from using Cactus Ave. Extension to prevent their travel through adjacent residential neighborhoods. Special design features and signage will reinforce this restriction.

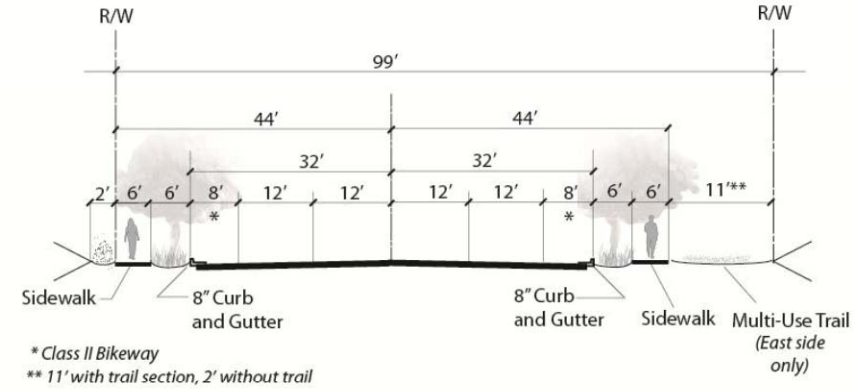

**Figure 27: Cactus Boulevard Extension Typical Section**

**Street "E"** is proposed to be a 4-lane undivided internal collector loop (see Figure 28) road providing direct access to development areas in the westerly portion of the project. Design details of this roadway will be determined by subsequent subdivision and site development approvals.

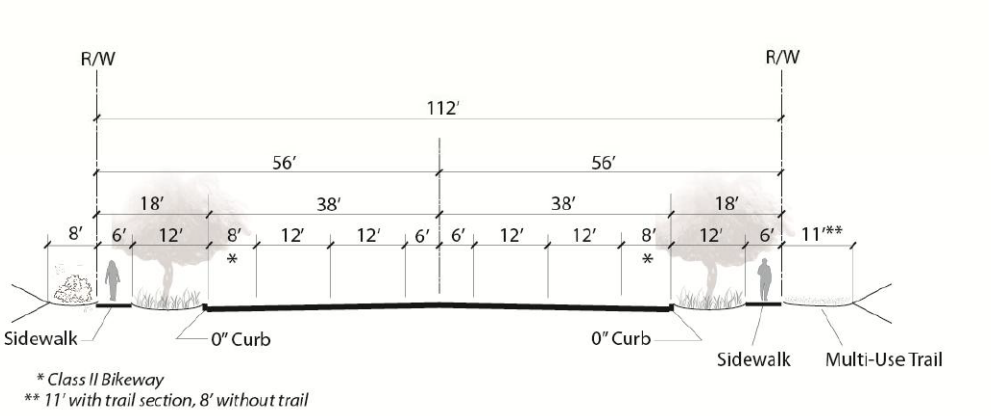

**Figure 28: Street E Typical Section**

**Street "F"** is proposed to be a 2-lane internal collector road providing direct access to development areas in the central portion of the project (see Figure 29). It would intersect with Street "A" at its northerly end and with Alessandro Boulevard at its southerly end. A roundabout is planned at its intersection with Alessandro Boulevard. Specific design details of this roadway will be determined by subsequent subdivision and site development approvals.

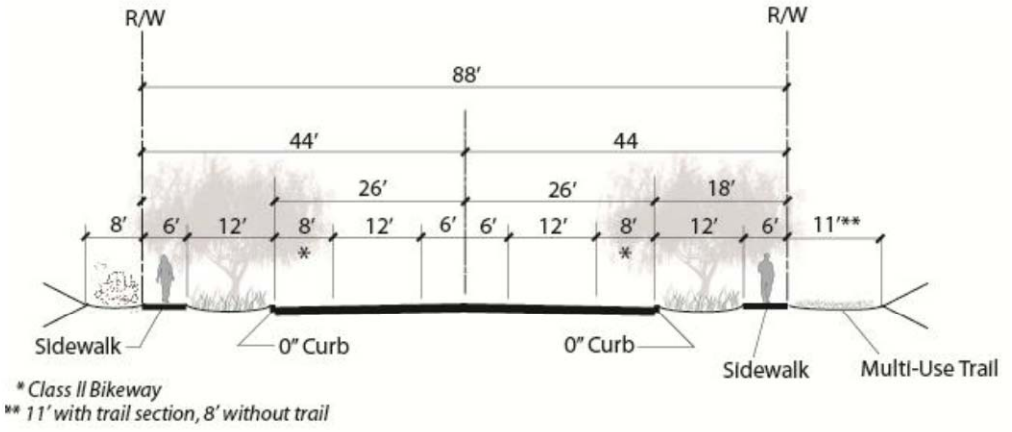

**Figure 29: Street F Typical Section**

**Eucalyptus Avenue** is proposed to be a 4-lane divided roadway running east-west through the northerly portion of the World Logistics Center from Street “B” on the east to a future Eucalyptus Ave. west of Redlands Blvd. (see Figure 30). The City's General Plan shows this street ultimately extending westerly across the City.

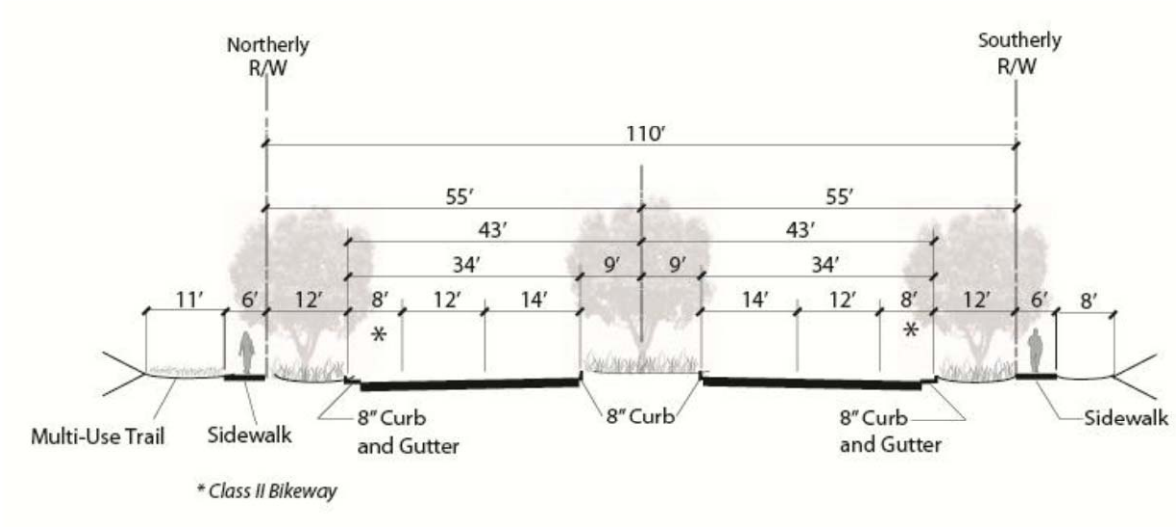

**Figure 30: Eucalyptus Avenue Typical Section**

The project would change a number of existing intersections in or adjacent to the project site, including:

- **Alessandro Blvd./Gilman Springs Rd. (IN-6)** would be signalized in Phase 1, and the eastbound approach changed from a shared left-turn/right-turn lane to dedicated left-turn lane and right-turn lanes. The northbound approach would have a left-turn pocket and two through lanes while the southbound approach would have a right-turn pocket and two through lanes. In Phase 2 an additional through lane would be added to the northbound and southbound approaches.
- **Theodore St./SR-60 WB ramps (IN-15)** would be signalized in Phase 1, one westbound and two northbound right-turn pockets would be added along with a southbound left-turn pocket. In Phase 2 this intersection would be replaced as part of the re-configuration of the interchange that will be described later in this section.
- **Theodore St./SR-60 EB ramps (IN-16)** would be signalized in Phase 1, eastbound and southbound right-turn pockets would be added, a northbound through lane would be added, and the existing left-turn pocket would be extended south to the adjacent intersection (IN-19). In Phase 2 this intersection would be eliminated and replaced with a new intersection to the north as part of the re-configuration of the interchange that will be described later in this section.
- **Theodore St. (Street A)/Fir Ave. (Eucalyptus) (IN-19)** would be signalized in Phase 1 and two northbound and southbound lanes added as part of the widening of Theodore St. In Phase 2 right-turn pockets would be added in the northbound, southbound, and eastbound directions, and an eastbound through lane added. A new westbound approach would be added with a left-turn pocket and a shared through/right turn lane.

Three roundabouts would be created, namely:

- **Alessandro Blvd. (Streets C and E)/Theodore St. (St. A) (IN-3)** is currently two closely-spaced offset intersections. These would be replaced with a 3-legged roundabout as shown in Figure 31.

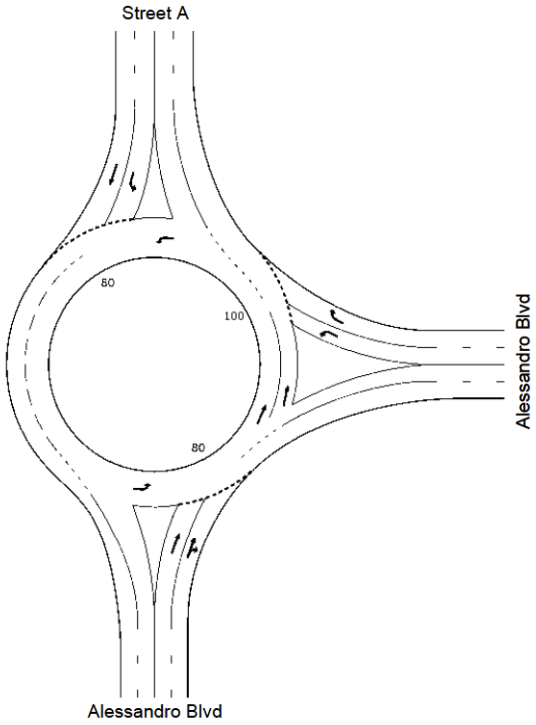

**Figure 31: Alessandro Blvd. (Streets C and E)/Theodore St. (Street A) Roundabout**

- **Streets E and F/Theodore St. (Street A) (IN-1)** would be created as a 4-leg roundabout in Phase 1 as shown in Figure 32.

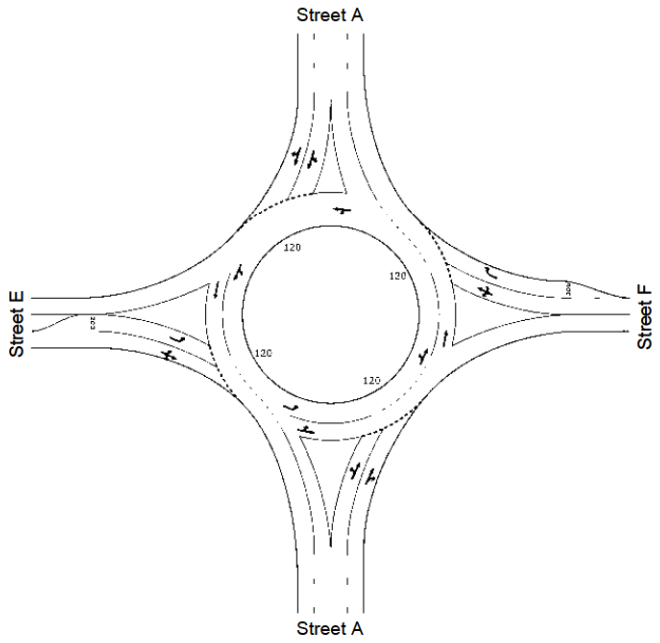

**Figure 32: Roundabout at Intersection of Streets A (Theodore St.), E, and F**

- **Streets C/Street F (IN-4)** would be created as a 3-leg roundabout as shown in Figure 33.

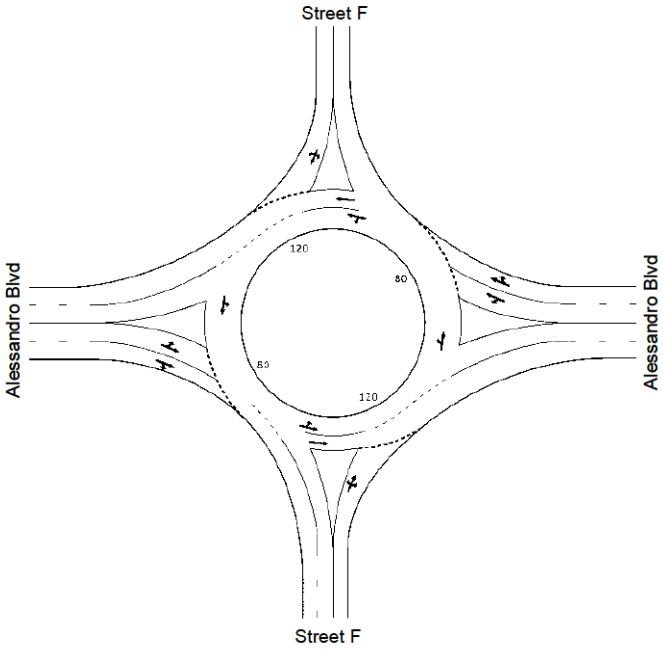

**Figure 33: Roundabout at Intersection of Streets F and C (Alessandro Blvd.)**

Another change from the current General Plan is that Alessandro Blvd. would be severed east of Merwin St. and connected to Cactus Ave. via Cactus Ave. Extension. This re-configuration is proposed to avoid impacts to the existing residential community west of the project area that would occur if Alessandro Blvd. were not severed and was widened into a 6-lane arterial as shown in the current General Plan.

The proposed circulation plan for the General Plan is shown in Figure 34.

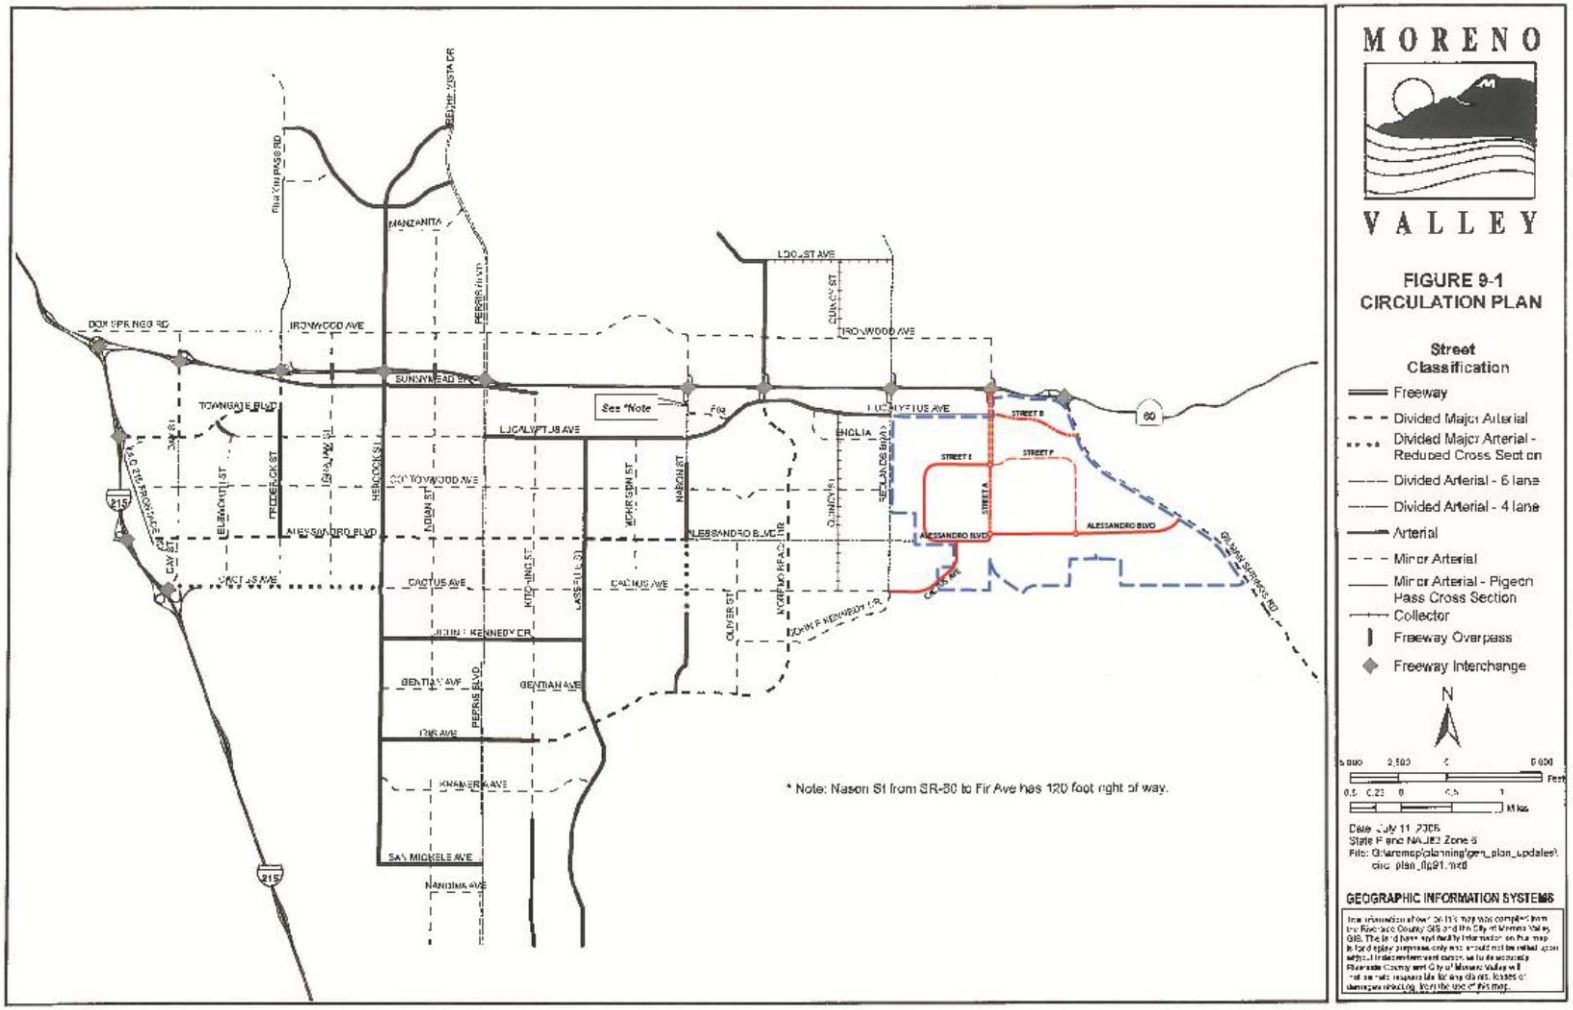

**Figure 34: Circulation Plan After Proposed Amendment**

A closely-related project that would serve the WLC is the reconfiguration of the SR-60 interchange at Theodore St. One of the new configurations being considered is shown in Figure 35. This project is included in the financially-constrained RTP project list and was assumed to be completed prior to Phase 2 of the WLC.

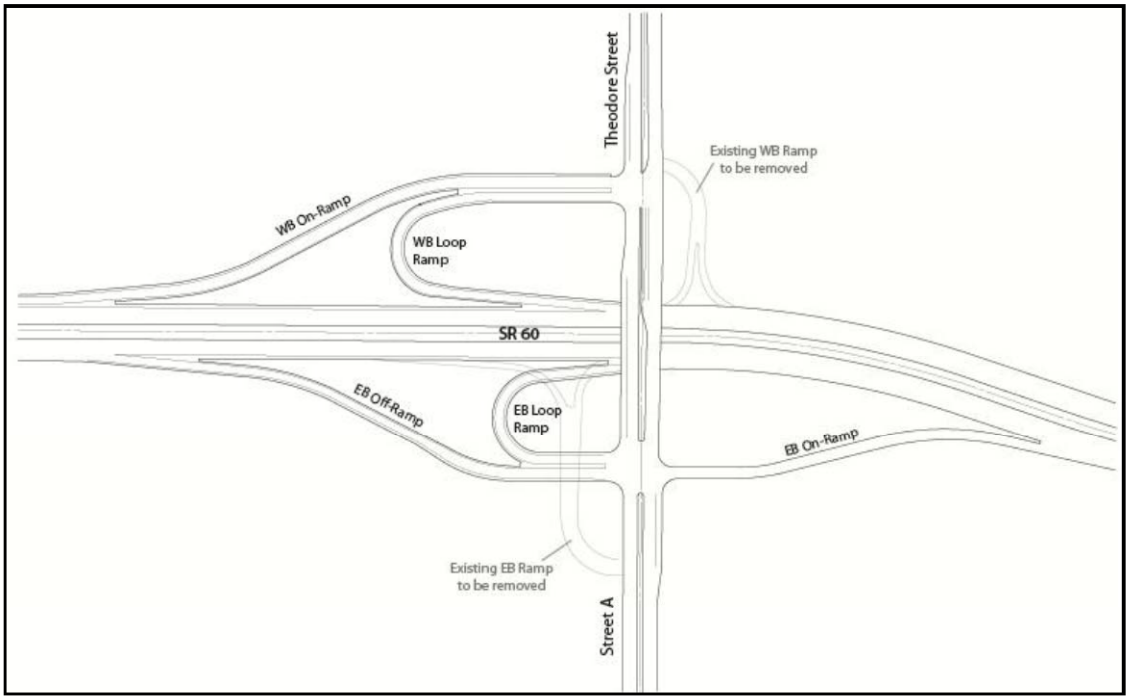

**Figure 35: Possible Future Configuration for the SR-60 Interchange at Theodore St.**

The developer of the WLC has discussed the interchange project with the City and has also entered into discussions with Caltrans and other agencies regarding this interchange project. The planning and design of this interchange is currently underway. For the purposes of this report, the improvements to the SR-60/Theodore interchange have been analyzed as part of the WLC project and have been studied in the same manner as the proposed project's internal roadways.

***Proposed Truck Routes***

The proposed revision to truck routes near the project site is shown in Figure 36. These routes would need to be incorporated into the Municipal Code.

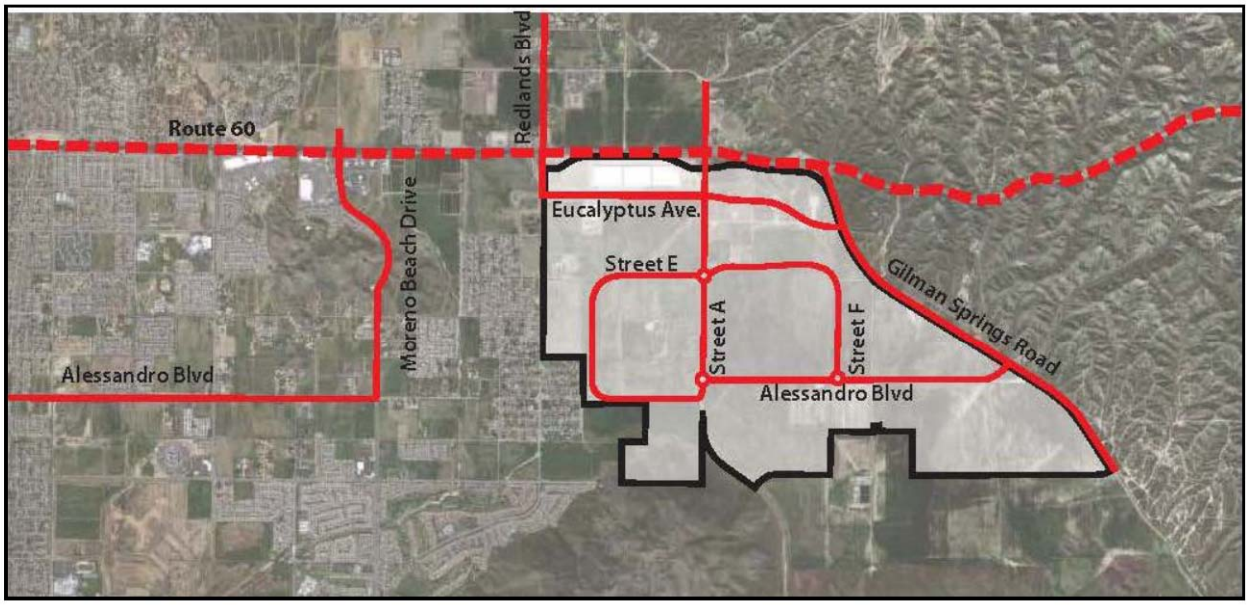

**Figure 36: Proposed Truck Routes Near Project Site**

***Bicycle and Pedestrian Facilities***

The WLC proposes Class II bike routes on all of its internal streets, thus providing safe access to all WLC buildings for employees wishing to commute by bicycle, as well as creating north-south and east-west paths through the site for bicycle through trips (see Figure 37).

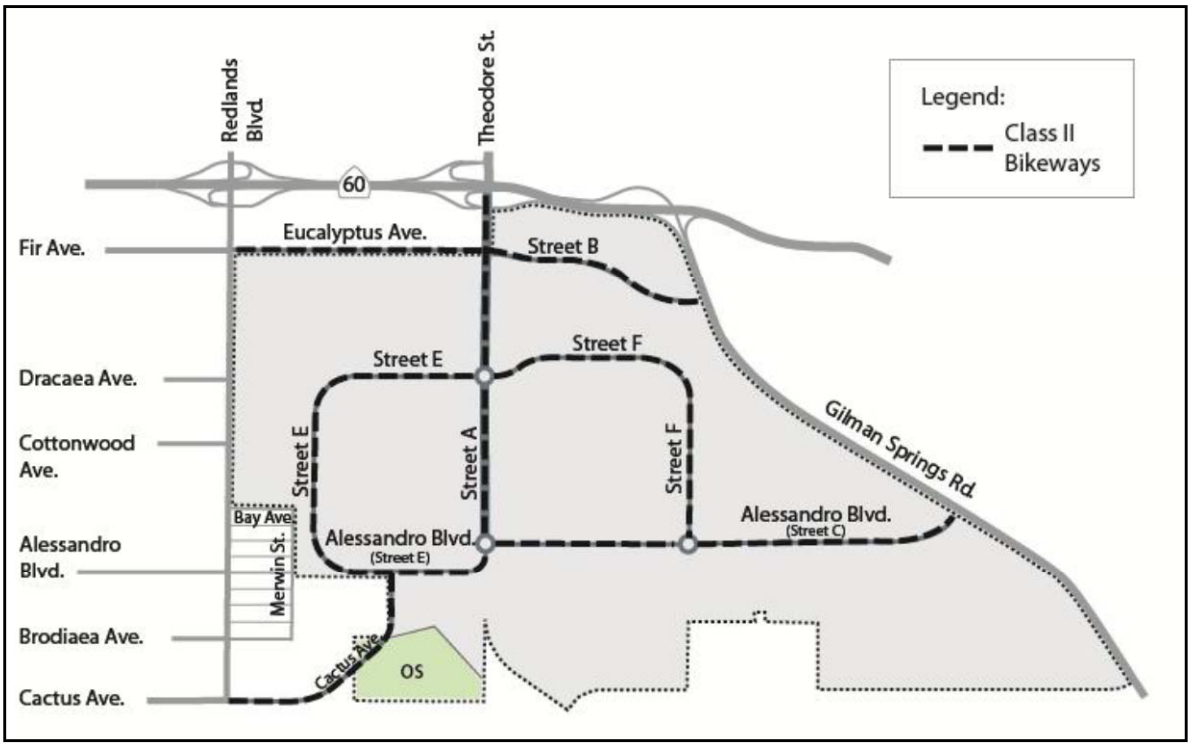

**Figure 37: Proposed WLC Bikeways**

The World Logistics Center proposes a network of pedestrian ways on project streets, as required to comply with ADA and other applicable codes, to connect all areas of the project to surrounding areas and to interconnect all buildings within the project.

An extension of the City's Redlands Blvd multi-use trail is proposed to be routed along the eastside of Redlands Blvd., and extend southerly through the project connecting to the existing trail along the south side of Cactus Ave., and to the San Jacinto Wildlife Area at the former Davis Rd. alignment (see Figure 38). Details of this trail alignment would be established with site-specific development proposals. The multi-use trails within the World Logistics Center would comply with existing City standards.

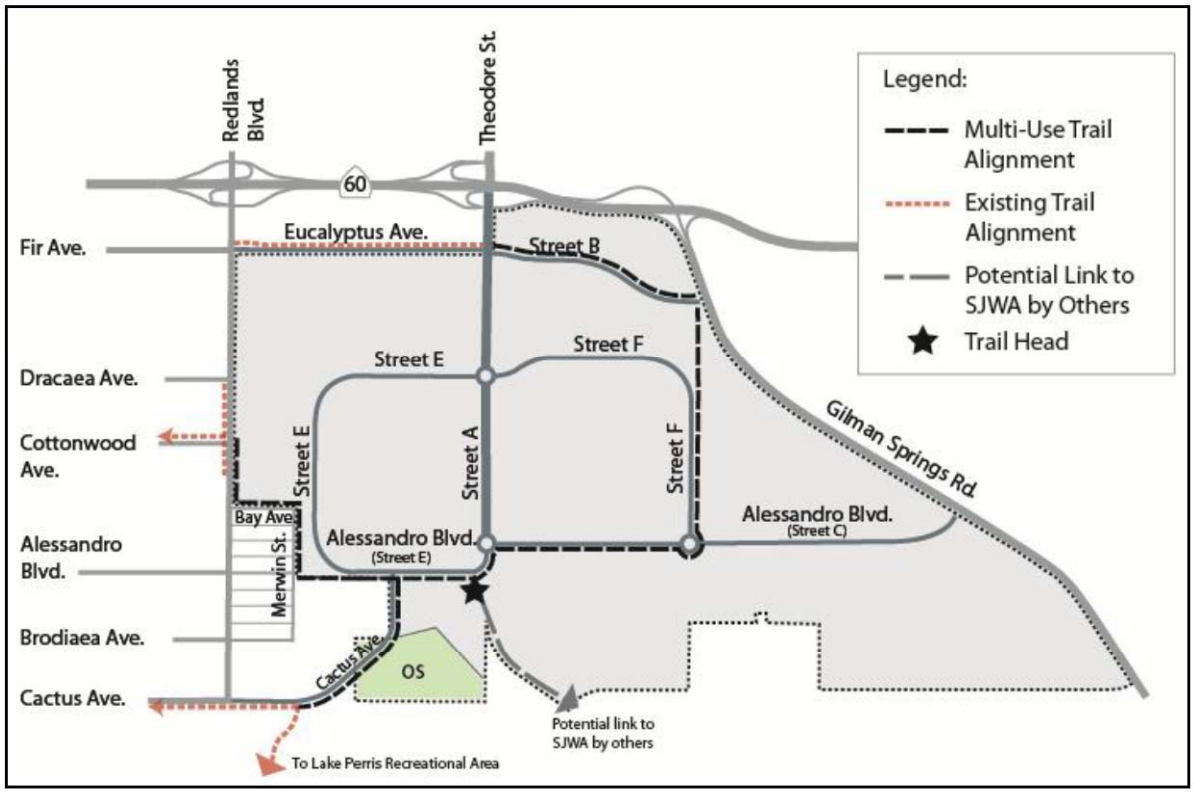

**Figure 38: Proposed Multi-Use Trails**

***Phasing***

The WLC would be developed over a number of years. For planning purposes it was assumed that Phase 1, to be completed by 2022, would contain approximately 21,450,000 square feet of logistics warehouse uses. This is approximately 52% of the total project building space. At that time, the road system would be partially built out (see Figure 22) with east-west through traffic served by Cactus Ave. Extension and Streets C and E, and north-south traffic served by Theodore St.

