Watershed F, Stream 1, Subarea F1
Existing Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area = 98.90(Ac.) = 0.155 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 98.90(Ac.) = 0.155 Sq. Mi.
Length along longest watercourse = 3020.00(Ft.)
Length along longest watercourse measured to centroid = 1040.00(Ft.)
Length along longest watercourse = 0.572 Mi.
Length along longest watercourse measured to centroid = 0.197 Mi.
Difference in elevation = 85.00(Ft.)
Slope along watercourse = 148.6093 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.121 Hr.
Lag time = 7.29 Min.
25% of lag time = 1.82 Min.
40% of lag time = 2.91 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 98.90 | 1.80 | 178.02 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 98.90 | 4.50 | 445.05 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

SubF124100

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.98 %
Adjusted average point rain = 4.499(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 50.000 | 76.00 | 0.000 |
| 47.000 | 85.00 | 0.000 |
| 1.900 | 90.00 | 0.000 |

Total Area Entered = 98.90(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 76.0 | 76.0 | 0.291 | 0.000 | 0.291 | 0.506 | 0.147 |

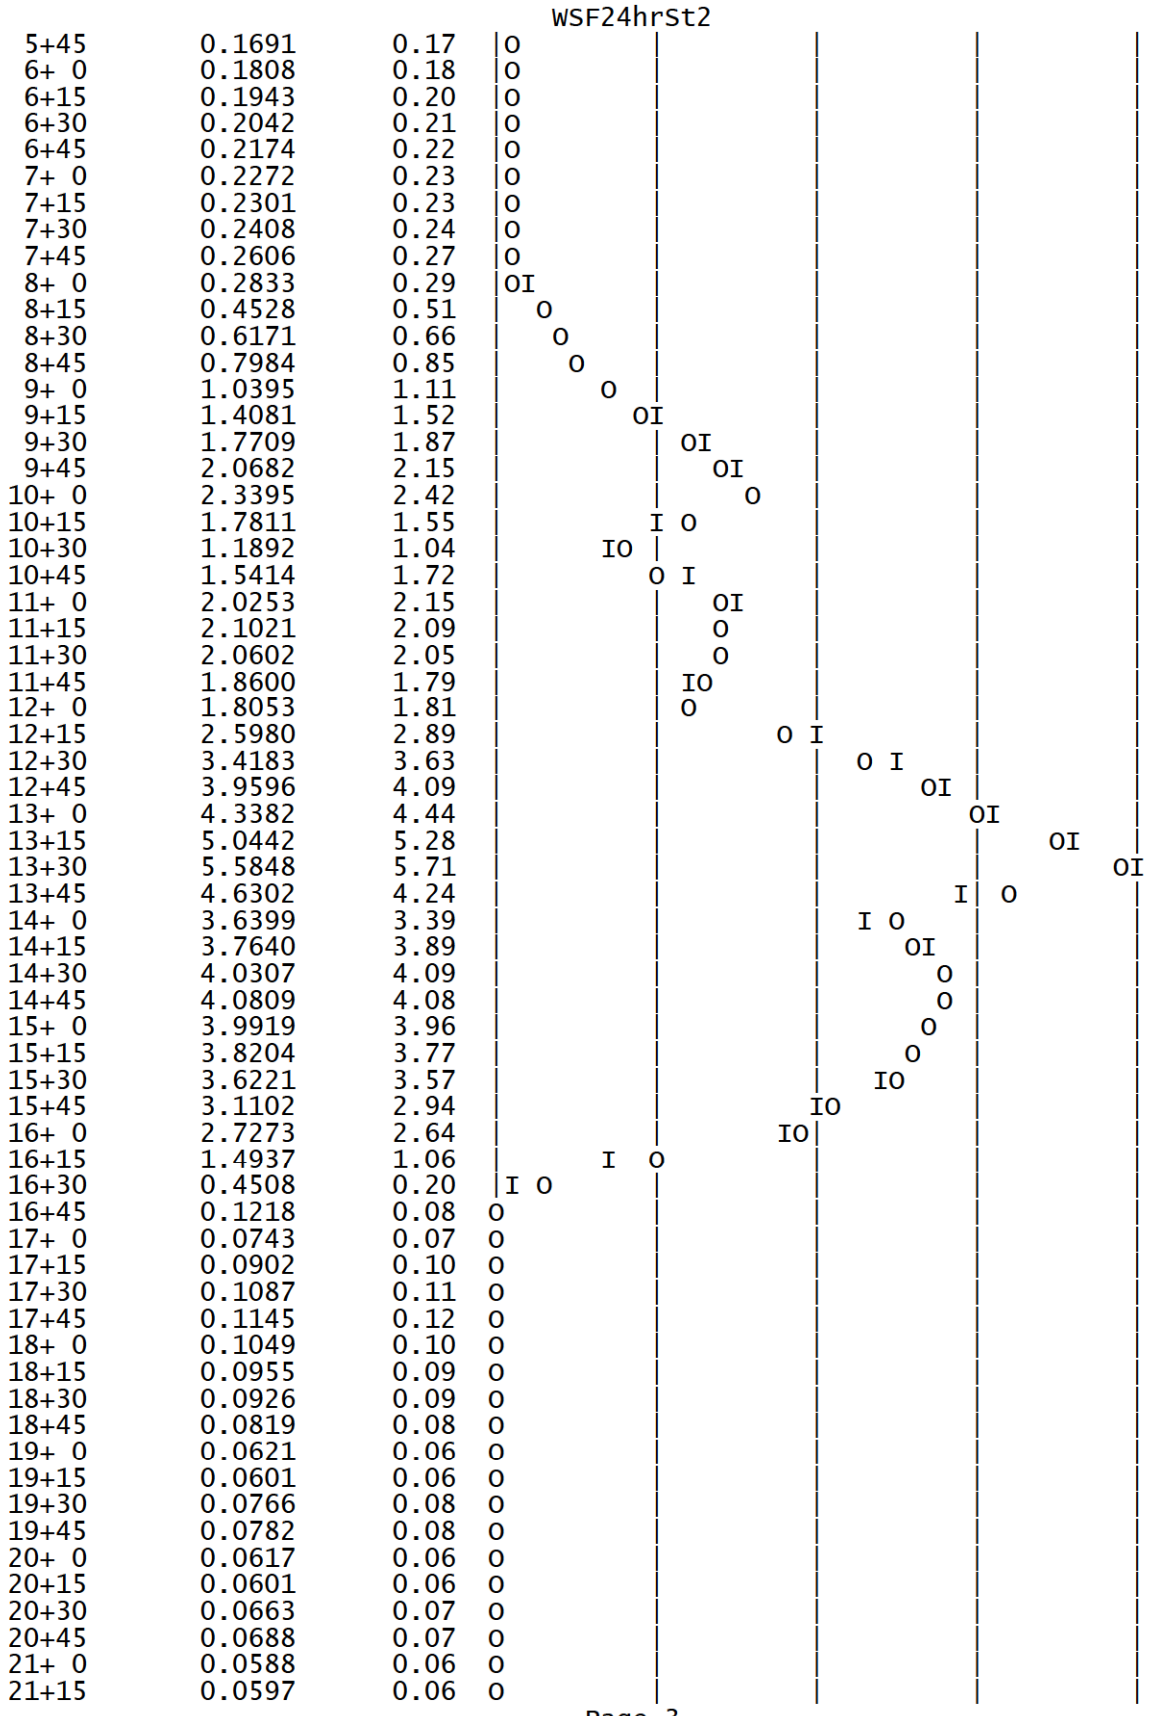
**** STREAM ROUTING SCS CONVEX METHOD ****
---
HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 950.00 (Ft.)
Elevation difference = 28.00 (Ft.)
Slope of channel = 0.029474 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 950.00(Ft.) Elevation difference = 28.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 10.000(Ft.)
Slope or 'Z' of left channel bank = 2.000
Slope or 'Z' of right channel bank = 2.000
Manning's 'N' = 0.030
Maximum depth of channel = 5.000(Ft.)
Flow(q) thru subarea = 1.432(CFS)
Depth of flow = 0.086(Ft.)
Average velocity = 1.635(Ft/s)
Total flow rate = 1.432(CFS)
Channel flow top width = 10.344(Ft.)
Depth of flow in channel = 0.09(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 1.64(Ft/s)
Travel time = 0.00 min.

```
Individual channel flow =    1.432(CFS)
Total capacity of improved channels =      1.432(CFS)
Critical Depth in Channel =    0.09(Ft.)



Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea =      5.714(CFS)
Depth of flow =     0.197(Ft.)
Average velocity =     2.792(Ft/s)
Total flow rate =     5.714(CFS)
Channel flow top width =   10.788(Ft.)
Depth of flow in channel =   0.20(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =    2.79(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =    5.714(CFS)
Total capacity of improved channels =      5.714(CFS)
Critical Depth in Channel =    0.21(Ft.)

********************** SCS CONVEX CHANNEL ROUTING **********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.6215   Travel time =   5.67 (min.)
         dt*(unit time interval) =  15.00(min.),  e=   3.1702
         dt(routing time-step) =   3.52 (min.),   c* =   0.9541

Output hydrograph delayed by 0  unit time increments

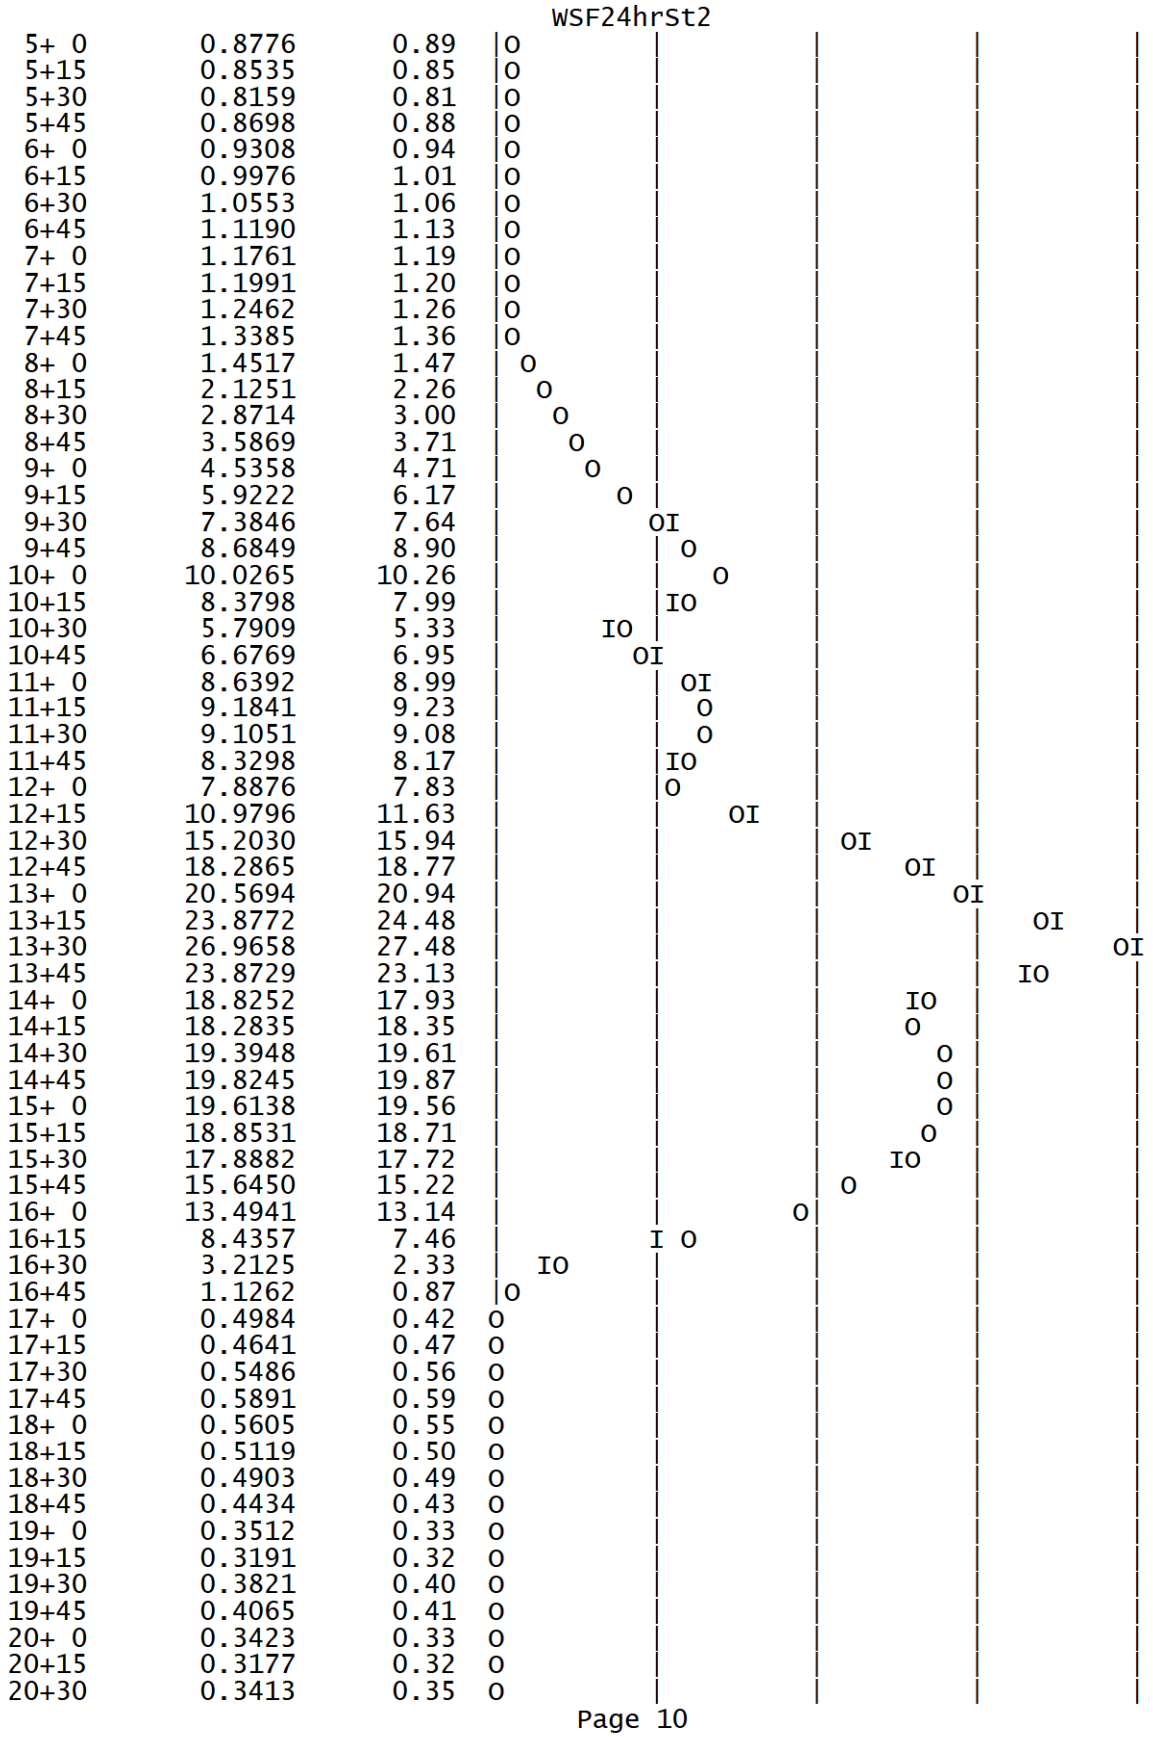
HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 980.00 (Ft.)
Elevation difference = 25.00 (Ft.)
Slope of channel = 0.025510 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 980.00(Ft.) Elevation difference = 25.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 10.000(Ft.)
Slope or 'Z' of left channel bank = 2.000
Slope or 'Z' of right channel bank = 2.000
Manning's 'N' = 0.030
Maximum depth of channel = 5.000(Ft.)
Flow(q) thru subarea = 6.715(CFS)
Depth of flow = 0.226(Ft.)
Average velocity = 2.838(Ft/s)
Total flow rate = 6.715(CFS)
Channel flow top width = 10.905(Ft.)
Depth of flow in channel = 0.23(Ft.)

Total number of channels (same dimensions) = 1
Flow Velocity = 2.84(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 6.715(CFS)
Total capacity of improved channels = 6.715(CFS)
Critical Depth in Channel = 0.24(Ft.)



Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 27.480(CFS)
Depth of flow = 0.522(Ft.)
Average velocity = 4.765(Ft/s)
Total flow rate = 27.480(CFS)
Channel flow top width = 12.089(Ft.)
Depth of flow in channel = 0.52(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 4.77(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 27.480(CFS)
Total capacity of improved channels = 27.480(CFS)
Critical Depth in Channel = 0.59(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.7371 Travel time = 3.43 (min.)
dt*(unit time interval) = 15.00(min.), e= 4.2918
dt(routing time-step) = 2.53 (min.), c* = 0.9968

Output hydrograph delayed by 0 unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****
---
HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 2360.00 (Ft.)
Elevation difference = 69.00 (Ft.)
Slope of channel = 0.029237 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 2360.00(Ft.) Elevation difference = 69.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 10.000(Ft.)
Slope or 'Z' of left channel bank = 2.000
Slope or 'Z' of right channel bank = 2.000
Manning's 'N' = 0.030
Maximum depth of channel = 5.000(Ft.)
Flow(q) thru subarea = 1.200(CFS)
Depth of flow = 0.078(Ft.)
Average velocity = 1.522(Ft/s)
Total flow rate = 1.200(CFS)
Channel flow top width = 10.311(Ft.)
Depth of flow in channel = 0.08(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 1.52(Ft/s)
Travel time = 0.00 min.

Individual channel flow = 1.200(CFS)
Total capacity of improved channels = 1.200(CFS)
Critical Depth in Channel = 0.08(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 6.330(CFS)
Depth of flow = 0.210(Ft.)
Average velocity = 2.895(Ft/s)
Total flow rate = 6.330(CFS)
Channel flow top width = 10.839(Ft.)
Depth of flow in channel = 0.21(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 2.90(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 6.330(CFS)
Total capacity of improved channels = 6.330(CFS)
Critical Depth in Channel = 0.23(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.6301 Travel time = 13.58 (min.)
dt*(unit time interval) = 15.00(min.), e= 1.5016
dt(routing time-step) = 8.56 (min.), c* = 0.7754

Output hydrograph delayed by 0 unit time increments

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

----------------------------------------------------------------------
Watershed F, Stream 2, Subarea F2
Existing Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area = 12.70(Ac.) = 0.020 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 12.70(Ac.) = 0.020 Sq. Mi.
Length along longest watercourse = 980.00(Ft.)
Length along longest watercourse measured to centroid = 750.00(Ft.)
Length along longest watercourse = 0.186 Mi.
Length along longest watercourse measured to centroid = 0.142 Mi.
Difference in elevation = 25.00(Ft.)
Slope along watercourse = 134.6939 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.071 Hr.
Lag time = 4.27 Min.
25% of lag time = 1.07 Min.
40% of lag time = 1.71 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 12.70 | 1.80 | 22.86 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 12.70 | 4.50 | 57.15 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 12.700 | 85.00 | 0.000 |

Total Area Entered = 12.70(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

----------------------------------------------------------------------
English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

----------------------------------------------------------------------
Watershed F, Stream 2, Subarea F3
Existing Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area = 6.50(Ac.) = 0.010 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 6.50(Ac.) = 0.010 Sq. Mi.
Length along longest watercourse = 950.00(Ft.)
Length along longest watercourse measured to centroid = 630.00(Ft.)
Length along longest watercourse = 0.180 Mi.
Length along longest watercourse measured to centroid = 0.119 Mi.
Difference in elevation = 28.00(Ft.)
Slope along watercourse = 155.6211 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.064 Hr.
Lag time = 3.85 Min.
25% of lag time = 0.96 Min.
40% of lag time = 1.54 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 6.50 | 1.80 | 11.70 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 6.50 | 4.50 | 29.25 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 6.500 | 85.00 | 0.000 |

Total Area Entered = 6.50(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Drainage Area = 17.50(Ac.) = 0.027 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 17.50(Ac.) = 0.027 Sq. Mi.
Length along longest watercourse = 1610.00(Ft.)
Length along longest watercourse measured to centroid = 650.00(Ft.)
Length along longest watercourse = 0.305 Mi.
Length along longest watercourse measured to centroid = 0.123 Mi.
Difference in elevation = 139.00(Ft.)
Slope along watercourse = 455.8509 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.065 Hr.
Lag time = 3.88 Min.
25% of lag time = 0.97 Min.
40% of lag time = 1.55 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 17.50 | 1.80 | 31.50 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 17.50 | 4.50 | 78.75 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

SubF3124100

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 2.200 | 46.00 | 0.000 |
| 2.900 | 66.00 | 0.000 |
| 12.400 | 83.00 | 0.000 |

Total Area Entered = 17.50(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

----------------------------------------------------------------------
English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

----------------------------------------------------------------------
Watershed F, Stream 2, Subarea F32
Existing Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area = 29.80(Ac.) = 0.047 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 29.80(Ac.) = 0.047 Sq. Mi.
Length along longest watercourse = 2360.00(Ft.)
Length along longest watercourse measured to centroid = 1350.00(Ft.)
Length along longest watercourse = 0.447 Mi.
Length along longest watercourse measured to centroid = 0.256 Mi.
Difference in elevation = 69.00(Ft.)
Slope along watercourse = 154.3729 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.121 Hr.
Lag time = 7.27 Min.
25% of lag time = 1.82 Min.
40% of lag time = 2.91 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 29.80 | 1.80 | 53.64 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 29.80 | 4.50 | 134.10 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 27.600 | 85.00 | 0.000 |
| 2.200 | 90.00 | 0.000 |

Total Area Entered = 29.80(Ac.)

----------------------------------------------------------------------

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

----------------------------------------------------------------------
English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

----------------------------------------------------------------------
Watershed F, Stream 2, Subarea F4
Existing Condition
100-year, 3-hour

----------------------------------------------------------------------
Drainage Area = 54.70(Ac.) = 0.085 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 54.70(Ac.) = 0.085 Sq. Mi.
Length along longest watercourse = 3200.00(Ft.)
Length along longest watercourse measured to centroid = 1700.00(Ft.)
Length along longest watercourse = 0.606 Mi.
Length along longest watercourse measured to centroid = 0.322 Mi.
Difference in elevation = 330.00(Ft.)
Slope along watercourse = 544.5000 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.117 Hr.
Lag time = 7.01 Min.
25% of lag time = 1.75 Min.
40% of lag time = 2.81 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 54.70 | 1.80 | 98.46 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 54.70 | 4.50 | 246.15 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

SubF424100

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 4.000 | 46.00 | 0.000 |
| 9.300 | 66.00 | 0.000 |
| 41.400 | 83.00 | 0.000 |

Total Area Entered = 54.70(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 46.0 | 46.0 | 0.611 | 0.000 | 0.611 | 0.073 | 0.045 |
| 66.0 | 66.0 | 0.405 | 0.000 | 0.405 | 0.170 | 0.069 |
| 83.0 | 83.0 | 0.210 | 0.000 | 0.210 | 0.757 | 0.159 |
| | | | | | Sum (F) = | 0.272 |

Area averaged mean soil loss (F) (In/Hr) = 0.272
Minimum soil loss rate ((In/Hr)) = 0.136
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Unit Hydrograph Data

| Unit time period (hrs) | | Time % of lag | Distribution Graph % | Unit Hydrograph (CFS) |
|---|---|---|---|---|
| 1 | 0.250 | 213.856 | 44.943 | 24.776 |
| 2 | 0.500 | 427.712 | 48.675 | 26.833 |
| 3 | 0.750 | 641.568 | 5.562 | 3.066 |
| 4 | 1.000 | 855.424 | 0.820 | 0.452 |
| | | | Sum = 100.000 | Sum= 55.127 |

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

| Unit | Time (Hr.) | Pattern Percent | Storm Rain (In/Hr) | Loss rate(In./Hr) Max | Low | Effective (In/Hr) |
|---|---|---|---|---|---|---|

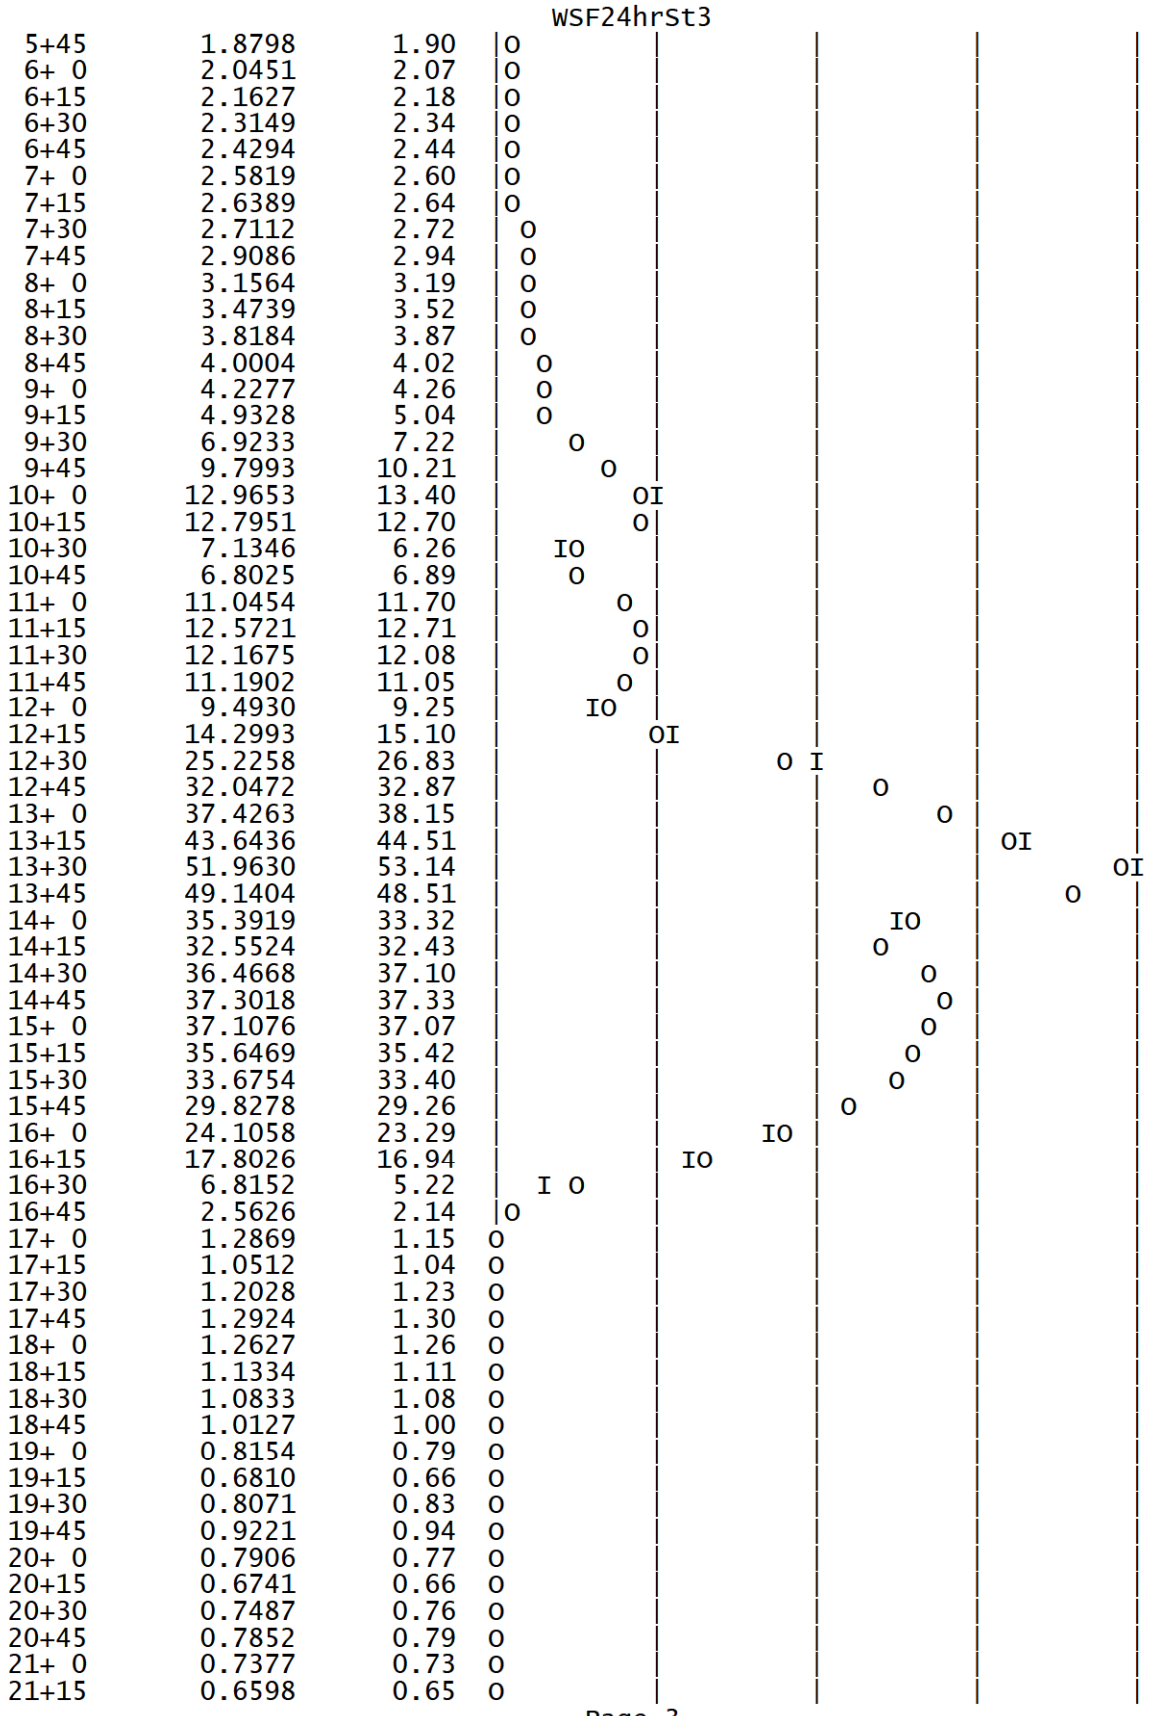
**** STREAM ROUTING SCS CONVEX METHOD ****
---
HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 980.00 (Ft.)
Elevation difference = 29.00 (Ft.)
Slope of channel = 0.029592 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 980.00(Ft.) Elevation difference = 29.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 10.000(Ft.)
Slope or 'Z' of left channel bank = 2.000
Slope or 'Z' of right channel bank = 2.000
Manning's 'N' = 0.030
Maximum depth of channel = 5.000(Ft.)
Flow(q) thru subarea = 11.507(CFS)
Depth of flow = 0.298(Ft.)
Average velocity = 3.638(Ft/s)
Total flow rate = 11.507(CFS)
Channel flow top width = 11.194(Ft.)
Depth of flow in channel = 0.30(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 3.64(Ft/s)
Travel time = 0.00 min.

Individual channel flow = 11.507(CFS)
Total capacity of improved channels = 11.507(CFS)
Critical Depth in Channel = 0.34(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 53.141(CFS)
Depth of flow = 0.736(Ft.)
Average velocity = 6.296(Ft/s)
Total flow rate = 53.141(CFS)
Channel flow top width = 12.943(Ft.)
Depth of flow in channel = 0.74(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 6.30(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 53.141(CFS)
Total capacity of improved channels = 53.141(CFS)
Critical Depth in Channel = 0.90(Ft.)



********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.7874 Travel time = 2.59 (min.)
dt*(unit time interval) = 15.00(min.), e= 5.2286
dt(routing time-step) = 2.04 (min.), c* = 0.9997

Output hydrograph delayed by 0 unit time increments

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

----------------------------------------------------------------------
English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

----------------------------------------------------------------------
Watershed F, Steam 3, Subarea F5
Existing Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area = 146.60(Ac.) = 0.229 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 146.60(Ac.) = 0.229 Sq. Mi.
Length along longest watercourse = 5600.00(Ft.)
Length along longest watercourse measured to centroid = 3020.00(Ft.)
Length along longest watercourse = 1.061 Mi.
Length along longest watercourse measured to centroid = 0.572 Mi.
Difference in elevation = 408.00(Ft.)
Slope along watercourse = 384.6857 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.192 Hr.
Lag time = 11.53 Min.
25% of lag time = 2.88 Min.
40% of lag time = 4.61 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 146.60 | 1.80 | 263.88 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 146.60 | 4.50 | 659.70 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

SubF524100

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.97 %
Adjusted average point rain = 4.499(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 15.100 | 46.00 | 0.000 |
| 11.500 | 66.00 | 0.000 |
| 120.000 | 83.00 | 0.000 |

Total Area Entered = 146.60(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 46.0 | 46.0 | 0.611 | 0.000 | 0.611 | 0.103 | 0.063 |
| 66.0 | 66.0 | 0.405 | 0.000 | 0.405 | 0.078 | 0.032 |
| 83.0 | 83.0 | 0.210 | 0.000 | 0.210 | 0.819 | 0.172 |
| | | | | | Sum (F) = | 0.266 |

Area averaged mean soil loss (F) (In/Hr) = 0.266
Minimum soil loss rate ((In/Hr)) = 0.133
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

----------------------------------------------------------------------
English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

----------------------------------------------------------------------
Watershed F, Stream 3, Subarea F6
Existing Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area = 4.90(Ac.) = 0.008 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 4.90(Ac.) = 0.008 Sq. Mi.
Length along longest watercourse = 980.00(Ft.)
Length along longest watercourse measured to centroid = 480.00(Ft.)
Length along longest watercourse = 0.186 Mi.
Length along longest watercourse measured to centroid = 0.091 Mi.
Difference in elevation = 29.00(Ft.)
Slope along watercourse = 156.2449 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.058 Hr.
Lag time = 3.51 Min.
25% of lag time = 0.88 Min.
40% of lag time = 1.40 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 4.90 | 1.80 | 8.82 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 4.90 | 4.50 | 22.05 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

SubF624100

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 4.900 | 85.00 | 0.000 |

Total Area Entered = 4.90(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

**** STREAM ROUTING SCS CONVEX METHOD ****

HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 350.00 (Ft.)
Elevation difference = 11.00 (Ft.)
Slope of channel = 0.031429 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 350.00(Ft.) Elevation difference = 11.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 10.000(Ft.)
Slope or 'Z' of left channel bank = 2.000
Slope or 'Z' of right channel bank = 2.000
Manning's 'N' = 0.030
Maximum depth of channel = 5.000(Ft.)
Flow(q) thru subarea = 5.063(CFS)
Depth of flow = 0.180(Ft.)
Average velocity = 2.719(Ft/s)
Total flow rate = 5.063(CFS)
Channel flow top width = 10.719(Ft.)
Depth of flow in channel = 0.18(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 2.72(Ft/s)
Travel time = 0.00 min.

Individual channel flow = 5.063(CFS)
Total capacity of improved channels = 5.063(CFS)
Critical Depth in Channel = 0.20(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 25.151(CFS)
Depth of flow = 0.466(Ft.)
Average velocity = 4.937(Ft/s)
Total flow rate = 25.151(CFS)
Channel flow top width = 11.864(Ft.)
Depth of flow in channel = 0.47(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 4.94(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 25.151(CFS)
Total capacity of improved channels = 25.151(CFS)
Critical Depth in Channel = 0.56(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.7439 Travel time = 1.18 (min.)
dt*(unit time interval) = 15.00(min.), e= 11.7113
