Appendix B
Mitigation Measures

APPENDIX B
Mitigation Measures

The lead agencies have developed mitigation measures to avoid or reduce potential adverse environmental effects associated with the Project and alternatives. The full text of the mitigation measures is provided in this appendix. These measures would be implemented during all appropriate phases of the Project, from initial ground breaking and construction, to operation and maintenance, and through closure and decommissioning. These measures refer to the "Project Owner" rather than the "Applicant" in anticipation of defining the responsibilities of Sonoran West Solar Holdings, LLC in the event that the Project is approved. For purposes of implementation of these measures, the Project Owner is defined as Sonoran West Solar Holdings, LLC, its successors and assigns, and/or its contractors.

For several of the mitigation measures presented here, the Applicant has submitted, and the Lead Agencies have reviewed, draft resource- or process-specific mitigation plans; in each such case, the draft plan is appended to the Final EIS and Proposed PA. Where the Lead Agencies have determined that the draft plans submitted by the Applicant may not adequately avoid, minimize, or mitigate impacts, additional details to be incorporated into final mitigation plans are provided in mitigation measures. Based on the review process described in specific mitigation measures, the Applicant (or Project Owner) would revise draft plans as needed and submit them to the specified agencies for review, comment, and/or approval.

Six mitigation measures require compensatory mitigation: BIO-18, BIO-19, BIO-20, BIO-26, BIO-28, and BIO-29. The CDCA Plan, as amended by the NECO Plan, identifies compensatory mitigation requirements for impacts to the Mojave desert tortoise and Mojave fringe-toed lizard. Additionally, the Biological Opinion prepared by USFWS identifies required compensatory mitigation to address impacts to the Mojave desert tortoise under the Endangered Species Act (see Appendix I.13). The remaining measures have been considered and incorporated by BLM as part of California state laws, plans, and programs that require compensatory mitigation, in accordance with BLM Instruction Memorandum 2019-018.

Air Resources

AQ-1: **Dust Control Plan.** In the event that the Project Owner secures the necessary approvals for the Project and selects a construction contractor, the specific logistics for construction and operation of the Project can then be finalized, and it would at that time be practicable and feasible to develop a detailed Dust Control Plan for the Project. The Project Owner shall develop and implement a Dust Control Plan that describes the fugitive dust control measures that shall be implemented and monitored at all locations of proposed facility construction activities and during operation and maintenance. The Project Owner shall submit the plan to BLM and MDAQMD for review and approval no less than 60 days prior to the start of construction. The Project Owner shall incorporate the plan into all contracts and contract specifications for construction work. The plan shall outline the steps to be taken to minimize fugitive dust generated by construction and operation activities to such a degree that Project-generated visible fugitive dust plumes are prevented from leaving the Project site. The plan shall:

- Describe each active construction activity or operation-period activity that may result in the generation of fugitive dust;
- Identify activities likely to be sources of fugitive dust, e.g., earth moving, storage piles, and vehicular traffic;

- Describe the control measures the Project Owner will apply to each of the sources identified. The descriptions shall be sufficiently detailed to demonstrate that the Project Owner is using the best available control measures required by the air quality districts and the County of Riverside; and
- Describe the role of the mitigation monitor who will monitor implementation of the Dust Control Plan and initiate corrective action, if needed.

A designated representative of the Project Owner shall submit documentation to BLM's Authorized Officer in Monthly Compliance Reports to demonstrate that visible fugitive dust plumes are prevented from leaving the Project site and to show that the Project Owner is adhering to all applicable rules, including, but not limited to, the following control measures:

a. Visible speed limit signs shall be posted at the site entrance(s).

b. No vehicle shall exceed 25 miles per hour (mph) on paved roads or 15 mph on unpaved roads. Speeds shall be reduced if visible dust emissions occur.

c. Street sweeping and trackout devices shall be used at the construction site. If visible soil material is carried into adjacent public streets, sweep streets daily or wash trucks and equipment before entering public streets.

d. Excavation, spoils, access roads, storage piles, and other sources of fugitive dust (parking areas, staging areas, other) shall be frequently watered or stabilized if construction activity causes persistent visible emissions of fugitive dust beyond the work area.

e. Apply water or chemical soil stabilizers to form and maintain a crust on inactive construction areas (disturbed lands that are unused for four consecutive days).

f. Cover stockpiles and suspend construction work when winds exceed 25 mph.

g. Stockpiles not in active use shall be covered at all times regardless of ambient wind speed.

h. Pre-water soils prior to clearing and trenching.

i. Pre-moisten dirt, sand, and loose materials prior to transport, import, and export.

j. Cover loads in haul trucks or maintain at least six inches of free-board when traveling on public roads.

k. Dedicate a water truck or high-capacity hose to every soil screening operation.

l. Minimize drop height of material through screening equipment.

m. Reduce the amount of disturbed area where possible.

n. Plant vegetative ground cover in disturbed areas as soon as possible following construction activities.

o. The Project Owner shall in general avoid disturbing desert pavement surfaces during construction. Where the BLM agrees that disturbance of the pavement is unavoidable, the Project Owner shall ensure that all areas where desert pavement has been temporarily disturbed during construction of the Project shall be applied with a BLM-approved soil stabilizer where appropriate for stabilization based on soil characteristics prior to Project operation. The Project Owner shall develop, for review and approval by the BLM, a plan that outlines the frequency of non-toxic soil stabilizer applications based on the specifications of the selected soil stabilizer. The Plan shall be developed in coordination with scientists engaged by the BLM to find the most efficient methods for stabilizing soil surfaces using diverse methods in addition to chemical stabilizers: e.g., development of soil biotic crusts, revegetation, construction of small netted fences, and other methods. The Plan shall be submitted to the BLM for approval prior to the start of ground disturbance.

p. Installing the following signage, which shall be erected not later than the commencement of construction: A minimum 48 inch high by 96 inch wide sign containing the following shall be

located within 50 feet of each project site entrance, meeting the specified minimum text height, black text on white background, on one inch A/C laminated plywood board, with the lower edge between six and seven feet above grade, with the contact name of a responsible official for the site and a local or toll-free number that is accessible 24 hours per day:

"[Site Name] {four inch text}
[Project Name/Project Number] {four inch text}
IF YOU SEE DUST COMING FROM {four inch text}
THIS PROJECT CALL: {four inch text}
[Contact Name], PHONE NUMBER XXX-XXXX {six inch text}
If you do not receive a response, Please Call {three inch text}
The MDAQMD at 1-800-635-4617 {three inch text}"

q. If visible dust plumes that have been transported off the project site and within 400 feet upwind of any regularly occupied structures not owned by the Project Owner or 200 feet beyond the centerline of the construction of linear facilities are observed by the mitigation monitor for the Dust Control Plan or reported to MDAQMD, the mitigation monitor shall implement corrective actions including:

   i. Confirm that all applicable Dust Control Plan measures are in active use, particularly with respect to restrictions on activity during winds exceeding 25 mph;

   ii. Direct intensive application of watering and/or soil stabilization measures, street sweeping, and vehicle washing as listed in the Dust Control Plan within 15 minutes of identifying visible plumes; and

   iii. Direct a temporary shutdown of the activity causing the emissions if steps q.i and q.ii fail to result in effective mitigation within one hour of the original determination. The activity shall not restart until the mitigation monitor is satisfied that appropriate additional mitigation or other site conditions have changed so that visual dust plumes will not result upon restarting the shutdown source. The Project Owner may appeal to the BLM Authorized Officer any directive from the mitigation monitor to shut down an activity.

r. During operation, permanent unpaved roads shall be treated to minimize dust (e.g., surfaced with gravel, compacted native soil, or a dust palliative such as ChlorTex Road Binder, Eccotext Soil Binder, or PlasTex Soil Stabilizer or similar product [not lime treatment])**.** Any dust palliative would require approval from the BLM Authorized Officer prior to application. This treatment shall be maintained as needed throughout the life of the Project to maintain the effectiveness of dust suppression.

The Project Owner or its designated representative shall obtain approval from the MDAQMD prior to any deviations from fugitive dust control measures specified in the approved Dust Control Plan. A justification statement used to explain the technical and safety reason(s) that preclude the use of required fugitive dust control measures shall be submitted to the appropriate agency for review. The provisions of the Dust Control Plan shall also apply to project decommissioning activities.

AQ-2: **Diesel Engine Standards.** The construction contractor shall use off-road construction diesel engines that meet the Tier 4 Final California Emissions Standards, unless it is infeasible for all off-road equipment to have Tier 4-compliant engines because such an engine is not available for a particular type of off-road equipment. In such circumstances, the BLM AO will allow the use of Tier 4 Interim or Tier 3 engines on a case-by-case basis when the contractor has documented that no Tier 4 Final equipment, or emissions equivalent retrofit equipment, is available for a particular equipment type that must be used to complete construction. Documentation shall consist of signed written statements from at least two local construction equipment rental firms. In addition, all on-highway vehicles used for construction of the Project that are under direct control of the Project Owner or construction contractor shall meet or exceed the USEPA and California Air Resource Board exhaust emissions

standards for model year 2014, including the use of newer heavy-duty highway compression-ignition engines (e.g., long-haul trucks, refuse haulers, shuttle buses, etc., that are over 19,500 pounds).

AQ-3: **Idling Policy.** In order to ensure that idling time for on road vehicles with a gross vehicular weight rating of 10,000 pounds or greater does not exceed the 5-minute limit established in Title 13 CCR Section 2485, and that idling time for off-road engines does not exceed the 5-minute limit established in Title 13 CCR Section 2449(d)(3), the Project Owner and/or its construction contractor(s) shall prepare and implement a written idling policy and distribute it to all equipment operators. The idling policy for the 5-minute idling limit shall cover all on road vehicles (regardless of gross vehicular weight rating) and shall further require that for all diesel-powered off-road engines, the idling limit is reduced to 2 minutes, while maintaining the exceptions specified in Title 13 CCR Section 2449(d)(3). Clear signage of these requirements shall be posted for workers at the entrances to the Project Site.

AQ-4: **Construction Equipment Maintenance.** The construction contractor shall maintain construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determined to be running in proper condition before it is operated.

AQ-5: Thirty days prior to commencement of construction, the Project Owner or construction contractor shall notify the MDAQMD of the expected construction phases of the Project, so it can consider the multiple projects that may be undergoing construction at the same time.

Biological Resources

General Measures

AQ-1: **Dust Control Plan** (see Air Resources section)

BIO-1: **Designated Biologist(s).** Prior to issuance of the Notice to Proceed, the Project proponent shall designate at least one Designated Biologist (DB) for the Project.

***DB Approval*:** The DB shall be approved by the BLM's Authorized Officer (AO) and CDFW and in consultation with USFWS. The Project proponent shall submit the resume of the proposed DB(s) with at least three references and their contact information. If the DB is not also a USFWS and CDFW Authorized Biologist (AB) for desert tortoise, a separate AB shall be designated and be present onsite for measures associated with the federal- and state- listed desert tortoise; AB qualifications and responsibilities are detailed in BIO-21.

***DB Responsibilities*:** The Project proponent shall ensure that the DB(s) performs the activities described below during all pre-construction site mobilization activities, construction-related ground-disturbance, grading, boring, trenching, commissioning, or other activities that may impact biological resources. The DB may be assisted by the approved Biological Monitor(s) (BM(s)) but shall remain the contact for the Project proponent and the Resource Agencies.

a) The DB shall be responsible for overseeing monitoring and compliance with protective measures for the biological resources. Approval from the CDFW and the USFWS would be necessary for the monitoring or handling of federally and state listed wildlife species.

b) The DB shall maintain communications with the appropriate personnel (project manager, resident engineer) to ensure that issues relating to biological resources are appropriately and lawfully managed. The DB shall also be present to verify compliance with all conservation measures.

c) The DB shall submit reports that document compliance with biological resources mitigation, minimization, and avoidance measures as described under Mitigation Measure BIO-3 (BRMMRP).

d) The DB shall be onsite during all vegetation clearing and grubbing during Project construction habitat to be impacted.

e) The DB may present the Worker Environmental Awareness Training (WEAP) described under BIO-17.

f) The DB shall ensure proper implementation of protective measures developed in coordination with USFWS and CDFW to avoid all impacts to all encountered sensitive species as well as other nesting birds.

g) The DB shall immediately notify the resident engineer to halt work, if necessary, and coordinate with the BLM, USFWS, and CDFW to ensure the proper implementation of species and habitat protection measures.

h) The DB shall report any breach of the conservation measures within 24 hours of its occurrence to the BLM, USFWS, and CDFW.

BIO-2: **Biological Monitors.** The Project Owner shall employ BMs to support Project compliance activities as needed under the supervision of the DB and ABs.

***BM Approval*:** The Project proponent or DB shall submit the resumes, at least three references, and contact information for each of the proposed BMs to the BLM, USFWS, and CDFW for approval. The resumes shall demonstrate, to the satisfaction of the BLM, USFWS, and CDFW, the appropriate education and experience to accomplish the assigned biological resource tasks.

***BM Responsibilities*:** BMs shall assist in conducting surveys and in monitoring of site mobilization activities and all vegetation and ground-disturbing activities, including pre-construction phase activities.

***Desert Tortoise Assistance*:** For all work with desert tortoise, BMs must be approved based on desert tortoise qualifications (see requirements for approval and responsibilities in BIO-21).

BIO-3: **Biological Resources Mitigation, Monitoring, and Reporting Plan (BRMMRP).** Prior to the issuance of the Notice to Proceed, the Project Owner shall develop a BRMMRP for review and approval by the BLM and CDFW and part of the issuance of the ROW Grant. The BRMMRP shall provide a matrix to document implementation and monitor effectiveness of all biological mitigation measures, including adopted BLM and CDFW mitigation measures, measures included in resource management plans, and all permit-required mitigation. The BRMMRP shall ensure that all measures intended to avoid or reduce impacts are appropriately implemented, documented, and reported to the applicable agencies.

During pre-construction and construction activities, the Project Owner and DB shall provide quarterly and final compliance reports to the BLM, CDFW, and USFWS, documenting the effectiveness of mitigation measures, level of take of endangered or threatened federal or endangered, threatened, or candidate state species associated with the Project and practicality of the protection measures that are in place and making recommendations for modifying the measures to enhance species protection, as needed. The report shall also provide information on the overall biological resources-related activities conducted, including the worker awareness training, clearance/pre-activity surveys, monitoring activities, and any observed desert tortoises, including injuries and fatalities. Biological issues also shall be covered in the ongoing compliance reporting required by the BLM.

BIO-4: **Delineation of Work Areas.** Prior to initiation of construction, the DB shall ensure that the anticipated impact zones, including staging areas, equipment access, and disposal or temporary placement of spoils, are delineated with stakes and flagging to avoid natural resources. No construction-related activities shall occur outside of the designated impact area (i.e., Project site). Staging, stockpiling, and materials storage areas shall be delineated as described under BIO-5.

BIO-5: **Staging, Stockpiling, and Materials Storage.** During construction, the Project proponent shall ensure that all construction materials, staging, employee parking, storage, dispensing, fueling, and maintenance activities are located in upland areas outside of microphyll woodland and ephemeral washes, and that measures, as specified in the Drainage, Erosion, and Sediment Control Plan (Mitigation Measure BIO-14) are taken to prevent any potential runoff from entering waters of the State. Staging areas shall be located within permanent impact areas or previously disturbed sites within the Project site. Spoils shall be stockpiled only in areas subject to grading and disturbance and shall be placed to minimize impacts to native vegetation.

BIO-6: **Vehicle Access and Speed Limits.** During construction, personnel shall only access the site via Powerline Road and shall maintain a speed limit of 15 mph. Speed limits on roads or anywhere within the Project site shall not exceed 15 mph.

Cross-country vehicle and equipment use outside of the designated Project site (including the gen-tie line) and access roads shall be prohibited. All vehicles passing or turning around shall do so within the designated Project site and access roads.

During operations, all vehicles and site access shall remain on designated Project roads. No off-road travel shall occur. To minimize the likelihood for vehicle strikes of wildlife species a speed limit of 15 miles per hour shall be established for travel along Powerline Road. Speed limits shall be clearly marked by the proponent, and workers shall be made aware of these limits and the penalties authorized for exceeding them.

BIO-7: **Equipment Parking and Storage.** During construction, parking and storage of Project-related equipment and vehicles shall occur within the desert tortoise-exclusion fencing. Anytime a vehicle or construction equipment is parked in areas where desert tortoises may be present (e.g., unfenced areas of the site, even where ground has been cleared), the ground under the vehicle shall be inspected for the presence of desert tortoise before the vehicle is moved. This inspection shall involve both the front and rear tires, in front of each tire, and behind each tire. If a desert tortoise is observed, it shall be left to move on its own. If it does not move within 15 minutes, the AB, or BM under the direct supervision of an AB, shall remove and relocate the desert tortoise to a safe location.

BIO-8: **Hazardous Spills.** During construction and operations, all vehicles and equipment shall be in proper working condition to ensure that there is no potential for releases or spills of motor oil, antifreeze, hydraulic fluid, grease, or other hazardous materials. The DB shall be informed of any hazardous spills within 24 hours. Hazardous spills shall be immediately cleaned up according to the specifications established by the BLM California Hazardous Materials Specialist and the contaminated soil shall be properly disposed of at a hazardous waste facility permitted by the California Department of Toxic Substance Control. Servicing of construction equipment shall only take place in designated areas or offsite. Service/maintenance vehicles shall carry a bucket and pads to absorb leaks or spills.

Fueling and servicing of construction equipment shall take place only in a specifically designated area with proper secondary containment and not within 50 feet of washes or native desert habitats. Contractor equipment shall be checked for leaks prior to operation and repaired as necessary before equipment use may resume.

BIO-9: **Prevent Ponding.** During construction, a DB, AB, or BM shall patrol construction watering areas to ensure that water does not puddle for extended periods of time (generally several hours) and thereby attract desert tortoise, Couch's spadefoot, common ravens, and other wildlife to the site. The Project Owner will avoid diverting water to soils of soil series that the NRCS has determined are frequent ponding sites, as specified in the preliminary NRCS Riverside East soil survey information provided by the NRCS Victorville Soil Survey Office for the project site. Should extended puddling be observed, the DB, AB, or BM shall instruct the construction crew to cease watering within that location until the area has dried and implement re-grading or other measure to prevent extended puddling from recurring.

BIO-10: **Debris and Trash Disposal.** During construction and operations, all non-hazardous spoils, trash, and debris shall be removed by the construction contractor offsite as-needed to a solid waste disposal facility permitted by the California Department of Resources Recycling and Recovery (CalRecycle). Non-hazardous spoils and debris (not including food items) shall be stored within the Project site until removal and protected from dispersal by wind and water erosion. Trash and food items shall be contained in closed containers at all times and removed daily to reduce the attractiveness to opportunistic predators such as common ravens, coyotes, desert kit foxes, and other predators that may prey on sensitive species.

BIO-11: **Pets and Firearms.** During construction and operations, workers shall be prohibited from bringing pets (except service dogs) and firearms (except those in possession of authorized security personnel or local, state, or federal law enforcement officials) to the site.

BIO-12: **Wildlife Entrapment Avoidance.** During construction and operations, the following shall be implemented:

a. ***Backfill Trenches*.** At the end of each workday, the DB or BM shall ensure that all potential wildlife pitfalls (trenches, bores, and other excavations), both outside and within the area fenced with desert tortoise exclusion fencing, have been backfilled. If backfilling is not feasible, all trenches, bores, and other excavations shall be sloped at a 3:1 ratio at the ends to provide wildlife escape ramps, or covered completely to prevent wildlife access, or fully enclosed with desert tortoise-exclusion fencing. All trenches, bores, and other excavations outside the areas permanently fenced with desert tortoise exclusion fencing shall be inspected periodically throughout the day, at the end of each workday and at the beginning of each day by the DB or a BM. Should a tortoise or other wildlife become trapped, an AB shall remove and relocate the individual as described in the Desert Tortoise Relocation/Translocation Plan. Any wildlife encountered during the course of construction shall be allowed to leave the construction area unharmed.

b. ***Avoid Entrapment of Desert Tortoise and/or Burrowing Owl*.** All construction pipes, culverts, or similar structures with a diameter greater than 3 inches, stored less than 8 inches aboveground for one or more nights, shall be inspected for any wildlife before the material is moved, buried or capped. As an alternative, all such structures may be capped before being stored outside the fenced area, or placed on pipe racks. Similarly, no open pipes with a diameter greater than 3 inches will be stored or buried in a vertical orientation unless capped to prevent entrapment of birds and other wildlife.

BIO-13: **Lighting.** During construction, if construction activities occur at night, all Project lighting (e.g., staging areas, equipment storage sites, roadway) shall be directed downward onto the roadway or construction site and away from sensitive habitat. Light glare shields shall also be used to reduce the extent of illumination into adjoining areas and above into night skies.

During operations, the Project's lighting system shall provide the minimum illumination required to meet safety and security objectives and shall be oriented to minimize additional illumination in areas not pertinent to the facility. Project design shall include the following specific lighting features:

1) No permanent lights shall be installed within sensitive habitat.
2) Any lighting adjacent to sensitive habitat shall be directed or shielded away from the habitat, and motion-sensitive lighting shall be utilized adjacent to sensitive habitat so that there is not a constant source of light illuminating the surrounding habitat.
3) Light glare shields shall be used to reduce the extent of illumination into adjoining areas and above into night skies.
4) Full cut-off luminaires will be used to minimize uplighting.
5) Lights will be directed downward or toward the area to be illuminated.

6) Light fixtures will not spill light beyond the Project boundary.

7) Lights in highly illuminated areas that are not occupied on a continuous basis will have switches, timer switches, or motion detectors so that the lights operate only when the area is occupied.

8) Where practicable, vehicle mounted lights will be used for night maintenance activities.

9) Where practicable, consistent with safety and security, lighting will be kept off when not in use.

Operational lighting requirements pursuant to this measure shall be incorporated into the lighting plan required by Mitigation Measure VIS-1.

BIO-14: **Storm Water Management Plan and Drainage, Erosion, and Sediment Control Plan (DESCP).** Prior to issuance of the Notice to Proceed, the Project proponent shall prepare an Agency-approved Storm Water Management Plan and a DESCP to comply with BLM, USFWS, CDFW, and RWQCB requirements. The Project shall employ a comprehensive system of management controls, including site-specific BMPs, to minimize erosion and storm water contact with contaminants and thereby reduce exposure of wildlife and plants to pollutants in the storm water. The Plan shall include an adaptive management plan to monitor system performance and make adjustments to the design and BMPs if the BLM AO determines through monitoring that the system is inadequate.

BIO-15: **Wildfire Prevention.** During construction, wildfire risk reduction measures shall be implemented, consistent with the Fire Prevention Plan requirements outlined in Mitigation Measure FIRE-1. Vehicles shall not drive or park drive or where catalytic converters could ignite dry vegetation. In times of high fire hazard (e.g., red flag warnings, PAL E designations), vehicles and equipment shall carry firefighting equipment or high fire risk construction activities shall be halted, consistent with Mitigation Measure FIRE-1. The use of shields, protective mats, or other fire prevention equipment shall be used during grinding, welding, or other spark-generating activities to prevent or minimize the potential for ignitions. Smoking shall be prohibited within vegetated areas.

BIO-16: **Weed Management.** Prior to construction, the Project Owner shall prepare a Weed Management Plan for BLM and CDFW approval (a draft is included as Appendix I.10 in the Final EIS and Proposed PA). The Weed Management Plan shall include measures to reduce the potential for introducing non-native plant species to the site and to treat non-native plants, if introduced to the Project site or vicinity, including but not limited to the following: During construction and operations, the introduction of non-native plant species shall be avoided and controlled wherever possible, and may be achieved through physical or chemical removal (i.e., herbicides) and prevention. The Weed Management Plan shall provide sufficient information about the herbicides proposed to be used on the site to support the BLM's issuance of a Pesticide Use Proposal (PUP) to the Project Owner without additional analysis. Acceptable physical and/or chemical methods are described in the BLM's Programmatic Environmental Impact Statement for vegetation treatments using herbicides in 17 western states (2007). Preventing non-native plants and weeds from entering the site via vehicular sources shall include measures such as the use of rumble strips (e.g., Trackclean) or other method(s) of vehicle cleaning for vehicles coming and going from the site. Earth-moving equipment shall be cleaned of debris and plant propagules prior to transport to the Project site. Weed-free rice straw or other certified weed-free straw shall be used for erosion control. Weed populations introduced into the site during construction shall be eliminated by chemical and/or mechanical means approved by the BLM consistent with their Programmatic Environmental Impact Statement for vegetation treatments using herbicides in 17 western states and by CDFW and in accordance with applicable federal, state, and local regulations.

BIO-17: **Worker Environmental Awareness Program (WEAP).** Prior to construction, the Project proponent shall develop a WEAP to be approved by the BLM, CDFW, and USFWS. The WEAP shall contain information on all special-status species, vegetation communities, non-native invasive weed species (and how to reduce/limit their spread), and all general biological mitigation measures as well as all specific protection measures for special-status species. The WEAP shall be

administered to all Project personnel prior to their work during site preconstruction, construction, operation, and decommissioning and shall include documentation of training with training acknowledgements signed by each worker. The WEAP shall:

1. Be developed by or in consultation with the DB, AB, or BM and consist of an onsite or training center presentation in which supporting written material and electronic media, including photographs of protected species, is made available to all participants;
2. Discuss the locations and types of sensitive biological resources on the Project site and adjacent areas, and explain the reasons for protecting these resources; provide information to participants that no snakes, reptiles, or other wildlife shall be fed, harmed, or harassed and that no plants shall be collected;
3. Place special emphasis on desert tortoise and desert kit fox, including information on physical characteristics, distribution, behavior, ecology, sensitivity to human activities, legal protection, penalties for violations, reporting requirements, and protection measures;
4. Include a discussion of fire prevention measures to be implemented by workers during Project activities (e.g., protective measures when grinding or welding; provisioning vehicles with water and shovels or fire extinguishers during period of high fire risk; smoking in designated areas and proper disposal of cigarettes and cigars, etc.);
5. Describe the temporary and permanent habitat protection measures to be implemented at the Project site;
6. Identify events that require notification of the DB, AB, or BM, including but not limited to (1) desert tortoise observations; (2) special-status species observations in the work area; (3) observations of dead or injured wildlife within or near the work area; (4) accidental impacts outside of the designated work area, and (5) accidental spills of contaminants (within 24 hours);
7. Provide contact information and describe the chain of communication for biological resources-related issues.
8. Identify who to contact if there are further comments and questions about the material discussed in the program; and
9. Include a training acknowledgment form to be signed by each worker indicating that they received training and agree to abide by the guidelines.

The WEAP can be administered by a competent individual(s) or by media acceptable to CDFW the DB and the BLM AO. Any prerecorded presentation shall be accompanied by a formal process that allows submission of questions to the AB or BM that shall be read and answered within 24 hours of submission.

Resource-Specific Measures

As part of these resource-specific measures, this document incorporates by reference the mitigation measures within the following biological resource management plans that have been prepared for the Project and are included in Appendix I:

- Desert Tortoise Translocation Plan (BIO-23)
- Raven Management Plan (BIO-25)
- Couch's Spadefoot Management Plan (BIO-27)
- Burrowing Owl Management Plan (BIO-29)
- American Badger and Desert Kit Fox Monitoring and Management Plan (BIO-30)
- Nesting Bird Management Plan (BIO-31)

- Bird and Bat Conservation Strategy (BIO-32)
- Decommissioning Plan (BIO-34)

Vegetation Communities

BIO-18: **Vegetation Communities Restoration and Compensation.**

***Restoration Plan*:** Prior to issuance of the Notice to Proceed, the Project Owner shall prepare and obtain approval from the BLM and CDFW of a plan to restore areas subject to temporary impacts during the construction period. While all impacts will be mitigated as permanent due to the long re-establishment time required for desert vegetation, certain portions of the project site may only be impacted during construction, including, but not limited to portions of the gen-tie line and, if Alternative B is selected, disturbance areas that would be avoided by DE-2 and DE-3. The Project Owner shall be responsible for preparing an accurate map of temporarily disturbed areas upon completion of construction. Only native plant species and native microbial organisms which would naturally occur within the disturbed habitats shall be used for restoration. Seed tags shall be submitted to the BLM and CDFW at least 14 days before the date of proposed seeding for acceptance. Restoration activities shall be implemented within 30 days of construction completion or during the soonest appropriate planting season.

For all temporarily disturbed areas, the Restoration Plan shall include a description of proposed methods for topsoil salvage (as applicable) and replacement, plant/seed salvage including salvage of succulents, seeding techniques, inoculation of native microbial organisms for plant mycorrhizae and for biotic soil crust formation, methods to stabilize and shape soil surface to reduce soil erosivity, and techniques to increase soil fertility and water holding capacity. Plant salvage measures shall follow applicable state and federal regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.

A monitoring and reporting protocol shall be a requisite part of the Plan, and the following performance standards shall be met by the end of monitoring year 2:

1. at least 80 percent of the species observed within the temporarily disturbed areas shall be native species that naturally occur in desert scrub habitats; and
2. relative cover and density of plant species within the temporarily disturbed areas shall be equal to or greater than 60 percent of native background density.

If these standards are not met, remedial restoration measures shall be prepared and submitted to the BLM and CDFW for approval prior to implementation.

***Sensitive Vegetation Community Restoration or Compensation*:** Permanent impacts on Creosote Bush–White Bursage/Big Galleta Grass Association (estimated at 289.4 acres) shall be compensated through a combination of compensation and restoration at a minimum 1:1 ratio. Habitat compensation shall be accomplished through BLM- and CDFW-approved land preservation or mitigation fee payment for the purpose of habitat compensation of lands supporting comparable habitats to those lands impacted by the Project. Restoration may be appropriate as mitigation for permanent impacts provided that restoration is demonstrated to be feasible and the restoration effort is implemented pursuant to the restoration plan described above. Compensatory mitigation shall be subject to BLM and CDFW approval and include preservation, enhancement, restoration, and/or creation on lands protected by acquisition, easement, or other legal mechanism and shall provide in-kind or higher value habitat. If lands are acquired, the terms and conditions of this acquisition shall be as described in Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements. So long as security is posted in accordance with Provision 3 below (Security for Implementation of Mitigation), the Project Owner shall acquire, in fee or in easement, the land, no more than 18 months after the start of Project ground-disturbing activities. If all or any portion of the acquired Mojave desert tortoise or other required

compensation lands acquired under Mitigation Measures BIO-19, 20, 26, 28, or 29 meet the criteria above for sensitive vegetation community compensation lands that meets any of the criteria above may be used to fulfill that portion of the obligation for sensitive vegetation community mitigation.

BIO-19: **Riparian Habitat.** The Project Owner shall implement the following measures to avoid, minimize and mitigate for direct and indirect impacts to riparian vegetation (microphyll woodlands) and ephemeral washes and riparian habitat:

1. Prior to construction, the BM shall verify that demarcation of boundary fencing avoids microphyll woodlands by an approximate buffer of 200 feet, with the exception of crossing locations where two access road crossings occur within microphyll woodlands (the northeast access road and the middle-western access road). At these locations, crossing widths shall be microsited to avoid mature trees and constructed with the minimum width necessary to minimize direct impacts to the drainage. When the Project Owner or Contractor to Project Owner follows these BMPs, mitigation to replace lost woodlands would be avoided. If mature trees cannot be avoided at wash crossings and impacts to microphyll woodlands exceed 0.01 acre, compensatory mitigation shall be provided as described below.
2. *Compensatory Mitigation*: If the Project results in direct impacts to state-jurisdictional streams and riparian habitat, the Project Owner shall provide BLM and CDFW-approved compensatory mitigation at a ratio of 3:1 for any impacts greater than 0.01 acre to microphyll woodlands and 1:1 for all other directly impacted unvegetated ephemeral washes. Based on anticipated project impacts of up to 1.2 acres of microphyll woodlands and 90.6 acres of unvegetated ephemeral washes, resulting mitigation requirements would total up to 3.6 acres for microphyll woodlands and 90.6 acres for unvegetated ephemeral washes. Compensatory mitigation shall be subject to BLM and CDFW approval and include preservation, enhancement, restoration, and/or creation on lands protected by acquisition, easement, or other legal mechanism and shall provide in-kind or higher value habitat. If lands are acquired, the terms and conditions of this acquisition shall be as described in Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements. Mitigation for impacts to state waters shall occur within the same watershed where the Project occurs and/or surrounding watersheds, as close to the Project site as possible. So long as security is posted in accordance with Provision 3 below (Security for Implementation of Mitigation), the Project Owner shall acquire, in fee or in easement, the land, no more than 18 months after the start of Project ground-disturbing activities. If all or any portion of the acquired Mojave desert tortoise or other required compensation lands acquired under BIO-18, 20, 26, 28, or 29 meet the criteria above for riparian vegetation (microphyll woodlands) and ephemeral washes and riparian habitat, the portion of the other species' or habitat compensation lands that meets any of the criteria above may be used to fulfill that portion of the obligation for riparian vegetation (microphyll woodlands) and ephemeral washes and riparian habitat mitigation.
3. *Security for Implementation of Mitigation*: Prior to issuance of the Notice to Proceed, the Project Owner shall provide financial assurances to the BLM and CDFW to guarantee that an adequate level of funding is available to provide compensatory mitigation, as described in this condition. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the BLM and CDFW in the form of an irrevocable letter of credit, a pledged savings account or Security prior to initiating ground-disturbing Project activities. Prior to submittal, the Security shall be approved by the BLM and CDFW to ensure funding is adequate. (See Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements, for a discussion of the assumptions used in calculating the Security.) The Security amounts may change based on land costs or the estimated costs of enhancement and endowment. The final amount due shall be determined by the PAR or PAR-like analysis conducted pursuant to BIO-26, Part 3, Compensation Lands Acquisition Requirements, and approved by the BLM and CDFW. The final mitigation acreage is also subject to CDFW concurrence with Project impacts to waters of the state and riparian areas that were developed by the Project Owner.

4. *Preparation of Long Term Management Plan (LTMP)*: The Project Owner shall submit to the BLM and CDFW a draft LTMP for approval that reflects site-specific enhancements for the jurisdictional areas on the acquired compensation lands. The objective of the Management Plan shall be to enhance the wildlife value of the jurisdictional areas, and may include enhancement actions such as weed control, fencing to exclude livestock, or erosion control.
5. *Code of Regulations*: Prior to construction, the Project Owner shall provide a copy of the BRMMP and CDFW permits to all contractors, subcontractors, and the Project Owner's Project supervisors. Copies shall be readily available at work sites at all times during periods of active work and must be presented to any CDFW personnel upon demand. The BLM AO reserves the right to issue a stop work order or allow CDFW to issue a stop work order after giving notice to the Project Owner if the BLM AO in consultation with CDFW, determines that the Project Owner has breached any of the terms or conditions or for other reasons, including but not limited to the following:
    a. The information provided by the Project Owner regarding streambed alteration is incomplete or inaccurate;
    b. New information becomes available that was not known to it in preparing the terms and conditions; or
    c. The Project or Project activities as described in the Final EIS or Final EIR have changed.
6. *Best Management Practices*: The Project Owner shall also comply with the following conditions to protect drainages near the Project Disturbance Area:
    a. The Project Owner shall not allow water containing mud, silt, or other pollutants from grading, aggregate washing, or other activities to enter ephemeral drainages or be placed in locations that may be subjected to high storm flows and ponding.
    b. The Project Owner shall comply with all litter and pollution laws. All contractors, subcontractors, and employees shall also obey these laws, and it shall be the responsibility of the Project Owner to ensure compliance.
    c. Spoil sites shall be located within the Project site and at least 30 feet from the boundaries and drainages or in locations that may be subjected to high storm flows, where spoils might be washed back into drainages.
    d. Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil or other petroleum products, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from Project-related activities, shall be prevented from contaminating the soil and/or entering waters of the state. The Project Owner or any party working under contract or with the permission of the Project Owner shall immediately remove any such materials placed within a drainage or where the materials may enter a drainage.
    e. The Project Owner shall prevent any broken concrete, debris, soil, silt, sand, bark, slash, sawdust, rubbish, cement or concrete or washings thereof, oil or petroleum products or other organic or earthen material from any construction or associated activity of whatever nature from entering into, or being placed where rainfall or runoff may wash the materials into waters of the state.
    f. When operations are completed, any excess materials or debris shall be removed from the work area as soon as possible and shall not remain for longer than 5 days following completion of operations. No rubbish shall be deposited, even temporarily, within 150 feet of the high water mark of any drainage.

g. No equipment maintenance shall occur within 150 feet of any ephemeral drainage where petroleum products or other pollutants from the equipment may enter these areas under any flow.

Special-Status Plants

BIO-20: **Special-Status Plant Avoidance, Minimization, and Compensation.**

***Avoidance and Minimization*:** Prior to and during construction, the Project proponent shall identify and implement site design modifications to minimize impacts on special-status plants along Project access roads and the gen-tie line including:

1. Limit the extent of work areas;
2. Microsite roads and linear features to avoid known and newly discovered occurrences; and
3. Where blading for access roads is not required, drive and crush vegetation as an alternative to blading of roads to preserve the seed bank.

***Environmentally Sensitive Areas (ESAs)*:** Prior to the start of vegetation or ground-disturbing activities, a qualified botanist shall designate environmentally sensitive areas (ESAs) around special-status plants outside of the Project site within 100 feet of the limits of disturbance. This includes areas identified to have special-status plant species during prior surveys. The locations of ESAs shall be clearly marked on construction drawings and shall be flagged in the field. The boundaries of the ESAs shall be marked on drawings and/or flagged in the field a minimum of 20 feet from the occurrence. Where this is not possible due to construction constraints, other protection measures, such as silt fencing and sediment controls, may be employed to protect the occurrences. Equipment and vehicle maintenance and wash areas shall be located 100 feet from the upgradient side of any ESAs. ESAs shall be clearly delineated in the field with temporary construction fencing and signs prohibiting movement of the fencing or sediment controls. Violations of the ESA boundaries could result in work stoppages and/or compensation for damages to the resource being protected.

***Vegetation Trimming*:** During O&M, staff shall be trained to identify rare plant species known to occur on site as part of the WEAP (BIO-17), and vegetation trimming shall be conducted to allow special-status species to set seed prior to trimming.

***Compensation*:** For unavoidable impacts to Harwood's eriastrum, the Project Owner shall provide compensatory mitigation at a 1:1 ratio through one of the following options: (1) Acquisition and protection of habitat supporting the species, (2) restoration/enhancement of habitat occupied by the species on protected public lands, (3) or in-lieu fee payment to support these activities. Compensation shall be initiated or completed within 12 months from the time the resource impact occurs, unless a 6-month extension is approved by the Authorizing Officer. The Project Owner shall provide funding for the acquisition and/or restoration/ enhancement, initial improvement, and long-term maintenance and management of the acquired or restored lands. The actual costs to comply with this condition will vary depending on the Project disturbance area, the actual costs of acquiring compensation habitat, the actual costs of initially improving the habitat, the actual costs of long-term management as determined by a Property Analysis Record (PAR) or similar methodology, and other transactional costs related to the use of compensatory mitigation. The Project Owner shall comply with other related requirements of this measure, as follows:

1. *Compensatory Mitigation by Acquisition.* The requirements for the acquisition initial protection and habitat improvement, and long-term maintenance and management of compensation lands for state and Federally protected plant species include all of the following:

    1.1. *Selection Criteria for Acquisition Lands*. The compensation lands selected for acquisition may include any of the following three categories:

1.1.1. *Occupied Habitat, No Habitat Threats*. The compensation lands selected for acquisition shall be occupied by the species and shall be characterized by site integrity and habitat quality that are required to support the species, and shall be of equal or better habitat quality than that of the affected occurrence. The occurrence of the species on the proposed acquisition lands should be viable, stable or increasing (in size and reproduction).

1.1.2. *Occupied Habitat, Habitat Threats*. Occupied compensation lands characterized by habitat threats may also be acquired as long as the population could be reasonably expected to recover with habitat restoration efforts (e.g., OHV or grazing exclusion, or removal of invasive, non-native plants) and is accompanied by a Revegetation Plan as described in Mitigation Measure BIO-18 above.

1.1.3. *Unoccupied but Adjacent*. The Project Owner may also acquire habitat for which occupancy by the species has not been documented, if the proposed acquisition lands are adjacent to occupied habitat. The Project Owner shall provide evidence that acquisitions of such unoccupied lands would improve the defensibility and long-term sustainability of the occupied habitat by providing a protective buffer around the occurrence and by enhancing connectivity with undisturbed habitat. This acquisition may include habitat restoration efforts where appropriate, particularly when these restoration efforts will benefit adjacent habitat that is occupied by the species.

1.2. *Review and Approval of Compensation Lands Prior to Acquisition*. The Project Owner shall submit a formal acquisition proposal to the BLM AO describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands for special-status plants in relation to the criteria listed above, and must be approved by the BLM AO.

1.3. *Compensation Land Management Plan*. The Project Owner or approved third party shall prepare a management plan for the compensation lands in consultation with the entity that will be managing the lands. The goal of the management plan shall be to support and enhance the long-term viability of the plant occurrences. The Management Plan shall be submitted for review and approval to the BLM AO.

1.4. *Integrating Plant Mitigation with Other Mitigation Lands*. If all or any portion of the acquired Mojave desert tortoise or other required compensation lands meet the criteria above for special-status plant compensation lands, the portion of the other species' or habitat compensation lands that meets any of the criteria above may be used to fulfill that portion of the obligation for plant mitigation.

1.5. *Compensation Lands Acquisition Requirements*. The Project Owner shall comply with the following requirements relating to acquisition of the compensation lands after the BLM AO, has approved the proposed compensation lands:

1.5.1. *Preliminary Report*. The Project Owner, or an approved third party, shall provide a recent preliminary title report, initial hazardous materials survey report, biological analysis, and other necessary or requested documents for the proposed compensation land to the BLM AO. All documents conveying or conserving compensation lands and all conditions of title are subject to review and approval by the BLM AO. For conveyances to the state, approval may also be required from the California Department of General Services, the Fish and Game Commission and the Wildlife Conservation Board.

1.5.2. *Title/Conveyance*. The Project Owner shall acquire and transfer fee title to the compensation lands, a conservation easement over the lands, or both fee title and conservation easement, as required by the BLM AO. Any transfer of a conservation

easement or fee title may be to CDFW or an organization qualified to hold title to and manage compensation lands (pursuant to California Government Code §65965), to BLM, or another public agency approved by the BLM AO. If an approved non-profit organization holds fee title to the compensation lands, a conservation easement shall be recorded in favor of CDFW or another entity approved by the BLM AO. If an entity other than CDFW holds a conservation easement over the compensation lands, the BLM AO may require that CDFW or another entity approved by the BLM AO, in consultation with CDFW, be named a third party beneficiary of the conservation easement. The Project Owner shall obtain approval of the BLM AO of the terms of any transfer of fee title or conservation easement to the compensation lands.

1.5.3. *Initial Protection and Habitat Improvement*. The Project Owner shall fund activities that the BLM AO requires for the initial protection and habitat improvement of the compensation lands. These activities will vary depending on the condition and location of the land acquired, but may include trash removal, construction and repair of fences, invasive plant removal, and similar measures to protect habitat and improve habitat quality on the compensation lands. The costs of these activities are estimated to be $330 per acre, using the estimated cost per acre for Mojave desert tortoise mitigation as a best available proxy. A qualified organization, CDFW or another public agency may hold and expend the habitat improvement funds if it is qualified to manage the compensation lands (pursuant to California Government Code §65965), if it meets the approval of the BLM AO in consultation with CDFW, and if it is authorized to participate in implementing the required activities on the compensation lands. If CDFW takes fee title to the compensation lands, the habitat improvement fund must be paid to CDFW or its designee.

1.5.4. *Property Analysis Record*. Upon identification of the compensation lands, the Project Owner shall conduct a PAR or PAR-like analysis to establish the appropriate amount of the long-term maintenance and management fund to pay the in-perpetuity management of the compensation lands. The PAR or PAR-like analysis must be approved by the BLM AO before it can be used to establish funding levels or management activities for the compensation lands.

1.5.5. *Long-Term Maintenance and Management Funding*. The Project Owner shall deposit the endowment (with an entity qualified pursuant to Government Code sections 65965-65968, as amended and approved by BLM and CDFW) a non-wasting capital long-term maintenance and management fee in the amount determined through the PAR analysis conducted for the compensation lands.

1.5.6. *Long-Term Maintenance and Management Fund Entity*. The BLM AO, in consultation with CDFW, may designate another non-profit organization to hold the long-term maintenance and management fee if the organization is qualified to manage the compensation lands in perpetuity.

1.5.7. *Interest, Principal, and Pooling of Funds*. The Project Owner shall ensure that an agreement is in place with the long-term maintenance and management fund (endowment) holder/manager to ensure the following requirements are met:

i. Interest. Interest generated from the initial capital long-term maintenance and management fund shall be available for reinvestment into the principal and for the long-term operation, management, and protection of the approved compensation lands, including reasonable administrative overhead, biological monitoring, improvements to carrying capacity, law enforcement measures, and any other action that is approved by the BLM AO and is designed to protect or improve the habitat values of the compensation lands.

ii. Withdrawal of Principal. The long-term maintenance and management fund principal shall not be drawn upon unless such withdrawal is deemed necessary by the BLM AO or by the approved third-party long-term maintenance and management fund manager, to ensure the continued viability of the species on the compensation lands.

iii. Pooling Long-Term Maintenance and Management Funds. An entity approved to hold long-term maintenance and management funds for the Project may pool those funds with similar non-wasting funds that it holds from other projects for long-term maintenance and management of compensation lands for special-status plants. However, for reporting purposes, the long-term maintenance and management funds for this Project must be tracked and reported individually to the BLM AO.