For Phase 2, full build-out of the project was assumed. An additional east-west through route would be provided when Eucalyptus Ave. (Street B) is connected with Redlands Blvd. to the west and Gilman Springs Rd. to the east.

## C. PROJECT TRIP GENERATION

As was discussed in an earlier chapter, in order to ensure that the traffic forecasts would be conservative (i.e. not underestimate actual volumes) the trip generation rates selected for use in this study were the rates found in the latest edition of ITE's *Trip General Manual*. These rates are shown in Table 23.

**Table 23: Trip Generation Rates for Proposed and Existing Land Uses**

| Land Use Type | Unit | AM Peak Hour | | | PM Peak Hour | | | ADT |
|---|---|---|---|---|---|---|---|---|
| | | In | Out | Total | In | Out | Total | |
| **Proposed Land Uses** | | | | | | | | |
| High-Cube Logistics Center (ITE 152) | KSF | 0.076 | 0.034 | 0.110 | 0.037 | 0.083 | 0.120 | 1.680 |
| Light Logistics (ITE 150) | KSF | 0.237 | 0.063 | 0.300 | 0.080 | 0.240 | 0.320 | 3.560 |
| Utilities Servicing Station (ITE 170)* | KSF | 0.720 | 0.080 | 0.800 | 0.342 | 0.418 | 0.760 | 8.000 |
| Fire Station** | Site | 20 | 8 | 28 | 10 | 20 | 29 | 137 |
| Gas Station w Convenience Store (ITE 945) | Pumps | 5.08 | 5.08 | 10.16 | 6.76 | 6.76 | 13.51 | 162.78 |
| Convenience Store (ITE 851) | KSF | 33.52 | 33.52 | 67.03 | 26.73 | 25.68 | 52.41 | 737.99 |
| **Existing Land Uses** | | | | | | | | |
| Single-Family Dwellings (ITE 210) | DU | 0.188 | 0.563 | 0.750 | 0.630 | 0.370 | 1.000 | 9.520 |
| Utilities Servicing Station (ITE 170)* | KSF | 0.720 | 0.080 | 0.800 | 0.342 | 0.418 | 0.760 | 8.000 |

"KSF" means "thousand square feet"

* Note: AM directionality taken from table for trips/employee. Daily rate is assumed to be ten time peak-hour rates

** Fire Station rate is based on the average of three traffic studies:

Fehr and Peers, *Loyola Marymount University Master Plan Project*, City of Los Angeles Department of Transportation, 2009, Table 5.

LLG Engineers, *Peaceful Valley Ranch*, County of San Diego, 2007, page 11.

McMahon, *Upper Dublin Fire House*, Montgomery County, Pennsylvania, 2010, page 15.

Using these rates, the trips that would be generated by the WLC are shown in Table 24 and Table 25.

**Table 24: Trips Generated by Proposed and Existing Land Uses**

| Land Use Type | Unit | Amount | AM Peak Hour | | | PM Peak Hour | | | ADT |
|---|---|---|---|---|---|---|---|---|---|
| | | | In | Out | Total | In | Out | Total | |
| **Proposed Land Uses** | | | | | | | | | |
| High-Cube Logistics Center | KSF | 40,400 | 3,066 | 1,378 | 4,444 | 1,503 | 3,345 | 4,848 | 67,872 |

## D. PROJECT TRIP DISTRIBUTION

A survey of warehouses in the Inland Empire[37] found that 80% of the vehicles entering or leaving warehouse sites are passenger cars, nearly all of which are used for commute trips by employees of the warehouses. The travel pattern of the project-related auto traffic is discussed below, followed by a discussion of project-related truck traffic.

### *WLC Auto Traffic*

As discussed previously, Moreno Valley currently has a severe jobs/housing imbalance that results in long westbound commutes for thousands of city residents every workday. The WLC would create approximately 20,000 local job opportunities[38]; nearly doubling the number of jobs in Moreno Valley. This would have several effects on commute patterns:

- Many current and future residents of Moreno Valley would have the opportunity to work locally with very short commute trips.
- Residents of neighboring cities who work at the WLC would have short commutes and, importantly, be able to access the site using the arterial road network. This is consistent with the

---

[36] Light trucks are 2 axle trucks with six wheels, medium trucks are those with three axles, and heavy trucks are those with four or more axles. Pickup trucks with four wheels are included in the "auto" category.

[37] *Truck Trip Generation Study*, City of Fontana, August 2003.

[38] Based on a ratio of 0.5 employees per 1000 square feet of logistics. This ratio is taken from: *DTA Public Works Database; confirmed by "Employment Density Study," SCAG (2001), and "Logistics Trends and Specific Industries," NAIOP Research Foundation (March 2010).San Bernardino Planning Department.*

policies of the Western Riverside Council of Governments and the Riverside County Transportation Commission to promote use of the arterial road network as an alternative to freeways. Tests with the RivTAM model (see Figure 39) suggest that nearly half of auto traffic associated with the WLC would be on surface streets; i.e. not on freeways.

- Workers coming from more distant locations would, in most cases, be travelling on freeways in the off-peak direction; i.e. commuters traveling to the WLC from Los Angeles or Orange Counties would be headed eastbound in the morning and westbound in the evening. This would enable them to take advantage of the existing unused off-peak capacity of freeways, since the freeways were sized for flows in the peak direction.

- Assuming, as RivTAM does, that WLC employees would work elsewhere if the WLC project were not implemented, then the availability of jobs at the east end of Moreno Valley would reduce the number of workers driving long commutes to distant jobsites to the west and southwest. Figure 40 shows that although the project would increase freeway auto traffic eastbound in the morning (where unused capacity is available), it would also decrease the traffic in the more congested westbound direction. In the evening the pattern would reverse, with the project relieving traffic in the congested eastbound direction (see Figure 41). Therefore, the WLC project would have a net beneficial impact on the regional freeway auto traffic. This is the effect sought in the policies of SCAG, WRCOG, and other regional governments and agencies that encourage better jobs/housing balances as a way to reduce peak directional flows on the regional freeway system.

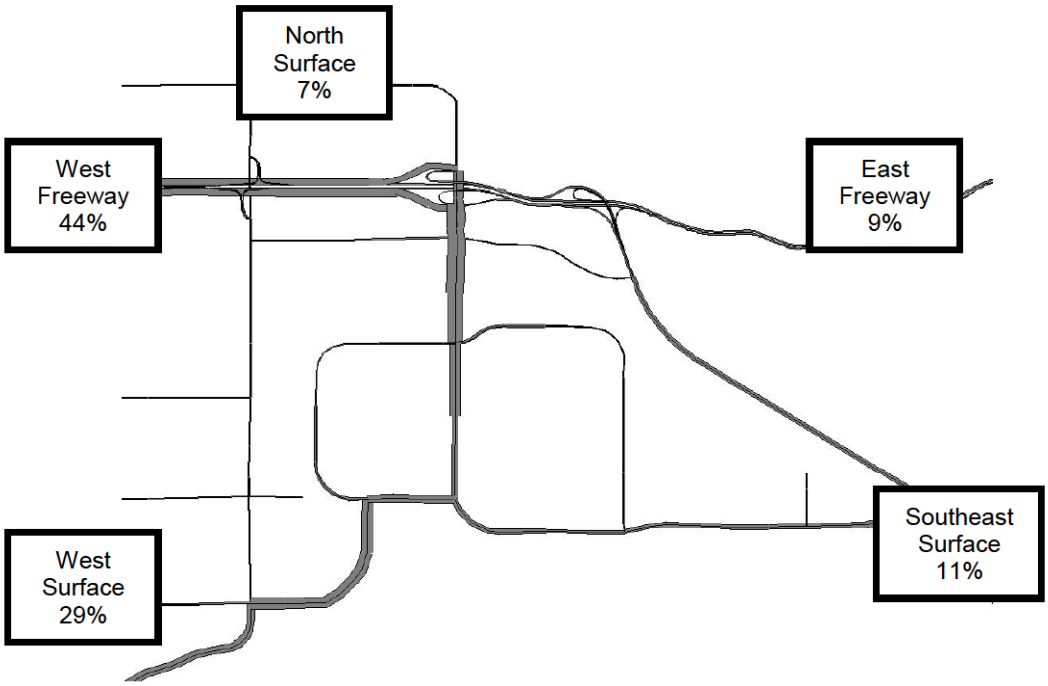

**Figure 39: Daily Distribution of WLC Auto Trips**

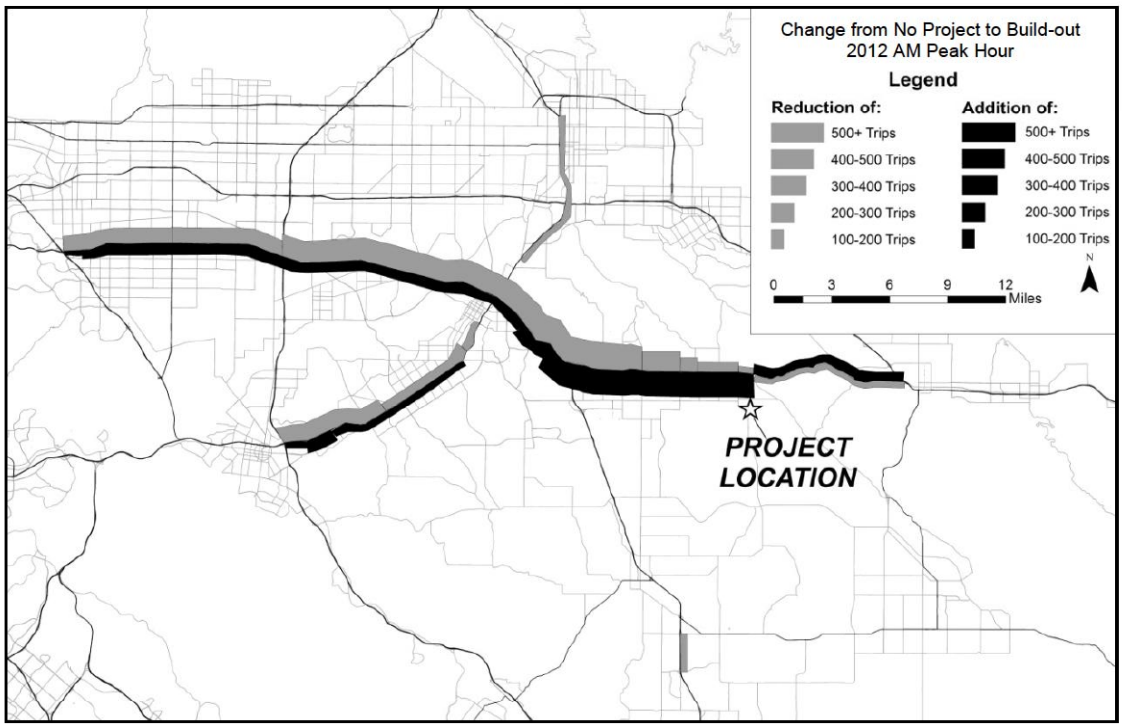

**Figure 40: Effect of WLC on Freeway Car Traffic, AM Peak Hour 2012**

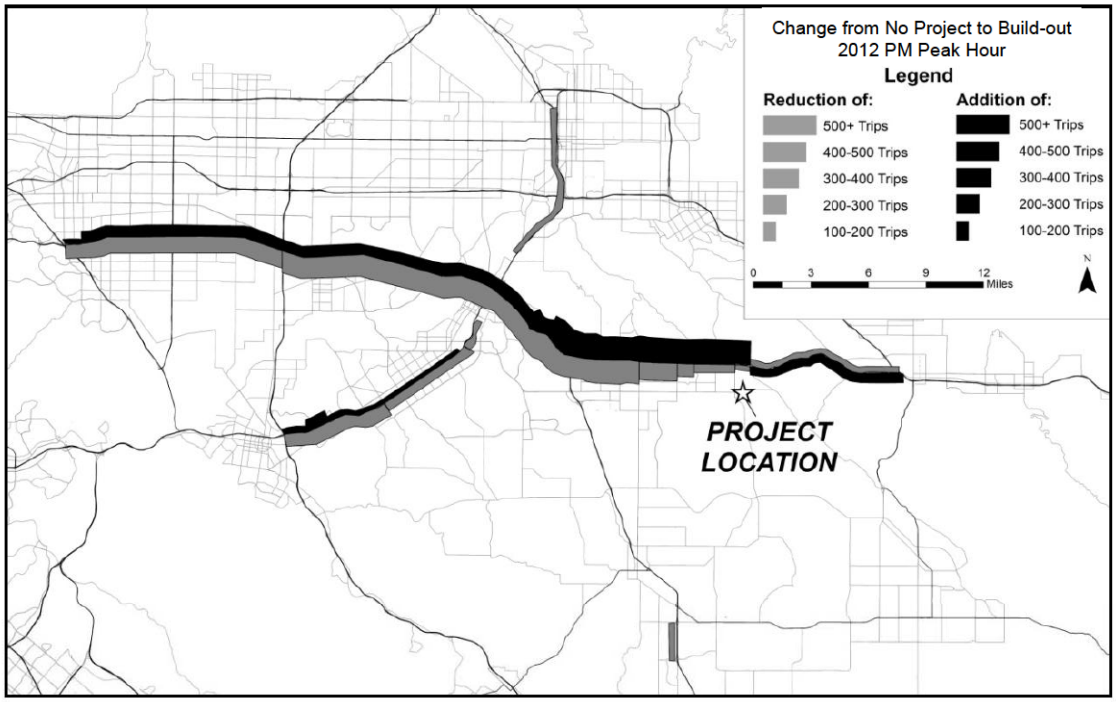

**Figure 41: Effect of WLC on Freeway Car Traffic, PM Peak Hour 2012**

***WLC Truck Traffic***

The truck traffic associated with a typical logistics center has a much different time-of-day pattern than auto traffic. Figure 42 shows the combined traffic data for vehicles entering or leaving the 31 logistics centers in 2011 NAIOP trip generation study. As shown, besides being much larger, the auto traffic shows distinct peaks while truck traffic is spread much more evenly throughout the 24-hour period. The five hours with the highest truck traffic all occurred outside of the freeway peak periods.

Some readers of the Draft TIA misunderstood Figure 42 to mean that the WLC traffic analysis did not cover the worst-case scenario. In fact, because of the conservatively high trip-generation rate used in the WLC analysis, along with the fact that the peak hour of trip generation for the WLC was assumed to occur simultaneous with the peak hour of background traffic, the assumptions in the WLC analysis are far more conservative (i.e. assume worse conditions) than the NAIOP survey would suggest is likely to occur (see Figure 43). In addition, the 2PM to 3PM hour was also studied with regards to possible impacts on pedestrians in the areas around schools, since most schools release students at that time of the day (see Chapter 12, Section B of this report).

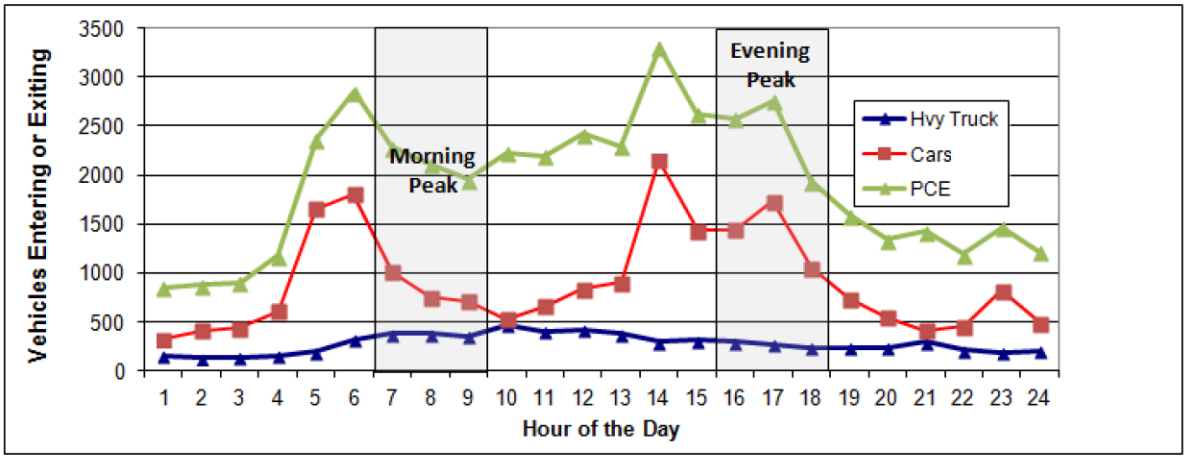

**Figure 42: Time-of-Day Distribution of Traffic from Logistics Warehouses**

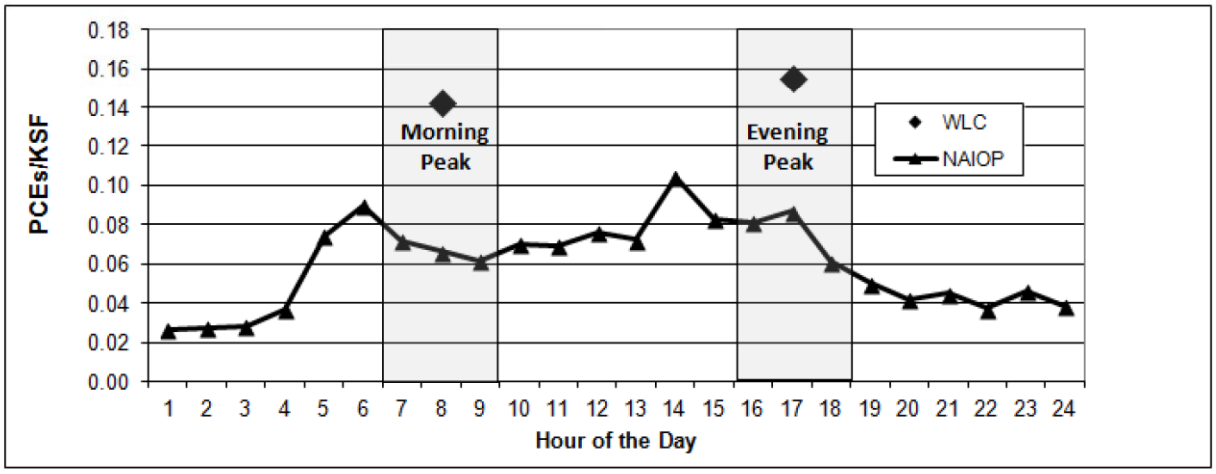

**Figure 43: Time-of-Day Distribution, WLC Assumptions Compared to NAIOP**

Since the internal trips, the port-related trips, and the majority of external trips (all but those on I-10) use routes west of the project site, it is anticipated that a large majority of the WLC truck traffic would be oriented to the west of the project, with a much smaller amount to and from the east. Also, due to truck routing restrictions the majority of WLC truck traffic would use the freeway system to enter and leave the site. However, there may be some trips between the WLC and local businesses, for example trip chaining among warehouses to consolidate cargos, that may use surface streets such as Gilman Springs Rd. Tests with the RivTAM model confirm this pattern (see Figure 44).

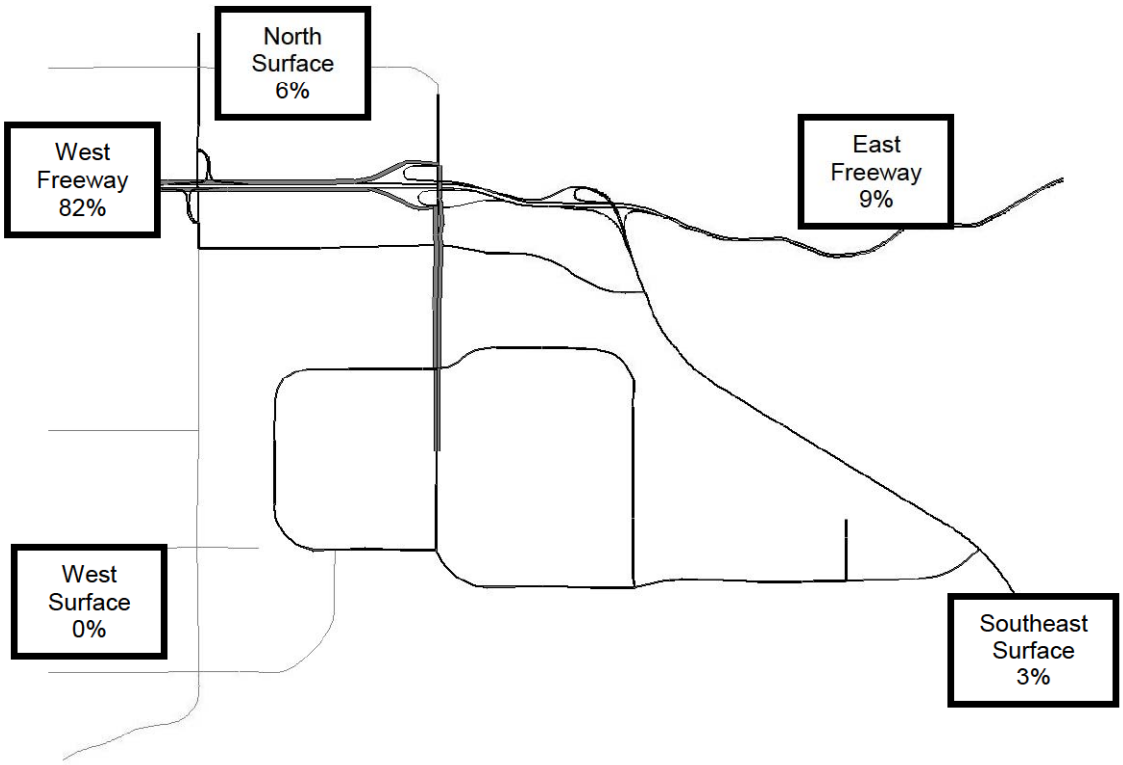

**Figure 44: Daily Distribution of WLC Truck Trips**

The percentage of WLC truck trips that would go to the port were estimated based on the assumptions described in Chapter 12 (see Table 87) for each study year. These percentages were then applied to the trip generation rates to find the number of WLC trucks going to and from the port in each analysis period. These are shown in Table 26. Tests with the SCAG traffic model showed that these trips would split approximately evenly between the two routes shown in Figure 56, so half of these trips were assigned to the SR-60 route and the other half assigned to the SR-91 route.

**Table 26: WLC Truck Trips to and from the Port by Analysis Period**

| Scenario | AM Peak Hour | | PM Peak Hour | | Daily | |
|---|---|---|---|---|---|---|
| | In | Out | In | Out | In | Out |

| 2022 Plus Phase 1 | 19 | 11 | 15 | 18 | 127 | 127 |
| 2035 Plus Build-out | 57 | 33 | 46 | 53 | 393 | 393 |

## E. TRIP GENERATION COMPARISONS

The final traffic study for the Moreno Highlands Specific Plan [39], which served as the basis for approval of that plan, forecast a total of 178,608 average vehicle trips per day (ADT) being generated by the Specific Plan. That would be more than two-and-a-half times as many trips (256%; see Figure 45) as are forecast for the WLC (69,542 ADT). The Moreno Highlands traffic studies did not distinguish between car and truck traffic and so did not provide a forecast in terms of PCEs. However, even if the Moreno Highlands plan were to generate no truck trips at all (only auto trips), it would still generate nearly twice as many PCEs trips as the WLC[40]. Thus, the World Logistics Center would generate substantially less traffic than what is envisioned in the existing Specific Plan.

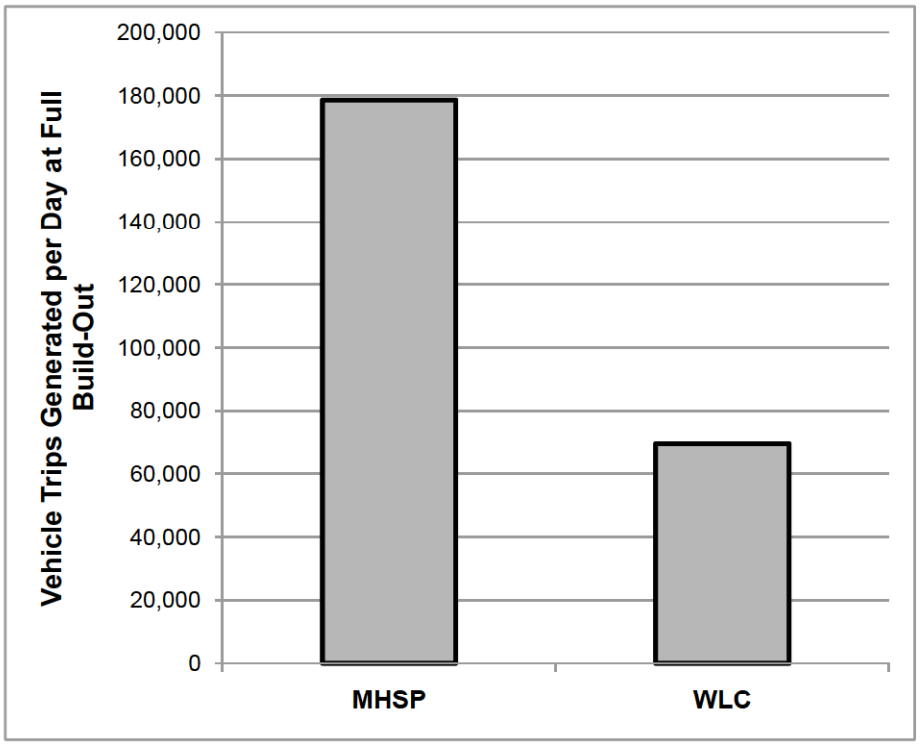

**Figure 45: Comparison of Trip Generation**

The comparison between the traffic forecast for the proposed WLC project and the traffic forecast for the Moreno Highlands Specific Plan indicates that the current Circulation Element of the General Plan is designed to accommodate approximately twice as much traffic from the WLC site than the WLC project is likely to generate. The much lower traffic volumes forecast for the WLC can therefore be expected to

[39] *Moreno Highlands SP 212-1 Traffic Impact Study Addendum*, Endo Engineering, October 1991

[40] 178,608 PCEs for Moreno Highlands would be 191% of the 93,414 PCEs forecast for the WLC

result in less strain on the transportation system than the land uses envisioned in the current General Plan.

## F. RAIL ALTERNATIVE

Several comments received on the DEIR requested that the provision of rail service to the project site be studied as a potential means of reducing the number of trucks driving between the ports and the site, and therefore a reduction in the number of significant impacts caused by the project. This section describes why rail service is not considered a viable option for reducing the traffic impacts of the WLC. This conclusion is based on several factors, including the physical constraints to bringing rail service to the WLC site, the cost of cargo movement by rail relative to movement by truck, capacity constraints in the rail system that the WLC branch line would tie into, and the minimal effect that rail service would have even if all other factors could be overcome. These factors are discussed in turn below.

### *The Possible Alignments for Bringing Rail Service to the WLC Site*

The WLC site is not currently served by rail. The rail lines nearest the site are the Union Pacific Yuma Line (single-track in this area), the Riverside County Transportation Commission's San Jacinto Branch Line (single-track, currently inactive), and the BNSF double-track line through the City of Riverside (see Figure 46).

As can be seen in Figure 46, there are four general alignment possibilities for a branch line to the WLC. Each has problems associated with it:

- Western Alignment – Alignments running from the BNSF line in Riverside to the WLC, an approximate distance of 15 miles, would have to run through built-up areas of the Cities of Riverside and Moreno Valley. The cost of acquiring right-of-way through these areas, and the impacts to the community (noise, traffic disruption, safety, division of the community, etc.) render such alignments unviable. Moreover, trains using the at-grade rail crossings in the City of Riverside already impose substantial delays on road traffic. In fact, in recent years the City of Riverside has sued the ports over the issue of traffic impacts from additional trains passing through their city. Adding more crossings and more trains would exacerbate this problem.

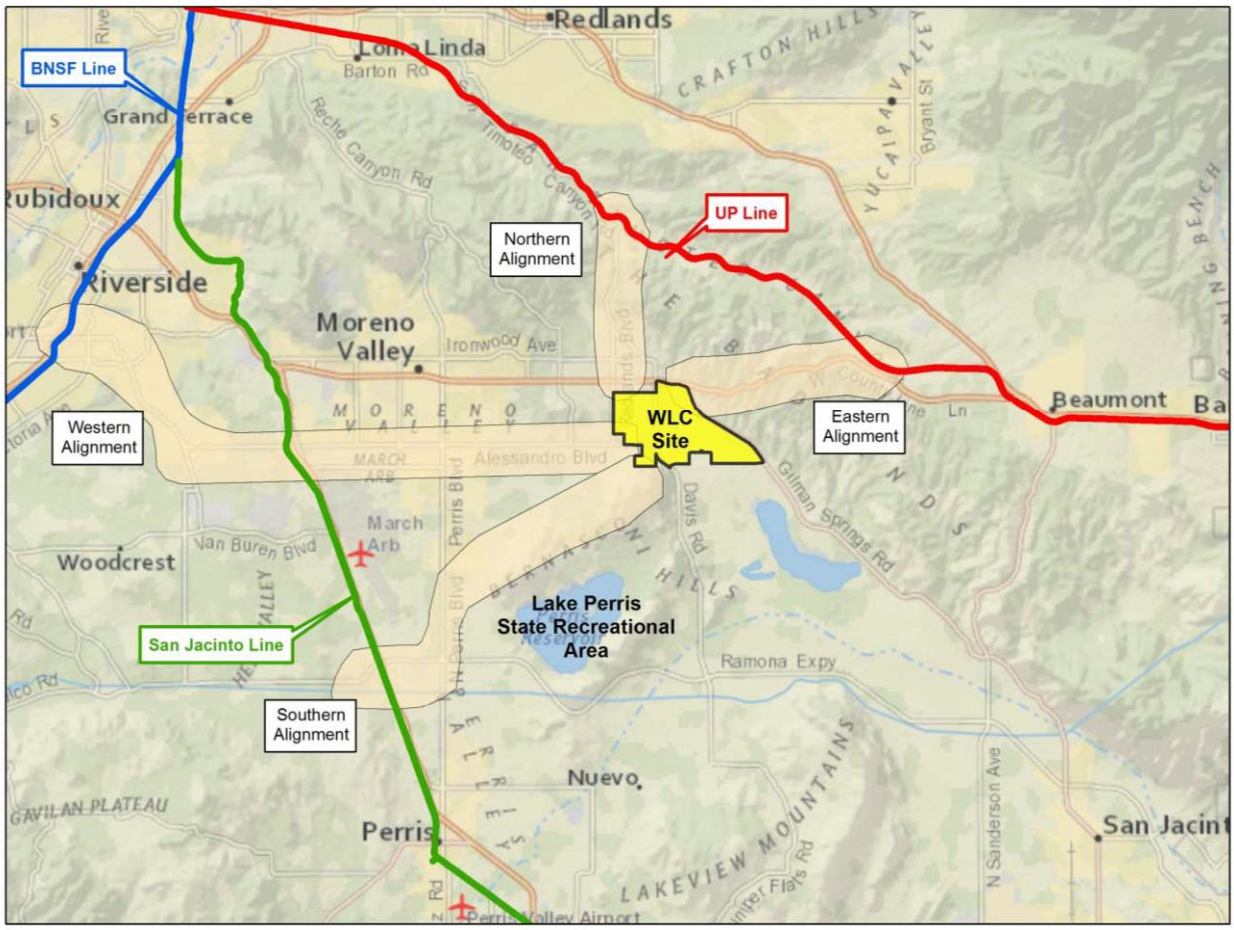

**Figure 46: Conceptual Rail Alignments**

- Southern Alignment – It would be possible to avoid densely populated and built-out areas by connecting to the San Jacinto Branch Line south of March Air Reserve Base. However, the only way to avoid established communities would be to pass along the northern portion of the Lake Perris State Recreation Area. The alignment, approximately 10 miles in length, would be a major impact as it would require constructing and operating a rail line along the slopes of the Lake Perris State Recreation Area and potentially the San Jacinto Wildlife Area. There would also be traffic impacts at road crossings, potential grade issues, and grade separated crossings needed for drainage channels and I-215. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways (which will be discussed in a later section).
- Northern Alignment – The shortest alignment to an existing rail line is to the north in the vicinity of Redlands Blvd. and connecting to the UP Yuma line near the intersection of Redlands Blvd. and San Timoteo Canyon Rd., approximately five miles from the project site. This alignment would require extensive ROW acquisition, very serious grade issues that would increase the length of

track needed[41], environmental impacts on the Badlands, and a grade separated crossing of SR-60. The impacts and costs of this approach would be disproportionate to the benefit of removing WLC trucks from the freeways.