dt(routing time-step) = 0.88 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

Drainage Area = 69.50(Ac.) = 0.109 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 69.50(Ac.) = 0.109 Sq. Mi.
Length along longest watercourse = 3750.00(Ft.)
Length along longest watercourse measured to centroid = 1820.00(Ft.)
Length along longest watercourse = 0.710 Mi.
Length along longest watercourse measured to centroid = 0.345 Mi.
Difference in elevation = 285.00(Ft.)
Slope along watercourse = 401.2800 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.135 Hr.
Lag time = 8.10 Min.
25% of lag time = 2.03 Min.
40% of lag time = 3.24 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 69.50 | 1.80 | 125.10 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 69.50 | 4.50 | 312.75 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

SubF724100

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.99 %
Adjusted average point rain = 4.499(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 5.300 | 46.00 | 0.000 |
| 14.300 | 66.00 | 0.000 |
| 49.900 | 83.00 | 0.000 |

Total Area Entered = 69.50(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|

----------------------------------------------------------------------
English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

----------------------------------------------------------------------
Watershed F, Stream 4, Subarea F8
Existing Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area = 4.10(Ac.) = 0.006 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 4.10(Ac.) = 0.006 Sq. Mi.
Length along longest watercourse = 350.00(Ft.)
Length along longest watercourse measured to centroid = 200.00(Ft.)
Length along longest watercourse = 0.066 Mi.
Length along longest watercourse measured to centroid = 0.038 Mi.
Difference in elevation = 11.00(Ft.)
Slope along watercourse = 165.9429 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.028 Hr.
Lag time = 1.68 Min.
25% of lag time = 0.42 Min.
40% of lag time = 0.67 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 4.10 | 1.80 | 7.38 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 4.10 | 4.50 | 18.45 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

SubF824100

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 4.100 | 85.00 | 0.000 |

Total Area Entered = 4.10(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

**** STREAM ROUTING SCS CONVEX METHOD ****
---
HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 2549.66 (Ft.)
Elevation difference = 37.90 (Ft.)
Slope of channel = 0.014865 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 2549.66(Ft.) Elevation difference = 37.90(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 12.000(Ft.)
Slope or 'Z' of left channel bank = 0.000
Slope or 'Z' of right channel bank = 0.000
Manning's 'N' = 0.015
Maximum depth of channel = 9.000(Ft.)
Flow(q) thru subarea = 732.800(CFS)
Depth of flow = 3.127(Ft.)
Average velocity = 19.528(Ft/s)
Total flow rate = 732.800(CFS)
Channel flow top width = 12.000(Ft.)
Depth of flow in channel = 3.13(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 19.53(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 732.800(CFS)
Total capacity of improved channels = 732.800(CFS)
Critical Depth in Channel = 4.88(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 1792.150(CFS)
Depth of flow = 5.958(Ft.)
Average velocity = 25.065(Ft/s)
Total flow rate = 1792.150(CFS)

Channel flow top width = 12.000(Ft.)
Depth of flow in channel = 5.96(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 25.07(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 1792.150(CFS)
Total capacity of improved channels = 1792.150(CFS)
Critical Depth in Channel = 8.88(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9365 Travel time = 1.70 (min.)
dt*(unit time interval) = 15.00(min.), e= 6.6319
dt(routing time-step) = 1.59 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   2568.71 (Ft.)
Elevation difference =   49.44 (Ft.)
Slope of channel =  0.019247 (Vert/Hcriz)
Channel type - Improved Channel

Channel length =  2568.71(Ft.)     Elevation difference =  49.44(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width  =   12.000(Ft.)
Slope or 'Z' of left channel bank =   0.000
Slope or 'Z' of right channel bank =   0.000
Manning's 'N'    = 0.015
Maximum depth of channel  =    9.000(Ft.)
Flow(q) thru subarea =    841.267(CFS)
Depth of flow =     3.146(Ft.)
Average velocity =    22.281(Ft/s)
Total flow rate =   841.267(CFS)
Channel flow top width =   12.000(Ft.)
Depth of flow in channel =   3.15(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   22.28(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  841.267(CFS)
Total capacity of improved channels =    841.267(CFS)
Critical Depth in Channel =    5.38(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea =   2012.239(CFS)
Depth of flow =     5.899(Ft.)
Average velocity =    28.426(Ft/s)
Total flow rate =  2012.239(CFS)
Channel flow top width =   12.000(Ft.)
Depth of flow in channel =   5.90(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   28.43(Ft/s)
Travel time  =    0.00 min.
Individual channel flow = 2012.239(CFS)
Total capacity of improved channels =   2012.239(CFS)
Critical Depth in Channel =    9.50(Ft.)

********************** SCS CONVEX CHANNEL ROUTING **********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
         where c* = 1 - (1-c)^e and dt = c(length)/velocity
         c(v/v+1.7) =   0.9436   Travel time =   1.51 (min.)
       dt*(unit time interval) =  15.00(min.),  e=   7.3703
       dt(routing time-step) =   1.42 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

Length of stream = 4281.63 (Ft.)

Elevation difference = 85.63 (Ft.)
Slope of channel = 0.019999 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 4281.63(Ft.) Elevation difference = 85.63(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 12.000(Ft.)
Slope or 'Z' of left channel bank = 0.000
Slope or 'Z' of right channel bank = 0.000
Manning's 'N' = 0.015
Maximum depth of channel = 8.000(Ft.)
Flow(q) thru subarea = 910.196(CFS)
Depth of flow = 3.280(Ft.)
Average velocity = 23.125(Ft/s)
Total flow rate = 910.196(CFS)
Channel flow top width = 12.000(Ft.)
Depth of flow in channel = 3.28(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 23.13(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 910.196(CFS)
Total capacity of improved channels = 910.196(CFS)
Critical Depth in Channel = 5.63(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 1640.000(CFS)
Depth of flow = 4.998(Ft.)
Average velocity = 27.344(Ft/s)
Total flow rate = 1640.000(CFS)
Channel flow top width = 12.000(Ft.)
Depth of flow in channel = 5.00(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 27.34(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 1640.000(CFS)
Total capacity of improved channels = 1640.000(CFS)
Critical Depth in Channel = 8.38(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9415 Travel time = 2.61 (min.)
dt*(unit time interval) = 15.00(min.), e= 4.4034
dt(routing time-step) = 2.46 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

HYDROGRAPH STREAM ROUTING DATA:
Length of stream =    500.00 (Ft.)
Elevation difference =   10.00 (Ft.)
Slope of channel =  0.020000 (Vert/Hcriz)
Channel type - Improved Channel

Channel length =   500.00(Ft.)     Elevation difference =  10.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Covered channel
Channel base width  =   12.000(Ft.)
Slope or 'Z' of left channel bank =   1.000
Slope or 'Z' of right channel bank =   1.000
Manning's 'N'    = 0.015
Maximum depth of channel  =    8.000(Ft.)
Flow(q) thru subarea =    376.055(CFS)
Depth of flow =     1.625(Ft.)
Average velocity =    16.981(Ft/s)
Total flow rate =   376.055(CFS)
Channel flow top width =   15.251(Ft.)
Depth of flow in channel =   1.63(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   16.98(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  376.055(CFS)
Total capacity of improved channels =    376.055(CFS)
Critical Depth in Channel =    2.88(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Covered channel
Flow(q) thru subarea =    931.518(CFS)
Depth of flow =     2.775(Ft.)
```

```
Average velocity =    22.722(Ft/s)
Total flow rate =   931.518(CFS)
Channel flow top width =   17.549(Ft.)
Depth of flow in channel =    2.77(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   22.72(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  931.518(CFS)
Total capacity of improved channels =    931.518(CFS)
Critical Depth in Channel =    4.94(Ft.)

********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.9304   Travel time =   0.37 (min.)
         dt*(unit time interval) =  15.00(min.),  e=  29.6403
         dt(routing time-step) =   0.34 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

Drainage Area = 872.60(Ac.) = 1.363 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 872.60(Ac.) = 1.363 Sq. Mi.
Length along longest watercourse = 10000.00(Ft.)
Length along longest watercourse measured to centroid = 5000.00(Ft.)
Length along longest watercourse = 1.894 Mi.
Length along longest watercourse measured to centroid = 0.947 Mi.
Difference in elevation = 1000.00(Ft.)
Slope along watercourse = 528.000( Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.137 Hr.
Lag time = 8.20 Min.
25% of lag time = 2.05 Min.
40% of lag time = 3.28 Min.
Unit time = 15.00 Min.
Duration of storm = 3 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 872.60 | 0.85 | 741.71 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 872.60 | 1.90 | 1657.94 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 0.850(In)
Area Averaged 100-Year Rainfall = 1.900(In)

Point rain (area averaged) = 1.900(In)
Areal adjustment factor = 99.62 %
Adjusted average point rain = 1.893(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 872.600 | 85.00 | 0.000 |

Total Area Entered = 872.60(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   2549.66 (Ft.)
Elevation difference =   37.90 (Ft.)
Slope of channel =  0.014865 (Vert/Horiz)
Channel type - Improved Channel

Channel length =  2549.66(Ft.)     Elevation difference =  37.90(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width  =   12.000(Ft.)
Slope or 'Z' of left channel bank =   0.000
Slope or 'Z' of right channel bank =   0.000
Manning's 'N'    = 0.015
Maximum depth of channel  =    9.000(Ft.)
Flow(q) thru subarea =    208.441(CFS)
Depth of flow =     1.349(Ft.)
Average velocity =    12.880(Ft/s)
Total flow rate =   208.441(CFS)
Channel flow top width =   12.000(Ft.)
Depth of flow in channel =   1.35(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   12.88(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  208.441(CFS)
Total capacity of improved channels =    208.441(CFS)
Critical Depth in Channel =    2.11(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea =    770.876(CFS)
Depth of flow =     3.239(Ft.)
Average velocity =    19.830(Ft/s)
Total flow rate =   770.876(CFS)
```

```
Channel flow top width =   12.000(Ft.)
Depth of flow in channel =   3.24(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   19.83(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  770.876(CFS)
Total capacity of improved channels =    770.876(CFS)
Critical Depth in Channel =    5.06(Ft.)

********************** SCS CONVEX CHANNEL ROUTING ********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.9210   Travel time =   2.14 (min.)
        dt*(unit time interval) =  15.00(min.),  e=   5.3999
        dt(routing time-step) =   1.97 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 2568.71 (Ft.)
Elevation difference = 49.44 (Ft.)
Slope of channel = 0.019247 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 2568.71(Ft.) Elevation difference = 49.44(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 12.000(Ft.)
Slope or 'Z' of left channel bank = 0.000
Slope or 'Z' of right channel bank = 0.000
Manning's 'N' = 0.015
Maximum depth of channel = 9.000(Ft.)
Flow(q) thru subarea = 251.598(CFS)
Depth of flow = 1.401(Ft.)
Average velocity = 14.963(Ft/s)
Total flow rate = 251.598(CFS)
Channel flow top width = 12.000(Ft.)
Depth of flow in channel = 1.40(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 14.96(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 251.598(CFS)
Total capacity of improved channels = 251.598(CFS)
Critical Depth in Channel = 2.38(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 877.993(CFS)
Depth of flow = 3.242(Ft.)
Average velocity = 22.571(Ft/s)
Total flow rate = 877.993(CFS)
Channel flow top width = 12.000(Ft.)
Depth of flow in channel = 3.24(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 22.57(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 877.993(CFS)
Total capacity of improved channels = 877.993(CFS)
Critical Depth in Channel = 5.50(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9300 Travel time = 1.90 (min.)
dt*(unit time interval) = 15.00(min.), e= 6.0026
dt(routing time-step) = 1.76 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****
---
HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 500.00 (Ft.)
Elevation difference = 10.00 (Ft.)
Slope of channel = 0.020000 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 500.00(Ft.) Elevation difference = 10.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Covered channel
Channel base width = 12.000(Ft.)
Slope or 'Z' of left channel bank = 1.000
Slope or 'Z' of right channel bank = 1.000
Manning's 'N' = 0.015
Maximum depth of channel = 8.000(Ft.)
Flow(q) thru subarea = 97.120(CFS)
Depth of flow = 0.723(Ft.)
Average velocity = 10.563(Ft/s)
Total flow rate = 97.120(CFS)
Channel flow top width = 13.445(Ft.)
Depth of flow in channel = 0.72(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 10.56(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 97.120(CFS)
Total capacity of improved channels = 97.120(CFS)
Critical Depth in Channel = 1.22(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Covered channel
Flow(q) thru subarea = 386.405(CFS)
Depth of flow = 1.652(Ft.)

Average velocity = 17.135(Ft/s)
Total flow rate = 386.405(CFS)
Channel flow top width = 15.304(Ft.)
Depth of flow in channel = 1.65(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 17.14(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 386.405(CFS)
Total capacity of improved channels = 386.405(CFS)
Critical Depth in Channel = 2.94(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9097 Travel time = 0.49 (min.)
dt*(unit time interval) = 15.00(min.), e= 22.9354
dt(routing time-step) = 0.44 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****
______________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =    500.00 (Ft.)
Elevation difference =   10.00 (Ft.)
Slope of channel =  0.020000 (Vert/Horiz)
Channel type - Improved Channel

Channel length =   500.00(Ft.)     Elevation difference =  10.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Covered channel
Channel base width  =    8.000(Ft.)
Slope or 'Z' of left channel bank =   1.000
Slope or 'Z' of right channel bank =   1.000
Manning's 'N'    = 0.015
Maximum depth of channel  =   10.000(Ft.)
Flow(q) thru subarea =     58.102(CFS)
Depth of flow =     0.677(Ft.)
Average velocity =     9.886(Ft/s)
Total flow rate =    58.102(CFS)
Channel flow top width =    9.355(Ft.)
Depth of flow in channel =   0.68(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =    9.89(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =   58.102(CFS)
Total capacity of improved channels =     58.102(CFS)
Critical Depth in Channel =    1.13(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Covered channel
Flow(q) thru subarea =    231.104(CFS)
Depth of flow =     1.540(Ft.)
```

```
Average velocity =    15.726(Ft/s)
Total flow rate =   231.104(CFS)
Channel flow top width =   11.081(Ft.)
Depth of flow in channel =    1.54(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   15.73(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  231.104(CFS)
Total capacity of improved channels =    231.104(CFS)
Critical Depth in Channel =    2.63(Ft.)

********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.9024   Travel time =   0.53 (min.)
        dt*(unit time interval) =  15.00(min.),   e=  21.2449
        dt(routing time-step) =   0.48 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

-----------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

-----------------------------------------------------------------
Watershed A1 Offsite
Proposed Conditions
100 yr 24 hr

----------------------------------------------------------------
Drainage Area =     872.60(Ac.)  =      1.363 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     872.60(Ac.)  =      1.363 Sq. Mi.
Length along longest watercourse =   10000.00(Ft.)
Length along longest watercourse measured to centroid =    5000.00(Ft.)
Length along longest watercourse =      1.894 Mi.
Length along longest watercourse measured to centroid =      0.947 Mi.
Difference in elevation =    1000.00(Ft.)
Slope along watercourse =    528.0000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =    0.137 Hr.
Lag time =     8.20 Min.
25% of lag time =     2.05 Min.
40% of lag time =     3.28 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      872.60             1.80                1570.68

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      872.60             4.50                3926.70

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.83 %
Adjusted average point rain =    4.492(In)

Sub-Area Data:
Area(Ac.)          Runoff Index    Impervious %
   872.600            85.00           0.000
 Total Area Entered =    872.60(Ac.)
```

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

---

Watershed A2 Offsite
Proposed Conditions
100 yr 24 hr

---

Drainage Area = 248.30(Ac.) = 0.388 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 248.30(Ac.) = 0.388 Sq. Mi.
Length along longest watercourse = 8200.00(Ft.)
Length along longest watercourse measured to centroid = 4000.00(Ft.)
Length along longest watercourse = 1.553 Mi.
Length along longest watercourse measured to centroid = 0.758 Mi.
Difference in elevation = 820.00(Ft.)
Slope along watercourse = 528.0000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.116 Hr.
Lag time = 6.98 Min.
25% of lag time = 1.75 Min.
40% of lag time = 2.79 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 248.30 | 1.80 | 446.94 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 248.30 | 4.50 | 1117.35 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.95 %
Adjusted average point rain = 4.498(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 248.300 | 85.00 | 0.000 |

Total Area Entered = 248.30(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------------
Watershed A3 Offsite
Proposed Conditions
100 yr. 24 hr.