1.5.8. *Other Expenses*. In addition to the costs listed above, the Project Owner shall be responsible for all other costs related to acquisition of compensation lands and conservation easements, including but not limited to the title and document review costs incurred from other state agency reviews, overhead related to providing compensation lands to CDFW or an approved third party, escrow fees or costs, environmental contaminants clearance, and other site cleanup measures.

1.5.9. *Mitigation Security*. The Project Owner shall provide financial assurances to the BLM AO to guarantee that an adequate level of funding is available to implement any of the mitigation measures required by this condition that are not completed prior to the start of ground-disturbing Project activities. Financial assurances shall be provided to the BLM AO in the form of an irrevocable letter of credit, a pledged savings account or another form of approved security ("Security"). The amount of the Security shall be $2,280 per acre, using the estimated cost per acre for Mojave desert tortoise mitigation as a best available proxy. The actual costs to comply with this condition will vary depending on the actual costs of acquiring compensation habitat, the costs of initially improving the habitat, and the actual costs of long-term management as determined by a PAR report. Prior to submitting the Security to the BLM AO, the Project Owner shall obtain the BLM AO's approval of the form of the Security. The BLM AO may draw on the Security if the BLM AO determines the Project Owner has failed to comply with the requirements specified in this condition. The BLM AO may use money from the Security solely for implementation of the requirements of this condition. The BLM AO's use of the Security to implement measures in this condition may not fully satisfy the Project Owner's obligations under this condition, and the Project Owner remains responsible for satisfying the obligations under this condition if the Security is insufficient. The unused Security shall be returned to the Project Owner in whole or in part upon successful completion of the associated requirements in this condition.

2. *Compensatory Mitigation by Habitat Enhancement/Restoration*: As an alternative or adjunct to land acquisition for compensatory mitigation, the Project Owner may undertake habitat enhancement or restoration for the plant species. Examples of suitable enhancement projects include but are not limited to the following:

   i) control unauthorized vehicle use into an occurrence (or pedestrian use if clearly damaging to the species);

   ii) control of invasive non-native plants that infest or pose an immediate threat to an occurrence;

   iii) exclude grazing by wild burros or livestock from an occurrence; or

iv) restore lost or degraded hydrologic or geomorphic functions critical to the species by restoring previously diverted flows, removing obstructions to the wind sand transport corridor above an occurrence, or increasing groundwater availability for dependent species.

If the Project Owner elects to undertake a habitat enhancement project for mitigation, the project must meet the following performance standards: The proposed enhancement project shall achieve rescue of an off-site occurrence that is currently assessed, based on the NatureServe threat ranking system (Master et al. 2009; see also Morse et al. 2004) with one of the following threat ranks:

a) long-term decline >30 percent;

b) an immediate threat that affects >30 percent of the population, or

c) has an overall threat impact that is High to Very High. "Rescue" would be considered successful if it achieves an improvement in the occurrence trend to "stable" or "increasing" status, or downgrading of the overall threat rank to slight or low (from "High" to "Very High").

If the Project Owner elects to undertake a habitat enhancement project for mitigation, they shall submit a Habitat Enhancement/Restoration Plan to the BLM AO for review and approval, and shall provide sufficient funding for implementation and monitoring of the Plan. The amount of the Security shall be $2,280 per acre, using the estimated cost per acre for Mojave desert tortoise mitigation as a best available proxy for every acre of habitat supporting the plant species which is directly or indirectly impacted by the Project. The amount of the security may be adjusted based on the actual costs of implementing the enhancement, restoration and monitoring. The implementation and monitoring of the enhancement/restoration may be undertaken by an appropriate third party such as NFWF, subject to approval by the BLM AO. The Habitat Enhancement/Restoration Plan shall include each of the following:

2.1. *Goals and Objectives*. Define the goals of the restoration or enhancement project and a measurable course of action developed to achieve those goals. The objective of the proposed habitat enhancement plan shall include restoration of a plant occurrence that is currently threatened with a long-term decline. The proposed enhancement plan shall achieve an improvement in the occurrence trend to "stable" or "increasing" status, or downgrading of the overall threat rank to slight or low (from "High" to "Very High").

2.2. *Historical Conditions*. Provide a description of the pre-impact or historical conditions (before the site was degraded by weeds or grazing or ORV, etc.), and the desired conditions.

2.3. *Site Characteristics.* Describe other site characteristics relevant to the restoration or enhancement project (e.g., composition of native and pest plants, topography and drainage patterns, soil types, geomorphic and hydrologic processes important to the site or species.

2.4. *Ecological Factors*. Describe other important ecological factors of the species being protected, restored, or enhanced such as total population, reproduction, distribution, pollinators, etc.

2.5. *Methods*. Describe the restoration methods that will be used (e.g., invasive exotics control, site protection, seedling protection, propagation techniques, etc.) and the long-term maintenance required. The implementation phase of the enhancement must be completed within five years.

2.6. *Budget*. Provide a detailed budget and time-line, and develop clear, measurable, objective-driven annual success criteria.

2.7. *Monitoring*. Develop clear, measurable monitoring methods that can be used to evaluate the effectiveness of the restoration and the benefit to the affected species. The Plan shall

include a minimum of five years of quarterly monitoring, and then annual monitoring for the remainder of the enhancement project, and until the performance standards for rescue of a threatened occurrence are met. At a minimum the progress reports shall include: quantitative measurements of the projects progress in meeting the enhancement project success criteria, detailed description of remedial actions taken or proposed and contact information for the responsible parties.

2.8. *Reporting Program*. The Plan shall ensure accountability with a reporting program that includes progress toward goals and success criteria. Include names of responsible parties. 9. Contingency Plan. Describe the contingency plan for failure to meet annual goals. 10. Long-term Protection. Include proof of long-term protection for the restoration site. For private lands this would include conservations easements or other deed restrictions; projects on public lands must be contained in a Desert Wildlife Management Area, Wildlife Habitat Management Area, or other land use protections that will protect the mitigation site and species.

Desert Tortoise

BIO-21: **Desert Tortoise Authorized Biologist (AB) and Biological Monitors (BMs).** The Project Owner shall ensure implementation of the following AB approval procedures, responsibilities, and authorities.

***AB Approval*:** A minimum of 30 days prior to the start of pre-construction activities, the Project Owner or DB shall submit to the BLM and CDFW a list of proposed AB(s) along with their qualifying documents (resume with references and contact information, along with a completed copy of the most recent Desert Tortoise Authorized Biologist Qualifications). Minimum qualifications are specified in the Biological Opinion (CM 3). The AB shall be approved by the BLM and CDFW and shall be permitted to handle desert tortoises. No Project pre-construction activities shall begin until an AB is approved. An AB may also fill the roles of DB or BM, if approved for those roles by the BLM and CDFW.

BM Approval: A minimum of 30 days prior to the start of pre-construction activities, the Project Owner, DB, or Desert Tortoise AB shall submit to the BLM and CDFW a list of proposed Desert Tortoise BM(s) along with their qualifying documents (resume with references and contact information). To be approved for work with desert tortoise, BMs must have a solid understanding of the adopted BLM and CDFW mitigation measures, the conservation measures in the Biological Opinion, and USFWS guidelines on desert tortoise surveys and handling procedures. BMs may not conduct field or clearance surveys or other specialized duties of the AB unless directly supervised by an AB. BMs will have the right and responsibility to halt any activities that are in violation of the Project's mitigation measures intended to protect desert tortoise.

***AB Responsibilities*:** The AB will have in their possession a copy of all mitigation and compliance measures related to desert tortoise while Project work is being conducted. Further, the AB will have the right and responsibility to halt any activities that are in violation of any of the measures intended to protect desert tortoise. Work shall proceed only after hazards to the desert tortoise are removed and the species is no longer at risk, or the individual has been moved from harm's way by the AB.

The AB will have discretion to assign duties and serve as a mentor to approved desert tortoise Biological Monitors (BMs) in conducting desert tortoise related duties. CDFW must approve BMs to perform specific tasks based on the BM's demonstrated skills, knowledge, and qualifications. Direct supervision is always required for field and clearance surveys and handling of desert tortoises; direct supervision means that the AB has direct voice and sight contact with the BM.

The AB(s) will be responsible for the following activities:

a) All surveys, trainings, compliance monitoring, and reporting related to the desert tortoise.

b) Handling and relocating desert tortoise out of harm's way or translocating desert tortoise when necessary. (BMs shall ensure compliance with the protection measures and may conduct surveys and compliance monitoring, but shall not be allowed to handle desert tortoise without direct oversight of an AB.)

c) The AB shall be notified of all desert tortoise observations, including injuries and mortalities.

d) Notifying the BLM, CDFW, and USFWS within 24 hours of any desert tortoise injuries or mortalities.

e) The AB shall be on site during fencing activities.

BIO-22: **Desert Tortoise Exclusion Fence.** Prior to grading or any long-term actions which might result in harm to a desert tortoise or which remove tortoise habitat, portions of the Project site subject to driving or construction disturbance shall be enclosed with a permanent desert tortoise-exclusion fence to keep desert tortoise in habitat adjacent to the site from entering the site during construction and operations phases. The access roads between development areas shall have temporary desert tortoise-exclusion fencing installed along their length through the washes in areas with the highest desert tortoise density (between the two southern-most development areas). Work activities occurring in unfenced areas will be monitored as detailed in Mitigation Measure BIO-23.

All desert tortoise exclusion fencing shall follow the specifications for desert tortoise exclusion fence in the USFWS 2009 *Desert Tortoise Field Manual,* as referenced in the Desert Tortoise Translocation Plan (Appendix I), or the latest USFWS guidance. Following completion of construction, the desert tortoise-exclusion fencing along these access roads between development areas shall be removed and desert tortoise-exclusion gates with grates shall be installed at each end of the access road between development areas.

All areas with exclusion fencing will incorporate desert tortoise shade structures on the exterior and interior of the fence and spaced a minimum of 1,000 feet apart to provide refuge and reduce the risk of hyperthermia for desert tortoise walking along the fence. Construction of shade structures will follow guidance in the 2018 "Shade Structures for Desert Tortoise Exclusion Fence: Draft Design Guidance" issued by the Palm Springs USFWS Office. Shade structures must be checked after each major rainfall event to ensure they are clear of debris and functional.

All fence construction shall be monitored by an AB or appointed BM(s) to verify that no desert tortoise is harmed. Following installation, the fencing shall be inspected twice daily until the end of the subsequent desert tortoise active season, then monthly thereafter and within 24 hours after all major rainfall events. Damage to the fencing shall be repaired immediately.

BIO-23: **Desert Tortoise Pre-Construction Clearance Surveys and Translocation.** Following installation of permanent desert tortoise fencing and prior to construction activities which might result in harm to a desert tortoise or which remove tortoise habitat, the desert tortoise AB shall oversee desert tortoise clearance surveys to locate and remove desert tortoises from within fenced Project areas. Survey methods shall meet the standards established by the USFWS in the 2009 Desert Tortoise Field Manual, or latest USFWS guidance, and follow the following procedures, subject to modification by USFWS and CDFW authorizations. A minimum of two perpendicular clearance passes within fenced areas shall be completed during the desert tortoise active season, from late March through May and during September through October to maximize the probability of finding all desert tortoise. Desert tortoises found shall be moved by an AB or BM under direct supervision in accordance with a BLM, CDFW, and USFWS-approved Desert Tortoise Translocation Plan (Appendix I). After two consecutive clearance passes with no detection of desert tortoise or new desert tortoise sign (e.g., scat), construction activities can commence. For areas not enclosed by exclusion fencing, preconstruction clearance surveys shall be conducted within 24 hours prior to the onset of surface disturbance and an AB or BM Biological Monitor shall be present in the vicinity of construction activities at all times.

Following site clearance, the AB shall prepare a report to document the results of clearance surveys, including the number of desert tortoises encountered, the capture and release locations of all desert tortoise found, individual desert tortoise data for each tortoise, and other relevant data. The AB shall submit this report to the BLM, CDFW, and USFWS.

BIO-24: **Resource Agency Notifications.** During construction and operations, the following shall occur:

***Dead or Injured Tortoises*:** If a dead or injured desert tortoise is found, the AB shall make initial notification to the BLM, CDFW, and USFWS within 24 hours of its finding. The notification must be made both by telephone and in writing to the nearest USFWS Field Office, located in Palm Springs, California, and to the CDFW contact listed in the Project's Incidental Take Permit. The report shall include the date and time of the finding or incident (if known), location of the specimen, a photograph, cause of injury/death (if known), and other pertinent information. If directed by CDFW or USFWS, the AB shall submit the dead tortoise for necropsy at a facility recommended by USFWS as outlined in Salvaging Injured, Recently Dead, Ill, and Dying Wild, Free-Roaming Desert Tortoises (Berry 2003). For any desert tortoises with non-fatal injuries, the AB shall oversee transportation to a nearby qualified veterinarian (approved by CDFW and USFWS prior to construction) for treatment at the expense of the proponent. If an injured desert tortoise does not recover, the AB shall contact CDFW and USFWS for direction concerning the final disposition of the desert tortoise carcass.

***Emergency Response Impacts*:** For emergency response situations, the AB and/or DB shall immediately notify the nearest USFWS Field Office, located in Palm Springs, California, and to the CDFW contact listed in the Project's Incidental Take Permit. As a part of this response, the agency representatives may require additional measures to protect the desert tortoise. During any emergency responses by Project staff or specialized responders to a scenario involving an imminent threat related to human health, fire, hazardous waste, or repairs requiring off-road vehicle and equipment use, CDFW and USFWS may also require measures to recover damaged habitat.

BIO-25: **Raven Monitoring, Management, and Control Plan.** Prior to issuance of the Notice to Proceed, the Project proponent shall prepare a Raven Monitoring, Management, and Control Plan (Appendix I) that is consistent with the most current USFWS-approved raven management guidelines and submit it to the BLM, CDFW, and USFWS for approval. The management plan shall include but not be limited to a program to monitor raven presence in the Project vicinity, determine if raven numbers are increasing, and to implement raven control measures as needed based on monitoring results. The purpose of the plan is to avoid any Project-related increases in raven numbers during construction, operation, and decommissioning. The DB or AB shall oversee implementation of the plan. The Project Owner shall also provide funding for implementation of the USFWS Regional Raven Management Program. The Project Owner shall submit payment to the Project sub-account of the Renewable Energy Action Team (REAT) Account held by the National Fish and Wildlife Foundation (NFWF) to support the USFWS Regional Raven Management Program. The one-time fee shall be as described in the cost allocation methodology or based on current guidance as provided by USFWS or CDFW. Based on an estimated contribution of $105 per acre impacted, the fee is expected to total $262,962 for impacts to 2,504.4 acres. The actual fee would be determined based on the latest practice and based on the impact acreage of the selected alternative.

BIO-26: **Desert Tortoise Compensatory Mitigation.** Prior to issuance of the notice to proceed, the Project Owner shall provide compensatory mitigation via land acquisition or purchase of Covered Species credits from a CDFW-approved mitigation or conservation bank at a 1:1 ratio for impacts to 2,504.4 acres within the Alternative A footprint, adjusted to reflect the final footprint of the selected alternative. To satisfy this measure, the Project Owner shall acquire and protect and transfer 1 acre of Mojave desert tortoise habitat for every acre of habitat within the final Project footprint, and provide associated funding for the acquired lands, as specified below. The Project Owner may choose to

satisfy its mitigation obligations by purchasing Covered Species credits from a CDFW-approved mitigation or conservation bank.

The timing of the mitigation shall correspond with the timing of the site disturbance activities. However, if security is posted in accordance with 3.h. below (Mitigation Security), the Project Owner shall initiate or complete the acquisition, protection, and transfer of all lands and record any required conservation easements no later than 18 months from the time the resource impact occurs. Extensions must be approved by CDFW and the Authorizing Officer.

If compensation lands are acquired in fee title or in easement, the requirements for acquisition, initial improvement and long-term management of compensation lands shall include all of the following:

1. ***Selection Criteria for Compensation Lands.*** The compensation lands selected for acquisition in fee title or in easement shall at a minimum:
    a. be within the Chuckwalla DWMA or, if sufficient land is unavailable, in other locations within the Colorado Desert Recovery Unit;
    b. be located outside of a Development Focus Area (DFA) as defined under the DRECP;
    c. provide habitat for all life stages of Mojave desert tortoise with capacity to regenerate naturally when disturbances are removed;
    d. be prioritized near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation;
    e. be connected to lands with Mojave desert tortoise habitat equal to or better quality than the Project site, ideally with populations that are stable, recovering, or likely to recover;
    f. not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible;
    g. not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration;
    h. not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat;
    i. have water and mineral rights included as part of the acquisition, unless the Resource Agencies agree in writing to the acceptability of land; and
    j. have live desert tortoise on the conserved lands or on lands abutting the conserved lands.
2. ***Review and Approval of Compensation Lands Prior to Acquisition.*** The Project Owner shall submit a formal acquisition proposal to the Resource Agencies describing the parcel(s) intended for compensatory acquisition This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands for Mojave desert tortoise in relation to the criteria listed above. Approval from the Resource Agencies shall be required prior to acquisition of all compensatory mitigation parcels.
3. ***Compensation Lands Acquisition Requirements.*** To provide for the acquisition and perpetual protection and management of the compensation lands, the Project Owner shall comply with the following requirements:
    a. *Preliminary Report*. The Project Owner, or approved third party, shall provide a recent (within 1 year) preliminary title report, initial hazardous materials survey report, biological analysis, and other necessary or requested documents for the proposed compensation land to the Resource Agencies. All documents conveying or conserving compensation lands and all conditions of title are subject to review and approval by the Resource Agencies. For

conveyances to the state, approval may also be required from the California Department of General Services, the Fish and Game Commission, and the Wildlife Conservation Board.

b. *Title/Conveyance*. The Project Owner shall transfer fee title to the compensation lands, a conservation easement over the lands, or both fee title and conservation easement. Transfer of either fee title or an approved conservation easement will usually be sufficient, but in some situations, e.g., the donation of lands burdened by a conservation easement to BLM, shall require that both types of transfers be completed. Any transfer of a conservation easement or title must be to CDFW, a governmental entity, special district, non-profit organization, for-profit entity, person, or another entity to hold title to and manage the property provided that the district, organization, entity, or person meets the requirements of Government Code sections 65965-65968, as amended, and Probate Code sections 18501-18510, as amended, or to BLM under terms approved by the Authorizing Officer and CDFW. If CDFW does not hold the conservation easement, CDFW shall be expressly named in the approved conservation easement as a third-party beneficiary.

c. *Initial Habitat Improvement Fund*. The Project Owner shall fund the initial protection and habitat improvement of the compensation lands. The interim management period shall be a minimum of three years from the date of land acquisition and protection and full funding of the Endowment and includes expected management following start-up activities. Alternatively, a non-profit organization may hold the habitat improvement funds if it is qualified to manage the compensation lands (pursuant to California Government Code §65965) and if it meets the approval of CDFW and the Authorizing Officer. If CDFW takes fee title to the compensation lands, the habitat improvement fund must be paid to CDFW or its designee.

d. *Property Analysis Record*. Upon identification of the compensation lands, the Project Owner shall conduct a PAR or PAR-like analysis to establish and get approval from the Resource Agencies regarding the amount of the appropriate long- term maintenance and management fee to fund the in-perpetuity management of the acquired mitigation lands.

e. *Long-Term Maintenance and Management Fund*. The Project Owner shall deposit the endowment (with an entity qualified pursuant to Government Code sections 65965-65968, as amended and approved by BLM and CDFW) a non-wasting capital long-term maintenance and management fee in the amount determined through the PAR analysis conducted for the compensation lands.

f. If CDFW takes fee title to the compensation lands, CDFW shall determine whether it will hold the long-term management fee in the special deposit fund or designate another entity to manage the long-term maintenance and management fee for CDFW and with CDFW supervision.

g. *Interest and Principal*. The Project Owner, the BLM AO and CDFW shall ensure that an agreement is in place with the long-term maintenance and management fee holder/manager to ensure the following conditions:

g.1 Interest. Interest generated from the initial capital long-term maintenance and management fee shall be available for reinvestment into the principal and for the long-term operation, management, and protection of the approved compensation lands, including reasonable administrative overhead, biological monitoring, improvements to carrying capacity, law enforcement measures, and any other action approved by CDFW designed to protect or improve the habitat values of the compensation lands.

g.2 Withdrawal of Principal. The long-term maintenance and management fee principal shall not be drawn upon unless such withdrawal is deemed necessary by the CDFW or the approved third-party long-term maintenance and management fee manager to ensure the continued viability of the species on the compensation lands. If CDFW takes fee title to

the compensation lands, monies received by CDFW pursuant to this provision shall be deposited in a special deposit fund established solely for the purpose to manage lands in perpetuity unless CDFW designates NFWF or another entity to manage the long-term maintenance and management fee for CDFW.

g.3 Other Expenses. In addition to the costs listed above, the Project Owner shall be responsible for all other costs related to acquisition of compensation lands and conservation easements, including but not limited to title and document review costs, expenses incurred from other state agency reviews, and overhead related to providing compensation lands to CDFW or an approved third party; escrow fees or costs; environmental contaminants clearance; and other site cleanup measures.

h. *Mitigation Security*. The Project Owner shall provide financial assurances to the BLM AO and CDFW with copies of the document(s) to the USFWS, to guarantee that an adequate level of funding is available to implement the mitigation measures described herein. These funds shall be used solely for implementation of the measures associated with the Project in the event the Project Owner fails to comply with the requirements specified in this measure and shall be returned to the Project Owner upon successful compliance with the requirements in this measure. The BLM AO's or CDFW's use of the security to implement required measures may not fully satisfy the Project Owner's obligations under this condition. Financial assurance can be provided to the BLM AO and CDFW in the form of an irrevocable letter of credit, a pledged savings account or another form of security ("Security") approved in advance in writing by CDFW and the BLM AO. Security shall be provided in the amounts calculated as follows prior to ground disturbance (amounts can change based on current assessments at time of Security):

h.1. Start-up costs for compensation lands, including initial site protection and enhancement costs estimated at $300 per acre.

h.2. Land acquisition costs for compensation land, calculated at $1,800 per acre.

h.3. Interim management period shall be a minimum of three years from the date of acquisition and protection and endowment and shall include fence repair, continuing trash removal, site monitoring, and vegetation and invasive species management, calculated at $330 per acre.

h.4. Long term maintenance and management fee, calculated at $1,450 per acre.

The amount of security shall be adjusted for any change in the Project footprints for each phase (acquisition, initial protection/improvement, and long-term management and maintenance) as described above.

i. Acquisition of compensation lands may be delegated to a third party, such as a private or non-governmental organization. Land acquisition, initial protection or maintenance, and management activities shall be approved by BLM and CDFW and implemented within 18 months of start of construction.

Couch's Spadefoot

BIO-27: **Couch's Spadefoot Protection Plan.** Prior to issuance of the Notice to Proceed, the Project proponent shall prepare a Couch's Spadefoot Protection Plan (see Appendix I) to be approved by the BLM and CDFW. The plan shall include the following:

1. ***Habitat Survey Protocol and Results*:** Figures showing the areas surveyed and the location of potential breeding habitat in relation to proposed Project features. The plan shall also include a survey protocol to locate potential future breeding ponds.

2. ***Avoidance and Minimization Measures*:** A description of measures that would be implemented to avoid impacts to potential breeding ponds, such as buffers, protective fencing or other barriers, worker's education, minimizing construction traffic within the vicinity of breeding ponds, and biological monitoring.
3. ***Monitoring and Reporting Requirements*:** Any observations of live or dead Couch's spadefoots shall be reported to BLM. If a live toad is observed, the DB or BM shall monitor the toad to ensure it is safely out of harm from construction activities.

Mojave Fringe-toed Lizard

BIO-28: **Mojave Fringe-Toed Lizard and Desert Dunes.** During construction, the Project proponent shall minimize impacts to dune habitat associated with access roads and/or gen-ties that support Mojave fringe-toed lizards. Roads shall be kept at-grade to avoid blocking local sand transport within desert dune habitat.

During construction, when vehicle traffic is occurring along Powerline Road, a Biological Monitor shall be present during Mojave fringe-toed lizard active periods to ensure the effectiveness of minimization and avoidance measures. Active periods, for the purpose of this mitigation measure, are defined as time periods between March and September and when temperatures are between 70 and 102 degrees Fahrenheit or any other time when Mojave fringe-toed lizards are observed on Powerline Road. To ensure adherence to speed limits and ensure the effectiveness of avoidance measures, the Biological Monitor may require the installation of additional speed limit signs, placement of temporary speed bumps, or additional WEAP training.

For impacts to Mojave fringe-toed lizard habitat that cannot be avoided, the Project proponent shall provide compensatory mitigation under the CDCA Plan, as amended. This shall be accomplished either by land acquisition acceptable to the BLM and CDFW, or a Resource Agency-assessed financial contribution calculated based on the final construction footprint. Direct permanent impacts to both occupied and unoccupied, dune and non-dune Mojave fringe-toed lizard habitat shall be mitigated at a ratio of 3:1. Desert dune habitat mitigation must be in-kind at 3:1 to meet the NECO Plan requirement for dune habitat compensation, but mitigation for non-dune habitat is not required to be desert dune. Actual mitigation shall be based on impacts of the selected Project Alternative. If all or any portion of the acquired Mojave desert tortoise or other required compensation lands acquired under BIO-18, 19, 20, 26, or 29 meet the criteria above for sensitive vegetation community compensation lands, the portion of the other species' or habitat compensation lands that meets any of the criteria above may be used to fulfill that portion of the obligation for Mojave fringe-toed lizard mitigation.

Mitigation may include compensation lands purchased in fee or in easement in whole or in part, for impacts to Mojave fringe-toed lizard habitat. Without this mitigation, the project would not be consistent with the land use plan, with which BLM is required to comply. As required under CEQA the Mojave fringe-toed lizard is a species of special concern and impacts to the species and habitat should be mitigated to less than significant. If compensation lands are acquired, the Project Owner shall provide funding for the acquisition in fee title or in easement, initial habitat improvements and long-term maintenance and management of the compensation lands. Compensation shall be initiated or completed within 18 months from the time the resource impact occurs. Extensions must be approved by the BLM AO and CDFW.

1. ***Criteria for Compensation Lands*:** The compensation lands selected for acquisition shall:
    a. Be deposits of eolian or fine windblown sands typically associated with dunes (at a minimum of 1:1), as well as washes, hillsides, margins of dry lakes, and sandy hummocks, preferably within the McCoy Valley or Chuckwalla Valley, outside of DFAs. To the extent feasible, land should have the potential to contribute to Mojave fringe-toed lizard habitat connectivity

and build linkages between known populations of Mojave fringe-toed lizards and preserve lands with suitable habitat;

b. Be occupied with Mojave fringe-toed lizards or be connected to lands currently occupied by Mojave fringe-toed lizard;

c. To the extent feasible, be near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation;

d. Provide quality habitat for Mojave fringe-toed lizard, that has the capacity to regenerate naturally when disturbances are removed;

e. Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration;

f. Not contain hazardous wastes that cannot be removed to the extent the site is suitable for habitat;

g. Not be subject to property constraints (i.e. mineral leases); and

h. Be on land for which long-term management is feasible.

2. ***Security for Implementation of Mitigation*:** The Project Owner shall provide financial assurances to the BLM AO and CDFW to guarantee that an adequate level of funding is available to implement the acquisitions, maintenance and enhancement of Mojave fringe-toed lizard habitat as described in this measure. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the BLM AO and CDFW according to the measures outlined in Mitigation Measure Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements. The final amount due shall be determined by an updated appraisal and a PAR or PAR-like analysis conducted as described in Mitigation Measure Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements.

3. ***Preparation of the Land Management Plan*:** The Project Owner shall submit to the BLM and CDFW a draft Management Plan for approval that reflects site-specific enhancement measures for the Mojave fringe-toed lizard habitat on the acquired compensation lands. The objective of the Management Plan shall be to enhance the value of the compensation lands for Mojave fringe-toed lizards, and may include enhancement actions such as weed control, fencing to exclude livestock, erosion control, or protection of sand sources or sand transport corridors.

Western Burrowing Owl

BIO-29: **Burrowing Owl Mitigation.**

***Burrowing Owl Management Plan*:** Prior to issuance of the Notice to Proceed, the Project proponent shall prepare a Burrowing Owl Management Plan (see Appendix I) subject to BLM and CDFW approval. This plan shall include biologist qualifications, and methods for passive relocation, burrow closure, and monitoring of burrowing owls. Focused surveys shall additionally be performed to verify the absence of burrows owls and avoid impacts to this species prior to and during construction consistent with CDFW 2012 Staff Report of Burrowing Owl Mitigation recommendations (CFDW 2012). The preconstruction survey methodology, need for artificial replacement burrows, burrow monitoring, and reporting requirements shall be detailed in the Burrowing Owl Management Plan.

***Burrowing Owl Compensatory Mitigation*:** If preconstruction surveys determine the presence of burrowing owls that would be impacted by the Project, consistent with CDFW mitigation guidance (California Burrowing Owl Consortium 1993) the Project Owner shall acquire, in fee or in easement,

land suitable to support a resident population of burrowing owls and shall provide funding for the enhancement and long-term management of these compensation lands based on 6.5 acres per pair or individual bird documented during the preconstruction survey as anticipated to be impacted by the Project. Compensation shall be initiated or completed within 12 months from the time the resource impact occurs, unless a 6-month extension is approved by the Authorizing Officer. The responsibilities for acquisition and management of the compensation lands may be delegated by written agreement to CDFW or to a third party, such as a non-governmental organization dedicated to habitat conservation, subject to approval by the BLM AO, in consultation with CDFW prior to land acquisition or management activities. Additional funds shall be based on the adjusted market value of compensation lands at the time of construction to acquire and manage habitat.

a. *Criteria for Burrowing Owl Mitigation Lands*. The terms and conditions of this acquisition or easement shall be as described in as described in Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements, with the additional criteria to include: 1) the mitigation land must provide suitable habitat for burrowing owls, and 2) the acquisition lands must be within the currently known range for burrowing owl. If all or any portion of the acquired Mojave desert tortoise or other required compensation lands acquired under BIO-18, 19, 20, 26, or 29 meet both of these criteria for burrowing owl compensation lands, the portion of the other species' or habitat compensation lands that meets the criteria may be used to fulfill that portion of the obligation for burrowing owl compensatory mitigation. If the burrowing owl mitigation land is separate from the acreage required for Mojave desert tortoise compensation lands, the Project Owner shall fulfill the requirements described below in this measure.

b. *Security*. If the burrowing owl mitigation land is separate from the acreage required for Mojave desert tortoise compensation lands, the Project Owner or an approved third party shall complete acquisition of the proposed compensation lands within the time period specified for this acquisition (see the verification section at the end of this measure). Alternatively, financial assurance can be provided by the Project Owner to the BLM AO and CDFW, according to the measures outlined in Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the BLM AO in the form of an irrevocable letter of credit, a pledged savings account, or another form of security ("Security") prior to initiating ground-disturbing Project activities. Prior to submittal, the Security shall be approved by the BLM AO in consultation with CDFW and the USFWS to ensure funding. The final amount due shall be determined by an updated appraisal and PAR analysis conducted as described in Mitigation Measure BIO-26, Part 3, Compensation Lands Acquisition Requirements.

Desert Kit Fox and American Badger

BIO-30: **Desert Kit Fox and American Badger Management Plan.** Prior to issuance of the Notice to Proceed, the Project proponent shall prepare a Desert Kit Fox and American Badger Management Plan (Appendix I) that defines the strategy for management of kit foxes and badgers, subject to the BLM and CDFW approval. The plan shall include methodologies for pre-construction clearance surveys, den monitoring, passive relocation, and burrow excavation and closure.

Birds and Bats

BIO-31: **Nesting Bird Management and Monitoring Plan.** Prior to issuance of the Notice to Proceed, the Project proponent shall prepare and obtain approval of a Nesting Bird Management and Monitoring Plan (Appendix I) from the BLM and CDFW. This plan shall include protocols related to the methodology or pre-construction nesting bird surveys, nest buffers, and minimization and avoidance measures for nesting birds.

BIO-32: **Bird and Bat Conservation Strategy.** Prior to issuance of the Notice to Proceed, the Project proponent shall finalize and obtain approval of a Bird and Bat Conservation Strategy (BBCS; Appendix I) from the BLM, USFWS, and CDFW, and shall demonstrate to the Lead Agencies that Project design guidelines included in the BBCS have been incorporated into final Project design. The BBCS shall specify the Project phase(s) applicable to each measure and the Project proponent shall implement requirements of the BBCS throughout all phases of the Project as specified. The BBCS shall include the following:

(1) Describe baseline conditions for bird and bat species present within the Project site, including results of site-specific surveys.

(2) Assess potential risk to bird and bats based on the proposed activities, including all potential risks identified in the Final EIS or Final EIR.

(3) Specify conservation measures that will be employed to avoid, minimize, and/or mitigate any potential adverse effects to these species. Specifically, to minimize the potential for avian electrocutions and collisions with above ground lines, wires, fences, the communications tower, and solar panels, the BBCS shall include, but not be limited to, the following measures:

(a) Project design guidelines consistent with the Avian Power Line Interaction Committee's (APLIC's) Suggested Practices for Avian Protection On Power Lines (2006; "Electrocution Manual") and Reducing Avian Collisions with Power Lines (2012; "Collision Manual") to the maximum extent feasible. Where APLIC suggested design guidelines are not feasible, the BBCS shall explain why and what alternatives have been considered to achieve the electrocution and/or collision reduction objectives.

(b) The latest applicable communication tower guidance, including the USFWS's Communication Tower Guidance (2018) and the Federal Communications Commission's Opportunities to Reduce Bird Collisions with Communications Towers While Reducing Tower Lighting Costs (2017).

(c) The latest monitoring, detection, and avoidance measures applicable to photovoltaic projects, including techniques that minimize attraction of birds to hazardous situations that are mistaken to be or simulate natural habitats (e.g., bodies of water) and evaluation and installation of the best available feasible bird and bat detection and deterrent technologies available at the time of construction.

(d) Lighting minimization measures consistent with Mitigation Measure BIO-13.

(4) Describe the incidental bird and bat mortality and injury monitoring and reporting that will take place during construction.

(5) Describe the post-construction avian and bat mortality monitoring and reporting of the deaths and injuries of birds and bats from collisions with facility features such as, but not limited to, transmission lines, tower structures (e.g., meteorological towers), and the solar field. The study design shall be approved by the BLM AO and CDFW in coordination with USFWS, and shall be incorporated into the Project's BRMMRP (see Mitigation Measure BIO-3).

(6) Specify the process for using the monitoring data to inform an adaptive management program that would avoid and minimize Project-related avian and bat impacts.

(7) Specify the conservation measures that would be implemented if found necessary through the adaptive management program. Such measures could potentially include efforts to make panels more visible to birds (e.g., white borders around panel edges, or the use of noise deterrents).

(8) Post-construction mortality monitoring and reporting shall be required for a minimum of three years, including the following project components: PV solar panel arrays (a minimum of 40% survey coverage per year), perimeter fencing (100% survey coverage per year), and the gen-tie line (a minimum of 50% survey coverage per year).

Decommissioning

BIO-33: **Decommissioning Plan.** Prior to issuance of the Notice to Proceed, the Project Owner shall prepare a BLM AO-approved Decommissioning Plan (draft provided as Appendix I.4). The plan shall describe methods and requirements for site re-contouring, restoration of drainages, revegetation, soil restoration, weed management, and restoration monitoring, reporting and performance standards. This plan must be consistent with VIS-5. The Project Owner shall adhere to the approved plan for the reclamation, rehabilitation, and revegetation of the Project site upon decommissioning. Responsibilities include but are not limited to the following:

a. Removal of all above and below ground infrastructure for either reuse, recycling, or disposal at appropriately licensed facilities.

b. Restoration of landform features, vegetative cover, hydrologic function, and soil profiles and function to support native vegetation. Results of a weed management survey during decommissioning activities will help determine whether additional monitoring or control measures are necessary to achieve successful reclamation of the site.

Greenhouse Gas Emissions

No mitigation is required.

Cultural Resources

CUL-1: **NHPA Section 106 Memorandum of Agreement and Historic Properties Treatment Plan.** If Alternative A or B is selected and the BLM finds that there could be a direct adverse affect on the 17 sites that BLM is treating as eligible for listing on the National Register of Historic Places (National Register), a Memorandum of Agreement (MOA) for the Project shall be prepared in accordance with Section 106 of the NHPA. The MOA shall be executed by the BLM and prepared in consultation with the ACHP, SHPO, the Applicant, tribes, and other identified consulting parties. The MOA will be binding on the BLM and Applicant. The MOA shall be executed prior to the ROD. The MOA will contain measures to avoid, minimize, and mitigate adverse effects to historic properties; procedures for unanticipated effects and post-review discoveries; a plan to comply with NAGPRA and other laws governing the discovery of human remains; and a program of monitoring and protecting historic properties during construction as well as during operations and decommissioning. Resolution of adverse effects to historic properties will be developed in consultation with consulting parties.

Where National Register- and California Register of Historical Resources (California Register)-eligible or listed cultural resources cannot be protected from adverse direct and/or indirect effects, the Applicant shall comply with appropriate treatment(s) to mitigate adverse effects that will be detailed in a Historic Properties Treatment Plan (HPTP) developed as part of the MOA process described above (and appended to the MOA) and prepared for the Project prior to issuance of the NTP.

CUL-2: **Long-Term Management Plan.** The Applicant shall prepare a Long-Term Management Plan (LTMP) for protection and management of National Register- and California Register-eligible cultural resources during Project operations and decommissioning. The LTMP shall be developed in consultation with consulting parties and include requirements for conducting the post-construction monitoring/condition assessments and regular reporting to the BLM, as well as procedures for addressing unanticipated effects to cultural resources covered under the LTMP.

CUL-3: **Identification of Human Remains.** For human remains discovered on BLM-administered land, the plan for securing the discovery site and subsequent actions shall be included in the Monitoring and Discovery Plan required under Mitigation Measure CUL-5. In the event of a discovery, the BLM must be contacted immediately and State Health and Safety Code §7050.5 states that no further

disturbance shall occur until the County Coroner has made the necessary findings as to origin. If the discovery is determined to be subject to NAGPRA (25 USC § 3001 and 43 CFR 10), the plan will describe the necessary process for notification of tribes and subsequent steps as required by law and regulations (i.e., development and implementation of a NAGPRA Plan of Action, which would be separate from the Monitoring and Discovery Plan required under Mitigation Measure CUL-5 and its contents and consultation process directed by NAGPRA).

For human remains discovered on state or private lands, State Health and Safety Code §7050.5 states that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin. Further, pursuant to PRC §5097.98(b), remains shall be left in place and free from disturbance until a final decision as to treatment and disposition has been made. If the Riverside County Coroner determines the remains to be Native American, the NAHC shall be contacted within the period specified by law. The NAHC shall identify the "Most Likely Descendant," who shall then make recommendations to and engage in consultation with CDFW and property owner concerning the treatment of the remains as provided in PRC §5097.98. The landowner may reach an agreement with the Most Likely Descendant for treating and disposing of human remains pursuant to state CEQA Guidelines §15064.5(d). Human remains from other ethnic/cultural groups with recognized historical associations to the Project area shall also be subject to consultation between appropriate representatives from that group and the CDFW.

CUL-4: **Cultural Resources Personnel and Project Documentation for Cultural Resources Personnel.** Prior to the issuance of a Notice to Proceed (NTP) by BLM for the Project, the Project Owner shall obtain the services of a Project Archaeologist and one or more alternates, if alternates are needed. The Project Archaeologist shall manage all monitoring, mitigation, curation, and reporting activities for the Project. The Project Archaeologist shall have a primarily administrative and coordination role for the Project. The Project Archaeologist may obtain the services of additional cultural resources specialists, if needed, to assist in monitoring, mitigation, and curation activities. The Project Archaeologist shall have a BLM California cultural resource use permit (CRUP) and all supervisory cultural resource field staff (Principal Investigators and Field Directors or Crew Chiefs) shall be listed on that permit and otherwise meet the requirements outlined in BLM Manual 8150. The Project Owner shall ensure that the Project Archaeologist makes recommendations regarding the eligibility for listing in the NRHP and CRHR of any cultural resources that are newly discovered or that may be affected in an unanticipated manner.

Prior to the issuance of the NTP by BLM for the Project, the Project Owner shall provide the Project Archaeologist with copies of the Final EIS and Proposed PA and maps and drawings showing the footprints of the power plant, all linear facility routes, all access roads, and all laydown areas, and other project facilities. Maps shall include the appropriate USGS quadrangles and maps at an appropriate scale (e.g., 1:2400 or 1" = 200') for plotting cultural features or materials. If the Project Archaeologist requests enlargements or strip maps for linear facility routes, the Project Owner shall provide copies to the Project Archaeologist and BLM project manager. The BLM project manager shall review map submittals and, in consultation with the Project Archaeologist, approve those that are appropriate for use in cultural resources planning activities. No ground disturbance shall occur prior to BLM project manager approval of maps and drawings, unless such activities are specifically approved by the BLM project manager. Ground disturbance is defined as any of the following activities: mowing, grading, disk and roll, pile or stake driving, mechanical excavation, drilling, digging, trenching, blasting, and using high pressure water to cut into the ground. If construction of the Project would proceed in phases, maps and drawings not previously provided shall be provided to the Project Archaeologist and BLM project manager prior to the start of each phase. Written notice identifying the proposed schedule of each project phase shall be provided to the Project Archaeologist and BLM project manager. Weekly, until ground disturbance is completed, the project construction manager shall provide to the Project Archaeologist and BLM project manager a schedule of project activities for the following week, including the identification of area(s) where

ground disturbance will occur during that week. The Project Owner shall notify the Project Archaeologist and BLM project manager of any changes to the scheduling of the construction phases.

CUL-5: **Monitoring and Discovery Plan.** Prior to issuance of the NTP, the Applicant (or Project Owner) shall prepare and submit for approval to the BLM a Plan for Archaeological Monitoring, Post-Review Discoveries, and Unanticipated Effects (also referred to as a Monitoring and Discovery Plan or MDP). The MDP shall be submitted to the BLM for review and consultation with consulting parties. The MDP shall either be appended to the MOA, if an MOA is required, or be a standalone document if no MOA is required. The required content of the MDP is discussed below, but could change as a result of the BLM's consultation with consulting parties.

In the event that the BLM approves the Alternative C footprint, the following applies: The 17 unevaluated archaeological resources treated as eligible for the National Register (CA-RIV-01819/H, CA-RIV-10033/H, CA-RIV-11650, CA-RIV-12731, CA-RIV-12750, CA-RIV-12758/H, CA-RIV-12759, CA-RIV-12784, CA-RIV-12786, CA-RIV-12787, CA-RIV-12793, CA-RIV-12796, CA-RIV-12803, CA-RIV-12807, CA-RIV-12808, CA-RIV-12822, and CA-RIV-12831) shall be avoided by Project-related disturbance. To ensure this, the MDP for the Alternative C footprint, if approved, shall include the following protocols:

- Any of these 17 resources that are within 50 feet, including buffer areas, of proposed construction activities will be identified and labeled as Environmentally Sensitive Areas (ESAs).
- The ESAs will be designated by marking the boundaries of sites with appropriate buffer zones (generally a buffer of 20 feet beyond the outer limits of the site extent, as demonstrated by surface and/or subsurface indications) using temporary fencing or other easily recognizable boundary defining materials. These areas will be shown on the engineering plans for the project as off-limits to construction activities.
- ESAs will be identified and established by the Project Archaeologist or other supervisory-level archaeologist listed on the BLM cultural resources use permit prior to initiation of ground-disturbing activities and will be maintained for the duration of the work effort in the ESA vicinity. Once established, an ESA will define areas where construction can occur while preventing construction activities and damage to archaeological sites within the designated ESA.
- The Project Archaeologist or other supervisory-level archaeologist listed on the BLM cultural resources use permit will be on site during construction to observe grading, trenching or other excavation for any facilities, roads or other project components related to the undertaking near ESAs and in other areas determined appropriate for full-time monitoring.

For any Project footprint approved (whether Alternative A, B, or C), where National Register- or California Register-eligible cultural resources cannot be protected from direct and/or indirect effects by Project design, as in the case of post-review discoveries, the Applicant shall comply with appropriate resolution measure(s) in the MOA, if one is required, and HPTP.

The MDP shall describe a program for avoiding and monitoring those National Register- or California Register-eligible resources that can be avoided during Project construction, as noted above. (Management of these resources during operations and decommissioning shall be addressed in a Long-Term Management Plan described in CUL-2.) The MDP shall also include maps and narrative discussion of areas considered to be of high sensitivity for discovery of buried archaeological resources. Monitoring strategies will be guided by the buried site sensitivity model developed from geoarchaeological analysis. The MDP shall detail provisions for monitoring construction activities in these high-sensitivity areas. It shall also detail the methods, consultation procedures, and timelines for addressing all post-review discoveries as well as unanticipated effects to known historic properties. To comply with the requirements of CUL-3, the MDP shall include a plan for the initiation of NAGPRA compliance and consultation in the event of post-review discovery of human remains and other

NAGPRA objects, including securing the discovery site, notifying the Coroner and tribes, and implementing subsequent steps required by law and regulations.