- Eastern Alignment – The final possibility would be to connect to the UP Yuma line along an alignment parallel to SR-60. This alignment would connect to the existing rail network near the Morongo Golf Club at Tukwet Canyon, approximately five miles to the east of the WLC site. The eastern alignment would be affected by the same drawbacks as the northern alignment, with the addition of the need to construct a bridge over San Timoteo Creek.

  As can be seen from the discussion above, providing rail service to the WLC along any of the possible alignments would in itself create serious environmental impacts.

***Relative Costs of Truck and Rail Service***

The loading and unloading of rail cargos require special equipment and handling and can only be performed at specialized places, which adds to the cost of shipping goods by rail. On the other hand, the actual movement of goods by rail is more energy-efficient and less expensive than movement by truck. This combination of relatively high fixed costs at each end of a trip with low variable costs for the distance traveled means rail can be a less expensive way to ship cargo than truck, but only if the shipping distance is sufficiently long.

The breakeven distance between rail and truck shipping has been the subject of several studies. The industry rule-of-thumb is that the rail becomes economically viable when cargos are shipped more than 500 miles. For example, the National Rail Plan, a nationwide guiding document from the U.S. Department of Transportation Federal Railroad Administration, has set the freight rail goal to, "Develop strategies to attract 50 percent of all shipments 500 miles or greater to intermodal rail."[42] In addition, the Plan highlights the importance that trucks have in conjunction with rail when moving freight as trucks, "excel in providing time-sensitive delivery services for high-value goods being transported over medium and short-haul distances."[43] A local example is the Ports of Long Beach/Los Angeles Rail Master Planning Study, which indicates that rail loaded with two levels of shipping containers, "traditionally competes well with

---

41 Although the grade passable by train depends on the load, generally tracks climb at less than three percent. For example, as the BNSF Cajon line traverses the Cajon Pass, the maximum uphill grade is 2.2 percent. Therefore, constructing a track through the Badlands, either near Redlands Blvd. or State Route 60, may require a longer more circuitous layout to avoid the grades. A longer track would require more right-of-way, result in a greater impact to the environmentally sensitive area, and be more costly to construct.

42 National Rail Plan, U.S. Department of Transportation Federal Railroad Administration, September 2010. Available at: https://www.fra.dot.gov/eLib/Details/L02696, page 14.

43 Ibid.

trucks at distances greater than 500 miles.[44] Figure 47, from the San Pedro Bay Ports Rail Market Study, shows the breakeven point between truck and rail freight transport beginning east of Las Vegas and Phoenix, and north of the Bay Area. For shipments between the Ports of Los Angeles and Long Beach and the WLC, a distance of about 70 miles, shipping by rail would be far more expensive than by truck. So even if a rail line were built to the WLC, it would be uneconomical to use it for trips to and from the ports.

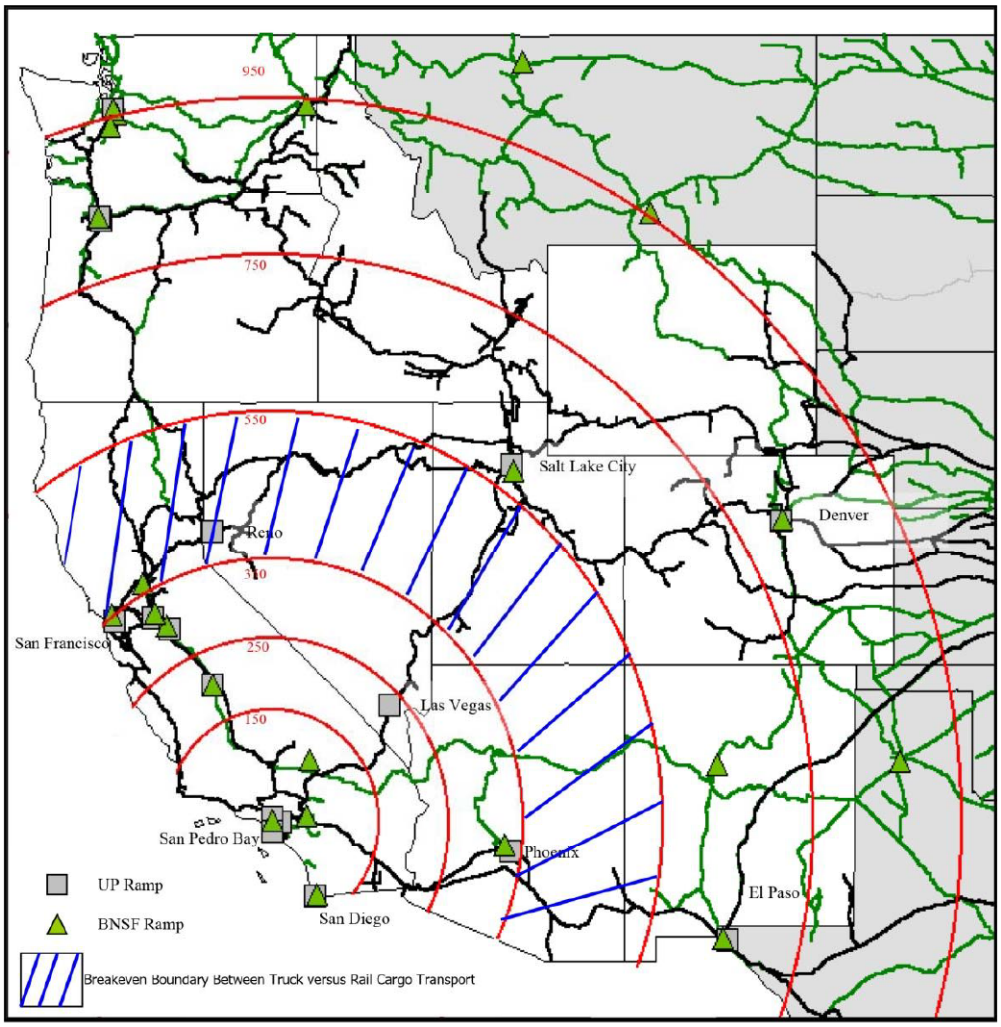

**Figure 47: Range of Typical Rail Market in Southern California[45]**

***Capacity Constraints in the Rail System***

If a rail line could be built to the WLC site and tenants could be induced to use it despite higher costs, this would only be helpful if the regional rail system had sufficient capacity to accommodate WLC freight without detriment to other users.

In fact, there are serious capacity constraints in the rail network in the Los Angeles basin. Among other things, rail operations for both BNSF and UP are already constrained by the capacity of the lines between the ports and western Riverside County. Two studies, completed in the early 2000s and using the year 2000 as the existing condition, found that many of the rail lines were already operating near capacity.[46] The studies evaluated 10 and 25 years of projected growth on the network and found that within 10 years (of the date of the study) the network would be overcapacity. Without capacity increasing improvements, 10 years of train traffic growth was forecast to increase delay more than six-fold. This did not include additional delays that would be caused by trains serving the WLC.

The Los Angeles-Inland Empire Railroad Main Line Advanced Planning Study from October 2002 found that the, "region's rail system is inadequate for forecast train traffic."[47] The study presented other findings that illustrate the near-capacity state of the rail network, for example, "…just 25 percent of the forecast 2010 traffic is sufficient to roughly double the average delay per train, to 67.6 minutes for BNSF freight and 54.4 minutes for UP freight." This occurs because small increases in train traffic result in disproportionate delays as the network nears capacity.

Several minor improvements to the rail network have been made since the 2002 study. However, accommodating estimated future demand in the year 2025 by providing capacity improvements alone would be costly; to meet future demand without rerouting would require capacity of some segments to be increased from two to four tracks. Therefore, an approach has been developed to revise train routing on the existing rail network and make limited capacity-increasing improvements. Even the limited improvements are estimated to cost over $2 billion.[48]

The fact that the rail system has limited capacity to accommodate additional traffic means that potential users have to be prioritized so that the capacity can be allocated efficiently. Highest priority would be for long-distance rail service direct from the ports. Short-distance cargo trips between the ports and the WLC would receive much lower priority than long-distance shipments because they would generate less revenue (unless a premium was charged). If regional passenger trains (e.g. Metrolink) share the tracks with freight trains, as is the case for some lines, then service to WLC would drop even further on the priority list.

---

46 Los Angeles-Inland Empire Railroad Main Line Advanced Planning Study, Los Angeles Economic Development Corporation, October 2002, page 15.

47 Ibid. page 8.

48 Inland Empire Railroad Main Line Study, Southern California Association of Governments, June 2005, page 75.

Based on existing capacity of the rail network and projected growth, the studies indicated that the rail network would be overcapacity without further capital investments, which are beyond the scope of the WLC project.

***Minimal Reduction in Traffic***

Assuming that a rail line could be built to the WLC site and assuming that WLC freight could be accommodated by the rail network and that the costs for these things could be covered by subsidies or by increasing the prices on goods moved through the WLC, the question must be asked, "how much of a reduction in truck traffic impacts would be achieved?"

The answer is, "very little". As was discussed earlier, the economics of freight shipment make rail viable only for trips of 500 miles or more. As is described elsewhere in this report (Chapter 12, Section F), between 2% and 7% (depending on the year) of the truck trips beginning or ending in WLC go to the ports and these trips have no significant impact on freeway LOS for most of their length. So the effect of rail service on reducing truck impacts would be very small.

***Conclusions About the Rail Alternative***

This analysis of the rail alternative found that bringing rail service to the site would be very costly, result in serious environmental impacts, create major disruption to existing communities, and take many years to design, acquire right-of-way and construct. Even if a line were built, both economics and system constraints would deter its use for cargos between the WLC and the ports. Even if built and used, rail service would have very little effect on reducing the traffic impacts of the WLC. Based on these considerations rail service was not included in the design of the WLC.

# 5. EXISTING PLUS PHASE 1 CONDITIONS

The analysis of Existing Plus Phase 1 conditions shows the effect of project-related traffic using the same land use and road network assumptions as the Existing scenario plus the build-out of Phase 1 (only) of the WLC and no changes occurred to the off-site land uses or roadway system.

## A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 27 compares the average daily traffic (ADT) volumes for study roadway segments to Existing Conditions and to their threshold of significance under the City's General Plan policies. Under Existing Plus Phase 1 Conditions two segments would exceed the threshold of significance set by General Plan policy, namely:

- Gilman Springs Rd. between SR-60 and Alessandro Blvd. would exceed the threshold of significance under both Existing Conditions and under Existing Plus Phase 1 Conditions. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under Existing Plus Phase 1 Conditions.

- Gilman Springs Rd. from Alessandro Blvd. to Bridge St. would exceed the threshold of significance under both Existing Conditions and under Existing Plus Phase 1 Conditions. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under Existing Plus Phase 1 Conditions.

In each case adding lanes would bring the LOS above the target threshold set in the General Plan. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 48 shows the turning movement volumes under Existing Plus Phase 1 (see Figure 16 for the key map).

Table 28 presents the LOS for the study intersections under the Existing Plus Phase 1 conditions in the AM and PM peak hours. Detailed worksheets are presented in Appendix C.

| S-22 | Cactus Ave. | Redlands Blvd | Cactus Ave Extension | C | 2U*** | 472 | A | 2U | 9,250 | C | | | |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

Indicates LOS exceeds the target level

Table 28 identifies where impacts occur. As shown in the table, there are 15 study intersections where the project would have a significant impact. Twelve of these intersections would exceed the threshold of significance under Existing Conditions and three would exceed the threshold of significance with the addition of the project. These intersections are:

Would Exceed Threshold of Significance Under Both Existing Conditions and Existing Plus Phase 1 Conditions

- Redlands Blvd./Locust Ave.
- Redlands Blvd./SR-60 WB ramps
- Oliver St./Alessandro Blvd.
- Lasselle St./Cactus Ave.
- Gilman Springs Rd./Bridge St.
- SR-79 (Sanderson Ave.) NB/Gilman Springs Rd.
- SR-79 (Sanderson Ave.) SB/Gilman Springs Rd.
- San Timoteo Canyon Rd./Alessandro Rd.
- San Timoteo Canyon Rd./Live Oak Canyon Rd.
- Redlands Blvd./San Timoteo Canyon Rd.
- Moreno Beach Dr./SR-60 EB Ramps
- Alessandro Blvd./Chicago Ave.

Would Exceed Threshold of Significance Under Existing Plus Phase 1 Conditions (only)

- Redlands Blvd./Cactus Ave.
- Arlington Ave./Victoria Ave.
- Moreno Beach Dr./John Kennedy Dr.

The mitigation measures shown in Table 29 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that if they could be constructed they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Indicates that the LOS exceeds the target leve "LT" and "RT" denote left turn and right turn respectively

Notes: "CSS" means cross-street is stop-controlled "NB" and "SB" denote northbound and southbound respectively

"AWS" means all-way stop "EB" and "WB" denote eastbound and westbound respectively

## C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

***Freeway Mainline Basic Sections***

Table 30 compares the LOS for freeway mainline sections for the Existing and Existing Plus Phase 1 conditions. Details of the LOS calculations for freeways under Existing Plus Phase 1 conditions can be found in Appendix J. As shown in Table 31, there are nine sections where the project would have a significant impact. Eight of these sections would be deficient under both Existing and Existing Plus Phase 1 conditions, namely:

Northbound or Eastbound

- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- I-215 from SR-74 to Redlands Ave.

Southbound or Westbound

- SR-60 from I-215 to Day St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- I-215 from SR-74 to Redlands Ave.
- I-215 from Baseline Rd. to Highland Ave

An additional section was found to be deficient under Plus Phase 1 conditions: SR-91 from Central Ave. to 14th St. in the eastbound direction.

Adding a mixed-flow lane would improve these sections to better than LOS "E" in the Plus Phase 1 condition and thus would reduce the impact of the WLC project to a less-than-significant level. Mitigation measures that would be needed to reduce the impact of the project to a less-than-significant level are summarized in Table 31. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11

## Table 30: Existing Plus Phase 1 Freeway Mainline LOS

| ID | Freeway | Segment | Existing Conditions | | | | | | Existing Plus Phase 1 Conditions | | | | | |

Indicates that the LOS exceeds the target level

***Freeway Weaving LOS***

Table 32 compares the LOS for study weaving sections under Existing and Existing Plus Phase 1 conditions. As shown in the table, four sections would be significantly impacted under Existing Plus Phase 1 conditions, and all of which would operate below target LOS "D" under both Existing and Plus Phase 1. These segments are:

Northbound and Eastbound

- SR-60 from Blaine St./3rd St. to University Ave.
- SR-91 from Arlington Ave. to Central Ave.

Southbound and Westbound

- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from 14th St. to University Ave.

No additional sections would be deficient under Plus Phase 1 conditions. Table 33 identifies mitigation measures that would reduce the impact of the WLC project to a less-than-significant level.

The mitigation measures shown in Table 33 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

### *Freeway Ramp LOS*

Table 34 compares the freeway ramp level of service on SR-60 under Existing and Existing Plus Phase 1 conditions. Under Existing and Existing Plus Phase 1 conditions only one ramp operates below the target LOS of "D": SR-60 westbound on-ramp from Central Ave.

No ramps that currently operate at an acceptable LOS would exceed the LOS threshold as a result of Phase 1 of the project.

Table 35 shows the mitigation measures needed to reduce the impacts of the WLC to a less-than-significant level. The mitigation measures shown in Table 35 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Indicates that the LOS exceeds the target level

# 6. EXISTING PLUS BUILD-OUT CONDITIONS

The analysis of Existing Plus Build-out conditions shows the effects that project-related traffic would have on the local and regional road system if the WLC's land uses and internal road network were built-out in full in 2012 and no changes occurred to the off-site land uses or roadway system.

## A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 36 compares the LOS for study roadway segments under Existing Conditions and Existing Plus Build-out Conditions. As shown, under Existing Plus Build-out Conditions three segments exceed the target LOS set by General Plan policy, namely:

- Gilman Springs Rd. between SR-60 and Alessandro Blvd. exceeds the target LOS under both Existing Conditions and under Existing Plus Build-out Conditions. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under the Existing Plus Build-out Conditions.

- Gilman Springs Rd. from Alessandro Blvd. to Bridge St. exceeds the threshold of significance under both Existing Conditions and under Existing Plus Build-out Conditions. Widening the road from two lanes to four lanes would allow it to achieve the target LOS under Existing Plus Build-out Conditions.

- Cactus Ave. east of Redlands Blvd. would exceed the threshold of significance under Existing Plus Build-out Conditions. The road currently has two eastbound lanes and one westbound lane. Adding a second westbound lane would enable it to achieve the target LOS under Existing Plus Build-out Conditions.

In each case adding lanes would achieve the LOS target set in the General Plan. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 49 shows the turning movement volumes under Existing Plus Build-out conditions (see Figure 16 for the key map). Table 37 presents the LOS for the study intersections under the Existing Plus Build-out conditions in the AM and PM peak hours. Detailed worksheets are presented in Appendix D. Table 38 identifies where impacts occur and mitigation measures that would reduce the impacts to a less-than-significant level.

## Table 36: Existing Plus Build-out Road Segment Impacts and Mitigations

| | Roadway | From | To | LOS Standard* | Existing Conditions | | | Existing Plus Build-out Conditions | | | Project Significant Impact? | Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant | LOS After Mitigation |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

Indicates LOS exceeds the target level

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

## Table 37: Intersection LOS under Existing Plus Build-out Conditions (continued)

| ID | Study Intersection | LOS Standard | Existing Conditions | | | Existing Plus Build-out | | |

| IN-134 | Redlands Blvd/San Timoteo Canyon Rd | C | F | F | F | F | Yes | SIGNAL | 8.6 | A | 5.9 | A | Signalize. Add 1 EB RT. Also add EB RT overlap phase. |

Indicates that the LOS exceeds the target leve "LT" and "RT" denote left turn and right turn respectively

Notes: "CSS" means cross-street is stop-controlled "NB" and "SB" denote northbound and southbound respectively

"AWS" means all-way stop "EB" and "WB" denote eastbound and westbound respectively

As shown in Table 38, there are 17 study intersections where the project would have a significant impact. Twelve of these intersections already exceed the threshold of significance under Existing Conditions and another five would exceed the threshold of significance with the addition of the project. These intersections are:

Exceed Threshold of Significance Under Both Existing Conditions and Existing Plus Build-out Conditions

- Redlands Blvd./Locust Ave.
- Redlands Blvd./SR-60 WB ramps
- Oliver St./Alessandro Blvd.
- Moreno Beach Dr./SR-60 EB Ramps
- Lasselle St./Cactus Ave.
- Alessandro Blvd./Chicago Ave.
- Gilman Springs Rd./Bridge St.
- SR-79 (Sanderson Ave.) NB/Gilman Springs Rd.
- SR-79 (Sanderson Ave.) SB/Gilman Springs Rd.
- San Timoteo Canyon Rd./Alessandro Rd.
- San Timoteo Canyon Rd./Live Oak Canyon Rd.
- Redlands Blvd./San Timoteo Canyon Rd.

Exceed Threshold of Significance Under Existing Plus Build-out Conditions (but not under Existing No-Project Conditions)

- Redlands Blvd./Cactus Ave.
- Moreno Beach Dr./John Kennedy Dr.
- Moreno Beach Dr./Ironwood Ave.
- Arlington Ave./Victoria Ave.
- Bridge St./Ramona Expy.

In each case, a change in the traffic control mechanism, or the addition of lanes, or both, would reduce the impact of the project to a less-than-significant level.

The mitigation measures shown in Table 38 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

***Freeway Mainline Basic Sections***

Table 39 compares the LOS for freeway mainline sections for the Existing and Existing Plus Build-out scenarios. Details of the LOS calculations for freeways under Existing Plus Build-out conditions can be found in Appendix K. Table 40 identifies the ten basic freeway sections where the project has a significant impact. Eight of these sections would be deficient under both Existing and Existing Plus Build-out conditions, namely:

Northbound or Eastbound

- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- I-215 from SR-74/Case Rd. to Redlands Ave.

Southbound or Westbound

- SR-60 from I-215 to Day St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- I-215 from SR-74/Case Rd. to Redlands Ave.
- I-215 from Baseline Rd. to Highland Ave./SR-210

Two additional sections were found to be deficient under Plus Build-out conditions, namely:

Eastbound

- SR-91 from Central Ave. to 14th St.

Westbound

- SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.

Table 40 also identifies the mitigation measures needed to reduce the impact to a less-than-significant level. In each case adding a mixed-flow lane[49] would bring the LOS to "D" or better. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS,

---

[49] A "mixed-flow lane" is the most common type of freeway lane. The term is used to distinguish them from carpool lanes, truck lanes, etc.

## Table 39: Existing Plus Build-out Freeway Mainline LOS

| ID | Freeway | Segment | Existing Conditions | | | | | | Existing Plus Build-out Conditions | | | | | |

Indicates that the LOS exceeds the target level

this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

***Freeway Weaving LOS***

Table 41 compares the LOS for the study weaving sections under Existing and Existing Plus Build-out conditions. As shown in Table 41, there are six sections where the project would have a significant impact. Five of these sections would be deficient under both Existing and Existing Plus Build-out conditions, namely:

Northbound and Eastbound

- SR-60 from SR-91 to Blaine St./3rd St.
- SR-60 from Blaine St./3rd St. to University Ave.
- SR-91 from Arlington Ave. to Central Ave.

Southbound and Westbound

- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from 14th St. to University Ave.

An additional section was found to be deficient under Plus Build-out conditions: SR-60 Central Ave. to Fair Isle Dr./Box Springs Rd. (in the eastbound direction).

Table 42 shows that in every case the addition of a mixed-flow lane or a second off-ramp lane would reduce the impact of the WLC project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

| W-50 | SR-91 | 14th St to University Ave | C | C | E | E | Yes | 5,230 | 22.7 | C | 7,080 | 33.7 | D | Add a second off-ramp lane |

Indicates that the LOS exceeds the target level

***Freeway Ramp LOS***

Table 43 compares the freeway ramp level of service on SR-60 under Existing and Existing Plus Build-out conditions. One study ramp, namely the SR-60 eastbound on-ramp from Central Ave. currently operates at LOS "F" in the PM peak hour and would also operate at LOS "F" under Existing Plus Build-out conditions, but with a higher traffic density. Adding a mixed-flow lane to the freeway would reduce the impact of the project to a less-than-significant level.

Table 44 shows the mitigation measures needed to reduce the impacts of the WLC to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## Table 43: Existing Plus Build-out Freeway Ramp Level of Service

# 7. 2022 NO-PROJECT CONDITIONS

This chapter describes traffic conditions under the assumption that existing land uses plus other past, present, and reasonably foreseeable projects (both land development and roadway improvements) up to the year 2022 are implemented. Conditions on the WLC site were assumed to be unchanged from existing conditions. This scenario forms a basis of comparison for the 2022 Plus Phase 1 scenario that is discussed in the next chapter of this report. The 2022 scenarios are the "cumulative" scenarios in that they incorporate all known land development projects and all funded roadway projects.

## A. 2022 NO-PROJECT TRAFFIC VOLUMES

The forecast turning movement volumes for this scenario are shown in Figure 50. Figure 16 is the key map for the Figure 50 sub-figures.

| S-22 | Cactus Ave. | Redlands Blvd | Cactus Ave Extension | C | 2U*** | 472 | A |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.
** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.
*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.
Indicates LOS exceeds the target level

In this scenario, Gilman Springs Rd. north and south of Alessandro exceed the LOS target set by General Plan policy, which also occurred under Existing Conditions.

### *Intersection LOS*

Table 46 presents the LOS for the study intersections under 2022 No-Project conditions in the AM and PM peak hours. Detailed worksheets are presented in Appendix E. The number of intersections that

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

exceeded the LOS target rose from 12 under Existing Conditions to 31 under 2022 No-Project conditions due to population and employment growth. The intersections that were forecast to exceed the LOS target were:

- Redlands Blvd./Locust Ave. (AM, PM)
- Redlands Blvd./SR-60 WB ramps (AM, PM)
- Theodore Ave./Fir (Eucalyptus) Ave. (PM)
- Oliver St./Alessandro Blvd. (AM, PM)
- Redlands Blvd./Alessandro Blvd. (AM)
- Moreno Beach Dr./Ironwood Ave. (AM)
- Moreno Beach Dr./SR-60 EB Ramps (AM)
- Lasselle St./Iris Ave. (PM)
- Krameria Ave./Perris Blvd. (AM, PM)
- Lasselle St./Alessandro Blvd. (AM)
- Lasselle St./Cactus Ave. (AM, PM)
- Frederick St./Alessandro Blvd. (PM)
- Graham St./Alessandro Blvd. (PM)
- Perris Blvd./Alessandro Blvd. (PM)
- Graham St./Cactus Ave. (AM, PM)
- Alessandro Blvd./Sycamore Canyon Blvd. (PM)
- I-215 SB Ramps/Cactus Ave. (PM)
- Elsworth St./Cactus Ave. (PM)
- Martin Luther King Blvd./Canyon Crest Dr. (AM)
- Arlington Ave./Victoria Ave. (AM, PM)
- Alessandro Blvd./Chicago Ave. (AM, PM)
- Ramona Expwy./Evans Rd. (AM)
- Placentia Ave./Perris Blvd. (PM)
- Gilman Springs Rd./Bridge St. (AM)
- SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. (AM, PM)
- SR-79 (Sanderson Ave.) SB/Gilman Springs Rd. (AM, PM)
- W 6th St./California Ave. (AM, PM)
- San Timoteo Canyon Rd./Alessandro Rd. (AM, PM)
- San Timoteo Canyon Rd./Live Oak Canyon Rd. (AM, PM)
- Redlands Blvd./San Timoteo Canyon Rd. (AM, PM)
- W Crescent Ave./Alessandro Rd. (AM)

***Freeway Mainline Basic Sections***

Table 47 presents the results of the LOS analysis for freeway mainline sections. A total of 33 freeway mainline basic sections were forecast to exceed the target LOS of "D". In comparison, 17 sections in Existing No-Project conditions were forecast to exceed the LOS target. The sections that would exceed LOS "D" under 2022 No-Project conditions are:

North or Eastbound

- SR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Central Ave. to Mountain Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.
- SR-60 from Heacock St. to Perris Blvd.
- SR-91 from I-15 to McKinley St.
- SR-91 from Pierce St. to Magnolia Ave.
- I-215 from Columbia Ave. to Center St.
- I-215 from Iowa Ave./La Cadena Dr. to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.

South or Westbound

- SR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Grove Ave to Vineyard Ave

- SR-60 from Valley Way to Rubidoux Blvd
- SR-60 from Market St. to Main St.
- SR-60 from Main St. to SR-91
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-91 from McKinley St. to Pierce St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- I-215 from Columbia Ave. to Center St.
- I-215 from Center St. to Iowa Ave./La Cadena Dr.
- I-215 from Iowa Ave./La Cadena Dr. to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.

## Table 47: 2022 No-Project Freeway Mainline Level of Service

| ID | Freeway | Segment | Northbound / Eastbound | | | | | | Southbound / Westbound | | | | | |

Indicates that the LOS exceeds the target level

***Freeway Weaving LOS***

Table 48 shows the weaving LOS under 2022 No-Project conditions. Six north- or east-bound sections and one south- or westbound sections would operate below LOS "D". These sections are:

North or Eastbound

- SR-60 from SR-71/ Garey Ave. to Reservoir St.
- SR-60 from Main St. to SR-91
- SR-60 from SR-91 to W. Blaine St./3rd St.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from Arlington Ave. to Central Ave.
- I-215 from SR-60 to Columbia Ave.

South or Westbound

- SR-60 from SR-91 to W. Blaine St./3rd St.

Indicates that the LOS exceeds the target level

### *Freeway Ramp LOS*

Table 49 shows the level of service at study freeway ramps under 2022 No-Project conditions. One ramp was found to operate below the target LOS of "D", namely:

- SR-60 eastbound On-Ramp from Central Ave.

Details of the LOS calculations for freeways under 2022 No-Project Conditions can be found in Appendix L.

## Table 49: 2022 No-Project Freeway Ramp Level of Service

| ID | Freeway / Direction | Ramp Segment | Ramp No. of Lanes | AM Peak Hour | | | | PM Peak Hour | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|

Indicates that the LOS exceeds the target level

# 8. 2022 PLUS PHASE 1 CONDITIONS

The analysis of 2022 Plus Phase 1 Conditions shows the effect of project-related traffic if the first phase of the WLC project were built and no other changes from the 2022 No-Project scenario occurred to the roadway system or land uses.

## A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 50 compares the average daily traffic (ADT) volumes for study roadway segments to 2022 No-Project Conditions and to their threshold of significance under the City's General Plan policies. Under 2022 Plus Phase 1 Conditions three segments would exceed the threshold of significance set by General Plan policy, namely:

- Gilman Springs Rd. between SR-60 and Alessandro Blvd. would exceed the threshold of significance under both 2022 No-Project Conditions and under 2022 Plus Phase 1 Conditions. Widening the road from two lanes to four lanes would allow it to achieve the target LOS in the 2022 Plus Phase 1 Conditions.

- Gilman Springs Rd. from Alessandro Blvd. to Bridge St. would exceed the threshold of significance under both 2022 No-Project Conditions and under 2022 Plus Phase 1 Conditions. Widening the road from two lanes to four lanes would allow it to achieve the target LOS in the 2022 Plus Phase 1 Conditions.

- Redlands Blvd. from Fir (future Eucalyptus) Ave. to the SR-60 eastbound ramps would exceed the threshold of significance under 2022 Plus Phase 1 Conditions. Widening the road from two lanes to four lanes would allow it to achieve the target LOS in the 2022 Plus Phase 1 Conditions.

In each case adding lanes would bring the LOS to the level required in the General Plan. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## Table 50: 2022 Plus Phase 1 Road Segment Impacts and Mitigations

| | Roadway | From | To | LOS Standard* | 2022 No-Project Conditions | | | 2022 Plus Phase 1 Conditions | | | Project Significant Impact? | Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant | LOS After Mitigation |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| S-20 | Alessandro Blvd | Redlands Blvd | Merwin Street | C | 2U | 3,886 | A | 2U | 772 | A | | | |
| S-21 | Redlands Blvd | Alessandro Blvd | Cactus Ave. | C | 2U | 8,583 | B | 2U | 4,755 | A | | | |
| S-22 | Cactus Ave. | Redlands Blvd | Cactus Ave Extension | C | 2U*** | 472 | A | 2U | 9,699 | C | | | |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Road currently has 2 lanes in one direction and 1 lane in the other. The capacity shown is based on the narrower direction.