------------------------------------------------------------------------
Drainage Area =     521.40(Ac.)  =      0.815 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     521.40(Ac.)  =      0.815 Sq. Mi.
Length along longest watercourse =   10000.00(Ft.)
Length along longest watercourse measured to centroid =    5000.00(Ft.)
Length along longest watercourse =      1.894 Mi.
Length along longest watercourse measured to centroid =      0.947 Mi.
Difference in elevation =    1000.00(Ft.)
Slope along watercourse =    528.0000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =    0.137 Hr.
Lag time =     8.20 Min.
25% of lag time =     2.05 Min.
40% of lag time =     3.28 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      521.40             1.80                938.52

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      521.40             4.50               2346.30

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.90 %
Adjusted average point rain =    4.495(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
   521.400            85.00          0.000
 Total Area Entered =    521.40(Ac.)
```

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.000 | 0.187 | 1.000 | 0.187 |
| | | | | | Sum (F) = | 0.187 |

Area averaged mean soil loss (F) (In/Hr) = 0.187
Minimum soil loss rate ((In/Hr)) = 0.094
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

--------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

--------------------------------------------------------------------
Line A, Subarea A2
Proposed Condition
100-yr, 24-hr

------------------------------------------------------------------
Drainage Area =     293.70(Ac.)  =      0.459 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     293.70(Ac.)  =      0.459 Sq. Mi.
Length along longest watercourse =    3701.83(Ft.)
Length along longest watercourse measured to centroid =     990.93(Ft.)
Length along longest watercourse =      0.701 Mi.
Length along longest watercourse measured to centroid =      0.188 Mi.
Difference in elevation =      27.00(Ft.)
Slope along watercourse =     38.5107 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =    0.083 Hr.
Lag time =     4.99 Min.
25% of lag time =     1.25 Min.
40% of lag time =     2.00 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      293.70             1.80                528.66

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      293.70             4.50               1321.65

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.94 %
Adjusted average point rain =    4.497(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
   293.700           85.00          0.750
 Total Area Entered =    293.70(Ac.)
```

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

---

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

---

Line A, Subarea A1
Proposed Condition
100-yr 24-hr

---

Drainage Area = 211.60(Ac.) = 0.331 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 211.60(Ac.) = 0.331 Sq. Mi.
Length along longest watercourse = 2457.20(Ft.)
Length along longest watercourse measured to centroid = 1302.27(Ft.)
Length along longest watercourse = 0.465 Mi.
Length along longest watercourse measured to centroid = 0.247 Mi.
Difference in elevation = 27.06(Ft.)
Slope along watercourse = 58.1462 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.073 Hr.
Lag time = 4.38 Min.
25% of lag time = 1.10 Min.
40% of lag time = 1.75 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 211.60 | 1.80 | 380.88 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 211.60 | 4.50 | 952.20 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.96 %
Adjusted average point rain = 4.498(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 211.600 | 85.00 | 0.750 |

Total Area Entered = 211.60(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

Proposed Condition
100-yr, 24-hr

------------------------------------------------------------------------
Drainage Area =     119.20(Ac.)  =      0.186 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     119.20(Ac.)  =      0.186 Sq. Mi.
Length along longest watercourse =    3200.00(Ft.)
Length along longest watercourse measured to centroid =    1600.00(Ft.)
Length along longest watercourse =       0.606 Mi.
Length along longest watercourse measured to centroid =       0.303 Mi.
Difference in elevation =      32.00(Ft.)
Slope along watercourse =     52.8000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =     0.089 Hr.
Lag time =      5.34 Min.
25% of lag time =      1.33 Min.
40% of lag time =      2.14 Min.
Unit time =     15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =      0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]        Rainfall(In)[2]       Weighting[1*2]
      119.20              1.80                  214.56

100 YEAR Area rainfall data:

Area(Ac.)[1]        Rainfall(In)[2]       Weighting[1*2]
      119.20              4.50                  536.40

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =     1.800(In)
Area Averaged 100-Year Rainfall =     4.500(In)

Point rain (area averaged) =     4.500(In)
Areal adjustment factor =    99.98 %
Adjusted average point rain =     4.499(In)

Sub-Area Data:
Area(Ac.)          Runoff Index    Impervious %
   119.200            85.00           0.750
 Total Area Entered =     119.20(Ac.)
```

Drainage Area = 321.10(Ac.) = 0.502 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 321.10(Ac.) = 0.502 Sq. Mi.
Length along longest watercourse = 3200.00(Ft.)
Length along longest watercourse measured to centroid = 1600.00(Ft.)
Length along longest watercourse = 0.606 Mi.
Length along longest watercourse measured to centroid = 0.303 Mi.
Difference in elevation = 32.00(Ft.)
Slope along watercourse = 52.8000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.089 Hr.
Lag time = 5.34 Min.
25% of lag time = 1.33 Min.
40% of lag time = 2.14 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 321.10 | 1.80 | 577.98 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 321.10 | 4.50 | 1444.95 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.94 %
Adjusted average point rain = 4.497(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 321.100 | 85.00 | 0.750 |

Total Area Entered = 321.10(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   2000.00 (Ft.)
Elevation difference =   40.00 (Ft.)
Slope of channel =  0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  2000.00(Ft.)   Elevation difference =  40.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =   180.883(CFS)
Given pipe size =     96.00(In.)
Calculated individual pipe flow  =   180.883(CFS)
Normal flow depth in pipe =   26.11(In.)
Flow top width inside pipe =   85.44(In.)
Critical Depth =    3.36(Ft.)
Pipe flow velocity =     16.35(Ft/s)
Travel time through pipe =    2.04 min.

Pipe length  =  2000.00(Ft.)   Elevation difference =  40.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =   367.343(CFS)
Given pipe size =     96.00(In.)
Calculated individual pipe flow  =   367.343(CFS)
Normal flow depth in pipe =   37.88(In.)
Flow top width inside pipe =   93.84(In.)
Critical Depth =    4.87(Ft.)
Pipe flow velocity =     19.93(Ft/s)
Travel time through pipe =    1.67 min.

********************** SCS CONVEX CHANNEL ROUTING ********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
         where c* = 1 - (1-c)^e and dt = c(length)/velocity
         c(v/v+1.7) =   0.9214   Travel time =   1.67 (min.)
       dt*(unit time interval) =  15.00(min.),   e=   6.8217
       dt(routing time-step) =   1.54 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****
________________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   3500.00 (Ft.)
Elevation difference =   70.00 (Ft.)
Slope of channel =  0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  3500.00(Ft.)   Elevation difference =  70.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =     4.827(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =     4.827(CFS)
Normal flow depth in pipe =    4.91(In.)
Flow top width inside pipe =   36.30(In.)
Critical depth could not be calculated.
Pipe flow velocity =      5.77(Ft/s)
Travel time through pipe =   10.12 min.

Pipe length  =  3500.00(Ft.)   Elevation difference =  70.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =    27.237(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =    27.237(CFS)
Normal flow depth in pipe =   11.20(In.)
Flow top width inside pipe =   52.20(In.)
Critical Depth =    1.37(Ft.)
Pipe flow velocity =      9.70(Ft/s)
Travel time through pipe =    6.01 min.
```

```
********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.8509   Travel time =   6.01 (min.)
        dt*(unit time interval) =  15.00(min.),  e=   2.2882
        dt(routing time-step) =   5.12 (min.),   c* =   0.9872

Output hydrograph delayed by 0  unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****
_________________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =    4000.00 (Ft.)
Elevation difference =    80.00 (Ft.)
Slope of channel =  0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  4000.00(Ft.)   Elevation difference =  80.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =     40.899(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =     40.899(CFS)
Normal flow depth in pipe =    13.66(In.)
Flow top width inside pipe =    56.47(In.)
Critical Depth =     1.69(Ft.)
Pipe flow velocity =     10.94(Ft/s)
Travel time through pipe =     6.09 min.

Pipe length  =  4000.00(Ft.)   Elevation difference =  80.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =    103.363(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =    103.363(CFS)
Normal flow depth in pipe =    21.80(In.)
Flow top width inside pipe =    66.16(In.)
Critical Depth =     2.74(Ft.)
Pipe flow velocity =     14.32(Ft/s)
Travel time through pipe =     4.66 min.

********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =    0.8939   Travel time =    4.66 (min.)
        dt*(unit time interval) =  15.00(min.),   e=    2.7363
        dt(routing time-step) =    4.16 (min.),   c* =    0.9978

Output hydrograph delayed by 0  unit time increments

Process from Point/Station 3.000 to Point/Station 3.000
**** RETARDING BASIN ROUTING ****

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 112
Hydrograph time unit = 15.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

| Basin Depth (Ft.) | Storage (Ac.Ft) | Outflow (CFS) | (S-O*dt/2) (Ac.Ft) | (S+O*dt/2) (Ac.Ft) |
|---|---|---|---|---|
| 0.000 | 0.000 | 0.000 | 0.000 | 0.000 |
| 1.000 | 0.001 | 0.001 | 0.001 | 0.001 |
| 2.000 | 0.002 | 0.001 | 0.002 | 0.002 |
| 3.000 | 10.000 | 500.000 | 4.835 | 15.165 |
| 4.000 | 30.000 | 700.000 | 22.769 | 37.231 |
| 6.000 | 41.000 | 900.000 | 31.702 | 50.298 |

Hydrograph Detention Basin Routing

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

**** STREAM ROUTING SCS CONVEX METHOD ****

HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 2000.00 (Ft.)
Elevation difference = 40.00 (Ft.)
Slope of channel = 0.020000 (Vert/Horiz)
Channel type - Pipe

```
Pipe length  =  2000.00(Ft.)   Elevation difference =  40.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =    81.213(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =    81.213(CFS)
Normal flow depth in pipe =   19.25(In.)
Flow top width inside pipe =   63.74(In.)
Critical Depth =    2.41(Ft.)
Pipe flow velocity =     13.37(Ft/s)
Travel time through pipe =    2.49 min.

Pipe length  =  2000.00(Ft.)   Elevation difference =  40.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =   198.176(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =   198.176(CFS)
Normal flow depth in pipe =   30.84(In.)
Flow top width inside pipe =   71.26(In.)
Critical Depth =    3.85(Ft.)
Pipe flow velocity =     17.12(Ft/s)
Travel time through pipe =    1.95 min.

********************** SCS CONVEX CHANNEL ROUTING **********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.9097   Travel time =    1.95 (min.)
        dt*(unit time interval) =  15.00(min.),  e=   5.9798
        dt(routing time-step) =   1.77 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------------
Watershed B, Onsite B1
Proposed Condition
100-yr 24-hr

------------------------------------------------------------------------
Drainage Area =     182.80(Ac.)  =      0.286 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     182.80(Ac.)  =      0.286 Sq. Mi.
Length along longest watercourse =    3500.00(Ft.)
Length along longest watercourse measured to centroid =    1750.00(Ft.)
Length along longest watercourse =       0.663 Mi.
Length along longest watercourse measured to centroid =       0.331 Mi.
Difference in elevation =      70.00(Ft.)
Slope along watercourse =    105.6000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =     0.084 Hr.
Lag time =     5.01 Min.
25% of lag time =     1.25 Min.
40% of lag time =     2.00 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
        0.00            0.01                 0.00
        0.00            0.01                 0.00
      182.80            1.80               329.04

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      182.80            4.50               822.60

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.96 %
Adjusted average point rain =    4.498(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
   182.800            85.00          0.750
```

Total Area Entered = 182.80(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

--------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

--------------------------------------------------------------------
Watershed B, Onsite B2
Proposed Condition
100-yr, 24-hr

--------------------------------------------------------------------
Drainage Area =     204.50(Ac.)  =      0.320 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     204.50(Ac.)  =      0.320 Sq. Mi.
Length along longest watercourse =     3500.00(Ft.)
Length along longest watercourse measured to centroid =     1700.00(Ft.)
Length along longest watercourse =      0.663 Mi.
Length along longest watercourse measured to centroid =      0.322 Mi.
Difference in elevation =      70.00(Ft.)
Slope along watercourse =     105.6000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =     0.083 Hr.
Lag time =     4.96 Min.
25% of lag time =     1.24 Min.
40% of lag time =     1.98 Min.
Unit time =     15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =      0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]        Rainfall(In)[2]      Weighting[1*2]
      204.50             0.01                 2.04

100 YEAR Area rainfall data:

Area(Ac.)[1]        Rainfall(In)[2]      Weighting[1*2]
      204.50             4.50               920.25

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =     0.010(In)
Area Averaged 100-Year Rainfall =     4.500(In)

Point rain (area averaged) =     4.500(In)
Areal adjustment factor =    99.96 %
Adjusted average point rain =     4.498(In)

Sub-Area Data:

```

```
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   4000.00 (Ft.)
Elevation difference =   80.00 (Ft.)
Slope of channel =  0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  4000.00(Ft.)   Elevation difference =  80.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =   292.188(CFS)
Given pipe size =    96.00(In.)
Calculated individual pipe flow  =   292.188(CFS)
Normal flow depth in pipe =   33.49(In.)
Flow top width inside pipe =   91.51(In.)
Critical Depth =    4.32(Ft.)
Pipe flow velocity =    18.72(Ft/s)
Travel time through pipe =    3.56 min.

Pipe length  =  4000.00(Ft.)   Elevation difference =  80.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =   725.870(CFS)
Given pipe size =    96.00(In.)
Calculated individual pipe flow  =   725.870(CFS)
Normal flow depth in pipe =   56.34(In.)
Flow top width inside pipe =   94.54(In.)
Critical Depth =    6.78(Ft.)
Pipe flow velocity =    23.67(Ft/s)
Travel time through pipe =    2.82 min.

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.9330   Travel time =   2.82 (min.)
        dt*(unit time interval) =  15.00(min.),   e=   4.1390
        dt(routing time-step) =   2.63 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------------
Watershed C, Subdrain Area C3
Proposed Conditions
100 Yr. 3 Hr.

------------------------------------------------------------------------
Drainage Area =      83.70(Ac.)  =      0.131 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =      83.70(Ac.)  =      0.131 Sq. Mi.
Length along longest watercourse =    3000.00(Ft.)
Length along longest watercourse measured to centroid =    1500.00(Ft.)
Length along longest watercourse =      0.568 Mi.
Length along longest watercourse measured to centroid =      0.284 Mi.
Difference in elevation =      50.00(Ft.)
Slope along watercourse =     88.0000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =    0.077 Hr.
Lag time =     4.61 Min.
25% of lag time =     1.15 Min.
40% of lag time =     1.85 Min.
Unit time =    15.00 Min.
Duration of storm = 3 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       83.70                 0.85               71.14

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       83.70                 1.90              159.03

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    0.850(In)
Area Averaged 100-Year Rainfall =    1.900(In)

Point rain (area averaged) =    1.900(In)
Areal adjustment factor =   99.96 %
Adjusted average point rain =    1.899(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
    83.700            85.00          0.750
 Total Area Entered =     83.70(Ac.)

**** STREAM ROUTING SCS CONVEX METHOD ****
______________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   4320.00 (Ft.)
Elevation difference =   46.00 (Ft.)
Slope of channel =  0.010648 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  4320.00(Ft.)   Elevation difference =  46.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =   143.360(CFS)
Given pipe size =     96.00(In.)
Calculated individual pipe flow  =   143.360(CFS)
Normal flow depth in pipe =   27.23(In.)
Flow top width inside pipe =   86.55(In.)
Critical Depth =    2.98(Ft.)
Pipe flow velocity =     12.21(Ft/s)
Travel time through pipe =    5.90 min.

Pipe length  =  4320.00(Ft.)   Elevation difference =  46.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =   441.830(CFS)
Given pipe size =     96.00(In.)
Calculated individual pipe flow  =   441.830(CFS)
Normal flow depth in pipe =   50.34(In.)
Flow top width inside pipe =   95.89(In.)
Critical Depth =    5.36(Ft.)
Pipe flow velocity =     16.55(Ft/s)
Travel time through pipe =    4.35 min.

********************** SCS CONVEX CHANNEL ROUTING **********************
```

Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9069 Travel time = 4.35 (min.)
dt*(unit time interval) = 15.00(min.), e= 2.8683
dt(routing time-step) = 3.94 (min.), c* = 0.9989

Output hydrograph delayed by 0 unit time increments

___________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   1300.00 (Ft.)
Elevation difference =   30.00 (Ft.)
Slope of channel =  0.023077 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  1300.00(Ft.)   Elevation difference =  30.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =   159.585(CFS)
Given pipe size =     96.00(In.)
Calculated individual pipe flow  =   159.585(CFS)
Normal flow depth in pipe =   23.63(In.)
Flow top width inside pipe =   82.70(In.)
Critical Depth =    3.14(Ft.)
Pipe flow velocity =     16.59(Ft/s)
Travel time through pipe =    1.31 min.

Pipe length  =  1300.00(Ft.)   Elevation difference =  30.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =   471.547(CFS)
Given pipe size =     96.00(In.)
Calculated individual pipe flow  =   471.547(CFS)
Normal flow depth in pipe =   41.81(In.)
Flow top width inside pipe =   95.20(In.)
Critical Depth =    5.53(Ft.)
Pipe flow velocity =     22.46(Ft/s)
Travel time through pipe =    0.96 min.

********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.9296   Travel time =   0.96 (min.)
        dt*(unit time interval) =  15.00(min.),  e=  11.4819
        dt(routing time-step) =   0.90 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****
------------------------------------------------------------------------
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   3000.00 (Ft.)
Elevation difference =   50.00 (Ft.)
Slope of channel =  0.016667 (Vert/Horiz)
Channel type - Improved Channel

Channel length =  3000.00(Ft.)     Elevation difference =  50.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Covered channel
Channel base width  =    5.000(Ft.)
Slope or 'Z' of left channel bank =   1.000
Slope or 'Z' of right channel bank =   1.000
Manning's 'N'    = 0.015
Maximum depth of channel  =    5.000(Ft.)
Flow(q) thru subarea =     37.864(CFS)
Depth of flow =     0.732(Ft.)
Average velocity =     9.029(Ft/s)
Total flow rate =    37.864(CFS)
Channel flow top width =    6.463(Ft.)
Depth of flow in channel =   0.73(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =    9.03(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =   37.864(CFS)
Total capacity of improved channels =     37.864(CFS)
Critical Depth in Channel =    1.13(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Covered channel
Flow(q) thru subarea =    154.262(CFS)
Depth of flow =     1.660(Ft.)
```

```
Average velocity =    13.958(Ft/s)
Total flow rate =   154.262(CFS)
Channel flow top width =    8.319(Ft.)
Depth of flow in channel =   1.66(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   13.96(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  154.262(CFS)
Total capacity of improved channels =    154.262(CFS)
Critical Depth in Channel =    2.59(Ft.)

********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.8914   Travel time =   3.58 (min.)
        dt*(unit time interval) =  15.00(min.),  e=   3.4649
        dt(routing time-step) =   3.19 (min.),   c* =   0.9995

Output hydrograph delayed by 0  unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****
________________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =    400.00 (Ft.)
Elevation difference =   10.00 (Ft.)
Slope of channel =  0.025000 (Vert/Horiz)
Channel type - Improved Channel

Channel length =   400.00(Ft.)     Elevation difference =  10.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Covered channel
Channel base width  =    5.000(Ft.)
Slope or 'Z' of left channel bank =   1.000
Slope or 'Z' of right channel bank =   1.000
Manning's 'N'    = 0.015
Maximum depth of channel  =    5.000(Ft.)
Flow(q) thru subarea =      5.237(CFS)
Depth of flow =     0.198(Ft.)
Average velocity =     5.088(Ft/s)
Total flow rate =     5.237(CFS)
Channel flow top width =    5.396(Ft.)
Depth of flow in channel =   0.20(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =    5.09(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =    5.237(CFS)
Total capacity of improved channels =      5.237(CFS)
Critical Depth in Channel =    0.32(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Covered channel
Flow(q) thru subarea =     24.423(CFS)
Depth of flow =     0.499(Ft.)
```

```
Average velocity =     8.897(Ft/s)
Total flow rate =    24.423(CFS)
Channel flow top width =    5.998(Ft.)
Depth of flow in channel =   0.50(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =    8.90(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =   24.423(CFS)
Total capacity of improved channels =     24.423(CFS)
Critical Depth in Channel =    0.85(Ft.)

********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.8396   Travel time =   0.75 (min.)
        dt*(unit time interval) =  15.00(min.),  e=  16.2294
        dt(routing time-step) =   0.63 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------------
Watershed C, Stream 1, Existing Condition
Subarea C21
100-year, 24-hour

------------------------------------------------------------------------
Drainage Area =     180.10(Ac.)  =      0.281 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     180.10(Ac.)  =      0.281 Sq. Mi.
Length along longest watercourse =    5800.00(Ft.)
Length along longest watercourse measured to centroid =    2200.00(Ft.)
Length along longest watercourse =      1.098 Mi.
Length along longest watercourse measured to centroid =      0.417 Mi.
Difference in elevation =     547.00(Ft.)
Slope along watercourse =    497.9586 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time =    0.164 Hr.
Lag time =     9.86 Min.
25% of lag time =     2.47 Min.
40% of lag time =     3.95 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      180.10             1.80                324.18

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      180.10             4.50                810.45

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.96 %
Adjusted average point rain =    4.498(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
    17.000            66.00          0.000
     1.300            77.00          0.000
   161.800            83.00          0.000
```

Total Area Entered = 180.10(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |

| | | | | | Sum (F) = | 0.271 |

Area averaged mean soil loss (F) (In/Hr) = 0.271
Minimum soil loss rate ((In/Hr)) = 0.136
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

---------------------------------------------------------------------------

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

---------------------------------------------------------------------
English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

---------------------------------------------------------------------
Watershed Cm Subdrain Area C2
Proposed Conditions
100 Yr, 24 Hr.

---------------------------------------------------------------------
Drainage Area = 105.00(Ac.) = 0.164 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 105.00(Ac.) = 0.164 Sq. Mi.
Length along longest watercourse = 3000.00(Ft.)
Length along longest watercourse measured to centroid = 1500.00(Ft.)
Length along longest watercourse = 0.568 Mi.
Length along longest watercourse measured to centroid = 0.284 Mi.
Difference in elevation = 50.00(Ft.)
Slope along watercourse = 88.0000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time = 0.077 Hr.
Lag time = 4.61 Min.
25% of lag time = 1.15 Min.
40% of lag time = 1.85 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 105.00 | 1.80 | 189.00 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 105.00 | 4.80 | 504.00 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.800(In)

Point rain (area averaged) = 4.800(In)
Areal adjustment factor = 99.98 %
Adjusted average point rain = 4.799(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 105.000 | 85.00 | 0.750 |

Total Area Entered = 105.00(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

VALLEY S-Curve

Unit Hydrograph Data

| Unit time period (hrs) | | Time % of lag | Distribution Graph % | Unit Hydrograph (CFS) |
|---|---|---|---|---|
| 1 | 0.250 | 325.140 | 59.121 | 62.562 |
| 2 | 0.500 | 650.280 | 35.788 | 37.871 |
| 3 | 0.750 | 975.420 | 5.091 | 5.387 |
| | | | Sum = 100.000 Sum= | 105.820 |

The following loss rate calculations reflect use of the minimum calculated loss rate subtracted from the Storm Rain to produce the maximum Effective Rain value

| Unit | Time (Hr.) | Pattern Percent | Storm Rain (In/Hr) | Loss rate(In./Hr) Max | Low | Effective (In/Hr) |
|---|---|---|---|---|---|---|
| 1 | 0.25 | 0.20 | 0.038 | ( 0.107) | 0.012 | 0.027 |

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------------
Watershed C, Subdrain Area C2
Proposed Conditions
100 Yr, 24 Hr.

------------------------------------------------------------------
Drainage Area =     303.00(Ac.)  =      0.473 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     303.00(Ac.)  =      0.473 Sq. Mi.
Length along longest watercourse =    4000.00(Ft.)
Length along longest watercourse measured to centroid =    2000.00(Ft.)
Length along longest watercourse =      0.758 Mi.
Length along longest watercourse measured to centroid =      0.379 Mi.
Difference in elevation =      80.00(Ft.)
Slope along watercourse =    105.6000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =    0.092 Hr.
Lag time =     5.55 Min.
25% of lag time =     1.39 Min.
40% of lag time =     2.22 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      303.00             1.80                545.40

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      303.00             4.80               1454.40

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.800(In)

Point rain (area averaged) =    4.800(In)
Areal adjustment factor =   99.94 %
Adjusted average point rain =    4.797(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
   303.000           85.00          0.750
 Total Area Entered =     303.00(Ac.)
```

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

**** RETARDING BASIN ROUTING ****

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 107
Hydrograph time unit = 15.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)

Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

| Basin Depth (Ft.) | Storage (Ac.Ft) | Outflow (CFS) | (S-O*dt/2) (Ac.Ft) | (S+O*dt/2) (Ac.Ft) |
|---|---|---|---|---|
| 0.000 | 0.000 | 0.000 | 0.000 | 0.000 |
| 1.000 | 8.000 | 550.000 | 2.318 | 13.682 |
| 2.000 | 16.000 | 850.000 | 7.219 | 24.781 |
| 3.000 | 30.000 | 1000.000 | 19.669 | 40.331 |
| 4.000 | 42.000 | 1200.000 | 29.603 | 54.397 |

Hydrograph Detention Basin Routing

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

**** STREAM ROUTING SCS CONVEX METHOD ****

HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 3720.00 (Ft.)
Elevation difference = 74.40 (Ft.)
Slope of channel = 0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length = 3720.00(Ft.) Elevation difference = 74.40(Ft.)
Manning's N = 0.015 No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow = 81.478(CFS)
Given pipe size = 96.00(In.)
Calculated individual pipe flow = 81.478(CFS)
Normal flow depth in pipe = 17.54(In.)
Flow top width inside pipe = 74.20(In.)
Critical Depth = 2.22(Ft.)
Pipe flow velocity = 12.96(Ft/s)
Travel time through pipe = 4.78 min.