In addition, the MDP shall include the following elements, with specific details to be determined based on input from consulting parties:

1. A general research design;
2. Protocols for the National Register evaluation (for all criteria) and treatment of known and newly discovered prehistoric and historic-period archaeological resource types. Treatment may involve data recovery as mitigation. Protocols shall be specified for addressing unanticipated effects to known historic properties. Protocols for addressing new discoveries and unanticipated effects to known historic properties will involve notification procedures for contacting the BLM, BLM review, and how the BLM will involve consulting parties.
3. Artifact collection and curation policies, as related to the research questions formulated in the research design, that apply to cultural resources materials and documentation resulting from evaluation and data recovery at both known prehistoric and historic-period archaeological sites and any National Register-eligible (as determined by the BLM) prehistoric and historic-period archaeological sites discovered during construction;
4. The implementation sequence and the estimated time frames needed to accomplish all Project-related tasks during the ground disturbance and post-ground-disturbance analysis phases of the Project;
5. The person(s) expected to perform each of the tasks, their responsibilities, and the reporting relationships between project construction management and the mitigation and monitoring team;
6. Description of all impact-avoidance measures (such as flagging or fencing) to prohibit or otherwise restrict access to sensitive resource areas that are to be avoided during ground disturbance, construction, and/or operation and identification of any areas where these measures are to be implemented shall be identified;
7. The commitment to record on Department of Parks and Recreation (DPR) 523 forms, to map, and to photograph all encountered cultural resources over 50 years of age and to curate all archaeological materials excavated and/or recovered as a result of fieldwork under the MDP (i.e., data recovery), in accordance with 36 CFR Part 79 (or if applicable, the California State Historical Resources Commission's Guidelines for the Curation of Archaeological Collections);
8. The commitment of the Project Owner to pay all curation fees for artifacts recovered and for related documentation produced during cultural resources investigations conducted for the Project and, through the Project Archaeologist, to identify a curation facility that will accept cultural resources materials resulting from the project cultural resources investigations;
9. The Project Archaeologist shall attest to having access to equipment and supplies necessary for site mapping, photography, and recovery of all cultural resource materials (that cannot be treated prescriptively) from previously identified National Register- and California Register-eligible archaeological resources and from National Register- and California Register-eligible resources that are encountered during ground disturbance;
10. The contents, format, and review and approval process of the final Cultural Resource Report (CRR; see CUL-6);
11. Monitoring recommendations for different areas of the direct APE including the level of monitoring intensity based on subsurface sensitivity;
12. Procedures for discoveries of human remains including initiating NAGPRA compliance; and

13. A Tribal Participation Plan is strongly encouraged, and if completed should be appended to the MDP.

As described in CUL-4, the Project Archaeologist shall manage all monitoring, mitigation, curation, and reporting activities under the MDP. The Project Archaeologist shall have a primarily administrative and coordination role for the Project. The Project Archaeologist may obtain the services of additional cultural resource specialists, if needed, to assist in monitoring, mitigation, and curation activities. The Project Archaeologist shall have a BLM California cultural resource use permit and all supervisory cultural resource field staff (Principal Investigators and Field Directors or Crew Chiefs) shall be listed on that permit and otherwise meet the requirements outlined in BLM Manual 8150. The Project Owner shall ensure that the Project Archaeologist makes recommendations regarding the eligibility for listing in the National Register and California Register of any cultural resources that are newly discovered or that may be affected in an unanticipated manner.

The MDP shall address monitoring reporting. On forms provided by the BLM project manager, CRMs shall keep a daily log of any monitoring and other cultural resources activities and any instances of noncompliance with the mitigation measures. Copies of the daily monitoring logs shall be provided by the Project Archaeologist to the BLM, if requested by the BLM project manager. From these logs, the Project Archaeologist shall compile a monthly monitoring summary report to be submitted for BLM review monthly. If there are no monitoring activities, the summary report shall specify why monitoring has been suspended. The Project Archaeologist or alternate shall report daily to the BLM project manager on the status of the Project's cultural resources-related activities, unless reducing or ending daily reporting is requested by the Project Archaeologist and approved by the BLM project manager. In the event that the Project Archaeologist believes that the current level of monitoring is not appropriate in certain locations, a letter or e-mail detailing the justification for changing the level of monitoring shall be provided to the BLM project manager for review and approval prior to any change in the level of monitoring. Cultural resources monitoring activities are the responsibility of the Project Archaeologist. Any interference with monitoring activities, removal of a monitor from duties assigned by the Project Archaeologist, or direction to a monitor to relocate monitoring activities by anyone other than the Project Archaeologist shall be considered non-compliance with this mitigation measure. Upon becoming aware of any incidents of non-compliance with the mitigation measures the Project Archaeologist and/or the Project Owner shall notify the BLM Authorized Officer by telephone or e-mail within 24 hours. The Project Archaeologist shall also recommend corrective action to resolve the problem or achieve compliance with the mitigation measures. When the issue is resolved, the Project Archaeologist shall write a report describing the issue, the resolution of the issue, and the effectiveness of the resolution measures. This report shall be provided monthly for the review of the BLM project manager.

The MDP shall address the authority to halt ground disturbance during construction. The Project Owner shall only grant authority to halt ground disturbance during construction to the Project Archaeologist, alternate Project Archaeologist, and other supervisory cultural resource field staff (i.e., PI or Field Director listed on the BLM California cultural resource use permit) in the event of a discovery. Redirection of ground disturbance shall be accomplished under the direction of the construction supervisor in consultation with the Project Archaeologist. In the event that a cultural resource over 50 years of age is found (or if younger, determined exceptionally significant by the BLM), or impacts to such a resource can be anticipated, ground disturbance shall be halted or redirected in the immediate vicinity of the discovery sufficient to ensure that the resource is protected from further impacts. Monitoring and daily reporting shall continue during the Project's ground-disturbing activities elsewhere. Additional procedures regarding halting ground disturbance to address a post-review discovery or unanticipated effects shall be described in the MDP.

CUL-6: **Cultural Resources Monitoring Report and Cultural Resources Report (CRR).** Cultural Resources Monitoring Reports shall be required and must meet BLM requirements. The report shall include documentation of the required cultural/historical sensitivity training for the construction staff

held during the pre-grade meeting (see CUL-7). BLM and CDFW shall review the report to determine adequate compliance. The details of the report's structure and contents will be described in the MDP (see CUL-5).

The CRR, if required as the result of a discovery during construction, shall conform to BLM Cultural Resource Use Permit stipulations regarding reporting which include, but are not limited to, those listed in the California Office of Historic Preservation's Preservation Planning Bulletin Number 4(a) December 1989, Archaeological Resource Management Reports (ARMR): Recommended Contents and Format (ARMR Guidelines) for the Preparation and Review of Archaeological Reports.

CUL-7: **Worker Environmental Awareness Program (WEAP).** Prior to issuance of a NTP by the BLM and for the duration of ground disturbance (as defined in CUL-4), the Project Owner shall provide Worker Environmental Awareness Program (WEAP) training to all workers within their first week of employment at the project site, along the linear facilities routes, and at laydown areas, roads, and other ancillary areas. The training shall be prepared by the Project Archaeologist, may be conducted by any member of the archaeological team, and may be presented in the form of a video. Tribal representatives will be given the opportunity to participate in the WEAP training. The Project Archaeologist shall be available (by telephone or in person) to answer questions posed by employees. The training may be discontinued when ground disturbance is completed or suspended, but must be resumed when ground disturbance, such as landscaping, resumes. The training shall include:

1. A discussion of applicable laws and penalties under the law;
2. Samples or visuals of artifacts that might be found in the project vicinity;
3. A discussion of what such artifacts may look like when partially buried, or wholly buried and then freshly exposed;
4. A discussion of what prehistoric and historical archaeological deposits look like at the surface and when exposed during construction, and the range of variation in the appearance of such deposits;
5. Instruction that only the Project Archaeologist, alternate Project Archaeologist, and supervisory cultural resource field staff have the authority to halt ground disturbance in the area of a discovery to an extent sufficient to ensure that the resource is protected from further impacts, as determined by the Project Archaeologist;
6. Instruction that employees are to halt work on their own in the vicinity of a potential cultural resources discovery and shall contact their supervisor and the Project Archaeologist or supervisory cultural resource field staff, and that redirection of work would be determined by the construction supervisor and the Project Archaeologist;
7. An informational brochure that identifies reporting procedures in the event of a discovery;
8. An acknowledgement form signed by each worker indicating that they have received the training; and
9. A sticker that shall be placed on hard hats indicating that environmental training has been completed.
10. No ground disturbance shall occur prior to implementation of the WEAP program, unless such activities are specifically approved by the BLM project manager.

Energy Conservation

No mitigation is required.

BIO-16: **Weed Management** (see Biological Resources section)

FIRE-1: **Fire Safety Plan** (see Wildland Fire Ecology section)

Land Use, Lands, and Realty

No mitigation is required.

Noise

No mitigation is required.

Paleontological Resources

PALEO-1: **Paleontological Resource Monitoring and Mitigation Plan.** Prior to the start of any Project-related construction activities, the Project Owner shall retain a BLM-approved paleontologist to create and implement a Project-specific Paleontological Resource Monitoring and Mitigation Plan (PRMMP). The plan must be submitted to the BLM for approval at least 30 days prior to the start of construction and must be approved before ground disturbance can begin. The qualified paleontologist shall be responsible for implementing all the paleontological conditions of approval and for using qualified personnel to assist in this work. The contents of the PRMMP shall include, but not be limited to the following:

***Preconstruction Resource Collection*.** Prior to the initiation of any ground-disturbing activities, including geotechnical work, grubbing, or grading, all scientifically significant specimens will be collected from the surface of the Project site where such ground-disturbing activities will occur. This includes the specimens noted but not collected during prior surveys by AECOM (2018), as well as any previously undiscovered localities that may have been exposed by erosion in the interim. The qualified paleontologist will work with the BLM to develop project-specific significance definitions, sampling protocols, and procedures for screening sites for microfauna (as identified by the AECOM survey report [2018]). Collection activities shall be conducted in accordance with BLM guidelines (2007, 2009) and carried out by BLM-approved paleontological staff. Any paleontological fieldwork occurring on lands administered by the BLM will require a Paleontological Resources Use Permit issued by the BLM state office. All specimens collected shall be curated with a BLM-approved repository.

***Construction Measures*.** Construction phase measures shall include the following:

1. Monitoring of all ground-disturbing activities by a BLM-approved paleontologist. The level and intensity of monitoring during ground-disturbing activities shall be determined by the qualified paleontologist, in consultation with the BLM.
2. Procedures for fossil eggshell discovery and recovery. If fossil eggshell specimens are recovered from deep augering (8 to 20 feet), some shall be radiocarbon dated to determine the age of subsurface deposits. The sample size for dating shall be determined by the qualified paleontologist, in consultation with the BLM.
3. Collection and processing of standard sediment samples as defined by SVP (2010). The rate of sampling shall be determined by the qualified paleontologist, in consultation with the BLM These samples may be collected during construction activities and utilize materials excavated for construction of the Project; separate sampling is not required.
4. Recovered significant fossils shall be prepared, identified, reported, and curated in a BLM-approved paleontological repository.

Following implementation of the PRMMP, a Paleontological Resources Monitoring Report shall be prepared as directed in Mitigation Measure PALEO-3.

PALEO-2: **Worker Environmental Awareness Program (WEAP).** Prior to the start of Project-related construction activities, a WEAP shall be developed by the BLM-approved qualified paleontologist. The WEAP shall address the potential to encounter paleontological resources in the field, the sensitivity and importance of these resources, and the legal obligations to preserve and protect such resources. The training program shall also include the set of reporting procedures that workers are to follow if paleontological resources are encountered during Project activities. The WEAP may be combined with other environmental training programs for the Project.

PALEO-3: **Paleontological Resources Monitoring Report.** The Project Owner shall ensure preparation of a paleontological resources monitoring report by the qualified paleontologist. The report shall be completed following the analysis of any recovered fossil materials and related information. The required contents of the report shall be described in the Paleontological Resource Monitoring and Mitigation Plan (PALEO-1) and shall include, but not be limited to, a description and inventory list of recovered fossil materials (if any); a map showing the location of paleontological resources found in the field; determinations of scientific significance; and a statement by the qualified paleontologist that project impacts to paleontological resources have been mitigated.

Recreation and Public Access (Off-Highway Vehicles)

REC-1: **Temporary Route Closure.** No less than 60 days prior to construction, the Project Owner shall coordinate with the Authorized Officer (AO) administering NECO Plan designated Open Route MM703 (Powerline Road) to establish temporary closure of the route to avoid construction area hazards, if the route is deemed unsafe to use during construction. Coordination shall include determination of the most appropriate detour routes for OHV users, including consideration of existing conditions at the time such coordination occurs (e.g., if other nearby projects result in changes in the local open route system). The Project Owner shall post a public notice of the temporary route closure and detour routes at the locations listed below. The notice shall include highly visible materials, colors, and/or finishes and large primary text to attract the attention of OHV users; such design details shall be specified by the AO. The notice shall provide a map of the closure and alternate routes, and shall specify penalties for any off-route OHV activities. The Project Owner shall document its coordination efforts with the AO and submit this documentation to the BLM and other agencies affected at least 30 days prior to construction. Signage locations include, but may not be limited to the following (the NECO Plan AO may require additional locations):

a. Intersection of Wiley's Well Road and open route MM712, in an orientation visible to southbound travelers on Wiley's Well Road and westbound travelers on MM712.

b. Intersection of open routes MM1086 and MM712, in an orientation visible to southbound travelers on MM1086 south of this intersection.

c. Intersection of open routes MM703 and MM1092, in an orientation visible to northbound travelers on MM703 northwest of this intersection.

Furthermore, the NECO Plan AO may require changes to the required information and location of detour signage, at the Project Owner's expense, if route closures associated with any nearby projects would affect the accuracy or adequacy of the posted signage during the period of MM703 closure associated with this project.

REC-2: **LTVA Permit Documentation.** Prior to construction, the BLM shall document the number of permits issued and visitor-days for the Mule Mountains and Midland LTVAs for the previous two fiscal years and provide this information to the Project Owner to establish a baseline for use without the Project. During construction, the BLM shall monitor the use of the Mule Mountains and Midland LTVAs, including through the number of permits purchased compared to typical years and through observation during normal patrols. If an increase of 15 percent or more in the number of permits issued compared to prior years occurs, and if BLM determines that use of LTVAs by Project construction workers is resulting in physical deterioration of developed campground facilities or natural elements, or resulting in the accumulation of excess trash, the Project Owner shall provide for additional garbage pickup service, janitorial visits, and maintenance and repairs, as needed, to ensure that Project-related use does not cause substantial physical deterioration within the LTVAs, consistent with BLM management performance standards for the LTVA. BLM shall conduct quarterly reviews of LTVA use and inform the Project Owner in writing if and when use exceedances and physical deterioration are confirmed and shall provide specific itemized estimates of the additional necessary services to maintain the LTVA consistent with a typical level of use. The Project Owner shall provide appropriate funding to BLM based on these estimates within 30 days of written notification, or if approved by the BLM AO, shall contract with service providers to provide these additional services directly within 45 days of written notification. If funding is provided, the BLM shall ensure that the documented services are provided within 30 days of receipt of funds. The Project Owner shall also coordinate with the County of Riverside to provide either hardening of the access roads (e.g., Wiley's Well Road) or monthly blading during the LTVA season.

Socioeconomics, Environmental Justice, Population and Housing

No mitigation is required.

Special Designations

No mitigation is required.

Transportation

No mitigation is required.

Utilities and Public Services

BIO-15: **Storm Water Management Plan and DESCP** (see Biological Resources section)

BIO-16: **Weed Management** (see Biological Resources section)

BIO-32: **Bird and Bat Conservation Strategy** (see Biological Resources section)

FIRE-1: **Fire Safety Plan** (see Wildland Fire Ecology section)

WAT-1: **Groundwater Monitoring, Reporting, and Mitigation Plan** (see Water Resources section)

WAT-2: **Colorado River Water Supply Plan** (see Water Resources section)

PSU-1: **Waste Recycling Plan (WRP).** Prior to issuance of a grading and/or building permit, the Project Owner shall submit a WRP to the BLM and CDFW for review and approval. At a minimum, the WRP must identify the materials (i.e., solar panels, cardboard, concrete, asphalt, wood, etc.) that will be generated by construction and development; the projected amounts of each; the applicable state and local laws and regulations governing waste disposal and recycling (e.g., Department of Toxic Substances Control regulations regarding photovoltaic modules); the measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials; the facilities and/or haulers that will be utilized; and the targeted Project-specific recycling or reduction rate. During construction, the project site shall have, at a minimum, two bins: one for waste disposal and the other for the recycling of Construction and Demolition (C&D) materials. Additional bins are encouraged to be used for further source separation of C&D recyclable materials, and shall be provided if required by applicable state and local laws. The Project Owner shall maintain accurate records (receipts) for recycling of C&D recyclable materials and solid waste disposal; arrangements for such receipts can be made through the franchise hauler.

Prior to final building inspection, the Project Owner shall present evidence (i.e., receipts or other type of verification) to demonstrate project compliance with the approved WRP to the BLM and CDFW. Receipts must clearly identify the amount of waste disposed and C&D materials recycled.

Prior to Lead Agency approval of the Decommissioning Plan in Mitigation Measure BIO-34, the Project Owner shall submit a WRP to the Lead Agencies. At a minimum, the WRP must identify the materials (i.e., solar panels, cardboard, concrete, asphalt, wood, semiconductor materials, etc.) that will be generated by the decommissioning and closure of the facility, the projected amounts, the measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials, the facilities and/or haulers that will be utilized, and the targeted recycling or reduction rate. During the decommissioning and closure, the project site shall have, at a minimum, two (2) bins: one for waste disposal and the other for the recycling of Construction and Demolition (C&D) materials. Disposal of any toxic semiconductor materials, such as cadmium telluride, copper indium gallium selenide, gallium indium phosphide, and gallium arsenide, will follow existing or future regulations from the Department of Toxic Substances Control. Additional bins are encouraged to be used for further source separation of C&D recyclable materials. Accurate record keeping (receipts) for recycling of C&D recyclable materials and solid waste disposal must be kept. Arrangements can be made through the franchise hauler.

Visual Resources

AQ-1: **Dust Control Plan** (see Air Resources section)

BIO-18: **Vegetation Communities Restoration and Compensation** (see Biological Resources section)

VIS-1: **Design.** Prior to construction, the BLM Authorized Officer (AO) and Project Owner shall meet with one or more BLM landscape architects and/or other scenic resource specialists trained in BLM Visual Resources Management and approved by the BLM AO to coordinate on the VRM mitigation strategy and confirm the compliance checking schedule and procedures. The BLM landscape architect(s) and/or approved scenic resource specialist(s) shall review the Project final design drawings and construction documents for completeness with regard to the visual mitigation elements, assuring that requirements and commitments are adequately addressed.

The Project Owner and/or its contractor(s) shall integrate the following visual design elements into the construction plans, details, drawings, and specifications (including, but not be limited to, grubbing and clearing, vegetation thinning and clearing, grading, restoration, drainage, and structural plans) submitted to BLM and CDFW. Visual design elements shall be measureable by size (i.e., schematics will include dimension in set units which can be verified during the construction,

operation, and/or decommissioning phases) and able to be monitored while under construction, while operational, and when decommissioned, and plans must demonstrate how VRM objectives will be met, monitored, and measured for conformance. Visual design elements must at a minimum include:

1. ***Reduce contrast caused by graded roads*:** To reduce contrast caused by exposing un-oxidized soils and rock in roadways, at select locations of concern from KOPs, spot applications of a product such as Permeon shall be used to dull and darken the ground plane quickly after grading.
2. ***Color treat structures to reduce contrasts with the existing landscape*:** The Project Owner shall color treat all operation and maintenance facilities and other ancillary on-site facilities using a BLM standard environmental color that is identified through a site study for color and texture selection and approved by the BLM. Where feasible and appropriate, similar color treatment shall be applied to rear surfaces of the modules, frames, tracker structures (if applicable), Grouped structures, including the water tanks and prefabricated buildings, shall be treated with the same color. Further, materials, coating, or paints having little or no specular or reflective qualities shall be used on structures including, but not limited to, buildings, tanks, fences, fence railings, poles, aboveground pipes and culverts, and reverse sides of signs and guardrails, whenever feasible. Substation equipment shall be specified with a low-reflectivity neutral finish. Insulators at substations and on takeoff equipment shall be non-reflective and non-refractive. The surfaces of substation structures shall be given low-reflectivity finishes with neutral colors that contrast minimally with the surrounding landscape. Chain-link fences shall have a dulled, darkened finish to reduce contrast. Components that would have a warranty voided or would be rendered unusable by these actions may be exempt from these requirements if documentation is provided to the BLM AO and the AO approves the exemption.
3. ***Lighting*:** The Project Owner shall prepare a lighting plan that documents how security and safety lighting will be designed and installed to minimize night-sky impacts during facility operation. The lighting plan shall include the safety and security reasons that require the need for all nighttime lighting on the facility. Wherever feasible, consistent with safety and security, lighting shall be kept off when not in use. The lighting plan shall include a process for promptly addressing and mitigating complaints about potential lighting impacts. The Project Owner shall submit the lighting plan to the BLM for review and approval at least 30 days prior to construction. The lighting plan must include, but is not limited to the following specifications:
    a. *Nighttime lighting* – Except as required to meet safety and security requirements, there shall be no exterior nighttime lighting on the Project site during operation. For these purposes, "nighttime" means the period of time between two hours after sunset until sunrise.
    b. *Number and installation* – Lighting for facilities shall not exceed the minimum number of lights and brightness required for safety and security, and shall not cause excessive reflected glare. Lights shall be directed downward or toward the area to be illuminated. All fixtures must be mounted properly, at the proper angle. Light fixtures shall not spill light beyond the Project boundary.
    c. *Lighting types* – Lighting shall be amber in color when accurate color rendition is not required. Use of low-pressure sodium lamps or yellow LED lighting or equivalent is required, and no bluish-white lighting shall be used in permanent outdoor lighting. Except as required to meet minimum safety and security requirements, all permanent lighting shall use full cutoff luminaires that are fully shielded (i.e., not emitting direct or indirect light above an imaginary horizontal plane passing through the light source), and must meet the Illuminating Engineering Society (IES) glare requirement limiting intensity of light from the luminaire in the region between 80 and 90 degrees from the ground.
    d. *Timers or motion detectors* – Lights in highly illuminated areas that are not occupied on a continuous basis shall be equipped with timer switches or motion detectors so that the lights operate only when the area is occupied.

e. *Protection of biological resources* – The lighting plan shall incorporate operational lighting requirements of Mitigation Measure BIO-13 to ensure that biological resources are protected from nighttime lighting as specified therein.

4. Access road and gen-tie design shall minimize vegetation and ground disturbance and take advantage of existing clearings wherever feasible.
5. Along all off-site access roads, all internal access roads 16 feet or wider, and the gen-tie route, all graveled surfaces, areas to be permanently cleared of vegetation, and (if applicable) cut slopes shall be treated with BLM-approved rock stains or other color treatment appropriate with the surrounding landscape.
6. Openings in vegetation for facilities, structures, and roads shall be feathered and shaped to repeat the size, shape, and characteristics of naturally occurring openings.
7. The gen-tie line shall use non-specular conductors and non-reflective coatings on insulators to the extent that these are available at the time of procurement.

VIS-2: **Construction.** The Project Owner and/or its contractor(s) shall reduce visual impacts during construction through the following measures:

1. Ensure that equipment operators receive training on visual impact mitigation objectives and activities before construction activities begin.
2. Preserve existing rocks, native vegetation, drainage patterns, and other natural characteristics to the extent feasible.
3. Edges of grubbed and graded areas shall be feathered to reduce form and line contrasts with the existing landscapes.
4. In areas not requiring permanent grubbing and grading, use brush-beating or mowing or use protective surface matting rather than removing vegetation to the extent feasible.
5. Mulch and spread slash from vegetation removal to cover fresh soil disturbances as part of the Restoration Plan described in Mitigation Measure BIO-18.
6. If graveled surfaces are used during construction, reduce the visual color contrast of graveled surfaces with BLM-approved color treatment practices.
7. Use removable or washable markings to indicate surveyor construction activity limits; no paint or permanent discoloring agents shall be applied to rocks or vegetation.
8. Remove all stakes and flagging from the construction area and dispose of them in an approved facility after use.
9. Ensure that lighting for evening construction does not exceed the minimum number of lights and brightness required for safety and security, and does not cause excessive reflected glare. No night lighting shall be used outside of construction hours unless controlled by a timer or motion detector so that it remains off when not in use.

VIS-3: **Operation and Maintenance.** Terms and conditions for VRM mitigation compliance shall be maintained and monitored on an annual basis for the life of the project for compliance with visual objectives, adaptive management adjustments, and modifications listed below and as necessary and approved by the BLM landscape architect or other designated visual/scenic resource specialist. Minimum measures are as follows:

1. The Project Owner shall maintain revegetated surfaces until a self-sustaining stand of vegetation which does not require supplemental water or fertilizer is re-established and visually adapted to the undisturbed surrounding vegetation.

2. No new ground disturbance that would create long-term visual contrast visible from KOPs shall be created during operation without completion of a VRM analysis and approval by the BLM AO. New ground disturbance would include disturbance of areas not proposed for disturbance in the Applicant's Plan of Development and not described and analyzed in the Final EIS and Proposed PA. It could also include re-disturbance of previously treated or restored areas, such as scraping of oxidized surfaces or vegetation removal other than maintenance trimming and mowing described in the ROW grant. If new ground disturbances are approved by the BLM AO during operation, interim restoration shall be undertaken as soon as possible after disturbances.
3. Painted facilities shall be kept in good repair and repainted when color fades or flakes.
4. Color-treated solar equipment (if applicable) shall be kept in good repair, and retreated when color fades or flakes.

VIS-4: **Glint and Glare Mitigation and Monitoring.** Consistent with Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands, the Project Owner shall prepare and submit to the BLM a Glint and Glare Mitigation and Monitoring plan that identifies mitigation measures to minimize the intensity, duration, and geographic extent of glint and glare visible from publicly accessible locations, and provides for monitoring of the effectiveness and maintenance of such measures. The plan shall include, but not be limited to, the following information and mitigation and monitoring requirements:

1. Based on final design including panel and mounting type and solar array configuration, complete final glare modeling for each KOP evaluated in the Final EIS and Proposed PA using the ForgeSolar PV planning and glare analysis tool.
2. Based on final modeling, program solar tracker arrays contributing to glare to turn away from affected KOPs during the times of day when glare visible at that KOP is generated. This programming need only be applied to the panels/arrays that would cause the glare, as modeled, if generation of glare is limited to a portion of the Project site.
3. Use panels made with textured glass surfaces to diffuse reflected light, or if the use of textured glass panels is found not to be technically feasible, the plan shall describe the reason for its infeasibility.
4. If glare with the potential for temporary after-image remains visible to drivers on I-10, coordinate with Caltrans to place signs warning drivers of the potential for hazardous glare.

VIS-5: **Decommissioning and Site Reclamation.** The Project Owner shall prepare a Decommissioning and Site Reclamation Plan, covering visual impact mitigation measures, and submit to BLM for approval prior to construction. The following decommissioning and reclamation activities and practices shall be included in the plan and implemented to mitigate visual impacts:

1. Pre-development visual conditions shall be documented and the visual elements of form, line, color, and texture shall be restored to pre-development visual compatibility or to that of the surrounding landscape setting conditions, whichever achieves the better visual quality and most ecologically sound outcome, as approved by the BLM.
2. The plan shall require that all aboveground and near-ground structures be removed. Some structures shall be removed only to a level below the ground surface that will allow reclamation/restoration. Any topsoil that is removed during decommissioning activities shall be salvaged, stockpiled, and reapplied during final reclamation as described under item 6.
3. The plan shall include provisions for monitoring and determining compliance with the Project's visual mitigation and reclamation objectives.
4. Soil borrow areas, cut-and-fill slopes, berms, water bars, and other disturbed areas shall be contoured to approximate naturally occurring slopes, thereby avoiding form and line contrasts

with the existing landscapes. The Project Owner shall contour to a rough texture (i.e., use large rocks/boulders, grade uneven surfaces, and/or vegetation mulches/debris) in order to trap seed and to discourage off-road travel, thereby reducing associated visual impacts.

5. A combination of seeding, planting of nursery stock, transplanting of local vegetation within the proposed disturbance areas, and staging of decommissioning activities enabling direct transplanting shall be utilized. Where feasible, native vegetation shall be used for revegetating to establish a composition consistent with the form, line, color, and texture of the surrounding undisturbed landscape.
6. Any topsoil that has been removed and stockpiled during decommissioning activities shall be reapplied to disturbed areas, and the areas shall be revegetated by using a mix of native species selected for visual compatibility with existing vegetation, where applicable, or by using a mix of native and non-native species if necessary to ensure successful restoration. Gravel and other surface treatments shall be removed or buried.
7. Rocks, brush, and vegetal debris shall be restored whenever possible to approximate preexisting visual conditions.
8. Edges of revegetated areas shall be feathered to reduce form and line contrasts with the existing landscapes.
9. The Plan shall include a decommissioning VRM Monitoring schedule, terms for monitoring, and the conditions and methods of measurement for determining compliance.

Water Resources

BIO-14: **Storm Water Management Plan and DESCP** (see Biological Resources section)

WAT-1: **Groundwater Monitoring, Reporting, and Mitigation Plan.** If the Project Owner or its contractors will use groundwater pumped from any well (onsite or offsite) that extracts water from the Chuckwalla Valley Groundwater Basin (CVGB) or Palo Verde Mesa Groundwater Basin (PVMGB), then prior to such groundwater use the Project Owner shall retain a BLM-approved qualified hydrogeologist to develop a Groundwater Monitoring, Reporting, and Mitigation Plan (GMRMP), in coordination with the BLM, to ensure that groundwater wells surrounding the Project site and Project supply well(s) are not adversely affected by project activities. The Project Owner shall submit the GMRMP to the BLM for review and approval. Additionally, although no Groundwater Sustainability Agencies (GSAs) has been established for the Riverside County portions of the CVGB and PVMGB, in the event that such agencies have been established when the GMRMP is developed, the Project Owner also shall submit the plan to the GSAs. The Project Owner must obtain BLM approval for the GMRMP prior to the start of construction of any groundwater well or prior to the start of pumping from any existing well in the CVGB or PVMGB, and shall implement the approved GMRMP throughout any Project phase that pumps groundwater for consumptive use.

The GMRMP shall provide detailed methodology for monitoring site groundwater levels and comparisons for levels within the basin including identification of the closest private wells to the Project site. Monitoring shall be performed during pre-construction, construction, and operation of the project, with the intent to establish pre-construction and project-related groundwater level and quantitatively compared against observed and simulated trends near the project pumping wells. The GMRMP shall include a schedule for submittal of quarterly data reports by the Project Owner to the BLM and the GSAs, if established, for the duration of the construction period. These quarterly data reports shall be prepared and submitted for review and approval, and shall include water level monitoring data and effect on the nearest offsite private wells. The BLM and GSAs, if established, shall determine whether groundwater wells surrounding the Project site and Project supply well(s) are adversely affected by Project activities in a way that requires additional mitigation and, if so, shall determine what measures are needed. Examples of additional mitigation could include cessation

of pumping at the Project site until groundwater levels return to levels that allow nearby wells to resume pre-Project pumping levels or compensation for whatever additional equipment is necessary to lower nearby pumps to levels that can adequately continue pumping, if approved by the BLM. After the completion of construction, the Project owner and the BLM shall jointly evaluate the effectiveness of the GMRMP and determine if monitoring frequencies or procedures should be revised or eliminated.

WAT-2: **Colorado River Water Supply Plan.** If the Project Owner or its contractors will use groundwater pumped from any well (onsite or offsite) that extracts water from the Chuckwalla Valley Groundwater Basin (CVGB) or Palo Verde Mesa Groundwater Basin (PVMGB), then prior to the onset of water pumping for consumptive use, the project owner shall prepare a Colorado River Water Supply Plan (Plan) and submit this Plan to the BLM and the Colorado River Board of California for review and approval, and to the Metropolitan Water District of Southern California (MWD; this agency holds a contract to provide a legally authorized and reliable water supply to replace water from the Colorado River) and the Colorado River Regional Water Quality Control Board (RWQCB) for review and comment. The Plan shall demonstrate the availability of and identify best available measures that will be taken to replace water on an acre-foot to acre-foot basis, if the project results in consumption of any water from below the Colorado River Accounting Surface. These measures will ensure that no allocated water from the Colorado River is consumed without entitlement to that water. The plan shall also include monitoring and reporting protocols to ensure that water conservation/offset activities are effectively implemented and achieve the intended purpose of replacing Colorado River water diversions. If the project does not result in diversion of Colorado River water (via pumping from near [within +/- 0.84 feet at the 95-percent confidence level], equal to, or below the identified accounting surface elevation for the well-used for water supply) it will not be necessary to implement the water conservation/offset activities identified in the Colorado River Water Supply Plan. However, the Plan must be approved by the BLM and the Colorado River Board of California prior to project-related groundwater pumping so that if at any time during the Project it is determined that groundwater is being produced from below the Colorado River Accounting Surface at the well used for water supply, the requirements described in this measure shall be immediately implemented, starting with the cessation of groundwater pumping and calculation of the quantity of groundwater pumped from below the accounting surface. The amount of groundwater depletion requiring mitigation, if any, shall be equal to the amount of withdrawals from below the Colorado River Accounting Surface as determined by the Groundwater Monitoring, Reporting, and Mitigation Plan in Mitigation Measure WAT-1.

Wildland Fire Ecology

BIO-15: **Wildfire Prevention** (see Biological Resources section)

BIO-16: **Weed Management** (see Biological Resources section)

FIRE-1: **Fire Safety Plan.** The Project Owner shall prepare and implement a Fire Safety Plan to ensure the safety of workers and the public during Project construction, operation and maintenance, and decommissioning activities. The Project Owner must provide the Fire Safety Plan to the BLM for review and approval and to the Riverside County Fire Department (RCFD) for review and comment before the BLM will issue a Notice to Proceed (NTP). The Fire Safety Plan shall include, but not be limited to, the following elements:

1. Procedures for minimizing potential ignition, including, but not limited to, vegetation clearing, parking requirements/restrictions, idling restrictions, smoking restrictions, proper use of gas-powered equipment, and hot work restrictions.
2. Work restrictions during Red Flag Warnings and High to Extreme Fire Danger days.

3. All internal combustion engines used at the Project site shall be equipped with spark arrestors. Spark arrestors shall be in good working order.
4. Once initial two-track roads have been cut and initial fencing completed, light trucks and cars shall be used only on roads where the roadway is cleared of vegetation. Mufflers on all cars and light trucks shall be maintained in good working order.
5. Fire rules shall be posted on the project bulletin board at the contractor's field office and areas visible to employees.
6. Equipment parking areas and small stationary engine sites shall be cleared of all flammable materials.
7. Fire suppression equipment requirements when spark-generating work is being implemented.
8. Smoking shall be prohibited in all vegetated areas and within 50 feet of combustible materials storage, and shall be limited to paved areas or areas cleared of all vegetation.
9. Each Project construction site (if construction occurs simultaneously at various locations) and the proposed solar plant site shall be equipped with fire extinguishers and fire-fighting equipment sufficient to extinguish small fires.
10. The Project Owner shall coordinate with the BLM and RCFD to create a training component for emergency first responders to prepare for specialized emergency incidents that may occur at the Project site.
11. All construction workers, plant personnel, and maintenance workers visiting the plant and/or transmission lines to perform maintenance activities shall receive training on fire prevention procedures, the proper use of fire-fighting equipment, and procedures to be followed in the event of a fire. Training records shall be maintained and be available for review by the BLM and RCFD. Fire prevention procedures shall be included in the Project's Worker Environmental Awareness Program (WEAP) (Mitigation Measure BIO-17).
12. Vegetation near all solar panel arrays, ancillary equipment, and access roads shall be controlled through periodic cutting and spraying of weeds, in accordance with the Weed Management Plan.
13. The BLM and RCFD shall be consulted during plan preparation and fire safety measures recommended by these agencies included in the plan.
14. The plan shall list fire prevention procedures and specific emergency response and evacuation measures that would be required to be followed during emergency situations.
15. All on-site employees shall participate in annual fire prevention and response training exercises with the BLM and RCFD.
16. The plan shall list all applicable wildland fire management plans and policies established by state and local agencies and demonstrate how the Project will comply with these requirements.
17. The Project Owner shall designate an emergency services coordinator from among the full-time on-site employees who shall perform routine patrols of the site during the fire season equipped with a portable fire extinguisher and communications equipment. The Project Owner shall notify the BLM and RCFD of the name and contact information of the current emergency services coordinator in the event of any change.
18. Remote monitoring of all major electrical equipment (transformers and inverters) will screen for unusual operating conditions. Higher than nominal temperatures, for example, can be compared with other operational factors to indicate the potential for overheating which under certain conditions could precipitate a fire. Units could then be shut down or generation curtailed remotely until corrective actions are taken.

19. Fires ignited onsite shall be immediately reported to BLM and the RCFD.

The engineering, procurement, and construction contract(s) for the project shall clearly state the requirements of this mitigation measure.

Glossary

A

Air Basin: A regional area defined for state air quality management purposes based on considerations that include topographic features that influence meteorology and pollutant transport patterns, and political jurisdiction boundaries that influence the design and implementation of air quality management programs.

Air Quality Control Region: A regional area defined for federal air quality management purposes based on considerations that include topographic features that influence meteorology and pollutant transport patterns, and political jurisdiction boundaries that influence the design and implementation of air quality management programs.

Alluvium: A fine-grained fertile soil consisting of mud, silt, and sand deposited by flowing water on flood plains, in river beds, and in estuaries.

Alluvial Fan: A fan-shaped material of water-deposited material.

Ambient Air Quality Standards (AAQS): A combination of air pollutant concentrations, exposure durations, and exposure frequencies that are established as thresholds above which adverse impacts to public health and welfare may be expected. Ambient air quality standards are set on a national level by the U.S. Environmental Protection Agency. Ambient air quality standards are set on a state level by public health or environmental protection agencies as authorized by state law.

Ambient Air: Outdoor air in locations accessible to the general public.

Area of Critical Environmental Concern (ACEC): A special management area designated by BLM to protect significant historic, cultural, or scenic values; fish and wildlife resources; natural process or systems; and/or natural hazards; that:

a. has more than locally significant qualities which give it special worth, consequence, meaning, distinctiveness, or cause for concern, especially compared to any similar resource;

b. has qualities or circumstances that make it fragile, sensitive, rare, irreplaceable, exemplary, unique, endangered, threatened, or vulnerable to adverse change;

c. has been recognized as warranting protection in order to satisfy national priority concerns or to carry out the mandates of Federal Land Management and Practices Act (FLMPA);

d. has qualities which warrant highlighting in order to satisfy public or management concerns about safety and public welfare; and/or

e. poses a significant threat to human life and safety or to property.

Area of Potential Effects (APE): The geographic area or areas within which an action may directly or indirectly cause changes in the character or use of historic properties, if such properties exist.

Attainment Area: An area that has air quality as good as or better than a national or state ambient air quality standard. A single geographic area may be an attainment area for one pollutant and a non-attainment area for others.

B

Best Management Practices (BMPs): A practice or combination of practices that are determined to provide the most effective, environmentally sound, and economically feasible means of managing an activity and mitigating its impacts.

C

Cancer: A class of diseases characterized by uncontrolled growth of somatic cells. Cancers are typically caused by one of three mechanisms: chemically induced mutations or other changes to cellular DNA; radiation induced damage to cellular chromosomes; or viral infections that introduce new DNA into cells.

Carbon Monoxide (CO): A colorless, odorless gas that is toxic because it reduces the oxygen-carrying capacity of the blood.

Characteristic: A distinguishing trait, feature, or quality.

Characteristic Landscape: The established landscape within an area being viewed. This does not necessarily mean a naturalistic character. It could refer to an agricultural setting, an urban landscape, a primarily natural environment, or a combination of these types.

Climate: A statistical description of daily, seasonal, or annual weather conditions based on recent or long-term weather data. Climate descriptions typically emphasize average, maximum, and minimum conditions for temperature, precipitation, humidity, wind, cloud cover, and sunlight intensity patterns; statistics on the frequency and intensity of tornado, hurricane, or other severe storm events may also be included.

Community Noise Equivalent Level (CNEL): A 24-hour average noise level rating with a 5 dB penalty factor applied to evening noise levels and a 10 dB penalty factor applied to nighttime noise levels. The CNEL value is very similar to the Day-Night Average Sound Level (Ldn) value, but includes an additional weighting factor for noise during evening hours.

Contrast: Opposition or unlikeness of different forms, lines, colors, or textures in a landscape.

Contrast Rating: A method of analyzing the potential visual impacts of proposed management activities.

Corrosive Soils: Potential soil-induced electrochemical or chemical action that could corrode or deteriorate concrete, reinforcing steel in concrete structures, and bare-metal structures.

Cretaceous: In geologic history the third and final period of the Mesozoic era, from 144 million to 65 million years ago, during which extensive marine chalk beds formed.

Criteria Pollutant: An air pollutant for which there is a national ambient air quality standard (carbon monoxide, nitrogen dioxide, ozone, sulfur dioxide, inhalable particulate matter, fine particulate matter, or airborne lead particles).

Critical Habitat: Habitat designated by the U.S. Fish and Wildlife Service under Section 4 of the federal Endangered Species Act and under the following criteria: 1) specific areas within the geographical area occupied by the species at the time it is listed, on which are found those physical or biological features essential to the conservation of the species and that may require special management of protection; or 2) specific areas outside the geographical area by the species at the time it is listed but that are considered essential to the conservation of the species.

Cryptobiotic Soils: A type of biological soil crust that occurs in hot desert areas, such as the Mojave and Sonoran deserts, comprised of a complex mosaic of cyanobacteria, lichens, mosses, or other bacteria. Cyanobacterial filaments weave through the top few millimeters of soil, gluing loose particles together and forming a matrix that stabilizes and protects soil surfaces from erosive forces (BLM, 2001).

Cultural Modification: Any man-caused change in the land form, water form, vegetation, or the addition of a structure which creates a visual contrast in the basic elements (form, line, color, texture) of the naturalistic character of a landscape.

Cultural Resource: A location of human activity, occupation, or use identifiable through field inventory, historical documentation, or oral evidence. Cultural resources include archaeological and historical sites, structures, buildings, objects, artifacts, works of art, architecture, and natural features that were important in past human events. They may consist of physical remains or areas where significant human events occurred, even

though evidence of the events no longer remains. And they may include definite locations of traditional, cultural, or religious importance to specified social or cultural groups.

Cultural Resource Integrity: The condition of a cultural property, its capacity to yield scientific data, and its ability to convey its historical significance. Integrity may reflect the authenticity of a property's historic identity, evidenced by the survival or physical characteristics that existed during its historic or prehistoric period, or its expression of the aesthetic or historic sense of a particular period of time.

Cultural Resource Survey: A descriptive listing and documentation, including photographs and maps of cultural resources. Included in an inventory are the processes of locating, identifying, and recording sites, structures, buildings, objects, and districts through library and archival research, information from persons knowledgeable about cultural resources, and on-the-ground surveys of varying intensity.

Class I: A professionally prepared study that compiles, analyzes, and synthesizes all available data on an area's cultural resources. Information sources for this study include published and unpublished documents, BLM inventory records, institutional site files, and state and National Register files. Class I inventories may have prehistoric, historic, and ethnological and sociological elements. These inventories are periodically updated to include new data from other studies and Class II and III inventories.

Class II: A professionally conducted, statistically based sample survey designed to describe the probable density, diversity, and distribution of cultural properties in a large area. This survey is achieved by projecting the results of an intensive survey carried out over limited parts of the target area. Within individual sample units, survey aims, methods, and intensities are the same as those applied in Class III inventories. To improve statistical reliability, Class II inventories may be conducted in several phases with different sample designs.

Class III: A professionally conducted intensive survey of an entire target area aimed at locating and recording all visible cultural properties. In a Class III survey, trained observers commonly conduct systematic inspections by walking a series of close interval parallel transects until they have thoroughly examined an area.

D

Day/Night Average Sound Level (Ldn): A 24-hour average noise level rating with a 10 dB penalty factor applied to nighttime noise levels. The Ldn value is very similar to the CNEL value, but the CNEL value does not include any weighting factor for noise during evening hours.

Decibel (dB): A generic term for measurement units based on the logarithm of the ratio between a measured value and a reference value. Decibel scales are most commonly associated with acoustics (using air pressure fluctuation data); but decibel scales sometimes are used for ground-borne vibrations or various electronic signal measurements.

Desert Pavement: A surface covering of closely packed rock fragments of pebble or cobble size found on desert soils.

Distance Zones: A subdivision of the landscape as viewed from an observer position. The subdivision (zones) includes foreground-middle ground, background, and seldom seen.

E

Enhancement: A management action designed to improve visual quality.

Equivalent Average Sound Pressure Level (Leq): The decibel level of a constant noise source that would have the same total acoustical energy over the same time interval as the actual time-varying noise condition being measured or estimated. Leq values must be associated with an explicit or implicit averaging time in order to have practical meaning.

Erosion: A natural process whereby soil and highly weathered rock materials are worn away and transported to another area, most commonly by wind or water.

Ethnographic Resources: Resources representing the heritage of a particular ethnic or cultural group, such as Native Americans or African, European, Latino, or Asian immigrants. They may include traditional resource-collecting areas, ceremonial sites, value-imbued landscape features, cemeteries, shrines, or ethnic neighborhoods and structures.

Excavation: The scientific examination of an archaeological site through layer-by-layer removal and study of the contents within prescribed surface units, e.g. square meters.

Expansive Soils: A soil which significantly changes its volume in horizontal and vertical planes with changes in moisture content.