**** Due to the severing of Alessandro Blvd. and the diversion of traffic to other routes, there is no need to widen this section beyond the current 2U configuration

Indicates LOS exceeds the target level

## B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 51 shows the turning movement volumes under 2022 Plus Phase 1 conditions (see Figure 16 for the key map). Table 51 presents the LOS for the study intersections under the 2022 Plus Phase 1 conditions in the AM and PM peak hours. Detailed worksheets are presented in Appendix F. Table 52 identifies where impacts occur and mitigation measures that would reduce the impacts to a less-than-significant level.

As shown in Table 52, there are 34 study intersections where the project would have a significant impact. Twenty-eight of these intersections exceed the threshold of significance under 2022 No-Project conditions and six would exceed the threshold of significance with the addition of the project. These are:

Would Exceed Threshold of Significance Under Both 2022 No-Project Conditions and 2022 Plus Phase 1 Conditions

- Redlands Blvd./Locust Ave.
- Redlands Blvd./SR-60 WB ramps
- Oliver St./Alessandro Blvd.
- Moreno Beach Dr./Ironwood Ave.
- Moreno Beach Dr./SR-60 EB Ramps
- Lasselle St./Iris Ave.
- Krameria Ave./Perris Blvd.
- Lasselle St./Alessandro Blvd.
- Lasselle St./Cactus Ave.

The mitigation measures shown in Table 52 are those that would be needed to reduce the impact of the project to a less-than-significant level. The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## Table 52: 2022 Plus Phase 1 Intersection Impacts and Mitigations

| ID | Study Intersection | LOS Standard | Determination of Impact | | | | | 2022 Plus Phase 1 & Mitigations | | | | | Mitigation Measures Required to Reduce Impact to Less-Than-Significant |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| IN-60 | Perris Blvd/Alessandro Blvd | D | D | D | F | F | Yes | SIGNAL | 35.5 | D | 49.9 | D | Add 1 NB LT, 1 SB LT, 1 WB LT,and 1 EB LT. |
| IN-62 | Graham Str/Cactus Ave | D | F | F | E | E | Yes | SIGNAL | 34.7 | C | 44.0 | D | Add 1 EB RT and 1 NB LT lane. |
| IN-66 | Alessandro Blvd/Sycamore Canyon Blvd | D | D | D | E | E | Yes | SIGNAL | 38.8 | D | 46.8 | D | Add SB RT overlap. |
| IN-70 | Day Str/Alessandro Blvd | D | B | B | D | E | Yes | SIGNAL | 10.3 | B | 32.3 | C | Add 1 EB LT lane. |

Indicates that the LOS exceeds the target level

Notes: "CSS" means cross-street is stop-controlled
"AWS" means all-way stop
"RABT" means roundabout
"LT" and "RT" denote left turn and right turn respectively
"TH" denotes through lanes
"NB" and "SB" denote northbound and southbound respectively
"EB" and "WB" denote eastbound and westbound respectively

## Table 52: 2022 Plus Phase 1 Intersection Impacts and Mitigations (continued)

| ID | Study Intersection | LOS Standard | Determination of Impact | | | | | 2022 Plus Phase 1 & Mitigations | | | | | Mitigation Measures Required to Reduce Impact to Less-Than-Significant |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | AM Peak Hour | | PM Peak Hour | | | | AM Peak Hour | | PM Peak Hour | | |
| | | | No-Project LOS | Plus Phase 1 LOS | No-Project LOS | Plus Phase 1 LOS | Project Impact? | Traffic Control | Delay | LOS | Delay | LOS | |
| IN-74 | Elsworth Str/Cactus Ave | D | C | C | F | F | Yes | SIGNAL | 27.2 | C | 78.9 | E | Widen NB approach and change NB lane geometry from: 1 LT and 1 shared LT/TH/RT lanes to 3 LTs and 1 TH and 1 RT. Add 1 EB and WB TH lanes (to become 4 TH lanes). |
| IN-83 | Martin Luther King Blvd/Canyon Crest Dr | D | F | F | D | D | Yes | SIGNAL | 52.8 | D | 42.7 | D | Add NB RT lane.<br><br>NOTE: not an impact in 2035 due to redistributed volumes. |
| IN-94 | Arlington Ave/Victoria Ave | D | F | F | F | F | Yes | SIGNAL | 49.5 | D | 51.7 | D | Add WB LT lane. Add WB RT lane. Adjust timings.<br><br>NOTE: Mitigation measures are different than those suggeted for 2035. The projected SB LT volume is higher in 2022 than in 2035. |
| IN-95 | Alessandro Blvd/Chicago Ave | D | E | E | F | F | Yes | SIGNAL | 33.2 | C | 54.2 | D | Add EB TH lane. Add WB LT lane. Add WB TH lane. Add NB LT lane. Add NB TH lane. Reconfigure SB approach to 1 LT, 3 THs and 1 shared TH/RT. |
| IN-103 | Ramona Expy/Evans Rd | E | F | F | D | D | Yes | SIGNAL | 63.1 | E | 41.1 | D | Add 3rd WB TH lane. Already has 3 receiving lanes. Add 2nd SBR. |
| IN-112 | Placentia Ave/Perris Blvd | D | D | D | E | E | Yes | SIGNAL | 24.8 | C | 39.9 | D | Add NB RT. Add EB RT and lengthen EB LT by approximately 100'. |
| IN-123 | Gilman Springs Rd/Bridge Str | C | C | D | D | D | Yes | SIGNAL | 14.5 | B | 17.1 | C | Add a TWTL along the SB approach to offer a weave zone for EB LT. |
| IN-124 | SR-79(Sanderson Ave) NB/Gilman Springs Rd | C | F | F | F | F | Yes | SIGNAL | 9.0 | A | 7.0 | A | Signalize. |
| IN-125 | SR-79(Sanderson Ave) SB/Gilman Springs Rd | C | F | F | F | F | Yes | SIGNAL | 12.8 | B | 6.5 | A | Signalize. |
| IN-129 | W 6th St/California Ave | C | D | E | F | F | Yes | SIGNAL | 19.7 | B | 22.7 | C | Signalize. |
| IN-132 | San Timoteo Canyon Rd/Alessandro Rd | D | F | F | F | F | Yes | SIGNAL | 37.8 | D | 15.9 | B | Signalize. Add 1 WB RT. This intersection has planned widening by 2035, which would replace the turn lane. |
| IN-133 | San Timoteo Canyon Rd/Live Oak Canyon Rd | C | F | F | F | F | Yes | SIGNAL | 20.7 | C | 19.5 | B | Signalize. |
| IN-134 | Redlands Blvd/San Timoteo Canyon Rd | C | F | F | F | F | Yes | SIGNAL | 12.5 | B | 16.1 | C | Signalize. Add 1 EB RT. Also add EB RT overlap phase. |
| IN-135 | W Crescent Ave/Alessandro Rd | C | D | E | C | C | Yes | SIGNAL | 13.0 | B | 9.3 | A | Signalize. |

Indicates that the LOS exceeds the target level

Notes: "CSS" means cross-street is stop-controlled
"AWS" means all-way stop
"RABT" means roundabout
"LT" and "RT" denote left turn and right turn respectively
"TH" denotes through lanes
"NB" and "SB" denote northbound and southbound respectively
"EB" and "WB" denote eastbound and westbound respectively

## C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

***Freeway Mainline Basic Sections***

Table 53 compares the LOS for freeway mainline sections for the 2022 No-Project and 2022 Plus Phase 1 scenarios. Details of the LOS calculations for freeways under 2022 Plus Build-out Conditions can be found in Appendix M. Table 54 identifies 33 basic freeway sections where the project has a significant impact and identifies measures that would reduce project impacts to a less-than-significant level. Twenty-nine of these 33 sections would operate worse than the target LOS under both 2022 No-Project and Plus Phase 1 conditions, namely:

Northbound or Eastbound Sections

- SR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Central Ave. to Mountain Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.
- SR-60 from Heacock St. to Perris Blvd.
- SR-91 from Pierce St. to Magnolia Ave.
- I-215 from Columbia Ave. to Center St.
- I-215 from Iowa Ave./La Cadena Dr to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.

Southbound or Westbound Sections

- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Valley Way to Rubidoux Blvd.

- SR-60 from Market St. to Main St.
- SR-60 from Main St. to SR-91
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-91 from McKinley St. to Pierce St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- I-215 from Columbia Ave. to Center St.
- I-215 from Center St. to Iowa Ave./La Cadena Dr.
- I-215 from Iowa Ave./La Cadena Dr. to Barton Rd.
- I-215 from Barton Rd. to Mt. Vernon Ave.

There were four segments that would be deficient only under Plus Phase 1 conditions, namely:

Northbound or Eastbound Sections

- SR-91 from Central Ave. to 14th St.

Southbound or Westbound Sections

- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.
- SR-60 from Heacock St. to Perris Blvd.

As shown in Table 54, three of these sections would operate at LOS "F" under 2022 No-Project conditions and would continue to do so under 2022 Plus Phase 1 conditions. Adding a mixed-flow lane would improve these sections to LOS "E" under 2022 Plus Phase 1 conditions. While this would not be sufficient to achieve the target LOS it would nevertheless be an improvement over 2022 No-Project conditions and so would reduce the impact of the WLC project to a less-than-significant level.

## Table 53: 2022 Plus Phase 1 Freeway Mainline Level of Service

| ID | Freeway | Segment | 2022 No-Project Conditions | | | | | | 2022 Plus Phase 1 Conditions | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | Northbound / Eastbound | | | | | | Northbound / Eastbound | | | | | |
| | | | AM Peak Hour | | | PM Peak Hour | | | AM Peak Hour | | | PM Peak Hour | | |

***Freeway Weaving LOS***

Table 55 compares the LOS for study weaving sections under 2022 No-Project and 2022 Plus Phase 1 conditions. As shown in the table, there are 10 sections where the project would have a significant impact. Seven of these 10 sections would be deficient under both 2022 No-Project and Plus Phase 1 conditions, namely:

Northbound or Eastbound

- SR-60 from SR-71/S. Garey Ave. to Reservoir St.
- SR-60 from Main St. to SR-91
- SR-60 from SR-91 to W. Blaine St./3rd St.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from Arlington Ave. to Central Ave.
- I-215 from SR-60 to Columbia Ave.

Southbound or Westbound

- SR-60 from SR-91 to W. Blaine St/3rd St.

There were three segments that would be deficient only under Plus Phase 1 conditions, namely:

Southbound or Westbound:

- SR-60 from Blaine St/3rd St. to University Ave.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-60 from Day St. to Pigeon Pass Rd./Frederick St.

Indicates that the LOS exceeds the target level

Table 56 identifies mitigation measures that would reduce the impact of the WLC project to a less-than-significant level. These mitigation measures may not all be feasible due physical and financial constraints, and may not be desirable as a matter of public policy. Chapter 11 analyses the mitigation measures in greater detail and discusses options for funding those that are feasible.

### *Freeway Ramp LOS*

Table 57 compares the freeway ramp level of service on SR-60 under 2022 No-Project and 2022 Plus Phase 1 conditions. As shown in the table, only the SR-60 eastbound On-Ramp from Central Ave would have a significant impact with the project. This location would operate below LOS "D" under both 2022 No Project and Plus Phase 1 conditions. Table 58 shows the mitigation measures needed to reduce the impacts of the WLC to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Indicates that the LOS exceeds the target level

# 9. 2035 NO-PROJECT CONDITIONS

This chapter describes traffic conditions under the assumption that existing land uses plus other past, present, and reasonably foreseeable projects (both land development and roadway improvements) up to the year 2035 are implemented. Within the City of Moreno Valley full build-out of the General Plan was assumed, except for the project site which was assumed to be unchanged from existing conditions. This scenario forms a basis of comparison for the 2035 Plus Build-out scenario.

## A. 2035 NO-PROJECT TRAFFIC VOLUMES

The forecast turning movement volumes for this scenario are shown in Figure 52. Figure 16 is the key map for the Figure 52 sub-figures.

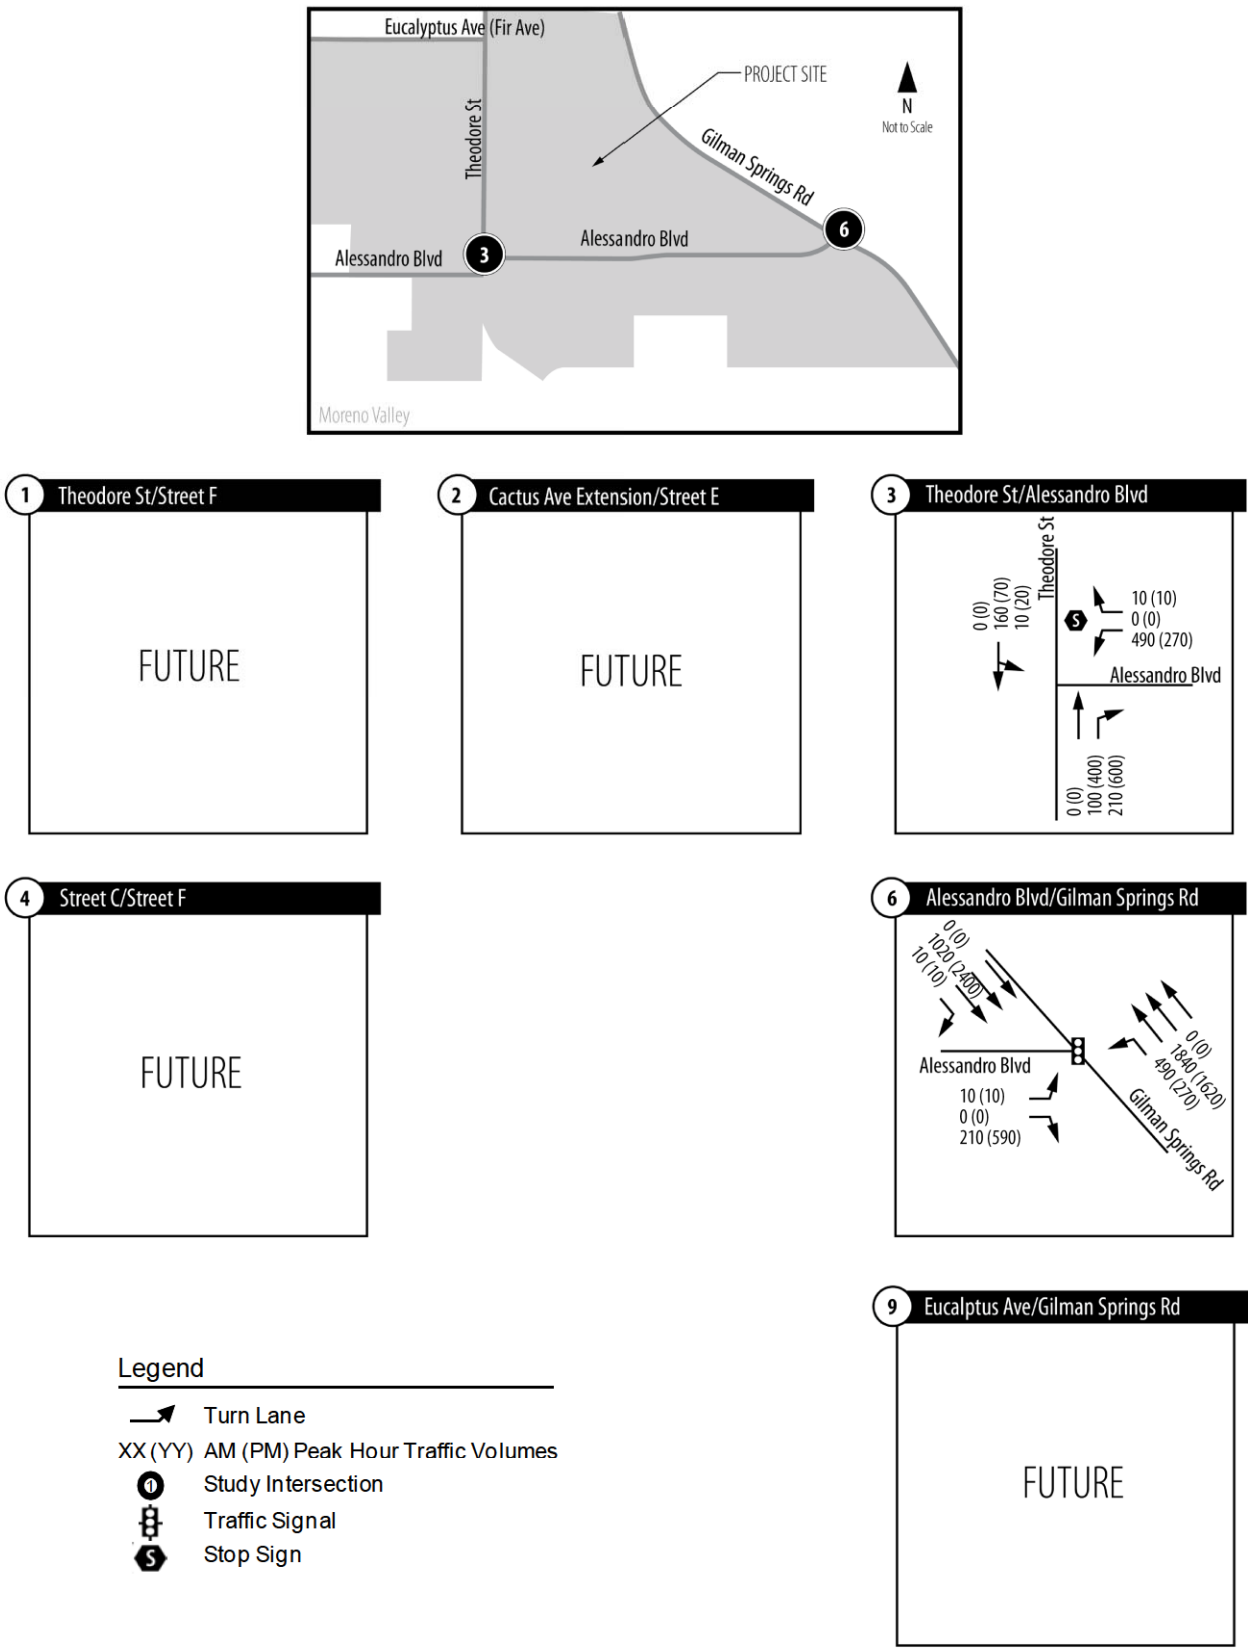

**Figure 52: Turning Movement Volumes under 2035 No-Project Conditions**

## B. 2035 NO-PROJECT LEVEL OF SERVICE

### *Roadway Segment Analysis*

Table 59 shows the LOS for study roadway segments under 2035 No-Project conditions.

**Table 59: LOS of Study Road Segments under 2035 No-Project Conditions**

| | Roadway | From | To | LOS Standard* | Roadway Section** | Daily Volume | LOS |
|---|---|---|---|---|---|---|---|
| S-1 | Theodore Street (A) | SR-60 WB Ramps | Ironwood Avenue | D | 2U | 9,774 | C |
| S-2 | Theodore Street (A) | SR-60 EB Ramps | Fir (Eucalyptus) Ave. | D | 2U | 8,726 | B |
| S-3 | Fir (Eucalyptus) Ave. | Redlands Blvd | Theodore Street (A) | D | 2U | 6,847 | A |
| S-4 | Eucalyptus Ave (B) | Theodore Street (A) | Gilman Springs Rd | N/A | Future Road | | |
| S-5 | Theodore Street (A) | Fir (Eucalyptus) Ave. | Street E | D | 2U | 3,295 | A |
| S-6 | Street E | Theodore Street (A) | Cactus Ave Extension | N/A | Future Road | | |
| S-7 | Street F | Theodore Street (A) | Alessandro Blvd (Street C) | N/A | Future Road | | |
| S-8 | Theodore Street (A) | Fir (Eucalyptus) Ave. | Alessandro Blvd (Street C) | D | 2U | 3,437 | A |
| S-9 | Alessandro Blvd (Street E) | Merwin Street | Theodore Street (A) | D | 2U | 10,854 | D |
| S-10 | Cactus Ave Extension | Alessandro Blvd (Street E) | Cactus Ave. | N/A | Future Road | | |
| S-11 | Alessandro Blvd (Street C) | Theodore Street (A) | Street F | D | 2U | 7,437 | A |
| S-13 | Alessandro Blvd (Street C) | Street F | Gilman Springs Rd | D | 2U | 7,437 | A |
| S-14 | Alessandro Blvd | Moreno Beach Drive | Redlands Blvd | D | 4U | 6,373 | A |
| S-16 | Gilman Springs Rd | Alessandro Blvd (Street C) | Bridge Street | D | 6D | 49,434 | D |
| S-17 | Gilman Springs Rd | SR-60 | Alessandro Blvd (Street C) | D | 6D | 41,537 | C |
| S-18 | Redlands Blvd | SR-60 EB Ramps | Fir (Eucalyptus) Ave. | D | 4U | 13,411 | A |
| S-19 | Redlands Blvd | Fir (Eucalyptus) Ave. | Alessandro Blvd | C | 4U | 7,665 | A |
| S-20 | Alessandro Blvd | Redlands Blvd | Merwin Street | C | 4U | 11,038 | A |
| S-21 | Redlands Blvd | Alessandro Blvd | Cactus Ave. | C | 4U | 11,511 | A |
| S-22 | Cactus Ave. | Redlands Blvd | Cactus Ave Extension | C | 4U | 1,144 | A |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways

Indicates volume-to-capcity (V/C) ratio greater than 1.00

In this scenario Gilman Springs Rd. and Redlands Blvd. are assumed to have been widened in accordance with General Plan policy to six and four lanes respectively. Under these conditions all study street segments would be within the target LOS.

### *Intersection LOS*

Table 60 presents the LOS for the study intersections under 2035 No-Project conditions in the AM and PM peak hours. Detailed worksheets are presented in Appendix G. The number of intersections that would exceed the target LOS rose from 12 under Existing Conditions to 32 under 2022 No-Project Conditions to 36 under 2035 No-Project Conditions due to population and employment growth. The intersections that would operate exceed the target LOS are:

- Theodore St./Ironwood Ave. (PM)
- Theodore St./SR-60 WB ramps (AM, PM)
- Theodore St./SR-60 EB ramps (PM)

- Theodore Ave./Fir (Eucalyptus) Ave. (PM)
- Redlands Blvd./Alessandro Blvd. (AM, PM)
- Moreno Beach Dr./Locust Ave. (AM, PM)
- Moreno Beach Dr./SR-60 EB Ramps (AM, PM)
- Iris Ave./Perris Blvd. (AM, PM)
- Kitching St./Iris Ave. (AM, PM)
- Lasselle St./Iris Ave. (PM)
- Lasselle St./Cactus Ave. (AM)
- Graham St./Alessandro Blvd. (PM)
- Indian St./Cactus Ave. (PM)
- Alessandro Blvd./Sycamore Canyon Blvd. (PM)
- I-215 SB Ramps/Cactus Ave. (PM)
- I-215 NB Ramps/Cactus Ave. (AM, PM)
- Elsworth St./Cactus Ave. (AM, PM)
- Central Ave./Lochmoor Dr. (PM)
- Alessandro Blvd./Mission Grove Pkwy. (PM)
- Martin Luther King Blvd./I-215 NB Ramps (AM)
- Central Ave./Chicago Ave. (PM)
- Central Ave./Canyon Crest Dr. (PM)
- Arlington Ave./Riverside Ave./SR-91 SB Ramps (PM)
- Arlington Ave./Victoria Ave. (AM, PM)
- Alessandro Blvd./Chicago Ave. (AM, PM)
- Alessandro Blvd./Canyon Crest Dr. (AM, PM)
- Ramona Expwy./Indian St. (AM, PM)
- Evans Rd./Rider St. (AM)
- Gilman Springs Rd./Bridge St. (AM, PM)
- SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. (AM, PM)

- SR-79 (Sanderson Ave.) SB/Gilman Springs Rd. (AM, PM)
- W 6th St./California Ave. (AM, PM)
- W 6th St./Beaumont Ave. (AM, PM)
- Reche Canyon Rd./Reche Vista Rd. (AM, PM)
- San Timoteo Canyon Rd./Live Oak Canyon Rd. (AM, PM)
- Redlands Blvd./San Timoteo Canyon Rd. (AM, PM)

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

***Freeway Mainline Basic Sections***

Table 61 presents the results of the LOS analysis for freeway mainline sections. A total of 57 freeway mainline basic sections were forecast to exceed the target LOS of "D", up from 33 under 2022 No-Project conditions, and 17 under Existing No-Project conditions due to employment and population growth. The sections that would exceed the target LOS would be:

North or Eastbound

- SR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Central Ave. to Mountain Ave.
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Archibald Ave. to Haven Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.
- SR-60 from Heacock St. to Perris Blvd.
- SR-60 from Redlands Blvd. to Theodore St.
- SR-60 from Gilman Springs Rd. to Jack Rabbit Trail
- SR-60 from Jack Rabbit Trail to Potrero Blvd.
- SR-91 from I-15 to McKinley St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Adam St. to Madison St.

- SR-91 from Central Ave. to 14th St.
- I-10 from SR-60 to Beaumont Ave.
- I-10 from Beaumont Ave. to Pennsylvania Ave.
- I-10 from Pennsylvania Ave. to Highland Springs
- I-10 from Highland Springs Ave. to Sunset Ave.
- I-10 from S. Hargrave St. to Field Rd.
- I-10 from Morongo Trail to Main St.
- I-215 from Scott Rd. to Garbani Rd.
- I-215 from SR-74 to Ellis Ave.
- I-215 from Ellis Ave. to Redlands Ave.

South or Westbound

- SR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Market St. to Main St.
- SR-60 from Main St. to SR-91
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-60 from Pigeon Pass Rd. to Heacock St.
- SR-60 from Redlands Blvd. to Theodore St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Tyler St. to Van Buren Blvd.

- SR-91 from Madison St. to Indiana Ave.
- I-10 from SR-60 to Beaumont Ave.
- I-10 from Pennsylvania Ave. to Highland Springs Ave.
- I-10 from Highland Springs Ave. to Sunset Ave.
- I-10 from S. 8th St. to S. Hargrave St.
- I-215 from Ethanac Rd. to SR-74
- I-215 from SR-74 to Ellis Ave.
- I-215 from Ellis Ave. to Redlands Ave.
- I-215 from Center St. to Iowa Ave./La Cadena Dr.
- I-215 from Baseline Rd. to Highland Ave.

Indicates that the LOS exceeds the target level

***Freeway Weaving LOS***

Table 62 shows the weaving LOS under 2035 No-Project conditions. Seven north- or east-bound sections and six south- or westbound sections would operate below LOS "D". These sections are:

North or Eastbound

- SR-60 from SR-71/Garey Ave. to Reservoir St.
- SR-60 from Main St. to SR-91
- SR-60 from SR-91 to W. Blaine St./3rd St.
- SR-60 from W. Blaine St./3rd St. to University Ave.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-60 from Theodore St. to Gilman Springs Rd.
- SR-91 from Arlington Ave. to Central Ave.

South or Westbound

- SR-60 from Haven Ave. to Archibald Ave.
- SR-60 from SR-91 to W. Blaine St./3rd St.
- SR-60 from W. Blaine St./3rd St. to University Ave.
- SR-60 from University Ave. to Martin Luther King Blvd.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- I-10 from Haugen-Lehmann Way to SR-111

Indicates that the LOS exceeds the target level

***Freeway Ramp LOS***

Table 63 shows the level of service of study freeway ramps under 2035 No-Project conditions. Eight ramps would exceed the target LOS of "D", compared to one under 2022 No-Project and Existing No-Project conditions. This is due to population and employment growth outpacing the growth of highway capacity. The ramps that would exceed LOS "D" under 2035 No-Project conditions would be:

- SR-60 eastbound On-Ramp from Central Ave.
- SR-60 eastbound Off-Ramp to Theodore St.
- SR-60 eastbound Loop On-Ramp from Theodore St.
- SR-60 eastbound Off-Ramp to Gilman Spring Rd.
- SR-60 eastbound On-Ramp from Gilman Spring Rd.
- SR-60 westbound Off-Ramp to Theodore St.
- SR-60 westbound On-Ramp from Theodore St.
- SR-60 westbound Loop On-Ramp from Redlands Blvd.

Details of the LOS calculations for freeways under 2035 No-Project Conditions can be found in Appendix N.

## Table 63: 2035 No-Project Freeway Ramp Level of Service

| ID | Freeway / Direction | Ramp Segment | Ramp No. of Lanes | AM Peak Hour | | | | PM Peak Hour | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|

| R-18 | SR-60 WB | Off-Ramp to Central Ave | 2 | 8,340 | 480 | 32.0 | D | 9,200 | 540 | 35.0 | D |
| R-19 | SR-60 WB | Off-Ramp to Martin Luther King Blvd | 1 | 8,330 | 710 | 32.5 | D | 8,980 | 660 | 34.1 | D |

Indicates that the LOS exceeds the target level

# 10. 2035 PLUS BUILD-OUT CONDITIONS

The analysis of 2035 Plus Build-out Conditions shows the effect of project-related traffic if the WLC project were built-out in full and no other changes from the 2035 No-Project scenario occurred to the roadway system of land uses.

## A. ROAD SEGMENT LOS, IMPACTS, AND MITIGATIONS

Table 64 compares the LOS for study roadway segments under 2035 Plus Build-out Conditions to 2035 No-Project Conditions and to the target LOS under the City's General Plan policies. Under 2035 Plus Build-out Conditions traffic volumes on one segment would exceed the target LOS, namely:

- Gilman Springs Rd. from Alessandro Blvd. to Bridge St. would exceed the threshold of significance under 2035 Plus Build-out Conditions. Widening the road from six lanes to eight lanes would allow it to achieve the target under 2035 Plus Build-out Conditions. However, 6 lanes is the maximum planned for under the City of Moreno Valley General Plan and further widening may be undesirable from a public policy standpoint.

The feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## Table 64: 2035 Plus Build-out Road Segment Impacts and Mitigations

| | Roadway | From | To | LOS Standard* | 2035 No-Project Conditions | | | 2035 Plus Build-out Conditions | | | Project Significant Impact? | Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant | LOS After Mitigation |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | Roadway Section** | Daily Volume | LOS | Roadway Section* | Daily Volume | LOS | | | |

| S-17 | Gilman Springs Rd | SR-60 | Alessandro Blvd (Street C) | D | 6D | 41,537 | C | 6D | 47,958 | D | | | |
| S-18 | Redlands Blvd | SR-60 EB Ramps | Fir (Eucalyptus) Ave. | D | 4U | 13,411 | A | 4U | 17,626 | C | | | |
| S-19 | Redlands Blvd | Fir (Eucalyptus) Ave. | Alessandro Blvd | C | 4U | 7,665 | A | 4U | 5,037 | A | | | |
| S-20 | Alessandro Blvd | Redlands Blvd | Merwin Street | C | 4U | 11,038 | A | 4U | 1,677 | A | *** | | |
| S-21 | Redlands Blvd | Alessandro Blvd | Cactus Ave. | C | 4U | 11,511 | A | 4U | 5,653 | A | | | |
| S-22 | Cactus Ave. | Redlands Blvd | Cactus Ave Extension | C | 4U | 1,144 | A | 4U | 16,916 | B | | | |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** Section is the number of lanes, with "U" for "undivided" and "D" for "Divided" roadways.