Pipe length = 3720.00(Ft.) Elevation difference = 74.40(Ft.)
Manning's N = 0.015 No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow = 283.395(CFS)
Given pipe size = 96.00(In.)
Calculated individual pipe flow = 283.395(CFS)
Normal flow depth in pipe = 32.95(In.)
Flow top width inside pipe = 91.16(In.)
Critical Depth = 4.24(Ft.)
Pipe flow velocity = 18.56(Ft/s)
Travel time through pipe = 3.34 min.

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9161 Travel time = 3.34 (min.)
dt*(unit time interval) = 15.00(min.), e= 3.6007
dt(routing time-step) = 3.06 (min.), c* = 0.9999

Output hydrograph delayed by 0 unit time increments

Drainage Area = 183.80(Ac.) = 0.287 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 183.80(Ac.) = 0.287 Sq. Mi.
Length along longest watercourse = 4950.00(Ft.)
Length along longest watercourse measured to centroid = 2120.00(Ft.)
Length along longest watercourse = 0.938 Mi.
Length along longest watercourse measured to centroid = 0.402 Mi.
Difference in elevation = 461.00(Ft.)
Slope along watercourse = 491.7333 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.153 Hr.
Lag time = 9.18 Min.
25% of lag time = 2.29 Min.
40% of lag time = 3.67 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 183.80 | 1.80 | 330.84 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 183.80 | 4.50 | 827.10 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 99.96 %
Adjusted average point rain = 4.498(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 22.800 | 46.00 | 0.000 |
| 35.900 | 66.00 | 0.000 |
| 8.300 | 77.00 | 0.000 |

116.800 83.00 0.000
Total Area Entered = 183.80(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 46.0 | 46.0 | 0.611 | 0.000 | 0.611 | 0.124 | 0.076 |

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

--------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

--------------------------------------------------------------------
Watershed D, Onsite D1
Proposed Condition
100-year, 24-hour

--------------------------------------------------------------------
Drainage Area =     160.67(Ac.)  =      0.251 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     160.67(Ac.)  =      0.251 Sq. Mi.
Length along longest watercourse =     1500.00(Ft.)
Length along longest watercourse measured to centroid =      750.00(Ft.)
Length along longest watercourse =       0.284 Mi.
Length along longest watercourse measured to centroid =       0.142 Mi.
Difference in elevation =       30.00(Ft.)
Slope along watercourse =     105.6000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =     0.044 Hr.
Lag time =      2.63 Min.
25% of lag time =      0.66 Min.
40% of lag time =      1.05 Min.
Unit time =     15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =      0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]        Rainfall(In)[2]       Weighting[1*2]
      160.67             1.80                  289.21

100 YEAR Area rainfall data:

Area(Ac.)[1]        Rainfall(In)[2]       Weighting[1*2]
      160.67             4.50                  723.01

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =     1.800(In)
Area Averaged 100-Year Rainfall =     4.500(In)

Point rain (area averaged) =     4.500(In)
Areal adjustment factor =    99.97 %
Adjusted average point rain =     4.499(In)

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------------
Watershed D, Onsite D2
Proposed Condition
100-year, 24-hour

------------------------------------------------------------------------
Drainage Area =     119.91(Ac.)  =      0.187 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     119.91(Ac.)  =      0.187 Sq. Mi.
Length along longest watercourse =    5750.00(Ft.)
Length along longest watercourse measured to centroid =    2875.00(Ft.)
Length along longest watercourse =      1.089 Mi.
Length along longest watercourse measured to centroid =      0.545 Mi.
Difference in elevation =     115.00(Ft.)
Slope along watercourse =    105.6000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =    0.122 Hr.
Lag time =     7.31 Min.
25% of lag time =     1.83 Min.
40% of lag time =     2.92 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      119.91             1.80                215.84

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      119.91             4.50                539.60

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.98 %
Adjusted average point rain =    4.499(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
   119.910            85.00          0.750
 Total Area Entered =    119.91(Ac.)
```

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

**** STREAM ROUTING SCS CONVEX METHOD ****

HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 2500.00 (Ft.)
Elevation difference = 50.00 (Ft.)
Slope of channel = 0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length = 2500.00(Ft.) Elevation difference = 50.00(Ft.)
Manning's N = 0.015 No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow = 227.053(CFS)
Given pipe size = 90.00(In.)
Calculated individual pipe flow = 227.053(CFS)
Normal flow depth in pipe = 30.09(In.)
Flow top width inside pipe = 84.92(In.)
Critical Depth = 3.86(Ft.)
Pipe flow velocity = 17.53(Ft/s)
Travel time through pipe = 2.38 min.

Pipe length = 2500.00(Ft.) Elevation difference = 50.00(Ft.)
Manning's N = 0.015 No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow = 538.459(CFS)
Given pipe size = 90.00(In.)
Calculated individual pipe flow = 538.459(CFS)
Normal flow depth in pipe = 48.80(In.)
Flow top width inside pipe = 89.68(In.)
Critical Depth = 5.99(Ft.)
Pipe flow velocity = 22.02(Ft/s)
Travel time through pipe = 1.89 min.

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9283 Travel time = 1.89 (min.)
dt*(unit time interval) = 15.00(min.), e= 6.0258
dt(routing time-step) = 1.76 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

Process from Point/Station 71.000 to Point/Station 72.000
**** ADD/COMBINE/RECOVER HYDROGRAPHS ****

From stored stream number 1 the total
volume of 159.49 (Ac.Ft) is being added to the
current hydrograph at its original rate from user
with a delay time to start of addition of 0.00 hours.

------------------------------------------------------------------------
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   1070.00 (Ft.)
Elevation difference =   51.00 (Ft.)
Slope of channel =  0.047664 (Vert/Horiz)
Channel type - Improved Channel

Channel length =  1070.00(Ft.)     Elevation difference =  51.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width  =   20.000(Ft.)
Slope or 'Z' of left channel bank =   2.000
Slope or 'Z' of right channel bank =   2.000
Manning's 'N'    = 0.030
Maximum depth of channel  =   10.000(Ft.)
Flow(q) thru subarea =    139.636(CFS)
Depth of flow =     0.761(Ft.)
Average velocity =     8.525(Ft/s)
Total flow rate =   139.636(CFS)
Channel flow top width =   23.044(Ft.)
Depth of flow in channel =   0.76(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =    8.52(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  139.636(CFS)
Total capacity of improved channels =    139.636(CFS)
Critical Depth in Channel =    1.11(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea =    575.561(CFS)
Depth of flow =     1.747(Ft.)
Average velocity =    14.019(Ft/s)
Total flow rate =   575.561(CFS)
```

```
Channel flow top width =   26.990(Ft.)
Depth of flow in channel =   1.75(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity =   14.02(Ft/s)
Travel time  =    0.00 min.
Individual channel flow =  575.561(CFS)
Total capacity of improved channels =    575.561(CFS)
Critical Depth in Channel =    2.69(Ft.)

********************** SCS CONVEX CHANNEL ROUTING ********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.8919   Travel time =   1.27 (min.)
        dt*(unit time interval) =  15.00(min.),  e=   9.1478
        dt(routing time-step) =   1.13 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****

HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 1200.00 (Ft.)
Elevation difference = 24.00 (Ft.)
Slope of channel = 0.020000 (Vert/Horiz)
Channel type - Improved Channel

Channel length = 1200.00(Ft.) Elevation difference = 24.00(Ft.)
Channel evaluation using mean flow rate of hydrograph
Channel base width = 12.000(Ft.)
Slope or 'Z' of left channel bank = 1.000
Slope or 'Z' of right channel bank = 1.000
Manning's 'N' = 0.015
Maximum depth of channel = 6.000(Ft.)
Flow(q) thru subarea = 64.850(CFS)
Depth of flow = 0.567(Ft.)
Average velocity = 9.103(Ft/s)
Total flow rate = 64.850(CFS)
Channel flow top width = 13.134(Ft.)
Depth of flow in channel = 0.57(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 9.10(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 64.850(CFS)
Total capacity of improved channels = 64.850(CFS)
Critical Depth in Channel = 0.94(Ft.)

Channel evaluation using maximum flow rate of hydrograph
Flow(q) thru subarea = 275.722(CFS)
Depth of flow = 1.351(Ft.)
Average velocity = 15.288(Ft/s)
Total flow rate = 275.722(CFS)
Channel flow top width = 14.702(Ft.)
Depth of flow in channel = 1.35(Ft.)
Total number of channels (same dimensions) = 1
Flow Velocity = 15.29(Ft/s)
Travel time = 0.00 min.
Individual channel flow = 275.722(CFS)
Total capacity of improved channels = 275.722(CFS)
Critical Depth in Channel = 2.38(Ft.)

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.8999 Travel time = 1.31 (min.)
dt*(unit time interval) = 15.00(min.), e= 8.8276
dt(routing time-step) = 1.18 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

**** STREAM ROUTING SCS CONVEX METHOD ****

HYDROGRAPH STREAM ROUTING DATA:
Length of stream = 1500.00 (Ft.)
Elevation difference = 30.00 (Ft.)
Slope of channel = 0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length = 1500.00(Ft.) Elevation difference = 30.00(Ft.)
Manning's N = 0.013 No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow = 67.036(CFS)
Given pipe size = 96.00(In.)
Calculated individual pipe flow = 67.036(CFS)
Normal flow depth in pipe = 14.87(In.)
Flow top width inside pipe = 69.47(In.)
Critical Depth = 2.01(Ft.)
Pipe flow velocity = 13.53(Ft/s)
Travel time through pipe = 1.85 min.

Pipe length = 1500.00(Ft.) Elevation difference = 30.00(Ft.)
Manning's N = 0.013 No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow = 277.939(CFS)
Given pipe size = 96.00(In.)
Calculated individual pipe flow = 277.939(CFS)
Normal flow depth in pipe = 30.26(In.)
Flow top width inside pipe = 89.20(In.)
Critical Depth = 4.21(Ft.)
Pipe flow velocity = 20.46(Ft/s)
Travel time through pipe = 1.22 min.

********** SCS CONVEX CHANNEL ROUTING **********
Convex method of stream routing data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
where c* = 1 - (1-c)^e and dt = c(length)/velocity
c(v/v+1.7) = 0.9233 Travel time = 1.22 (min.)
dt*(unit time interval) = 15.00(min.), e= 9.1971
dt(routing time-step) = 1.13 (min.), c* = 1.0000

Output hydrograph delayed by 0 unit time increments

Process from Point/Station 2.000 to Point/Station 2.000

**** RETARDING BASIN ROUTING ****

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 109
Hydrograph time unit = 15.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

| Basin Depth (Ft.) | Storage (Ac.Ft) | Outflow (CFS) | (S-O*dt/2) (Ac.Ft) | (S+O*dt/2) (Ac.Ft) |
|---|---|---|---|---|
| 0.000 | 0.000 | 0.000 | 0.000 | 0.000 |
| 1.000 | 0.001 | 0.001 | 0.001 | 0.001 |
| 2.000 | 0.002 | 0.002 | 0.002 | 0.002 |
| 3.000 | 10.000 | 200.000 | 7.934 | 12.066 |
| 4.000 | 26.000 | 550.000 | 20.318 | 31.682 |

Hydrograph Detention Basin Routing

**** STREAM ROUTING SCS CONVEX METHOD ****
___________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   2500.00 (Ft.)
Elevation difference =   50.00 (Ft.)
Slope of channel =  0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  2500.00(Ft.)   Elevation difference =  50.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =    79.058(CFS)
Given pipe size =     90.00(In.)
Calculated individual pipe flow  =    79.058(CFS)
Normal flow depth in pipe =   17.64(In.)
Flow top width inside pipe =   71.45(In.)
Critical Depth =    2.23(Ft.)
Pipe flow velocity =     12.94(Ft/s)
Travel time through pipe =    3.22 min.

Pipe length  =  2500.00(Ft.)   Elevation difference =  50.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =   265.189(CFS)
Given pipe size =     90.00(In.)
Calculated individual pipe flow  =   265.189(CFS)
Normal flow depth in pipe =   32.67(In.)
Flow top width inside pipe =   86.56(In.)
Critical Depth =    4.18(Ft.)
Pipe flow velocity =     18.30(Ft/s)
Travel time through pipe =    2.28 min.

********************** SCS CONVEX CHANNEL ROUTING *********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.9150   Travel time =   2.28 (min.)
        dt*(unit time interval) =  15.00(min.),  e=   5.1337
        dt(routing time-step) =   2.08 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

Process from Point/Station 71.000 to Point/Station 72.000
**** ADD/COMBINE/RECOVER HYDROGRAPHS ****

From stored stream number 1 the total
volume of 202.68 (Ac.Ft) is being added to the
current hydrograph at its original rate from user
with a delay time to start of addition of 0.00 hours.

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------
Watershed E, Offsite E2
Proposed Condition
100-yr, 24-hr

------------------------------------------------------------------
Drainage Area =     780.80(Ac.)  =      1.220 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =     780.80(Ac.)  =      1.220 Sq. Mi.
Length along longest watercourse =   14080.00(Ft.)
Length along longest watercourse measured to centroid =    8100.00(Ft.)
Length along longest watercourse =      2.667 Mi.
Length along longest watercourse measured to centroid =      1.534 Mi.
Difference in elevation =     877.00(Ft.)
Slope along watercourse =    328.8750 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time =    0.409 Hr.
Lag time =    24.53 Min.
25% of lag time =     6.13 Min.
40% of lag time =     9.81 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      780.80             1.80               1405.44

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
      780.80             4.50               3513.60

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.85 %
Adjusted average point rain =    4.493(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
    62.200            46.00          0.000
    11.200            66.00          0.000
     4.800            77.00          0.000
```

| | | |
|---|---|---|
| 702.600 | 83.00 | 0.000 |

Total Area Entered = 780.80(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

---

Watershed E, Offsite E3
Proposed Condition
100-year, 24-hour

---

Drainage Area = 17.50(Ac.) = 0.027 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 17.50(Ac.) = 0.027 Sq. Mi.
Length along longest watercourse = 1610.00(Ft.)
Length along longest watercourse measured to centroid = 650.00(Ft.)
Length along longest watercourse = 0.305 Mi.
Length along longest watercourse measured to centroid = 0.123 Mi.
Difference in elevation = 139.00(Ft.)
Slope along watercourse = 455.8509 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.065 Hr.
Lag time = 3.88 Min.
25% of lag time = 0.97 Min.
40% of lag time = 1.55 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 17.50 | 1.80 | 31.50 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 17.50 | 4.50 | 78.75 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 2.200 | 46.00 | 0.000 |
| 2.900 | 66.00 | 0.000 |
| 12.400 | 83.00 | 0.000 |

Total Area Entered = 17.50(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 46.0 | 46.0 | 0.611 | 0.000 | 0.611 | 0.126 | 0.077 |
| 66.0 | 66.0 | 0.405 | 0.000 | 0.405 | 0.166 | 0.067 |
| 83.0 | 83.0 | 0.210 | 0.000 | 0.210 | 0.709 | 0.149 |
| | | | | | Sum (F) = | 0.293 |

Area averaged mean soil loss (F) (In/Hr) = 0.293
Minimum soil loss rate ((In/Hr)) = 0.146
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.900

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

------------------------------------------------------------------
Watershed E, Onsite E1
Proposed Condition
100-year, 24-hour

----------------------------------------------------------------------
Drainage Area =      81.47(Ac.)  =     0.127 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =      81.47(Ac.)  =      0.127 Sq. Mi.
Length along longest watercourse =    1200.00(Ft.)
Length along longest watercourse measured to centroid =     600.00(Ft.)
Length along longest watercourse =      0.227 Mi.
Length along longest watercourse measured to centroid =      0.114 Mi.
Difference in elevation =      24.00(Ft.)
Slope along watercourse =    105.6000 Ft./Mi.
Average Manning's 'N' = 0.015
Lag time =    0.037 Hr.
Lag time =     2.22 Min.
25% of lag time =     0.56 Min.
40% of lag time =     0.89 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       81.47                 1.80              146.65

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       81.47                 4.50              366.62

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.98 %
Adjusted average point rain =    4.499(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
    81.470            85.00          0.750
 Total Area Entered =     81.47(Ac.)
```

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

English (in-lb) Input Units Used
English Rainfall Data (Inches) Input Values Used

English Units used in output format

---

Watershed E, Onsite E2
Proposed Conditions
100 Yr. 24 Hr.

---

Drainage Area = 17.10(Ac.) = 0.027 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment = 17.10(Ac.) = 0.027 Sq. Mi.
Length along longest watercourse = 2900.00(Ft.)
Length along longest watercourse measured to centroid = 1850.00(Ft.)
Length along longest watercourse = 0.549 Mi.
Length along longest watercourse measured to centroid = 0.350 Mi.
Difference in elevation = 53.00(Ft.)
Slope along watercourse = 96.4966 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time = 0.162 Hr.
Lag time = 9.69 Min.
25% of lag time = 2.42 Min.
40% of lag time = 3.88 Min.
Unit time = 15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow = 0.00(CFS)

2 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 17.10 | 1.80 | 30.78 |

100 YEAR Area rainfall data:

| Area(Ac.)[1] | Rainfall(In)[2] | Weighting[1*2] |
|---|---|---|
| 17.10 | 4.50 | 76.95 |

STORM EVENT (YEAR) = 100.00
Area Averaged 2-Year Rainfall = 1.800(In)
Area Averaged 100-Year Rainfall = 4.500(In)

Point rain (area averaged) = 4.500(In)
Areal adjustment factor = 100.00 %
Adjusted average point rain = 4.500(In)

Sub-Area Data:

| Area(Ac.) | Runoff Index | Impervious % |
|---|---|---|
| 17.100 | 85.00 | 0.750 |

Total Area Entered = 17.10(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|
| 85.0 | 85.0 | 0.187 | 0.750 | 0.061 | 1.000 | 0.061 |
| | | | | | Sum (F) = | 0.061 |

Area averaged mean soil loss (F) (In/Hr) = 0.061
Minimum soil loss rate ((In/Hr)) = 0.030
(for 24 hour storm duration)
Soil low loss rate (decimal) = 0.300

**** STREAM ROUTING SCS CONVEX METHOD ****
_____________________________________________________________________
HYDROGRAPH STREAM ROUTING DATA:
Length of stream =   1200.00 (Ft.)
Elevation difference =   24.00 (Ft.)
Slope of channel =  0.020000 (Vert/Horiz)
Channel type - Pipe

Pipe length  =  1200.00(Ft.)   Elevation difference =  24.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using mean flow rate of hydrograph
Required pipe flow  =    19.552(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =    19.552(CFS)
Normal flow depth in pipe =    9.55(In.)
Flow top width inside pipe =   48.84(In.)
Critical depth could not be calculated.
Pipe flow velocity =      8.79(Ft/s)
Travel time through pipe =    2.27 min.

Pipe length  =  1200.00(Ft.)   Elevation difference =  24.00(Ft.)
Manning's N = 0.015   No. of pipes = 1
Pipe evaluation using maximum flow rate of hydrograph
Required pipe flow  =    54.380(CFS)
Given pipe size =     72.00(In.)
Calculated individual pipe flow  =    54.380(CFS)
Normal flow depth in pipe =   15.74(In.)
Flow top width inside pipe =   59.51(In.)
Critical Depth =    1.96(Ft.)
Pipe flow velocity =     11.90(Ft/s)
Travel time through pipe =    1.68 min.
```

```
********************** SCS CONVEX CHANNEL ROUTING ********************
Convex method of stream routing  data items:
Using equation: Outflow =
O(t+dt) = (1-c*)O(t+dt-dt*) + Input(c*)
          where c* = 1 - (1-c)^e and dt = c(length)/velocity
          c(v/v+1.7) =   0.8750   Travel time =   1.68 (min.)
        dt*(unit time interval) =  15.00(min.),  e=   7.1333
        dt(routing time-step) =   1.47 (min.),   c* =   1.0000

Output hydrograph delayed by 0  unit time increments

Process from Point/Station 3.000 to Point/Station 3.000

**** RETARDING BASIN ROUTING ****

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 101
Hydrograph time unit = 15.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

| Basin Depth (Ft.) | Storage (Ac.Ft) | Outflow (CFS) | (S-O*dt/2) (Ac.Ft) | (S+O*dt/2) (Ac.Ft) |
|---|---|---|---|---|
| 0.000 | 0.000 | 0.000 | 0.000 | 0.000 |
| 1.000 | 5.000 | 650.000 | -1.715 | 11.715 |
| 2.000 | 10.000 | 800.000 | 1.736 | 18.264 |
| 3.000 | 18.000 | 1200.000 | 5.603 | 30.397 |

Hydrograph Detention Basin Routing

Graph values: 'I'= unit inflow; 'O'=outflow at time shown

Riverside County Synthetic Unit Hydrology Method
RCFC & WCD Manual date - April 1978

Program License Serial Number 6097

------------------------------------------------------------------
 English (in-lb) Input Units Used
 English Rainfall Data (Inches) Input Values Used

 English Units used in output format

-------------------------------------------------------------------
Watershed F, Offsite F2
Proposed Condition
100 yr, 24 hr

--------------------------------------------------------------------
Drainage Area =      54.70(Ac.)  =      0.085 Sq. Mi.
Drainage Area for Depth-Area Areal Adjustment =      54.70(Ac.)  =      0.085 Sq. Mi.
Length along longest watercourse =    3200.00(Ft.)
Length along longest watercourse measured to centroid =    1700.00(Ft.)
Length along longest watercourse =       0.606 Mi.
Length along longest watercourse measured to centroid =       0.322 Mi.
Difference in elevation =     330.00(Ft.)
Slope along watercourse =    544.5000 Ft./Mi.
Average Manning's 'N' = 0.030
Lag time =    0.117 Hr.
Lag time =     7.01 Min.
25% of lag time =     1.75 Min.
40% of lag time =     2.81 Min.
Unit time =    15.00 Min.
Duration of storm = 24 Hour(s)
User Entered Base Flow =     0.00(CFS)

2 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       54.70                 1.80                98.46

100 YEAR Area rainfall data:

Area(Ac.)[1]       Rainfall(In)[2]      Weighting[1*2]
       54.70                 4.50               246.15

STORM EVENT (YEAR) =  100.00
Area Averaged 2-Year Rainfall =    1.800(In)
Area Averaged 100-Year Rainfall =    4.500(In)

Point rain (area averaged) =    4.500(In)
Areal adjustment factor =   99.99 %
Adjusted average point rain =    4.500(In)

Sub-Area Data:
Area(Ac.)          Runoff Index   Impervious %
     4.000             46.00          0.000
     9.300             66.00          0.000
    41.400             83.00          0.000
```