F

Fault (active): A fault that has had surface displacement during Holocene time (last 11,000 years).

Fault (potentially active): A Quaternary-age (last 1.8 million years) fault that lacks evidence of Holocene-age displacement.

Fluvial: Of, relating to, or occurring in a river.

Form: The mass or shape of an object or objects which appear unified, such as a vegetative opening in a forest, a cliff formation, or a water tank.

G

Geomorphic Province: Naturally defined geologic regions that display a distinct landscape or landform.

Glare: The sensation produced by luminance within the visual field that is sufficiently greater than the luminance to which the eyes are adapted, which causes annoyance, discomfort, or loss in visual performance and visibility. See Glint.

Glint: A momentary flash of light resulting from a spatially localized reflection of sunlight.

Greenhouse Gas (GHG): A gaseous compound that absorbs infrared radiation and re-radiates a portion of that back toward the earth's surface, thus trapping heat and warming the earth's atmosphere.

H

Habitat: A specific set of physical conditions that surround a single species, a group of species, or a large community. In wildlife management, the major components of habitat are considered to be food, water, cover, and living space.

Hazardous Air Pollutant (HAP): Air pollutants which have been specifically designated by relevant federal or state authorities as being hazardous to human health. Most HAP compounds are designated due to concerns related to: carcinogenic, mutagenic, or teratogenic properties; severe acute toxic effects; or ionizing radiation released during radioactive decay processes.

Hertz (Hz): A standard unit for describing acoustical frequencies measured as the number of air pressure fluctuation cycles per second. For most people, the audible range of acoustical frequencies is from 20 Hz to 20,000 Hz.

Historical Site: A location that was used or occupied after the arrival of Europeans in North America (ca. A.D. 1492). Such sites may consist of physical remains at archaeological sites or areas where significant human events occurred, even though evidence of the events no longer remains. They may have been used by people of either European or Native American descent.

Holocene: Of, denoting, or formed in the second and most recent epoch of the Quaternary period, which began 10,000 years ago at the end of the Pleistocene.

Hydrocarbons: Any organic compound containing only carbon and hydrogen, such as the alkanes, alkenes, alkynes, terpenes, and arenes.

Hydrocompaction: Generally is limited to young soils that were deposited rapidly in a saturated state, most commonly by a flash flood. The soils dry quickly, leaving an unconsolidated, low density deposit with a high percentage of voids.

I

Indian Tribe: Any American Indian group in the United States that the Secretary of the Interior recognizes as possessing tribal status (listed periodically in the Federal Register).

Invasive Species: An exotic species whose introduction does or is likely to cause economic or environmental harm or harm to human health (Executive Order 13122, 2/3/99).

Isolate: Non-linear, isolated archaeological features without associated artifacts.

K

Key Observation Point (KOP): One or a series of points on a travel route or at a use area or a potential use area, where the view of a management activity would be most revealing.

L

Landscape Character: The arrangement of a particular landscape as formed by the variety and intensity of the landscape features and the four basic elements of form, line, color, and texture. These factors give the area a distinctive quality which distinguishes it from its immediate surroundings.

Landscape Features: The land and water form, vegetation, and structures which compose the characteristic landscape.

Landslide: A slope failure that involves downslope displacement and movement of material either triggered by static (i.e., gravity) or dynamic (i.e., earthquake) forces.

Leasable Minerals: Minerals whose extraction from federally managed land requires a lease and the payment of royalties. Leasable minerals include coal, oil and gas, oil shale and tar sands, potash, phosphate, sodium, and geothermal steam.

Line: The path, real or imagined, that the eye follows when perceiving abrupt differences in form, color, or texture. Within landscapes, lines may be found as ridges, skylines, structures, changes in vegetative types, or individual trees and branches.

Liquefaction: A condition in which a saturated cohesionless soil may lose shear strength because of a sudden increase in pore water pressure caused by an earthquake.

Locatable Minerals: Minerals subject to exploration, development, and disposal by staking mining claims as authorized by the Mining Law of 1872, as amended. This includes deposits of gold, silver, and other uncommon minerals not subject to lease or sale.

M

Maintenance Area: An area that currently meets federal ambient air quality standards but which was previously designated as a nonattainment area. Federal agency actions occurring in a maintenance area are still subject to Clean Air Act conformity review requirements.

Memorandum of Understanding (MOU): A written but noncontractual agreement between two or more agencies or other parties to take a certain course of action.

Metropolitan Statistical Areas (MSAs): A geographical region with a relatively high population density at its core and close economic ties throughout the area, delineated for use by federal statistical agencies in collecting, tabulating, and publishing federal statistics.

Mineral Material Disposal: The sale of sand, gravel, decorative rock, or other materials defined in 43 CFR 3600.

Mining Claim: A mining claim is a selected parcel of Federal Land, valuable for a specific mineral deposit or deposits, for which a right of possession has been asserted under the General Mining Law. This right is restricted to the development and extraction of a mineral deposit. The rights granted by a mining claim protect against a challenge by the United States and other claimants only after the discovery of a valuable mineral deposit. The two types of mining claims are lode and placer. In addition, mill sites and tunnel sites may be located to provide support facilities for lode and placer mining.

Mitigation: Mitigation includes: (a) Avoiding the impacts altogether by not taking an action or parts of an action, (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation, (c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment, (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action, (e) Compensating for the impact by replacing or providing substitute resources or environments (40 CFR §1508.20).

N

National Pollutant Discharge Elimination System (NPDES): The NPDES permit program has been delegated in California to the State Water Resources Control Board. These sections of the CWA require that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the United States must obtain a state certification that the discharge complies with other provisions of the Clean Water Act.

National Register of Historic Places: The official list, established by the National Historic Preservation Act, of the Nation's cultural resources worthy of preservation. The National Register lists archeological, historic, and architectural properties (i.e. districts, sites, buildings, structures, and objects) nominated for their local, state, or national significance by state and federal agencies and approved by the National Register Staff. The National Park Service maintains the National Register.

Native American: Indigenous peoples of the western hemisphere.

Nitric Oxide (NO): A colorless toxic gas formed primarily by combustion processes that oxidize atmospheric nitrogen gas or nitrogen compounds found in the fuel. Nitric oxide is a precursor of ozone, nitrogen dioxide, numerous types of photochemically generated nitrate particles (including PAN), and atmospheric nitrous and nitric acids. Most nitric oxide formed by combustion processes is converted into nitrogen dioxide by subsequent oxidation in the atmosphere over a period that may range from several hours to a few days.

Nitrogen Dioxide (NO_2): A toxic reddish gas formed by oxidation of nitric oxide. Nitrogen dioxide is a strong respiratory and eye irritant. Most nitric oxide formed by combustion processes is converted into nitrogen dioxide by subsequent oxidation in the atmosphere. Nitrogen dioxide is a criteria pollutant in its own right, and is a precursor of ozone, numerous types of photochemically generated nitrate particles (including PAN), and atmospheric nitrous and nitric acids.

Nitrogen Oxides (NO_x): A group term meaning the combination of nitric oxide and nitrogen dioxide; other trace oxides of nitrogen may also be included in instrument-based NOx measurements. Nitrogen oxides are a precursor of ozone, photochemically generated nitrate particles (including PAN), and atmospheric nitrous and nitric acids.

Non-native Species: A plant species that has been introduced, either intentionally or not, to a new geographical area. Non-native species can be, but are not necessarily invasive. See also Invasive Species.

Noxious Weed: According to the Federal Noxious Weed Act (PL 93-629), a weed that causes disease or has other adverse effects on man or his environment and therefore is detrimental to the agricultural and commerce of the United States and to the public health.

Nonattainment Area: An area that does not meet a federal or state ambient air quality standard. Federal agency actions occurring in a federal nonattainment area are subject to Clean Air Act conformity review requirements.

O

Off-Highway Vehicle (OHV): A vehicle operated exclusively off public roads and highways on lands that are open and accessible to the public, and includes racing motorcycles, trail bikes, mini bikes, dune buggies, all-terrain vehicles, jeeps, and snowmobiles.

Organic Compounds: Compounds of carbon containing hydrogen and possibly other elements (such as oxygen, sulfur, or nitrogen). Major subgroups of organic compounds include hydrocarbons, alcohols, aldehydes, carboxylic acids, esters, ethers, and ketones. Organic compounds do not include crystalline or amorphous forms of elemental carbon (graphite, diamond, carbon black, etc.), the simple oxides of carbon (carbon monoxide and carbon dioxide), metallic carbides, or metallic carbonates.

Overdraft condition: A condition in which the total volume of water being extracted from the groundwater basin would be greater than the total recharge provided to the basin.

Ozone (O_3): A compound consisting of three oxygen atoms. Ozone is a major constituent of photochemical smog that is formed primarily through chemical reactions in the atmosphere involving reactive organic compounds, nitrogen oxides, and ultraviolet light. Ozone is a toxic chemical that damages various types of plant and animal tissues and which causes chemical oxidation damage to various materials. Ozone is a respiratory irritant, and appears to increase susceptibility to respiratory infections. A natural layer of ozone in the upper atmosphere absorbs high energy ultraviolet radiation, reducing the intensity and spectrum of ultraviolet light that reaches the earth's surface.

P

Paleontological Resources (Fossils): The physical remains of plants and animals preserved in soils and sedimentary rock formations. Paleontological resources are for understanding past environments, environmental change, and the evolution of life.

Paleontology: A science dealing with the life forms of past geological periods as known from fossil remains.

Paleozoic Era: An era of geologic time (600 million to 280 million years ago) between the Late Precambrian and the Mesozoic eras and comprising the Cambrian, Ordovician, Silurian, Devonian, Missippian, Pennsylvanian, and Permian periods.

Particulate Matter: Solid or liquid material having size, shape, and density characteristics that allow the material to remain suspended in the atmosphere for more than a few minutes. Particulate matter can be characterized by chemical characteristics, physical form, or aerodynamic properties. Categories based on aerodynamic properties are commonly described as being size categories, although physical size is not used to define the categories. Many components of suspended particulate matter are respiratory irritants. Some components (such as crystalline or fibrous minerals) are primarily physical irritants. Other components are chemical irritants (such as sulfates, nitrates, and various organic chemicals). Suspended particulate matter also can contain compounds (such as heavy metals and various organic compounds) that are systemic toxins or necrotic agents. Suspended particulate matter or compounds adsorbed on the surface of particles can also be carcinogenic or mutagenic chemicals. See PM10 and PM2.5.

Peak Ground Acceleration (PGA): A common measure of ground motion during an earthquake. The PGA for a given component of motion is the largest value of horizontal acceleration obtained from a seismograph. PGA is expressed as the percentage of the acceleration due to gravity (g), which is approximately 980 centimeters per second squared. Unlike measures of magnitude, which provide a single measure of earthquake energy, PGA varies from place to place, and is dependent on the distance from the epicenter and the character of the underlying geology (e.g. hard bedrock, soft sediments, or artificial fills).

pH (parts hydrogen): a measure of the acidity or basicity of a water-based solution. Pure water is considered neutral with a pH of 7, while solutions with a pH less than 7 are said to be acidic and solutions with a pH greater than 7 are basic or alkaline.

Physiographic Province: An extensive portion of the landscape normally encompassing many hundreds of square miles, which portrays similar qualities of soil, rock, slope, and vegetation of the same geomorphic origin (Fenneman 1946; Sahrhaftig 1975).

Pleistocene (Ice Age): An epoch in the Quarternary period of geologic history lasting from 1.8 million to 10,000 years ago. The Pleistocene was an epoch of multiple glaciation, during which continental glaciers covered nearly one fifth of the earth's land.

Pliocene: The Pliocene Epoch is the period in the geologic timescale that extends from 5.332 million to 2.588 million years before present.

PM2.5 (fine particulate matter): A fractional sampling of suspended particulate matter that approximates the extent to which suspended particles with aerodynamic equivalent diameters smaller than 6 microns penetrate into the alveoli in the lungs. In a regulatory context, PM2.5 is any suspended particulate matter collected by a certified sampling device having a 50 percent collection efficiency for particles with aerodynamic equivalent diameters of 2.0 to 2.5 microns and an maximum aerodynamic diameter collection limit less than 6 microns. Collection efficiencies are greater than 50 percent for particles with aerodynamic diameters smaller than 2.5 microns and less than 50 percent for particles with aerodynamic diameters larger than 2.5 microns.

PM10 (inhalable particulate matter): A fractional sampling of suspended particulate matter that approximates the extent to which suspended particles with aerodynamic equivalent diameters smaller than 50 microns penetrate to the lower respiratory tract (tracheo-bronchial airways and alveoli in the lungs). In a regulatory context, PM10 is any suspended particulate matter collected by a certified sampling device having a 50 percent collection efficiency for particles with aerodynamic equivalent diameters of 9.5 to 10.5 microns and an maximum aerodynamic diameter collection limit less than 50 microns. Collection efficiencies are greater than 50 percent for particles with aerodynamic diameters smaller than 10 microns and less than 50 percent for particles with aerodynamic diameters larger than 10 microns.

Potential Fossil Yield Classification (PFYC) system: A system in which geologic units are classified based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts, with a higher class number indicating a higher potential. This classification is applied to the geologic formation, member, or other distinguishable unit, preferably at the most detailed mappable level.

Power Purchase Agreement (PPA): A contract between two parties, one who generates and intends to sell electricity, and one who is looking to purchase electricity, defining the commercial terms for the sale of electricity between the two parties.

Precursor: A compound or category of pollutant that undergoes chemical reactions in the atmosphere to produce or catalyze the production of another type of air pollutant.

Prehistoric: Refers to the period wherein American Indian cultural activities took place before written records and not yet influenced by contact with nonnative culture(s).

Q

Quaternary Age: The most recent of the three periods of the Cenozoic Era. In the geologic time scale of the International Commission on Stratigraphy, it follows the Tertiary Period, spanning time from approximately 2.6 ± 0.005 million years ago to the present. The Quaternary includes two geologic epochs: the Pleistocene and the Holocene.

R

Record of Decision: A formal decision document issued by a federal agency to document a decision made following the release of a Final Environmental Impact Statement.

Rehabilitation: A management alternative and/or practice which restores landscapes to a desired scenic quality.

Reverse Osmosis (RO) System: A water purification technology that uses a semipermeable membrane to remove many types of molecules and ions from solutions (e.g., to remove dissolved solids from groundwater).

Riparian: Situated on or pertaining to the bank of a river, stream, or other body of water. Normally describes plants of all types that grow rooted in the water table or sub-irrigation zone of streams, ponds, and springs.

Road: A linear route declared a road by the owner, managed for use by low-clearance vehicles having four or more wheels, and maintained for regular and continuous use.

Route: "Routes" represents a group or set of roads, trails, and primitive roads that represents less than 100 percent of the BLM transportation system. Generically, components of the transportation system are described as routes.

S

Saleable Minerals: Common variety minerals on the public lands, such as sand and gravel, which are used mainly for construction. See also Mineral Material Disposal.

Scale: The proportionate size relationship between an object and the surroundings in which the object is placed.

Scenery: The aggregate of features that give character to a landscape.

Scenic Area: An area whose landscape character exhibits a high degree of variety and harmony among the basic elements which results in a pleasant landscape to view.

Scenic Quality: The relative worth of a landscape from a visual perception point of view.

Scenic Quality Ratings: The relative scenic quality (A, B, or C) assigned a landscape by applying the scenic quality evaluation key factors; scenic quality A being the highest rating, B a moderate rating, and C the lowest rating.

Scenic Values: See Scenic Quality and Scenic Quality Ratings.

Secretary of the Interior: The U.S. Department of the Interior is in charge of the nation's internal affairs. The Secretary position is the head of this agency and serves on the President's cabinet.

Sedimentary Rocks: Rocks, such as sandstone, limestone, and shale, that are formed from sediments or transported fragments deposited in water.

Sensitivity Levels: Measures (e.g., high, medium, and low) of public concern for scenic quality.

Settlement: A process by which soils decrease in volume. Earthquake induced settlement results when relatively unconsolidated granular materials experience vibration associated with seismic events. Local settlement can occur when areas containing compressible soils are subject to foundation or fill loads.

Special-Status Species: Federal- or state-listed species, candidate or proposed species for listing, or species otherwise considered sensitive or threatened by state and federal agencies.

State Historic Preservation Office (SHPO): The official within and authorized by each state at the request of the Secretary of the Interior to act as liaison for the National Historic Preservation Act.

State Implementation Plan (SIP): Legally enforceable plans adopted by states and their subdivisions and submitted to EPA for approval, which identify the actions and programs to be undertaken by the State and its subdivisions to achieve and maintain national ambient air quality standards in a time frame mandated by the Clean Air Act.

State Water Resources Control Board (SWRCB): Created in 1967, joint authority of water allocation and water quality protection enables the SWRCB to provide comprehensive protection for California's waters. The mission of the nine Regional Water Quality Control Boards is to develop and enforce water quality objectives and implementation plans that will best protect the State's waters, recognizing local differences in climate, topography, geology, and hydrology.

Stratigraphy: The order and relative position of strata (a layer of rock in the ground) and their relationship to the geological time scale.

Subsurface: Of or pertaining to rock or mineral deposits which generally are found below the ground surface.

Sulfur Dioxide (SO_2): A pungent, colorless, and toxic oxide of sulfur formed primarily by the combustion of fossil fuels. It is a respiratory irritant, especially for asthmatics. It is a criteria pollutant in its own right, and a precursor of sulfate particles and atmospheric sulfuric acid.

T

Tertiary: The Tertiary Period marks the beginning of the Cenozoic Era. It began 65 million years ago and lasted more than 63 million years, until 1.8 million years ago. The Tertiary is made up of 5 epochs: the Paleocene Epoch, the Eocene Epoch, the Oligocene Epoch, the Miocene Epoch, and the Pliocene Epoch.

Texture: The visual manifestations of the interplay of light and shadow created by the variations in the surface of an object or landscape.

Total Dissolved Solids: A measure of the combined content of all inorganic and organic substances contained in a liquid that are smaller than two micrometers in diameter (e.g., sodium).

Toxic: Poisonous; exerting an adverse physiological effect on the normal functioning of an organism's tissues or organs through chemical or biochemical mechanisms following physical contact or absorption.

Traditional Cultural Properties: Areas associated with the cultural practices or beliefs of a living community. These sites are rooted in the community's history and are important in maintaining cultural identity.

Trail: A linear route managed for human-powered, stock, or off-highway vehicle forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

U

Unique Archaeological Resource: This term is used for the purposes of CEQA and is defined in CEQA Guidelines Section 15064.5 as an archaeological artifact, object, or site, about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it either contains information needed to answer important scientific research questions; has a special and particular quality such as being the oldest of its type or the best available example of its type; or, is directly associated with a scientifically recognized important prehistoric or historic event or person.

V

Vandalism (Cultural Resource): Malicious damage or the unauthorized collecting, excavating, or defacing of cultural resources. §6 of the Archaeological Resources Protection Act states that "no person may excavate,

remove, damage, or otherwise alter or deface any archaeological resource located on public lands or Indian lands…unless such activity is pursuant to a permit issued under section 4 of this Act."

Variables: Factors influencing visual perception including distance, angle of observation, time, size or scale, season of the year, light, and atmospheric conditions.

Variety: The state or quality of being varied and having the absence of monotony or sameness.

Viewshed: The landscape that can be directly seen under favorable atmospheric conditions, from a viewpoint or along a transportation corridor. Protection, rehabilitation, or enhancement is desirable and possible.

Visual Contrast: See Contrast.

Visual Quality: See Scenic Quality.

Visual Resources: The visible physical features on a landscape (e.g., land, water, vegetation, animals, structures, and other features).

Visual Resource Management Classes: Categories assigned to public lands based on scenic quality, sensitivity level, and distance zones. There are four classes. Each class has an objective which prescribes the amount of change allowed in the characteristic landscape.

Visual Resource Management (VRM): The inventory and planning actions taken to identify visual values and to establish objectives for managing those values; and the management actions taken to achieve the visual management objectives.

Visual Values: See Scenic Quality.

W

Wetlands: Permanently wet or intermittently water-covered areas, such as swamps, marshes, bogs, potholes, swales, and glades.

Wilderness Area: An area formally designated by Congress as part of the National Wilderness Preservation System as defined in the Wilderness Act of 1964 (78 Stat. 891), Section 2(c).

Wilderness Study Area: A roadless area or island that has been inventoried and found to have wilderness characteristics as described in Section 603 of FLPMA and Section 2(c) of the Wilderness Act of 1964 (78 Stat. 891).

D.1 Notice of Intent

governance funding agreement may include, but are not limited to: Construction, farming, concessions, maintenance, biological program efforts, habitat management, fire management, and implementation of comprehensive conservation planning.

Locations of Refuges and Hatcheries With Close Proximity to Self-Governance Tribes

The Service developed the list below based on the proximity of identified self-governance Tribes to Service facilities that have components that may be suitable for administering through a self-governance funding agreement.

1. Alaska National Wildlife Refuges—Alaska
2. Alchesay National Fish Hatchery—Arizona
3. Humboldt Bay National Wildlife Refuge—California
4. Kootenai National Wildlife Refuge—Idaho
5. Agassiz National Wildlife Refuge—Minnesota
6. Mille Lacs National Wildlife Refuge—Minnesota
7. Rice Lake National Wildlife Refuge—Minnesota
8. National Bison Range—Montana
9. Ninepipe National Wildlife Refuge—Montana
10. Pablo National Wildlife Refuge—Montana
11. Sequoyah National Wildlife Refuge—Oklahoma
12. Tishomingo National Wildlife Refute—Oklahoma
13. Bandon Marsh National Wildlife Refuge—Washington
14. Dungeness National Wildlife Refuge—Washington
15. Makah National Fish Hatchery—Washington
16. Nisqually National Wildlife Refuge—Washington
17. Quinault National Fish Hatchery—Washington
18. San Juan Islands National Wildlife Refuge—Washington
19. Tamarac National Wildlife Refuge—Wisconsin

For questions regarding self-governance, contact Scott Aikin, Fish and Wildlife Service, National Native American Programs Coordinator, 1211 SE Cardinal Court, Suite 100, Vancouver, Washington 98683, telephone (360) 604–2531 or fax (360) 604–2505.

F. Eligible U.S. Geological Survey (USGS) Programs

The mission of the USGS is to collect, analyze, and provide information on biology, geology, hydrology, and geography that contributes to the wise management of the Nation's natural resources and to the health, safety, and well-being of the American people. This information is usually publicly available and includes maps, data bases, and descriptions and analyses of the water, plants, animals, energy, and mineral resources, land surface, underlying geologic structure, and dynamic processes of the earth. The USGS does not manage lands or resources. Self-governance Tribes may potentially assist the USGS in the data acquisition and analysis components of its activities.

For questions regarding self-governance, contact Monique Fordham, Esq., National Tribal Liaison, U.S. Geological Survey, 12201 Sunrise Valley Drive, Reston, Virginia 20192, telephone (703) 648–4437 or fax (703) 648–6683.

G. Eligible Office of the Special Trustee for American Indians (OST) Programs

The Department has responsibility for what may be the largest land trust in the world, approximately 56 million acres. OST oversees the management of Indian trust assets, including income generated from leasing and other commercial activities on Indian trust lands, by maintaining, investing and disbursing Indian trust financial assets, and reporting on these transactions. The mission of the OST is to serve Indian communities by fulfilling Indian fiduciary trust responsibilities. This is to be accomplished through the implementation of a Comprehensive Trust Management Plan (CTM) that is designed to improve trust beneficiary services, ownership information, management of trust fund assets, and self-governance activities.

A Tribe operating under self-governance may include the following programs, services, functions, and activities or portions thereof in a funding agreement:

1. Beneficiary Processes Program (Individual Indian Money Accounting Technical Functions).

2. Appraisal Services Program. Tribes/consortia that currently perform these programs under a self-governance funding agreement with the Office of Self-Governance (OSG) may negotiate a separate memorandum of understanding (MOU) with OST that outlines the roles and responsibilities for management of these programs.

The MOU between the Tribe/consortium and OST outlines the roles and responsibilities for the performance of the OST program by the Tribe/consortium. If those roles and responsibilities are already fully articulated in the existing funding agreement with the OSG, an MOU is not necessary. To the extent that the parties desire specific program standards, an MOU will be negotiated between the Tribe/consortium and OST, which will be binding on both parties and attached and incorporated into the OSG funding agreement.

If a Tribe/consortium decides to assume the operation of an OST program, the new funding for performing that program will come from OST program dollars. A Tribe's newly-assumed operation of the OST program(s) will be reflected in the Tribe's OSG funding agreement.

For questions regarding self-governance, contact Lee Frazier, Program Analyst, Office of External Affairs, Office of the Special Trustee for American Indians (MS 5140—MIB), 1849 C Street NW, Washington, DC 20240–0001, phone: (202) 208–7587, fax: (202) 208–7545.

IV. Programmatic Targets

The programmatic target for Fiscal Year 2018 provides that, upon request of a self-governance Tribe, each non-BIA bureau will negotiate funding agreements for its eligible programs beyond those already negotiated.

V. Public Disclosure

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Dated: February 15, 2018.

Ryan K. Zinke,

Secretary.

BILLING CODE 4337–15–P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[LLCAD06000 L51010000.ER0000 17XL5017AP LVRWB17B5120 CACA 051967]

Notice of Intent To Prepare a Joint Environmental Impact Statement/Environmental Impact Report and Possible Land Use Plan Amendment for the Proposed RE Crimson Solar Project, Riverside County, CA

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of intent.

SUMMARY: In compliance with the National Environmental Policy Act of 1969, as amended (NEPA), and the Federal Land Policy and Management Act of 1976, as amended (FLPMA), the Bureau of Land Management (BLM)

Palm Springs-South Coast Field Office, Palm Springs, CA, intends to prepare a joint Environmental Impact Statement (EIS)/Environmental Impact Report (EIR), including a potential amendment to the California Desert Conservation Area (CDCA) Plan, and by this Notice is announcing the beginning of the scoping process to solicit public comments and identify issues.

DATES: This Notice initiates the public scoping process for the EIS/EIR and possible plan amendments. Comments on issues may be submitted in writing until April 9, 2018. The date(s) and location(s) of any scoping meetings will be announced at least 15 days in advance through local media, newspapers, and the BLM website at: *https://eplanning.blm.gov/.*

To be included in the Draft EIS/EIR, all comments must be received prior to the close of the 30-day scoping period or 15 days after the last public meeting, whichever is later. The BLM will provide additional opportunities for public participation upon publication of the Draft EIS/EIR.

ADDRESSES: The public may submit comments related to the RE Crimson Solar Project by any of the following methods:

- *Website: https://eplanning.blm.gov/.*
- *Email: blm_ca_crimsonsolar@blm.gov.*
- *Fax:* (541) 618–2400, ATTN: Miriam Liberatore, project manager, RE Crimson Solar.
- *Mail:* ATTN: Miriam Liberatore, project manager, RE Crimson Solar, Bureau of Land Management, 3040 Biddle Road, Medford, OR 97504.

Documents pertinent to this proposal may be examined at the BLM Palm Springs-South Coast Field Office located at 1201 Bird Center Drive, Palm Springs, CA 92262.

FOR FURTHER INFORMATION CONTACT: Miriam Liberatore, project manager, telephone (541) 618–2412; address Bureau of Land Management, 3040 Biddle Road, Medford, OR 97504; email: *mliberat@blm.gov.* Contact Ms. Liberatore to be added to the mailing list. Persons who use a telecommunications device for the deaf (TDD) may call the Federal Relay Service at (800) 877–8339, to contact the above individual during normal business hours. The Service is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. Telephone replies will be returned during normal business hours.

SUPPLEMENTARY INFORMATION: Sonoran West Solar Holdings, LLC, a wholly owned subsidiary of Recurrent Energy LLC, has requested a right-of-way (ROW) authorization to construct, operate, maintain, and decommission a maximum 350 megawatt solar photovoltaic facility and necessary ancillary facilities, including battery storage, project substations, access roads, operations and maintenance buildings, and lay down areas.

The Project site consists of about 2,700-acres of BLM-administered land within the Riverside East Solar Energy Zone (SEZ). The Desert Renewable Energy Conservation Plan (DRECP) Land Use Plan Amendment also designated the area as a Development Focus Area (DFA).

This document provides notice that the BLM Palm Springs-South Coast Field Office and the California Department of Fish and Wildlife intend to jointly prepare an EIS/EIR, which may include a CDCA Plan Amendment, for the Project. It also announces the beginning of the scoping process for this effort and seeks public input on environmental issues and potential planning criteria relevant to the Project and any potential plan amendments. The public scoping process guides the planning process and determines the relevant issues that will influence the scope of the environmental analysis, including alternatives and environmental consequences.

Preliminary issues for the project have been identified by BLM personnel; Federal, State, and local agencies; and other stakeholders. The issues include: Air quality and greenhouse gas emissions; biological resources, including special status wildlife and vegetation species; cultural resources; geology and soils; hazards and hazardous materials; hydrology and water quality; lands and realty; mineral resources; noise; paleontological resources; recreation; socioeconomics and environmental justice; special designations; transportation and travel management; visual resources; wildland fire ecology; and areas with high potential for renewable energy development.

Written comments may be submitted to the BLM at a scoping meeting, or via one of the methods listed in the addresses section above. Input must be received by the close of the 30-day scoping period or within 15 days after the last public meeting, whichever is later.

By this Notice, the BLM is complying with requirements in 43 CFR 1610.2(c) to notify the public of potential amendments to the CDCA Plan, as amended, predicated on the findings in the EIS/EIR.

If one or more land use plan amendments are necessary, the BLM will integrate the land use planning process with the NEPA process for the Project. A preliminary list of the potential planning criteria that will be used to help guide and define the scope of the plan amendment includes:

1. The plan amendments will be completed in compliance with FLPMA, NEPA, and all other relevant Federal laws, executive orders, and BLM policies;

2. Existing valid plan decisions will not be changed and any new plan decisions will not conflict with existing plan decisions; and

3. The plan amendment(s) will recognize valid existing rights.

The public may submit comments to the BLM on issues and planning criteria in writing at any public scoping meeting, or by using one of the methods listed in the **ADDRESSES** section above.

The BLM will use and coordinate the NEPA scoping process to help fulfill the public involvement process under the National Historic Preservation Act (NHPA) (54 U.S.C. 306108 as provided in 36 CFR 800.2(d)(3)). The information about historic and cultural resources within the area potentially affected by the proposed action will assist the BLM in identifying and evaluating impacts to such resources.

The BLM will consult with Indian tribes on a government-to-government basis in accordance with Executive Order 13175 and other policies. Tribal concerns, including impacts on Indian trust assets and potential impacts to cultural resources, will be given due consideration. Federal, State, and local agencies, along with tribes and other stakeholders that may be interested in or affected by the proposed action that the BLM is evaluating are invited to participate in the scoping process and, if eligible, may request or be requested by the BLM to participate in the development of the environmental analysis as a cooperating agency.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so. The minutes and list of attendees for each scoping meeting will be available to the public and open for 30 days after the meeting to any participant who wishes to clarify the views he or she expressed. With respect to the

potential land use plan amendment, the BLM will evaluate identified issues to be addressed in the plan amendment, and will place them into one of three categories:

1. Issues to be resolved in the plan amendment;

2. Issues to be resolved through policy or administrative action; or

3. Issues beyond the scope of this plan amendment.

The BLM will provide an explanation in the Draft EIS/EIR as to why an issue was placed in category two or three. The public is also encouraged to help identify any management questions and concerns that should be addressed in the EIS/EIR and potential land use plan amendments. The BLM will work collaboratively with interested parties to identify the management decisions that are best suited to local, regional, and national needs and concerns.

The BLM will use an interdisciplinary approach to develop the EIS and potential land use plan amendments in order to consider the variety of resource issues and concerns identified. Specialists with expertise in the following disciplines will be involved in the planning process: Air, minerals and geology, outdoor recreation, archaeology, paleontology, wildlife and botany, lands and realty, hydrology, soils, sociology, and economics.

Authority: 40 CFR 1501.7 and 43 CFR 1610.2.

Danielle Chi,

BLM California Deputy State Director.

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[17XL1109AF LLUTG01100 L13100000.EJ0000]

Notice of Availability of a Draft Environmental Impact Statement for the Greater Chapita Wells Natural Gas Infill Project, Uintah County, Utah

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of availability.

SUMMARY: In accordance with the National Environmental Policy Act of 1969, as amended, the Bureau of Land Management (BLM) has prepared a Draft Environmental Impact Statement (EIS) for the Greater Chapita Wells Natural Gas Infill Project and by this notice is announcing the opening of the comment period.

DATES: To ensure comments will be considered, the BLM must receive written comments on the Greater Chapita Wells Draft EIS within 45 days following the date the Environmental Protection Agency publishes its NOA in the **Federal Register**. The BLM will announce future meetings or hearings and any other public involvement activities at least 15 days in advance through public notices, media releases, and/or mailings.

ADDRESSES: You may submit comments related to the Greater Chapita Wells project by any of the following methods:

- *Website: http://go.usa.gov/csKAz.*
- *Email: UT_Vernal_Comments@blm.gov.*
- *Fax:* 435–781–4410.
- *Mail:* Bureau of Land Management, Vernal Field Office, 170 South 500 East, Vernal, Utah 84078.

Copies of the Greater Chapita Wells Draft EIS are available in the Vernal Field Office at the above address and website.

FOR FURTHER INFORMATION CONTACT: Stephanie Howard, Project Manager, 435–781–4400; BLM Vernal Field Office, 170 South 500 East, Vernal, UT 84078; *showard@blm.gov.* Persons who use a telecommunications device for the deaf (TDD) may call the Federal Relay Service (FRS) at 1–800–877–8339 to contact the above individual during normal business hours. FRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. You will receive a reply during normal business hours.

SUPPLEMENTARY INFORMATION: The BLM published in the September 9, 2009, **Federal Register** a Notice of Intent to prepare an EIS (74 FR 46458). The Greater Chapita EIS Project Area encompasses approximately 43,109 acres located in Township 8 South, Ranges 22 through 24 East; Township 9 South, Ranges 22 and 23 East; and Township 10 South, Range 23 East, Salt Lake Base and Meridian, about 25 miles south of Vernal, Utah. Of the 43,109 acres within the project area, about 76 percent is Federal surface administered by the BLM; 15 percent is tribal trust surface; 5 percent is State of Utah surface administered by the Utah Trust Lands Administration; and 4 percent is private surface. The entire project is within the exterior boundary of the Uintah and Ouray Reservation (Uncompahgre Indian Country).

Oil and gas drilling has been ongoing within the Chapita project area since 1952. As of March 2014, the project area contained 1,247 active gas wells on 960 well pads, approximately 257 miles of roads, and approximately 268 miles of pipelines. Total existing disturbance in the project area is approximately 3,975 acres, with approximately 1,000 acres under interim reclamation.

The Draft EIS analyzes a proposal by EOG Resources Inc (EOG) to further develop natural gas resources on their Federal leases in the project area. EOG's proposal includes drilling up to 2,808 new wells and constructing associated ancillary transportation, transmission, and water disposal facilities within the project area. The proposed life of the project is 55 years, with drilling and development activities to occur within the first 15 years. The new gas wells would be drilled to the Green River, Wasatch, Mesaverde Group (including the Blackhawk), Mancos, and Dakota formations at depths of 6,000 to 15,000 feet.

The Draft EIS describes and analyzes in detail the impacts of the No Action Alternative, and three action alternatives, including EOG's Proposed Action. Seven additional alternatives were considered, but eliminated from detailed analysis. The alternatives considered in detail include a landscape-scale mitigation plan that incorporates applicant-committed measures, design features (including best management practices), and the mitigation hierarchy, including compensatory mitigation as applicable to minimize or eliminate impacts to the resources of concern. In particular, the Draft EIS action alternatives contain an applicant-committed ozone management strategy designed to provide a reasonable assurance that project implementation would not contribute to the ongoing ozone situation in the Uinta Basin. This strategy contains five approaches to managing project emissions, including: Applicant-committed emission reduction measures; audio, visual, olfactory and infrared monitoring; a commitment to no-net increase of volatile organic compound emissions to be tracked via an emissions balance sheet; ozone training for personnel; and an ozone event action plan. The following is a summary of the main components of the various alternatives:

1. *No Action Alternative*—The proposed natural gas development on BLM lands and leases as described in the Proposed Action would not be implemented. However, under this alternative, natural gas exploration and development is assumed to continue on Federal, State, and private lands under previous authorizations. Up to 462 new gas wells would be drilled from 425 new well pads and 37 expanded well pads. This alternative also includes expansion of an existing compressor station, construction of 18 liquids gathering system (LGS) facilities,

EDMUND G. BROWN JR., Governor
CHARLTON H. BONHAM, Director

Notice of Preparation of a Joint Draft Environmental Impact Statement/Environmental Impact Report and Notice of Public Scoping Meetings

Date: March 8, 2018

To: Responsible/Trustee Agencies and Interested Parties

From: California Department of Fish and Wildlife

Subject: Notice of Preparation (NOP) of a Joint Draft Environmental Impact Statement/Environmental Impact Report for the RE Crimson Solar Project and Notice of Public Scoping Meetings

NOP Public Review Period: March 9 to April 23, 2018

Public Scoping Meetings:

Date: April 11, 2018 (Wednesday) **Location:** University of California, Riverside, Palm Desert, Room B117, 75080 Frank Sinatra Drive, Palm Desert, CA 92211 **Time**: 5:00 to 8:00 p.m.	**Date:** April 12, 2018 (Thursday) **Location:** City of Blythe Multipurpose Room, City Hall, 235 North Broadway, Blythe, CA 92225 **Time:** 12:00 to 3:00 p.m.

A. Introduction

In accordance with Section 15063 of the California Environmental Quality Act (CEQA) Guidelines, the California Department of Fish and Wildlife (CDFW), as the CEQA lead agency, will prepare a Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the RE Crimson Solar Project (proposed project) jointly with the U.S. Department of the Interior Bureau of Land Management (BLM). The project applicant, Recurrent Energy (RE), will need to obtain an Incidental Take Permit (ITP) and Lake and Streambed Agreement (LSAA) from the California Department of Fish and Wildlife and has also filed a Right-of-Way (ROW) Grant application with BLM. CDFW's need to contemplate a ITP and LSAA triggers the need to comply with CEQA and BLM's need to contemplate a right-of-way grant application triggers the need to comply with the National Environmental Policy Act (NEPA). CDFW and BLM have agreed to prepare a joint Draft EIS/EIR for the RE Crimson Solar Project. Therefore, CDFW, as the lead agency under California law, and BLM, as the federal lead agency, will prepare a Draft and Final EIR/EIS to comply with CEQA and NEPA.

As required by CEQA, this Notice of Preparation (NOP) is being sent to the Office of Planning and Research, responsible and trustee agencies and interested members of the public who submitted a request for such notices. The purpose of the NOP is to inform recipients that CDFW is beginning preparation of an EIS/EIR for the proposed project and to solicit comments concerning the scope and content of the environmental information that is germane to your agency's statutory responsibilities in connection with the proposed project. Information that will be most useful at this time would be descriptions of the significant environmental issues and reasonable alternatives and mitigation measures you would like to see explored in the Draft EIS/EIR.

As required by NEPA, the BLM will publish a Notice of Intent (NOI) in the Federal Register for preparation of a joint EIR/EIS for the RE Crimson Solar Project. Similar to this NOP, the intent of the NOI is to initiate the public scoping for the EIR/EIS, provide information about the proposed project, and also serve as an invitation for other federal agencies granted cooperating agency status to provide comments on the scope and content of the EIR/EIS.

This NOP includes background information on the project and the project location (Section B), a description of the proposed project (Section C), a summary of potential project impacts (Section D), time and location of the public scoping meetings (Section E), information on how to provide comments to CDFW (Section F), and where documents are available for public review (Section G).

In accordance with CEQA Guidelines Section 15082(b), there will be a 45-day comment period for this NOP, beginning on March 9, 2018, and ending on April 23, 2018. CDFW welcomes agency and public input during the public review period. In the event that no response or well-justified request for additional time is received from any responsible, federal, or trustee agency by the end of the review period, CDFW may presume that such agencies have no response.

B. Background and Project Location

B.1 Background

Sonoran West Solar Holdings LLC (Applicant), a wholly owned subsidiary of Recurrent Energy LLC, proposes to construct, operate, and decommission the proposed 350 megawatt (MW) utility-scale solar photovoltaic (PV) and would include up to 350 MW energy storage on approximately 2,500 acres of public lands administered by the BLM within the California Desert Conservation Area (CDCA) planning area. The proposed project is also located within the Riverside East Solar Energy Zone (SEZ) and within a Desert Renewable Energy Conservation Plan (DRECP) Development Focus Area (DFA).

The proposed project site was formerly identified for development of the Sonoran West Solar Energy Generating Station as proposed by BrightSource Energy in 2009. The former Sonoran

West project consisted of a 540-megawatt (MW) dual-turbine power tower project on approximately 7,600 acres of a combination of BLM-administered and privately owned land. The current proposed project represents a substantial reduction in land use requirements and associated impacts.

B.2 Project Location

The proposed project site is located in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, north of Mule Mountain, and south of Interstate 10 (I-10), including portions of Sections 1, 2, 11, 12, 13, 24, and 25 within Township 7 South, Range 20 East; and portions of Sections 6, 7, 17, and 18 within Township 7 South, Range 21 East (Figure 1). The proposed project site consists of approximately 2,500 acres of BLM-administered land within the Riverside East SEZ and within a DRECP DFA. The proposed project is not sited within the adjacent Section 368 Federal Energy Corridor pursuant to the Westwide Energy Corridor Final Programmatic EIS, except for a short gen-tie line that would interconnect the utility-scale solar PV facility to the Colorado River Substation.

The proposed project site is situated at the eastern edge of the Chuckwalla Hydrologic Area. The project area supports a broad alluvial fan that includes many braided washes and channels that converge into a primary channel flowing into an intra-state playa lake northwest of the proposed project site.

The proposed project site is surrounded primarily by BLM-managed lands with some private parcels also located in the vicinity. The proposed project site is located at the northern foot of the Mule Mountain Area of Critical Environmental Concern, which is an important cultural resource for local Native American tribes. Southern California Edison (SCE) high-voltage transmission lines and the Colorado River Substation (CRS) are located directly north of the proposed project site, and the I-10 freeway is north of and parallel to those facilities. The proposed First Solar Desert Quartzite project site is located to the east of the proposed project site, and the recently approved Blythe Mesa Solar Project is located northeast of the Desert Quartzite site. Designated critical habitat for desert tortoise is located to the west of the proposed project site as is the Chuckwalla Desert Wildlife Management Area and Critical Habitat Unit.

C. Project Description

The proposed project consists of a utility-scale solar PV and energy storage project that would be located on up to approximately 2,500 acres of public lands managed by the BLM within the CDCA planning area. The proposed project would interconnect to the regional electrical grid at the SCE 230-kilovolt (kV) CRS. The project would generate up to 350 MW of renewable energy using PV technology and would include up to 350 MW of integrated energy storage capacity.

The proposed project is comprised of the following components/facilities:

- **Photovoltaic Modules and Support Structures**: the solar facility would include an estimated 2 million solar modules, although the precise module count would depend on the technology ultimately selected at the time of procurement. Module mounting systems that may be installed include either fixed-tilt or tracking technology, depending on the PV modules ultimately selected. Modules would be arranged next to each other in long strings called rows and supported by steel piles.
- **Inverters, Transformers, and Electrical Collection System**: The proposed project would be designed and laid out primarily in 2 MW increments, which would include an inverter equipment area measuring approximately 40 feet by 25 feet. Each 2 MW increment would include an inverter-transformer station constructed on a concrete pad or steel skid and centrally located within the PV arrays.
- **Project Substations and Gen-Tie Line**: Up to four substations would transform voltage from the 34.5 kV electrical collection cables to 230 kV. The area of each substation and associated equipment would be approximately 30,000 square feet and would include power transformers and footings, control buildings, metering stands, microwave towers up to approximately 100 feet in height, and dead-end structures up to approximately 80 feet in height. The project gen-tie would be would be constructed with either monopoles, lattice steel structures, or wooden H-frame poles. A portion of the gen-tie line may be constructed underground to cross under existing transmission lines.
- **Operations and Maintenance Building**: An operations and maintenance (O&M) building would be located near the project substations. The O&M building would be approximately 2,000 square feet (approximately 40 feet by 50 feet by 15 feet at its tallest point) and would accommodate O&M staff.

Other features/components of the proposed facility include a supervisory control and data acquisition system, an optional battery or flywheel storage system capable of storing up to 350 MW of electricity, a meteorological data collection system, and telecommunications facilities. If provided, the storage system would consist of up to 3,000 electrical enclosures measuring approximately 40 feet by 8 feet by 8.5 feet high and installed on concrete foundations.

Access to the project site would be provided from the existing paved Powerline Road to the CRS. The project's on-site roadway system would include a perimeter road, access roads, and internal roads. In the event that the Applicant cannot reach an agreement with the private landowner, two new access road segments along Powerline Road would be constructed in order to avoid two privately owned parcels through which the existing Powerline Road crosses. Multiple points of ingress/egress would be provided to the site and accessed by site personnel via locked gates. Security fencing would be installed along the perimeter of the proposed project site and motion-sensitive, directional security lights would be installed to provide adequate

illumination around the substation areas, each inverter cluster, and at gates. Other security measures including infrared security cameras may be installed.

D. Potential Environmental Effects

The EIS/EIR will evaluate potential environmental effects of the proposed project. The EIS/EIR will identify reasonable alternatives, compare the environmental impacts of the alternatives to those of the proposed project, and propose mitigation to avoid and/or reduce impacts deemed potentially significant.