*** Due to the severing of Alessandro Blvd. and the diversion of traffic to other routes, there is no need to widen this section beyond the current 2U configuration

Indicates LOS exceeds the target level

## B. INTERSECTION LOS, IMPACTS, AND MITIGATIONS

Figure 53 shows the turning movement volumes under 2035 Plus Build-out Conditions (see Figure 16 for the key map). Table 65 presents the LOS for the study intersections under the 2035 Plus Build-out Conditions in the AM and PM peak hours. Detailed worksheets are presented in Appendix H. Table 66 identifies where impacts occur and mitigation measures that would reduce the impacts to a less-than-significant level.

As shown in Table 66 there are 35 study intersections where the project would have a significant impact. Thirty of these intersections exceed the threshold of significance under 2035 No-Project Conditions and five would exceed the threshold of significance with the addition of the project. These intersections are:

Would Exceed Threshold of Significance Under Both 2035 No-Project Conditions and 2035 Plus Build-out Conditions

- Theodore St./Ironwood Ave.
- Moreno Beach Dr./Locust Ave.
- Moreno Beach Dr./SR-60 EB Ramps
- Iris Ave./Perris Blvd.
- Kitching St./Iris Ave.
- Lasselle Str./Iris Ave.
- Lasselle St./Cactus Ave.
- Graham St./Alessandro Blvd.
- Alessandro Blvd./Sycamore Canyon Blvd.
- I-215 NB Ramps/Cactus Ave.
- Elsworth St./Cactus Ave.
- Central Ave./Lochmoor Dr.
- Alessandro Blvd./Mission Grove Pkwy.
- Martin Luther King Blvd./I-215 NB Ramps
- Central Ave./Chicago Ave.
- Central Ave./Canyon Crest Dr.
- Arlington Ave./Riverside Ave./SR-91 SB Ramps
- Arlington Ave./Victoria Ave.
- Alessandro Blvd./Chicago Ave.
- Alessandro Blvd./Canyon Crest Dr.
- Ramona Expwy./Indian St.
- Evans Rd./Rider St.

- Gilman Springs Rd./Bridge St.
- SR-79 (Sanderson Ave.) NB/Gilman Springs Rd.
- SR-79 (Sanderson Ave.) SB/Gilman Springs Rd.
- W 6th St./California Ave.
- W 6th St./Beaumont Ave.
- Reche Canyon Rd./Reche Vista Dr.
- San Timoteo Canyon Rd./Live Oak Canyon Rd.
- Redlands Blvd./San Timoteo Canyon Rd.

Would Exceed Threshold of Significance Under 2035 Plus Build-out Conditions (only)

- Redlands Blvd./Ironwood Ave.
- Moreno Beach Dr./Cactus Ave.
- Redlands Blvd./Cactus Ave.
- Moreno Beach Dr./Ironwood Ave.
- San Timoteo Canyon Rd./Alessandro Rd.

The mitigation measures shown in Table 66 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

Notes:

"NB" and "SB" denote northbound and southbound respectively

"EB" and "WB" denote eastbound and westbound respectively

Indicates LOS exceeds the target level

"CSS" means cross-street is stop-controlled

"AWS" means all-way stop

"RABT" means roundabout

Indicates that the LOS exceeds the target level

Notes: "CSS" means cross-street is stop-controlled
"AWS" means all-way stop
"RABT" means roundabout
"LT" and "RT" denote left turn and right turn respectively
"TH" denotes through lanes
"NB" and "SB" denote northbound and southbound respectively
"EB" and "WB" denote eastbound and westbound respectively

## C. FREEWAY SEGMENT LOS, IMPACTS, AND MITIGATIONS

***Freeway Mainline Basic Sections***

Table 67 compares the LOS for freeway mainline sections for the 2035 No-Project and 2035 Plus Build-out scenarios. Details of the LOS calculations for freeways under 2035 Plus Build-out Conditions can be found in Appendix O. Table 68 identifies the 52 basic freeway sections where the project has a significant impact and identifies measures that would reduce project impacts to a less-than-significant level. Forty-eight of the 52 sections would operate below LOS "D" under both 2035 No-Project conditions and 2035 Plus Build-out conditions, namely:

- Northbound or Eastbound SectionsSR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Ramona Ave. to Central Ave.
- SR-60 from Central Ave. to Mountain Ave
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Vineyard Ave. to Archibald Ave.
- SR-60 from Archibald Ave. to Haven Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Rubidoux Blvd. to Market St.
- SR-60 from Market St. to Main St.
- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.
- SR-60 from Heacock St. to Perris Blvd.
- SR-60 from Gilman Springs Rd. to Jack Rabbit Trail
- SR-60 from Jack Rabbit Trail to Potrero Blvd.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Adam St. to Madison St.

- SR-91 from Central Ave. to 14th St.
- I-10 from SR-60 to Beaumont Ave.
- I-10 from Pennsylvania Ave. to Highland Springs Ave.
- I-10 from Highland Springs Ave. to Sunset Ave.
- I-10 from S. Hargrave St. to Field Rd.
- I-10 from Morongo Trail to Main St.

Southbound or Westbound Sections

- SR-60 from Reservoir St. to Ramona Ave.
- SR-60 from Mountain Ave. to Euclid Ave.
- SR-60 from Euclid Ave. to Grove Ave.
- SR-60 from Grove Ave. to Vineyard Ave.
- SR-60 from Valley Way to Rubidoux Blvd.
- SR-60 from Market St. to Main St.
- SR-60 from Main St. to SR-91
- SR-60 from Fair Isle Dr./Box Springs Rd. to I-215
- SR-60 from I-215 to Day St.
- SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.
- SR-60 from Redlands Blvd. to Theodore St.
- SR-91 from Pierce St. to Magnolia Ave.
- SR-91 from Magnolia Ave. to La Sierra Ave.
- SR-91 from La Sierra Ave. to Tyler St.
- SR-91 from Tyler St. to Van Buren Blvd.
- SR-91 from Madison St. to Arlington Ave.
- I-215 from SR-74 to Ellis Ave.
- I-215 from Center St. to Iowa Ave./La Cadena Dr.
- I-215 from Baseline Rd. to Highland Ave.
- I-10 from SR-60 to Beaumont Ave.

- I-10 from Pennsylvania Ave. to Highland Springs Ave.
- I-10 from Highland Springs Ave. to Sunset Ave.
- I-10 from S. 8th St. to S. Hargrave St.

Four sections were found to be deficient under Plus Build-out conditions only, namely:

Northbound or Eastbound Sections

- I-10 from 8th St. to Hargrave St.

Southbound or Westbound Sections

- SR-60 from Martin Luther King Blvd. to Central Ave.
- SR-60 from Heacock St. to Perris Blvd.
- SR-91 from Van Buren Blvd. to Adam St.

There are seven locations would operate at LOS "F" under 2035 No-Project conditions and would continue to do so under 2035 Plus Build-out conditions, and adding a mixed-flow lane would improve six sections to LOS "E" while one would still operate at LOS "F". While this is below the threshold of significance it would be an improvement over 2035 No-Project conditions and so would reduce the impact of the WLC project to a less-than-significant level.

The mitigation measures shown in Table 68 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other

tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

## Table 67: 2035 Plus Build-out Freeway Mainline LOS

| ID | Freeway | Segment | 2035 No-Project Conditions | | | | | | 2035 Plus Build-out Conditions | | | | | |

Indicates that the LOS exceeds the target level

### *Freeway Weaving LOS*

Table 69 compares the LOS for study weaving sections under 2035 No-Project and 2035 Plus Build-out conditions. As shown in the table, there are 12 sections where the project would have a significant impact. Eleven of the 12 sections would be deficient under both 2035 No-Project and Plus Build-out conditions, namely:

Northbound or Eastbound

- SR-60 from SR-71/Garey Ave. to Reservoir St.
- SR-60 from Main St. to SR-91
- SR-60 from SR-91 to W. Blaine St./3rd St.
- SR-60 from W. Blaine St./3rd St. to University Ave.

- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.
- SR-91 from Arlington Ave. to Central Ave.

Southbound or Westbound

- SR-60 from Haven Ave. to Archibald Ave.
- SR-60 from SR-91 to W. Blaine St./3rd St.
- SR-60 from W. Blaine St./3rd St. to University Ave.
- SR-60 from University Ave. to Martin Luther King Blvd.
- SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.

There was only one segment that would be deficient only under Plus Build-out conditions, namely:

Southbound or Westbound

- SR-60 from Day St. to Pigeon Pass Rd./Frederick St.

Table 70 identifies mitigation measures that would reduce the impact of the WLC project to a less-than-significant level. In five cases the mitigation would achieve the threshold of significance. In the other seven cases the LOS after mitigation would be worse than the LOS target but better than the 2035 No-Project condition, and so the project's impact with mitigation would be less-than-significant.

The mitigation measures shown in Table 70 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

### *Freeway Ramp LOS*

Table 71 compares the freeway ramp level of service on SR-60 under 2035 No-Project and 2035 Plus Build-out conditions. As shown in the table, there are nine ramps where the project would have a significant impact. Four ramps would operate at below LOS "D" under both 2035 No-Project and 2035 Plus Build-out conditions while other five ramps would operate below LOS of "D" under 2035 Plus Build-out conditions only. These locations are:

Would Operate Below LOS "D" Under Both 2035 No-Project and Plus Build-out Conditions

- SR-60 eastbound On-Ramp from Central Ave.
- SR-60 eastbound On-Ramp from Gilman Springs Rd.
- SR-60 westbound On-Ramp from Theodore St.
- SR-60 westbound Loop On-Ramp from Redlands Blvd.

Would Operate Below LOS "D" Under 2035 Plus Build-out Conditions (only)

- SR-60 eastbound On-Ramp from Martin Luther King Blvd
- SR-60 westbound Off-Ramp to Redlands Blvd
- SR-60 westbound Direct On-Ramp from Redlands Blvd.
- SR-60 westbound Off-Ramp to Central Ave.
- SR-60 westbound Off-Ramp to Martin Luther King Blvd.

The mitigation measures shown in Table 72 are those that would be needed to reduce the impact of the project to a less-than-significant level. While these measures are feasible in the sense that, if they could be constructed, they would achieve the target LOS, this does not necessarily mean that they pass other tests of feasibility. The physical and financial feasibility of these mitigation measures and the means to fund them are discussed in greater depth in Chapter 11.

# 11. MITIGATION MEASURES

The results of the traffic analysis indicate the proposed project would have some level of impact on the local and regional roadway system. The greatest impact by number of locations would occur under the 2035 Plus Build-out conditions. This chapter discusses the mitigation measures that would be needed to reduce the impact of the project to a less-than-significant level. The discussion includes the fee programs relevant to the WLC, the methodology used to determine project impacts, and policy considerations regarding possible mitigations. The objective of each recommended measure is to allow the road or intersection to achieve the target level of service under Plus Build-out Plus Mitigations conditions or, where that is not feasible, to improve the level of service at the impacted locations to a level not worse than under No-Project conditions.

As set forth in greater detail below, in some circumstances mitigation is infeasible and so project impacts cannot be mitigated to less than significant levels. In such cases a statement of overriding considerations should be considered in accordance with City of Moreno Valley General Plan Policy 5.3.7 which reads:

> "*Provide consideration to projects that have overriding regional or local benefits that would be desirable even though the LOS standards cannot be met. These projects would be required to analyze traffic impacts and mitigate such impacts to the extent that it is deemed feasible*."

## A. THE TUMF PROGRAM

In 1988 the voters of Riverside County approved Measure A, a half-cent sales tax to fund transportation projects. In 2002 voters approved a 20-year extension of Measure A, this time including a Transportation Uniform Mitigation Fee or TUMF. The rationale behind TUMF was that having a single uniform fee program to mitigate the cumulative regional impacts of new development on the area's arterial highway system would be more effective than having multiple, and potentially uncoordinated, fee programs with varying policies, fee amounts and project lists. Under the TUMF, developers of residential, industrial, and commercial properties pay a development fee to fund transportation projects that will be required as a result of the growth the projects create. The program is recognition by voters that residents and employees in all of western Riverside County's jurisdictions benefit from arterials located not just in their own city, but also in nearby cities as well.

The TUMF program is designed to provide a network of roads, bridges, interchanges and railroad grade separations, known as the Regional System of Highways and Arterials (RSHA), needed to accommodate future growth in the area through 2035. The RSHA was developed by the Public Works Directors of the WRCOG member jurisdictions. A "Nexus Study" was then prepared in accordance with the California Mitigation Fee Act, which requires that a reasonable relationship exist between the impact fee collected

and the proposed improvements for which a fee is used. The study determined the proportion of the cost of the improvements that should be borne by different types of development based on the trip generating characteristics of each land use type. The Nexus Study was updated in 2010 and the RSHA was revised to reflect the most current transportation needs and costs for western Riverside County. The new RSHA network reflected several changes due to completed projects and recommendations from the WRCOG Public Works Committee (PWC) to better represent the transportation needs of western Riverside County.

TUMF is administered by the Western Riverside Council of Governments (WRCOG). As administrator, WRCOG receives all fees generated from the TUMF as collected by the local jurisdictions. TUMF funds are programmed by WRCOG's partner agencies, which are responsible for prioritizing projects and overseeing their development.

The TUMF program uses six categories of land uses; two residential and four non-residential. The two residential types are single-family residential and multi-family residential. Non-residential categories include industrial, retail, service commercial, and high-cube warehouse, with fees being assessed at different rates depending on the category. The high-cube warehouses in the WLC would fall into the "high-cube" category of non-residential development. Based on the current formula for calculating fees, if the WLC builds out as planned the developer would pay $34 million in TUMF fees.

TUMF fees are collected when a development reaches the building permit stage. TUMF revenues are allocated as follows:

- 46.39 percent is allocated for regional improvements. These revenues are programmed by the RCTC pursuant to an agreement with WRCOG.
- 46.39 percent is allocated to the geographic zone from which the fees are collected. Project prioritization and programming are undertaken by the jurisdictions in each of the five zones.
- 1.64 percent is allocated for regional transit projects. WRCOG administers the funds on behalf of the Riverside Transit Agency which prioritizes and programs capital transit projects.
- 1.59 percent is allocated to the Multiple Species Habitat Conservation Plan (MSHCP)
- 4.00% is used for program administration.

Since its inception TUMF has collected more than $554 million in revenues, making it the largest multi-jurisdictional fee program in the nation. It has completed 46 projects with several dozen more under development. The projects successfully funded by the program include a variety of road widening, intersection improvements, and freeway interchanges, including:

- Widening Pigeon Pass Rd. from 2 lanes to 4 lanes from Climbing Rose Dr. to Hidden Springs Dr.
- Widening the Ramona Expressway from 2 lanes to 6 lanes from I-215 to Evans Rd.

- Improvements to the Ironwood Ave./Moreno Beach Dr. Intersection
- Improvements to the Ironwood Ave./Nason St. intersection
- Adding a northbound lane to Lasselle St. from John F Kennedy Dr. to Alessandro Blvd.
- Widening Oleander Ave. from Perris Blvd to Indian Ave.
- The Van Buren Blvd./SR-91 Interchange project
- Widening State St. in Hemet from 2 to 4 lanes with a center turn lane
- Widening Sanderson Ave. from Menlo to Ramona Expressway

This track record of success is a key reason to believe that TUMF projects have a good probability of being implemented. Between now and 2035, when the program is scheduled for completion, the TUMF Program is forecasted to provide $1.9 billion towards a total of $4.2 billion in arterial road, bridge, intersection and interchange improvements in western Riverside County[50].

## B. THE DIF PROGRAM

The City of Moreno Valley's Development Impact Fee (DIF) program is used to fund road and intersection improvements needed to accommodate new residential, commercial, and industrial development. The program collects fees from three categories of residential development (single-family, multi-family, and mobile homes) and five categories of commercial development (general commercial, regional commercial, general industrial, high-cube warehouse, and office) based on their respective trip generating characteristics. In many cases developers dedicate right-of-way and/or construct improvements that are part of the TUMF or DIF programs in lieu of paying the fees. These facilities are typically part of a project's direct frontage or are necessary to accommodate traffic needs in the immediate area of the project. DIF fees on high-cube warehouses are currently set at $0.9955 per square foot, which means that the WLC would more than $40 million in DIF fees if the project builds out as planned.

DIF funds are overseen by the City's Public Works Department. Department staff monitor traffic volumes and periodically develop a Capital Improvement Program (CIP) for use of the funds. The CIP is reviewed and approved by the city council. Examples of projects successfully completed using DIF funds include:

- Iris Ave. from Indian St. to Perris Blvd.
- Lasselle St./Bay Ave. traffic signal
- Lasselle St./Cottonwood Ave. traffic signal

---

[50] *Transportation Uniform Mitigation Fee Program* 2012 Annual Report, page 17. Western Riverside Council of Governments. The TUMF program is one of several sources used to fund improvements.

- Cactus Ave. eastbound improvements from I-215 to Veterans Way

This track record of success is a key reason to believe that DIF projects have a good probability of being implemented. The DIF program supplements the TUMF program by funding elements of the City's General Plan Circulation Element not covered by TUMF, and in some projects by providing funds for additional capacity beyond what the TUMF project will provide. DIF and TUMF are routinely used in combination with other funding sources so that the inability of any single source to fund an entire project does not prevent the project from being implemented. Table 73 shows a sample of projects from Moreno Valley's Capital Improvement Program that used DIF and/or TUMF funds in combination with other funding sources.

**Table 73: Projects Using DIF and TUMF in Combination with Other Funding Sources**

| Project | DIF Funds | TUMF Funds | Other Funds | Sources of Other Funds |
|---|---|---|---|---|
| Iron Avenue / Heacock Street to Perris Boulevard | $1,509,420 | $72,413 | $57,358 | 2005 Lease Revenue Bonds |
| Nason Street / Cactus Avenue Street Improvements | $9,272,000 | | $15,910,845 | Measure "A"; State-Local Partnership Program; General Fund; General City C.P.; Successor Agency Tax Revenue; Redevelopment Agency Cap. Proj.; Eastern Municipal Water District; Riverside County Flood Control; 2007 Taxable Lease Revenue Bonds |
| SR-60 / Moreno Beach Drive South Side of Interchange (Phase 1) | | $3,500,000 | $6,110,735 | Successor Agency; Redevelopment Agency |
| SR-60 / Nason Street Interchange | $740,000 | | $13,285,777 | Measure "A"; Federal Demonstration Funds; Demo Toll Credit - Const.; Surface Transportation Program Local (construction); Surface Transportation Program Local Toll Credit - Const. |
| Heacock Street South Extension | | $300,000 | $564,172 | Measure "A" |
| Emergency Vehicle Pre-emption at 117 Traffic Signals | $93,534 | | $840,000 | Highway Safety Improvement Program |
| Nason Street / Riverside County Regional Medical Center Main Driveway Traffic Signal | $250,000 | | $50,000 | Measure "A" |
| Transportation Management Center | $316,578 | | $214,646 | Air Quality Management |
| Lasselle Street / John F. Kennedy Drive to Alessandro Boulevard | | $2,757,886 | $1,058,143 | 2005 Lease Revenue Bonds |
| Kitching Street / Alessandro Boulevard to Gentian Avenue | $11,903 | | $1,639,854 | 2005 Lease Revenue Bonds |
| Pigeon Pass Road Widening / Climbing Rose Drive to North City Limits | $462,239 | $679,953 | $22,664 | Measure "A" |
| Total | $12,655,674 | $7,310,252 | $39,754,194 | |
| Percentage of Total | 21% | 12% | 67% | |

The DIF program has been updated several times, most recently in October 2012, to reflect changes in priorities as development occurs in different parts of the city.

## C. METHODOLOGY FOR DETERMINING IMPACTS

The potential impacts of the project were classified as either direct impacts or cumulative impacts. A direct impact of the project is one that would occur if the proposed project was the only change from

existing conditions. A cumulative impact is defined in the CEQA Guidelines, Section 15355 as, "an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts." Both types of impacts can be either significant or less-than-significant depending on whether or not they result in traffic conditions that exceed the threshold of significance set by the agency that has jurisdiction over the road in question. For example, if a road was subject to a threshold of significance of LOS "D", and the proposed project would by itself cause the LOS to change from "B" to "C", then the direct impact would be less-than-significant. If the addition of other past, present, and reasonably foreseeable future projects would result in LOS "E", then the cumulative impact of the project would be significant.

The methodology used to identify mitigation measures included:

1) Determining whether the LOS exceeded the target threshold in the Plus Build-out condition.
2) If so, then determining whether the LOS under Plus Build-out conditions was better than the LOS under No-Project conditions. Some study freeway segments were found to exceed the threshold of significance under Plus Build-out conditions but the traffic density was better under Plus Build-out conditions than No-Project conditions. This would happen because detailed computer modeling shows that the project would cause some commuters to switch from the peak direction to the off-peak direction, thus reducing congestion at some locations (see Figure 40 and Figure 41). The project's impacts were considered significant only when the Plus Build-out condition was worse than the No-Project condition.
3) If the project had a significant impact, capacity-increasing improvements were then added incrementally until the LOS was within the target threshold of significance.
4) For cumulative projects, determining whether the mitigations could be funded as part of an established fee program such as TUMF or DIF. If so, then Payment into the TUMF or DIF program could constitute mitigation of impacts to the TUMF and DIF facilities.
5) For improvements that would not be funded from an established fee program the project's fair-share contribution was computed using the formula in Caltrans' *Guide for the Preparation of Traffic Impact Studies - Appendix "B"*. This formula defines the project's fair-share as the project-related traffic's percentage share of overall traffic growth, not including new traffic attributable to projects that have already been approved. Where there were significant impacts in both the AM and PM peak periods, the period with the higher share of project traffic was used to determine the fair-share contribution.

Potential mitigation measures were analyzed to determine whether they were feasible or not. Improvements were deemed to be infeasible if they would require the acquisition of existing homes or businesses, if they would result in excessive air, noise, or vibration impacts on existing homes,

businesses, or sensitive natural environments, or would create safety impacts that could be considered less acceptable than a reduced traffic LOS. In cases where feasibility is uncertain, the recommended improvement was treated as feasible in order to produce a conservative estimate of project responsibilities (i.e. "conservative" in the sense that the project's responsibilities would not be under-estimated).

In cases where a proposed modification to an existing intersection would result in the elimination of an existing bus stop or bicycle lane the proposed mitigation would include the replacement of the bicycle lane or bus stop even if not explicitly stated. This is also true of the replacement of existing curbs, gutters, sidewalks, lights, and other existing design features.

## D. FORMAT FOR REPORTING IMPACTS

The remainder of the chapter is devoted to reporting project impacts and mitigation measures. The situation for each impacted facility is discussed in the text and the results are summarized in Table 74 through Table 79. These tables all follow a similar format which includes the following data fields (columns):

(A) This field identifies the location of the impact.

(B) This field identifies which agency has jurisdiction over the facility in question.

(C) This field shows the agency's target LOS for the facility in question.

(D) This field shows the LOS under Existing conditions. This is used to determine whether or not there is an existing deficiency.

(E) This field shows the LOS under Existing Plus Build-out conditions. This is used to determine whether or not the project has a significant impact.

(F) This field shows whether there is a significant impact. It is based on the thresholds of significance described in Chapter 2.

(G) This field describes what improvements would be required to achieve the target LOS under Existing Plus Build-out conditions.

(H) This field states whether the measure described in Column G is feasible or not. In some cases the needed improvements may not be feasible. For example, it may be infeasible to widen a road because doing so would cause serious negative impacts to an adjacent neighborhood.

(I) This field shows the LOS after all feasible mitigations have been implemented. If mitigation is infeasible then Column I will be the same as Column E.

(J) This field states whether the impact would still be significant after all feasible mitigation measures have been implemented. For those facilities under the jurisdiction of the City of Moreno Valley (see Column B) a "No" in Column J indicates that the impact will be mitigated to a less-than-significant level. For those facilities outside the jurisdiction of the City of Moreno Valley, Column J indicates what would happen if the jurisdiction that controls the facility implements the recommended feasible mitigations. However, because the City of Moreno Valley cannot guarantee that the other agency will implement the needed improvement the City cannot guarantee that the impact will be mitigated to a less-than-significant level.

(K) This field shows whether or not there is an existing deficiency. Generally speaking, under state law a developer is responsible for mitigating the impacts of their project but is not responsible for rectifying existing deficiencies that are the result of earlier projects. They need only pay a fair-share representing the portion of the improvements required to mitigate the impacts attributable to their own project.

(L) This field reports the action that the developers of the WLC will be required to take as a condition of approval.

## E. PROJECT DIRECT IMPACTS

The direct impacts of the WLC project were determined by comparing the LOS of study facilities under Existing and Existing Plus Build-out conditions. The direct impacts of the project and their mitigation measures were as follows:

## Table 74: Project Direct Impacts on Road Sections

| Study Roadway | | From | To | Jurisdiction | LOS Standard* | Existing LOS | Existing Plus Build-out LOS | Does the Project have a Significant Impact? | Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant | Is the Mitigation Feasible? | LOS After Feasible Mitigations are Implemented | Impact Significant After Feasible Mitigations are Implemented? | Is There an Existing Deficiency? | Developer Action Required |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| (A) | | | | (B) | (C) | (D) | (E) | (F) | (G) | (H) | (I) | (J) | (K) | (L) |
| **Road Section Impacts that can be Mitigated to a Less-Than-Significant Level** | | | | | | | | | | | | | | |
| S-22 | Cactus Ave. | Redlands Blvd | Cactus Ave Extension | Moreno Valley | C | A | E | Yes | Widen to 4 lanes | Yes | A | No | No | Pay fair share (95.9%) |
| **Road Section Impacts that are Considered Significant and Unavoidable (because they are not under the control of the City of Moreno Valley)** | | | | | | | | | | | | | | |
| S-16 | Gilman Springs Rd | Alessandro Blvd (Street C) | Bridge Street | Riverside County | D | F | F | Yes | Widen to 4 lanes | Yes | C | No | Yes | Pay fair share (12.2%) |
| S-17 | Gilman Springs Rd | SR-60 | Alessandro Blvd (Street C) | Riverside County | D | E | F | Yes | Widen to 4 lanes | Yes | C | No | Yes | Pay fair share (17.8%) |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

Indicates LOS exceeds the target level

***Road Section Direct Impacts***

The project's direct impacts on road sections are summarized in Table 74. These impacts would be:

- **Cactus Ave. east of Redlands Blvd.** (S-22) currently has one westbound lane and two eastbound lanes. The WLC would involve the re-construction of Alessandro Blvd. along a new alignment that ends at Cactus Ave. Extension, which would connect Cactus Ave. and Alessandro Blvd. (Street E) as the main route for east-west through traffic. Cactus Ave. would need to be widened to four lanes in conjunction with this change. The City will require the developer to pay a fair share for this improvement as a condition of approval.

- **Gilman Springs Rd. from Alessandro Blvd. to Bridge St.** (S-16) is already deficient and needs to be widened to four lanes and will need to be widened to six lanes in the future. In accordance with General Plan Policy 5.5.7 the City will require the developer to widen Gilman Springs Rd. to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer will receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair-share contribution.

  However, because Gilman Springs Rd. is a Riverside County facility and is thus outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. Moreover, there are right-of-way constraints involving sensitive environmental areas that may limit widening to four lanes between Alessandro Blvd. and Bridge St., or even preclude any widening at all. The project's impacts on Gilman Springs Rd. must therefore be considered significant and unavoidable. The City will work with Riverside County to find funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

- **Gilman Springs Rd. from SR-60 to Alessandro Blvd.** (S-17) is already deficient and needs to be widened to four lanes. In accordance with General Plan Policy 5.5.7 the City will require the developer to widen Gilman Springs Rd. to provide three southbound lanes and one northbound lane along the frontage of the WLC project. The developer would receive a TUMF credit for the portion of the cost of this improvement that exceeds the project's fair-share contribution.

  However, because Gilman Springs Rd. is a Riverside County facility and is thus outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on Gilman Springs Rd. must therefore be considered significant and unavoidable. The City will work with Riverside County to find funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

***Intersection Direct Impacts***

The project's direct impacts on study intersections are summarized in Table 75. These impacts would be:

- **Redlands Blvd./Locust Ave. intersection** (IN-10) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Signalizing the intersection and adding an eastbound left-turn and westbound left-turn would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Redlands Blvd./SR-60 WB ramps intersection** (IN-13) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Signalizing the intersection and adding a northbound right-turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Oliver St./Alessandro Blvd. intersection** (IN-20) already exceeds the LOS threshold in the AM peak hour and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Changing from side-street stop control to all-way stop control would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Redlands Blvd./Cactus Ave. intersection** (IN-27) currently operates within the LOS threshold but would exceed the threshold in both the AM and PM peak hour under Existing Plus Build-out conditions. Signalizing the intersection and adding eastbound and westbound left-turn lanes would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Moreno Beach Dr./John Kennedy Dr. intersection** (IN-28) currently operates within the LOS threshold but would exceed the threshold in the PM peak hour under Existing Plus Build-out conditions. Adding a westbound left-turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.