Total Area Entered = 54.70(Ac.)

| RI AMC2 | RI AMC-2 | Infil. Rate (In/Hr) | Impervious (Dec.%) | Adj. Infil. Rate (In/Hr) | Area% (Dec.) | F (In/Hr) |
|---|---|---|---|---|---|---|

# Appendix B
# FIRMs 06065C0760G, 06065C0770G, and 06065C0790G

## NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

**Coastal Base Flood Elevations** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

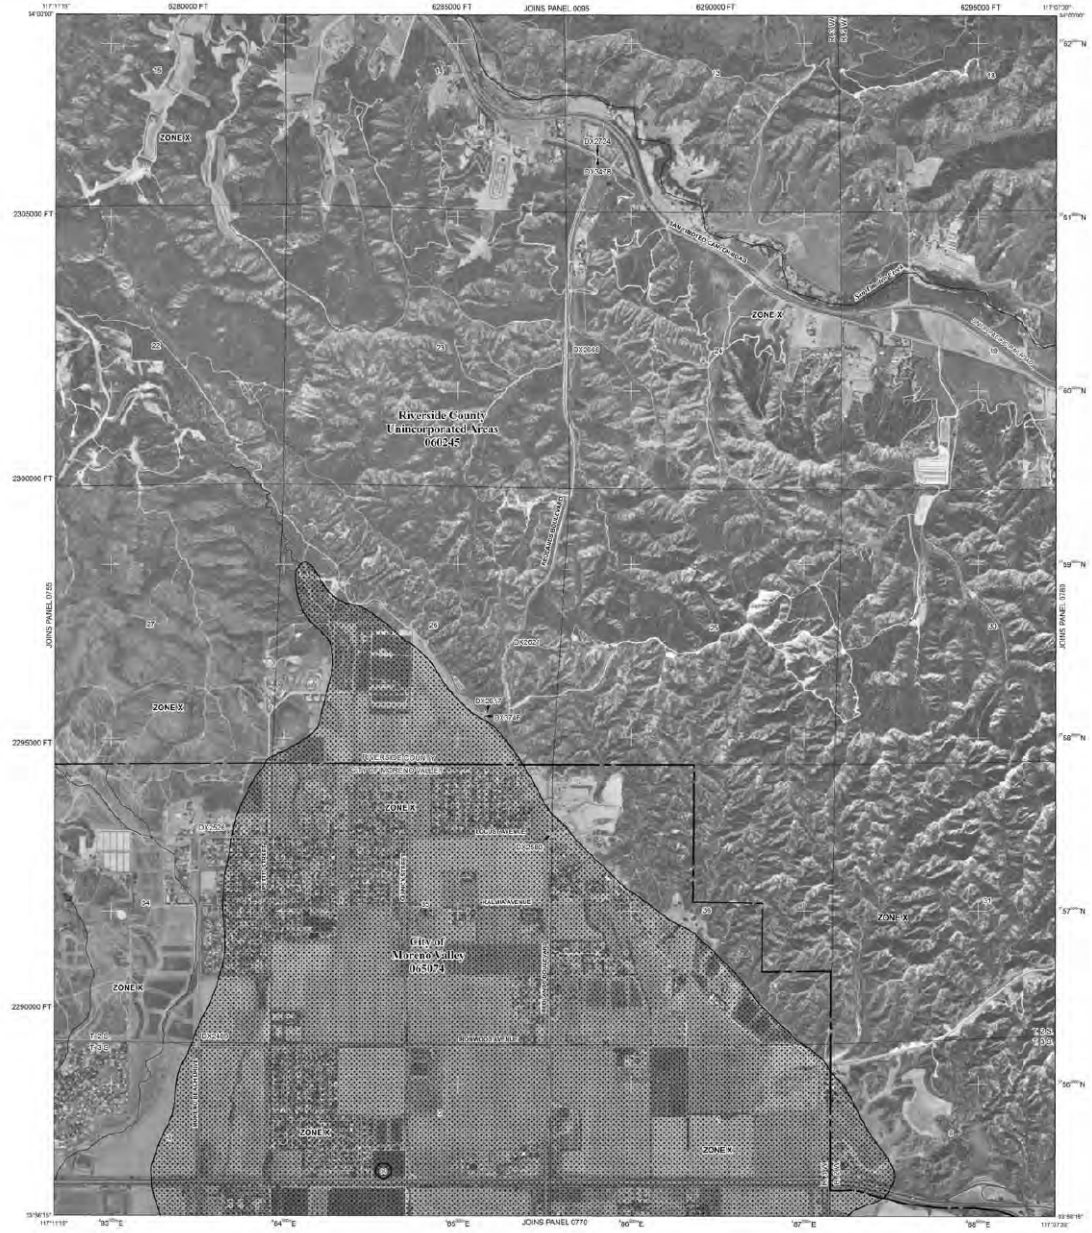
The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, NNGS12
National Geodetic Survey
SSMC-3 #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

**Base map** information shown on this FIRM was derived from U.S. Geological Survey Digital Orthophoto Quadrangles produced at a scale of 1:12,000 from photography dated 1994 or later.



This map may reflect more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.

## NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

**Coastal Base Flood Elevations** shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

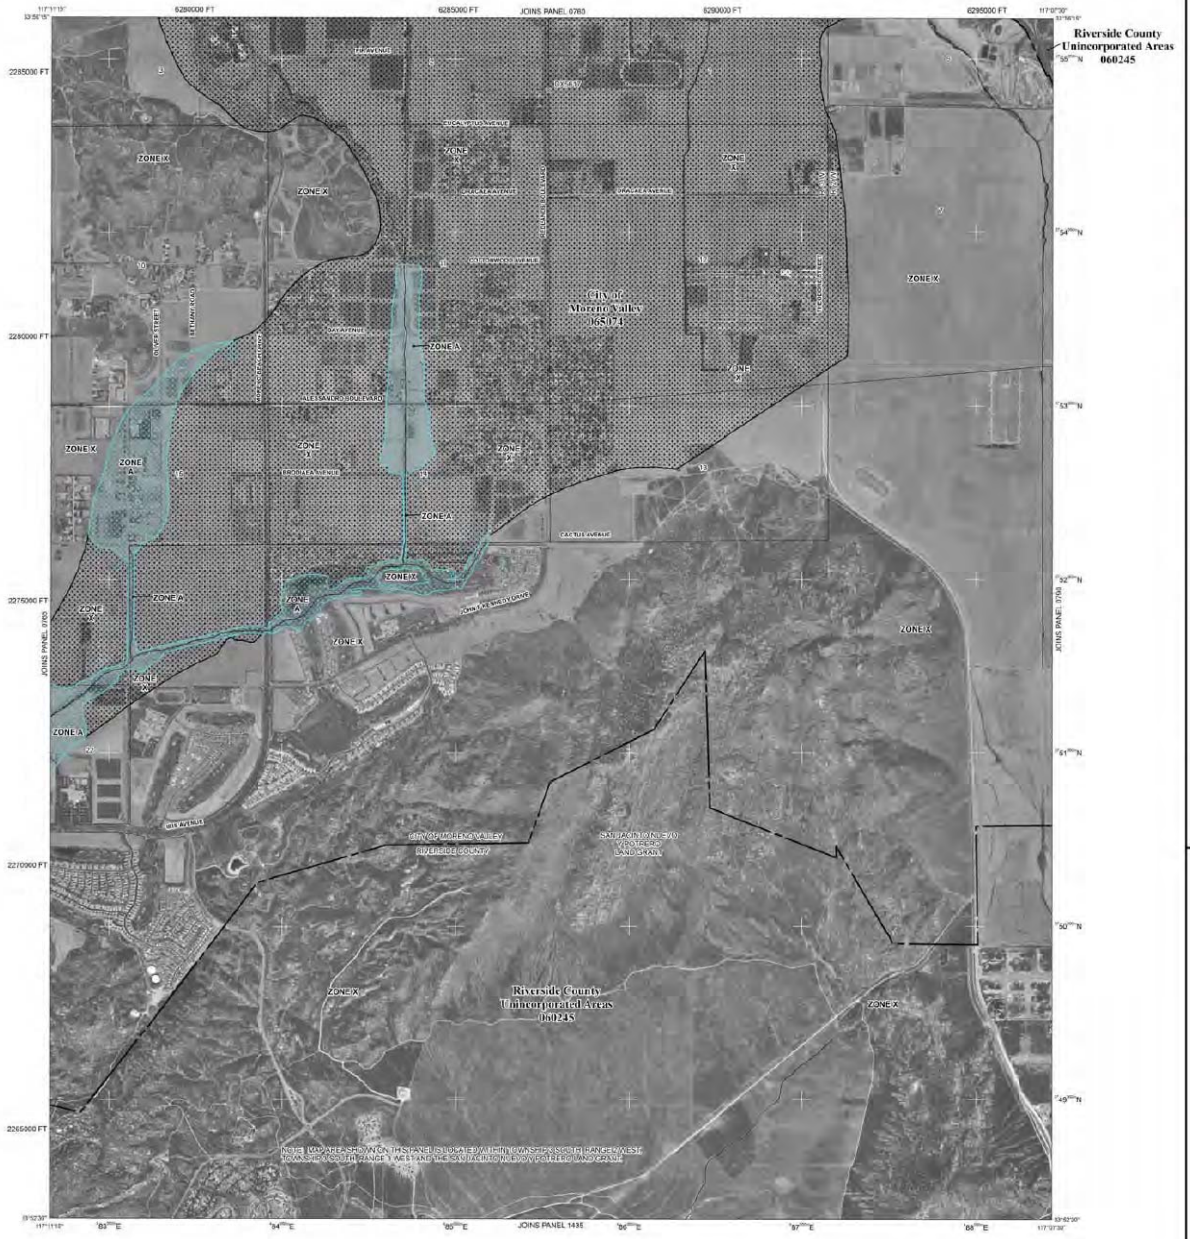
The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 11. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, NNGS12
National Geodetic Survey
SSMC-3 #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

**Base map** information shown on this FIRM was derived from U.S. Geological Survey Digital Orthophoto Quadrangles produced at a scale of 1:12,000 from photography dated 1994 or later.



This map may reflect more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

**Corporate limits** shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, a Flood Insurance Study report, and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://msc.fema.gov.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov.

## LEGEND

SPECIAL FLOOD HAZARD AREAS SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

- **ZONE A** — No Base Flood Elevations determined.
- **ZONE AE** — Base Flood Elevations determined.
- **ZONE AH** — Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
- **ZONE AO** — Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
- **ZONE AR** — Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
- **ZONE A99** — Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
- **ZONE V** — Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
- **ZONE VE** — Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

- **ZONE X** — Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

- **ZONE X** — Areas determined to be outside the 0.2% annual chance floodplain.
- **ZONE D** — Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

* Referenced to the North American Vertical Datum of 1988

- (A)—(A) — Cross section line
- (B)—(B) — Transect line
- 87°07'45", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western hemisphere
- 1000-meter Universal Transverse Mercator grid values, zone 11S
- 6000000 FT — 1000-foot grid ticks: California State Plane coordinate system, zone VI (FIPSZONE 0406), Lambert Conformal Conic projection
- DX5510 — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

# Appendix H
# Runoff and Infiltration Volume Analysis

# World Logistics Center Specific Plan Runoff and Infiltration Volume Analysis

**PREPARED FOR:** Highland Fairview

**PREPARED BY:** CH2M HILL

**DATE:** October 21, 2013

## Introduction

The proposed World Logistics Center Specific Plan (WLC) is a master plan for the development of logistics warehouse distribution facilities on approximately 2,610 acres of land in the Rancho Belago area of eastern Moreno Valley. The Specific Plan proposes the development of 40.4 million square feet of high-cube logistics facilities on 2,382.8 acres, 200,000 square feet of light logistics facilities on 37.1 acres, an in-project fueling station, 115.8 acres of street right-of-way and 74.3 acres of permanent open space.

The Specific Plan area is situated southerly of State Route 60, generally between Redlands Boulevard and Gilman Springs Road (the easterly City limit). The Specific Plan extends to, but does not include, the San Jacinto Wildlife Area (SJWA). The General Plan Amendment and Zone Change which accompany the Specific Plan includes a portion of the SJWA property in order to designate that land for open space use.

The purpose of this technical memorandum is to identify changes in overall surface runoff volumes and infiltration due to the implementation of the World Logistics Center Specific Plan (Project). Any change in infiltration (positive or negative) could result in an associated change of groundwater recharge. The results of this study will be included in the Project's Environmental Impact Report (EIR).

## Background

A water balance model was developed to estimate potential changes in site runoff, evapotranspiration and infiltration at the project site due to the development of the project.

The current land use for the project area is predominantly agricultural. It is estimated that runoff will increase at the project site due to increases in of impervious areas after development. This increased runoff will be properly managed with storm water Best Management Projects (BMPs) to minimize the change in infiltration and runoff under post project conditions.

The evaluation of change in site runoff and infiltration was based on pre (Baseline) and post-project (Scenarios 1 and 2) project conditions. The analysis was based in a continuous rainfall-runoff model and the use of historical precipitation and evapotranspiration data. The model runoff results for the pre-project scenario was compared against available model results from the Mosaic LSM Model, available via Nasa's Giovanni's North American Land Data Assimilation System (NLDAS) (Acker and Leptoukh, 2007). Monthly Mosaic LSM runoff model results are available at a 0.125 degree resolution scale, which represents

approximately 39,000 acres on the proximities of the project area. The comparison was made in order to validate the model results because no historical runoff data are available for the project location.

# Data Collection

A range of data sources were used to support the development of the water balance model. Collected data include historical precipitation, historical reference evapotranspiration ($ET_0$), crop coefficients, crop growth information for dry wheat, land use, hydrological soil groups, and final project land use and landscape configuration.

Historical daily rainfall data were available for three stations located between 12 to 20 miles from the project site. Those stations presented in Table 1 are UC Riverside (CIMIS, 2013), San Jacinto (NCDC, 2013) and Hemet (NCDC, 2013). The UC Riverside station was chosen for use in the model because of its proximity to the project site and also because the station has records for reference evapotranspiration. The project location receives an average of nine inches of rain per year with most of the rain happening during the months of December, January and February. The average $ET_0$ for the site is 57 in/yr.

TABLE 1
**Climate Station Location and with Approximate Distance from Project Site**

| Station Number | Name | Latitude (Decimal Degrees) | Longitude (Decimal Degrees) | Approx. Distance from the Site (miles) |
|---|---|---|---|---|
| CIMIS #44 | UC RIVERSIDE | 33.970 | -117.340 | 12 |
| GHCND:USC00043896 | HEMET CA US | 33.750 | -116.950 | 19 |
| GHCND:USC00047813 | SAN JACINTO R S CA US | 33.787 | -116.958 | 14 |

Current land use data were available from the USDA geospatial Data Gateway (USDA, 2012a). Land use is predominantly identified as cultivated crops, assumed to be non-irrigated winter wheat. Information about the crop coefficient (kc) that defines the crop evapotranspiration (ET) and growth patterns were available at the Food and Agriculture Organization of the United Nations website (FAO, 2013) and is summarized in Table 2.

TABLE 2
**Evapotranspiration Crop Coefficient (KC) for Wheat During Different Growth Seasons**

| Month | Kc Coefficient | Stage of Development |
|---|---|---|
| JAN | 1.15 | Crop development |
| FEB | 1.15 | Crop development |
| MAR | 1.15 | Mid Season |
| APR | 1.15 | Mid Season |
| MAY | 0.4 | Late Season |
| JUN | 0.25 | Dormant |
| JUL | 0.25 | Dormant |

TABLE 2
**Evapotranspiration Crop Coefficient (KC) for Wheat During Different Growth Seasons**

| Month | Kc Coefficient | Stage of Development |
|---|---|---|
| AUG | 0.25 | Dormant |
| SEP | 0.25 | Dormant |
| OCT | 0.25 | Dormant |
| NOV | 0.25 | Dormant |
| DEC | 0.7 | Initial |

Post development conditions are those given in the proposed Specific Plan. A key element that will define site infiltration and runoff exiting the site is the capacity and infiltration rates of the detention basins to be implemented by the project. Table 3 presents the estimated minimum infiltration rates expected from different hydrological soil groups (Mays, 2005). The majority of the project site soil is categorized as hydrological soil B and its minimum infiltration rates are expected to be between the 0.15 and 0.3 inches per hour.

TABLE 3
**Estimated Infiltration for Different Hydrological Soil Types from Mays (2005)**

| Hydrological Soil Group | Minimum Infiltration Rate (in/hr) |
|---|---|
| A | 0.3-0.45 |
| B | 0.15-0.3 |
| C | 0-0.05 |

Table 4 presents the estimated sizes of the detention basins and the estimated lower range of infiltration assuming hydrological soil group B. Note that bioretention areas will collect runoff from impervious areas (land and buildings) and assumes the same infiltration capacity as the detention basins.

TABLE 4
**Proposed Sizes for the Stormwater Detention Basins and the Associated Range of Infiltration Rates**

| Basin Name | Volume (ac-ft) | Depth (ft) | Area (acres) | Dead Storage (ac-ft) | Infiltration Lower Range[1] | |
|---|---|---|---|---|---|---|
| | | | | | cfs | cfs |
| A1 | 129 | 8 | 35 | 32 | 5.25 | 10.50 |
| B1 | 16 | 8 | 3 | 4 | 0.45 | 0.90 |
| B2 | 55 | 8 | 6 | 14 | 0.95 | 1.90 |
| B3 | 75 | 5 | 21 | 30 | 3.15 | 6.30 |
| C1 | 107 | 8 | 10 | 27 | 1.50 | 3.00 |

| F1 | 30 | 5 | 6 | 12 | 0.95 | 1.90 |
| F2 | 11 | 5 | 2 | 4 | 0.35 | 0.70 |
| | | | | Total | 19.77 | 39.53 |

[1] Assuming Hydrological soil Type B with infiltration rates of 0.15-0.3 in/hr.

Post-development conditions also include the new site configuration in terms of land use. Significant portions of the land use will be buildings (932 acres), however, it is expected that bioretention, detention basins and open areas will also cover significant areas (678 acres). Table 5 presents the expected land use areas after project implementation.

TABLE 5
**Proposed Post Development Land Use Types and Areas**

| Land Use | Area (acres) |
|---|---|
| Buildings | 932 |
| Bioretention | 144 |
| Detention Basins | 131 |
| Roads | 200 |
| Truck Loading | 400 |
| Parking Areas | 400 |
| Open Areas | 403 |
| Total: | 2610 |

The Bioretention area size is estimated as 1/12 of the impervious areas which includes buildings plus docking and parking areas. Roads, truck loading and parking areas are approximate values and open areas are the balance of the total project area.

# Methodology

A simplified water balance model was developed based on a soil-moisture accounting equation. The goal of a water budged model is to balance water inputs and outputs to and from the plant root zone (CIMIS, 2013). A detailed water balance equation is given by Equation 1:

$$S = IR + P + C - ET - DP - R \quad (1)$$

Where:

S= Soil Storage

IR=Irrigation

P=Precipitation

C=Capillary Rise

ET=Evapotranspiration

DP=Deep Percolation

R=Runoff

As the goal of this analysis was to identify changes to runoff and infiltration, Equation 1 can be simplified to Equation 2:

$$I = P - R - ET \quad (2)$$

Where:

I= Infiltration

Irrigation (IR) is nonexistent and Infiltration accounts for the terms S, C and DP.

Daily precipitation and reference ET are available from 1985 to 2012 from the UC Riverside CIMIS station, leaving the runoff and infiltration terms to be calculated.

Rainfall runoff is that part of the total rainfall that is not lost to interception, infiltration, and depression or storage. The method selected to estimate runoff is the USDA Soil Conservation Service (SCS) runoff curve number model, which is one of the most commonly used options to estimate rainfall runoff and is widely used for estimating floods on small to medium sized drainage basins (Maidment, 1992). The SCS curve number (CN) method is described in detail in Chapter 4 of the National Engineering Handbook (USDA, 2012b).

Curve Numbers (CN) are defined on the basis of land use cover soil type and antecedent moisture content (AMC) groups. The CN value indicates the runoff potential of a defined area during periods when the soil is not frozen. A higher CN indicates a higher potential for runoff, with a value of 100 equal to 100 percent runoff (i.e., all rainfall is excess and there are no losses). The methodology is described in detail in Chapters 9 and 10 of the National Engineering Handbook (USDA, 2012a). For continuous model simulations the CN value is

adjusted accordingly to the season of the crop (dormant or growing) and the last 5-day antecedent rainfall.

The representation of the CN values for pre-project conditions was done by identifying all those areas in the project site with individual combinations of hydrological soil types and land uses. Combinations of hydrological soil type and land use defines the CN values for each specific land use/soil type area. For the pre-project conditions, a total of 608 areas were identified with different combinations of land use and hydrological soil type. Precipitation was then applied to each one of those areas to estimate runoff based on the SCS method. Estimated ET for dry wheat and calculated runoff were subtracted from precipitation, so the infiltration (I) could be estimated. In reality, part of the infiltration will be later consumed by vegetation through evapotranspiration, be stored in the soil or become deep percolation, i.e., groundwater recharge. The current analysis is not concerned with those quantities and only estimates the changes in total infiltration during precipitation events. However, any changes in infiltration are expected to have impacts to groundwater recharges, with increases in infiltration likely resulting in more groundwater recharge and decreases in infiltration potentially resulting in less groundwater recharge.

The same water budget model methodology was applied to the post-project conditions except that only those seven areas presented on Table 5 are considered in the model computations. Also, the post-project condition assumes that runoff generated within the project area will be collected at bioretention areas and detention basins. The model assumes that all runoff within the project area flows first to bioretention areas. If the runoff flow exceeds the bioretention infiltration and storage capacity, then those excess flows are directed to detention basins. The model simplifies the bioretention and detention basins into two model elements, each with a specified infiltration capacity that is a function of the user defined infiltration rate multiplied by the sum of bioretention and detention basin areas.

The detention basins under post-project conditions are drained up to dead storage at a rate of current storage divided by 3 days. After reaching dead storage, basins still can empty by evaporation or through infiltration, if infiltration rates are greater than zero. All flow out of the detention basins occurring above dead storage is considered to flow offsite and is computed as runoff exiting the project area footprint. All infiltration basin or biorention areas is counted as infiltration within the project area.

## Assumptions and Limitations

This analysis is based on a daily continuous rainfall-runoff model results. The selection of 23 years of daily precipitation data (1990-2012) was based on data availability; that is, it includes wet and dry periods, and is sufficient for the current analysis, which focuses on changes between current and future conditions. The rainfall-runoff model uses the SCS method to estimate daily runoff from daily precipitation totals, and is adjusted by the antecedent moisture condition coefficient, which is a function of the last 5 days of precipitation and crop-growth stage.

Historical daily precipitation is equally applied for the entire area. There is no spatial variation of rainfall. Historical daily $ET_0$ values are also applied for the entire area but vary depending on the kc coefficient from every sub area with different combinations of hydrological soil types and land uses.

Infiltration is considered the remainder of precipitation after Runoff and ET are taken out. In reality, after a storm, any precipitation that infiltrates will move into soil storage (percolation) and will be later consumed by plant ET or become deep percolation (and ultimately, groundwater recharge). The project is not concerned with those terms but only concerned about the impact that the project will bring to runoff and infiltration after a storm event, as changes to infiltration may result in changes to groundwater recharge.

The size and infiltration capacity of the detention basins and bioretention areas are key to the comparison of pre- and post-project conditions. Minimum and maximum infiltration rate scenarios are considered in this study in order to bracket any potential impacts on infiltration in the project area. In addition, identification of monitoring and mitigation measures under a range of infiltration rates are key to maintaining infiltration post-project implementation.

Landscape vegetation kc values are based on the proposed landscape plan for the site, which includes for most part includes plant species with low ET consumption rates.

Due to the limited 23 years of climate data and lack of disaggregation of the Infiltration component of the water balance equation, the model results are not suitable for past or future direct estimates of groundwater recharge; however, decreases in infiltration may result in decreases in groundwater recharge and increases in infiltration will likely result in increases in groundwater recharge. The reason decreases in infiltration may result in decreases in groundwater recharge is that for pre-project conditions it is not known how much infiltration is consumed by evapotranspiration. Infiltration in pre-project conditions occurs over large areas, which typically results in only partially saturating the soil column in after most rainfall events. Then, plants draw this wisely dispersed infiltrated water from storage in the soil column, further reducing soil moisture storage, such that infiltrated water does not percolate beyond the root depth. Therefore, only a fraction of infiltrated water becomes groundwater recharge. On the other hand, for the post-project conditions, increases in infiltration are occurring at focused areas with volumes of water that can easily fill the soil column beyond root zone depths, so much of that infiltrated water will percolate and contribute to groundwater recharge.

The model also does not consider any climate change projections since the change in infiltration and runoff would happen independently of the project development. The analysis is concerned with long term changes in runoff and evaporation and do not capture daily peak flow events.