Potential issues and impacts to the existing environment to be analyzed in the EIS/EIR include the following environmental topics. Note, topic names in parenthesis below is terminology used in NEPA documentation and will appear in the joint EIR/EIS.

- Aesthetics (Visual Resources)
- Air Quality
- Biological Resources
- Cultural and Paleontological Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards/Hazardous Materials, Wildland Fire Ecology
- Hydrology and Water Quality
- Land Use and Planning (Lands and Realty)
- Mineral Resources
- Noise
- Population and Housing (Socioeconomics and Environmental Justice)
- Recreation
- Tribal Cultural Resources
- Transportation and Traffic (Transportation and Public Access)
- Utilities and Public Services

The EIS/EIR will also address the cumulative environmental consequences of the proposed project in combination with other closely related past, present, and reasonably foreseeable probable future projects in the area. This will serve to satisfy CEQA requirements regarding regional cumulative effect concerns. Pursuant to CEQA Guidelines Section 15063(a), CDFW has elected to proceed directly to the preparation of a Draft EIR rather than preparing an Initial Study.

In compliance with CEQA Guidelines Section 15126.6, the EIS/EIR will describe and evaluate the comparative merits of a reasonable range of alternatives to the proposed project. The EIS/EIR will also identity any alternatives that were considered but rejected by the lead agency as infeasible and briefly explain the reasons why. The EIS/EIR will provide an analysis of the No Project Alternative and will also identify the environmentally superior alternative. The alternatives to be analyzed in the EIS/EIR will be developed during the environmental review process and will consider input received during public scoping.

E. Public Scoping Meeting

CDFW and BLM will hold two public scoping meetings to inform interested parties about the proposed project, and to provide agencies and the public with an opportunity to provide written comments on the scope and content of the joint EIS/EIR. The meeting dates, locations, and times are as follows:

Date: April 11, 2018 (Wednesday) **Location:** University of California, Riverside Palm Desert, Room B117, 75080 Frank Sinatra Drive, Palm Desert, CA 92211 **Time**: 5:00 to 8:00 p.m.	**Date:** April 12, 2018 (Thursday) **Location:** City of Blythe Multipurpose Room, City Hall, 235 North Broadway, Blythe, CA 92225 **Time:** 12:00 to 3:00 p.m.

The meeting space is accessible to persons with disabilities. Individuals needing special assistive devices will be accommodated to the best ability of CDFW. For more information, please contact Magdalena Rodriguez via email at magdalena.rodriguez@wildlife.ca.gov or phone at 909.844.2520 at least 1 week before the meeting.

Everyone is encouraged to attend a meeting to express their concerns about the proposed project and to offer suggestions regarding the project as proposed, including alternatives.

F. Providing Comments

At this time, CDFW is soliciting comments on the NOP regarding your views on how the project may affect the environment. This information will be considered when preparing the Draft EIS/EIR's discussion of environmental topics, significant effects, mitigation measures, and alternatives. Because of time limits mandated by state law, comments should be provided no later than 5:00 p.m. on [April 23, 2018 (45-day comment period).

You may submit comments in a variety of ways: (1) by U.S. mail, (2) by electronic mail (email), or (3) by attending a public scoping meeting and submitting written comments at that time. Comments provided by email should include "**RE Crimson Solar Project NOP Scoping Comments**" in the subject line, and the name and physical address of the commenter should be contained in the body of the email.

Please send all comments to:

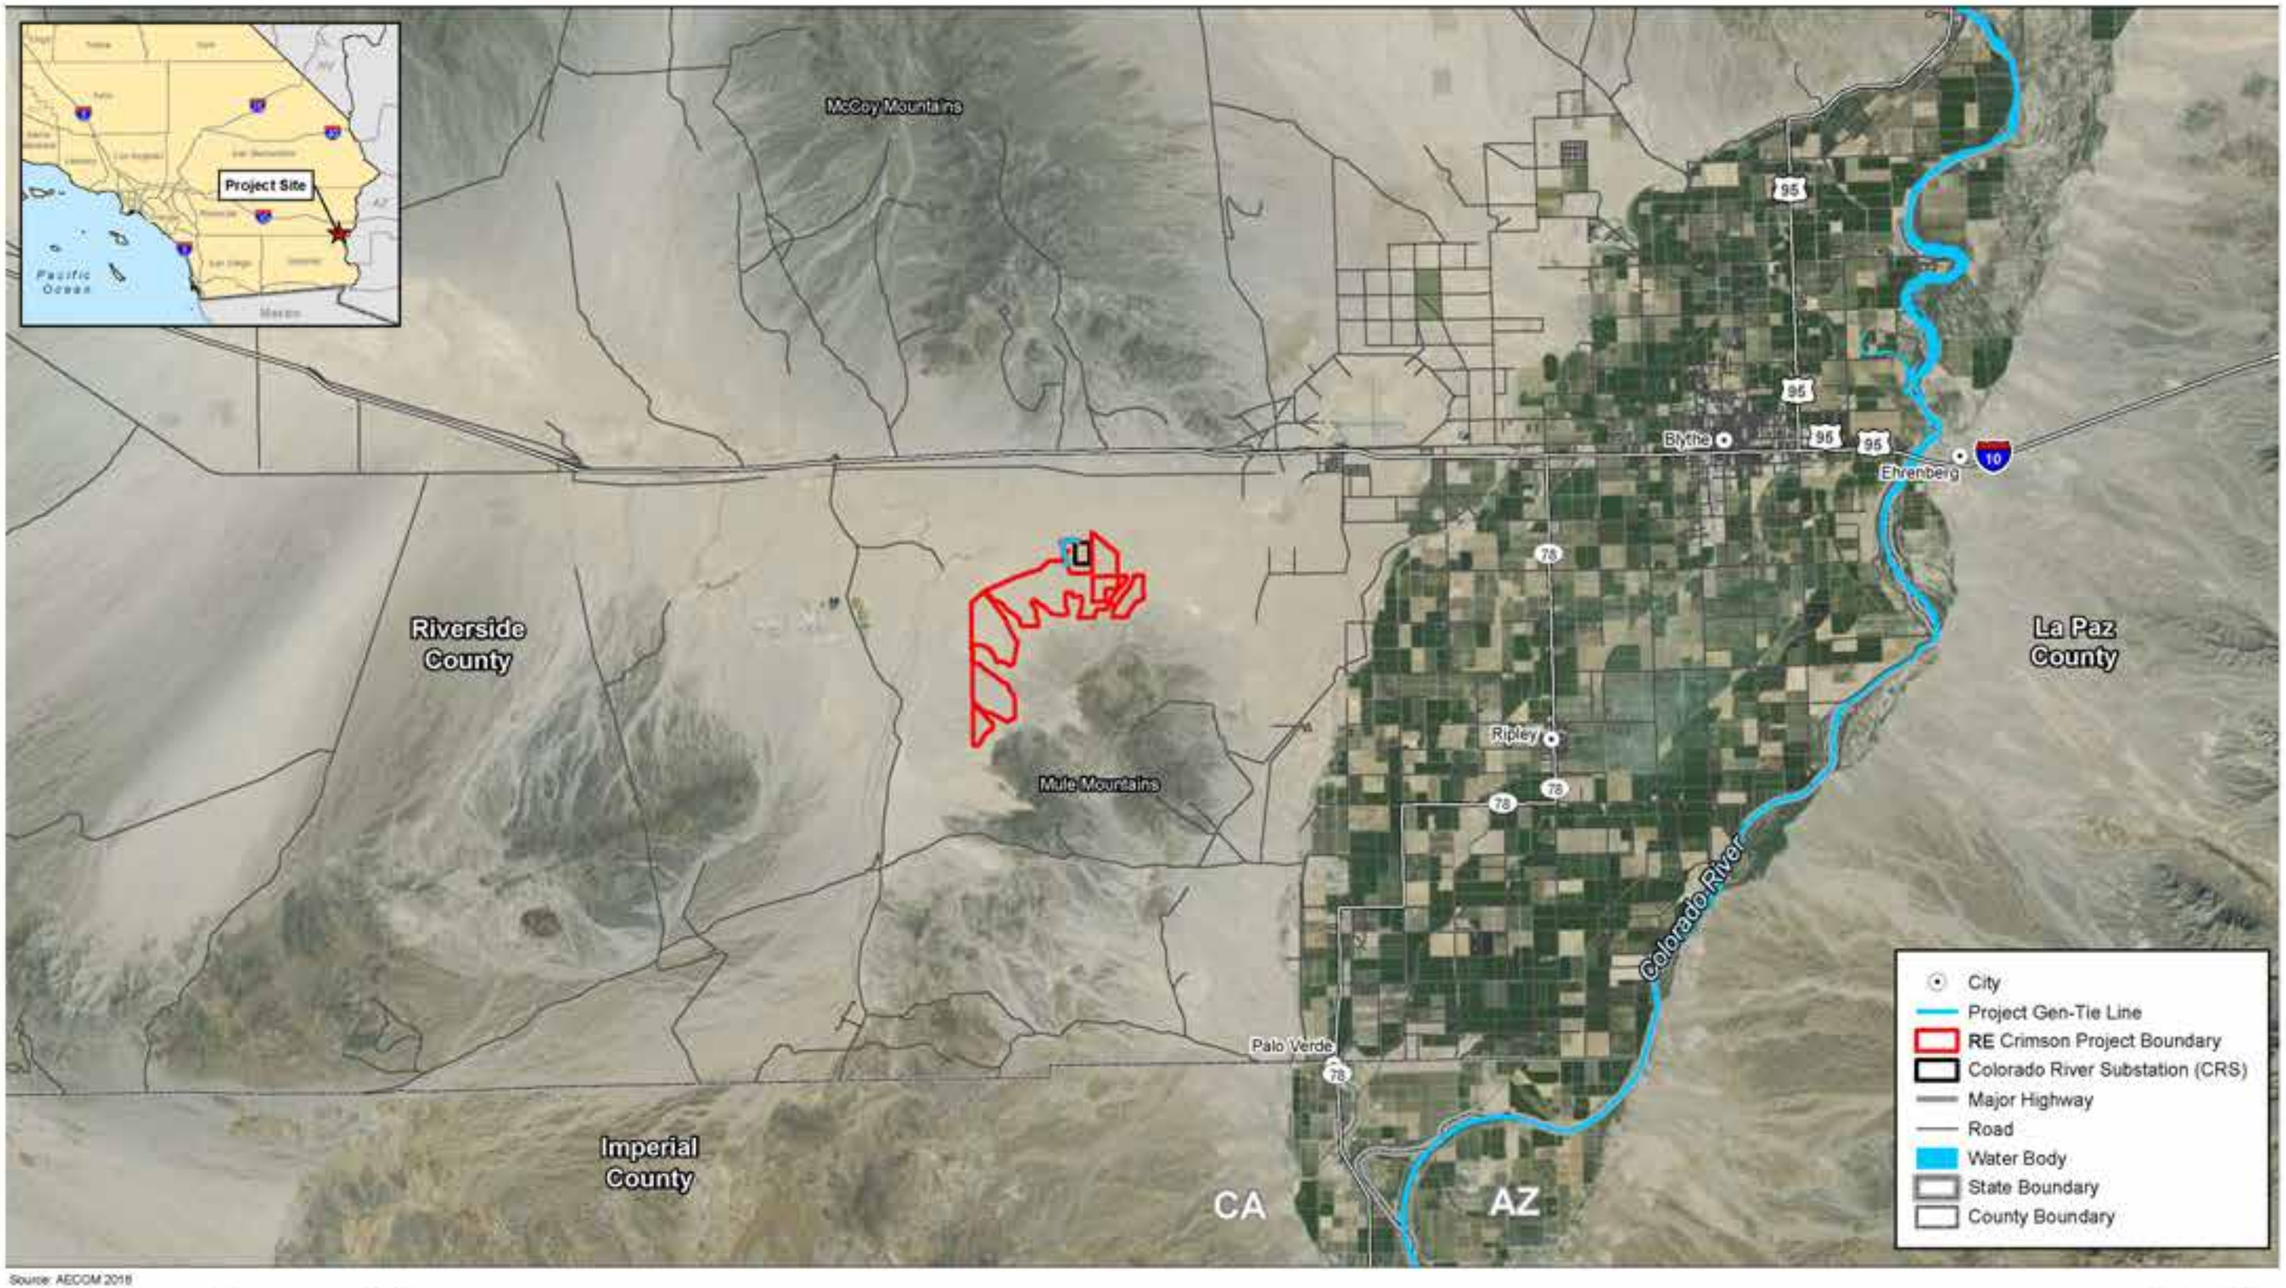
OR via email: magdalena.rodriguez@wildlife.ca.gov
(subject line: "**RE Crimson Solar Project NOP Scoping Comments**")

All comments on environmental issues received during the public comment period will be considered and addressed in the Draft EIS/EIR, which is anticipated to be available for public review in late 2018/early 2019.



G. Location of Documents Available for Public Review

A hard copy of the NOP is available for review at the locations listed in Table 1.

Table 1
Repository Sites

Notice of Preparation - Project Location Map

Attachment 1

California Environmental Quality Act Environmental Checklist

Following are the questions included in Appendix G of the California Environmental Quality Act (CEQA) Guidelines Environmental Checklist Form (California Code of Regulations, Section 15000 et seq.). These are issues that may be evaluated in an Environmental Impact Statement/Environmental Impact Report (EIS/EIR), if they are determined to be relevant to the project. This list is provided only to provide the reader with a general idea of the environmental topics that could be considered for the proposed project. As a joint EIS/EIR is being prepared for the proposed RE Crimson Solar Project, a few topic names listed below may differ to comply with National Environmental Policy Act (NEPA) terminology, but the environmental evaluation will address the CEQA impact significance criteria.

I. AESTHETICS (VISUAL RESOURCES). Would the project:

- Have a substantial adverse effect on a scenic vista?
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?
- Substantially degrade the existing visual character or quality of the site and its surroundings?
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

II. AGRICULTURE AND FORESTRY RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

Would the project:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

- Conflict with existing zoning for agricultural use, or a Williamson Act contract?
- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?
- Result in the loss of forest land or conversion of forest land to non-forest use?
- Involve other changes in the existing environmental which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

III. AIR QUALITY. Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.

Would the project:

- Conflict with or obstruct implementation of the applicable air quality plan?
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation?
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?
- Expose sensitive receptors to substantial pollutant concentrations?
- Create objectionable odors affecting a substantial number of people?

IV. BIOLOGICAL RESOURCES. Would the project:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites?
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

V. CULTURAL AND PALEONTOLOGICAL RESOURCES. Would the project:

- Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?
- Directly or indirectly destroy a unique paleontological resource or site unique geologic feature?
- Disturb any human remains, including those interred outside of formal cemeteries?

VI. GEOLOGY AND SOILS. Would the project:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to the California Division of Mines and Geology Spec. Pub. 42)
  - Strong seismic groundshaking?
  - Seismic-related ground failure, including liquefaction?
  - Landslides?
- Result in substantial soil erosion or the loss of topsoil?
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of wastewater?

VII. GREENHOUSE GAS EMISSIONS. Would the project:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

VIII. HAZARDS/HAZARDOUS MATERIALS, WILDLAND FIRE ECOLOGY. Would the project:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?
- Emit hazardous emissions or handle hazardous or acutely hazardous material, substances, or waste within one-quarter mile of an existing or proposed school?
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?
- For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?
- Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

IX. HYDROLOGY AND WATER QUALITY. Would the project:

- Violate any water quality standards or waste discharge requirements?

- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted?
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount or surface runoff in a manner which would result in flooding on- or off-site?
- Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?
- Otherwise substantially degrade water quality?
- Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?
- Place within a 100-year flood hazard area structures which would impede or redirect flood flows?
- Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?
- Inundation by seiche, tsunami, or mudflow?

X. LAND USE AND PLANNING (LANDS AND REALTY). Would the project:

- Physically divide an established community?
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?
- Conflict with any applicable habitat conservation plan or natural community conservation plan?

XI. MINERAL RESOURCES. Would the project:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

- Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

XII. NOISE. Would the project result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?
- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?
- For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

XIII. POPULATION AND HOUSING (SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE). Would the project:

- Induce substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extensions of roads or other infrastructure)?
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

XIV. PUBLIC SERVICES.

- Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:
    - Fire protection?

- Police Protection?
- Schools?
- Parks?
- Other public facilities?

XV. RECREATION. Would the project:

- Increase the use of existing neighborhood, and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?
- Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

XVI. TRANSPORTATION AND TRAFFIC (TRANSPORTATION AND PUBLIC ASSESS). Would the project:

- Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?
- Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?
- Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
- Result in inadequate emergency access?
- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

XVII. TRIBAL CULTURAL RESOURCES.

- Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and

scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

XVIII. UTILITIES AND SERVICES SYSTEMS. Would the project:

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?
- Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?
- Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?
- Comply with federal, state, and local statutes and regulations related to solid waste?

IXX. MANDATORY FINDINGS OF SIGNIFICANCE:

- Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

- Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)
- Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

SECTION 1
Overview of NEPA/CEQA Scoping Process

1.1 Introduction

Sonoran West Solar Holdings, LLC, a wholly owned subsidiary of Recurrent Energy, LLC, (the Applicant) has applied to the Bureau of Land Management (BLM) for a right-of-way (ROW) grant on public lands to construct, operate, maintain, and decommission a 350 megawatt (MW) photovoltaic (PV) solar energy generating facility and related infrastructure on approximately 2,500 acres of BLM administered public lands, located approximately 13 miles west of the City of Blythe, California, in unincorporated Riverside County. The Recurrent Energy (RE) Crimson Solar Project (Project) would interconnect to the regional electrical grid at the Southern California Edison (SCE) 220 kilovolt (kV) Colorado River Substation, generate up to 350 megawatts (MW) of renewable energy using PV technology, and include up to 350 MW of integrated energy storage capacity.

If the ROW grant application is approved, an amendment of the California Desert Conservation Area Plan of 1980, as amended (CDCA Plan) would be required to identify the site as appropriate for the proposed use. The ROW grant application and CDCA Plan amendment are subject to review under the National Environmental Policy Act (NEPA). The Project also would require authorization by the California Department of Fish and Wildlife (CDFW) of an Incidental Take Permit and a Lake and Streambed Agreement. These discretionary permitting decisions are subject to review under the California Environmental Quality Act (CEQA). The BLM, as the federal lead agency, and CDFW, as the State lead agency, have agreed to prepare a joint Draft Environmental Impact Statement (EIS)/Environmental Impact Report (EIR) for the Project.

This scoping report documents the joint NEPA/CEQA scoping process and summarizes the scoping comments received for the Project. Specifically, this report describes the scoping events and activities conducted for the Project. It also summarizes the written and oral comments received on the BLM's Notice of Intent (NOI) and CDFW's Notice of Preparation (NOP). This report informs the Lead Agencies' determination of the range of issues and alternatives to be addressed in the EIS/EIR. The Lead Agencies will use the comments received during the scoping period to:

1) Identify key issues to focus the analysis
2) Identify reasonable alternatives to the Project
3) Analyze environmental impacts of the Project and alternatives
4) Identify ways to avoid or reduce environmental impacts
5) Inform the Lead Agencies' decision-making processes.

1.2 Summary of NEPA/CEQA Scoping Process

The NEPA/CEQA scoping process provides government agencies, Tribes, organizations, and members of the public the opportunity to identify environmental issues and alternatives for consideration in the EIS/EIR. The scoping process and results are an initial step in the environmental review process.

To comply with NEPA (40 CFR 1501.7), the U.S. Environmental Protection Agency (EPA) published a NOI in the Federal Register on March 9, 2018, that provided notice of the BLM's intent to prepare an EIS for the Project (77 FR 64824). The NOI serves as the official legal notice that a federal agency is commencing preparation of an EIS. The Federal Register serves as the U.S. Government's official noticing and reporting publication. The NOI initiates the public scoping period for the EIS, provides information about the Project, and serves as an invitation to provide comments on the scope and content of the EIS. The NOI for the Project is included as Appendix A-1.

Newspaper notices were published in the Palo Verde Valley Times, and the Desert Sun announcing the public scoping meetings. The BLM also issued a press release regarding the NOI on March 9, 2018. The NOI and press release, included as Appendix B-1, were made available to agencies and the public on BLM's eplanning website:

https://eplanning.blm.gov

As required by Section 15082 of the CEQA Guidelines (14 CCR 15000 et seq.), CDFW issued an NOP on March 8, 2018, that summarized the Project, stated CDFW's intention to prepare a joint EIS/EIR, and requested comments from interested parties. The NOP is included as Appendix A-2. Twenty public notices were sent to property owners; 15 copies of the NOP were sent to the California State Clearinghouse; 46 public notices were sent to federal, state, and local agencies and organizations; and public notices were sent to 5 local libraries. Public notices also were sent to 30 Native American tribal groups.

During the NOI comment period, the BLM and CDFW held a total of three public scoping meetings. The first scoping meeting took place from 5-8 p.m. on April 3, 2018 in Palm Springs at the BLM's South Coast Field Office (1201 Bird Center Drive). The second meeting took place on April 11, 2018 from 5-8 p.m., at the University of California Riverside campus in Palm Desert, California (75080 Frank Sinatra Dr. B117, Palm Desert, CA 92211). The final public scoping meeting took place on April 12, 2018 at the City of Blythe's City Hall Multipurpose Room from 12-3 p.m. (235 North Broadway, Blythe CA 92225). Comment cards and speaker cards were available to participants. The BLM and CDFW provided a presentation explaining the EIS/EIR processes, the BLM's and the CDFW's roles throughout these processes, and public participation opportunities (the presentation is provided in Appendix C-3).

The scoping meetings provided government agencies and the public with opportunities to receive information about the Project and the NEPA/CEQA process, as well as to provide a forum for receipt of oral and written comments. Sixteen people attended the first scoping meeting in Palm Springs on April 3, 2018; eleven attended the Palm Desert scoping meeting on April 11, 2018;

and 32 attended the final scoping meeting in the City of Blythe on April 12, 2018. The meeting attendees included representatives from local and state agencies, Tribes, organizations, and private citizens.

All materials provided at the scoping meetings are contained within Appendix C and include the following:

1) Comment Cards
2) Speaker Registration Cards
3) Scoping Meeting Presentations

Appendix D includes the sign-in sheets from the scoping meetings. Appendix E includes the transcripts of the April 3, April 11, and April 12 meetings.

The comment period ended on April 27, 2018 for purposes of NEPA and on April 23, 2018 for purposes of CEQA. In total, 31 letters were received: 8 from federal, state, and local agencies; 5 from tribes; and 18 from individuals and organizations (see Table 1-1). These 31 letters and all oral comments have been included in each Lead Agency's administrative record for the Project, are documented in this scoping report, and will be considered in the drafting of the EIS/EIR.

1.3 Agencies, Organizations, and Persons Providing Scoping Comments

Federal, state, and local agencies; Tribes; organizations; and members of the public provided written comments during the scoping period. Written comments received during the scoping meetings and in response to the NOI/NOP are included in Appendix F. Table 1-1 presents the agencies, Tribes, organizations, and individuals that provided written comments during the scoping process in chronological order.

1.4 Scoping Report Organization

This scoping report summarizes the comments and issues identified during the scoping period, including the public scoping meetings. The Lead Agencies will review and consider all of the scoping comments received in preparing the EIS/EIR for the Project.

Section 2 provides summary information on the Applicant's stated Project objectives and a description of the Project.

Section 3 provides a summary of the comments received and issues raised during the Project's scoping periods, including comments received during the public scoping meetings.

Section 4 provides a summary of future steps in the planning process and indicates opportunities for public participation in the environmental review process.

The Appendices that follow Section 4 include notices, scoping meeting notices, scoping comments received, transcripts from the scoping meetings, and other information.

SECTION 2
Summary of the Project

2.1 The BLM's Purpose and Need

The BLM's purpose and need for action will dictate the range of alternatives under NEPA and provide a basis for the rationale for eventual selection of an alternative in a decision. The BLM's purpose and need for the Project is to respond to the Applicant's application under Title V of the Federal Land Policy and Management Act of 1976 (FLPMA) (43 USC §1761(a)(4)) for a ROW grant to construct, operate, maintain, and decommission a solar PV facility on public lands in compliance with FLPMA, BLM ROW regulations, and other applicable federal laws. In accordance with §103(c) of FLPMA, public lands are to be managed for multiple uses that take into account the long-term needs of future generations for renewable and non-renewable resources. The Secretary of the Interior is authorized to grant ROWs on public lands for systems of generation, transmission, and distribution of electric energy (43 USC §1761(a)(4)). Taking into account BLM's multiple use mandate, the BLM will decide whether to approve, approve with modification(s), or deny issuance of a ROW grant to the Applicant for the Project.

The BLM's action also will include consideration of a concurrent land use plan amendment of the CDCA Plan. The CDCA Plan, while recognizing the potential compatibility of solar generation facilities on public lands, requires that all sites associated with power generation or transmission that are not identified in the CDCA Plan be added to it through the land use plan amendment process.

2.2 Applicant's Project Objectives

The BLM and CDFW will consider the Applicant's Project objectives in developing a reasonable range of alternatives to the Project under CEQA and NEPA. The applicant has identified five objectives for the Project:

1) Generate 350 MW of clean electricity to assist the State of California in achieving its 50 percent renewable portfolio standard for 2030 by providing a significant new source of wholesale renewable energy;
2) Assist California utilities in meeting their obligations under the California Public Utilities Commission's (CPUC's) Energy Storage Framework and Design Program, including the procurement target of 1,325 MWs by 2020, by providing up to 350 MW of storage capacity;
3) Facilitate grid interconnection of intermittent and variable PV generation and minimize line losses associated with off-site storage by collocating substantial electrical storage capacity at the PV facility site;

4) Realize economies of scale inherent in constructing a utility-scale solar facility on contiguous lands in the immediate vicinity of a high-voltage interconnection to the California Independent System Operator (CAISO)-controlled grid; and
5) Bring living-wage skilled jobs to Riverside County through Project development, construction, and operation.

2.3 Project Description

The Project consists of a utility-scale solar PV and energy storage project that would be located on up to approximately 2,500 acres of public lands managed by the BLM within the CDCA planning area. The Project would interconnect to the regional electrical grid at the Southern California Edison (SCE) 220 kilovolt (kV) Colorado River Substation, generate up to 350 MW of renewable energy using PV technology, and include up to 350 MW of integrated energy storage capacity.

The Project is comprised of the following components/facilities:

- **Photovoltaic Modules and Support Structures**: the solar facility would include an estimated 2 million solar modules, although the precise module count would depend on the technology ultimately selected at the time of procurement. Module mounting systems that may be installed include either fixed-tilt or tracking technology, depending on the PV modules ultimately selected. Modules would be arranged next to each other in long strings called rows and supported by steel piles.
- **Inverters, Transformers, and Electrical Collection System**: The Project would be designed and laid out primarily in 2 MW increments, which would include an inverter equipment area measuring approximately 40 feet by 25 feet. Each 2 MW increment would include an inverter-transformer station constructed on a concrete pad or steel skid and centrally located within the PV arrays.
- **Project Substations and Gen-Tie Line**: Up to four substations would transform voltage from the 34.5 kV electrical collection cables to 230 kV. The area of each substation and associated equipment would be approximately 30,000 square feet and would include power transformers and footings, control buildings, metering stands, microwave towers up to approximately 100 feet in height, and dead-end structures up to approximately 80 feet in height. The proposed gen-tie would be would be constructed with either monopoles, lattice steel structures, or wooden H-frame poles. A portion of the gen-tie line could be constructed underground to cross under existing transmission lines.
- **Operations and Maintenance Building**: An operations and maintenance (O&M) building would be located near the proposed substations. The O&M building would be approximately 2,000 square feet (approximately 40 feet by 50 feet by 15 feet at its tallest point) and would accommodate O&M staff.

Other features/components of the proposed facility include a supervisory control and data acquisition system, an optional battery or flywheel storage system capable of storing up to 350 MW of electricity, a meteorological data collection system, and telecommunications facilities. If provided, the storage system would consist of up to 3,000 electrical enclosures measuring approximately 40 feet by 8 feet by 8.5 feet high and installed on concrete foundations.

Access to the Project site would be provided from the existing paved Powerline Road to the Colorado River Substation. The Project's on-site roadway system would include a perimeter road, access roads, and internal roads. In the event that the Applicant cannot reach an agreement with the private landowner, two new access road segments along Powerline Road would be constructed in order to avoid two privately-owned parcels through which the existing Powerline Road crosses. Multiple points of ingress/egress would be provided to the site and accessed by site personnel via locked gates. Security fencing would be installed along the perimeter of the proposed site and motion-sensitive, directional security lights would be installed to provide adequate illumination around the substation areas, each inverter cluster, and at the gates. All lighting would be shielded and directed downward to minimize the potential for glare or spillover onto adjacent properties.

SECTION 3
Summary of Scoping Comments

This section of the report summarizes the comments raised by agencies, Tribes, organizations, and members of the public during the scoping process. Table 1-1 provides a list of commenters including federal, state, and local agencies as well as Tribes, organizations, and individuals who provided comments. A number of environmental concerns were raised during the scoping process that focused on the Project's potential effects to environmental resources and issue areas. This scoping report summarizes the comments received according to the following major themes:

1) Project description
2) Human environment issues
3) Natural environment issues
4) Indirect and cumulative impacts
5) Project alternatives
6) EIS/EIR administrative and permitting issues.

3.1 Project Description

Several commenters expressed concerns regarding the proposed location of the Project, particularly that it is proposed on relatively undisturbed land designated as Lands with Wilderness Characteristics (LWC). Many commenters also noted that the Project could have significant impacts on cultural resources, biological resources (including habitat connectivity/corridors), as well as visual and water resources due to the location of the site.

The Southwest Regional Carpenters noted that conflicting descriptions of the base acreage for the project were given: BLM estimated the Project will be sited on 2,700 acres of undeveloped land; CDFW stated the Project will consist of 2,500 acres; and the Project site map provided in CDFW's NOP delineated approximately 2,250 acres. The comment requested that the EIS/EIR provide an accurate, stable description of the Project acreage. The comment also requested that if Project features remain uncertain, the agencies should evaluate the worst-case scenario of the potential environmental impacts of the Project.

The Colorado River Indian Tribes suggested that it was unclear whether the energy storage facilities would be "optional" or considered as part of the Project.

Several comments acknowledged that the original Project footprint was modified (reduced) to avoid impacts to sensitive resources. EPA recommended that the Lead Agencies evaluate a low impact development with a reduced amount of grading. Although the Project application was

submitted to the BLM before the Desert Renewable Energy Conservation Plan (DRECP) was finalized and thus is not required to comply with the DERCP, the current Project footprint is within the boundary of the Riverside East Development Focus Area (DFA) with potential for resource impacts.

Several comments including those from Defenders of Wildlife, the California Wilderness Coalition and the Center for Biological Diversity recommended that the BLM include a full consideration of the science used to develop the DRECP, along with other new information, when considering whether to approve the Project and proposed land-use plan amendment, to assure that achievement of the goals of the DRECP would not be compromised if the Project is approved.

Statement of Purpose and Need

The EPA, the Colorado River Indian Tribes, and Basin and Range Watch (along with Western Watersheds Project) submitted comments regarding the Statement of Purpose and Need of the Project.

Basin and Range Watch requested that the Purpose and Need statement be rewritten to emphasize BLM's commitments to protect valuable resources on public lands, specifically the need to protect the resources on this site and in Chuckwalla Valley by examining Distributed Generation and Brownfield alternatives. Basin and Range Watch and Western Watershed stated that the Statement of Purpose and Need should include the need to protect (1) cultural resources, (2) biological, (3) visual, (4) hydrological, (5) air quality of the Project site. The comment also stated that:

> *Any Bureau of Land Management Purpose and Need Statement should not interpret the following orders (EO 13212, DOI 3285A1, MOU AB52, SBX2) to justify the project. Executive Order 13212 mandates transmission of energy in a 'safe and environmentally sound manner'; Secretarial Order 32851A1 establishes development of renewable energy as a (federal) priority; AB52 and SBX2 established goals for CA GHG reduction."*

The comment stated that the orders do not require the renewable energy to come from the proposed site or from public lands in general, that California's goals could be fulfilled with built environment and brownfields alternatives. The comment provided two additional documents. One described the "duck curve" relating to over-generation from solar energy in California, the next provided information regarding avian-solar interactions.

The EPA submitted comments stating the following with regard to the Statement of Purpose and Need:

1) The purpose and need should identify, and describe the underlying problem, deficiency, or opportunity that the action is meant to address. For example, this section should clearly indicate the factors that are used to evaluate the size of the project, in terms or land acreage, in relation to achieving the underlying need.
2) The EIS/EIR should discuss the Project in the context of the larger energy market that the Project would serve;

3) The EIS/EIR should identify potential purchasers of the power produced; and

4) The EIS/EIR should discuss how the Project will assist the State in meeting its renewable energy portfolio standards and goals.

The Colorado River Indian Tribe commented that BLM and CDFW must take care in crafting the project objectives and Purpose and Need to ensure that the EIS/EIR considers an adequate range of alternatives.

3.2 Human Environment Issues

Aesthetics/Visual Resources

Several commenters expressed concern about the visual impact that would occur as a result of the Project and called for visual resource studies to identify the Project's impact to surrounding landscapes and scenic vistas.

Basin and Range Watch stated that the Project would be visible from the Mule Mountains ACEC and the McCoy Mountains Wilderness Area, as well as from residential areas. The comment noted that due to the immense size of the project, impacts to Visual Resource Management (VRM) Class I and II Standards should be analyzed in the EIS.

The Southwest Regional Council of Carpenters noted that the Project could generate light pollution, in addition to other potential impacts.

Cultural Resources

Numerous comments were received that stated the Project would likely have significant impacts to existing cultural and historic resources within and near the proposed site. Cultural resource comments received from the Colorado River Indian Tribes and others who expressed concern about the handling of Native American artifacts during the Project's development requested that the BLM conduct Native American tribal consultation throughout the permitting process.

The Native American Heritage Commission and others submitted comments recommending early consultation and coordination with tribal governments to determine the location of cultural artifacts and minimize the potential damage to these resources.

The Native American Heritage Commission also stated that the Lead Agencies should consider the historic context of proposed projects and research the cultural landscape of the Project site. Additionally, historic properties of religious and cultural significance are to be kept confidential, and if Native American cultural sites and/or Native American burial sites are prevalent at the Project site they should be avoided. The Colorado River Indian Tribes stated that the EIS/EIR must ensure that potential impacts to known and unknown cultural artifacts are analyzed and avoided. Concerns were raised regarding existing sites in the Mule Mountains ACEC and some stated that the current designation is not broad enough to protect all resources. One commenter recommended that expansion of the Mule Mountains ACEC should be considered before the BLM takes action with respect to the Project.

Numerous comments stated that the Project area contains significant cultural and historic resources including archeological sites, historic trails, petroglyphs, and sacred sites. The Colorado River Indian Tribes noted that the proposed site is located within 16 miles of the reservation and that tribal members use public lands for hunting and for other activities of importance to the tribes. Specific concerns were also raised by the Colorado River Indian Tribes regarding the proposed energy storage enclosures, which the comment noted would quadruple the grading required for the Project.

Solid Waste

Comments were received from the Riverside County Department of Waste Resources (RCDWR) expressing concerns regarding the quantity of construction and demolition waste the Project could generate and how this waste would be disposed of. The comments recommended that the EIR/EIS quantitatively analyze the Project's potential solid waste impacts. A projected maximum amount of waste generated from Project build out was recommended using appropriate waste generation factors for the proposed land use. RCDWR provided information regarding the nearest landfill to the project area, the Blythe Landfill (owned by RCDWR) and a link to CalRecycle's waste generation factor tool. Basin and Range Watch with Western Watersheds Project commented that proposed batteries would create a waste/ recycling issue and suggested that BLM should be asking if batteries would be recycled.

Public Health and Safety

The Department of Toxic Substances Control submitted the following comments:

1. The EIS/EIR should identify and determine whether current or historic uses at the site may have resulted in any release of hazardous wastes/substances. A Phase I Environmental Site Assessment may be appropriate to identify any recognized environmental conditions.
2. If there are any recognized environmental conditions in the Project area, then proper investigation, sampling and remedial actions overseen by the appropriate regulatory agencies should be conducted prior to the new development or any construction.
3. If the proposal includes discharging wastewater to a storm drain, an NPDES permit may be required from the Regional Water Quality Control Board (RWQCB).
4. If planned activities include building modifications/demolitions, lead-based paints or products, mercury, and asbestos containing materials (ACMs) should be investigated and mitigated/disposed of in accordance with all applicable and relevant laws and regulations. In addition, evaluate whether polychlorinated biphenyls (PCBs) containing materials is present in onsite buildings and address as necessary to protect human health and the environment.
5. If the site was used for agricultural or related activities, residual pesticides may be present in onsite soil. DTSC recommends investigation and mitigation, as necessary, to address potential impact to human health and environment from residual pesticides.
6. DTSC recommends evaluation, proper investigation and mitigation, if necessary of onsite areas with current or historic PCB-containing transformers.
7. Please evaluate whether the proposed site is located within or in close proximity to the Formerly Used Defense Site (FUDS) based, in part, on the United States Department of

Defense ordnance maps. DTSC recommends assessment and/or investigation be conducted in the Project area to assess potential impacts from the nearby FUDS if necessary.

8. Export & Import of Soil: If soil contamination is suspected or observed in the Project area, then excavated soil should be sampled prior to export/disposal. If the soil is contaminated, it should be disposed of in accordance with all applicable and relevant laws and regulations. In addition, if the Applicant proposes to import soil to backfill the excavated areas, proper evaluation and/or sampling should be conducted to make sure that the imported soil is free of contamination.
9. If during construction/demolition of the Project, soil and/or groundwater contamination is suspected, construction/demolition in the area should cease and appropriate health and safety procedures should be implemented. If it is determined that contaminated soil and/or groundwater exist, the EIS/EIR should identify how any required investigation and/or remediation will be conducted and the appropriate government agency to provide regulatory oversight.

The EPA submitted comments stating that the EIS should address potential direct, indirect, and cumulative impacts of waste including hazardous waste from construction and operation of the solar farm as well as the proposed battery storage facility. The document should identify projected hazardous waste types and volumes, and expected storage, disposal and management. It should address the applicability of state and federal hazardous waste requirements and include measures to mitigate hazardous waste. The EPA also stated that if PV panel trackers will utilize hazardous materials such as refrigerants, discuss and evaluate potential impacts from accidental or unexpected releases on environmental resources. Alternative tracking methods that minimize hazardous materials use should be evaluated. Identify whether any pesticides, including herbicides or rodenticides, would be used at the Project site. The letter included an additional comment regarding the use of weed control measures. The comment stated that soils under PV arrays are often sterilized with pesticides to prevent weed growth, which prevents revegetation of native plants that could minimize erosion and provide wildlife habitat.

Valley Fever: EPA stated that reasonable measures to reduce fugitive dust should be implemented, for the benefit of local receptors such as construction workers and nearby residents, and to reduce potential exposure to *Coccidioides immitis* (Valley Fever). Regarding Valley Fever, the EPA noted that the project site is located in an area that the CDC has classified as suspected endemic for *Coccidioides immitis*, a fungus causing valley fever in humans, and that ground disturbance may result in Coccidioides spore dispersal. A discussion of this potential health and safety risk, as well as measures identified in the EIS be included to prevent or reduce exposure to workers and local residents. La Cuna de Aztlan Sacred Sites Protection Circle noted in their comment letter that the community of Mesa Verde (8 miles west of Blythe) has one of the highest per capita rate(s) of asthma, Valley Fever, bronchitis, and pneumonia, due to the fungus being released when desert soils are disrupted. The comment stated that if more solar projects are constructed, the health for people living in the area surrounding the Palo Verde Valley will become more critical. La Cuna de Aztlan Sacred Sites Protection Circle further noted an increase in Valley Fever among prisoners at Chuckawalla and Iron State Prison.

Electromagnetic field (EMF) generation: The Southwest Regional Council of Carpenters noted in their comment letter potential impacts related to electromagnetic field (EMF) generation, and pollution from spills, among other possible Project impacts.

Environmental Justice

Comments submitted by the EPA state that the EIS/EIR should include an evaluation of environmental justice populations within the geographic scope of the Project. If such populations exist, the EIS/EIR should address the potential for disproportionate adverse impacts to minority and low-income populations, and the approaches used to foster public participation by these populations. Assessment of the Project's impact on minority and low-income populations should reflect coordination with those affected populations. The EPA also recommends that the EIS/EIR should describe outreach conducted to all other communities that could be affected by the Project, since rural communities may be among the most vulnerable to health risks associated with the Project.

Additional comments pertaining to the need for socioeconomics and environmental justice issues to be addressed in the EIS/EIR were received in a comment letter from Basin and Range Watch/ Western Watersheds Project, that questioned how the project would impact property values and quality of life of adjacent residents in Mesa Verde.

Land Use

The EPA recommends that BLM consider the latest science used to develop the DRECP, as well as any additional recent scientific studies, and consider evaluating an action alternative that would comply with the DRECP Conservation Management Actions (CMA). Specifically, the EPA requests that the EIS include a 'crosswalk' table highlighting how each alternative would meet or not meet the criteria for each CMA.

Basin and Range Watch along with Western Watersheds Project included comments related to the Land Use Plan/CDCA Plan:

> *The lands lie within the California Desert Conservation Area legislated under the Federal Land and Policy Management Act (FLPMA). The region is designated as Class M which is designated for a 'controlled balance between higher intensity use and protection.' A variety of uses are listed in this class and the problem is that designating up to 6 square miles as a Right of Way for ONLY solar energy is inconsistent with Class M (Moderate Use) designation. The solar project would be more appropriate on lands with Class I (Intensive Use) designation – that is "lands managed for concentrated use to meet human needs".*

Basin and Range Watch along with Western Watersheds Project in their comments also noted that the DRECP, approved in 2016, is now under review by the current administration. While the project site is within a Development Focus Area (DFA), the application predates the DRECP. The comment stated that the region is under no requirement to see this development under the DRECP. Additionally, the comments noted that the conservation designations under the Northern

and Eastern Colorado Desert Coordinated Management Plan (NECO) should be reviewed and included in the Project review.

The Wilderness Society with the California Wilderness Coalition (CWC) submitted comments noting that much of the Project site has been designated as Lands with Wilderness Characteristics (LWC). The comment stated that in general energy development is not appropriate in LWC due to the sensitive resources and land values found in LWC. The comment recommended that BLM avoid development in LWC or mitigate for impacts to LWC consistent with Riverside East DFA requirements pursuant to the DRECP. The comment requested that the LWC inventory be current for the Project area, and that potential impacts be analyzed per FLPMA. CWC provided three attachments along with the comment letter, all regarding LWC. The comment specifically recommended the following:

1. BLM must ensure that lands with wilderness characteristics inventory is up to date for Crimson Solar Project area and analyze potential impacts.
    a. LWC inventory requirements
    b. BLM is required to respond to wilderness inventory information submitted by the public.
    c. BLM must analyze impacts to lands with wilderness characteristics as part of the Crimson Solar EIS.
2. BLM is required to consider ways to avoid, minimize, and offset impacts to lands with wilderness characteristics.
    a. BLM should consider ways to avoid and minimize impacts to lands with wilderness characteristics.
    b. BLM and the project developer should commit to compensatory mitigation to offset unavoidable impacts to lands with wilderness characteristics; such mitigation should be focused in the Big Maria Mountains, Palen McCoy Wilderness Area of other designated wilderness area in general proximity to the project and (as an example) could include:
        i. Removal and restoration of approximately 15 miles of unauthorized vehicle routes;
        ii. Conversion of approximately 3 miles of vehicle route into hiking trails, and;
        iii. Installation of vehicle barriers and signing along publicly accessible portions of wilderness boundaries.
3. BLM should develop an alternative that analyzes Crimson Solar under the DRECP.

Defenders of Wildlife and California Wilderness Coalition similarly recommended that the BLM should utilize the existing information in the Programmatic Solar Energy Development Plan (more commonly referred to as the Solar Energy Program, which was established in 2012 through the Record of Decision for the Final Programmatic Environmental Impact Statement for Solar Energy Development in Six Southwestern States (Solar PEIS)) and the DRECP regarding the proposed site and lands affected by other nearby projects in developing a description of the affected environment, cumulative impacts, and specific measures to avoid minimize and mitigate significant environmental impacts. The comment noted that the information in the Solar PEIS and DRECP comprises some of the best available science, though site specific information including protocol surveys, etc. would also be necessary to complete the analysis under NEPA.

Recreation

The Wilderness Society and CWC noted that LWC areas in the Project area have outstanding opportunities for solitude and primitive recreation, in addition to supplemental values including woodlands habitats that provide a haven for songbirds, as well as an abundance of cultural resources.

La Cuna de Aztlan Sacred Sites Protection Circle noted an abundance of trails in and near the Project area, and stated that the main trail that leads northwest toward Corn Springs (near the Mule Mountains) would be destroyed by Project. The Center for Biological Diversity also noted that many of their 1.6 million members from the western United States and southern California area enjoy visiting, studying, photographing, and hiking in the California Desert Conservation Lands, including areas in and around the Project site.

Transportation and Traffic

The Southern California Association of Governments (SCAG) recommends that the Project's traffic study includes a side-by-side comparison of their nine 2016 Regional Transportation Plan/ Sustainable Communities Strategies (RTP/SCS) Goals with discussions of the consistency, non-consistency, or non-applicability of the policy and supportive analysis in a table format. Suggested format is as follows:

SCAG 2016 RTP/SCS Goals

Goal	Analysis
RTP/SCS G1: Align the plan investments and policies with improving regional economic development and competitiveness.	Consistent: Statement as to why; Not-Consistent: Statement as to why; or Not Applicable: Statement as to why; EIS/EIR page number reference.
RTP/SCS G2: Maximize mobility and accessibility for all people and goods in the region.	Consistent: Statement as to why; Not-Consistent: Statement as to why; or Not Applicable: Statement as to why. EIS/EIR page number reference.
Etc.	Etc.