## Table 75: Direct Impacts on Intersections and Mitigation Measures

| Study Intersection | | Jurisdiction | LOS Standard | Existing Conditions | | Existing Plus Build-out | | Does the Project Have a Significant Impact? | Mitigation Measures Required to Reduce Impact to Less-Than-Significant | Is Mitigation Feasible? | LOS After Feasible Mitigations are Implemented | | Impact Significant After Feasible Mitigations are Implemented? | Is There an Existing Deficiency? | Developer Action Required |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | AM | PM | AM | PM | | | | AM LOS | PM LOS | | | |
| (A) | | (B) | (C) | (D) | | (E) | | (F) | (G) | (H) | (I) | | (J) | (K) | (L) |
| **Intersection Direct Impacts that can be Mitigated to a Less-Than-Significant Level** | | | | | | | | | | | | | | | |
| IN-10 | Redlands Blvd/Locust Ave | Moreno Valley | C | D | E | F | F | Yes | Signalize. Add 1 EB LT and 1 WB LT. | Yes | A | A | No | Yes | Implement improvement, with reimbursement agreement based on fair share contribution (34.8%) |
| IN-13 | Redlands Blvd/SR-60 WB ramps | Moreno Valley | D | E | F | E | F | Yes | Signalize. Add 1 NB RT. | Yes | B | B | No | Yes | Implement improvement, with reimbursement agreement based on fair share contribution (49.6%) |
| IN-20 | Oliver Str/Alessandro Blvd | Moreno Valley | C | D | B | F | C | Yes | Change to AWS. | Yes | C | B | No | Yes | Implement improvement, with reimbursement agreement based on fair share contribution (11.5%) |
| IN-27 | Redlands Blvd/Cactus Ave | Moreno Valley | C | B | A | F | F | Yes | Signalize. Add 1 EB LT, 1 WB LT. | Yes | B | B | No | No | Implement improvement, with reimbursement agreement based on fair share contribution (60.7%) |
| IN-28 | Moreno Beach Dr/John Kennedy Dr | Moreno Valley | D | B | B | C | F | Yes | Add 1 WB LT Lane. | Yes | B | B | No | No | Implement improvement, with reimbursement agreement based on fair share contribution (36.3%) |
| IN-36 | Moreno Beach Dr/Ironwood Ave | Moreno Valley | D | D | D | E | D | Yes | Add 1 NB RT lane. | Yes | D | D | No | No | Implement improvement, with reimbursement agreement based on fair share contribution (14.9%) |
| IN-37 | Moreno Beach Dr/SR-60 EB Ramps | Moreno Valley | D | D | E | D | F | Yes | Add 1 EB RT lane. | Yes | C | C | No | Yes | N/A* |
| IN-53 | Lasselle Str/Cactus Ave | Moreno Valley | C | D | D | D | D | Yes | Add 1 WB LT, 1 NB LT, 1 SB LT, Add overlap phase for NB and EB RT. | Yes | D | C | No | Yes | Implement improvement, with reimbursement agreement based on fair share contribution (46.2%) |
| **Intersection Direct Impacts that are Considered Significant and Unavoidable (either because they are not under the control of the City of Moreno Valley or because mitigation is infeasible)** | | | | | | | | | | | | | | | |
| IN-94 | Arlington Ave/Victoria Ave | City of Riverside | D | D | C | E | C | Yes | Add WB LT lane | Yes | D | C | No | No | Pay fair share (7.5%) |
| IN-95 | Alessandro Blvd/Chicago Ave | City of Riverside | D | D | E | D | E | Yes | Add NB LT lane; adjust signal timings. | Yes | D | D | No | Yes | Pay fair share (10.3%) |
| IN-122 | Bridge St/Ramona Expy | Riverside County | C | C | C | D | D | This intersection is due to be closed in the near future and replaced by a grade separated intersection further west. No improvements are warranted | | | | | | | |
| IN-123 | Gilman Springs Rd/Bridge Str | Riverside County | C | D | C | E | D | Yes | Signalize. | Yes | A | A | No | Yes | Pay fair share (25.7%) |
| IN-124 | SR-79(Sanderson Ave) NB/Gilman Springs Rd | Riverside County | C | D | D | F | E | Yes | Signalize. | Yes | A | A | No | Yes | Pay fair share (13.6%) |
| IN-125 | SR-79(Sanderson Ave) SB/Gilman Springs Rd | Riverside County | C | D | E | E | F | Yes | Signalize. | Yes | A | A | No | Yes | Pay fair share (20.7%) |
| IN-132 | San Timoteo Canyon Rd/Alessandro Rd | Redlands | D | F | C | F | F | Yes | Signalize. | Yes | D | B | No | Yes | Pay fair share (33.6%) |
| IN-133 | San Timoteo Canyon Rd/Live Oak Canyon Rd | Riverside County | C | F | F | F | F | Yes | Signalize. | Yes | B | B | No | Yes | Pay fair share (32.1%) |
| IN-134 | Redlands Blvd/San Timoteo Canyon Rd | Riverside County | C | F | F | F | F | Yes | Signalize. Add 1 EB RT. Also add EB RT overlap phase. | Yes | A | A | No | Yes | Pay fair share (34.1%) |

Notes: "CSS" means cross-street is stop-controlled "AWS" means all-way stop "NB" and "SB" denote northbound and southbound respectively

"AWS" means all-way stop "LT" and "RT" denote left turn and right turn respectively "EB" and "WB" denote eastbound and westbound respectively

Indicates LOS exceeds the target level * Improvements already being made at intersection

- **Moreno Beach Dr./Ironwood Ave. intersection** (IN-36) currently operates within the LOS threshold but would exceed the threshold in the AM peak hour under Existing Plus Build-out conditions. Adding a northbound right-turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.

- **Moreno Beach Dr./SR-60 EB Ramps intersection** (IN-37) already exceeds the LOS threshold in the PM peak hour and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Adding an eastbound right-turn lane would reduce project impacts to a less-than-significant level. At time of publication, improvements were already being made to the intersection.

- **Lasselle St./Cactus Ave. intersection** (IN-53) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Constructing an additional lane for the westbound left turn, northbound left-turn, southbound left-turn, and modifying the traffic signal to provide overlap phasing for northbound right-turns and eastbound right turns would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.

- **Arlington Ave./Victoria Ave. intersection** (IN-94) currently operates within the LOS threshold but would exceed the threshold in the AM peak hour under Existing Plus Build-out conditions. Adding an additional westbound left-turn lane would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. However, because this intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Alessandro Blvd./Chicago Ave. intersection** (IN-95) is already built out to near the practical limit before grade separation is required (it has five lanes for each approach). Despite this it already operates at LOS "E" in the PM peak period. To achieve the target LOS under Existing Plus Build-out conditions would require the addition of another northbound left-turn lane (with adjusted signal timings).

This intersection is under the jurisdiction of the City of Riverside. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval. However, because this intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Bridge St./Ramona Expressway intersection** (IN-122) currently operates within the LOS threshold but would exceed the threshold in the AM and PM peak hours under Existing Plus Build-out conditions. Signalizing the intersection would reduce project impacts to a less-than-significant level. However, there is a plan to close this intersection in the future and replace it with a grade-separated crossing west of the current location as part of the Villages of Lakeview project. It may not be worthwhile to signalize this intersection for only a few years before closing it.

  This intersection is under the jurisdiction of the Riverside County, because the intersection is outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **Gilman Springs Rd./Bridge St. intersection** (IN-123) already exceeds the LOS threshold in AM peak hour and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair share of this improvement as a condition of approval. However, because this intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with Riverside County to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **SR-79 (Sanderson Ave.) NB/Gilman Springs Rd. intersection** (IN-124) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would

experience longer delays under Existing Plus Build-out conditions. Signalizing this intersection would reduce project impacts to a less-than-significant level.

This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because this intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **SR-79 (Sanderson Ave.) SB/Gilman Springs Rd. intersection** (IN-125) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **San Timoteo Canyon Rd./Alessandro Rd. intersection** (IN-132) already exceeds the LOS threshold in the AM peak hour and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Redlands. The City will require the developer to pay for a fair share of this improvement as a condition of approval. However, because this intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Redlands to develop a mechanism for implementing improvements that would provide an acceptable LOS at this intersection.

- **San Timoteo Canyon Rd./Live Oak Canyon Rd. intersection** (IN-133) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would

experience longer delays under Existing Plus Build-out conditions. Signalizing this intersection would reduce project impacts to a less-than-significant level.

This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **Redlands Blvd./San Timoteo Canyon Rd. intersection** (IN-134) already exceeds the LOS threshold in both the AM and PM peak hours and traffic using the intersection would experience longer delays under Existing Plus Build-out conditions. Signalizing this intersection and adding an eastbound right-turn storage lane with an overlap phase would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. The City will require the developer to pay a fair-share contribution towards improvement of this intersection as a condition of approval. However, because intersection is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

***Freeway Direct Impacts***

Unlike the surface streets, where intersection improvements are generally both feasible and desirable, the strategic situation for freeways in western Riverside County is such that major freeway improvements are becoming increasingly problematic over time. A key problem is that the rights-of way are essentially built out in many locations and cannot be expanded without severe impacts to existing communities (loss of homes and businesses, visual intrusion, increased noise and air quality impacts, etc.) and high costs to replace overcrossing structures. Moreover, there is a growing consensus that over-provision of freeway capacity facilitates long-distance commuting by car and leads to more auto-oriented residential development on the urban fringe, which in turn increases greenhouse gas emissions. This has resulted in a policy shift away from continued expansion of the freeway system, as reflected, for example, in Riverside County Transportation Commission's Ordinance No. 02-001 which reads in part,

> *"State Routes 91 and 60 and Interstate Routes 15 and 215 cannot cost effectively be widened enough to provide for the traffic expected as Riverside County continues to grow. In addition to the specific highway improvements listed in Section 1 above, congestion relief for these*

*highways will require that new north–south and east-west transportation corridors will have to be developed to provide mobility within Riverside County and between Riverside County and its neighboring Orange and San Bernardino Counties."*

In other words, as a matter of policy, with the exception of spot improvements in some specific locations, the overall strategy to relieve congestion on SR-60 and SR-91 is to improve the capacity of surface streets that could serve as alternate routes to freeways. The policy to forego further widening of some sections of SR-60 and SR-91 is also noted in the Riverside County Congestion Management Program (CMP) which permits LOS "F" for some of the study freeway sections because those sections already operated at LOS "F" when the CMP was established in 1991[51]. For these reasons some of the identified mitigation measures may not be pursued even if they are deemed feasible in an engineering sense. In such cases the project's payment into the TUMF and DIF programs and funding for the surface street improvements would constitute a type of mitigation because they help create viable alternative routes that would substitute for freeway travel for some trips. For the purposes of this report, however, the impacts were treated as significant and unavoidable.

The project's direct impacts on the regional freeway system are summarized in Table 76. The freeways studied in this report are state facilities outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvements of these freeways as a condition of approval. However, because the freeways are outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable. These impacts would be:

*Direct Impacts on Freeway Mainline Basic Sections*

- **Eastbound SR-60 from Euclid Ave. to Grove Ave.** (F-6) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report[52].

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of

| R-2 | SR-60 EB On-Ramp from Central Ave | Caltrans | D | B | F | C | F | Yes | Add one mixed flow lane. | No | C | F | Yes | Yes | N/A* |

Indicates LOS exceeds the target level

** Improvement identified in the current RTP and planned to be completed independent of the WLC project

* Not applicable because mitigation is infeasible

- **Eastbound SR-60 from Martin Luther King Blvd. to Central Ave.** (F-24) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The Transportation Concept Report does not call for further widening of this section, which could only be accomplished by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.

- **Westbound SR-60 from I-215 to Day St.** (F-27) already exceeds the LOS threshold in the AM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St.** (F-29) currently operates at an acceptable LOS but would exceed the LOS threshold in the PM peak hour under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Pierce St. to Magnolia Ave.** (F-41) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of

the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Magnolia Ave. to La Sierra Ave.** (F-42) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. However, this could only be accomplished by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.

- **Eastbound SR-91 from Central Ave. to 14th St.** (F-49) currently operates at an acceptable LOS but would exceed the LOS threshold in the AM peak hour under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Northbound I-215 from SR-74/Case Rd. to Redlands Ave.** (F-71) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project.

- **Southbound I-215 from SR-74/Case Rd. to Redlands Ave.** (F-71) already exceeds the LOS threshold in the AM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project.

- **Southbound I-215 from Baseline Rd to Highland Ave.** (F-83) already exceeds the LOS threshold in both the AM and PM peak hours and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project. There is no need for action by the developer since the mitigation measure will already be in place, thus eliminating the Project's impact.

*Direct Impacts on Freeway Weaving Sections*

- **Eastbound SR-60 from SR-91 to W. Blaine St/.3rd St.** (W-21) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would reduce the impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Eastbound SR-60 from W Blaine St./3rd St. to University Ave.** (W-22) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a second off-ramp lane would bring the LOS to within the target threshold.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.** (W-25) currently operates near capacity and the addition of the project would increase traffic above the target LOS threshold. Adding a mixed-flow lane would reduce the impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without eliminating the adjacent frontage road. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.** (W-25) already exceeds the LOS threshold in the AM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The improvement is identified in the current SCAG RTP and planned to be completed by 2022 independent of the WLC project.

- **Eastbound SR-91: Arlington Ave. to Central Ave.** (W-48) already exceeds the LOS threshold in the AM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a second off-ramp lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of

the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-91: 14th St. to University Ave.** (W-50) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a second off-ramp lane would bring the LOS to within the target threshold.

  SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

*Direct Impacts on Freeway Ramps*

- **Eastbound SR-60 from On-Ramp from Central Ave.** (R-2) already exceeds the LOS threshold in the PM peak hour and traffic density would increase under Existing Plus Build-out conditions. Adding a mixed-flow lane would reduce the impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without eliminating the adjacent frontage road. Since widening the freeway is infeasible, this impact is significant and unavoidable.

As individual projects within the WLC are processed the City will require that each project do a traffic impact assessment in accordance with City guidelines. These project-level assessments will determine the timing of each mitigation measure.

## F. PROJECT CUMULATIVE IMPACTS

The cumulative impacts of the WLC project were determined by comparing the LOS of study facilities under 2035 No-Project and 2035 Plus Build-out conditions. The cumulative impacts of the project and their associated mitigation measures are described below. In cases where the facility had mitigation measures identified for direct impacts and requires additional improvements under cumulative conditions, the improvements described below are the improvements required beyond those described in the previous section on direct impacts.

### *Cumulative Impacts on Road Sections*

The project's cumulative impact on road sections is summarized in Table 77. This impact would be:

- **Gilman Springs Rd. from Alessandro Blvd. to Bridge St.** (S-16) should be widened from two lanes to four lanes in the short term (see previous section on direct impacts) and may need to be further widened from four lanes to eight lanes sometime in the 2022-to-2035 timeframe. Gilman Springs is a TUMF facility. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because Gilman Springs Rd. is a Riverside County facility and is thus outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. Moreover, there are right-of-way constraints involving sensitive environmental areas that may limit widening to six lanes between Alessandro Blvd. and Bridge St., or even preclude any widening at all. The project's impacts on Gilman Springs Rd. must therefore be considered significant and unavoidable. The City will work with Riverside County and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS on this road to the extent feasible.

## Table 77: Cumulative Impacts on Road Sections and Mitigations

| Roadway | | From | To | Jurisdiction | LOS Standard* | 2035 No-Project LOS | 2035 Plus Build-out LOS | Does the Project have a Significant Impact? | Mitigation Measures Required to Reduce Project Impacts to Less-Than-Significant | Is the Mitigation Feasible? | LOS After Feasible Mitigations are Implemented | Impact Significant After Feasible Mitigations are Implemented? | Is There an Existing Deficiency? | Developer Action Required |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| (A) | | | | (B) | (C) | (D) | (E) | (F) | (G) | (H) | (I) | (J) | (K) | (L) |
| **Road Section Cumulative Impacts that are Considered Significant and Unavoidable (because they are not under the control of the City of Moreno Valley)** | | | | | | | | | | | | | | |
| S-16 | Gilman Springs Rd | Alessandro Blvd (Street C) | Bridge Street | Riverside County | D | D | F | Yes | Widen to 8 lanes | Partially (to 6 lanes) | F | Yes | Yes | Pay Fair Share (12.2%) |

* LOS Standard is "C" in residential areas and "D" for roads in employment-generating areas or near freeways.

** WLC's impacts would already be mitigated with the measures identified for direct impacts.

Indicates LOS exceeds the target level

*Cumulative Impacts on Study Intersections*

The WLC project's cumulative impacts on study intersections is summarized in Table 78, and described in detail below:

- **Redlands Blvd./Ironwood Ave. intersection** (IN-11) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a second southbound left-turn lane would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.
- **Theodore St./Ironwood Ave. intersection** (IN-12) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Signalizing the intersection would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.
- **Moreno Beach Dr./Cactus Ave. intersection** (IN-25) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a second eastbound left-turn lane would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.
- **Redlands Blvd./Cactus Ave. intersection** (IN-27) should be signalized and added eastbound and westbound left-turn lanes in the short term (see previous section on direct impacts) and may exceed the target LOS threshold at some point in the 2022-to2035 period. Constructing a westbound left-turn lane would reduce project impacts to a less-than-significant level. The City will require the developer to pay a fair-share contribution towards this improvement as a condition of approval.
- **Moreno Beach Dr./Locust Ave. intersection** (IN-35) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Signalizing the intersection and constructing a westbound left-turn lane would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.
- **Moreno Beach Dr./Ironwood Ave. intersection** (IN-36) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Adding northbound and southbound left-turn lanes and changing north/south lefts from split to protected left-turn phase would reduce project impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City

will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.

- **Moreno Beach Dr./SR-60 EB Ramps intersection** (IN-37) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a southbound left-turn lane and changing the eastbound approach to one left-turn and one through lane would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.

## Table 78: Cumulative Intersection Impacts and Mitigations

| Study Intersection | | Jurisdiction | LOS Standard | 2035 No-Project | | 2035 Plus Build-out | | Does the Project Have a Significant Impact? | Mitigation Measures Required to Reduce Impact to Less-Than-Significant | Is Mitigation Feasible? | LOS After Feasible Mitigations are Implemented | | Impact Significant After Feasible Mitigations are Implemented? | TUMF Facility? | DIF Facility? | Developer Action Required |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | AM | PM | AM | PM | | | | AM LOS | PM LOS | | | | |
| (A) | | (B) | (C) | (D) | | (E) | | (F) | (G) | (H) | (I) | | (J) | (K) | (L) | (M) |
| **Intersection Cumulative Impacts that can be Mitigated to a Less-Than-Significant Level** | | | | | | | | | | | | | | | | |
| IN-11 | Redlands Blvd/Ironwood Ave | Moreno Valley | D | D | D | D | E | Yes | Add 1 SB LT lane. | Yes | D | D | No | Yes | Yes | Pay DIF |
| IN-12 | Theodore Street/Ironwood Avenue | Moreno Valley | D | C | F | E | F | Yes | Signalize. | Yes | A | A | No | No | Yes | Pay DIF |
| IN-25 | Moreno Beach Dr/Cactus Ave | Moreno Valley | C | C | C | C | D | Yes | Add 1 EB LT lane. | Yes | B | C | No | No | Yes | Pay DIF |
| IN-27 | Redlands Blvd/Cactus Ave | Moreno Valley | C | B | B | F | F | Yes | Add 1 WB LT lane. | Yes | B | C | No | No | No | Pay fair share (60.7%) |
| IN-35 | Moreno Beach Dr/Locust Ave | Moreno Valley | C | D | E | D | F | Yes | Signalize. Add 1 WB LT lane. | Yes | A | B | No | Yes | Yes | Pay DIF |
| IN-36 | Moreno Beach Drive & Ironwood Avenue | Moreno Valley | D | D | D | D | E | Yes | Change N/S from split to protected LT phase. Add NB and SB LT lanes. | Yes | D | D | No | Yes | Yes | Pay DIF |
| IN-37 | Moreno Beach Dr/SR-60 EB Ramps | Moreno Valley | D | F | F | F | F | Yes | Change EB from 1 shared LT/TH to 1 LT and 1 TH. Add 1 SB LT lane. Change split phasing on E/W movement to protected LT phasing. | Yes | C | D | No | Yes | Yes | Pay DIF |
| IN-39 | Iris Ave/Perris Blvd | Moreno Valley | D | E | E | E | F | Yes | Add 1 WB LT and 1 SB LT lane. | Yes | D | D | No | Yes | Yes | Pay DIF |
| IN-40 | Kitching St/Iris Ave | Moreno Valley | C | E | F | E | F | Yes | Add 1 WB LT and change NB shared TH/RT to RT lane and add another RT lane. Provide overlap phase for NB RT. Add 1 EB TH lane. | Yes | C | C | No | No | No | Pay fair share (16%) |
| IN-41 | Lasselle Str/Iris Ave | Moreno Valley | D | C | E | D | F | Yes | Add 1 WB LT lane (resulting 3 turn lanes), and 1 EB RT Need to widen Lasselle in the SB to have 3 receiving lanes. | Yes | C | D | No | Yes | No | Pay TUMF |
| IN-57 | Graham Str/Alessandro Blvd | Moreno Valley | D | D | F | D | F | Yes | Add 1 NB LT and 1 WB LT lanes. | Yes | C | D | No | Yes | Yes | Pay DIF |
| IN-74 | Elsworth Str/Cactus Ave | Moreno Valley | D | F | F | F | F | Yes | Widen NB approach and change NB lane geometry from: 1 LT and 1 shared LT/TH/RT lanes to 3 LTs and 1 TH and 1 RT. Add 1 WB LT and EB RT lanes. | Yes | D | D | No | Yes | Yes | Pay DIF |

Notes: "CSS" means cross-street is stop-controlled
"AWS" means all-way stop
Indicates LOS exceeds the target level
"RABT" means roundabout
* Not applicable because mitigation is infeasible
** The "Plus Build-out and Mitigations" condition is better than the "No-Project" condition
"NB" and "SB" denote northbound and southbound respectively
"EB" and "WB" denote eastbound and westbound respectively
"LT" and "RT" denote left turn and right turn respectively
"TH" denotes through lanes

## Table 78: Cumulative Intersection Impacts and Mitigations (continued)

| Study Intersection | | Jurisdiction | LOS Standard | 2035 No-Project | | 2035 Plus Build-out | | Does the Project Have a Significant Impact? | Mitigation Measures Required to Reduce Impact to Less-Than-Significant | Is Mitigation Feasible? | LOS After Feasible Mitigations are Implemented | | Impact Significant After Feasible Mitigations are Implemented? | TUMF Facility? | DIF Facility? | Developer Action Required |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | AM | PM | AM | PM | | | | AM LOS | PM LOS | | | | |

| IN-131 | Reche Canyon Rd/Reche Vista Dr | Riverside County | C | D | F | D | F | Yes | Adjusted NB approach to a dedicated LT and a shared LT/RT lane. | Yes | B | C | No | Yes | No | Pay TUMF |

Notes: "CSS" means cross-street is stop-controlled
"AWS" means all-way stop
Indicates LOS exceeds the target level
"RABT" means roundabout
* Not applicable because mitigation is infeasible
** The "Plus Build-out and Mitigations" condition is better than the "No-Project" condition
"NB" and "SB" denote northbound and southbound respectively
"EB" and "WB" denote eastbound and westbound respectively
"LT" and "RT" denote left turn and right turn respectively
"TH" denotes through lanes

- **Iris Ave./Perris Blvd. intersection** (IN-39) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a second westbound left-turn lane and a second southbound left-turn lane would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.
- **Kitching St./Iris Ave. intersection** (IN-40) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Adding a third eastbound through lane and a second westbound left-turn lane, widening and reconfiguring the northbound approach to provide one left-turn lane, one through lane, and two right-turn lanes, and modifying the traffic signal to provide overlap phasing for the northbound right-turn movement would reduce cumulative impacts to a less-than-significant level. The City will impose as a condition of approval that the WLC will provide fair-share funds to cover the cost of this improvement, which the City will use to construct the needed improvements.
- **Lasselle St./Iris Ave. intersection** (IN-41) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Adding a third westbound left-turn lane and an eastbound right-turn lane would reduce project impacts to a less-than-significant level. This improvement is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact.
- **Graham St./Alessandro Blvd. intersection** (IN-57) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a northbound left-turn lane and a westbound left-turn lane would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.
- **Elsworth St./Cactus Ave. intersection** (IN-74) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Widening the northbound approach to provide three left-turn lanes, one through lane, and one right-turn lane, and adding a westbound left-turn lane and eastbound right-turn lane would reduce cumulative impacts to a less-than-significant level. This intersection is eligible for funds under the DIF program. The City will collect DIF fees in accordance with City Municipal Code 3.42.030 and 3.42.040, and use these fees to improve this intersection.
- **Alessandro Blvd./Sycamore Canyon Blvd. intersection** (IN-66) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Providing a southbound right-turn overlap phase at the signal would reduce cumulative impacts to a less-than-significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **I-215 NB Ramps/Cactus Ave. intersection** (IN-73) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing an eastbound right-turn lane, a westbound right-turn lane, a second northbound left-turn lane, and a second southbound left-turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the March AFB Joint Powers Authority. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the March AFB Joint Powers Authority and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Central Ave./Lochmoor Dr. intersection** (IN-75) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Converting the northbound approach to one left-turn lane and a shared left-right-turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Alessandro Blvd./Mission Grove Pkwy. intersection** (IN-80) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Modifying the traffic signal to provide an additional eastbound left-turn, westbound left-turn, and northbound through lane would reduce cumulative impacts to a less-than-significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Martin Luther King Blvd./I-215 NB Ramps intersection** (IN-85) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Signalizing the intersection would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is not eligible for TUMF funding. The City will work with the City of Riverside to establish a mechanism for collecting and distributing payments from developers for inter-jurisdictional impacts not covered by the TUMF program. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **Central Ave./Chicago Ave. intersection** (IN-86) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Modifying the traffic signal to provide overlap phasing for the northbound right-turn movement would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Central Ave./Canyon Crest Dr. intersection** (IN-88) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing an eastbound right-turn lane, a second westbound left-turn lane, and a second northbound left-turn lane, and a southbound right-turn lane (and adjust signal timings) would reduce cumulative impacts to a less-than-significant level.

This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Arlington Ave./Riverside Ave./SR-91 SB Ramps intersection** (IN-90) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a third southbound left-turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Arlington Ave./Victoria Ave. intersection** (IN-94) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a fourth eastbound through lane, a second westbound left-turn lane, and a second westbound right-turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Alessandro Blvd./Chicago Ave**. **intersection** (IN-95) is already built out to near the practical limit before grade separation is required (it has five lanes for each approach). Despite this it already operates at LOS "F" in the PM peak period. To achieve the target LOS in 2035 would require the addition of lanes to the eastbound through, westbound left-turn, westbound though,

northbound left-turn, southbound left-turn, and southbound right-turn movements. There are established residential communities on each corner that would be impacted by such a widening or by grade separation. These mitigation measures are thus likely to be infeasible, and the project impact at this location is therefore considered to be a significant and unavoidable.

- **Alessandro Blvd./Canyon Crest Dr. intersection** (IN-98) will exceed the target LOS threshold at some point in the 2022-to-2035 period. The following measures would reduce cumulative impacts to a less-than-significant level: widen and reconfigure the eastbound approach to provide: one left-turn lane, one through lane, and two right-turn lanes; add an additional westbound through lane; add an additional northbound left-turn and northbound right-turn lane; and reconfigure the southbound approach to one left-turn lane, three through lanes, and one shared through-right-turn lane.

  This intersection is under the jurisdiction of the City of Riverside. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Riverside and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Ramona Expwy./Indian St. intersection** (IN-101) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing one eastbound right-turn lane, a second northbound left-turn lane, and one northbound right-turn lane, and modifying the traffic signal to provide overlap phasing for all right-turn movements would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Perris. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Perris and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **Evans Rd./Rider St. intersection** (IN-107) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing an exclusive right-turn lane the on the southbound approach would reduce cumulative impacts to a less-than-significant level.

This intersection is under the jurisdiction of the City of Perris. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with the City of Perris and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

- **W. 6th St./California Ave. intersection** (IN-129) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Signalizing this intersection would reduce project impacts to a less-than-significant level.

  This intersection is under the jurisdiction of the City of Beaumont. Although it is a TUMF facility signalization is not currently eligible for TUMF funding. The City will work with the City of Beaumont to establish a mechanism for collecting and distributing payments from developers for inter-jurisdictional impacts not covered by the TUMF program. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable.

- **W. 6th St./Beaumont Ave. intersection** (IN-130) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Constructing a northbound right-turn lane, an eastbound right-turn lane, a second southbound left-turn lane, and a second westbound left-turn lane, removing on-street parking and restriping to provide a second westbound through lane, modifying the traffic signal to provide protected phasing for eastbound and westbound left-turn movements, and providing overlap phasing for northbound and eastbound right-turn movements would reduce cumulative impacts to a less-than-significant level.

  There are established commercial buildings on the corners on the northern part of the intersection that would be impacted by such a widening. These mitigation measures are thus infeasible, and the project impact at this location is therefore considered to be significant and unavoidable.

- **Reche Canyon Rd./Reche Vista Dr. intersection** (IN-131) will exceed the target LOS threshold at some point in the 2022-to-2035 period. Converting the existing northbound right-turn lane into a shared left-right-turn lane would reduce cumulative impacts to a less-than-significant level.

  This intersection is under the jurisdiction of Riverside County. It is eligible for TUMF funding. The City will collect TUMF fees in accordance with Municipal Code Chapter 3.44, and payment of these fees will constitute the mitigation for this impact. However, because both the intersection and the funding source are outside the jurisdiction of the City of Moreno Valley, the City cannot

ensure that the identified improvements would be made. The project's impacts on this intersection must therefore be considered significant and unavoidable. The City will work with Riverside County and WRCOG to direct TUMF funding for improvements that would provide an acceptable LOS at this intersection.

*Cumulative Freeway Mainline Mitigations*

The WLC's cumulative impacts on the freeways system are summarized in Table 79, and described in detail below:

**Eastbound SR-60 from S. Reservoir St. to Ramona Ave.** (F-2) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

The state freeway system is owned and operated by Caltrans and is thus outside the jurisdiction of the City of Moreno Valley. The City will work with Caltrans to establish a mechanism for collecting funds from developers for use in funding needed freeway improvements. However, since at the present time no such mechanism exists that would ensure that WLC funds contributed to Caltrans or any other state agency would be used to implement specific improvements that mitigate WLC impacts, and there is no mechanism by which the City can construct or guarantee the construction of any improvements to the freeway system by itself, this and all other freeway impacts must be considered as significant and unavoidable.

## Table 79: Cumulative Freeway Impacts and Mitigations

| Study Facility | | Juris-diction | LOS Standard | Determination of Impact | | | | | Mitigation Measures Required to Reduce Impact to Less-Than-Significant | Is Mitigation Feasible? | LOS After Feasible Mitigations are Implemented | | Impact Significant After Feasible Mitigations are Implemented? | Is There an Existing Deficiency? | Developer Action Required |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | 2035 No-Project | | 2035 Plus Build-out | | Does the Project Have a Significant Impact? | | | AM LOS | PM LOS | | | |

Indicates LOS exceeds the target level

** Although the target LOS is not met, conditions with the project and the mitigation measure would be better than No-Project conditions

* Not applicable because mitigation is infeasible

*** The mitigation measures are in addition to the mitigation measure needed for direct Project impacts (see Table 76)

**** The additional lane needed between Redlands Blvd. and Moreno Beach Dr. as mitigation for R-16 is the same lane that is needed to mitigate impacts to R-17. Only one lane is needed; not one for R-16 and a second for R-17.

- **Westbound SR-60 from South Reservoir St. to Ramona Ave.** (F-2) already exceeds the target LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Ramona Ave to Central Av**e (F-3) already exceeds the LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Central Ave. to Mountain Ave.** (F-4) already exceeds the LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Mountain Ave. to Euclid Ave.** (F-5) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Mountain Ave. to Euclid Ave.** (F-5) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

The existing freeway right-of-way in this section cannot accommodate additional lanes and the right-of-way cannot be expanded without severe impacts to the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-60 from Euclid Ave. to Grove Ave.** (F-6) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target

  The existing freeway right-of-way in this section cannot accommodate additional lanes and the right-of-way cannot be expanded without severe impacts to the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Eastbound SR-60 from Grove Ave. to Vineyard Ave.** (F-7) already exceeds the LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Grove Ave. to Vineyard Ave.** (F-7) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Vineyard Ave. to Archibald Ave.** (F-8) already exceeds the LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Archibald Ave. to Haven Ave.** (F-9) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035

Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Valley Way to Rubidoux Blvd.** (F-17) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

  **Westbound SR-60 from Valley Way to Rubidoux Blvd.** (F-17) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means to either widen the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

  **Eastbound SR-60 from Rubidoux Blvd. to Market St.** (F-18) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Market St. to Main St.** (F-19) already exceeds the LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane

would bring the LOS to within target threshold. The addition of a lane is identified in the Transportation Concept Report.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Market St. to Main St.** (F-19) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Main St. to SR-91** (F-20) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Martin Luther King Blvd. to Central Ave.** (F-24) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Fair Isle Dr./Box Springs Rd. to I-215** (F-26) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Pigeon Pass Rd./Frederick St. to Heacock St**. (F-29) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. The addition of a lane is identified in the Transportation Concept Report.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Heacock St. to Perris Blvd.** (F-30) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Heacock St. to Perris Blvd.** (F-30) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Redlands Blvd .to Theodore St.** (F-34) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing

that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Gilman Springs Rd. to Jack Rabbit Trail** (F-36) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  Caltrans already has plans to build a truck climbing lane in this area. However, as explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Jack Rabbit Trail to Potrero Blvd.** (F-37) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow would reduce the cumulative impact to a less-than-significant level.