# Model Validation

Model validation was based on comparison to a large-scale soil moisture water budget model, Mosaic LSM (Koster and Suarez 1996). Monthly values of precipitation, runoff and evapotranspiration were used to estimate monthly infiltration values. The infiltration considered only months where precipitation was higher than evapotranspiration plus runoff. This approach was consistent with the modeling approach described above.

The comparison of model generated runoff comparison between the Mosaic LSM and the model developed for this project is presented in Figure 1 and the comparison for Infiltration is presented in Figure 2.

It is not surprising that the Mosaic model results show higher runoff values. The larger Mosaic model domain comprises developed land uses with higher runoff coefficients,

Mosaic precipitation is generally higher than the one reported by the UC Riverside station and the monthly time step averaged results of the Mosaic model results might hide peak events of rainfall/runoff that are verified in a daily model (2010 difference).

The comparison is satisfactory and indicates that the model developed for the site is within the estimated regional ranges for runoff and infiltration.

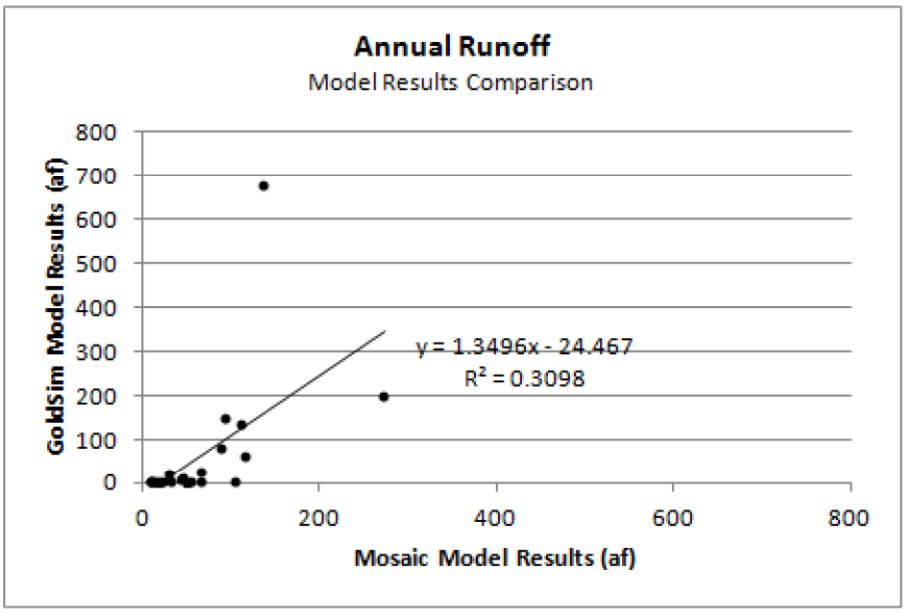

*Figure 1: Total Annual Runoff Comparison between Baseline Conditions Computed for this Project and the Estimated Values from the Mosaic LSM Model*

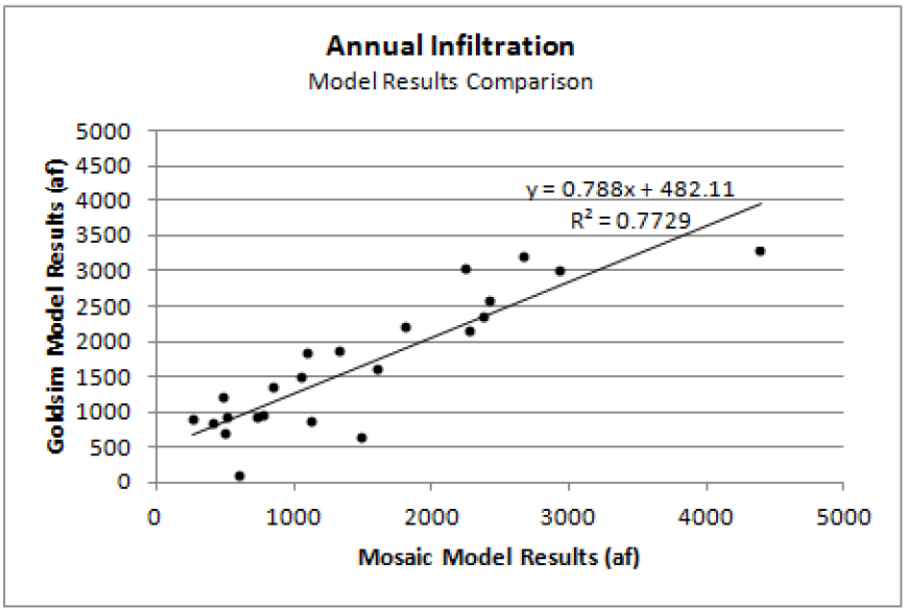

*Figure 2: Total Annual Runoff Comparison between Baseline Conditions Computed for this Project and the Estimated Values from the Mosaic LSM Model*

# Water Balance Study

A total of three scenarios were considered in the water balance study, a baseline plus two scenarios. The scenarios and are briefly described below:

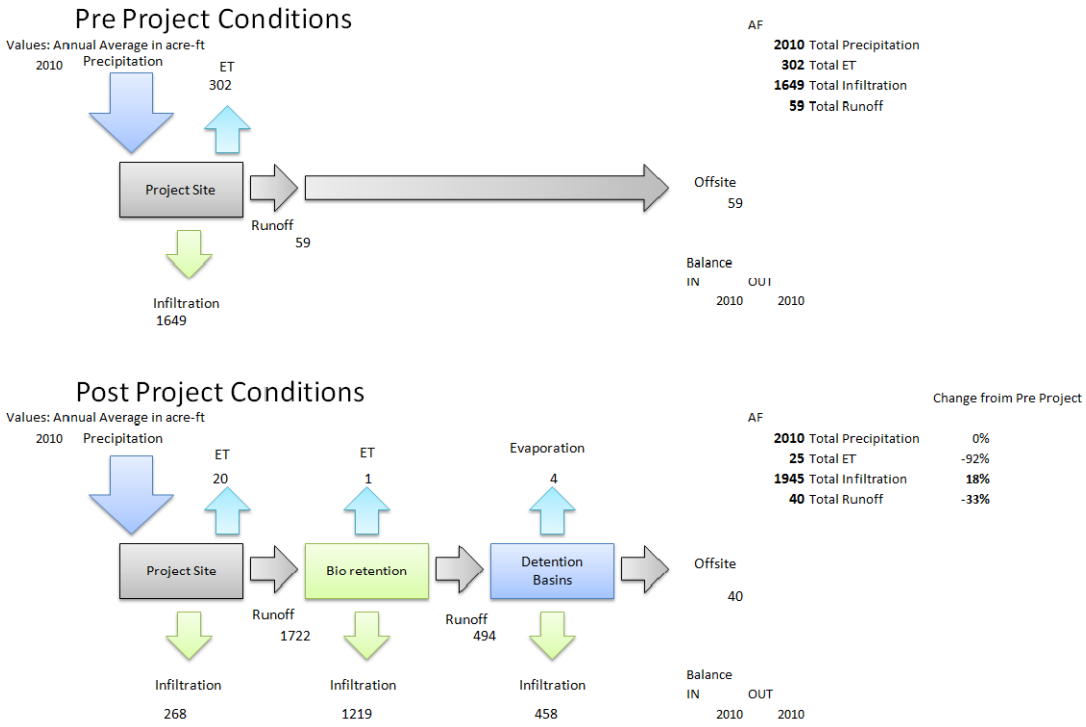
1. Baseline or pre-project conditions, where most of the land use is agricultural and the crop is considered to be dry wheat.
2. Scenarios or post-project conditions, where the development of the site will happen and impervious areas will increase. Two scenarios were considered under the post development conditions, those are:

    Scenario 1: Detention basins and bioretention areas with 0.15 in/hr infiltration rate. This scenario considers the use of detention basins not only for storm peak attenuation but also for infiltration. The lower end of the minimum infiltration rate for soil type B is considered. The detention basins are assumed to take 3 days to empty and total dead storage currently assumed at 212 AF. In reality the amount of dead storage needed will be a function of the infiltration rate at the site.

    Scenario 2: Detention basins and bioretention areas with 0.3 in/hr infiltration rate. This scenario considers the use of detention basins not only for storm peak attenuation but also for infiltration. The higher end of the minimum infiltration rate for soil type B is considered. The detention basins are assumed to take 3 days to empty and dead storage is assumed at 212 AF.

Figure 3 shows a summary comparison of the water balance between pre project conditions and post project scenario 1. The water balance shows the annual average volumes for all the water balance components considered in the model. Figure 4 shows a summary comparison of the water balance between pre-project conditions and post project scenario 2.

The main differences between pre-and post-project conditions presented in Figures 3 and 4 are, 1) a shift between runoff and infiltration and, 2) a reduction in evapotranspiration. Under pre-project conditions, most of the precipitation becomes infiltration ( 82% of precipitation or ~1654 AF/yr). Post-project conditions results in a reduction of infiltration to approximately 13% of the precipitation (~268AF/yr). A reduction in direct infiltration will be compensated by:



- A reduction in evapotranspiration to approximately 2% of the total precipitation from an original 15% or ~303AF/yr by installing drought-tolerant landscaping.
- An increase in infiltration through implementation of bioretention and detention basins that together will infiltrate between 79% and 83% of total precipitation.

Reduction of evapotranspiration and implementation of bioretention and detention basins will not only offset those losses in infiltration when compared to baseline, but increases the infiltration by 12% to 18%.

Post Project Assuming minimum Infiltration rate for soil group B=0.15 in/hr for Bio retention areas and detention Basins.
Dead storage for detention basins assumed to be 212 AF. Less dead storage will imply faster basin drainage which equals to higher runoff exiting the site

*Figure 3: Pre-Project and Post Project Scenario 1 Water Balance Summary*

Post Project Assuming minimum Infiltration rate for soil group B=0.3 in/hr for Bio retention areas and detention Basins.
Dead storage for detention basins assumed to be 212 AF. Less dead storage will imply faster basin drainage which equals to higher runoff exiting the site

*Figure 4: Pre-Project and Post Project Scenario 2 Water Balance Summary*

## Summary of Results

The model scenarios assumptions are summarized in Table 6 and model results are summarized in Table 7.

TABLE 6
**Summary of Model Assumptions**

| Scenario | Detention Basin Total Storage Volume/Dead Storage (AF) | Basin Infiltration Rate (in/hr) | Bioretention Areas Infiltration Rate (in/hr) |
|---|---|---|---|
| Baseline[1] | NA | NA | NA |
| Scenario 1 | 681/212 | 0.15 | 0.15 |
| Scenario 2 | 681/212 | 0.3 | 0.3 |

[1] Baseline infiltration conditions are a function of current soils and crop.

TABLE 7
**Model Results for Runoff and Infiltration and the Percentage Change from Baseline Conditions**

| | Runoff | | Infiltration | |
|---|---|---|---|---|
| Scenario | 1990-2012 Average(AF/yr) | Percent Change from Baseline | 1990-2012 Average(AF/yr) | Percent Change from Baseline |
| Baseline | 59 | - | 1649 | - |
| Scenario 1 | 125 | 110% | 1850 | 12% |
| Scenario 2 | 40 | -33% | 1945 | 18% |

Figures 5 and 6 show the annual changes in runoff and infiltration from Baseline conditions for those two scenarios for the time period 1990 through 2012, inclusive. Year of 2010 stands out as a year of high runoff and lower infiltration when compared to baseline. This outcome is due to a high precipitation event in December of 2010. This event, which lasted a few days, resulted in significant short term (4 days) runoff releases from the project site for scenario 1. The considerably higher flows out of the detention basins did not give the chance for the water to infiltrate on the days following the storm, therefore, scenario 1 shows higher runoff with lower infiltration when compared to Baseline.

Both scenarios 1 and 2 (minimum range of infiltration rates) will result in higher infiltration than pre-project conditions. This fact is due to mainly the reduction in ET (removal of the crops) and implementation of bioretention areas and detentions basins. The change in runoff will be a function of how the runoff stored at the basins will be discharged to the environment. This discharge is a function of the basin discharge capacity, infiltration rate of the basin and dead storage size. An increase of dead storage keeps water at the site for longer periods and provides an opportunity for that water to either evaporate or be infiltrated. Figure 7 presents how the runoff exiting the site is impacted by dead storage size and infiltration rate assumptions. This figure also shows the pre project average annual runoff exiting the site (59 AF/yr) and those results for scenarios 1 and 2.

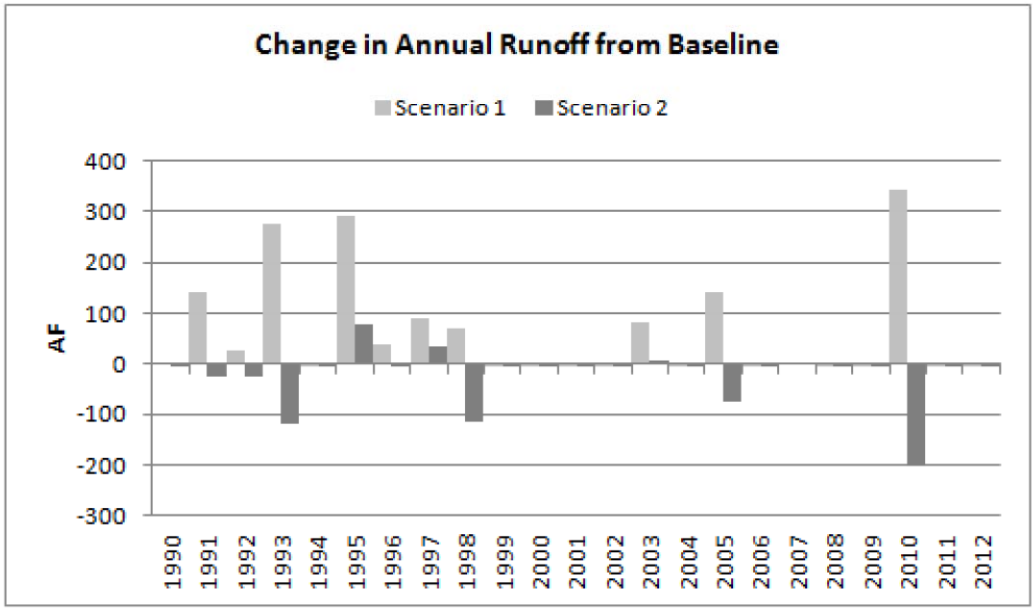


*Figure 5: Change in Runoff from Baseline Conditions for the Two Project Scenarios*

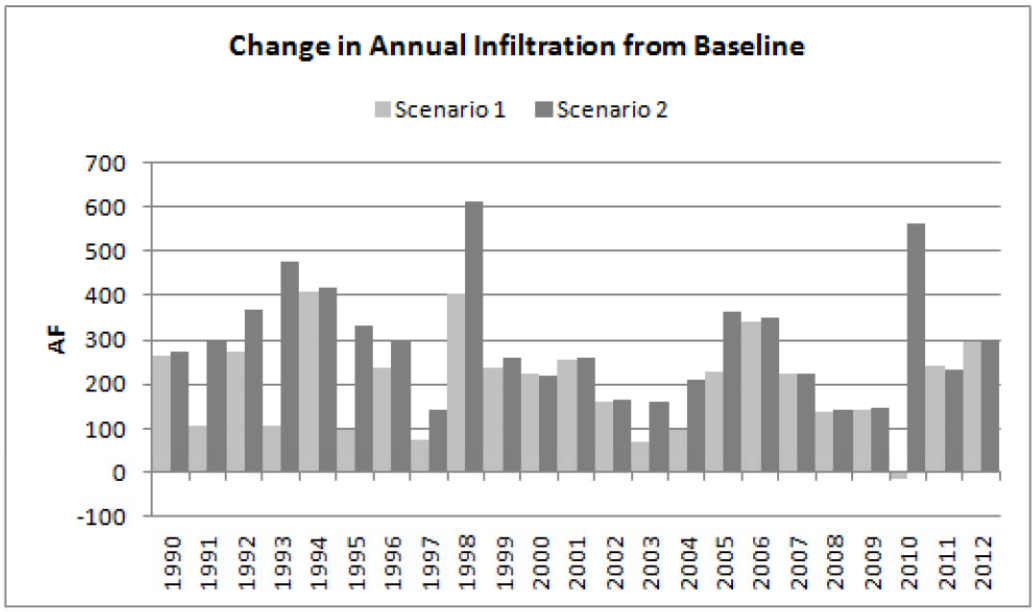

*Figure 6: Change in Infiltration from Baseline Conditions for the Two Project Scenarios*

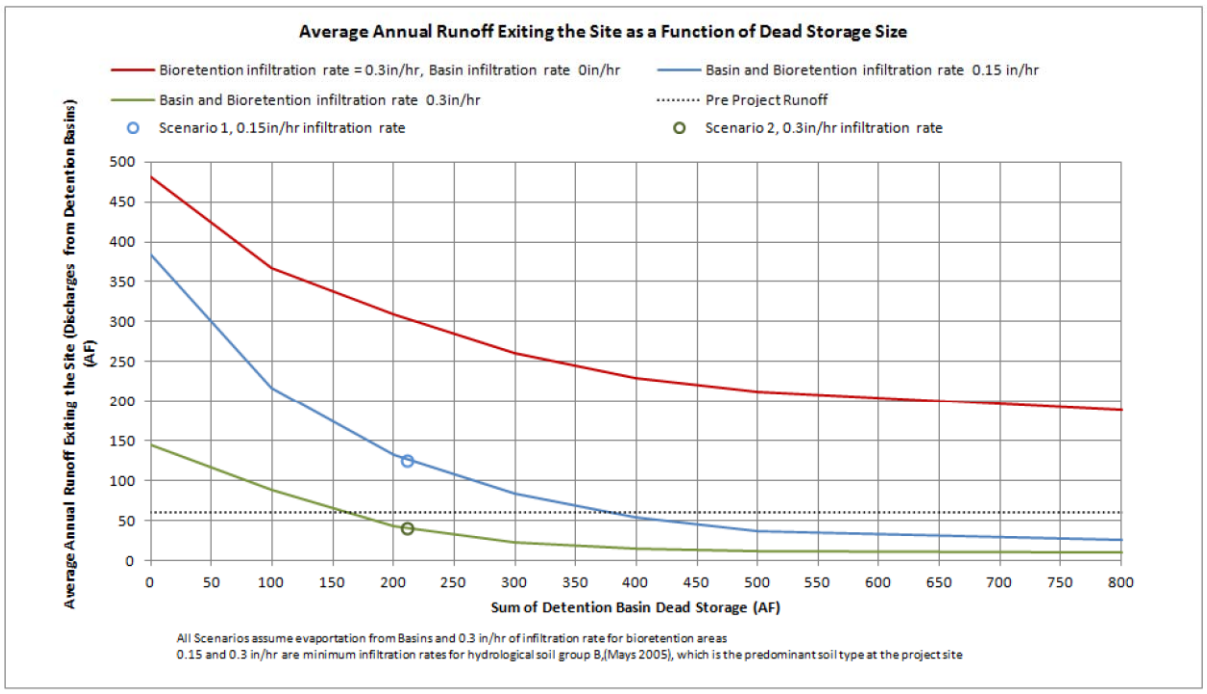

*Figure 7: Impact of Dead Storage Size and Infiltration Rates on Runoff Exiting the Project Site*

# Mitigation

The following mitigation measures will need to be implemented to assure that infiltration of precipitation will not be adversely impacted:

- Bioretention areas and detention basins will be located and designed to capture runoff and create infiltration at least equal to pre-project conditions as assessed in the water balance model for the site-specific soil conditions encountered at the project location
- Field investigations will be conducted to determine the infiltration rate of soils underlying the proposed locations of bioretention areas and detention basins. Infiltration rate of the underlying soils will be used to properly size these bioretention areas and detention basins to ensure that adequate volumes of runoff, in cumulative total for all bioretention areas and detention basins, will be captured and infiltrated. The water balance model will be updated and rerun for the site-specific conditions encountered to confirm the water balance.

It will be necessary to monitor and inspect the bioswales and detention basins assuring minimal infiltrations rates. The monitoring plan will follow the guidelines presented by the California Storm water Quality Association (CASQA).

For the bioretention areas, as needed maintenance activities will be conducted to remove accumulated sediment that may obstruct flow through the swales. Bioretention areas will be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. The maintenance activities should occur when sediment on channels and culverts builds up to more than 3 inches (CASQA 2003). The swales will need to be cultivated or rototilled if drawdown takes more than 48 hours.

For the detention/infiltration basins, a 3-5 year maintenance program will be implemented mainly to keep infiltration rates close to original values because sediment accumulation could reduce original infiltration rate by 25-50%. Infiltration rates in detention basins will be monitored at the beginning and end of each wet season to assess any degradation in infiltration rates. If cumulative infiltration rates of all detention basins drops below the minimum required rates, then the detention basins will be reconditioned to improve infiltration capacity by scraping the bottom of the detention basin, seed or sod to restore groundcover, aerate bottom and detach basin bottom (CASQA 2003).

## A Brief Introduction

This Project-Specific WQMP Template for the **Santa Ana Region** has been prepared to help guide you in documenting compliance for your project. Because this document has been designed to specifically document compliance, you will need to utilize the WQMP Guidance Document as your "how-to" manual to help guide you through this process. Both the Template and Guidance Document go hand-in-hand, and will help facilitate a well prepared Project-Specific WQMP. Below is a flowchart for the layout of this Template that will provide the steps required to document compliance.

## OWNER'S CERTIFICATION

This Project-Specific Water Quality Management Plan (WQMP) has been prepared for Highland Fairview by CH2M HILL for the World Logistics Center Specific Plan project.

This WQMP is intended to comply with the requirements of the City of Moreno Valley for Municipal Code Section 8.10 which includes the requirement for the preparation and implementation of a Project-Specific WQMP.

The undersigned, while owning the property/project described in the preceding paragraph, shall be responsible for the implementation and funding of this WQMP and will ensure that this WQMP is amended as appropriate to reflect up-to-date conditions on the site. In addition, the property owner accepts responsibility for interim operation and maintenance of Stormwater BMPs until such time as this responsibility is formally transferred to a subsequent owner. This WQMP will be reviewed with the facility operator, facility supervisors, employees, tenants, maintenance and service contractors, or any other party (or parties) having responsibility for implementing portions of this WQMP. At least one copy of this WQMP will be maintained at the project site or project office in perpetuity. The undersigned is authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under the City of Moreno Valley Water Quality Ordinance Water Quality Ordinance (Municipal Code Section 8.10).

At the time of the Final WQMP, the undersigned will be authorized to certify and to approve implementation of this WQMP. The undersigned is aware that implementation of this WQMP is enforceable under City of Moreno Valley Water Quality Ordinance (Municipal Code Section 8.10).

"I, the undersigned, certify under penalty of law that the provisions of this WQMP have been reviewed and accepted and that the WQMP will be transferred to future successors in interest."

# Section A: Project and Site Information

The proposed World Logistics Center Specific Plan (WLC) is a master plan for the development of logistics warehouse distribution facilities on approximately 2,610 acres of land in the Rancho Belago area of eastern Moreno Valley. The Specific Plan proposes the development of 40.4 million square feet of high-cube logistics facilities on 2,382.8 acres, 200,000 square feet of light logistics facilities on 37.1 acres, an in-project fueling station, 115.8 acres of street right-of-way and 74.3 acres of permanent open space.

The Specific Plan area is situated southerly of State Route 60, generally between Redlands Boulevard and Gilman Springs Road (the easterly City limit). The Specific Plan extends to, but does not include, the San Jacinto Wildlife Area (SJWA) on the southern boundary. The General Plan Amendment and Zone Change which accompany the Specific Plan includes a portion of the SJWA property in order to designate that land for open space use.

Within the Specific Plan the primary land use category will be "Logistics Development". This use will provide for high-cube logistics warehouse space consisting of buildings of 500,000 square feet or larger. Warehousing and logistics activities consistent with the storage of manufactured goods and materials prior to their distribution to other facilities and retail outlets will be permitted within this category. Ancillary office and maintenance space will be permitted, along with the outdoor storage of trucks, trailers, and shipping containers. The "Light Logistics" land use category provides for general warehouse, self-storage and vehicle storage uses. Figure A.1 depicts the proposed Land Use Plan.

| Planning Area (PA) | Land Use | Area | Building SF |
|---|---|---|---|
| **Logistics Development** | | | |
| 1 | LD | 77.8 | 1,100,000 |

## A.1 Maps and Site Plans

Appendix 1 of this Project-Specific WQMP includes:

1. A Vicinity Map identifying the project site and surrounding planning areas in sufficient detail to allow the project site to be plotted on Co-Permittee base mapping;
2. A Receiving Waters Map identifying the locations of receiving waters to which the project directly or indirectly discharges; and
3. A Site Plan for the project. The following project features are not depicted in the current World Logistics Center Specific Plan Site Plan, but will be included in each final Project-Specific WQMP:

    - Drainage Management Areas
    - Drainage Path
    - Drainage Infrastructure, Inlets, Overflows
    - Location and identification of all structural BMPs, including LID and Treatment Control and Source Control BMPs;

- Landscaped areas;
- Impervious surfaces including paved areas and intended uses (i.e., parking, outdoor work area, outdoor material storage area, sidewalks, patios, tennis courts, etc.);
- Number and type of structures and intended uses (i.e., buildings, rooflines and downspouts, tenant spaces, dwelling units, community facilities such as pools, recreation facilities, tot lots, etc.);
- Infrastructure (i.e., streets, storm drains, etc.) that will revert to public agency ownership and operation;
- Location of existing and proposed public and private storm drainage facilities (i.e., storm drains, channels, basins, etc.), including catch basins and other inlets/outlet structures. Existing and proposed drainage facilities should be clearly differentiated;
- Location of points where onsite (or tributary offsite) flows exit the property/project site;
- Proposed drainage areas boundaries, including tributary offsite areas, for each location where flows exits the property/project site. Each tributary area should be clearly denoted;
- Pre- and post-project topography.