Additionally, SCAG recommended that the EIS/EIR reflect the most recently adopted SCAG forecasts (2020-2040 RTP/SCS population, household and employment forecasts) and review the SCAG 2016 RTP/SCS Final Program EIR list of Mitigation Measures Appendix for additional traffic impact mitigation guidance.

The Center for Biological Diversity also included comments related to traffic, and recommended that impacts related to construction and operation of the proposed facilities be disclosed, minimized and mitigated. Specific recommendations were provided for (Project-related) mobile sources of greenhouse gas emissions. Additional comments regarding increased traffic were received from the Southwest Regional Council of Carpenters.

3.3 Natural Environment Issues

Biological Resources

Biological issues raised by the public and responsible agencies included potential direct, indirect, and cumulative impacts on the integrity of the ecosystem and special-status species known to occur in the region. Specific comments addressed potential impacts to species including: desert tortoise, burro deer, bighorn sheep, and burrowing owl. Commenters requested that the Project site be surveyed for these species, as well as any other special status species that may exist in the area. Several commenters also expressed concern about the Project's impact on species' habitat corridors, which could potentially cause irreversible harm to the viability of species populations and diversity in the area.

The Southwest Regional Council of Carpenters noted a number of potential impacts to biological resources, including to avian impacts, kit fox, loss of habitat, corridor impacts, fragmentation, fringe effects, and take of desert tortoise and other protected species. Specifically, the commenter expressed concerns regarding desert tortoise critical habitat, noting that the Project site shares an approximate 3.5-mile-long border with this critical habitat area. The commenter recommends that the agencies should proceed under the assumption that the Project would cause significant impacts to and result in the "take" of desert tortoise habitat and individuals.

The Desert Tortoise Council requested that the Draft EIS/EIR include:

1. Current data on and analysis of the presence and densities of special status species, particularly Agassiz's desert tortoise.
2. Habitat quantity and quality in the action area;
3. The functions/viability of the populations in the action area with respect to current conditions and future development scenarios including viability of and connection with adjacent populations, and;
4. Appropriate actions to fully mitigate these effects to population viability, connectivity, and habitat loss/degradation.

Specific concerns over Project siting also were raised, as stated in the comment letter:

> *We are very concerned with the placement of this 2,500-acre solar facility in a relatively narrow, five-to-six-mile-wide corridor located between the Mule Mountains to the south and Interstate 10 to the north. While the footprint of the proposed facility may occupy about half of this corridor that is used by the tortoise and other species of wildlife for connectivity between populations, its placement in the center fragments this corridor and may substantially reduce or destroy its function in the future as a wildlife corridor.*

Basin and Range Watch and Western Watersheds Project identified the Project site as high quality desert tortoise, bighorn sheep, and a critical wildlife linkage habitat for burro deer. Moreover, the comment noted that a consideration of potential impacts for desert kit fox may be needed. A K9 distemper outbreak may have resulted from poor mitigation for another solar development 10 miles west of the Project site.

The EPA also recommended EIS should include assurances that the design of the transmission line would be in compliance with current standards and practices that reduce the potential for raptor fatalities and injuries. The commonly referenced source of such design practices is found within the avian Power Line Interaction Committee documents: Suggested Practices for Avian Protection on Power Lines: State of the Art in 2006 manual and Mitigation Bird Collisions with Power Lines: The State of the Art in 2012. In consultation with the USFWS, determine the need for a Bird and Bat Conservation Strategy to be developed using the 2005 Avian Power Line Interaction Committee and USFWS Avian Protection Plan Guidelines or the need for an Eagle Conservation Plan following the USFWS 2011 Draft Eagle Conservation Plan Guidance. Basin and Range Watch along with Western Watersheds Project also raised concerns regarding avian collisions and migratory bird impacts. The comment letter expressed concerns that the solar panel glare will create a "lake effect" that attracts avian species and recommends that the EIS/EIR include a list of the bird species that could be threatened by collision with the panels.

Comments submitted by the Center for Biological Diversity provided a table that noted a number for rare plants and animals that have a high potential to occur on the Project site. The comment asserted that the EIR/EIS must adequately address impact and propose effective ways to avoid, minimize and mitigate the impacts to the resources through a "robust slate" of alternatives including alternative siting and alternative on-site configurations. The organization also recommended that land acquisition for conservation be included as an avoidance strategy for many of the rare plants and habitat types found on the site, particularly for the large old growth yucca and microphyllous trees/ woodlands.

Center for Biological Diversity also expressed concerns regarding the site location in a sand transport corridor that originates from Joshua Tree National Park, through the Palen and Ford Dry Lake Valleys, across Interstate 10 to the agricultural areas adjacent to Blythe. The sand corridor provides habitat for the Mojave fringe-toed lizard and endemic insects. The organization stated that baseline data should be collected on all these sand-dependent species, as well as avoidance measures through Project design siting to minimize disruption to the sand transport corridor.

The California Native Plant Society along with the California Wilderness Coalition also submitted comments expressing concern regarding rare plants, vegetation, sand transport, corridors, jurisdictional waters, and ecological processes. The comment stated, "given the scale of the Project and existing site conditions, impacts to native plant and plant communities are unavoidable." Defenders of Wildlife also submitted comments with the California Wilderness Coalition expressing concerns regarding the Project's location vis-à-vis habitat corridor linkages.

Comments submitted by Basin and Range Watch included a list of plant and animal species that the organization believes would be affected by the Project and request surveys throughout different times of the year that also would identify wildlife species that may be negatively affected by the Project, including kit fox, burrowing owl, and fringe-toed lizard. They also recommend that the location of the off-site burrowing owl habitat conservation land is determined prior to Project approval and that impacts to the fringe-toed lizard are mitigated.

A comment letter from the Desert Tortoise Council raised concerns about the Project's potential impact on biological resources and suggested there is a lack of available information about the biological resources that currently exist on site. The organization also called for updated biological resource surveys that extend beyond the Project site to evaluate indirect impacts on species that inhabit the areas around the site and requested that the desert tortoise surveys are conducted at a 5-meter interval.

Comments submitted by the EPA state that the EIS/EIR should identify and quantify the species and the critical habitat areas that might be directly, indirectly, or cumulatively affected by each alternative and mitigate impact to these species, with emphasis placed on protecting species based on their status or potential status under the Endangered Species Act. The EPA recommends that the BLM work closely with the USFWS and CDFW to determine potential impacts of the Project on plant and wildlife species, especially species classified rare, threatened, endangered, or special status on federal state or agency lists.

Analysis of impacts and mitigation on covered species should include:

1) Baseline conditions of habitats and populations of the covered species;
2) A clear description of how avoidance, mitigation, and conservation measures will protect and encourage the recovery of the covered species and their habitats in the Project area;
3) Monitoring, reporting, and adaptive management efforts to ensure species and habitat conservation effectiveness;
4) Discuss how and when the BLM intends to meet its obligations under Section 7 of the Endangered Species Act, if applicable;
5) Include the biological assessment by reference or as an appendix, if one is prepared;
6) If a biological opinion is prepared by the USFWS, it should be summarized or included as an appendix in the EIS to demonstrate that the preferred alternative is consistent with the biological opinion.

The EPA states that the EIS/EIR should describe the extent of the construction, installation, and maintenance activities proposed onsite and the associated impacts on habitat and threatened and endangered species. The EPA encourages habitat conservation alternatives that avoid and protect high value habitat and create or preserve linkages between habitat areas to better conserve the covered species. Specific concerns also were raised regarding the width of desert tortoise habitat corridors.

1) The EIS should indicate what measures are recommended to protect important wildlife habitat areas from potential adverse effects of proposed activities. The EPA encourages the BLM to maximize options to protect habitat and minimize habitat loss and habitat fragmentation.
2) The EIS should describe how the corridor width for desert tortoise habitat and connectivity between the project site and the Mule Mountains was determined. The comment notes that a 1.5-mile corridor width for desert tortoise habitat connectivity was prescribed for the Silver State solar project (between the Project boundary and the Lucy Gray Mountains) after a much narrower corridor was initially proposed. The EPA suggests drawing on the experiences from

that project and discussing, in the EIS, how conclusions for this Project may or may not differ, in comparison.

3) The EIS should discuss the impacts associated with an increase of shade and alteration of rainfall deposition patterns on vegetation and/or species in the desert environment.

4) The EIS should provide detailed information on any proposed fencing design and placement, and its potential effects on drainage systems on the Project site. Fencing for the Project should meet appropriate hydrologic, wildlife protection and movement, and security performance standards. Those standards should be described in the EIS. The EPA recommends elimination of fencing altogether in the four primary drainages that transect the Project site to allow for unimpeded flows during precipitation events.

The EPA encourages alternative management practices to limit the use of herbicides, focusing instead on other methods to limit invasive species vegetation and decrease fire risk.

1) The EIS/EIR should describe the invasive management plan used to monitor and control noxious weeds. If herbicides or pesticides could be used to manage vegetation, the EIS/EIR should disclose the projected quantities and types of chemicals. The invasive plant management plan should identify methods that can be used to limit the introduction and spread of invasive species during the post-construction. These measures can include marketing and avoidance of invasives, timing construction activities during periods that would minimize their spread, proper cleaning of equipment and proper disposal of woody material removed from the site.

2) Because construction measures may not be completely effective in controlling the introduction and spread of invasive species, the EIS/EIR should describe post-construction activities such as surveying for invasive species following restoration of the construction site and measures to be taken if infestations are found.

Water Resources

Comments regarding the Project's impact on water resources were received from the Metropolitan Water District, Basin and Range Watch with Western Watersheds Project, the EPA, the Colorado River Board of California, and from the Center for Biological Diversity.

Comments from the Metropolitan Water District expressed concerns about the Project's direct, indirect, and cumulative impacts on water supplies, specifically potential impacts on Colorado River and local groundwater supplies. Metropolitan holds an entitlement to imported Colorado River water supplies, allocated pursuant to federal law as managed by the U.S. Department of the Interior, Bureau of Reclamation. The comment noted that in order to lawfully use Colorado River Water, an entitlement would be required. Additionally, the comment noted that no new entitlement for the use of Colorado River Water is available because this water source is already fully apportioned.

Subsequent comments raising the same issue of apportionment were received from the Colorado River Board of California. As the comment noted:

> *(t)he Chuckwalla Valley Groundwater Basin groundwater aquifer beneath the project site is considered by the USGS report to be hydraulically connected to the Colorado River and groundwater withdrawn from lands underlying the*

> *Accounting Surface would be replaced by Colorado River water, in total or in part. This means that if it is determined that any wells on or near the project site intended to supply water for the project are, in fact, pumping groundwater that would be replaced by Colorado River water, a contract with the Secretary of Interior is required before such a use is deemed to be a legally authorized use of this groundwater.*

The comment stated that the EIR/EIS should address and analyze proposed water uses as well as the Project's potential impact to Colorado River water resources.

> *If it is determined that groundwater pumping would yield water that would be replaced by water from the Colorado River, a legally authorized and reliable water supply for the project can be obtained through the project owner contracting with an existing BCPA Section 5 contractor holder- The Metropolitan Water District of Southern California.*

Additionally, the Colorado River Board requested that mitigation for potential impacts to Colorado River Water resources include preparation of a "Colorado River Water Supply Plan" prior to the onset of water consuming construction activities. Such a plan, the comment stated,

> *would identify measures taken to replace water on an acre-foot to acre-foot basis, if the project results in consumption of water from below the Accounting Surface, towards the purpose of ensuring that no allocated water from the Colorado River is consumed without an entitlement to that water.*

The Center for Biological Diversity noted that the Project may impact on-site drainages. The comment stated that the document must clarify impacts to jurisdictional waters of the U.S. and Waters of the State of California, suggested the use of Mapping Episodic Stream Activity (MESA) protocol for delineation to ensure robust analysis, and requested that the Applicant be required to avoid, minimize, and mitigate for impacts. The organization also suggested that the effects of additional groundwater pumping be evaluated in conjunction with other groundwater issues in the basin, such as pumping, nitrate plume, etc.

The EPA submitted comments concerning the Project's impact on water resources and stated that the EIS/EIR should estimate the quantity of water that Project would require (including during construction and operation) and describe the source of this water and potential effects on other water users and natural resources in the Project's area of influence. The EIS/EIR should clearly depict reasonably foreseeable direct, indirect, and cumulative impacts to water resources. If groundwater is to be used, the potentially-affected groundwater basin should be identified and any potential for subsidence and impacts to springs or other open water bodies and biologic resources should be analyzed. The EPA recommends that the EIS/EIR address the following points to identify the Project's water needs and the resulting impacts on water resources:

1. A discussion of the estimated quantity of water required for the proposed PV electrical generation facility (construction and operations), and describe the source of this water, and potential effects on other users.
2. A discussion of availability of groundwater within the basin and impacts to recharge, springs, or other surface water bodies, biologic resources, and the potential for subsidence.

3. If water would be supplied from an off-site source, include an analysis of environmental impacts associated with the transport and storage of such an alternative water supply.
4. A discussion of cumulative impacts to groundwater supply within the hydrographic basin, including impacts from other proposed large-scale developments.
5. An analysis of different types of technology that can be used to minimize or recycle water, including minimizing or eliminating water use for washing PV panels.
6. A description of water reliability for the Project and clarify how the existing and/or proposed sources may be affected by changing precipitation patterns,
7. An alternatives analysis discussion including compared acreages and channel lengths, habitat types, values, and functions of the waters that would be affected.

The EPA strongly advises avoidance of wetlands and water of the U.S. as well as careful micro-siting of Project components to avoid ephemeral drainages or desert washes to the maximum extent possible. The agency notes that desert washes preform a diversity of hydrologic, biochemical, and geochemical functions that directly affect the integrity and functional condition of higher order waters downstream. Ephemeral washes provide wildlife habitat; healthy ephemeral waters with plant communities control rates of sediment deposition and dissipate energy associated with flood flows. The California Native Plant Society also raised concerns regarding maintenance of washes and stream courses, as being essential to hydrologic function of desert ecosystems and sensitive habitats, such as the Blue Palo Verde-Ironwood Woodland.

The EPA noted concerns about the effect on site hydrology due to changes in microtopography and the potential for increased erosion and sedimentation, particularly in light of extensive animal burrow networks on site. The comment notes that as PV technology improves, less land in needed per megawatt generated. The EPA therefore recommends that mitigation measures or permit conditions include a requirement for a phased construction approach to ensure that only the necessary acreage is built upon.

Additionally, the EPA recommends coordination with the U.S. Army Corps of Engineers to obtain a jurisdictional delineation and confirm the presence of Waters of the U.S. in the Project area, in order to determine whether or not a Clean Water Act Section 404 permit is needed. If a permit is needed, the EIS/EIR should demonstrate the Project's compliance with the Section 404(b)(1) Guidelines. The EIS/EIR should describe all Waters of the U.S. that could be affected by the Project alternatives, and include maps that clearly identify all Waters of the U.S. within the Project area. The discussion should include acreages and channel lengths, habitat types, values, and functions of the Waters of the U.S.

If an aquatic feature does not constitute a Water of the U.S. but could be affected by the Project, the EPA recommends that the EIS/EIR characterize the functions of the aquatic feature and discuss potential mitigation measures. To avoid and minimize direct and indirect impacts to desert washes (such as erosion, migration of channels, and local scour), as applicable:

1. Avoid placement of support structures in washes;
2. Utilize existing natural drainage channels on site and more natural features, such as earthen berms or channels, rather than concrete-line channels;

3. Commit to the use of natural washes, in their present location and natural form, and the avoidance of microphyll woodlands;
4. including adequate natural buffers, for flood control to the maximum extent practicable, and applying the recommended buffer distances, as prescribed by the DRECP CMAs, for the four primary drainages that transect the project;
5. Minimize the number of road crossings over washes and designing necessary crossings to provide adequate flow-through during storm events; and
6. Avoid complete clearing and grading of the site by evaluating the mounting of PV panels at sufficient height above ground to minimize natural vegetation and reduce impacts to drainages.

Air Resources

The EPA, Basin and Range Watch, and the Mojave Desert Air Quality Management District (MDAQMD) submitted comments regarding air resource impacts. Many of the comments recommended that the EIS/EIR include studies that explain and quantify the potential air quality impacts throughout each phase of the Project.

The MDAQMD submitted comments recommending that the lead agency require the Project applicant to prepare and submit a dust control plan pursuant to requirements of District Rule 403.2 prior to commencing earth-moving activity that describes all applicable dust control measures that would be implemented. MDAQMD recommends the use of a water truck to maintain most surfaces during visible dust episodes to minimize fugitive dust emissions, or for projects with exposed sand or fine deposits, and, for projects that exposes such soils through earthmoving, chemical stabilization or covering with gravel. Additional Air Quality recommendations from MDAQMD included appropriate signage, perimeter wind fencing (at a minimum of four-feet high), maintenance of access roads to minimize fugitive dust.

The EPA stated that the EIS/EIR should provide a detailed discussion of ambient air conditions (baseline or existing conditions), National Ambient Air Quality Standards (NAAQS), criteria pollutant nonattainment areas, and potential air quality impacts of the Project, including cumulative and indirect impacts, for each fully evaluated alternative. Estimate criteria pollutant and greenhouse gas emissions for the construction phase, as well as for the operational phase from maintenance activities and ancillary operations.

The EPA and CBD recommended that the EIS/EIR describe and estimate air emissions from potential construction and maintenance activities, as well as, proposed mitigation measures to minimize those emissions. In addition, the EPA recommends that BLM closely coordinate with the MDAQMD and provide an update on such coordination in the EIS.

Climate Change

The EPA and Basin and Range Watch submitted comments regarding climate change impacts. Basin and Range Watch requested that the EIS/EIR include a projection of the Project's carbon footprint and an estimate of much CO_2 sequestration material would be eliminated through

bulldozing during construction. The comment included a link for a recommended CO_2 calculation guidance document.[1]

The EPA stated that the EIS/EIR should consider how climate change could potentially influence the Project, specifically within sensitive areas, and assess how the projected impacts could be exacerbated by climate change. The EIS/EIR also should quantify and disclose the anticipated climate change benefits of solar energy. The EPA suggests quantifying greenhouse gas emissions from different types of generating facilities including solar, geothermal, natural gas, coal-burning, and nuclear and compiling and comparing these values.

California Native Plant Society commented that the deserts of Western North America represent one of the earth's last remaining intact ecosystems, and noted that as these habitats provide a reservoir for biodiversity, ecosystem services, and evolutionary processes. In the face of climate change, the maintenance of the primary roles of desert habitats, the organization noted, is of utmost importance.

Many of the comment letters acknowledged generally beneficial aspect of solar development with respect to decreased greenhouse gas emissions, as compared to other forms of energy development.

3.4 Cumulative Impacts

Many of the comment letters received expressed concern about the cumulative impacts that would occur as a result of the Project being built in conjunction with several other large-scale energy projects in the desert. Commenters who expressed concern about this topic called for a thorough analysis of the cumulative impacts in the EIS/EIR.

The EPA noted that there are currently many solar projects in operation, or being proposed and constructed, on public or private lands in the desert southwest. EPA recommended that impacts from nearby solar projects such as Desert Quartzite, Blythe, McCoy, Palen and Blythe Mesa, and other developments in the region be considered, along with general resource trends. As mentioned, desert washes, ecosystems, and air quality are experiencing cumulative effects from multiple large solar installations in the desert and this is relevant to the assessment of cumulative impacts for the project. The EPA recommended that the BLM use methodology developed jointly by the EPA, the Federal Highway Administration, and the California Department of Transportation as a systematic approach to cumulative impact analysis, which would be applicable to any project.

The Colorado River Indian Tribes asserted that the BLM must take a hard look at cumulative impacts to cultural resources in the region. As explained, the destruction and removal of cultural resources from the Tribes' ancestral lands due to renewable energy projects has already caused tremendous spiritual harm to Tribal members. In addition to triggering extensive cultural resource removal, renewable energy projects have been sited in a way that severs the connectivity between cultural resource sites—a connectivity deemed vital to the traditional value of these cultural

[1] https://www.whitehouse.gov/sites/whitehouse.gov/files/documents/nepa_final_ghg_guidance.pdf

resources. The CRIT comment also noted that the satellite image used in the NOP showing the Project's location is out of date, and that current satellite imagery shows the same area with multiple large scale solar developments nearby.

The Center for Biological Diversity noted that a number of projects are currently permitted and or proposed in the vicinity, the region and the CDCA, and suggested that the EIS/EIR must evaluate cumulative impacts not only to the zone but also to surrounding resources including the Mule Mountains ACEC, other ACECs, Wildlife Habitat Management Areas (WHMAs), federally-designated Wilderness, Joshua Tree National Park, and to cultural resources across the landscape.

3.5 Project Alternatives

Basin and Range Watch, the EPA, as well as several other individuals and organizations submitted comments regarding Project alternatives. The comments generally requested that the EIS/EIR include an analysis of a range of alternatives to ensure that the full spectrum of alternatives to the Project are fully considered and evaluated.

The EPA recommended that BLM consider the latest science used to develop the DRECP, as well as any additional recent scientific studies, and consider evaluating an action alternative that would comply with the DRECP CMAs. Specifically, the EPA recommends that the EIS include a 'crosswalk' table highlighting how each alternative would meet or not meet the criteria for each CMA. Additionally, EPA suggests that a reduced size alternative would allow the developer greater flexibility to avoid any environmentally sensitive areas and should be considered. Further, the EIS should provide a discussion of the reasons for the elimination of alternatives which are not evaluated in detail.

The Wilderness Society and California Wilderness Coalition stated that although the Project is "grandfathered" and, as such, not required to comply with the DRECP, the two organizations strongly recommend that BLM develop an alternative that analyzes the Project under the DRECP and compares the impacts to resources and values to the impacts under other action alternatives. By developing an alternative that analyzes the Project under the DRECP, BLM could, the organizations suggest, determine whether permitting the Project using DRECP decisions and policies would lead to improved outcomes. The comment recommended that BLM select the proposed alternative as the agency preferred alternative.

Defenders of Wildlife and California Wilderness Coalition commented that the range of alternatives should be based on resource occurrence and sensitivity, with a goal of avoiding or minimizing impacts by modifying the size and location of the project. Similar to the comment letter noted above, this comment also suggested that one of the alternatives should include compliance with the DRECP.

Basin and Range Watch and Western Watersheds Project requested that the range of alternatives comply with NEPA guidelines and include (1) a No Action Alternative; (2) a Brownfields and Degraded Lands Alternative; (3) and a Distributed Generation Alternative. Additionally, the

comment suggested that BLM should examine the feasibility and problems with a plan to integrate 350 megawatts of battery storage at the Project site.

The EPA submitted comments regarding Project alternatives, stating that the EIS/EIR should describe how each alternative was developed, how it addresses each Project objective, and how it would be implemented. The alternatives analysis should include a discussion of a reduced acreage, reduced MW and modified footprint alternatives, as well as alternative sites and generating technologies, including different types of solar technologies, and describe the benefits associated with the proposed technology. The EIS/EIR should clearly describe the rational used to determine whether impacts of an alternative are significant or not. Thresholds of significance should be determined by considering the context and intensity of an action and its effects.

The EPA strongly encouraged the Lead Agencies to pursue the siting of renewable energy projects on disturbed, degraded, and contaminated sites, including fallow or abandoned agricultural lands before considering large tracts of undisturbed public lands. The EIS/EIR should identify and analyze an environmentally preferable alternative. Options such as reducing the footprint of the Project within the Project area or relocating sections/components of the Project to other areas, including private land, to reduce environmental impacts should be examined. The EPA also recommended that the EIS/EIR describe the current condition of the land selected for the Project, discuss whether the land is classified as disturbed, and describe to what extent the land could be used for other purposes in the future.

3.6 EIS/EIR Administrative and Permitting Issues

Agency Permits/Consultation

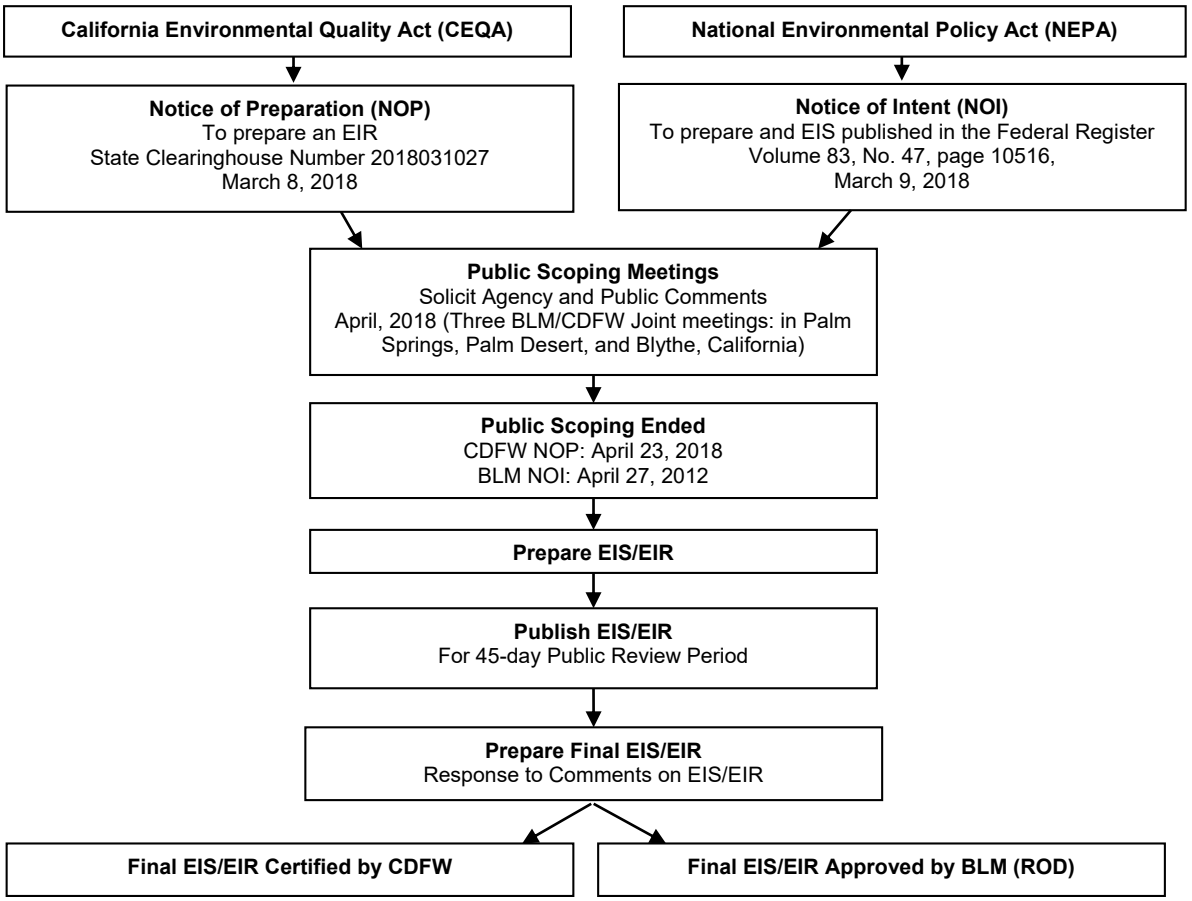
Several comments were submitted by Basin and Range Watch and the EPA regarding EIS/EIR administrative and permitting issues and needs. The EPA noted, based on the National Wetlands Inventory, there appear to be wetland features in the vicinity of the Project including riverine and fresh water ponds. If avoidance of these water features is not possible, the EPA recommended early consultation with the U.S. Army Corps of Engineers to determine if a Section 404 permit would be required under the Clean Water Act.

The Southwest Carpenters noted in their comment that BLM has not indicated whether it intends to initiate formal Section 7 consultation with U.S. Fish and Wildlife Service. The comment recommended that BLM request preparation of a Biological Assessment and Biological Opinion, as the Project has potential to jeopardize the continued existence of an endangered or threatened species. 16 U.S.C. § 1536.

Basin and Range Watch expressed concern that the Project would be inconsistent with FLPMA Class M (Moderate Use) designation, and suggested the solar project would be more appropriate on lands with a Class I (Intensive Use) designation- that is “for lands managed for concentrated use to meet human needs”.

The Metropolitan Water District submitted comments regarding water entitlements stating that if an exchange of water rights is required for the Project, proponents would have to obtain water

from existing junior priority holder. Such an exchange would require approval from the Metropolitan Water District's Board of Directors.



3.7 Issues Outside the Scope of the EIS/EIR

General comments were received that noted support and others that were against the development of the Project. Basin and Range Watch along with Western Watersheds Project suggested that although the East Riverside Solar Energy Zone and DFA have been approved, the Solar PEIS and DRECP analysis was poor; thus, the Project should be reviewed with a full 90-day Environmental Impact Statement. Basin and Range Watch with Western Watersheds Project expressed confusion about the scoping process, noting that different comment deadlines are listed on the BLM website, most likely due to the extension of the comment deadline.

Comments and several attachments were received from Kathleen Hayden regarding the management of public lands under the Wild Horse and Burro Act, and Federal Land Policy and Management Act. The comments were not specifically related to the scope of the DEIS/DEIR.

SECTION 4
Summary of Future Steps in the Planning Process

The EIS/EIR process requires a team of interdisciplinary resource specialists to complete each step. An important part of the environmental planning process is engaging the public and relevant agencies from the earliest stages of and throughout the planning process to address issues, comments, and concerns. The steps of the CEQA and NEPA planning processes and agency authority and decisions to be made are described as follows. Figure 4-1 provides a summary of the EIR (CEQA) and EIS (NEPA) processes.

Crimson Solar Project

Notices

ESA

Appendix A-1
Notice of Intent (published in the Federal Register on March 9, 2018)

governance funding agreement may include, but are not limited to: Construction, farming, concessions, maintenance, biological program efforts, habitat management, fire management, and implementation of comprehensive conservation planning.

Locations of Refuges and Hatcheries With Close Proximity to Self-Governance Tribes

The Service developed the list below based on the proximity of identified self-governance Tribes to Service facilities that have components that may be suitable for administering through a self-governance funding agreement.

1. Alaska National Wildlife Refuges—Alaska
2. Alchesay National Fish Hatchery—Arizona
3. Humboldt Bay National Wildlife Refuge—California
4. Kootenai National Wildlife Refuge—Idaho
5. Agassiz National Wildlife Refuge—Minnesota
6. Mille Lacs National Wildlife Refuge—Minnesota
7. Rice Lake National Wildlife Refuge—Minnesota
8. National Bison Range—Montana
9. Ninepipe National Wildlife Refuge—Montana
10. Pablo National Wildlife Refuge—Montana
11. Sequoyah National Wildlife Refuge—Oklahoma
12. Tishomingo National Wildlife Refute—Oklahoma
13. Bandon Marsh National Wildlife Refuge—Washington
14. Dungeness National Wildlife Refuge—Washington
15. Makah National Fish Hatchery—Washington
16. Nisqually National Wildlife Refuge—Washington
17. Quinault National Fish Hatchery—Washington
18. San Juan Islands National Wildlife Refuge—Washington
19. Tamarac National Wildlife Refuge—Wisconsin

For questions regarding self-governance, contact Scott Aikin, Fish and Wildlife Service, National Native American Programs Coordinator, 1211 SE Cardinal Court, Suite 100, Vancouver, Washington 98683, telephone (360) 604–2531 or fax (360) 604–2505.

F. Eligible U.S. Geological Survey (USGS) Programs

The mission of the USGS is to collect, analyze, and provide information on biology, geology, hydrology, and geography that contributes to the wise management of the Nation's natural resources and to the health, safety, and well-being of the American people. This information is usually publicly available and includes maps, data bases, and descriptions and analyses of the water, plants, animals, energy, and mineral resources, land surface, underlying geologic structure, and dynamic processes of the earth. The USGS does not manage lands or resources. Self-governance Tribes may potentially assist the USGS in the data acquisition and analysis components of its activities.

For questions regarding self-governance, contact Monique Fordham, Esq., National Tribal Liaison, U.S. Geological Survey, 12201 Sunrise Valley Drive, Reston, Virginia 20192, telephone (703) 648–4437 or fax (703) 648–6683.

G. Eligible Office of the Special Trustee for American Indians (OST) Programs

The Department has responsibility for what may be the largest land trust in the world, approximately 56 million acres. OST oversees the management of Indian trust assets, including income generated from leasing and other commercial activities on Indian trust lands, by maintaining, investing and disbursing Indian trust financial assets, and reporting on these transactions. The mission of the OST is to serve Indian communities by fulfilling Indian fiduciary trust responsibilities. This is to be accomplished through the implementation of a Comprehensive Trust Management Plan (CTM) that is designed to improve trust beneficiary services, ownership information, management of trust fund assets, and self-governance activities.

A Tribe operating under self-governance may include the following programs, services, functions, and activities or portions thereof in a funding agreement:

1. Beneficiary Processes Program (Individual Indian Money Accounting Technical Functions).

2. Appraisal Services Program. Tribes/consortia that currently perform these programs under a self-governance funding agreement with the Office of Self-Governance (OSG) may negotiate a separate memorandum of understanding (MOU) with OST that outlines the roles and responsibilities for management of these programs.

The MOU between the Tribe/consortium and OST outlines the roles and responsibilities for the performance of the OST program by the Tribe/consortium. If those roles and responsibilities are already fully articulated in the existing funding agreement with the OSG, an MOU is not necessary. To the extent that the parties desire specific program standards, an MOU will be negotiated between the Tribe/consortium and OST, which will be binding on both parties and attached and incorporated into the OSG funding agreement.

If a Tribe/consortium decides to assume the operation of an OST program, the new funding for performing that program will come from OST program dollars. A Tribe's newly-assumed operation of the OST program(s) will be reflected in the Tribe's OSG funding agreement.

For questions regarding self-governance, contact Lee Frazier, Program Analyst, Office of External Affairs, Office of the Special Trustee for American Indians (MS 5140—MIB), 1849 C Street NW, Washington, DC 20240–0001, phone: (202) 208–7587, fax: (202) 208–7545.

IV. Programmatic Targets

The programmatic target for Fiscal Year 2018 provides that, upon request of a self-governance Tribe, each non-BIA bureau will negotiate funding agreements for its eligible programs beyond those already negotiated.

V. Public Disclosure

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Dated: February 15, 2018.

Ryan K. Zinke,

Secretary.

BILLING CODE 4337–15–P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[LLCAD06000 L51010000.ER0000 17XL5017AP LVRWB17B5120 CACA 051967]

Notice of Intent To Prepare a Joint Environmental Impact Statement/Environmental Impact Report and Possible Land Use Plan Amendment for the Proposed RE Crimson Solar Project, Riverside County, CA

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of intent.

SUMMARY: In compliance with the National Environmental Policy Act of 1969, as amended (NEPA), and the Federal Land Policy and Management Act of 1976, as amended (FLPMA), the Bureau of Land Management (BLM)

Palm Springs-South Coast Field Office, Palm Springs, CA, intends to prepare a joint Environmental Impact Statement (EIS)/Environmental Impact Report (EIR), including a potential amendment to the California Desert Conservation Area (CDCA) Plan, and by this Notice is announcing the beginning of the scoping process to solicit public comments and identify issues.

DATES: This Notice initiates the public scoping process for the EIS/EIR and possible plan amendments. Comments on issues may be submitted in writing until April 9, 2018. The date(s) and location(s) of any scoping meetings will be announced at least 15 days in advance through local media, newspapers, and the BLM website at: *https://eplanning.blm.gov/.*

To be included in the Draft EIS/EIR, all comments must be received prior to the close of the 30-day scoping period or 15 days after the last public meeting, whichever is later. The BLM will provide additional opportunities for public participation upon publication of the Draft EIS/EIR.

ADDRESSES: The public may submit comments related to the RE Crimson Solar Project by any of the following methods:

- *Website: https://eplanning.blm.gov/.*
- *Email: blm_ca_crimsonsolar@blm.gov.*
- *Fax:* (541) 618–2400, ATTN: Miriam Liberatore, project manager, RE Crimson Solar.
- *Mail:* ATTN: Miriam Liberatore, project manager, RE Crimson Solar, Bureau of Land Management, 3040 Biddle Road, Medford, OR 97504.

Documents pertinent to this proposal may be examined at the BLM Palm Springs-South Coast Field Office located at 1201 Bird Center Drive, Palm Springs, CA 92262.

FOR FURTHER INFORMATION CONTACT: Miriam Liberatore, project manager, telephone (541) 618–2412; address Bureau of Land Management, 3040 Biddle Road, Medford, OR 97504; email: *mliberat@blm.gov.* Contact Ms. Liberatore to be added to the mailing list. Persons who use a telecommunications device for the deaf (TDD) may call the Federal Relay Service at (800) 877–8339, to contact the above individual during normal business hours. The Service is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. Telephone replies will be returned during normal business hours.

SUPPLEMENTARY INFORMATION: Sonoran West Solar Holdings, LLC, a wholly owned subsidiary of Recurrent Energy LLC, has requested a right-of-way (ROW) authorization to construct, operate, maintain, and decommission a maximum 350 megawatt solar photovoltaic facility and necessary ancillary facilities, including battery storage, project substations, access roads, operations and maintenance buildings, and lay down areas.

The Project site consists of about 2,700-acres of BLM-administered land within the Riverside East Solar Energy Zone (SEZ). The Desert Renewable Energy Conservation Plan (DRECP) Land Use Plan Amendment also designated the area as a Development Focus Area (DFA).

This document provides notice that the BLM Palm Springs-South Coast Field Office and the California Department of Fish and Wildlife intend to jointly prepare an EIS/EIR, which may include a CDCA Plan Amendment, for the Project. It also announces the beginning of the scoping process for this effort and seeks public input on environmental issues and potential planning criteria relevant to the Project and any potential plan amendments. The public scoping process guides the planning process and determines the relevant issues that will influence the scope of the environmental analysis, including alternatives and environmental consequences.

Preliminary issues for the project have been identified by BLM personnel; Federal, State, and local agencies; and other stakeholders. The issues include: Air quality and greenhouse gas emissions; biological resources, including special status wildlife and vegetation species; cultural resources; geology and soils; hazards and hazardous materials; hydrology and water quality; lands and realty; mineral resources; noise; paleontological resources; recreation; socioeconomics and environmental justice; special designations; transportation and travel management; visual resources; wildland fire ecology; and areas with high potential for renewable energy development.

Written comments may be submitted to the BLM at a scoping meeting, or via one of the methods listed in the addresses section above. Input must be received by the close of the 30-day scoping period or within 15 days after the last public meeting, whichever is later.

By this Notice, the BLM is complying with requirements in 43 CFR 1610.2(c) to notify the public of potential amendments to the CDCA Plan, as amended, predicated on the findings in the EIS/EIR.

If one or more land use plan amendments are necessary, the BLM will integrate the land use planning process with the NEPA process for the Project. A preliminary list of the potential planning criteria that will be used to help guide and define the scope of the plan amendment includes:

1. The plan amendments will be completed in compliance with FLPMA, NEPA, and all other relevant Federal laws, executive orders, and BLM policies;

2. Existing valid plan decisions will not be changed and any new plan decisions will not conflict with existing plan decisions; and

3. The plan amendment(s) will recognize valid existing rights.

The public may submit comments to the BLM on issues and planning criteria in writing at any public scoping meeting, or by using one of the methods listed in the **ADDRESSES** section above.

The BLM will use and coordinate the NEPA scoping process to help fulfill the public involvement process under the National Historic Preservation Act (NHPA) (54 U.S.C. 306108 as provided in 36 CFR 800.2(d)(3)). The information about historic and cultural resources within the area potentially affected by the proposed action will assist the BLM in identifying and evaluating impacts to such resources.

The BLM will consult with Indian tribes on a government-to-government basis in accordance with Executive Order 13175 and other policies. Tribal concerns, including impacts on Indian trust assets and potential impacts to cultural resources, will be given due consideration. Federal, State, and local agencies, along with tribes and other stakeholders that may be interested in or affected by the proposed action that the BLM is evaluating are invited to participate in the scoping process and, if eligible, may request or be requested by the BLM to participate in the development of the environmental analysis as a cooperating agency.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so. The minutes and list of attendees for each scoping meeting will be available to the public and open for 30 days after the meeting to any participant who wishes to clarify the views he or she expressed. With respect to the

potential land use plan amendment, the BLM will evaluate identified issues to be addressed in the plan amendment, and will place them into one of three categories:

1. Issues to be resolved in the plan amendment;
2. Issues to be resolved through policy or administrative action; or
3. Issues beyond the scope of this plan amendment.

The BLM will provide an explanation in the Draft EIS/EIR as to why an issue was placed in category two or three. The public is also encouraged to help identify any management questions and concerns that should be addressed in the EIS/EIR and potential land use plan amendments. The BLM will work collaboratively with interested parties to identify the management decisions that are best suited to local, regional, and national needs and concerns.

The BLM will use an interdisciplinary approach to develop the EIS and potential land use plan amendments in order to consider the variety of resource issues and concerns identified. Specialists with expertise in the following disciplines will be involved in the planning process: Air, minerals and geology, outdoor recreation, archaeology, paleontology, wildlife and botany, lands and realty, hydrology, soils, sociology, and economics.

Authority: 40 CFR 1501.7 and 43 CFR 1610.2.

Danielle Chi,

BLM California Deputy State Director.

[FR Doc. 2018–04691 Filed 3–8–18; 8:45 am]

BILLING CODE 4310–40–P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[17XL1109AF LLUTG01100 L13100000.EJ0000]

Notice of Availability of a Draft Environmental Impact Statement for the Greater Chapita Wells Natural Gas Infill Project, Uintah County, Utah

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of availability.

SUMMARY: In accordance with the National Environmental Policy Act of 1969, as amended, the Bureau of Land Management (BLM) has prepared a Draft Environmental Impact Statement (EIS) for the Greater Chapita Wells Natural Gas Infill Project and by this notice is announcing the opening of the comment period.

DATES: To ensure comments will be considered, the BLM must receive written comments on the Greater Chapita Wells Draft EIS within 45 days following the date the Environmental Protection Agency publishes its NOA in the **Federal Register**. The BLM will announce future meetings or hearings and any other public involvement activities at least 15 days in advance through public notices, media releases, and/or mailings.

ADDRESSES: You may submit comments related to the Greater Chapita Wells project by any of the following methods:

- *Website: http://go.usa.gov/csKAz.*
- *Email: UT_Vernal_Comments@blm.gov.*
- *Fax:* 435–781–4410.
- *Mail:* Bureau of Land Management, Vernal Field Office, 170 South 500 East, Vernal, Utah 84078.

Copies of the Greater Chapita Wells Draft EIS are available in the Vernal Field Office at the above address and website.

FOR FURTHER INFORMATION CONTACT: Stephanie Howard, Project Manager, 435–781–4400; BLM Vernal Field Office, 170 South 500 East, Vernal, UT 84078; *showard@blm.gov.* Persons who use a telecommunications device for the deaf (TDD) may call the Federal Relay Service (FRS) at 1–800–877–8339 to contact the above individual during normal business hours. FRS is available 24 hours a day, 7 days a week, to leave a message or question with the above individual. You will receive a reply during normal business hours.

SUPPLEMENTARY INFORMATION: The BLM published in the September 9, 2009, **Federal Register** a Notice of Intent to prepare an EIS (74 FR 46458). The Greater Chapita EIS Project Area encompasses approximately 43,109 acres located in Township 8 South, Ranges 22 through 24 East; Township 9 South, Ranges 22 and 23 East; and Township 10 South, Range 23 East, Salt Lake Base and Meridian, about 25 miles south of Vernal, Utah. Of the 43,109 acres within the project area, about 76 percent is Federal surface administered by the BLM; 15 percent is tribal trust surface; 5 percent is State of Utah surface administered by the Utah Trust Lands Administration; and 4 percent is private surface. The entire project is within the exterior boundary of the Uintah and Ouray Reservation (Uncompahgre Indian Country).

Oil and gas drilling has been ongoing within the Chapita project area since 1952. As of March 2014, the project area contained 1,247 active gas wells on 960 well pads, approximately 257 miles of roads, and approximately 268 miles of pipelines. Total existing disturbance in the project area is approximately 3,975 acres, with approximately 1,000 acres under interim reclamation.

The Draft EIS analyzes a proposal by EOG Resources Inc (EOG) to further develop natural gas resources on their Federal leases in the project area. EOG's proposal includes drilling up to 2,808 new wells and constructing associated ancillary transportation, transmission, and water disposal facilities within the project area. The proposed life of the project is 55 years, with drilling and development activities to occur within the first 15 years. The new gas wells would be drilled to the Green River, Wasatch, Mesaverde Group (including the Blackhawk), Mancos, and Dakota formations at depths of 6,000 to 15,000 feet.