  Caltrans already has plans to build a truck climbing lane in this area. However, as explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Pierce St. to Magnolia Ave.** (F-41) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from La Sierra Ave. to Tyler St.** (F-43) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing

that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-91 from La Sierra Ave. to Tyler St.** (F-43) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Tyler St. to Van Buren Blvd.** (F-44) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-91 from Van Buren Blvd. to Adam St.** (F-45) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-91 from Adam St. to Madison St.** (F-46) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-91 from Madison St. to Indiana Ave.** (F-47) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035

Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because SR-91 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from SR-60 to Beaumont Ave.** (F-52) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from SR-60 to Beaumont Ave.** (F-52) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from Pennsylvania Ave. to Highland Springs Ave.** (F-54) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from Pennsylvania Ave. to Highland Springs Ave.** (F-54) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from Highland Springs Ave. to Sunset Ave.** (F-55) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from Highland Springs Ave. to Sunset Ave.** (F-55) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from S 8th St. to S. Hargrave St.** (F-58) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound I-10 from S 8th St. to S. Hargrave St.** (F-58) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some

other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from S. Hargrave St. to Field Rd.** (F-59) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound I-10 from Main St. (Cabazon) to Main St.** (F-61) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-10 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Southbound I-215 from SR-74 to Ellis Ave.** (F-71[53]) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because I-215 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Southbound I-215 from Center St. to Iowa Ave/La Cadena Dr.** (F-75) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent frontage road. Since widening the freeway is infeasible, this impact is significant and unavoidable.

---

[53] I-215 currently runs unbroken between SR-74 and Redlands Ave. The 2012 RTP includes a project (3M0731) that would split this section with a new interchange at Ellis Ave. So this section is listed as "I-215 SR-74 to Redlands" on tables describing conditions prior to construction of the Ellis Avenue Interchange.

- **Southbound I-215 from Baseline Rd. to Highland Ave.** (F-83) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level. The freeway right-of-way in this section cannot accommodate an additional lane (beyond the lane already identified in the current SCAG RTP) and cannot be widened without impacting the adjacent railroad. Since widening the freeway is infeasible, this impact is significant and unavoidable.

*Cumulative Freeway Weaving Mitigations*

- **Eastbound SR-60: SR-71/S Garey Ave. to S. Reservoir St.** (W-1) already exceeds the LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level.

  SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley. The City will require the developer to pay a fair-share contribution towards improvement of this section as a condition of approval. However, because the freeway is outside the jurisdiction of the City of Moreno Valley and because no mechanism is in place for ensuring the availability of the non-project portion of the needed funds, the City cannot ensure that the identified improvements would be made. The project's impacts on this section must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Haven Ave. to Archibald Ave.** (W-9) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Eastbound SR-60 from Main St. to SR-91** (W-20) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from SR-91 to W. Blaine St./3rd St.** (W-21) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-60 from W Blaine St./3rd St. to University Ave.** (W-22) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level. The existing freeway right-of-way in this section cannot accommodate an additional lane and cannot be widened without impacting the adjacent residential community. Since widening the freeway is infeasible, this impact is significant and unavoidable.

- **Westbound SR-60 from University Ave. to Martin Luther King Blvd.** (W-23) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a second off-ramp lane would reduce the cumulative impact to a less-than-significant level.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Central Ave. to Fair Isle Dr./Box Springs Rd.** (W-25) already exceeds the LOS threshold and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Day St. to Pigeon Pass Rd./Frederick St.** (W-28) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing

that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

*Cumulative Freeway Ramp Mitigations*

- **Eastbound SR-60 from On-Ramp from Martin Luther King Blvd.** (R-1) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would reduce the cumulative impact to a less-than-significant level. The Transportation Concept Report does not call for further widening of this section, which could only be accomplished by eliminating the existing shoulder and thus leaving no space for disabled vehicles to pull over. Since this would create safety problems that would be less acceptable than a low LOS, mitigating this impact is infeasible. This impact is therefore significant and unavoidable.

- **Eastbound SR-60 from On-Ramp from Gilman Spring Rd.** (R-10) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for mainline segment F-36.)

  Caltrans has plans to re-configure the SR-60/Gilman Springs Rd. interchange in the future. However, as explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from On-Ramp from Theodore St.** (R-14) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for mainline segment F-34.)

  The City has a study underway to develop alternative designs for this interchange. The City will collect a fair-share contribution from the developer to implement this improvement in conjunction with the reconfiguration of the SR-60/Theodore St. Interchange.

- **Westbound SR-60 from Off-Ramp to Redlands Blvd.** (R-15) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for mainline segment F-34.)

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing

that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Loop On-Ramp from Redlands Blvd.** (R-16) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Direct On-Ramp from Redlands Blvd.** (R-17) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold.

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Off-Ramp to Central Ave.** (R-18) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for weaving segment W-25 in the direct impacts list, Table 74.)

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

- **Westbound SR-60 from Off-Ramp to Martin Luther King Blvd.** (R-19) will exceed the target LOS threshold at some point in the 2022-to-2035 period and traffic density would increase under 2035 Plus Build-out conditions. Adding a mixed-flow lane would bring the LOS to within the target threshold. (This improvement is already identified as the mitigation for mainline segment F-24.)

  As explained above, because SR-60 is a state facility outside the jurisdiction of the City of Moreno Valley, the City has no means for either widening the freeway itself or for guaranteeing

that some other agency will widen the freeway. This impact must therefore be considered significant and unavoidable.

## G. RECOMMENDED MITIGATION MEASURES

Based on the analysis described above following Mitigation Measures are recommended:

- MM Trans-1: A traffic impact analysis ("TIA"), conforming to the guidelines for TIAs adopted by the City shall be submitted in conjunction with each Plot Plan application within the WLCSP. Prior to the approval of the Plot Plan, the City shall review the TIA to determine if any of the traffic improvements listed in Tables 72 through 77 of the TIA prepared for the Program EIR are required to be completed prior to the issuance of a certificate of occupancy for each building. If the City determines that any of the improvements within Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated into insignificance, then the completion of construction of the improvements prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. Construction of improvements within the City shall be subject to reimbursement agreement for those costs that exceed the fair share contribution determined for the specific Plot Plan application. If the City determines that any of the improvements outside Moreno Valley are required to be constructed in order to ensure that the traffic impacts which will result from the construction and operation of the building will be mitigated to a less than significant level, then the payment of any necessary fair share contribution as prescribed in MM Trans-6 prior to the issuance of a Certificate of Occupancy for the building shall be made a Condition of Approval of the Plot Plan. If the City determines that the traffic impacts which will result from the construction or operation of a building will be significantly more adverse than those shown in the program EIR, further environmental review shall be conducted prior to the approval of the Plot Plan pursuant to Public Resources Code § 21166 and CEQA Guidelines § 15162 to determine what additional mitigation measures, if any, will be required in order to maintain the appropriate levels of service.

- MM Trans-2: As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require the dedication of appropriate right-of-way, where feasible, consistent with the Subdivision Map Act for frontage street improvements contained within the World Logistics Center Specific Plan Circulation Map, as shown in Figure 22. Required dedications shall be made prior to the issuance of occupancy permits for the requested development.Figure 22.

- MM Trans-3: As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the requisite Development Impact Fee (DIF) as set forth in Municipal Code Chapter 3.42.

Required DIF payments shall be made prior to the issuance of occupancy permits for the requested development.

- MM Trans-4: As a condition of approval for individual development permits processed in the future under the World Logistics Center Specific Plan, the City shall require each project to pay the requisite Transportation Uniform Mitigation Fee (TUMF) as set forth in Municipal Code Chapter 3.44. Required TUMF payments shall be made prior to the issuance of occupancy permits for the requested development.

- MM Trans-5: In order to ensure that all of the Project's traffic impacts are mitigated to the greatest extent feasible, the Applicant shall contribute its fair share of the cost of the needed traffic improvements that are not within the City as identified in the Traffic Impact Analysis, *i.e.,* under the jurisdiction of other cities, the County of Riverside or Caltrans, pursuant to MM Trans-6. As used in this mitigation measure, the Applicant's "fair share" has been determined in compliance with the requirements of the Fee Mitigation Act, Government Code § 66000 *et seq.*, and, pursuant to § 66001(g), does not require that the Applicant be responsible for making up for any existing deficiencies.

- MM Trans-6: The Applicant shall pay a portion of the fair share of the cost of traffic improvements identified in the Transportation Impact Analysis for those significantly impacted road segments and intersections for each warehouse building within the World Logistics Center if the impacted jurisdiction has established a fair share contribution program prior to the approval of a building-specific plot plan. The City shall determine whether a fair share program exists in the impacted jurisdiction and, if one does exist, require that the appropriate fees are paid by the Applicant, consistent with the requirements below, prior to the issuance of a certificate of occupancy for the building in question. If no fair share program exists or if the existing programs are not consistent with the requirements below, then no payment of fees shall be required. The impacts are to be determined on a road segment or intersection basis. Nothing in this condition requires the payment of a traffic impact fee imposed by another jurisdiction which covers improvement to facilities where the Project does not have a significant impact. Fair-share contributions will be determined on a building-by-building basis as a share of the impact of the Project as a whole (for each segment or intersection where the WLC project as a whole has a significant impact identified in the programmatic EIR) as determined by the Traffic Impact Analysis and will be due as each certificate of occupancy is issued. The fair share payments for the significantly impacted road segments and intersections identified in the program EIR will be required even though the impact resulting from a specific building does not, by itself, cause a significant impact.

  For example, the intersection of Martin Luther King Blvd. and the I-215 northbound ramps (Intersection 85) in the City of Riverside was identified as a place where the WLC contributes to cumulatively significant impacts, and where the fair share contribution of the WLC project as a

whole was computed to be 6.2%. If the City of Riverside establishes a fair share contribution program consistent with this MM Trans-6 to improve that intersection, then when a certificate of occupancy is to be issued for a 2-million sq.ft. high-cube warehouse in the WLC (approximately 5% of the entire WLC project) the amount of the fair share payment due from the Applicant to the City of Riverside would be computed as follows:

| Amount Due | = | Total cost of Improvement | * | Total WLC fair Share (6.2%) as determined by TIA | * | % attributable to the building that is subject to the certificate of occupancy (5%) |
|---|---|---|---|---|---|---|

A similar calculation would be done for each subsequent building, with payments for each due at the time of issuance of the certificate of occupancy. As a result, while each building individually would not produce a significant impact, and therefore would not be required to pay any mitigation fees if considered by itself, the total amount of the payments for all of the buildings would be equal to the fair share payment for the entire WLC to the extent that the responsible jurisdiction has chosen to adopt a fair share contribution funding program consistent with MM Trans-6.

- MM Trans-7: City shall work directly with WRCOG to request that TUMF funding priorities be shifted to align with the needs of the City, including improvements identified in this TIA. Toward this end, City shall meet regularly with WRCOG.

*Level of Significance after Mitigation*

The mitigation measures described above can be usefully grouped into four categories based on who is responsible for the facility, which is the primary determinant of the level of significance after mitigation. The four categories are as follows:

On-Site Improvements – These are changes to the road system within the WLC project site that are being undertaken as part of the WLC project. The developer shall be responsible for constructing the improvements described in the section "*Proposed Road Network*" in Chapter 4 above in accordance with City standards for roadway construction and the roadway cross-sections in the proposed Specific Plan. Completion of these improvements shall constitute the developer's mitigation of the project's on-site impacts. When these improvements are completed the project's impacts on the roadway system within the WLC project site will be mitigated to a **less-than-significant** level.

Off-Site Improvements for Non-TUMF Roads Under the Jurisdiction of the City of Moreno Valley - These are improvements to public streets in Moreno Valley that are outside the area covered by the proposed WLC Specific Plan Amendment. The developer shall be responsible for paying the

DIF as set forth in Municipal Code Chapter 3.42 which the City shall use to implement the mitigation measures identified in Table 74, Table 75, Table 76, Table 78 and Table 79 pertaining to DIF facilities. The developer shall also be required to pay its fair share of the improvements to City streets that are not in the DIF program where there are significant project impacts. These payments shall constitute the developer's mitigation of project impacts on this category of roads. When these improvements are completed the project's impacts on the City roadway system will be mitigated to a **less-than-significant** level.

Off-Site Improvements to TUMF Facilities – These are improvements to roads that are part of the TUMF Regional System of Highways and Arterials, some of which are under the jurisdiction of Moreno Valley and others are located in other jurisdictions. The developer shall be responsible for paying the TUMF fees in effect at the time of approval. These payments shall constitute the developer's mitigation of project impacts to this category of roads.

The City shall implement the mitigation measures identified in Table 76 and Table 79 pertaining to TUMF facilities under the City's jurisdiction. When these improvements are completed the project's impacts on the roadway system within the WLC project site will be mitigated to a **less-than-significant** level.

The City shall work with the other member agencies of WRCOG to program TUMF funds to implement the mitigation measures identified in Table 75, Table 76, Table 78 and Table 79 pertaining to TUMF facilities outside the jurisdiction of the City of Moreno Valley. To the extent that TUMF fees provided by the developer are used to implement the recommended improvements the project's impacts would be less-than-significant. However, because the City does not have direct control over TUMF funding the City cannot ensure that the identified improvements would be made. Thus at this point the project's impacts on these facilities must be considered **significant and unavoidable**.

Off-Site Improvements to Roads Outside the Jurisdiction of the City and Not Part of the TUMF Program – This category includes all of the recommended mitigation measures that are under the jurisdiction of Riverside County, Caltrans, and other municipalities and that are not included in the TUMF Regional System of Highways and Arterials.

At this time the City does not have cooperative agreements with neighboring jurisdictions that would serve as a mechanism for collecting and distributing developer funds to cover the cost of cross-jurisdictions mitigation measures, other than the TUMF program. The City shall therefore work with the City of Redlands and Riverside County to collect funds from the developer and to implement the signalization of the San Timoteo Rd./Alessandro Rd. intersection and the San Timoteo Rd./Live Oak Canyon intersection (respectively). The City shall also work with the City of

Riverside to collect a fair-share contribution from the developer to signalize the Martin Luther King Blvd./I-215 northbound ramp intersection. To the extent that the City is able to establish such a mechanism (as described in MM Trans-6) and the other jurisdiction constructs the recommended improvement the project's impacts would be less-than-significant. However, because the City cannot guarantee that such a mechanism will be established and does not have direct control over facilities outside of its jurisdiction the City cannot ensure that the identified improvements would be made. Thus at this point the project's impacts on these facilities must be considered **significant and unavoidable**.

Similarly, the City has not entered into an agreement with Caltrans for the collection of developer payments for improvements to the state highway system other than freeway interchange improvements funded through the TUMF program. Nor has Caltrans established a program to collect fair-share contributions to freeway improvements such as those indentified in Table 76 and Table 79. Instead, Caltrans has traditionally relied on other means to fund freeway improvements; means involving multiple stages of review and input from other agencies, with priorities and constraints applied at each stage, that preclude a direct connection between developer-provided fair-share funds and specific highway improvements.

Decisions on funding for improvements to the state highway system are made by four bodies, namely[54]:

Legislature: Establishes overall policies, including determining funding sources and distribution, and spending priorities through state statutes such as Revenue and Taxation Code, Streets and Highways Code, and Government Code. The Legislature appropriates funds through the annual budget for transportation projects and has authority to designate transportation projects statutorily.

California Transportation Commission (CTC): The nine-member CTC, appointed by the Governor, reviews and adopts the state transportation programs and approves projects nominated by Caltrans and regional agencies for funding. The CTC recommends policy and funding priorities to the Legislature and is also responsible for project delivery oversight.

California Department of Transportation (Caltrans): Caltrans owns, operates and maintains the state highway system. Caltrans plans, designs, and nominates interregional capital improvement projects on the state highway system and also manages the intercity rail operation.

---

54 This information came from *Transportation Funding in California*, Caltrans Economic Analysis Branch, 2011, page 2.

Metropolitan Planning Organizations (MPOs) and Regional Transportation Planning Agencies (RTPAs): MPOs and RTPAs are responsible for planning, coordinating and administering funds for regional transportation systems. In California, 17 MPOs and 48 RTPAs develop 20-year Regional Transportation Plans (RTPs) as well as 5-year Regional Transportation Improvement Program (RTIP), which identify projects for the regional portion of the State Transportation Improvement Program (STIP). SCAG is the MPO for Riverside County.

Most funds for improvements to the state highway system come through the State Highway Account (SHA), which receives funding from a variety of sources including:

- motor vehicle fuel taxes, part of which goes into the Highway Users Tax Account, a portion of which goes to the SHA and the rest goes to cities and counties according to a statutory formula.
- The fuel tax swap, enacted in 2011 (Fuel Tax Swap Fix), reenacted the provisions of the Fuel Tax Swap of 2010 addressing issues raised by the passage of Propositions 22 and 26. The Fuel Tax Swap eliminated the state sales tax on gasoline and instead imposed an additional excise tax on gasoline of 17.3¢ (July 2010). The increase in the excise tax would generate revenues equivalent to what would have been collected from the state sales tax on gasoline. These revenues are intended for new road construction (STIP), highway maintenance and operations (SHOPP), and local roadways.
- the federal fuel tax, which goes into the Highway Trust fund for use on the portions of the system that are designated ad federal aid highways

In addition local sales tax measures, such as Measure A in Riverside County, and the proceeds of Proposition 1B provide funding for improvements to certain portions of the state highway system.

The key feature of this system pertaining to the recommended freeway mitigation measures is that this system is outside the control of the City of Moreno Valley. The City shall work with Caltrans to establish a mechanism for collecting funds from developers for use in funding needed freeway improvements (as described in MM Trans-6). However, since at the present time no such mechanism exists that would ensure that WLC funds contributed to Caltrans or any other state agency would be used to implement specific improvements that mitigate WLC impacts, and there is no mechanism by which the City can construct or guarantee the construction of any improvements to the freeway system by itself, the project's impacts on the state highway system must be considered **significant and unavoidable**.

# 12. OTHER ISSUES

At the request of the City of Moreno Valley and to facilitate a more complete understanding of transportation issues related to the WLC, the following additional issues were studied.

## A. TRAFFIC SIGNAL WARRANT ANALYSIS

Traffic signal warrants are criteria used to determine whether a traffic signal might be justified at a particular location. The warrants represent minimum criteria for justifiability; in other words, meeting a warrant by itself does not necessarily mean that a signal should be installed. The City of Moreno Valley's TIA Guidelines mandate that study intersections that are not currently signalized be analyzed to determine whether the *California Manual of Uniform Traffic Control Devices*' (California MUTCD) peak-hour warrant is met for existing intersections or whether the California MUCTD daily warrant is met for future intersections. Table 80 through Table 82 show this analysis for No-Project and Plus Build-out conditions for the 2012, 2022, and 2035 conditions. Detailed signal warrant analyses can be found in Appendix P.

**Table 80: Signal Warrant Analysis for Existing**

| Study Intersection | | Jurisdiction | Traffic Control | Existing | | Existing Plus Phase 1 | | Existing Plus Build-out | |
|---|---|---|---|---|---|---|---|---|---|

* This would be a roundabout in the Plus Project condition.
** As part of a future upgrade of the Ramona Expressway, the Ramona Expressway/Bridge Street Intersection will be closed in the future and replaced with a new intersection west of the existing intersection.

In the medium-term future (2022), there are five intersections that would meet the signal warrant with the WLC project but would not meet the warrant without the project. These are:

- Alessandro Blvd./Theodore St.
- SR-60 WB Ramps/Theodore St.
- SR-60 EB Ramps/Theodore St.
- Eucalyptus Ave./Theodore St.
- Cactus Ave./Redlands Blvd.

In the long-term (2035) all five intersections listed above would warrant signalization even without the WLC project.

## B. TRAFFIC NEAR SCHOOLS

Several comments were received regarding possible traffic safety issues related to traffic going to or from the WLC passing near schools.

In one case the commenter mistakenly believed that WLC trucks would be using Alessandro Blvd. to access SR-60 and I-215. In fact, trucks will be prohibited from using Cactus Ave. Extension and trucks are already prohibited from using Redlands Blvd. south of Eucalyptus Ave., which means that they will not be using Alessandro Blvd. to get to and from the WLC. Figure 54 shows the designated trucks routes in and around Moreno Valley[55], while Figure 55 shows the main routes expected to be taken by WLC trucks. With the exception of Perris Blvd., which will be used by a small volume of WLC trucks[56], none of the routes go near schools.

It was assumed that other comments regarding "streets adjacent and near schools" were safety related due to the fact that there may be a higher amount of pedestrian activity near schools. Therefore, the safety impact of Project-related auto trips along streets adjacent to and near schools was evaluated by reviewing the existing pedestrian facilities and collecting pedestrian counts at the intersections along Project truck trip distribution routes.

The intersections reviewed exhibit the characteristics of typical suburban arterial roadways with common pedestrian accommodations, such as crosswalks, curb ramps, push buttons, pedestrian walk/don't walk signals, etc. All pedestrian crossings at the signalized intersections are protected; a protected crossing occurs where traffic that conflicts with the pedestrian movement is required to stop. Crosswalks near a school are striped in yellow, consistent with guidance from the *California Manual on Traffic Control Devices* (page 1282). In most cases, sidewalks exist along roadways and lead to the striped, protected crosswalks at the intersections.

Key intersections along the truck trip distribution routes were reviewed during a site visit and found to provide adequate pedestrian amenities with protected crossings, crosswalks, curb ramps, and pedestrian signals, consistent with other signalized intersections in the City. Therefore, the location of an intersection on a Project truck trip distribution route is not expected to cause unsafe pedestrian facilities.

Pedestrian counts were collected at 25 study intersections along the Project truck trip distribution routes to determine if unusually high pedestrian volumes were being experienced at intersections. Table 83

---

55 Note that Riverside County does not identify truck routes. The City of Riverside's code does not identify a positive list of where trucks are allowed, but does have a negative list of where trucks are prohibited based on weight.

56 22 medium and heavy trucks in the AM peak hour and 25 in the PM peak hour.

shows that many of the intersections along the routes have fewer than 30 pedestrian crossings per hour between the hours of 2:00 to 4:00 PM (the peak of school children crossing activity).

The main commuter routes expected to be used by WLC workers were identified using the RivTAM model. The routes with 50 or more peak-hour trips are shown in Figure 55.[57] These include the John F. Kennedy Dr./Moreno Beach Dr./Iris Ave. route, the Cactus Ave. route, the Alessandro Blvd. route, and the north Perris Ave. route. Only three locations were identified where significant pedestrian activity (50 or more pedestrians per hour) may encounter significant WLC commuter traffic (50 or more peak-hour trips). These occurred at the Iris Ave./Laselle St, Krameria Ave./Kitching St., and Alessandro Blvd./Perris Blvd. intersections. These intersections were specifically reviewed to ensure that pedestrian accommodations were provided. Protected, marked crosswalks exist at all of these intersections and pedestrian amenities are consistent with other, standard signalized intersections in the City.

Based on this analysis the conclusion was reached that the WLC project poses no special traffic safety risk to children near schools, and that appropriate safety measures have already been taken to minimize traffic risks in the vicinity of the schools near the project.

[57] Peak hour volumes are shown as a worse-case. Actual traffic volumes in the 2:00 to 3:00 PM period are forecast to be lower. The threshold of 50 project trips per hour was based on the City of Moreno Valley *Traffic Impact Guidelines* threshold for when potential impacts need to be analyzed.

## C. SAFETY AND OPERATIONAL CONSIDERATIONS

The City's guidelines mandate that the TIA cover the following safety and operational issues:

- Turn Lanes: The improvements needed for study intersections were described in detail in the preceding chapters.
- Intersections Needing Future Sight Distance Studies: The City's established sight distance standard will be applied at all street intersections in connection with all plot plan and subdivision applications.

[58] Peak hour car volumes are shown as a worse-case. Actual traffic volumes in the 2:00 to 3:00 PM period are forecast to be lower. Peak hour pedestrian crossings are shown as the one peak hour within the 2:00 to 4:00 PM period.

- Parking Restrictions: Each plot plan application will be reviewed to ensure that off-street parking will be provided at each building in compliance with the Moreno Valley Municipal Code. A limited amount of short-term on-street parking for trucks will be provided in selected areas of the WLC. Overnight or extended parking would be prohibited.

- Measures to Reduce Cut-Through Traffic in Adjacent Residential Neighborhoods: The design of the WLC incorporates several features that limit the project's impacts on adjacent residential areas. Eastbound Alessandro Blvd. will end at Merwin St. to prevent traffic from passing through the neighborhood directly west of the project. Cactus Ave. Extension would be for cars and light trucks only. The intersection of Cactus Ave. Extension and Street E would include signage and, if deemed necessary by the City, a design feature, such as a median island, height-restricting gateway, or reduced curb return, which would preclude trucks from turning onto Cactus Ave.

- Potential Impacts to Adjacent Schools, Parks, and/or Trails: There are no schools or parks within or adjacent to the WLC. The WLC Specific Plan provides for the continuation of a public multi-use trail from Redlands Blvd. through the WLC linking to the Lake Perris State Recreation Area and the San Jacinto Wildlife Area.

- Queue Lengths and Impacts to Adjacent Intersections and/or Driveways: As individual buildings are developed, a traffic study will be performed including a queue length analysis to ensure there is not spill back affecting nearby intersections.

- Emergency Access: Every plot plan will be conditioned to provide all emergency access required by federal, state, and local regulations. Emergency vehicles that currently pass through the site using either Theodore St. or Alessandro Blvd. would continue to have those routes available to them, upgraded to arterial standards. The Alessandro route would reach Redlands Blvd. at Cactus Ave. instead of at Alessandro. The change would not lengthen the route between Gilman Springs Rd. and the Riverside Community Regional Medical Center on Cactus Ave. or the route to and from the Kaiser Moreno Valley Community Hospital on Iris Ave. The extension of Eucalyptus Ave. through the WLC would provide an upgraded [59] route to the project site from the nearest existing fire station (the Moreno Beach fire station). Moreover, the WLC would include a fire station on site.

## D. TRANSIT, PEDESTRIAN, AND BICYCLE FACILITIES

There is currently no transit service in the project area. The WLC would be designed to accommodate bus access on all project streets. Bus turn-outs and shelters would be provided at all active bus stops. It

[59] There is currently a gated connection available to emergency vehicles only between Fir (future Eucalyptus) Avenue and Redlands Blvd.

is expected that transit service would be provided once the project reaches a transit-supportable level of operations.

The WLC pedestrian and bicycle facilities were described previously in Chapter 4 (see Figure 37, Figure 38, etc.).

## E. CONSTRUCTION TRAFFIC IMPACTS

A project phasing plan was developed to estimate the level of construction activity occurring during any given year during build-out of the project. Based on this plan, the expected level of truck activity related to construction of the project is shown in Table 84.

**Table 84: Estimated Construction-Related Truck Traffic**

| Land Use | 2022 Study Year | | |
|---|---|---|---|
| | Daily | AM Peak Hour | PM Peak Hour |
| **Building** | | | |
| Concrete Trucks | 50 | 5 | 5 |
| Material Delivery Trucks | 20 | 2 | 2 |
| Service/Support Trucks | 80 | 8 | 8 |
| **Utilities** | | | |
| Service/Support Trucks | 15 | 2 | 2 |
| **Curbing** | | | |
| Concrete Trucks | 4 | 1 | 1 |
| Service/Support Trucks | 5 | 1 | 1 |
| **Paving** | | | |
| Service/Support Trucks | 5 | 1 | 1 |
| **Landscaping** | | | |
| Service/Support Trucks | 6 | 1 | 1 |
| **Project Total** | **185** | **21** | **21** |

In addition, the estimated construction activity would generate approximately 250 inbound car trips during the AM peak hour and 250 outbound car trips during the PM peak hour in 2022. This traffic was added onto the traffic forecasts used in the LOS analysis.

## F. TRUCK TRIPS TO PORT

Several comments received on the Draft EIR indicated confusion regarding the volume of truck traffic between the WLC and the Ports of Los Angeles and Long Beach. In general, the DEIR commenters

seemed to believe that the truck traffic between the WLC and the ports will be much higher than will actually occur. This section responds to these comments by 1) describing the current share of port-related use of warehouse space, 2) estimating the truck traffic between the WLC and the ports using three different methods, 3) estimating the growth in WLC truck traffic to the port over time, and 4) determining whether WLC trucks would impose significant impacts on the freeways to the ports beyond those identified in previous chapters.

*Current Share of Port-Related Warehouse Space*

The DEIR commenters referred to SCAG's study entitled *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities*[60]. This study states that 13% of the occupied warehouse space in the SCAG region in 2009 was port-related. This indicates that while the ports are important sources of demand for warehouse space, the great majority of warehouse space serves other demands. In a large regional economy such as southern California this other demand amounted to 578 million square feet in 2009, and is growing over time.

The SCAG study also shows wide differentiation in the markets served. As can be seen in Table 85[61], Riverside County serves only a small percentage of port-related demand while playing a much more important role in serving non-port demand. This differentiation reflects the tendency of warehouse tenants whose operations rely on the ports to self-select locations close to the port.

**Table 85: Share of Port and Non-Port Demand by County**

| County | Share of Port Demand for Warehouse Space | Share of Non-Port Demand for Warehouse Space |
|---|---|---|
| Los Angeles | 61% | 21% |
| Orange | 7% | 7% |
| Ventura | 1% | 3% |
| San Bernardino | 19% | 34% |
| Riverside | 12% | 34% |
| Imperial | 0% | 1% |
| Total | 100% | 100% |

The information provided in the report indicates that only 5% of the warehouse space in Riverside County serves port-related demand (See Table 87), which suggests that the volume of truck traffic between the ports and warehouses in Riverside County, including those in WLC, will be relatively small.

---

60 *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities (Task Report 5)*, SCAG, June 2010

61 Ibid

The study also reached two conclusions regarding the regional supply of warehouse space, taken from the report's Executive Summary (pages ES-1 and ES-2):

- "*According to assumed growth rates, the region will run out of suitably zoned vacant land in about the year 2028. At that time, forecasts show that the demand for warehousing space will be approximately 1,023 million square feet.*
- *During the year 2035, there will be a projected shortfall of space of about 228 million square feet, unless other land not currently zoned for warehousing becomes available.*"

In other words, according to SCAG study cited by the commenters, even if all of the land currently zoned for warehouse space were developed, there would still be a massive shortfall of warehouse space by 2035 unless projects like the WLC are approved and built.

*Estimating Truck Trips between WLC and the Ports*

In order to ensure that a reasonable worst case scenario was used for the impact analysis, the number of truck trips between the WLC and the ports was forecast using three different methods, all based on data provided by regional planning agencies, with the highest of the three forecasts used for the analysis. The three methods were as follows:

*Method 1: RivTAM Model*

The first method for estimating truck trips to the port was to use the RivTAM model. As described in Chapter 2, RivTAM is the standard traffic forecasting tool used by agencies in Riverside County to analyze the regional effects of proposed projects. Like most other traffic models, RivTAM assigns trips to destinations using a gravity model where the number of trips between each origin-destination pair increases in proportion to the number of trips generated at each end, but decreases in proportion to the distance between the origin and destination. The effect of distance on the likelihood of travel between origin-destination pairs is determined by the trip length distribution which in turn is based on survey data.