## A.2 Identify Receiving Waters

The World Logistics Center Specific Plan project is immediately tributary to the Perris Valley (802.11) and Gilman Hot Springs (802.21) hydrologic subareas. Flows from the project site eventually drain south to the San Jacinto River. The San Jacinto River flows southwest and has been dammed to form Canyon Lake, which drains to Lake Elsinore. The Table A.1 lists each of the successive receiving waters and the pollutants for which the receiving waters are impaired, according to the Clean Water Act Section 303(d) list (2010).

**Table A.1** Identification of Receiving Waters

| Receiving Waters | EPA Approved 303(d) List Impairments | Designated Beneficial Uses | Proximity to RARE Beneficial Use |
|---|---|---|---|
| San Jacinto River | None | All uses considered Intermittent<br>MUN, AGR, GWR, REC1, REC2, WARM, WILD | Approx. 2 miles to RARE-designated San Jacinto Wildlife Preserve |
| Canyon Lake (Railroad Canyon Reservoir) | Nutrients, Pathogens | MUN, AGR, GWR, REC1, REC2, WARM, WILD | Not RARE |
| Lake Elsinore | Nutrients, Organic Enrichment/Low Dissolved Oxygen, PCBs, Sediment Toxicity, Unknown Toxicity | MUN, REC1, REC2, WARM, WILD | Not RARE |

## A.3 Additional Permits/Approvals required for the Project:

**Table A.2** Other Applicable Permits

| Agency | Permit Required | |
|---|---|---|
| State Department of Fish and Game, 1602 Streambed Alteration Agreement | ☒ Y | ☐ N |
| State Water Resources Control Board, Clean Water Act (CWA) Section 401 Water Quality Cert. | ☒ Y | ☐ N |
| US Army Corps of Engineers, CWA Section 404 Permit | ☐ TBD | ☐ |
| US Fish and Wildlife, Endangered Species Act Section 7 Biological Opinion | ☐ TBD | ☐ |
| Statewide Construction General Permit Coverage | ☒ Y | ☐ N |
| Statewide Industrial General Permit Coverage | ☐ Y | ☒ N |
| Western Riverside MSHCP Consistency Approval (e.g., JPR, DBESP) | ☒ Y | ☐ N |
| Other *(please list in the space below as required)*<br>State Water Resources Control Board General Permit – Construction<br>City of Moreno Valley Building Permit<br>City of Moreno Valley Grading Permit | <br><br>☒ Y<br>☒ Y<br>☒ Y | <br><br>☐ N<br>☐ N<br>☐ N |

If yes is answered to any of the questions above, the Co-Permittee may require proof of approval/coverage from those agencies as applicable including documentation of any associated requirements that may affect this Project-Specific WQMP.

# Section B: Optimize Site Utilization (LID Principles)

During preparation of the final WQMP a review of the information collected in Section 'A' will be made to identify the principal constraints on site design and selection of LID BMPs as well as opportunities to reduce imperviousness and incorporate LID Principles into the site and landscape design. For example, constraints might include impermeable soils, high groundwater, groundwater pollution or contaminated soils, steep slopes, geotechnical instability, high-intensity land use, heavy pedestrian or vehicular traffic, utility locations or safety concerns. Opportunities might include existing natural areas, low areas, oddly configured or otherwise unbuildable parcels, easements and landscape amenities including open space and buffers (which can double as locations for bioretention BMPs), and differences in elevation (which can provide hydraulic head). A brief narrative for each of the site optimization strategies is described below and will be included in the final WQMP. This narrative helps with the LID design and explains the design decisions.

The 2010 Santa Ana MS4 Permit further requires that LID Retention BMPs (Infiltration Only or Harvest and Use) be used unless it can be shown that those BMPs are infeasible. Therefore, the narrative in the final WQMP will identify and justify if there are any constraints that would prevent the use of those categories of LID BMPs. Opportunities that exist which will be utilized during project design will be noted. Upon completion of identifying Constraints and Opportunities as part of the final WQMP, they will be included on the WQMP Site plan in Appendix 1 in the final WQMP.

## Site Optimization

The following questions are based upon Section 3.2 of the WQMP Guidance Document. Review of the WQMP Guidance Document will also be used in preparation of each final Project-Specific WQMP to determine how best to optimize the final site layout and subsequently identify opportunities and/or constraints, and document compliance.

**Did you identify and preserve existing drainage patterns? If so, how? If not, why?**

The majority of the project site is agricultural and currently sheet flows to earthen ditches. Under the proposed project which will require mass grading, most of these ditches will be removed, with the exception of one natural drainage course, Line E, located at the eastern portion of the project as shown on Figure 1 of the Master Plan of Drainage Report. Portions of this natural drainage course south of Alessandro Boulevard will remain in a natural condition with the proposed project.

**Did you identify and protect existing vegetation? If so, how? If not, why?**

There are 74 acres of natural areas that will be conserved as undisturbed open space. Although most of the project area is agricultural and will require mass grading, where possible existing native trees and shrubs will be preserved in areas where there is no grading.

**Did you identify and preserve natural infiltration capacity? If so, how? If not, why?**

LID BMPs that promote infiltration and evapotranspiration will be incorporated in specific projects throughout the project site. Infiltration BMPs will be preferred, but may not be feasible on sites with low infiltration rates, or located on compacted engineered fill. In situations where infiltration BMPs are not appropriate, bioretention and/or biotreatment BMPs that provide opportunity for evapotranspiration and incidental infiltration will be implemented. The locations of these facilities will be shown in each final Project-Specific WQMP.

**Did you identify and minimize impervious area? If so, how? If not, why?**

A significant portion of the project will remain pervious for the purposes of landscaping, water quality treatment, and flood detention. The use of impervious surfaces for decorative purposes will be minimized where possible. Street, sidewalk, and parking design will incorporate or keep minimum street widths that still meet City requirements and emergency access requirements.

**Did you identify and disperse runoff to adjacent pervious areas? If so, how? If not, why?**

Runoff from impervious areas will sheet flow or be directed to LID or Treatment Control BMPs. Streets, sidewalks, and parking lots will sheet flow to landscaping/bioretention areas. All flows, including first flush and high flows, will sheet flow or be directed to LID or Treatment Control BMPs.

## Site Optimization BMPs

Site Optimization BMPs are intended to create a hydrologically functional project design that attempts to mimic the natural hydrologic regime. In accordance with the Riverside County WQMP, project proponents shall implement Site Design concepts that achieve each of the following:

1) Minimize Urban Runoff
2) Minimize Impervious Footprint
3) Conserve Natural Areas
4) Minimize Directly Connected Impervious Areas (DCIAs)

Each Site Optimization concept is presented below, with a discussion of whether the design concept will be incorporated in the project. Site Optimization BMPs will be shown in each final Project-Specific WQMP.

**Minimize Urban Runoff**

The project will be designed to minimize urban runoff using the following Site Design concepts.

- Maximize the permeable area. A significant portion of the project will remain pervious for the purposes of landscaping, water quality treatment, and flood detention. By incorporating more pervious, lower Runoff Coefficient (C factor) surfaces into the project, lower volumes of runoff will be produced.
- Incorporate landscaped buffer areas between sidewalks and streets. Bioretention areas between sidewalks and streets will be incorporated and serve the dual purpose of landscaping and water quality treatment.
- Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs. Although most of the project area will require mass grading, where possible existing native trees and shrubs will be preserved in areas where there is no grading. The planting and landscape will be designed to maximize water conservation, including the use of drought-tolerant and native planting.
- Use natural drainage systems. The majority of the project site is agricultural and currently sheet flows to earthen ditches. Under the proposed project which will require mass grading, most of these ditches will be removed, with the exception of one natural drainage course, Line E, located at the eastern portion of the project as shown on Figure 1 of the Master Plan of

Drainage Report. Portions of this natural drainage course south of Alessandro Boulevard will remain in a natural condition with the proposed project.

- Where soils conditions are suitable, use perforated pipe or gravel filtration pits for low flow infiltration. Infiltration basins will be proposed where soil conditions are appropriate.
- Construct onsite ponding areas or retention facilities to increase opportunities for infiltration consistent with vector control objectives. Flows from the project will be treated first by LID BMPs where most of the flow will infiltrate or evapotranspire. The treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through on-site detention and infiltration basins before flows are released off site. These basins will provide incidental infiltration and secondary treatment downstream of the LID BMPs. The locations of these facilities will be shown in each final Project-Specific WQMP.

**Minimize Impervious Footprint**

Each project will be designed to minimize impervious footprint using the following Site Optimization concepts.

- Maximize the permeable area. A significant portion of the project will remain pervious for the purposes of landscaping, water quality treatment, and flood control. By incorporating the aforementioned pervious, lower Runoff Coefficient (C factor) surfaces into the project, lower volumes of runoff will be produced.
- Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised. Street, sidewalk, and parking design will incorporate minimum street widths that still meet City requirements and emergency access requirements.
- Reduce widths of street where off-street parking is available. Street design will incorporate minimum street widths that still meet City requirements and emergency access requirements.
- Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design. The use of impervious surfaces for decorative purposes will be minimized where possible.

**Conserve Natural Areas**

The project will be designed to conserve natural areas using the following Site Optimization concepts.

- Conserve natural areas. There are 74 acres of natural areas that will be conserved as undisturbed open space.
- Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs. Although most of the project area will require mass grading, where possible existing native trees and shrubs will be preserved in areas where there is no grading. The planting and landscape will be designed to maximize water conservation, including the use of drought-tolerant or native planting.
- Use natural drainage systems. The majority of the project site is agricultural and currently sheet flows to earthen ditches. Under the proposed project which will require mass grading, most of these ditches will be removed, with the exception of one natural drainage course, Line E, located at the eastern portion of the project as shown on Figure 1 of the Master Plan of Drainage Report. Portions of this natural drainage course south of Alessandro Boulevard will remain in a natural condition with the proposed project.

**Minimize Directly Connected Impervious Areas**

The project will be designed to minimize directly connected impervious areas using the following Site Optimization concepts.

- Residential and commercial sites must be designed to contain and infiltrate roof runoff, or direct roof runoff to vegetative swales or buffer areas, where feasible. Runoff from impervious areas will sheet flow or be directed to LID BMPs.
- Where landscaping is proposed, drain impervious sidewalks, walkways, trails, and patios into adjacent landscaping. Streets, sidewalks, and parking lots will sheet flow to landscaping/bioretention areas.
- Increase the use of vegetated drainage swales in lieu of underground piping or imperviously lined swales. Runoff from impervious areas will sheet flow to vegetated swales, bioretention areas, infiltration basins, and/or detention basins.
- Rural swale system: street sheet flows to vegetated swale or gravel shoulder, curbs at street corners, culverts under driveways and street crossings. Streets will sheet flow to adjacent landscaping/ bioretention areas.
- Urban curb/swale system: street slopes to curb; periodic swale inlets drain to vegetated swale/biofilter. Streets will sheet flow to adjacent landscaping/bioretention areas.
- Design driveways with shared access, flared (single lane at street) or wheel strips (paving only under tires); or, drain into landscaping prior to discharging to the MS4. Driveways will sheet flow to adjacent landscaping/bioretention areas.
- Uncovered temporary or guest parking on private residential lots may be paved with a permeable surface, or designed to drain into landscaping prior to discharging to the MS4. Parking lots will sheet flow to adjacent landscaping/bioretention areas.
- Where landscaping is proposed in parking areas, incorporate landscape areas into the drainage design. Parking lots will sheet flow to adjacent landscaping/bioretention areas.

# Section C: Delineate Drainage Management Areas (DMAs)

**To be completed as part of each final Project Specific WQMP.**

Utilizing the procedure in Section 3.3 of the WQMP Guidance Document which discusses the methods of delineating and mapping your project site into individual DMAs, complete Table C.1 below to appropriately categorize the types of classification (e.g., Type A, Type B, etc.) per DMA for your project site. Upon completion of this table, this information will then be used to populate and tabulate the corresponding tables for their respective DMA classifications.

**Table C.1** DMA Classifications

| DMA Name or ID | Surface Type(s)[1] | Area (Sq. Ft.) | DMA Type |
|---|---|---|---|
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |

[1] *Reference Table 2-1 in the WQMP Guidance Document to populate this column*

**Table C.2** Type 'A', Self-Treating Areas

| **DMA Name or ID** | **Area (Sq. Ft.)** | **Stabilization Type** | **Irrigation Type (if any)** |
|---|---|---|---|

*Note: More than one drainage management area can drain to a single LID BMP; however, one drainage management area may not drain to more than one BMP.*

# Section D: Implement LID BMPs

The project will comply with the WQMP Guidance Document for the Santa Ana Region of Riverside County, which requires the use of LID BMPs that maximize infiltration, harvest and use, evapotranspiration and/or bio-treatment. Page 19 of the WQMP Guidance Document states:

"LID BMPs have been shown in studies throughout the country to be effective and reliable at treating a wide range of Pollutants that can be found in urban runoff, including those listed above [sediments, nutrients, metals, toxic organic compounds, trash, oxygen-demanding substances, oil and grease, bacteria and viruses, and pesticides], and those subject to adopted TMDLs in the Santa Ana Region of Riverside County (Bacteria and Nutrients). As such, the LID BMPs required in this WQMP are expected to treat discharges of urban-sourced 303(d) listed Pollutants from subject projects to an impaired waterbody on the 303(d) list such that the discharge from the project would not cause or contribute to an exceedance of Receiving Water Quality Objectives."

By complying with the WQMP and implementing LID-based BMPs, the project is mitigating water quality impacts. The BMP strategy for the project is to select Low Impact Development (LID) BMPs that promote infiltration and evapotranspiration, including infiltration basins, bioretention facilities, and extended detention basins. Generally infiltration BMPs have advantages over other types of BMPs, including reduction of the volume and rate of runoff, as well as full treatment of all potential pollutants potentially contained in the stormwater runoff. It is recognized however that infiltration may not be feasible on sites with low infiltration rates, or located on compacted engineered fill. If the BMP is considered in a fill condition, and the infiltration surface of the BMP cannot extend down into native soils, or if the BMP is considered in a cut condition, and there is no practicable way to verify infiltration rates at the final BMP elevation, infiltration BMPs will not be used. Prior to final design, infiltration tests shall be performed within the boundaries of the proposed infiltration BMP and at the bottom elevation (infiltration surface) of the proposed infiltration BMP to confirm the suitability of infiltration. In situations where infiltration BMPs are not appropriate, bioretention and/or biotreatment BMPs (including extended detention basins, bioswales, and constructed wetlands) that provide opportunity for evapotranspiration and incidental infiltration will be considered. Harvest and use BMPs will also be considered as an LID BMP to store runoff for later non-potable uses. Ponds may be used to collect storm water runoff for harvest and use.

The locations of the LID BMPs will be shown in each final Project-Specific WQMP. In order to meet Regional Water Quality Control Board (RWQCB) requirements, in the Santa Ana Watershed the design capture volume (VBMP) is based on capturing the volume of runoff generated from an 85th percentile, 24-hour storm event. The sizing and design criteria for the LID BMPs will follow the Riverside County Design Handbook for Low Impact Development Best Management Practices (Riverside County LID Design Handbook) (RCFCWCD, 2011). The Design Storm Depth (D85) was determined to be 0.68 inches per the Isohyetal Map for the 85th Percentile 24-hour Storm Event. Supporting engineering calculations and LID BMP design details will be provided in each final Project-Specific WQMP.

## D.1 Infiltration Applicability

While infiltration testing has not been performed on the site, a preliminary review of the feasibility of infiltration has been conducted. According to the Riverside County Hydrology Manual, the majority of the study area consists of Hydrologic Soil Group (HSG) Type B, which is considered appropriate for infiltration. The HSG map within the study area is included in Appendix 3. A geotechnical evaluation has been performed for the World Logistics Center Specific Plan area, and the geotechnical report is contained in the EIR as a technical appendix. The geotechnical field explorations included 80 test pits,

over 50 borings, and seven cone penetration tests. Based on the laboratory test data, the site mainly consists of silty sands (SM) with zones of silt (ML) beds. The silt beds range anywhere from 5 to 15 feet below ground surface (bgs). In some of the areas, the beds appear to be continuous from boring/pit to boring/pit. Based on the lab data, total fines (silt and clay) range from 36 percent (SM) to 80 percent (ML). Soils in the southeast portion of the site appear to be more granular, however. Based on the geotechnical report, most of the site is considered to be on the borderline between HSG Type B and C soils, with localized areas classified as HSG Type C. Infiltration testing will be performed prior to final design, and infiltration test reports will be included in each final Project-Specific WQMP. The determination of LID BMPs will be based on the results of the infiltration testing.

**The remainder of this section will be completed as part of each final Project Specific WQMP.**

Is there an approved downstream 'Highest and Best Use' for stormwater runoff (see discussion in Chapter 2.4.4 of the WQMP Guidance Document for further details)? ☐ Y ☐ N

If yes has been checked, Infiltration BMPs shall not be used for the site. If no, continue working through this section to implement your LID BMPs. It is recommended that you contact your Co-Permittee to verify whether or not your project discharges to an approved downstream 'Highest and Best Use' feature.

### Geotechnical Report

A Geotechnical Report or Phase I Environmental Site Assessment may be required by the Co-permittee to confirm present and past site characteristics that may affect the use of Infiltration BMPs. Both reports have been prepared for the Specific Plan area and are included in the EIR as technical appendices. A project-specific geotechnical report will be prepared at a later date for each project. .

Is this project classified as a small project consistent with the requirements of Chapter 2 of the WQMP Guidance Document? ☐ Y ☒ N

### Infiltration Feasibility

Table D.1 below is meant to provide a simple means of assessing which DMAs on your site support Infiltration BMPs and is discussed in the WQMP Guidance Document in Chapter 2.4.5. Check the appropriate box for each question and then list affected DMAs as applicable. If additional space is needed, add a row below the corresponding answer.

**Table D.1** Infiltration Feasibility

| Does the project site… | YES | NO |
|---|---|---|
| …have any DMAs with a seasonal high groundwater mark shallower than 10 feet? | | |
| If Yes, list affected DMAs: | | |
| …have any DMAs located within 100 feet of a water supply well? | | |
| If Yes, list affected DMAs: | | |
| …have any areas identified by the geotechnical report as posing a public safety risk where infiltration of stormwater could have a negative impact? | | |
| If Yes, list affected DMAs: | | |
| …have measured in-situ infiltration rates of less than 1.6 inches / hour? | | |
| If Yes, list affected DMAs: | | |
| …have significant cut and/or fill conditions that would preclude in-situ testing of infiltration rates at the final infiltration surface? | | |
| If Yes, list affected DMAs: | | |
| …geotechnical report identify other site-specific factors that would preclude effective and safe infiltration? | | |
| Describe here: | | |

If you answered "Yes" to any of the questions above for any DMA, Infiltration BMPs should not be used for those DMAs and you should proceed to the assessment for Harvest and Use below.

## D.2 Harvest and Use Assessment

Please check what applies*:*

☒ Reclaimed water will be used for the non-potable water demands for the project if it is available.

☐ Downstream water rights may be impacted by Harvest and Use as approved by the Regional Board (verify with the Co-permittee).

☐ The Design Capture Volume will be addressed using Infiltration Only BMPs. In such a case, Harvest and Use BMPs are still encouraged, but it would not be required if the Design Capture Volume will be infiltrated or evapotranspired.

If any of the above boxes have been checked, Harvest and Use BMPs need not be assessed for the site. If neither of the above criteria applies, follow the steps below to assess the feasibility of irrigation use, toilet use and other non-potable uses (e.g., industrial use).

**To be completed as part of each final Project Specific WQMP if reclaimed water is unavailable.**

### Irrigation Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for Irrigation Use BMPs on your site:

Step 1: Identify the total area of irrigated landscape on the site, and the type of landscaping used.

*Total Area of Irrigated Landscape*:

*Type of Landscaping (Conservation Design or Active Turf)*:

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for irrigation use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

*Total Area of Impervious Surfaces:*

Step 3: Cross reference the Design Storm depth for the project site (see Exhibit A of the WQMP Guidance Document) with the left column of Table 2-3 in Chapter 2 to determine the minimum area of Effective Irrigated Area per Tributary Impervious Area (EIATIA).

*Enter your EIATIA factor*:

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum irrigated area that would be required.

*Minimum required irrigated area*:

Step 5: Determine if harvesting stormwater runoff for irrigation use is feasible for the project by comparing the total area of irrigated landscape (Step 1) to the minimum required irrigated area (Step 4).

| Minimum required irrigated area (Step 4) | Available Irrigated Landscape (Step 1) |
|---|---|
| | |

## Toilet Use Feasibility

Complete the following steps to determine the feasibility of harvesting stormwater runoff for toilet flushing uses on your site:

Step 1: Identify the projected total number of daily toilet users during the wet season, and account for any periodic shut downs or other lapses in occupancy:

*Projected Number of Daily Toilet Users:*

*Project Type:*

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for toilet use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

*Total Area of Impervious Surfaces:*

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-1 in Chapter 2 to determine the minimum number or toilet users per tributary impervious acre (TUTIA).

*Enter your TUTIA factor:*

Step 4: Multiply the unit value obtained from Step 3 by the total of impervious areas from Step 2 to develop the minimum number of toilet users that would be required.

*Minimum number of toilet users:*

Step 5: Determine if harvesting stormwater runoff for toilet flushing use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

| Minimum required Toilet Users (Step 4) | Projected number of toilet users (Step 1) |
|---|---|
| | |

## Other Non-Potable Use Feasibility

Are there other non-potable uses for stormwater runoff on the site (e.g. industrial use)? See Chapter 2 of the Guidance for further information. If yes, describe below. If no, write N/A.

Step 1: Identify the projected average daily non-potable demand, in gallons per day, during the wet season and accounting for any periodic shut downs or other lapses in occupancy or operation.

*Average Daily Demand:*

Step 2: Identify the planned total of all impervious areas on the proposed project from which runoff might be feasibly captured and stored for the identified non-potable use. Depending on the configuration of buildings and other impervious areas on the site, you may consider the site as a whole, or parts of the site, to evaluate reasonable scenarios for capturing and storing runoff and directing the stored runoff to the potential use(s) identified in Step 1 above.

*Total Area of Impervious Surfaces:*

Step 3: Enter the Design Storm depth for the project site (see Exhibit A) into the left column of Table 2-3 in Chapter 2 to determine the minimum demand for non-potable uses per tributary impervious acre.

*Enter the factor from Table 2-3:*

Step 4: Multiply the unit value obtained from Step 4 by the total of impervious areas from Step 3 to develop the minimum number of gallons per day of non-potable use that would be required.

*Minimum required use:*

Step 5: Determine if harvesting stormwater runoff for other non-potable use is feasible for the project by comparing the Number of Daily Toilet Users (Step 1) to the minimum required number of toilet users (Step 4).

| **Minimum required non-potable use (Step 4)** | **Projected average daily use (Step 1)** |
|---|---|
| | |

If Irrigation, Toilet and Other Use feasibility anticipated demands are less than the applicable minimum values, Harvest and Use BMPs are not required and you should proceed to utilize LID Bioretention and Biotreatment, unless a site-specific analysis has been completed that demonstrates technical infeasibility as noted in D.3 below.

## D.3 Bioretention and Biotreatment Assessment

*Select one of the following:*

☒ LID Bioretention/Biotreatment BMPs will be used for some or all DMAs of the project as noted below in Section D.4 (note the requirements of Section 3.4.2 in the WQMP Guidance Document).

☐ A site-specific analysis demonstrating the technical infeasibility of all LID BMPs has been performed and is included in Appendix 5. If you plan to submit an analysis demonstrating the technical infeasibility of LID BMPs, request a pre-submittal meeting with the Co-permittee to discuss this option. Proceed to Section E to document your alternative compliance measures.