The Draft EIS describes and analyzes in detail the impacts of the No Action Alternative, and three action alternatives, including EOG's Proposed Action. Seven additional alternatives were considered, but eliminated from detailed analysis. The alternatives considered in detail include a landscape-scale mitigation plan that incorporates applicant-committed measures, design features (including best management practices), and the mitigation hierarchy, including compensatory mitigation as applicable to minimize or eliminate impacts to the resources of concern. In particular, the Draft EIS action alternatives contain an applicant-committed ozone management strategy designed to provide a reasonable assurance that project implementation would not contribute to the ongoing ozone situation in the Uinta Basin. This strategy contains five approaches to managing project emissions, including: Applicant-committed emission reduction measures; audio, visual, olfactory and infrared monitoring; a commitment to no-net increase of volatile organic compound emissions to be tracked via an emissions balance sheet; ozone training for personnel; and an ozone event action plan. The following is a summary of the main components of the various alternatives:

1. *No Action Alternative*—The proposed natural gas development on BLM lands and leases as described in the Proposed Action would not be implemented. However, under this alternative, natural gas exploration and development is assumed to continue on Federal, State, and private lands under previous authorizations. Up to 462 new gas wells would be drilled from 425 new well pads and 37 expanded well pads. This alternative also includes expansion of an existing compressor station, construction of 18 liquids gathering system (LGS) facilities,

Notice of Preparation of a Joint Draft Environmental Impact Statement/Environmental Impact Report and Notice of Public Scoping Meetings

Date: March 8, 2018

To: Responsible/Trustee Agencies and Interested Parties

From: California Department of Fish and Wildlife

Subject: Notice of Preparation (NOP) of a Joint Draft Environmental Impact Statement/Environmental Impact Report for the RE Crimson Solar Project and Notice of Public Scoping Meetings

NOP Public Review Period: March 9 to April 23, 2018

Public Scoping Meetings:

Date: April 11, 2018 (Wednesday) **Location:** University of California, Riverside, Palm Desert, Room B117, 75080 Frank Sinatra Drive, Palm Desert, CA 92211 **Time**: 5:00 to 8:00 p.m.	**Date:** April 12, 2018 (Thursday) **Location:** City of Blythe Multipurpose Room, City Hall, 235 North Broadway, Blythe, CA 92225 **Time:** 12:00 to 3:00 p.m.

A. Introduction

In accordance with Section 15063 of the California Environmental Quality Act (CEQA) Guidelines, the California Department of Fish and Wildlife (CDFW), as the CEQA lead agency, will prepare a Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the RE Crimson Solar Project (proposed project) jointly with the U.S. Department of the Interior Bureau of Land Management (BLM). The project applicant, Recurrent Energy (RE), will need to obtain an Incidental Take Permit (ITP) and Lake and Streambed Agreement (LSAA) from the California Department of Fish and Wildlife and has also filed a Right-of-Way (ROW) Grant application with BLM. CDFW's need to contemplate a ITP and LSAA triggers the need to comply with CEQA and BLM's need to contemplate a right-of-way grant application triggers the need to comply with the National Environmental Policy Act (NEPA). CDFW and BLM have agreed to prepare a joint Draft EIS/EIR for the RE Crimson Solar Project. Therefore, CDFW, as the lead agency under California law, and BLM, as the federal lead agency, will prepare a Draft and Final EIR/EIS to comply with CEQA and NEPA.

As required by CEQA, this Notice of Preparation (NOP) is being sent to the Office of Planning and Research, responsible and trustee agencies and interested members of the public who submitted a request for such notices. The purpose of the NOP is to inform recipients that CDFW is beginning preparation of an EIS/EIR for the proposed project and to solicit comments concerning the scope and content of the environmental information that is germane to your agency's statutory responsibilities in connection with the proposed project. Information that will be most useful at this time would be descriptions of the significant environmental issues and reasonable alternatives and mitigation measures you would like to see explored in the Draft EIS/EIR.

As required by NEPA, the BLM will publish a Notice of Intent (NOI) in the Federal Register for preparation of a joint EIR/EIS for the RE Crimson Solar Project. Similar to this NOP, the intent of the NOI is to initiate the public scoping for the EIR/EIS, provide information about the proposed project, and also serve as an invitation for other federal agencies granted cooperating agency status to provide comments on the scope and content of the EIR/EIS.

This NOP includes background information on the project and the project location (Section B), a description of the proposed project (Section C), a summary of potential project impacts (Section D), time and location of the public scoping meetings (Section E), information on how to provide comments to CDFW (Section F), and where documents are available for public review (Section G).

In accordance with CEQA Guidelines Section 15082(b), there will be a 45-day comment period for this NOP, beginning on March 9, 2018, and ending on April 23, 2018. CDFW welcomes agency and public input during the public review period. In the event that no response or well-justified request for additional time is received from any responsible, federal, or trustee agency by the end of the review period, CDFW may presume that such agencies have no response.

B. Background and Project Location

B.1 Background

Sonoran West Solar Holdings LLC (Applicant), a wholly owned subsidiary of Recurrent Energy LLC, proposes to construct, operate, and decommission the proposed 350 megawatt (MW) utility-scale solar photovoltaic (PV) and would include up to 350 MW energy storage on approximately 2,500 acres of public lands administered by the BLM within the California Desert Conservation Area (CDCA) planning area. The proposed project is also located within the Riverside East Solar Energy Zone (SEZ) and within a Desert Renewable Energy Conservation Plan (DRECP) Development Focus Area (DFA).

The proposed project site was formerly identified for development of the Sonoran West Solar Energy Generating Station as proposed by BrightSource Energy in 2009. The former Sonoran

West project consisted of a 540-megawatt (MW) dual-turbine power tower project on approximately 7,600 acres of a combination of BLM-administered and privately owned land. The current proposed project represents a substantial reduction in land use requirements and associated impacts.

B.2 Project Location

The proposed project site is located in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, north of Mule Mountain, and south of Interstate 10 (I-10), including portions of Sections 1, 2, 11, 12, 13, 24, and 25 within Township 7 South, Range 20 East; and portions of Sections 6, 7, 17, and 18 within Township 7 South, Range 21 East (Figure 1). The proposed project site consists of approximately 2,500 acres of BLM-administered land within the Riverside East SEZ and within a DRECP DFA. The proposed project is not sited within the adjacent Section 368 Federal Energy Corridor pursuant to the Westwide Energy Corridor Final Programmatic EIS, except for a short gen-tie line that would interconnect the utility-scale solar PV facility to the Colorado River Substation.

The proposed project site is situated at the eastern edge of the Chuckwalla Hydrologic Area. The project area supports a broad alluvial fan that includes many braided washes and channels that converge into a primary channel flowing into an intra-state playa lake northwest of the proposed project site.

The proposed project site is surrounded primarily by BLM-managed lands with some private parcels also located in the vicinity. The proposed project site is located at the northern foot of the Mule Mountain Area of Critical Environmental Concern, which is an important cultural resource for local Native American tribes. Southern California Edison (SCE) high-voltage transmission lines and the Colorado River Substation (CRS) are located directly north of the proposed project site, and the I-10 freeway is north of and parallel to those facilities. The proposed First Solar Desert Quartzite project site is located to the east of the proposed project site, and the recently approved Blythe Mesa Solar Project is located northeast of the Desert Quartzite site. Designated critical habitat for desert tortoise is located to the west of the proposed project site as is the Chuckwalla Desert Wildlife Management Area and Critical Habitat Unit.

C. Project Description

The proposed project consists of a utility-scale solar PV and energy storage project that would be located on up to approximately 2,500 acres of public lands managed by the BLM within the CDCA planning area. The proposed project would interconnect to the regional electrical grid at the SCE 230-kilovolt (kV) CRS. The project would generate up to 350 MW of renewable energy using PV technology and would include up to 350 MW of integrated energy storage capacity.

The proposed project is comprised of the following components/facilities:

- **Photovoltaic Modules and Support Structures**: the solar facility would include an estimated 2 million solar modules, although the precise module count would depend on the technology ultimately selected at the time of procurement. Module mounting systems that may be installed include either fixed-tilt or tracking technology, depending on the PV modules ultimately selected. Modules would be arranged next to each other in long strings called rows and supported by steel piles.
- **Inverters, Transformers, and Electrical Collection System**: The proposed project would be designed and laid out primarily in 2 MW increments, which would include an inverter equipment area measuring approximately 40 feet by 25 feet. Each 2 MW increment would include an inverter-transformer station constructed on a concrete pad or steel skid and centrally located within the PV arrays.
- **Project Substations and Gen-Tie Line**: Up to four substations would transform voltage from the 34.5 kV electrical collection cables to 230 kV. The area of each substation and associated equipment would be approximately 30,000 square feet and would include power transformers and footings, control buildings, metering stands, microwave towers up to approximately 100 feet in height, and dead-end structures up to approximately 80 feet in height. The project gen-tie would be would be constructed with either monopoles, lattice steel structures, or wooden H-frame poles. A portion of the gen-tie line may be constructed underground to cross under existing transmission lines.
- **Operations and Maintenance Building**: An operations and maintenance (O&M) building would be located near the project substations. The O&M building would be approximately 2,000 square feet (approximately 40 feet by 50 feet by 15 feet at its tallest point) and would accommodate O&M staff.

Other features/components of the proposed facility include a supervisory control and data acquisition system, an optional battery or flywheel storage system capable of storing up to 350 MW of electricity, a meteorological data collection system, and telecommunications facilities. If provided, the storage system would consist of up to 3,000 electrical enclosures measuring approximately 40 feet by 8 feet by 8.5 feet high and installed on concrete foundations.

Access to the project site would be provided from the existing paved Powerline Road to the CRS. The project's on-site roadway system would include a perimeter road, access roads, and internal roads. In the event that the Applicant cannot reach an agreement with the private landowner, two new access road segments along Powerline Road would be constructed in order to avoid two privately owned parcels through which the existing Powerline Road crosses. Multiple points of ingress/egress would be provided to the site and accessed by site personnel via locked gates. Security fencing would be installed along the perimeter of the proposed project site and motion-sensitive, directional security lights would be installed to provide adequate

illumination around the substation areas, each inverter cluster, and at gates. Other security measures including infrared security cameras may be installed.

D. Potential Environmental Effects

The EIS/EIR will evaluate potential environmental effects of the proposed project. The EIS/EIR will identify reasonable alternatives, compare the environmental impacts of the alternatives to those of the proposed project, and propose mitigation to avoid and/or reduce impacts deemed potentially significant.

Potential issues and impacts to the existing environment to be analyzed in the EIS/EIR include the following environmental topics. Note, topic names in parenthesis below is terminology used in NEPA documentation and will appear in the joint EIR/EIS.

- Aesthetics (Visual Resources)
- Air Quality
- Biological Resources
- Cultural and Paleontological Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards/Hazardous Materials, Wildland Fire Ecology
- Hydrology and Water Quality
- Land Use and Planning (Lands and Realty)
- Mineral Resources
- Noise
- Population and Housing (Socioeconomics and Environmental Justice)
- Recreation
- Tribal Cultural Resources
- Transportation and Traffic (Transportation and Public Access)
- Utilities and Public Services

The EIS/EIR will also address the cumulative environmental consequences of the proposed project in combination with other closely related past, present, and reasonably foreseeable probable future projects in the area. This will serve to satisfy CEQA requirements regarding regional cumulative effect concerns. Pursuant to CEQA Guidelines Section 15063(a), CDFW has elected to proceed directly to the preparation of a Draft EIR rather than preparing an Initial Study.

In compliance with CEQA Guidelines Section 15126.6, the EIS/EIR will describe and evaluate the comparative merits of a reasonable range of alternatives to the proposed project. The EIS/EIR will also identity any alternatives that were considered but rejected by the lead agency as infeasible and briefly explain the reasons why. The EIS/EIR will provide an analysis of the No Project Alternative and will also identify the environmentally superior alternative. The alternatives to be analyzed in the EIS/EIR will be developed during the environmental review process and will consider input received during public scoping.

E. Public Scoping Meeting

CDFW and BLM will hold two public scoping meetings to inform interested parties about the proposed project, and to provide agencies and the public with an opportunity to provide written comments on the scope and content of the joint EIS/EIR. The meeting dates, locations, and times are as follows:

Date: April 11, 2018 (Wednesday) **Location:** University of California, Riverside Palm Desert, Room B117, 75080 Frank Sinatra Drive, Palm Desert, CA 92211 **Time**: 5:00 to 8:00 p.m.	**Date:** April 12, 2018 (Thursday) **Location:** City of Blythe Multipurpose Room, City Hall, 235 North Broadway, Blythe, CA 92225 **Time:** 12:00 to 3:00 p.m.

The meeting space is accessible to persons with disabilities. Individuals needing special assistive devices will be accommodated to the best ability of CDFW. For more information, please contact Magdalena Rodriguez via email at magdalena.rodriguez@wildlife.ca.gov or phone at 909.844.2520 at least 1 week before the meeting.

Everyone is encouraged to attend a meeting to express their concerns about the proposed project and to offer suggestions regarding the project as proposed, including alternatives.

F. Providing Comments

At this time, CDFW is soliciting comments on the NOP regarding your views on how the project may affect the environment. This information will be considered when preparing the Draft EIS/EIR's discussion of environmental topics, significant effects, mitigation measures, and alternatives. Because of time limits mandated by state law, comments should be provided no later than 5:00 p.m. on [April 23, 2018 (45-day comment period).

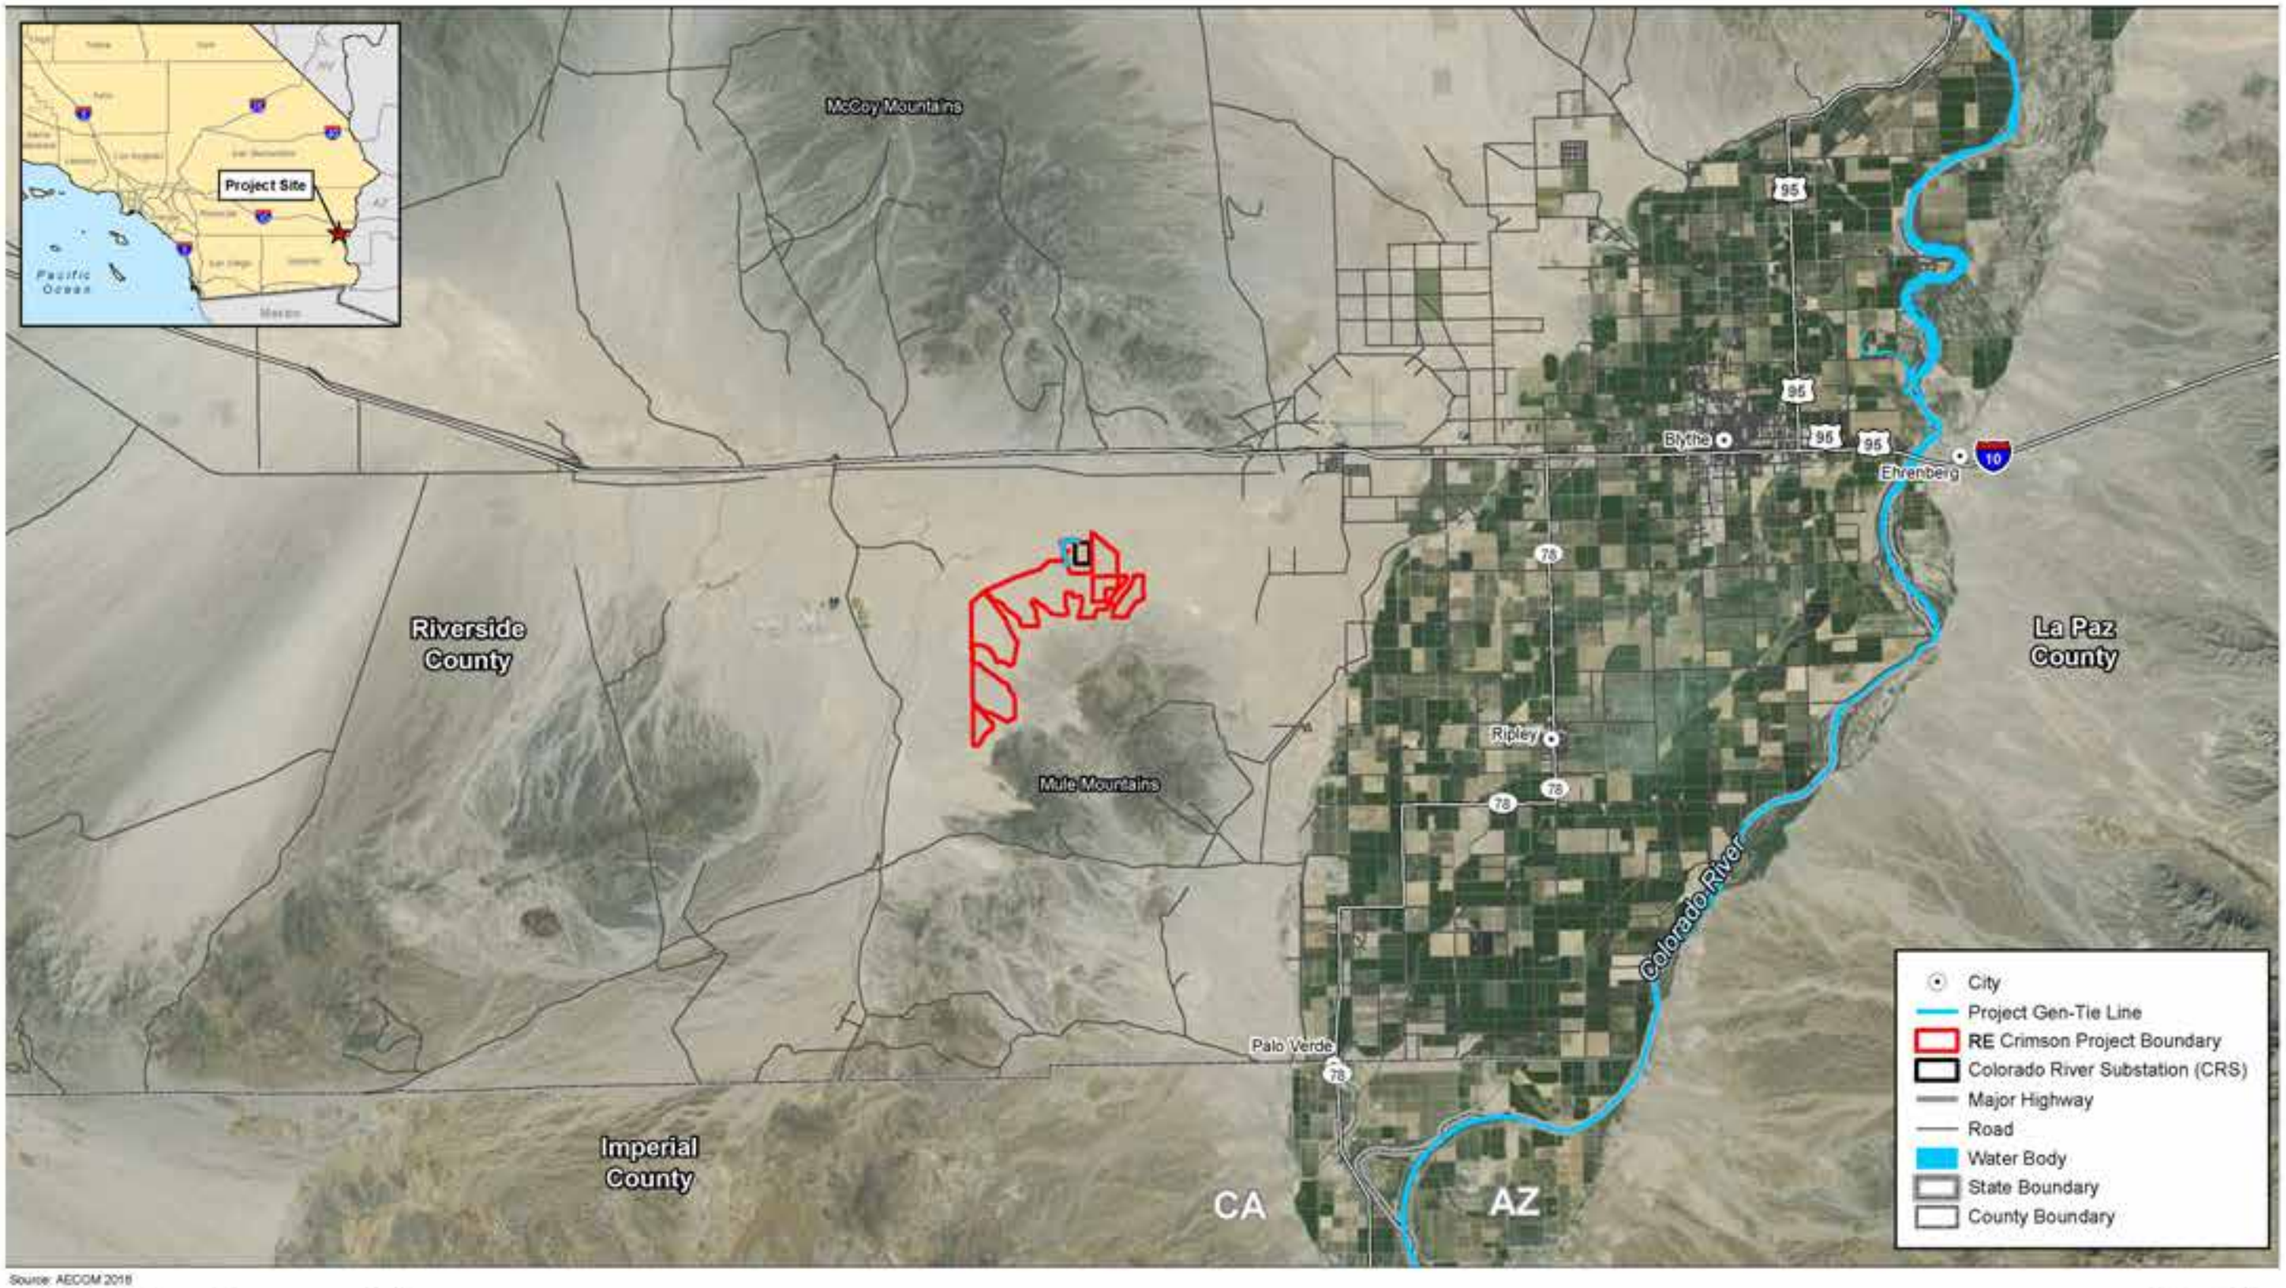
You may submit comments in a variety of ways: (1) by U.S. mail, (2) by electronic mail (email), or (3) by attending a public scoping meeting and submitting written comments at that time. Comments provided by email should include "**RE Crimson Solar Project NOP Scoping Comments**" in the subject line, and the name and physical address of the commenter should be contained in the body of the email.

Please send all comments to:

California Department of Fish and Wildlife
Attention: Magdalena Rodriguez, Project Manager
Mailing Address: 3602 Inland Empire Boulevard, Suite C220, Ontario, California 91764

OR via email: magdalena.rodriguez@wildlife.ca.gov
(subject line: "**RE Crimson Solar Project NOP Scoping Comments**")

All comments on environmental issues received during the public comment period will be considered and addressed in the Draft EIS/EIR, which is anticipated to be available for public review in late 2018/early 2019.



G. Location of Documents Available for Public Review

A hard copy of the NOP is available for review at the locations listed in Table 1.

Table 1
Repository Sites

Site	Address	Telephone
CDFW Blythe Office	17041 South Lovekin Boulevard Blythe, CA 92225	760.922.9189
CDFW Inland Deserts Region Office	3602 Inland Empire Boulevard, Suite C220, Ontario, CA 91764	909.484.0167
BLM Palm Springs-South Coast Field Office	1201 Bird Center Drive, Palm Springs, CA 92262	760.833.7150

Notice of Preparation - Project Location Map

Attachment 1

California Environmental Quality Act Environmental Checklist

Following are the questions included in Appendix G of the California Environmental Quality Act (CEQA) Guidelines Environmental Checklist Form (California Code of Regulations, Section 15000 et seq.). These are issues that may be evaluated in an Environmental Impact Statement/Environmental Impact Report (EIS/EIR), if they are determined to be relevant to the project. This list is provided only to provide the reader with a general idea of the environmental topics that could be considered for the proposed project. As a joint EIS/EIR is being prepared for the proposed RE Crimson Solar Project, a few topic names listed below may differ to comply with National Environmental Policy Act (NEPA) terminology, but the environmental evaluation will address the CEQA impact significance criteria.

I. AESTHETICS (VISUAL RESOURCES). Would the project:

- Have a substantial adverse effect on a scenic vista?
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?
- Substantially degrade the existing visual character or quality of the site and its surroundings?
- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

II. AGRICULTURE AND FORESTRY RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

Would the project:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

- Conflict with existing zoning for agricultural use, or a Williamson Act contract?
- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?
- Result in the loss of forest land or conversion of forest land to non-forest use?
- Involve other changes in the existing environmental which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

III. AIR QUALITY. Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations.

Would the project:

- Conflict with or obstruct implementation of the applicable air quality plan?
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation?
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?
- Expose sensitive receptors to substantial pollutant concentrations?
- Create objectionable odors affecting a substantial number of people?

IV. BIOLOGICAL RESOURCES. Would the project:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites?
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

V. CULTURAL AND PALEONTOLOGICAL RESOURCES. Would the project:

- Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?
- Directly or indirectly destroy a unique paleontological resource or site unique geologic feature?
- Disturb any human remains, including those interred outside of formal cemeteries?

VI. GEOLOGY AND SOILS. Would the project:

- Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to the California Division of Mines and Geology Spec. Pub. 42)
  - Strong seismic groundshaking?
  - Seismic-related ground failure, including liquefaction?
  - Landslides?
- Result in substantial soil erosion or the loss of topsoil?
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?

- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of wastewater?

VII. GREENHOUSE GAS EMISSIONS. Would the project:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

VIII. HAZARDS/HAZARDOUS MATERIALS, WILDLAND FIRE ECOLOGY. Would the project:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?
- Emit hazardous emissions or handle hazardous or acutely hazardous material, substances, or waste within one-quarter mile of an existing or proposed school?
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?
- For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?
- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?
- Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

IX. HYDROLOGY AND WATER QUALITY. Would the project:

- Violate any water quality standards or waste discharge requirements?

- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted?
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount or surface runoff in a manner which would result in flooding on- or off-site?
- Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?
- Otherwise substantially degrade water quality?
- Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?
- Place within a 100-year flood hazard area structures which would impede or redirect flood flows?
- Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?
- Inundation by seiche, tsunami, or mudflow?

X. LAND USE AND PLANNING (LANDS AND REALTY). Would the project:

- Physically divide an established community?
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?
- Conflict with any applicable habitat conservation plan or natural community conservation plan?

XI. MINERAL RESOURCES. Would the project:

- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

- Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

XII. NOISE. Would the project result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?
- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?
- For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

XIII. POPULATION AND HOUSING (SOCIOECONOMICS AND ENVIRONMENTAL JUSTICE). Would the project:

- Induce substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through extensions of roads or other infrastructure)?
- Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?
- Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

XIV. PUBLIC SERVICES.

- Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:
    - Fire protection?

- Police Protection?
- Schools?
- Parks?
- Other public facilities?

XV. RECREATION. Would the project:

- Increase the use of existing neighborhood, and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?
- Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

XVI. TRANSPORTATION AND TRAFFIC (TRANSPORTATION AND PUBLIC ASSESS). Would the project:

- Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?
- Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?
- Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?
- Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
- Result in inadequate emergency access?
- Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

XVII. TRIBAL CULTURAL RESOURCES.

- Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and

scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

XVIII. UTILITIES AND SERVICES SYSTEMS. Would the project:

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?
- Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?
- Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?
- Comply with federal, state, and local statutes and regulations related to solid waste?

IXX. MANDATORY FINDINGS OF SIGNIFICANCE:

- Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

- Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)
- Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Public Notice:
Scoping Meeting Announcement

ESA

Public Meetings Announcement

For the RE Crimson Solar Project
Draft Environmental Impact Statement/Environmental Impact Report

The Bureau of Land Management (BLM) and California Department of Fish and Wildlife (CDFW) intend to prepare a joint Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the RE Crimson Solar Project.

Sonoran West Solar Holdings LLC, a wholly owned subsidiary of Recurrent Energy LLC, proposes to construct, operate and decommission the proposed RE Crimson Solar Project. The project involves a 350 megawatt (MW) solar photovoltaic facility with an additional 350 MW energy storage facility on approximately 2,500 acres of public land administered by BLM.

Community participation is a critical part of the environmental review process. Public meetings will be held to aid the public's understanding of this project and to solicit written comments on the potential impacts, alternatives, and mitigation measures that should be considered in the Draft EIS/EIR.

Public Meetings

Tuesday, April 3, 2018
5:00 PM to 8:00 PM
BLM Palm Springs South Coast Field Office
1201 Bird Center Drive,
Palm Springs, CA 92262

Thursday, April 12, 2018
12:00 PM to 3:00 PM
City of Blythe Multi-Purpose Room
235 N. Broadway
Blythe, CA 92225

Wednesday, April 11, 2018
5:00 PM to 8:00 PM
University of California, Riverside, Palm Desert, Room B117
75080 Frank Sinatra Drive
Palm Desert, CA 92211

Written comments will be accepted at the public meetings and may also be mailed or emailed to the following contacts:

BLM Palm Springs-South Coast Field Office
Miriam Liberatore, Project Manager
1201 Bird Center Drive
Palm Springs, CA 92262
Email: blm_ca_crimsonsolar@blm.gov

Or

California Department of Fish and Wildlife
Magdalena Rodriguez, Project Manager
3602 Inland Empire Boulevard, Suite C220
Ontario, California 91764
Email: magdalena.rodriguez@wildlife.ca.gov

Further details can be found at the BLM webpage: https://eplanning.blm.gov. For more information, contact Miriam Liberatore, project manager: (541) 618-2412, or email: mliberat@blm.gov.

Scoping Meeting Presentations

U.S. Department of the Interior
Bureau of Land Management

Crimson Solar Project

Draft EIS/EIR Public Meeting – April 2018

Meeting Format

- Opening and Introductions
- BLM Presentation – Miriam Liberatore
- CDFW Presentation –Magdalena Rodriguez
- RE Crimson Solar Presentation – Scott Dawson
- Public Comments
- Instructions for the Open House – Miriam Liberatore
- Public Open House
- Meeting Closes at 3:00 p.m.

BLM's Role

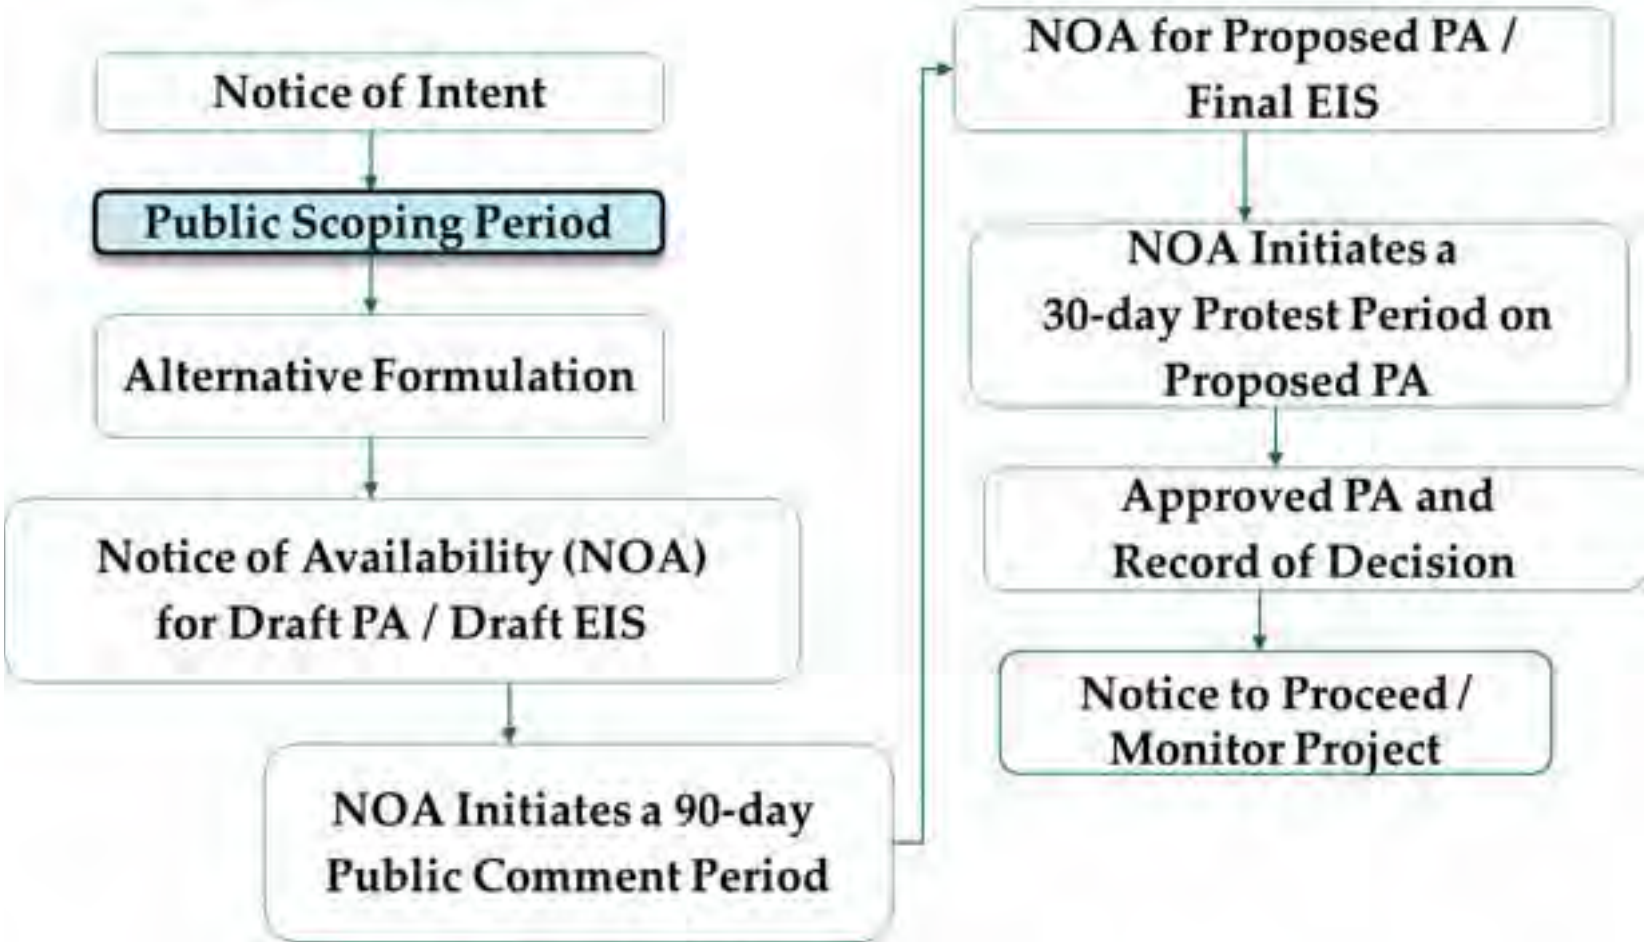
- Administration of public lands under Federal Land Policy and Management Act of 1976 (FLPMA)
- Review of the Land Use Plan and processing of an EIS-level Land Use Plan Amendment (PA/EIS)
  - California Desert Conservation Area Plan (1980, as amended) and Desert Renewable Energy Conservation Plan (DRECP)
- Issuance of right-of-way grants for use of federal land
- Lead agency for National Environmental Policy Act (NEPA), National Historic Preservation Act, etc.
- Lead agency for consultation with the U.S. Fish & Wildlife Service under Section 7 of the Endangered Species Act

National Environmental Policy Act

NEPA

- Purpose of this meeting
- Establishes a public, interdisciplinary framework for federal decision-making
- Ensures that agencies take environmental factors into account when considering federal actions
- Required environmental analysis documents include environmental impact statements (EISs) and environmental assessments (EAs)

Processing and Administration



BLM:

- Regulations: 43 CFR 2800
- Right-of-Way Information:
  - General Information https://www.blm.gov/programs/lands-and-realty/right-of-way
  - Obtaining ROW https://www.blm.gov/programs/lands-and-realty/right-of-way/obtaining-right-of-way

Current Status

- 2009 - SF-299 (application) filed for the Sonoran West Solar Energy Generating Station
- June 2015, Feb 2016, Sept 2017 – Pre-application meetings held for RE Crimson Solar Project
- May, Nov 2017 – Updated PODs submitted
- March 9, 2018 – NOI Published
- **Public scoping comments for the joint EIS/EIR must be submitted by <u>April 23, 2018.</u>**

BLM LUP Amendment / NEPA Process (PA / EIS)

Environmental Issue Areas

- Air Resources
- Vegetation
- Wildlife
- Cultural Resources
- Environmental Justice
- Geology and Soils Resources
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Lands and Realty
- Mineral Resources
- Recreation and Public Access
- Social and Economic Effects
- Special Designations and Wilderness
- Transportation and Traffic
- Utilities and Service Systems
- Visual Resources
- Water Resources
- Wildland Fire Ecology

CDFW's Role

- Lead agency for the California Environmental Quality Act (CEQA)
- Fish and Game Code Section 2081 Incidental Take Permit for desert tortoise
- Section 1600 et. Seq. Streambed Alteration Agreement for state jurisdictional streambeds

California Environmental Quality Act (CEQA)

- Requires environmental review of projects that need discretionary approval by local or state agencies
- Focused on analysis of “significant” impacts
- Preparation of an environmental impact report (EIR) is required for projects that could have a significant impact on the environment

EIR Process

- Distribute Notice of Preparation (NOP)
- Prepare Draft EIR
  - Identify and analyze direct, indirect, and cumulative impacts
  - Recommend mitigation measures and alternatives to avoid or reduce potentially significant impacts
- Circulate the Draft EIR for agency and public review
- Respond to comments and prepare the Final EIR
- After completion of the EIR process, decision makers can render a decision on the project

Public Participation Opportunities

- Submit written comments during scoping
- Become a Formal Cooperating Agency with BLM
- Attend public meetings
- Participate in workshops
- Provide written comments on the Draft PA/EIS/EIR

Contact Information

- Miriam Liberatore, BLM Project Manager
- Phone: (541) 618-2412
- e-mail: mliberat@blm.gov

- Magdalena Rodriguez, CDFW Staff Environmental Scientist
- Phone: (909)844-2520
- E-mail: Magdalena.Rodriguez@wildlife.ca.gov

PUBLIC HEARING OF THE
BUREAU OF LAND MANAGEMENT
CRIMSON SOLAR PROJECT

PALM SPRINGS, CALIFORNIA
TUESDAY, APRIL 3, 2018

Reported by:
LAURA A. RUTHERFORD, RPR
CSR No. 9266

PUBLIC HEARING OF THE
BUREAU OF LAND MANAGEMENT
CRIMSON SOLAR PROJECT

The Public Hearing of the Bureau of Land Management on the Crimson Solar Project was held at 1201 Bird Center Drive, Palm Springs, California, beginning at 5:19 p.m., and ending at 5:36 p.m., on Tuesday, April 3, 2018, before LAURA A. RUTHERFORD, RPR, Certified Shorthand Reporter No. 9266.

PALM SPRINGS, CALIFORNIA; TUESDAY, APRIL 3, 2018
5:19 P.M. - 5:36 P.M.
---oOo---

MR. HERREMA: Good evening. Welcome, everybody. I know we have a fairly thin crowd of members of the public here. I know Sammy is.

Is anybody else a member of the public, not affiliated with the Project?

Okay. Great. Well, good evening, and welcome to the Bureau of Land Management's Palm Spring South Coast field office. My name is Doug Herrema. I'm the field office manager here.

And real quick, before we get started, a little safety and facilities briefing. In the event of any emergency, you can see there's an exit door right here. You can open it just by pushing that bar up. And you can also get out through the front door over there. And we have restrooms, as well as water fountains in the front lobby.

So you're about to hear a presentation on the proposed Crimson Solar Project, and I'd like to thank you for taking time out of your schedules to be here with us this evening. It's really important for us to have public

involvement and engagement in order to have effective scoping processes, and for the BLM's ability to make good decisions on projects such as this.

So we look forward to your engagement and look forward to your comments. And with that, I'll turn it over to our project manager, Miriam Liberatore.

MS. LIBERATORE: And I'm going to stand over here, because I don't like dark corners.

It still works. Did better than the clock.

All right. Well, thank you for being here. I shared Doug's sentiment. I'm glad to see everyone here and glad to be getting input on this project. This is the Crimson Solar Project, and we're here to get public input as we work our way into the EIS process.

This is our agenda for tonight. We're sort of -- we are here. And we will hear a presentation from the Project Applicant, Recurrent. And then we'll take your comments.

And then after that, we'll have an open house, which we kind of just had. But there will be plenty of time to look at posters and to ask questions of those of us that are here representing agencies and the Applicant.

So BLM's role in this Project is that we've received a right-a-way grant application for citing the

Crimson Solar Project on public lands and under the authority of FLPMA, the Federal Land Policy and Management Act of 1976.

We have the obligation and the interest in doing this public process to produce an Environmental Impact Statement for the Project. As part of this Project, we will need to consider an amendment to our Land Use Management Plan to allow the project to be sited at this location.

The Project is in the area of the California Desert Conservation Area Plan of 1980. And there's also a Land Use Plan Amendment on that Plan, the DRECP, the Desert Renewable Energy Conservation Plan, which was implemented in 2016 -- '16.

And then the BLM has the authority to issue the right-of-way for the Project to be located on that site. We're the lead agency for the NEPA planning process on this and for the Section 106 National Historic Preservation Act.

And we are working jointly with the California Department of Fish and Wildlife that is the lead agency for the Project under the CEQA process. We are also consulting with the Fish and Wildlife Service.

So a short rundown on the National Environmental Policy Act and the process that we'll be

following for this, NEPA, Is the reason we're here. We're in the -- this -- sorry.

NEPA is the process under which we engage in an interdisciplinary framework for decisionmaking. And it ensures that we consider environmental factors and disclose them before we take an action.

We'll be producing an Environmental Impact Statement under this, and the State of California will be producing an Environmental Impact Report.

These are the authorities for our right-of-way. The 43 CFR 2800 is the right-of-way regulations for how we receive an application, process an application and make a decision on one. And these -- if you just in these links, they will take you -- we can get them to you. They will take you to the full information.

This is our process here, the flow chart. I'm an engineer. I like graphics. I like flow charts. We are sitting in this portion of the process right now, the public scoping period, where we seek your input and consider your suggestions.

Once we receive that, we'll use them to formulate alternatives for the Project. And then we will analyze them, analyze the impacts of the alternatives projects on the resources in the area and published our findings in a draft EIS right here.

We announce it by publishing a notice of availability in the Federal Register. And then we go into our 90-day comment period, where, for 90 days, it's open to public comment.

And that is the second bite at the apple for the public to tell us whether you see shortcomings in our analysis, whether there are things we should have considered and didn't, what, if any, outstanding issues that we want us to address. And then we also will be considering our plan amendment in that stage.

And it's showing the final Environmental Impact Statement after we close the public comment period and account for all of the comments received.

After we have issued the final EIS, we have a 30-day protest period -- oops. Wrong button. Sorry. Thirty-day protest period. This is our administrative review of our final EIS.

And on the Proposed Plan Amendment and the Proposal for -- actually, on the Proposed Plan Amendment, and then we will issue a decision after we resolve the protests on both the Plan Amendment and the right-of-way.

And then you don't see it on here, but there is a legal -- it's not administrative review, but there's a legal appeal, a right to appeal our decision on the right-of-way grant.

And then we can issue a notice to proceed after we make our decision on the right-of-way grant, even though there is maybe appeals ongoing.

And then once the Project is under construction, we have an obligation to monitor and to enforce the terms and conditions of our right-of-way grant.

Are there any questions on the process before I move on?

(No audible response.)

MS. LIBERATORE: So these are the environmental issues that we consider. There's a list of them here. I'm not going to read it out loud, but it is pretty comprehensive.

And then we don't have CDFW here tonight, but they have that parallel process under the California Environmental Quality Act. And then all I can say -- I don't want to speak for them, but if there are questions about their process, then we ask you to contact the project manager for CDFW. It's very similar to the NEPA process in that it's a system of analysis of impacts and disclosure.

So here's a summary of the public participation opportunities that we have. We will accept written comments during scoping period, which is now. We

also will be transcribing your oral comments tonight, and they will go into our record. You can do that at public meetings. You can do that without attending a public meeting. It's not required. And we have an email address for submission of electronic comments.

These are the contacts for questions and for submitting comments. That's me at the top, with my phone number and email. And then Montelena Rodriguez is the CDFW project manager, and there's her phone number and her email.

We're receiving comments by mail here at the Palm Springs office or by email at this address, and CDFW is receiving comments at their physical address and at this email address. And these are in the notices as well.

The next thing on our agenda is to hear from Recurrent with the details of the project, and speaking will the Scott Dawson.

MR. DAWSON: Great, thank you.

My name is Scott Dawson. I'm the Director of Permitting for Recurrent Energy. And I'm going to give you a brief overview of the Crimson Solar Project, as well as a brief overview of Recurrent.

Recurrent is a solar energy developer. We were founded in 2006. And offices are currently located in San Francisco and Austin. We have about 4 gigawatts of

projects across the U.S.

We're own by a parent company, Canadian Solar, which acquired Recurrent in 2015. They're a global energy developer. They are headquartered in Canada, and they do manufacture their own solar modules across the globe. Currently, we have factories in Canada, China, Indonesia, Vietnam and Brazil.

Just a little overview on the Crimson Solar Project, as it's proposed right now, it's within the East Riverside SEZ, which was part of the Western Solar PEIS, as well as in the DRECP development focused area.

Right now, the size of the Project is a little under 2500 acres. It's 350 megawatts of tracker P.V., with a potential for 350 megawatts of battery storage.

The electricity is going to be delivered to the grid at the Colorado River substation, and the gen-tie is going to be underneath a mile, about three-quarters of a mile.

Currently the energy is uncontracted, so there's not a buyer for it. And during construction, we're looking at approximately 400 construction jobs over two years.

Here's a map of where the current footprint sits. It's about 13 miles west of Blyth, south of the 10,

at the base of the Mule Mountains.