The WLC's proposed land uses were input into the RivTAM model as described in Chapter 2, the model was run, and the outputs were checked to find how many truck trips were assigned between the port TAZs and the WLC. Using the RivTAM model to estimate truck trips yields **82 truck trips per day between the ports and the WLC** if the WLC were built today (i.e. the 2012 Plus Full Build-Out scenario).

*Method 2: Based on Port Truck Study*

The best information currently available on truck trips from the ports comes from the Ports of Los Angeles and Long Beach Year 2010 Marine Terminal Gate Surveys[62]. These surveys found that 1.5% of truck trips entering the ports came from Riverside County, and 1.7% of trucks leaving the ports went to Riverside County. These finding are consistent with an earlier study[63] that found 1% of truck trips entering the ports came from Riverside County and 2% of truck trips leaving the ports went to Riverside County (the numbers are rounded in the study). Applying the percentages from the 2010 survey to the approximately 50,000 truck trips per day generated by the ports[64] yields a total of approximately 800 trucks per day between the ports and Riverside County.

If we make the conservative assumption that every one of these 800 truck trips goes to a warehouse rather than to a factory, store, or some other destination, and divide these trips among the 136 million square feet of occupied warehouse space in Riverside County, we find an average of 5.9 truck trips to or from the ports per million square feet of warehouse space per day. Applying this rate to the 40.6 million square feet of warehouse space proposed for the WLC yields **240 truck trips per day between the ports and the WLC** if the WLC were built today (the 2012 Plus Full Build-Out scenario).

*Method 3: Based on Truck Flows from Riverside County*

The best information currently available on regional truck traffic patterns comes from SCAG's Goods Movement Study[65] that was done in preparation for the 2012 RTP/SCS. Table 86 shows SCAG's estimated truck flows between Riverside County and other locations.

---

62 Technical Memorandum, *Ports of Los Angeles and Long Beach Year 2010 Marine Terminal Gate Surveys*, Cambridge Systematics to SCAG, November 2010

63 *Ports of Long Beach/Los Angeles Transportation Study*, Meyer, Mohaddes Associates, June 2001

64 *Goods Movement Appendix, Regional Transportation Plan 2012-2035*, SCAG, April 2012

65 *Draft Regional Transportation Plan 2012-2035*, *Goods Movement Appendix,* Southern California Association of Governments. December 2011.

**Table 86: Location of Other End of Trip, for Truck Trips Beginning or Ending in Riverside County**

| Trip Origin or Destination | Truck Trips | Percent of Truck Trips |
|---|---|---|
| Outside the SCAG Region | 11,183 | 10.4% |
| Port (including Secondary Trips) | 1,569 | 1.5% |
| Intermodal Facilities | 271 | 0.3% |
| Other Places in SCAG Region | 94,469 | 87.9% |
| Total | 107,492 | 100.0% |

Applying the ports' 1.5% share of Riverside County truck trips applies to WLC's 11,600 medium and heavy truck trips per day yields **174 truck trips per day between the ports and the WLC** if the WLC were built today (the 2012 Plus Full Build-Out scenario).

This analysis shows that a reasonable estimate of truck traffic between WLC and the ports would be in the range of 84-to-240 truck trips per day. The higher figure of 240 truck trips per day was used as a reasonable worst-case scenario.

*Growth in Truck Trips to the Port*

Some comments suggested that the analysis should consider the possibility that the share of warehouse space in the Inland Empire, and by extension the WLC, may grow over time. This section addresses those comments.

As discussed previously (see Table 86) currently only 1.5% (one and a half percent) of the truck trips in Riverside County are to or from the ports. In the future, port-related uses are anticipated to require a greater share of warehouse space. Table 87 shows the expected growth in port-related cargo's share of warehouse space by county. For Riverside County, SCAG estimates that the percentage of warehouse space devoted to port uses would more than triple between 2012 and 2035, from 5.0% to 16.3%.

**Table 87: Percentage of Warehouse Space that is Port-Related[66]**

| Year | Los Angeles | Orange | Riverside | San Bernardino | Ventura | Imperial | Total |
|---|---|---|---|---|---|---|---|
| **2012** | 27.8% | 6.0% | 5.0% | 5.4% | 3.6% | 0.0% | 15.9% |
| **2022** | 30.2% | 15.7% | 9.3% | 14.6% | 5.4% | 0.0% | 19.3% |
| **2035** | 28.3% | 28.5% | 16.3% | 21.8% | 7.6% | 0.0% | 22.5% |

[66] Source: *Industrial Space in Southern California: Future Supply and Demand for Warehousing and Intermodal Facilities* (Task 5 Report), Southern California Association of Governments. June 2010, pages 16-19.

Note that the percentage of warehouse space devoted to port-related cargo will always be larger than the percentage of trucks going to and from the port. That is because the cargo that has come from the port to the warehouse then leaves the warehouse in trucks going to non-port destinations. There may also be inbound truck trips to warehouses from places other than the ports, delivering shipments of packaging material and other items which might be combined with port-related cargo, thus further reducing the proportion of trucks that come from the ports.

The estimated percentage of WLC trucks going to the ports is summarized in Table 88. The percentage of WLC going to the port (2.07%) was estimated from 240 truck trips per day to the port compared to 11,621 total medium and heavy truck trips to and from the WLC.

**Table 88: Percentage of WLC Trucks to or from the Port**

| Year | % of Warehouse Space Used for Port-Related Cargo | % of Truck Trips Going to and from the Ports |
|---|---|---|
| 2012 | 5.00% | 2.07% |
| 2022 | 9.30% | 3.86% |
| 2035 | 16.30% | 6.76% |

These percentages were then applied to the trip generation rates to obtain the number of WLC trucks to and from the port for each analysis period. These are shown in Table 89. Tests with the SCAG traffic model showed that these trips would split approximately evenly between the two routes shown in Figure 56 and thus, half of these trips were assigned to the SR-60 route and half to the SR-91 route.

**Table 89: WLC Truck Trips to and from the Port by Analysis Period[67]**

| Scenario | AM Peak Hour | | PM Peak Hour | | Daily | |
|---|---|---|---|---|---|---|
| | In | Out | In | Out | In | Out |
| 2012 Plus Build-out | 18 | 10 | 14 | 17 | 121 | 121 |
| 2022 Plus Phase 1 | 19 | 11 | 15 | 18 | 127 | 127 |
| 2035 Plus Build-out | 57 | 33 | 46 | 53 | 393 | 393 |

*Determination of Whether Impacts are Significant*

The potential for traffic impacts along the SR-60 and SR-91 corridors was assessed by manually adding the forecasts for WLC trucks to and from the port to the No-Project condition from the SCAG model. Because the ports and the freeways leading to them are in Los Angeles County, the threshold of

[67] The 2022 Plus Phase 1 scenario has only half as much warehouse space as the 2012 Plus Full Build-Out scenario but, because the percent of space devoted to port uses nearly doubles in the 2012-to-2022 period, the truck trips to the port (once rounded to whole numbers) are nearly the same.

significance for the analysis was taken from the Los Angeles County Congestion Management Program (CMP)[68]. The CMP states that a significant impact would be deemed to occur if the project increased demand on a highway by at least 2% causing LOS "F" or, if the highway facility already operates at LOS "F", then a significant impact would be deemed to occur if the project increases traffic demand by 2% or more of capacity.

Table 90 through Table 101[69] show the results of this analysis for each section of the SR-60 and SR-91 corridors and in each direction, for both the AM and PM peak periods, for three of the four Plus Build-out scenarios studied in other sections of the report[70]. As shown in the tables the addition of the WLC traffic, which ranges from 0.05% to 1.17% of non-project traffic, would not cause a significant impact on any segment of these freeways.

---

[68] Note that Caltrans has not established thresholds of significance for freeway impacts, and neither have the CMPs for Orange, San Bernardino, or Riverside Counties.

[69] The determination of whether the 2% threshold was reached was done in Passenger Car Equivalents. Please see Chapter 2 Section A for an explanation of the PCE factors used.

[70] For freeway traffic the Existing Plus Phase 1 (Only) scenario is identical to the 2012 Plus Full Build-Out scenario but with only half as much warehouse space and so only half as many freeway truck trips. If the 2012 Plus Full Build-Out scenario does not generate any significant impacts then the Phase 1 (only) would necessarily not generate any significant impacts, either.

## G. GENERAL PLAN CONFORMITY

The City General Plan has established a set of goals, policies, and objectives for the Circulation Element. Table 102 shows how the WLC project conforms to these goals, policies, and objectives with the implementation of the proposed Specific Plan and General Plan amendments. In Table 102 WLCSP refers to the World Logistics Center Specific Plan while WLC is the World Logistics Center business entity for the project's development that ensures implementation of mitigations.

**Table 102: Conformity to General Plan (as Amended)**

| Goals, Policies, and Objectives<br>Goal, Policy, or Objective as Stated in the General Plan | | Consistent? | Explanation |
|---|---|---|---|
| **9.5 Circulation Element Goals, Objectives. Policies and Programs** | | | |
| **9.5.1 Circulation Element Goals** | | | |
| Goal 5.1 | Develop a safe, efficient, environmentally and financially sound, integrated vehicular circulation system consistent with the City General Plan Circulation Element Map, Figure 9-1, which provides access to development and supports mobility requirements of the system's users. | Yes | The WLC Specific Plan (WLCSP) meets the intent of the General Plan Circulation Element Map based on land use and design criteria. The WLCSP provides planned cross sections that satisfy minimum City requirements and serve the unique needs of logistics development. |
| Goal 5.2 | Maintain safe and adequate pedestrian, bicycle, and public transportation systems to provide alternatives to single occupant vehicular travel and to support planned land uses. | Yes | The WLCSP supports this goal of the General Plan Circulation Element based on land use and design criteria. All on-site roads would include design features to facilitate the use of alternative transportation modes including but not limited to bus, bicycle, pedestrian, etc. |
| **9.5.2 Circulation Element Objectives and Policies** | | | |
| ***Objective 5.1*** | ***Create a safe, efficient and neighborhood- friendly street system.*** | Yes | The WLCSP supports this objective in that the specific plan is designed to reduce vehicle and pedestrian conflicts near residential neighborhoods by prohibiting truck access to nearby residential areas. |
| Policy 5.1.1 | Plan access and circulation of each development project to accommodate vehicles (including emergency vehicles and trash trucks), pedestrians, and bicycles. | Yes | The planned street network features multiple routes to most buildings and would have two major east-west connectors called for in the General Plan. This would facilitate the passage of emergency and service vehicles. On-site roads would be provided with sidewalks and bicycle lanes. All of the WLC logistics buildings would be provided with bicycle racks. |
| Policy 5.1.2 | Plan the circulation system to reduce conflicts between vehicular, pedestrian and bicycle traffic. | Yes | The project features modern roundabouts at key locations, which are proven to be effective in reducing the frequency and severity of traffic accidents.<br>Pedestrian ways are not curb-adjacent, and streets are designed to accommodate bikeways. |
| Policy 5.1.3 | Require adequate off-street parking for all developments. | Yes | Off-street parking would be provided for all WLC buildings in accordance with City of Moreno Valley standards. |

| | | | |
|---|---|---|---|
| Policy 5.1.4 | Driveway placement shall be designed for safety and to enhance circulation wherever possible. | Yes | Driveway design and placement would not be less than City code or engineering standards. Specific proposals will be reviewed with the plot plans. |
| Policy 5.1.5 | Incorporate American Disability Act (ADA) and Title 24 requirements in roadway improvements as appropriate. | Yes | ADA compliant paths of travel would be required with all building permits. |
| Policy 5.1.6 | Design new developments to provide opportunity for access and circulation to future adjacent developments. | Yes | The WLCSP is bounded by SR-60 to the north, Gilman Springs Rd. to the east, and permanent open space to the south. There is a small amount of developable land west of the project that would benefit from the construction of Cactus Ave. Extension. |
| ***Objective 5.2*** | ***Implement access management policies.*** | Yes | The WLCSP supports this objective by prohibiting truck movements on Cactus Ave. Extension. All developments subject to plot plans including detailed access management conditions. |
| Policy 5.2.1 | Locate residential units with access from local streets. Minimize direct residential access from collectors. Prohibit direct single-family driveway access on arterials and higher classification roadways. | NA | The project has no residential component. Existing non-conforming uses would continue to have driveway access as long as the use continues. |
| Policy 5.2.2 | Feed short local streets into collectors. | NA | The project has no local streets. All on-site streets are classified as arterials or collectors and meet City standards. |
| Policy 5.2.3 | Encourage the incorporation of traffic calming design into local and collector streets to promote safe vehicle speeds. | Yes | The project has no residential component that would need traffic calming. There are three roundabouts to ensure that vehicle movement is fluid and to reduce pedestrian and vehicle conflicts. |
| Policy 5.2.4 | Design new subdivisions to minimize the disruptive impact of motor vehicles on local streets. Long, broad and linear streets should be avoided. Residential streets should be no wider than 40 feet, and should have an uninterrupted length of less than one half mile. Curvilinear streets and cul-de-sacs are preferred. Streets within the subdivision should be designed to facilitate access to residences and to discourage through traffic. | NA | The project has no residential component and so design features intended to enhance the quality of life for residents of the street are not applicable to the WLCSP. |

| | | | |
|---|---|---|---|
| ***Objective 5.3*** | ***Maintain Level of Service (LOS) "C" on roadway links, wherever possible, and LOS "D" in the vicinity of SR 60 and high employment centers. Figure 9-2 depicts the LOS standards that are applicable to all segments of the General Plan Circulation Element Map.*** | Yes | All WLC streets would be designed to function at LOS D or better. |
| Policy 5.3.1 | Obtain right-of-way and construct roadways in accordance with the designations shown on the General Plan Circulation Element Map and the City street improvement standards. | Yes | The project would obtain right-of-way and construct roadways in accordance with the General Plan Circulation Element Map as revised. |
| Policy 5.3.2 | Wherever feasible, promote the development of roadways in accordance with the City standard roadway cross-sections, as shown in Figure 9-3. Cross-sections range from two-lane undivided roadways to 8-lane divided facilities. | Yes | The project would develop roadways in accordance with City standard cross-sections. |
| Policy 5.3.3 | Create new roadway classifications to accommodate future traffic demand, including; Divided Major Arterial – Reduced Cross-Section, and Divided Arterial – 6-lane. These cross-sections are shown on Figure 9-3. | Yes | The project would develop roadways in accordance with City standard cross-sections. |
| Policy 5.3.4 | For planning purposes, utilize LOS standards shown on Table 5 –1 to determine recommended roadway widths. | Yes | The City LOS standards were used to develop the General Plan Amendment. |
| Policy 5.3.5 | Ensure that new development pays a fair share of costs to provide local and regional transportation improvements and to mitigate cumulative traffic impacts. For this purpose, require new developments to participate in Transportation Uniform Mitigation Fee Program (TUMF), the Development Impact Fee Program (DIF) and any other applicable transportation fee programs and benefit assessment districts. | Yes | The WLC would participate in the TUMF and DIF programs. |

| | | | |
|---|---|---|---|
| Policy 5.3.6 | Where new developments would increase traffic flows beyond the LOS C (or LOS D, where applicable), require appropriate and feasible mitigation measures as a condition of approval. Such measures may include extra right-of-way and improvements to accommodate left-turn and right-turn lanes at intersections, or other improvements. | Yes | The project applicant would pay fair-share contributions towards improvements needed to mitigate the project's traffic impacts where applicable. |
| Policy 5.3.7 | Provide consideration to projects that have overriding regional or local benefits that would be desirable even though the LOS standards cannot be met. These projects would be required to analyze traffic impacts and mitigate such impacts to the extent that it is deemed feasible. | Yes | Moreno Valley's jobs/housing ratio is currently very imbalanced, with too few jobs for the number of employable residents. By creating a large number of jobs in a housing-rich area, The WLCSP would reduce the need for long-distance out-commuting. The WLC has the potential to support reverse commute conditions reducing westbound commute impacts on SR-60. Also, the project helps fill the expected deficit in warehousing capacity that SCAG has identified as a drag on the regional economy (see *Logistics & Distribution: An Answer to Regional Upward Social Mobility*, SCAG June 2004). |
| Policy 5.3.8 | Pursue arterial improvements that link and/or cross the State route 60 (SR-60) Freeway, including an additional over-crossing at Graham St. | Yes | The project would participate in the TUMF program which funds interchange improvements. |
| Policy 5.3.9 | Address additional widenings at arterials providing access to SR-60 at Day St., Frederick St./Pigeon Pass Rd. and Perris Blvd. | Yes | The project would fund its fair share of improvements to these roads through its contributions to DIF and TUMF. |
| ***Objective 5.4*** | ***Maximize efficiency of the regional circulation system through close coordination with state and regional agencies and implementation of regional transportation policies.*** | Yes | WLC would pay all applicable DIF and TUMF fees and would participate in other multi-jurisdictional funding programs as established. |
| Policy 5.4.1 | Coordinate with Caltrans and the Riverside County Transportation Commission (RCTC) to identify and protect ultimate rights-of-way, including those for freeways, regional arterial projects, transit, bikeways and interchange expansion. | Yes | Project-specific Plot Plans and subdivisions would provide for the ultimate rights of way or regional facilities. |

| | | | |
|---|---|---|---|
| Policy 5.4.2 | Coordinate with Caltrans and RCTC regarding the integration of Intelligent Transportation Systems (ITS) consistent with the principles and recommendations of the Inland Empire Regional ITS Architecture Project. | NA | This policy concerns system-wide improvements that are not associated with individual development projects. |
| Policy 5.4.3 | Work with property owners, in cooperation with RCTC, to reserve rights-of-way for potential Community and Environmental Transportation Acceptability Process (CETAP) corridors through site design, dedication, and land acquisition, as appropriate. | NA | The project site is not on any of the four corridors being studied: Winchester to Temecula, Hemet to the Corona/Lake Elsinore area, west Moreno Valley to San Bernardino County, and Riverside County to Orange County. |
| Policy 5.4.4 | The City Council will commit to establishing ongoing relationships with all agencies that play a role in the development of the City's transportation system. Council members who are appointed to these agencies as City representatives shall seek out leadership roles to maximize their effectiveness on behalf of the City. Council will strive to maintain continuity in their appointments of representatives. | NA | This policy concerns relationships that are not associated with individual development projects. |
| Policy 5.4.5 | Work with RCTC, WRCOG, and the TUMF Central Zone Committee to facilitate the expeditious construction of TUMF Network projects, especially projects that directly benefit Moreno Valley. | Yes | The WLC would participate in the TUMF program. |
| Policy 5.4.6 | Cooperatively participate with SCAG, RCTC, and WRCOG in the planning for a transportation system that anticipates regional needs for the safe and efficient movement of goods and people. | NA | This policy is not directly related to the WLC project. |
| Policy 5.4.7 | Utilizing a combination of regional, state and federal funds, development impact fees, and other locally generated funds, provide needed improvements along SR 60 and the associated interchanges, including interchange and grade separation improvements. | Yes | With implementation of a cooperative program, the WLC would participate in a fair-share funding program for improvements to SR-60, if such a program is established among all contributing jurisdictions. |

| | | | |
|---|---|---|---|
| Policy 5.4.8 | Reserve rights-of-way to accomplish future improvements as specified in the Caltrans District 8 Route Concept Fact Sheet for SR-60. Specifically, SR-60 shall be built to six general purpose lanes and two High Occupancy Vehicle (HOV) lanes through Moreno Valley. Additional auxiliary lanes may be required between interchanges. The need for auxiliary lanes will be determined from future studies. | Yes | The City would work with Caltrans to define and protect the ultimate right-of-way for SR-60 and its interchange at Theodore St. |
| Policy 5.4.9 | Lobby the State Legislature to keep triple trailer trucks off highways in developed areas of California. | NA | This policy is not directly related to the WLC project. |
| ***Objective 5.5*** | ***Maximize efficiency of the local circulation system by using appropriate policies and standards to design, locate and size roadways.*** | Yes | The WLCSP supports this objective by requiring right of way standards that accommodates automobile and truck traffic that the project requires. Street cross sections meet or exceed minimum City standards. |
| Policy 5.5.1 | Space Collectors between higher classification roadways within development areas at appropriate one-quarter mile intervals. | Yes | The WLCSP supports this policy. The spacing of roadways for collectors is at appropriate intervals to reflect the size and scale of the WLC buildings. |
| Policy 5.5.2 | Provide dedicated left-turn lanes at all major intersections on minor arterials and higher classification roadways. | Yes, Partially | The most critical intersections within the project site would use modern roundabout rather than conventional intersections. These conform to the intent of the policy which is to minimize conflicts between left-turning traffic and through traffic. Subsequent subdivision applications will provide dedicated left-turn lanes in public streets as required by the City. |
| Policy 5.5.3 | Prohibit points of access from conflicting with other existing or planned access points. Require points of access to roadways to be separated sufficiently to maintain capacity, efficiency, and safety of the traffic flow. | Yes | Plot plans and subdivisions would be reviewed to analyze all points of access on a project by project basis. The WLC features a relatively small number of very large buildings. There would therefore be fewer access points needed than for the same square footage of conventional low-rise commercial buildings. The driveways to WLC would be located away from intersections at distances not be less than required by City code or engineering standards. |

| | | | |
|---|---|---|---|
| Policy 5.5.4 | Wherever possible, minimize the frequency of access points along streets by the consolidation of access points between adjacent properties on all circulation element streets, excluding collectors. | Yes | The WLC features a relatively small number of very large buildings. There would be fewer access points needed than for the same square footage of conventional low-rise business parks. Plot plans and subdivisions would be reviewed to analyze all points of access on a project by project basis. |
| Policy 5.5.5 | Design streets and intersections in accordance with the Moreno Valley Municipal Code. | Yes | Project streets and intersections would be built to comply with City standards. The cross-sections would be designed to accommodate the type of traffic associated with high-cube logistics. |
| Policy 5.5.6 | Consider the overall safety, efficiency and capacity of street designs as more important than the location of on-street parking. | Yes | On-street parking would be prohibited except at selected locations within the project subject to city approval. Safety, efficiency, and the capacity of the street would be key factors in selecting the location of on-street parking areas. |
| Policy 5.5.7 | For developments fronting both sides of a street, require that streets be constructed to full width. Where new developments front only one side of a street, require that streets be constructed to half width plus an additional 12-foot lane for opposing traffic, whenever possible. Additional width may be needed for medians or left and/or right turn lanes. | Yes | The applicant would comply with this policy. |
| Policy 5.5.8 | Whenever possible, require private and public land developments to provide on-site and off-site improvements necessary to mitigate any development-generated circulation impacts. A review of each proposed land development project shall be undertaken to identify project impacts to the circulation system. The City may require developers to provide traffic impact studies prepared by qualified professionals to identify the impacts of a development. | Yes | A traffic impact study has been conducted for the project. Improvements needed to mitigate project impacts have been identified. The project would pay TUMF and DIF fees that would cover its share of many improvements, and would pay its fair share towards the cost of implementing the remaining (non-TUMF or DIF) improvements. |
| Policy 5.5.9 | Design curves and grades to permit safe movement of vehicular traffic per applicable Caltrans and Moreno Valley standards. | Yes | All WLC roadways would be designed to meet or exceed City standards. |

| | | | |
|---|---|---|---|
| Policy 5.5.10 | Provide adequate sight distances for safe vehicular movement at all intersections and driveways. | Yes | Plot plans and subdivisions would be reviewed to ensure compliance with City standards. Driveways would provide sight distances per City code and engineering standards. |
| Policy 5.5.11 | Implement National Pollutant Discharge Elimination System (NPDES) Best Management Practices (BMPs) relating to construction of roadways to control runoff contamination from affecting water resources. | Yes | The WLCSP would design streets to comply with NPDES BMPs for street run-off. |
| ***Objective 5.6*** | ***Support development of a ground access system to March Inland Port in accordance with its development plan as a major cargo airport.*** | NA | The WLC is not related to the March Inland Cargo Port project. |
| Policy 5.6.1 | Ensure that City arterials that provide access to and from March Inland Port are properly designed to accommodate projected traffic volumes, including truck traffic. | NA | The WLC is not involved in the development of the March Inland Cargo Port. |
| Policy 5.6.2 | Ensure that traffic routes to March Inland Port are planned to minimize impacts to City residential communities. | NA | The WLC is not involved in the development of the March Inland Cargo Port. |
| ***Objective 5.7*** | ***Design roads to meet the needs of the residents of the community without detracting from the "rural" atmosphere in designated portions of Moreno Valley. (Designated "rural" areas include those encompassed by the Residential Agriculture 2, Residential 1, Rural Residential and Hillside Residential zoning districts. "Urban" areas encompass all other zoning districts.)*** | NA | The WLC project has no rural residential component. |
| Policy 5.7.1 | Pursue development of modified sidewalk standards for local and collector roads within low density areas to reflect the rural character of those areas. | NA | The WLC would not be a low density residential area. |

| | | | |
|---|---|---|---|
| Policy 5.7.2 | Provide sidewalks on arterials in designated low density areas that provide access to schools and bus stops. | NA | There is no residential component in this project. |
| ***Objective 5.8*** | ***Encourage development of an efficient public transportation system for the entire community.*** | Yes | All WLC streets would accommodate bus traffic, bus turnouts, and shelters. |
| Policy 5.8.1 | Support the development of high-speed transit linkages, or express routes, that would benefit the citizens and employers of Moreno Valley. | Yes | All WLC streets would accommodate bus traffic, bus turnouts, and shelters. |
| Policy 5.8.2 | Support the efforts of the March Joint Powers Authority in its pursuit of a Transit Center | NA | This policy is not directly related to the WLC. |
| Policy 5.8.3 | Encourage public transportation opportunities that address the particular needs of transit dependent individuals in the City such as senior citizens, the disabled and low -income residents. | Yes | The WLC would be designed to accommodate transit. The City would work with Riverside Transit Agency to develop routes serving WLC when development on the site has reached transit-supportive levels. |
| Policy 5.8.4 | Ensure that all new developments make adequate provision for bus stops and turnout areas for both public transit and school bus service. | Yes | WLC would provide bus turn-outs and shelters at all active bus stops. |
| Policy 5.8.5 | Continue on-going coordination with transit authorities toward the expansion of transit facilities into newly developed areas. | Yes | The WLC would be designed to accommodate transit and would work with transit operators to establish routes once the WLC has reached a transit-supportive level of development. |

| | | | |
|---|---|---|---|
| ***Objective 5.9*** | ***Support and encourage development of safe, efficient and aesthetic pedestrian facilities.*** | Yes | The WLCSP establishes right of way standards and street sections appropriate for an employment center. The Specific Plan requires pedestrian ways (sidewalks) along both sides of all streets in the WLC. Project provides multi-use trails throughout. |
| Policy 5.9.1 | Encourage walking as an alternative to single occupancy vehicle travel, and help ensure the safety of the pedestrian as follows: | Yes | The WLC encourages walking to work by providing jobs within walking distance of many homes in Moreno Valley. |
| | (a) All new developments shall provide sidewalks in conformance with the City's streets cross-section standards, and applicable policies for designated urban and rural areas. | Yes | All streets in the WLC would conform to GP cross-sections, as amended including the provision of sidewalks on all streets. |
| | (b) The City shall actively pursue funding for the infill of sidewalks in developed areas. The highest priority shall be to provide sidewalks on designated school routes. | NA | The WLC is not an infill area. |
| Policy 5.9.2 | Walkways shall be designed to minimize conflicts between vehicles and pedestrians. | Yes | All streets and sidewalks in the WLC would meet minimum city standards |
| Policy 5.9.3 | Where appropriate, provide amenities such as, but not limited to, enhanced paving, seating, and landscaping to enhance the pedestrian experience. | Yes | The WLC provides and supports pedestrian facilities along street right of ways as designed. California-friendly and drought-tolerant landscaping would be incorporated into the plan to create a pleasing environment. |
| Policy 5.9.4 | Require the provision of convenient and safe pedestrian access to buildings from the public sidewalk. | Yes | Pedestrian considerations are incorporated into the appropriate streetscapes and rely on individual building site planning efforts as established in the development standards and design guidelines. All plot plans would provide such access. |

| | | | |
|---|---|---|---|
| ***Objective 5.10*** | ***Encourage bicycling as an alternative to single occupant vehicle travel for the purpose of reducing fuel consumption, traffic congestion, and air pollution. The Moreno Bikeway Plan is shown in Figure 9-4.*** | Yes | All WLC streets would provide class II bikeways. The WLCSP provides continued trail use on the west side of Redlands Blvd. towards Alessandro Blvd. The WLCSP establishes right of way standards conducive to the economic center and to support heavy truck use. Pedestrian considerations are incorporated into the appropriate streetscapes and rely on individual building site planning efforts as established in the development standards and design guidelines. |
| Policy 5.10.1 | Bikeways shall link residential neighborhood areas with parks, employment centers, civic and commercial areas, and schools. | Yes | All streets within the WLC will include class II bikeways. They will link to bikeways to the west to provide paths between residential areas outside WLC and employment centers within the WLC site. |
| Policy 5.10.2 | Integrate bikeways, consistent with the Bikeway Plan, with the circulation system and maintain Class II and III bikeways as part of the City's street system. | Yes | The WLCSP provides continued trail use on the west side of Redlands Blvd. towards Alessandro Blvd. Class II bikeways are provided on all streets in the WLC. |
| Policy 5.10.3 | Support bicycle safety programs, and active enforcement of laws relating to the safe operation of bicycles on City streets. | NA | This is a system-wide policy not associated with any specific development proposal. |
| Policy 5.10.4 | Link local bikeways with existing and planned regional bikeways. | Yes | All streets within the WLC will include class II bikeways. They would link to bikeways to the west to provide paths between residential areas outside WLC and employment centers in WLC. |
| ***Objective 5.11*** | ***Eliminate obstructions that impede safe movement of vehicles, bicyclists, and pedestrians.*** | Yes | The WLC would provide a comprehensively planned network of roads, bikeways, pedestrian ways and trails to facilitate, efficient, safe travel for vehicles, cyclists, and pedestrians. Roadways would be designed with 8-ft shoulders with no parking, allowing unobstructed Class II bikeways. |

| | | | |
|---|---|---|---|
| Policy 5.11.1 | Landscaping adjacent to City streets, sidewalks and bikeways shall be designed, installed and maintained so as not to physically or visually impede public use of these facilities. | Yes | WLC landscape design standards would provide a safe environment for motorists, pedestrians, and cyclists that would not impede visibility or access to facilities. Landscape areas adjacent to streets would be maintained by a Property Owner Association |
| | (a) The removal or relocation of mature trees, street trees and landscaping may be necessary to construct safe pedestrian, bicycle and street facilities. | NA | Existing vegetation may be removed to provide adequate pedestrian, bicycle, and street facilities. |
| | (b) New landscaping, especially street trees shall be planted in such a manner to avoid overhang into streets, obstruction of traffic control devices or sight distances, or creation of other safety hazards. | Yes | The WLCSP would establish right of way standards and street design that allow for safe sight distances. |
| Policy 5.11.2 | Driveways shall be designed to avoid conflicts with pedestrian and bicycle travel. | Yes | Project-specific Plot Plans and subdivisions would be reviewed and approved by the City to ensure the safe design of streets, bikeways, and pedestrian ways. |
| ***Objective 5.12*** | ***Promote efficient circulation planning for all school sites that will maximize pedestrian safety, and minimize traffic congestion and neighborhood impacts.*** | NA | There are no schools in the WLC. |
| Policy 5.12.1 | Coordinate with school districts to identify suggested pedestrian routes within existing and new subdivisions for school children to walk to and from schools and/or bus stops. | NA | There are no schools in the WLC. |