## D.4 Feasibility Assessment Summaries

There is an existing 2% slope across the project site from north to south, which will require mass grading and significant cut and fill. The fill condition and/or native soil characteristics may preclude the implementation of infiltration basins at some BMP sites. Thus, while infiltration BMPs are preferred, the final BMPs will likely consist of infiltration basins where appropriate, and bioretention and biotreatment BMPs as the primary means for water quality treatment. A preliminary review of BMP sizing has been conducted, and the project will provide sufficient space to accommodate a combination of bioretention facilities and detention/infiltration basins. Bioretention facilities will be proposed in landscaped spaces, like parking islands, medians, walkways, and site entrances. The goal will be to design landscaped areas on the site as bioretention facilities. The project site will be graded to direct runoff from impervious surfaces into landscaped bioretention facilities. Flows will then be directed to the detention/infiltration basins.

**The remainder of this section will be completed as part of each final Project Specific WQMP.**

From the Infiltration, Harvest and Use, Bioretention and Biotreatment Sections above, complete Table D.2 below to summarize which LID BMPs are technically feasible, and which are not, based upon the established hierarchy.

**Table D.2** LID Prioritization Summary Matrix

| DMA Name/ID | LID BMP Hierarchy | | | | No LID (Alternative Compliance) |
|---|---|---|---|---|---|
| | 1. Infiltration | 2. Harvest and use | 3. Bioretention | 4. Biotreatment | |
| | ☐ | ☐ | ☐ | ☐ | ☐ |
| | ☐ | ☐ | ☐ | ☐ | ☐ |
| | ☐ | ☐ | ☐ | ☐ | ☐ |
| | ☐ | ☐ | ☐ | ☐ | ☐ |
| | ☐ | ☐ | ☐ | ☐ | ☐ |
| | ☐ | ☐ | ☐ | ☐ | ☐ |

For those DMAs where LID BMPs are not feasible, provide a brief narrative below summarizing why they are not feasible, include your technical infeasibility criteria in Appendix 5, and proceed to Section E below to document Alternative Compliance measures for those DMAs. Recall that each proposed DMA must pass through the LID BMP hierarchy before alternative compliance measures may be considered.

**Narrative description to be included as part of each final Project Specific WQMP**

## D.5 LID BMP Sizing

**This section will be completed as part of each final Project Specific WQMP.**

Each LID BMP must be designed to ensure that the Design Capture Volume will be addressed by the selected BMPs. First, calculate the Design Capture Volume for each LID BMP using the $V_{BMP}$ worksheet in Appendix F of the LID BMP Design Handbook. Second, design the LID BMP to meet the required $V_{BMP}$ using a method approved by the Co-permittee. Utilize the worksheets found in the LID BMP Design Handbook or consult with your Co-permittee to assist you in correctly sizing your LID BMPs. Complete Table D.3 below to document the Design Capture Volume and the Proposed Volume for each LID BMP. Provide the completed design procedure sheets for each LID BMP in Appendix 6. You may add additional rows to the table below as needed.

**Table D.3** DCV Calculations for LID BMPs

| DMA Type/ID | DMA Area (square feet) | Post-Project Surface Type | Effective Impervious Fraction, $I_f$ | DMA Runoff Factor | DMA Areas x Runoff Factor | *Enter BMP Name / Identifier Here* | | |
|---|---|---|---|---|---|---|---|---|
| | [A] | | [B] | [C] | [A] x [C] | | | |
| | | | | | | *Design Storm Depth (in)* | *Design Capture Volume,* $\mathbf{V_{BMP}}$ *(cubic feet)* | *Proposed Volume on Plans (cubic feet)* |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | $A_T = \Sigma[A]$ | | | | $\Sigma = [D]$ | [E] | $[F] = \frac{[D]x[E]}{12}$ | [G] |

[B], [C] is obtained as described in Section 2.3.1 of the WQMP Guidance Document

[E] is obtained from Exhibit A in the WQMP Guidance Document

[G] is obtained from a design procedure sheet, such as in LID BMP Design Handbook and placed in Appendix 6

# Section E: Alternative Compliance (LID Waiver Program)

**This section will be completed as part of each final Project Specific WQMP.**

LID BMPs are expected to be feasible on virtually all projects. Where LID BMPs have been demonstrated to be infeasible as documented in Section D, other Treatment Control BMPs must be used (subject to LID waiver approval by the Co-permittee). Check one of the following Boxes:

☐ LID Principles and LID BMPs have been incorporated into the site design to fully address all Drainage Management Areas. No alternative compliance measures are required for this project and thus this Section is not required to be completed.

- *Or* -

☐ The following Drainage Management Areas are unable to be addressed using LID BMPs. A site-specific analysis demonstrating technical infeasibility of LID BMPs has been approved by the Co-Permittee and included in Appendix 5. Additionally, no downstream regional and/or sub-regional LID BMPs exist or are available for use by the project. The following alternative compliance measures on the following pages are being implemented to ensure that any pollutant loads expected to be discharged by not incorporating LID BMPs, are fully mitigated.

List DMAs here.

# E.1 Identify Pollutants of Concern

Utilizing Table A.1 from Section A above which noted the project's receiving waters and their associated EPA approved 303(d) listed impairments, cross reference has been done with this information with that of the selected Priority Development Project Category in Table E.1 below.

The potential pollutants associated with the project are metals, nutrients, pesticides, toxic organic compounds, sediments, trash & debris, and oil & grease. The potential pollutants associated with the project that are also present in impaired Receiving Waters are bacterial indicators, nutrients, pesticides, sediments, and toxic organic compounds. There are no anticipated legacy pollutants as a result of past uses. A Phase I Environmental Site Assessment for the World Logistics Center Specific Plan has revealed no evidence of recognized environmental conditions (RECs) indicative of releases or threatened releases of hazardous substances on, at, in, or to the subject site.

The identified General Pollutant Categories that are the same as those listed for the receiving waters are the Pollutants of Concern and the appropriate boxes are checked on the last row. The purpose of this is to document compliance and to help appropriately plan for mitigating the Pollutants of Concern in lieu of implementing LID BMPs which will be determined in each final Project-Specific WQMP.

**Table E.1** Potential Pollutants by Land Use Type

| Priority Development Project Categories and/or Project Features (check those that apply) | General Pollutant Categories | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Bacterial Indicators | Metals | Nutrients | Pesticides | Toxic Organic Compounds | Sediments | Trash & Debris | Oil & Grease |
| ☐ Detached Residential Development | P | N | P | P | N | P | P | P |
| ☐ Attached Residential Development | P | N | P | P | N | P | P | P[(2)] |
| ☒ Commercial/Industrial Development | P[(3)] | P | P[(1)] | P[(1)] | P[(5)] | P[(1)] | P | P |
| ☐ Automotive Repair Shops | N | P | N | N | P[(4, 5)] | N | P | P |
| ☐ Restaurants (>5,000 ft$^2$) | P | N | N | N | N | N | P | P |
| ☐ Hillside Development (>5,000 ft$^2$) | P | N | P | P | N | P | P | P |
| ☒ Parking Lots (>5,000 ft$^2$) | P[(6)] | P | P[(1)] | P[(1)] | P[(4)] | P[(1)] | P | P |
| ☒ Retail Gasoline Outlets | N | P | N | N | P | N | P | P |
| **Project Priority Pollutant(s) of Concern** | ☒ | ☐ | ☒ | ☒ | ☒ | ☒ | ☐ | ☐ |

*P = Potential*

*N = Not Potential*

*(1) A potential Pollutant if non-native landscaping exists or is proposed onsite; otherwise not expected*

*(2) A potential Pollutant if the project includes uncovered parking areas; otherwise not expected*

*(3) A potential Pollutant is land use involving animal waste*

*(4) Specifically petroleum hydrocarbons*

*(5) Specifically solvents*

*(6) Bacterial indicators are routinely detected in pavement runoff*

## E.2 Stormwater Credits

**This section will be completed as part of each final Project Specific WQMP.**

Projects that cannot implement LID BMPs but nevertheless implement smart growth principles are potentially eligible for Stormwater Credits. Utilize Table 3-8 within the WQMP Guidance Document to identify your Project Category and its associated Water Quality Credit. If not applicable, write N/A.

**Table E.2** Water Quality Credits

| Qualifying Project Categories | Credit Percentage[2] |
|---|---|
| | |
| | |
| | |
| *Total Credit Percentage*[1] | |

[1] *Cannot Exceed 50%*
[2] *Obtain corresponding data from Table 3-8 in the WQMP Guidance Document*

## E.3 Sizing Criteria

**This section will be completed as part of each final Project Specific WQMP.**

After you appropriately considered Stormwater Credits for your project, utilize Table E.3 below to appropriately size them to the DCV, or Design Flow Rate, as applicable. Please reference Chapter 3.5.2 of the WQMP Guidance Document for further information.

**Table E.3** Treatment Control BMP Sizing

| DMA Type/ID | DMA Area (square feet) | Post-Project Surface Type | Effective Impervious Fraction, $I_f$ | DMA Runoff Factor | DMA Area x Runoff Factor | | *Enter BMP Name / Identifier Here* | | |
|---|---|---|---|---|---|---|---|---|---|
| | [A] | | [B] | [C] | [A] x [C] | | | | |
| | | | | | | *Design Storm Depth (in)* | *Minimum Design Capture Volume or Design Flow Rate (cubic feet or cfs)* | *Total Storm Water Credit % Reduction* | *Proposed Volume or Flow on Plans (cubic feet or cfs)* |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | $A_T$ = Σ[A] | | | | Σ= [D] | [E] | $[F] = \frac{[D]x[E]}{[G]}$ | [F] X (1-[H]) | [I] |

[B], [C] is obtained as described in Section 2.3.1 from the WQMP Guidance Document
[E] is obtained from Exhibit A in the WQMP Guidance Document
[G] is for Flow-Based Treatment Control BMPs [G] = 43,560, for Volume-Based Control Treatment BMPs, [G] = 12
[H] is from the Total Credit Percentage as Calculated from Table E.2 above
[I] as obtained from a design procedure sheet from the BMP manufacturer and should be included in Appendix 6

## E.4 Treatment Control BMP Selection

**This section will be completed as part of each final Project Specific WQMP.**

Treatment Control BMPs typically provide proprietary treatment mechanisms to treat potential pollutants in runoff, but do not sustain significant biological processes. Treatment Control BMPs must have a removal efficiency of a medium or high effectiveness as quantified below:

- **High**: equal to or greater than 80% removal efficiency
- **Medium**: between 40% and 80% removal efficiency

Such removal efficiency documentation (e.g., studies, reports, etc.) as further discussed in Chapter 3.5.2 of the WQMP Guidance Document, must be included in Appendix 6. In addition, ensure that proposed Treatment Control BMPs are properly identified on the WQMP Site Plan in Appendix 1.

Table E.4 **Treatment Control BMP Selection**

| Selected Treatment Control BMP Name or ID[1] | Priority Pollutant(s) of Concern to Mitigate2 | Removal Efficiency Percentage[3] |
|---|---|---|
| | | |
| | | |
| | | |
| | | |

[1] *Treatment Control BMPs must not be constructed within Receiving Waters. In addition, a proposed Treatment Control BMP may be listed more than once if they possess more than one qualifying pollutant removal efficiency.*

[2] *Cross Reference Table E.1 above to populate this column.*

[3] *As documented in a Co-Permittee Approved Study and provided in Appendix 6.*

# Section F: Hydromodification

### F.1 Hydrologic Conditions of Concern (HCOC) Analysis

If the project meets one of the following criteria which will be indicated by the check boxes below, hydromodification does not need to be addressed at this time. However, if the project does not qualify for Exemptions 1, 2 or 3, then additional measures must be added to the design to comply with HCOC criteria.

**HCOC EXEMPTION 1**: The Priority Development Project disturbs less than one acre. The Co-permittee has the discretion to require a Project-Specific WQMP to address HCOCs on projects less than one acre on a case by case basis. The disturbed area calculation should include all disturbances associated with larger common plans of development.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, HCOC criteria do not apply.

**HCOC EXEMPTION 2**: The volume and time of concentration[1] of storm water runoff for the post-development condition is not significantly different from the pre-development condition for a 2-year return frequency storm (a difference of 5% or less is considered insignificant) using one of the following methods to calculate:

- Riverside County Hydrology Manual
- Technical Release 55 (TR-55): Urban Hydrology for Small Watersheds (NRCS 1986), or derivatives thereof, such as the Santa Barbara Urban Hydrograph Method
- Other methods acceptable to the Co-Permittee

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, report results in Table F.1 below and provide your substantiated hydrologic analysis in Appendix 7.

Table F.1 Hydrologic Conditions of Concern Summary

| | 2 year – 24 hour | | |
|---|---|---|---|
| | **Pre-condition** | **Post-condition** | **% Difference** |
| **Time of Concentration** | | | |
| **Volume (Cubic Feet)** | | | |

[1] Time of concentration is defined as the time after the beginning of the rainfall when all portions of the drainage basin are contributing to flow at the outlet.

**HCOC EXEMPTION 3**: All downstream conveyance channels to an adequate sump (for example, Prado Dam, Lake Elsinore, Canyon Lake, Santa Ana River, or other lake, reservoir or naturally erosion resistant feature) that will receive runoff from the project are engineered and regularly maintained to ensure design flow capacity; no sensitive stream habitat areas will

be adversely affected; or are not identified on the Co-Permittees Hydromodification Sensitivity Maps.

Does the project qualify for this HCOC Exemption? ☐ Y ☒ N

If Yes, HCOC criteria do not apply and note below which adequate sump applies to this HCOC qualifier:

### F.2 HCOC Mitigation

If none of the above HCOC Exemption Criteria are applicable, HCOC criteria is considered mitigated if they meet one of the following conditions:

a. Additional LID BMPS are implemented onsite or offsite to mitigate potential erosion or habitat impacts as a result of HCOCs. This can be conducted by an evaluation of site-specific conditions utilizing accepted professional methodologies published by entities such as the California Stormwater Quality Association (CASQA), the Southern California Coastal Water Research Project (SCCRWP), or other Co-Permittee approved methodologies for site-specific HCOC analysis.

b. The project is developed consistent with an approved Watershed Action Plan that addresses HCOC in Receiving Waters.

c. Mimicking the pre-development hydrograph with the post-development hydrograph, for a 2-year return frequency storm. Generally, the hydrologic conditions of concern are not significant, if the post-development hydrograph is no more than 10% greater than pre-development hydrograph. In cases where excess volume cannot be infiltrated or captured and reused, discharge from the site must be limited to a flow rate no greater than 110% of the pre-development 2-year peak flow.

This project proposes to direct runoff to LID BMPs, where the flows will either be infiltrated, evapotranspired, or be treated. The treated flows will then be reduced to below or equal to pre-development conditions by routing the on-site storm water flows through on-site detention and infiltration basins before flows are released off site. The LID BMPs and detention/infiltration basins proposed at each drainage area will store increased runoff volume for a limited period of a time and release the outflow at a rate that does not exceed the pre-development condition identified in item c. above. As a result, the LID BMPs and detention/infiltration basins will mitigate the impacts of increased peak runoff and reduced time of concentration by attenuating the flows. Riprap or flow blocks will be used in the entrance spillways to reduce the runoff velocity and dissipate the flow energy. Basins with the outflow risers and pipe structures at the downstream end of the watershed will be directed to a spreading area and limit and spread the outflow so that the flow exiting the project boundary will be consistent with the pre-project condition. The sheet flow exiting the southerly boundary will not exceed the flow velocity or the peak flow rate, and will not reduce the overall time of concentration at the most downstream end of the project site compared to the pre-development condition.

The proposed LID BMPs, detention/infiltration basins and outflow structures along with open space will allow flows to infiltrate. The ability of sediment to be conveyed through the existing drainage courses was determined. The majority of the drainage courses deposit sediment in the existing condition and this will occur in the proposed condition through the use of the basins. Runoff leaving the project site via the spreading areas will mimic the sheet flow of the pre-existing condition to maintain the sediment carrying capacity of the existing condition. Thus, the amount of sediment for transport will be in balance

with the storm flows, and no additional erosion is expected at the downstream project boundary. Therefore, there will be no significant impacts on the downstream watershed and the project will not degrade the downstream water quality.

By implementing the items above, the project will address the hydrologic conditions of concern. At the time of final design for each project, detailed hydrologic and hydraulic calculations in accordance with Item c, above will be performed to ensure that the mitigation is appropriately implemented.

Preliminary supporting engineering studies and calculations are contained in the Draft Drainage Report for the World Logistics Center Project, and final studies and calculations will be included in Appendix 7 of each final Project-Specific WQMP.

# Section G: Source Control BMPs

Source control BMPs include permanent, structural features that may be required in your project plans — such as roofs over and berms around trash and recycling areas — and Operational BMPs, such as regular sweeping and "housekeeping", that must be implemented by the site's occupant or user. The MEP standard typically requires both types of BMPs. In general, Operational BMPs cannot be substituted for a feasible and effective permanent BMP. Using the Pollutant Sources/Source Control Checklist in Appendix 8, the following procedure was used to specify Source Control BMPs for the site:

1. **Identify Pollutant Sources:** Review Column 1 in the Pollutant Sources/Source Control Checklist. Check off the potential sources of Pollutants that apply to your site.

2. **Note Locations on Project-Specific WQMP Exhibit:** Note the corresponding requirements listed in Column 2 of the Pollutant Sources/Source Control Checklist. Show the location of each Pollutant source and each permanent Source Control BMP in your Project-Specific WQMP Exhibit located in Appendix 1. **This will be provided as part of each final Project Specific WQMP.**

3. **Prepare a Table and Narrative:** Check off the corresponding requirements listed in Column 3 in the Pollutant Sources/Source Control Checklist. In the left column of Table G.1 below, list each potential source of runoff Pollutants on your site (from those that you checked in the Pollutant Sources/Source Control Checklist). In the middle column, list the corresponding permanent, Structural Source Control BMPs (from Columns 2 and 3 of the Pollutant Sources/Source Control Checklist) used to prevent Pollutants from entering runoff. Add additional narrative in this column that explains any special features, materials or methods of construction that will be used to implement these permanent, Structural Source Control BMPs.

4. **Identify Operational Source Control BMPs:** To complete your table, refer once again to the Pollutant Sources/Source Control Checklist. List in the right column of your table the Operational BMPs that should be implemented as long as the anticipated activities continue at the site. Co-permittee stormwater ordinances require that applicable Source Control BMPs be implemented; the same BMPs may also be required as a condition of a use permit or other revocable Discretionary Approval for use of the site.

Source Control BMPs reduce the potential for stormwater runoff and pollutants from coming into contact with one another. Each Source Control BMP that is incorporated into the project is presented in the table below. The locations of the structural Source Control BMPs are not shown in the current Specific Plan phase, but will be shown in each final Project-Specific WQMP.

**Table G.1** Permanent and Operational Source Control Measures

| Potential Sources of Runoff pollutants | Permanent Structural Source Control BMPs | Operational Source Control BMPs |
|---|---|---|
| A. On-site storm drain inlets | Mark all inlets with the words "Only Rain Down the Storm Drain" or similar. Catch Basin Markers may be available from the Riverside County Flood Control and Water Conservation District, call 951.955.1200 to verify. | • Maintain and periodically repaint or replace inlet markings.<br>• Provide stormwater pollution prevention information to new site owners, lessees, or operators.<br>• See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

| | | |
|---|---|---|
| | | • Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains." |
| D2. Landscape/<br>Outdoor Pesticide Use | State that final landscape plans will accomplish all of the following.<br>• Preserve existing native trees, shrubs, and ground cover to the maximum extent possible.<br>• Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution.<br>• Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions.<br>• Consider using pest-resistant plants, especially adjacent to hardscape.<br>• To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions. | • Maintain landscaping using minimum or no pesticides.<br>• See applicable operational BMPs in "What you should know for…..Landscape and Gardening" at http://rcflood.org/stormwater/<br>• Provide IPM information to new owners, lessees and operators. |
| E. Pools, spas, ponds, decorative fountains, and other water features. | If the Co-Permittee requires pools to be plumbed to the sanitary sewer, place a note on the plans and state in the narrative that this connection will be made according to local requirements. | See applicable operational BMPs in "Guidelines for Maintaining Your Swimming Pool, Jacuzzi and Garden Fountain" at http://rcflood.org/stormwater/ |
| G. Refuse areas | • State how site refuse will be handled and provide supporting detail to what is shown on plans.<br>• State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar. | • State how the following will be implemented:<br>Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |
| I. Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.) | Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains.<br>Where appropriate, reference | See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

| | | |
|---|---|---|
| | documentation of compliance with the requirements of Hazardous Materials Programs for:<br>• Hazardous Waste Generation<br>• Hazardous Materials Release Response and Inventory<br>• California Accidental Release (CalARP)<br>• Aboveground Storage Tank<br>• Uniform Fire Code Article 80 Section 103(b) & (c) 1991<br>• Underground Storage Tank<br>www.cchealth.org/groups/hazmat/ | |
| L. Fuel Dispensing Areas | | The property owner shall dry sweep the fueling area routinely. See the Fact Sheet SD-30 , "Fueling Areas" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |
| M. Loading Docks | | • Move loaded and unloaded items indoors as soon as possible.<br>• See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |
| N. Fire Sprinkler Test Water | | See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |
| O. Miscellaneous Drain or Wash Water or Other Sources:<br>• Condensate drain lines<br>• Rooftop equipment<br>• Roofing, gutters, and trim. | • Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system.<br>• Rooftop equipment with potential to produce pollutants shall be roofed and/or have secondary containment.<br>• Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff. | N/A |
| P. Plazas, sidewalks, and parking lots. | | Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect washwater containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain. |

**Non-Structural Source Control BMPs**

The project will be designed with the following non-structural Source Control BMPs.

- Education for Property Owners, Operators, Tenants, Occupants, or Employees. Practical informational materials to promote the prevention of Urban Runoff pollution will be provided to educate employees/users of the project site. These materials shall include general housekeeping practices that contribute to the protection of stormwater quality. The project owner will request copies of these materials from http://www.floodcontrol.co.riverside.ca.us/YouCanHelp.asp at least 30 days prior to distribution, as required by the Riverside County WQMP

- Activity Restrictions. The project owner will enforce activity restrictions. Activity restrictions for water quality protection will include:

    - Prohibit vehicle washing, maintenance, or repair. No car wash racks or maintenance bays will be allowed within the project.

    - Prohibit outdoor work areas and processing areas within the project.

    - Prohibit the blowing, sweeping, or hosing of debris (leaf litter, grass clippings, litter, etc.) into streets, storm drain inlets, or other conveyances.

    - Require dumpster lids to be closed at all times.

- Irrigation System and Landscape Maintenance. The irrigation system and landscaping shall be consistent with the County's water conservation policy. Fertilizer and pesticide usage shall be consistent with the instructions contained on product labels and with regulations administered by California's Department of Pesticide Regulation. Additionally, landscape maintenance must address replacement of dead vegetation, repair of erosion rills, proper disposal of green waste, etc. Irrigation system maintenance must address periodic testing and observation of the irrigation system to detect overspray, broken sprinkler heads, and other system failures.

- Common Area Litter Control. Trash receptacles will be provided at appropriate locations throughout the project area. Trash receptacles will be emptied weekly, or as needed.

- Street Sweeping Private Streets and Parking Lots. The project owner shall provide sweeping of the parking lots on a monthly basis.

- Drainage Facility Inspection and Maintenance. The project owner shall be responsible for having privately owned catch basins inspected and cleaned annually. Ownership of all offsite drainage facilities will be turned over to the City of Moreno Valley at project completion. The City will be responsible for maintaining and inspecting all public drainage facilities.

# Section H: Construction Plan Checklist

**This section will be completed as part of each final Project Specific WQMP.**

Populate Table H.1 below to assist the plan checker in an expeditious review of your project. The first two columns will contain information that was prepared in previous steps, while the last column will be populated with the corresponding plan sheets. This table is to be completed with the submittal of your final Project-Specific WQMP.

**Table H.1** Construction Plan Cross-reference

| BMP No. or ID | BMP Identifier and Description | Corresponding Plan Sheet(s) |
|---|---|---|
| | | |
| | | |
| | | |
| | | |
| | | |

Note that the updated table — or Construction Plan WQMP Checklist — is **only a reference tool** to facilitate an easy comparison of the construction plans to your Project-Specific WQMP. Co-Permittee staff can advise you regarding the process required to propose changes to the approved Project-Specific WQMP.

# Section I: Operation, Maintenance and Funding

The Co-permittee will periodically verify that Stormwater BMPs on the site are maintained and continue to operate as designed. To make this possible, the following will be included in Appendix 9 of each final Project-Specific WQMP:

1. A means to finance and implement facility maintenance in perpetuity, including replacement cost.
2. Acceptance of responsibility for maintenance from the time the BMPs are constructed until responsibility for operation and maintenance is legally transferred. A warranty covering a period following construction may also be required.
3. An outline of general maintenance requirements for the Stormwater BMPs you have selected.
4. Figures delineating and designating pervious and impervious areas, location, and type of Stormwater BMP, and tables of pervious and impervious areas served by each facility. Geo-locating the BMPs using a coordinate system of latitude and longitude is recommended to help facilitate a future statewide database system.
5. A separate list and location of self-retaining areas or areas addressed by LID Principles that do not require specialized O&M or inspections but will require typical landscape maintenance as noted in Chapter 5, pages 85-86, in the WQMP Guidance. Include a brief description of typical landscape maintenance for these areas.