Just a little bit of a history of the Project. It was originally developed by BrightSource Energy as two concentrating solar thermal towers, not unlike the Ivanpah Project.

BrightSource developed that over a number of years, culminating in the CEC or CPUC, Public Utilities Commission, only approving a contract for one of the towers. And at that point, BrightSource determined that it was -- the project was unviable for them, so they went about selling the assets.

Because it was -- the original S.F. 299 was filed in 2009, it's a grandfathered or pending project under the Western Solar Plan and the DRECP. In late 2015, we acquired the project. We converted the technology to P.V., and we've been developing it since then.

We've had three pre-application meetings with various stakeholders, as well as agencies, on this meeting -- or on the Project. We've also submitted two pods changing the technology and changing the footprint. And then in early March of this year, the NOI was published.

This kind of gives you a visual history of the footprint of the Project. Back in 2009, when BrightSource originally filed the S.F. 299, it was going

to be 540 megawatts and 7600 acres.

And through various resource surveys, revisions of technology, we've basically dropped the megawatts by almost 200, but we've reduced the footprint by almost 70 percent.

So the load footprint on the right, the current footprint, its shape, really, is determined by the various resources on the ground. And you can see those back on the two boards back there.

And this goes into a little bit more detail. Originally, the BrightSource project was going to impact almost 2,000 acres of desert tortoise critical habitat. The current Project is out of critical habitat.

A huge amount of lizard habitat is now down to 30 acres, and a huge amount of mycrophyll woodland habitat is down to less than 2 acres, so we've sited and revised the siting of the footprint and shrunk it to avoid a huge amount of impacts that were originally proposed for this Project.

That's it. Anything else?

UNKNOWN SPEAKER: What's the P.O.D. stand for?

MR. DAWSON: Plan Of Development.

MS. LIBERATORE: Thank you, Scott.

So this is the public comment portion of our

meeting tonight. Christina is going to put contact information back up on the screen, but this is where we invite you to come up and make a public comment if you care to, and it will be transcribe and entered into the record.

Is there anyone who would like to speak tonight?

(No audible response.)

MS. LIBERATORE: I'm not hearing anyone. But I do want to have the contact information go back up in case anyone wants to write it down.

And then we will resume in the public -- the open house portion, if there's -- having heard the presentations, if you want to look at the poster boards again, look at the resources, ask any questions of us or of Recurrent, this is an opportunity to do so.

Are there any questions or any -- anything else we want to cover?

(No audible response.)

MS. LIBERATORE: All right, then. Thank you very much for coming, and we appreciate your public participation. Thank you.

(Ending time: 5:36 p.m.)

I, the undersigned, a Certified Shorthand Reporter for the State of California, do hereby certify:

That prior foregoing proceedings were taken before me at the time and place herein set forth; that any witnesses in the foregoing proceedings, prior to testifying, were placed under oath; that a verbatim record of the proceedings was made by me using machine shorthand which was thereafter transcribed under my direction; further, that the foregoing is an accurate transcription thereof.

I further certify that I am neither financially interested in the action nor a relative or employee of any attorney of any of the parties.

IN WITNESS WHEREOF, I have this date subscribed my name.

TRANSCRIPT OF PROCEEDINGS of the U.S. Department of the Interior Bureau of Land Management Crimson Solar Project EIS/EIR Public Meeting, at 75080 Frank Sinatra Drive, B117, Palm Desert, California, on Wednesday, April 11, 2018, at 5:07 p.m. before Dawn M. Davila, Certified Shorthand Reporter No. 8383.

APPEARANCES OF PRESENTERS:
Janet Cheek, Bureau of Land Management
Assistant Field Manager
Palm Springs South Coast Field Office
Miriam Liberatore, Bureau of Land Management
Project Manager
Medford District Office
Cristina Gispert, ESA
Environmental Contractor
Magdalena Rodriguez, California Department of Fish and Wildlife
Scott Dawson, Recurrent Energy

PALM DESERT, CALIFORNIA; WEDNESDAY, APRIL 11, 2018
5:07 P.M.

MS. CHEEK: Hello. My name is Janet Cheek, and I'm the Assistant Field Manager for the Palm Springs South Coast Bureau of Land Management office. And I wanted to welcome you today to our Crimson Solar Project scoping meeting. It's a joint meeting with BLM and CDFW, California Department of Fish and Wildlife. So I want to give a little bit of housekeeping. Restrooms are right out to the left and around the corner, men's and women. In case of an emergency, just exit straight out the door out into the public area.

To get us started and to give more of the rollout of the meeting, I'm going to introduce our project manager, Miriam Liberatore.

MS. LIBERATORE: Thank you, Janet.

Is that loud enough? Too loud? Okay.

Okay. So thanks again, everybody, for coming. We're -- we're excited to be scoping this project and to be collecting your comments. I guess I didn't prepare myself here.

So, yes, this is the Crimson Solar Project, and I'm Miriam Liberatore. I'm with the BLM. I'm stationed in Medford, Oregon, and I have the privilege of working on this

project. I'll be talking about BLM's role, and then I'll be handing off to my counterpart with CDFW, Magdalena Rodriguez. And -- here, I'm going to move this.

And then Recurrent Energy will give us a presentation of the project itself, and then we'll be -- open up for public comments. You can give comments orally; you can give comments in writing; you can give them tonight; you can give them, you know, by email or hard copy mail. And we'll tell you where to send things. And then we have an open house with some information posters that -- we have people to answer questions, if you have questions, and, you know, give you an idea of some of the project issues. So with that, I'll talk about BLM's role.

So BLM received an application for a right-of-way grant for this project, and that really is the root of BLM's involvement. Under the Federal Land Policy and Management Act or FLPMA, BLM has the authority to issue a right-of-way grant for projects under various conditions, and one of them is energy transmission and generation. So we have the application and an obligation to process it. And then we also have, under NEPA, an obligation to do an environmental review on any federal decision. So with those two requirements, we are conducting an environmental review of the Crimson Solar Project, and we're doing that cooperatively with CDFW. And the end result will be an

environmental impact statement for the BLM under NEPA, and an environmental impact -- environmental impact report for the state of California.

BLM is the lead agency for NEPA, and CDFW is the lead agency for CEQA. And then BLM is also the lead agency for consultation with the U.S. Fish and Wildlife Service.

So the NEPA side of this project is where BLM is involved, and it's the purpose of this meeting. This is the process under which we collect public input on issues, concerns, things that we should be aware of for this project and consider in our environmental review, and that's what we're doing tonight. NEPA was established for that purpose, to give a framework for public input and for federal consideration of environmental impacts of a project and as a decision making foundation for us. And I already mentioned the EIS.

These are the regulations that govern what we're doing, and we can make this -- these links available to you if you want them for later.

The current status of the project is early stage; we're in scoping. So we received an application for the right-of-way in 2009. This project's been around in a couple of different forms, and you'll hear more about that from Recurrent. We have held preapplication meetings in June of 2015, February of 2016, and September of 2017. And

in November of 2017, we received an updated plan of development, which we -- is a requirement for our process. And then in March -- on March 9th, we published our notice of intent to prepare an environmental impact statement. Right now we're in the public scoping period, and that will run -- actually, it says April 23rd, but that will run for at least 15 days beyond the date of the last public meeting.

And this is a graphic of the process for NEPA, and where we are now is in blue right there. We're in the public scoping period. So, you see, we're still at the very beginning. When we get the comments from the public and from our specialists, we will analyze the alternatives -- formulate -- formulate alternatives and then analyze the impacts of those alternatives. And at that point we'll produce a draft EIS and put that out for public comment. And then that's for 90 days. And it's 90 days because -- I didn't mention it, I meant to mention it earlier, but one of the complements of this project for the BLM is that the project site is -- the application for the right-of-way was filed under the California Desert Conservation Act -- Area -- thank you -- which was our resource management plan in effect at the time, and it still is but it's been amended in 2016. And so the site that the project is located on is intended for solar development under the -- under the DRECP amendment but not under the CDCA or at least not identified

as such. So we will be considering an amendment to our CDCA to allow development of this -- of the project on that site. And that gives us to a 90-day public comment period on our draft EIS.

After we incorporate comments from the public on the draft EIS, we'll be putting out a final, and we'll issue a notice of availability for that. And then the NOA initiates a 30-day protest period under the BLM's administrative review processes. And then after we've completed the resolution of any protests, then we are in a position where we can approve -- well, we can decide. We can make a decision on the plan amendment and on the right-of-way grant.

Are there any questions so far?

These are some -- did I miss -- okay.

These are some of the issue areas that we're looking at. It's pretty comprehensive, and I don't want to read the whole slide to you. But you can look at it. I'll leave it up here for a sec. And then these are the -- the resources that we'll be analyzing in the EIS.

And now I would like to introduce my counterpart at CDFW, Magdalena Rodriguez.

MS. RODRIGUEZ: Hi, I'm Magdalena Rodriguez of CDFW. I am the project lead for the state. And so for this particular -- we normally don't -- we normally aren't the

lead agency for most projects, but because this project is entirely on Bureau of Land Management land and there is no state nexus with the county, we took on the lead agency role. And that is because of the -- we have to issue an incidental permit for a tortoise and also a streambed alteration agreement for impacts to the site, so that kicked us into CEQA lead. And then the California Environmental Quality Act, CEQA, it -- it's kind of sister to NEPA, and it requires environmental review of projects that need any kind of discretionary approval, which is your 1600ITP. And it's mainly focused on analysis of significant impacts. It's a little different in some areas than the NEPA.

So we have a preparation of an environmental impact report, and that's required for these projects, any project that could have a significant impact. And for this particular project, we're combining the EIR with the EIS, so you'll just have one document. We already distributed the NOP which went out around the same time as the NOI. And we will prepare the draft EIR/EIS, and we'll analyze the direct, indirect, and cumulative impacts and also recommend mitigation measures and some alternatives.

The draft EIR goes out for agency and public review. Like I said, it will be a joint document. So all the comments and the draft will be together.

And similar to BLM, we're taking any kind of public

comments during scoping. I think on the NOP, my email's on there, or you can give comments today to us. And you can also attend public meetings or workshops, and then any written comments.

And this is all of our contact information: Miriam, myself, Magdalena. And then scoping comments can be sent, either emailed on the bottom or mailed. And then next will be Scott Dawson from Recurrent.

MR. DAWSON: Good afternoon. My name is Scott Dawson. I'm the director of permitting for Recurrent Energy. We're the developer for the RE Crimson Solar Project. I'm going to give you a brief overview of Recurrent and then a little more detailed overview of the project.

Recurrent is one of the top tier U.S. project developers for renewable energy, particularly for solar. We were founded in 2006. We have offices in San Francisco and Austin, Texas, and about a 4-gigawatt project pipeline that we're developing across the U.S. We're a subsidiary of Canadian Solar which acquired Recurrent Energy in 2015. Canadian was founded in 2001 and it's based in Guelph, Canada. And we manufacture our own polysilicon solar panels. We've got manufacturing facilities in Canada, China, Indonesia, Vietnam, Brazil.

So just a brief overview of the -- the Crimson

project as it's currently proposed. It's located in eastern Riverside County. It's within the east Riverside SEZ, as well as DRECP development focus area. Currently, the project site is about 2500 acres, a little less than that, and the proposed output is 350 megawatts with an option for a 350-megawatt battery storage facility onsite. The output of the site will be delivered to the Colorado River substation, which is owned by Southern California Edison, via a very short gen-Tie, which is less than a mile. Currently, the energy for the project is uncontracted. It doesn't have a contract for purchase, but there are various potential customers in California that are interested in the project. And construction would be approximately 400 construction jobs over two years.

Here is a map of where the project sits. It's about 11 miles due west of Blythe at the base of the Mule Mountains. Just a little bit of the project history of the Crimson project. The original SF-299 was filed by BrightSource Energy as a 540-megawatt solar tower project. Basically, something similar to what ISEGS looks like right now. BrightSource developed that over a number of years, and that culminated in going in front of the CPUC to get PPA approval. And the CPUC only approved one of the PPAs for the project. At that point BrightSource decided to stop developing the project and looked to sell its assets. The

project -- because it was -- the original SF-299 was submitted in 2009, it's a pending project under the Western Solar Plan, the solar PEIS, as well as the DRECP. Recurrent acquired the project assets back in 2016, converted the technology to tracking photovoltaic, and we've been developing it since then. There has been three preapplication meetings, two updated pods with the PV technology, and the NOI published in March of this year.

This is kind of the visual depiction of the history of the project back in 2009. The BrightSource footprint in green, 540 megawatts, 7600 acres. Then the Recurrent original proposal back in 2016, a reduction in megawatts and a reduction in acres. And then last year, further refinement down to 350 megawatts and 2500 acres.

A little more detail on some of the impacts of the original project. There is over 1900 acres of desert tortoise critical habitat that would have been impacted by the BrightSource proposal. Through redesign and siting on the landscape, the current proposal doesn't impact any desert tortoise critical habitat. Also, a large reduction for Mojave fringe-toed lizard habitat from 1100 acres down to 30 acres, and microphyll woodland habitat from 1700 acres down to just about 1.2 acres. So that's a very high level overview.

We also have resources mapped on the various

boards, so if anybody wants to look at those, get a little more detail on how the resources are laid out across the site. That's it.

MS. LIBERATORE: So this is when we would be accepting public comment if you have a -- want to give an oral comment. Is there anyone who would like to deliver oral comments today?

I guess not. Then we have our open house. So please make yourselves at home and enjoy the cookies out front and coffee. And if you have any questions about the posters, we're here to help and answer them. And if you would like to leave a written comment, we have cards on the table out front to do that as well. And then, Cristina, I'm going to put this back on the contact. And then if you want to take a picture of the contact information, you can do that too.

UNIDENTIFIED SPEAKER: Is this all on the BLM website under Projects? Because I know the BLM has projects sometimes.

MS. LIBERATORE: Right now at this point the only thing on our E-planning website is a map and the public meeting announcements, but more information will go up as we have it. We really don't have -- I mean -- you mean is the slideshow on it?

UNIDENTIFIED SPEAKER: Yes, the slides or something

like that.

MS. LIBERATORE: The slideshow is not, but the contact information is.

Thank you so much. Thank you so much, everyone, for coming. And we'll be here. So if you have any questions, please ask.

(The proceedings concluded at 5:26 p.m.)

Juan Gonzalez
Ron Dawson

BLYTHE, CALIFORNIA; THURSDAY, APRIL 12, 2018
12:03 P.M.

MS. CHEEK: Good afternoon. I would like to welcome everyone. Please take a seat, and we can get started with the presentation of the information on the Crimson Solar Project.

Hello, my name is Janet Cheek. I'm the Assistant Field Manager with the Palm Springs South Coast field office. And as I mentioned earlier, I would like to welcome you. This is a joint meeting with BLM and California Department of Fish and Wildlife public scoping meeting. Just a few little housekeeping. Restrooms are right out this way and to the left. And in case of an emergency, please exit to the door on the right.

I would like to take this opportunity to introduce Miriam Liberatore, who is the BLM project manager for this project.

MS. LIBERATORE: Thank you, Janet.

Welcome, everybody. We're happy to have you here and looking forward to hearing your comments. We're here for the Crimson Solar Project. And let me grab my -- so we'll start now; we're going through opening and introductions. I'm going to give you a presentation about BLM's role, and then California Department of Fish and

Wildlife is here to talk about their role in the project, and then Recurrent Energy will give a presentation about the details of the project itself, and then we'll be open for public comments. And after that, we'll have an open house, which we kind of already started when you were coming in with the posters of all the resources. And we'll be available to try and answer your questions on the spot if you have any for us or at least take them down and get back to you later with answers. And then we'll stay -- it says 8:00 p.m. We're actually going to stay until 3:00 p.m. today.

MS. GISPERT: Sorry.

MS. LIBERATORE: That's okay.

So BLM's role actually really stems from the fact that we have received a right-of-way grant application for the project to be located on federal lands. And under the FLPMA, the Federal Land Policy and Management Act, BLM has the authority to consider rights-of-way on public lands for a variety of activities, and one of them is energy generation and transmission. So that's the authority under which BLM considers a right-of-way grant for the project. And then under NEPA, we also have the obligation to conduct an environmental review of any projects that we make decisions on. So, therefore, with our authority to issue a right-of-way grant and our obligation to conduct an

environmental review, we have issued a notice of intent to prepare an environmental impact statement for the project.

We are the lead agency for the NEPA on this project. We're partnered with the U.S. -- I'm sorry. We're partnered with California Department of Fish and Wildlife, who is the lead agency for the CEQA side. And then we are also the lead agency for consultation with the Fish and Wildlife Service. And I believe also on the Section 106 -- is that right, George? -- for cultural resource --

MR. KLINE: Yes.

MS. LIBERATORE: -- concerns.

So the purpose of this meeting for the BLM is to -- to initiate our NEPA process, our public input and environmental review. And NEPA, if you're not familiar with it, is the framework under which we collect public comments and frame our issues for a project and then disclose the probable impacts of the project to the public.

These are the regulations that govern what we're doing. If you're interested in checking them later, you can either contact me for the links, you can take a picture of the screen, we can put it back up when we're done. But this would refer you on to sources of information.

This is the current status of the project. So we are -- and I'll show you a graphic in a minute about the overall NEPA process. But this project submitted its

initial right-of-way application back in 2009. The SF-299 is what we call our right-of-way application. And we held preapplication meetings, three of them, in 2015, '16, and '17. There is a gap in time there which Recurrent will address when they give you the history of the project. We received updated plans of development from Recurrent in May and November last year, and then in March of this year we published our notice of intent. And that kicked off our public scoping process, which is what we're doing today, gathering public comment.

It says on here that public comments must be received by April 23rd, but, in fact, we will continue to receive comments for at least 15 days past the date of the last meeting and potentially longer. So please send -- if you have comments, we want them.

This is the graphic of the NEPA process. We are here in the blue, the public scoping. So we're still at the very beginning of this project. Once we close the scoping period, we will take the comments we received and we'll develop alternatives for the project and analyze their impacts on the environment. And then we will publish those in a draft EIS and issue a notice of availability that will go into the Federal Register, the same as the notice of intent did. And then we'll have a 90-day comment period on the draft EIS. And it's 90 days because BLM is considering

a plan amendment for the California Desert Conservation Area plan. This project was submitted to us prior to our adopting the DRECP amendment to the plan, so it falls under the CDCA prior to the DRECP. And we need to amend that plan to allow this project to occupy that specific site. So that gives us a 90-day public comment period for the plan amendment.

After that period we will incorporate comments and address them and issue a final environmental impact statement. And then we will publish that and we'll initiate a 30-day protest period, which is BLM's administrative review process for the final EIS. And then once we've resolved those, we will make a decision on the amendment and on the right-of-way. And then if -- if a right-of-way were granted, there would be a notice to proceed which would follow that and then monitoring of the project construction.

Are there any questions so far?

These are some of the environmental issue areas that we'll be looking at. It's -- I'm not going to read you the list. It's fairly comprehensive, and we have poster boards around the room describing some of the resources. And these are what we see substantive comments on, or any other issues that you're aware of that we need to consider.

And now I'm going to introduce Magdalena Rodriguez from CDFW.

MS. RODRIGUEZ: Hi, I'm Magdalena Rodriguez. I work for California Department of Fish and Wildlife. And we came into this project because they are going to need an incidental take permit and a streambed agreement. Because the project is solely on BLM land, there is no other state nexus. So in order to issue those permits, we are taking the lead agency role for CEQA. And those are the two, 2081 and the 1600 were ITP and the 1600. For CEQA it requires an environmental review of the project similar to NEPA and anything that needs discretionary approval by local or state agencies. And it's mainly focused on analysis of significant impacts.

So we would prepare an environmental impact report; it's required for the projects that could have significant impacts. This project is going to prepare a joint EIR/EIS. We already -- at the same time as the NOI came out, we distributed the NOP. And then we'll prepare the draft EIR/EIS which will identify and analyze the direct, indirect, and cumulative impacts, and then also recommend mitigation measures and alternatives. The draft EIR will be circulated for agency and public review, same as the EIS since it's a joint document, and we will respond to all comments. And then the final EIR/EIS will be prepared, and then a decision will be made on the project.

You can submit written comments during the scoping

period, become a formal cooperating agency with BLM, attend the public meetings like this one, participate in workshops, or provide written comments on the draft.

This is myself and Miriam's contact information. You can send scoping comments to our offices or my direct email, and then the BLM has an email for the project itself.

And then I'm going to introduce Scott Dawson from Recurrent.

(UNIDENTIFIED SPEAKER): I had a question.

MS. RODRIGUEZ: Okay. Sorry. Go ahead.

(UNIDENTIFIED SPEAKER): Okay. Maybe it was in there, maybe I came in late, maybe you talked about it, maybe I missed it. I don't know. But on here anywhere does it say anything about 106 consultations with tribes?

MS. RODRIGUEZ: That's BLM; right?

MS. GISPERT: That's not in the presentation, but we have George Kline here who you can talk with directly about what we've done so far for Section 106.

(UNIDENTIFIED SPEAKER): Okay.

MS. RODRIGUEZ: And then the state also has AB52, which is required, which we've sent all the letters to the tribes from AB52.

MS. GISPERT: You can also make verbal comments. We'll invite you up.

(UNIDENTIFIED SPEAKER): Because, I mean, you know,

you're talking about, you know -- well, you have to go back into the presentation. You're talking about scoping meetings, comment periods, and so forth. But so far I didn't hear anything, you know, about tribal consultation. That's the reason I was saying, where do they fit in on this, you know, with the comment period and so forth? Because if you're talking about 30-days on the 23rd, you know, that's kind of quick. So any plans to have the tribes to have their comments, you know --

MS. LIBERATORE: Would you like me to --

MS. GISPERT: Yeah. Please.

MS. LIBERATORE: George, I would invite you to add if I miss anything. But the question was what about tribal consultation and how does that fit into this process. Tribal consultation -- you're talking about the government-to-government consultations?

(UNIDENTIFIED SPEAKER): Right. Yes.

MS. LIBERATORE: That's a separate process from the public comment solicitations through the NEPA process. That's a different authority and a different process. They run at the same time, more or less, but that's -- you're welcome to make comments through this process, and then we also do the government-to-government consultation with the tribes.

(UNIDENTIFIED SPEAKER): Okay. Because I was just

kind of thinking that, you know, this comment period that's coming up on the 23rd, well, that would be the last comment period that anybody would make.

MS. LIBERATORE: No. No.

(UNIDENTIFIED SPEAKER): Okay. Now that you've clarified. Okay.

MS. LIBERATORE: Okay. Thanks.

MS. GISPERT: Yeah, if you would like to make verbal comments, we're going to invite people to do that. Raise your hand and I'll give you a card, and we'll call you up.

MR. DAWSON: Okay. The good afternoon. My name is Scott Dawson. I'm the director of permitting with Recurrent Energy. And I'm going to give you a brief overview of Recurrent Energy and then a little bit more about the RE Crimson Solar Project.

Recurrent Energy is one of the top tier solar energy developers in the U.S. We were founded in 2006. We're based in San Francisco and Austin, Texas. And we have about a 4-gigawatt project pipeline across the U.S. We're a subsidiary of Canadian Solar, which acquired Recurrent in 2015. Canadian was founded in 2001 and they're -- they actually are a Canadian company. They're based in Canada. They manufacture their own polysilicon solar panels and they manufacture them in Canada, China, Indonesia, Vietnam,

Brazil.

Just for the kind of higher review of the Crimson Solar Project, it is in eastern Riverside County within the east Riverside SEZ as well as DRECP development focus area. The potential right-of-way is approximately 2500 acres. Currently, the project is proposed for 350 megawatts of output -- electrical output with an option for up to 350 megawatts of battery storage. The output from the project will interconnect to the grid via a small gen-tie to the Colorado River side which is directly to the north of the project. The project output, the electricity is currently uncontracted, but there are several customers that are interested in purchasing that electricity. And the construction of the project would be about 400 workers over 200 -- or over two years.

There is a map of the project. It's located approximately, from where we sit right now, maybe 15 miles to the east -- to the west -- I'm sorry -- at the base of the Mule Mountains.

The history of the project, this was originally proposed by a company called BrightSource Energy, and they filed the original applications back in 2009. And it was going to be 540 megawatts with dual concentrating solar towers, so not unlike the Ivanpah ISEGS project that is just south of Vegas off the highway.

So over a period of years, BrightSource developed this project. They executed some PPAs and they went to the CPUC to get approval for those PPAs, and only one was approved out of the two. And at that point BrightSource sought to sell the assets, and so we acquired the assets in late 2015. We've been developing the project since then. We've changed the technology from those power towers to PV, and we've had a number of preapplication meetings, updated plans of development, and then the notice of intent for development of the EIR/EIS was published last month.

This is kind of a visual look at how the project has developed over time. So the original project in 2009 from BrightSource on the left was 540 megawatts and 7600 acres. We acquired it in 2016. We changed the technology. It shrunk down; 450 megawatts and 4,000 acres. And then currently today it's at 350 megawatts and a little under 250 acre -- or 2500 acres. And mostly the development of the project and the way its current boundaries are is to reduce impacts to various resources across the site.

Here is a little bit more on the numbers. Originally as proposed, it had almost 2,000 acres of impact to desert tortoise critical habitat. Now we're completely out of desert tortoise critical habitat. It had over 1100 acres of Mojave fringe-toed lizard dune habitat. We're down to 30 acres of habitat. And 1700 acres of microphyll

woodland, which is a sensitive habitat in the desert, and now we're down to 1.2 acres. There is also -- in the back there is various boards having more detail about the various resource issues. So I encourage you to go look at those. And that's it.

Cristina.

MS. LIBERATORE: I'm going to make one comment for people who have maybe came in a little late or didn't notice it. We have a sign-in sheet here and we'd love it if you would sign in so that we have a record of who attended before you leave. You don't have to do it right now.

MS. GISPERT: Do you want to announce the -- do you want me? Okay.

Okay. So I have two speaker cards here. If there is anyone else who wants to speak, just fill out a card and we'll call you up. The first person we have here is Andrew Loubert.

MR. LOUBERT: Hi.

MS. GISPERT: Hi.

MR. LOUBERT: Is there a time limit?

MS. GISPERT: That's really up to you.

MR. LOUBERT: I'll be brief.

MS. GISPERT: Okay.

MR. LOUBERT: Hi, I'm Andrew Loubert. I'm the owner of 40 acres due west of the proposed project site. My

biggest sort of -- it's not really a concern, but it's something I want to pay attention to is what will this project do to impact future uses of the surrounding acreage and land. There is at least 160 acres of privately held land surrounded by the public lands, my parcel being one of them. And my biggest concern as the project moves forward is what will that project do to the economic or use of that land that the privately owned lands have. So I would talk to other owners, but that is an issue of concern that I will be tracking as the project is discussed going forward. Thank you.

MS. GISPERT: Okay. So for those of you who just arrived, if you would like to make public comments, just fill out these cards right here by the table and pass them to me, and we'll call you up.

So the next person is Alfredo Figueroa. How does five minutes sound?

MR. FIGUEROA: Thank you very much. My name is Alfredo Figueroa. I'm from the La Cuna de Aztlan. This seems like an old, old movie, we've gone so many times. See, the Mule Mountains -- for some of you people who don't understand, the Mule Mountains are Calli. Calli means earth. It's on the Aztec calendar. That's why you're right here in Blythe, California. California. That's the only thing I used to like about Schwarzenegger, he could

pronounce California the way it's supposed to be pronounced, California. So Calli is earth. And for the rest of the tribes that we are -- our relation here, you'll see a different -- a different interpretation, but it's all related to the creation. Right there is where we have the 20. We have -- all relates to the Aztec calendar. That's where we have the pentangles right there in the wash. That's where we have the main trails that lead from the Mule Mountains all the way to Eagle Mountain. That represents the four directions.

So, I mean, it's just -- the first time we protested anything that was going to be built there in the Mule Mountains was Sundesert Nuclear Power Plant. 1975, mind you. We were the first ones in the history of the United States to stop a nuclear power plant from being built. See. Why? Because of the same reason. It's so sacred. It's not just for the natives. No. No. It's everybody. Fortunately, we have a little bit of understanding. And fortunately, we have those codices that we can read and we can direct. But, apparently, the majority of the Anglo-Saxons don't have an interpretation of all this significance. Oh, we have a few now. Quite a good group now. Sierra Clubs and all these environmental groups that are with us now. But we need more. We need to stop these solar power plants. Those two that are made already,

McCoy and Blythe Solar Power, they're right in the most sacred valley of earth, the McCoy Valley. It's where Kokopilli and Cicimitl, El Tosco, the spirit that descends from Tamoanchan Granite Peak straight down to the Mule Mountains. Calli.

So I could talk about it all day, but we have other people here, our relations here to come. And we want everybody to have their interpretations so you don't think, "Oh, it's that same old guy." No, it's not that same old guy. It's us. It's not my interpreting. It's our interpreting. What we say, "clokinowaki," (phonetic); among all, we do all for the benefit of all. Different sizes, different shapes, but all together in the trunk of the human race. We were placed here by the creator to maintain a harmonious balance. Not like we used to play in football: eight men to the left. No, no, no. We've got to be that harmonious balance.

So if you have any other questions, just give us some questions. But I told you the facts. These are facts. I can show you the Aztec calendar. And right now we're going to have our other relations here that are going to tell you why. Calli. No. "Morkaheitay" (phonetic). In the old days they used to call them the upside-down mountains in English. Because we always knew they were the Morkaheitay. Morkaheitay is where you smash chili. But

upside-down were the three peeks.

I'm going to leave you right now because you people are -- it's going to take you a long time for you to understand, because like Steven Lexon (phonetic) said, it's going to take a jolt -- a big jolt for the majority of the Anglo-Saxons to understand why it's so sacred, these places. And you're understanding now a little better. Thank you very much.

MS. GISPERT: Okay. Linda Otero.

MS. OTERO: 25 minutes?

MS. GISPERT: 25 minutes.

MS. OTERO: I heard that.

Good morning, everyone. Or afternoon. My name is Linda Otero. I'm a member of the Fort Mojave Indian Tribe and the director of the Aha Makav Culture Society. I see that this project is progressing to the point of now the development of plans for an EIR/EIS. Years ago Recurrent visited our office and many -- likely visited many other tribal offices as well trying to get a sense of what a project like this would have in terms of tribes' concerns for this vicinity.

We indicated, as well as other tribes, that this project would have a major impact to this river corridor. The river corridor represents a part of our life ways, not just of the river, as described by Aha Makav, meaning

"people of the river," but the manifestations of all things that are a part of the river represent who we are. And so in the vicinity of where we are currently is part of that river corridor. Anything that adds to or impacts this river corridor has a significant change to our way of life. So there is more than just looking at it in the physical sense in terms of cultural manifestations or artifacts. It's about a people. And that's not what's understood in terms of what those major impacts would mean to the people.

So I see that, also, the opportunity to continue consultation, which takes a lot of work and effort as well from tribes, but nonetheless the two-prong process of an EIR and EIS when both are addressing at different levels. Mind you, too, that the resource management plan is going to be changed only because it's a pre-DRECP. So if that's the case, this place is also known, at least for management purposes, of an area of critical environmental concern. So in the sense of now representing the tribe and comments for -- for this stage of the game, we say no to this project. But if you don't -- no to any more solar in this vicinity as well. Because if you're going to look at the resource management plan, then management should look at it and support it by its state as well that the ACECB expanded to cover the sensitivity of this area. It's much larger than what is noted in the books right now.

So I don't think enough information has been brought forward to really investigate that, but it should be part of this process as well. Because if the research management plan is going to be changed based on this project, then the research management plan should also look into the processes of an ICEC expansion as well. My comments for right now.

MS. GISPERT: Okay. Is there anyone else who would like to speak at this time? We have -- okay. Make sure you say your name clearly for the transcriptionist.

MR. LEIVAS: Sure.

Good afternoon. Ahalrayo (phonetic), my language, How are you? (Unintelligible) -- language, Chemehuevi. My name is Matthew Leivas, Senior. I'm the director of the cultural center for Chemehuevi Tribe. And comments are ditto compared to everybody else. And what Alfredo spoke about is very sacred, sacred grounds and the sacred stories that he's shared with you, the years and years of accumulation of knowledge. And as far as our -- as far as my journey goes, with the peace and dignity journeys, you know, that journey started back in 1992, October 12th, when that commemorated the 500 years of the rebirth of new knowledge and our sun started shining again. (NonEnglish spoken).

But at any rate, I want to talk about the sacred

land. And I brought along a book. I want to share the title with you. It's called "29" written by a friend named Mary Sojourner. And she spoke about all these things. It's a novel. But she spoke about all these things that are happening in the desert right now. And I just want to share that with you because you've got to read what she has to say in there. It's based on facts. It's like Alfredo says; it's based on facts, not fiction. We're all part of this desert.

And I'm a cofounder of an organization called the Salt Song Project. It was to revive our sacred songs of the Chemehuevi, the Salt Songs that travels all this area along around the Colorado River and went through this near Blythe all the way up to Riverside Mountain and across the river and went back to its point of origin at a cave called Avi-Nava, Bill Williams. But at any rate, back a couple years ago, President Obama dedicated the Mojave Trails National Moment. And in that, he -- that proclamation, he identified the Chemehuevis as occupying the Mojave desert as well as other tribes. But he also identified the Salt Song Trail that traversed this whole sacred area and the songs that make our connection with Mother Earth and the cosmos and the healing. So that's what we bring back is the healing.

Now, my friend wrote this book because of issues

that are going on out in the desert. And if you read this book, it will be like opening up the Holy Grail here, and you'll find out what she's talking about. I can't explain it any more better than what she says in that book.

But we're all connected to this land and this river. Not too many people are talking about water sources and where water is going to come from for these projects. I'm assuming it's coming from the Colorado River. Don't you? Who does? Yeah, eventually you will. Possibly. But that's another fight. That's another issue. But we're on top of that too, because we have rights. All the river tribes have rights: Fort Mojave, Chemehuevi, Colorado River, Brighton, Cocopah. And those rights are being taken care of by the tribes to the best of their ability, and we're protecting those rights. But we're protecting the land, and that's the statement as to the songs and the connectedness of our people to that land. So I want to submit the paper to you just for your records and to identify what I'm talking about and share it with the public. So thank you very much. Love and respect to everybody here. And when we do ceremony, we don't do just ceremony for our people. We do ceremony for everybody. It's a healing process. Healing. That's what this place is all about. It's sacred. Don't disrupt it. Thank you.

MS. GISPERT: Is there anyone else who would like

to make comments?

Well, we invite you to stick around and look at the poster boards and ask questions. We'll be here.

Oh, sure. Make sure you say your name so the transcriptionist can hear you.

MR. GONZALEZ: Thank you.

Hello, everyone. My name is Juan Gonzalez. I'm son of Juan Gonzalez and Bertha Gonzalez from Ripley, California. I have nothing against solar projects. I mean, the land is already disturbed. Fine. It's perfectly fine. But that area right there holds many memories. Because when my father used to take us camping on Easter break or winter break -- I mean, you're going to take those memories away. Basically wipe them clean. I would -- I mean, like they were saying, that land is sacred to us. There is a lot of indigenous and cultural memorabilia or artifacts out there. And I just would hate to see that go.

So, I mean, solar projects on the roofs of houses or any other parts of the land, we're -- we're for that. But we're against this, destroying our culture and our memories. Thank you.

MS. GISPERT: Is there anyone else who would like to speak?

MR. RON DAWSON: Yeah, my name is Ron Dawson. And I have 120 acres just west of where this is supposed to be

going. And my dad's dream was to farm it. And I bought a bunch of equipment to clear the ground to do that. I want to raise ostriches too with a friend of mine, a highway patrolman. So I'm just curious what the impact's going to be to that. Contact me -- I wrote my name down -- and let me know what's going on. Thank you.

MS. GISPERT: Is there anyone else who would like to speak?

Okay. Well, you're welcome to stick around and check out the poster boards, and we're here to answer questions. Thank you.

(The proceedings concluded at 12:38 p.m.)

Notice of Preparation

March 9, 2018

To: Reviewing Agencies

Re: RE Crimson Solar Project
SCH# 2018031027

Attached for your review and comment is the Notice of Preparation (NOP) for the RE Crimson Solar Project draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

Magdalena Rodriguez
California Department of Fish and Wildlife, Region 6
3602 Inland Empire Blvd., Suite C-220
Ontario, CA 91764

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

SCH# 2018031027
Project Title RE Crimson Solar Project
Lead Agency Fish & Wildlife #6

Type NOP Notice of Preparation

Description Note: Review per Lead

The proposed project consists of a utility-scale polar PV and energy storage project that would be located on approximately 2,500 acres of public lands managed by the Bureau of Land Management within the California Desert Conservation Area planning area. The proposed project would interconnect to the regional electrical grid at the Southern California Edison (SCE) 230-kilovolt (kV) Colorado River Substation. The project would generate up to 350 megawatts (MW) of renewable energy using photovoltaic (PV) technology and would include up to 350 MW of integrated energy storage capacity. The proposed project site is located in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, north of Mule Mountain, and south of Interstate 10 (I-10)

Subject: Notice of Preparation (NOP) of a Joint Draft Environmental Impact Statement/Environmental Impact Report for the RE Solar Project and Notice of Public Scoping Meetings

Dear Ms. Rodriguez:

The Mojave Desert Air Quality Management District (District) has received the request for comments for the Joint Draft Environmental Impact Statement/Environmental Impact Report for the RE Crimson Solar Project and Notice of Public Scoping Meetings. This project proposes to construct, operate, and decommission of a 350 megawatt (MW) utility-scale solar photovoltaic and would include up to 350 MW energy storage on approximately 2,500 acres of public lands administered by the Bureau of Land Management within the California Desert Conservation Area (CDCA) planning area.

The District has reviewed the NOP and concurs with the scope of analysis proposed in the CEQA checklist for Air Quality. MDAQMD Designations and Classifications are available at http://mdaqmd.ca.gov/home/showdocument?id=538. The District also recommends that the following dust mitigation measures be required for the construction of the solar photovoltaic project (enforceable by the District AND by the land use agency):

- Prepare and submit to the MDAQMD, prior to commencing earth-moving activity, a dust control plan that describes all applicable dust control measures that will be implemented at the project;
- The following signage shall be erected not later than the commencement of construction: A minimum 48 inch high by 96 inch wide sign containing the following shall be located within 50 feet of each project site entrance, meeting the specified minimum text height, black text on white background, on one inch A/C laminated plywood board, with the lower edge between six and seven feet above grade, with the contact name of a responsible official for the site and a local or toll-free number that is accessible 24 hours per day:

"[Site Name] {four inch text}
[Project Name/Project Number] {four inch text}
IF YOU SEE DUST COMING FROM {four inch text}
THIS PROJECT CALL: {four inch text}
[Contact Name], PHONE NUMBER XXX-XXXX {six inch text}
If you do not receive a response, Please Call {three inch text}
The MDAQMD at 1-800-635-4617 {three inch text}"

- Use a water truck to maintain moist disturbed surfaces and actively spread water during visible dusting episodes to minimize visible fugitive dust emissions. For projects with exposed sand or fines deposits (and for projects that expose such soils through earthmoving), chemical stabilization or covering with a stabilizing layer of gravel will be required to eliminate visible dust/sand from sand/fines deposits.

- All perimeter fencing shall be wind fencing or the equivalent, to a minimum of four feet of height or the top of all perimeter fencing. The owner/operator shall maintain the wind fencing as needed to keep it intact and remove windblown dropout. This wind fencing requirement may be superseded by local ordinance, rule or project-specific biological mitigation prohibiting wind fencing.

- All maintenance and access vehicular roads and parking areas shall be stabilized with chemical, gravel or asphaltic pavement sufficient to eliminate visible fugitive dust from vehicular travel and wind erosion. Take actions to prevent project-related trackout onto paved surfaces, and clean any project-related trackout within 24 hours. All other earthen surfaces within the project area shall be stabilized by natural or irrigated vegetation, compaction, chemical or other means sufficient to prohibit visible fugitive dust from wind erosion.

The District supports the development of renewable energy sources; such development is expected to produce cumulative and regional environmental benefits.

Thank you for the opportunity to review this planning document. If you have any questions regarding this letter, please contact me at (760) 245-1661, extension 6726, or Tracy Walters at extension 6122.

Sincerely,

Alan J. De Salvio
Deputy Director – Mojave Desert Operations

RE: SCH# 2018031027, Crimson Solar Project, City of Blythe and Community of Wileys Well; Riverside County, California

Dear Ms. Rodriguez:

The Native American Heritage Commission has received the Notice of Preparation (NOP) for Draft Environmental Impact Report for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd. (a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a **separate category of cultural resources**, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment (Pub. Resources Code § 21084.2). Please reference California Natural Resources Agency (2016) "Final Text for tribal cultural resources update to Appendix G: Environmental Checklist Form," http://resources.ca.gov/ceqa/docs/ab52/Clean-final-AB-52-App-G-text-Submitted.pdf. Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends **lead agencies consult with all California Native American tribes** that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.**

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a **lead agency** shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
    a. A brief description of the project.
    b. The lead agency contact information.
    c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).
    d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A **lead agency** shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
    a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
    a. Alternatives to the project.
    b. Recommended mitigation measures.
    c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
    a. Type of environmental review necessary.
    b. Significance of the tribal cultural resources.
    c. Significance of the project's impacts on tribal cultural resources.
    d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
    a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
    b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
    a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
    b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

    This process should be documented in the Cultural Resources section of your environmental document.

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires **local governments** to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have been already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Please contact me if you need any additional information at gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton

NOTICE OF PREPARATION (NOP) OF A JOINT DRAFT ENVIRONMENTAL IMPACT STATEMENT/ENVIRONMENTAL IMPACT REPORT (EIS/EIR) FOR THE RE CRIMSON SOLAR PROJECT (SCH# 2018031027)

Dear Ms. Rodriguez:

The Department of Toxic Substances Control (DTSC) has reviewed the subject NOP. The following project description is stated in the NOP: "The proposed project consists of a utility-scale solar PY and energy storage project that would be located on up to approximately 2,500 acres of public lands managed by the BLM within the CDCA planning area. The proposed project would interconnect to the regional electrical grid at the SCE 230-kilovolt (kV) CRS. The project would generate up to 350 MW of renewable energy using PY technology and would include up to 350 MW of integrated energy storage capacity."

Based on the review of the submitted document, DTSC has the following comments:

1. The EIS/EIR should identify and determine whether current or historic uses at the project site may have resulted in any release of hazardous wastes/substances. A Phase I Environmental Site Assessment may be appropriate to identify any recognized environmental conditions.

2. If there are any recognized environmental conditions in the project area, then proper investigation, sampling and remedial actions overseen by the appropriate regulatory agencies should be conducted prior to the new development or any construction.

3. If the project plans include discharging wastewater to a storm drain, you may be required to obtain an NPDES permit from the overseeing Regional Water Quality Control Board (RWQCB).

4. If planned activities include building modifications/demolitions, lead-based paints or products, mercury, and asbestos containing materials (ACMs) should be investigated and mitigated/disposed of in accordance with all applicable and relevant laws and regulations. In addition, evaluate whether polychlorinated biphenyls (PCBs) containing materials is present in onsite buildings and address as necessary to protect human health and the environment.

5. If the site was used for agricultural or related activities, residual pesticides may be present in onsite soil. DTSC recommends investigation and mitigation, as necessary, to address potential impact to human health and environment from residual pesticides.

6. DTSC recommends evaluation, proper investigation and mitigation, if necessary, of onsite areas with current or historic PCB-containing transformers.

7. Please evaluate whether the proposed project is located within or in close proximity to the Formerly Used Defense Site (FUDS) based, in part, on the United States Department of Defense ordnance maps. DTSC recommends assessment and/or investigation be conducted in the project area to assess potential impacts from the nearby FUDS if necessary.

8. Export & Import of Soil: If soil contamination is suspected or observed in the project area, then excavated soil should be sampled prior to export/disposal. If the soil is contaminated, it should be disposed of properly in accordance with all applicable and relevant laws and regulations. In addition, if the project proposes to import soil to backfill the excavated areas, proper evaluation and/or sampling should be conducted to make sure that the imported soil is free of contamination.

9. If during construction/demolition of the project, soil and/or groundwater contamination is suspected, construction/demolition in the area should cease and appropriate health and safety procedures should be implemented. If it is determined that contaminated soil and/or groundwater exist, the EIS/EIR should identify how any required investigation and/or remediation will be conducted and the appropriate government agency to provide regulatory oversight.

If you have any questions regarding this letter, please contact me at (714) 484-5380 or by email at Johnson.Abraham@dtsc.ca.gov.

RIVERSIDE COUNTY
DEPARTMENT OF
WASTE RESOURCES
Hans W. Kernkamp, General Manager-Chief Engineer

March 20, 2018

Ms. Magdalena Rodriguez
California Department of Fish and Wildlife
3602 Inland Empire Boulevard, Suite C220
Ontario, CA 91764

RE: Notice of Preparation (NOP) of a Joint Draft Environmental Impact Report (DEIR)/Draft Environmental Impact Statement (DEIS) for the Recurrent Energy (RE) Crimson Solar Project.

Dear Ms. Rodriguez:

The Riverside County Department of Waste Resources (RCDWR) has reviewed the NOP for a DEIR/DEIS for the RE Crimson Solar Project (Project). The Project is located in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, north of Mule Mountain, and south of Interstate 10.

1. The RCDWR is concerned about the quantity of construction and demolition (C&D) waste that could be generated by the project and how the waste will be disposed of. This includes initial construction as well as the decommissioning and closure of the Project. Should a large quantity of the projects' C&D waste be brought to a county landfill for disposal, it could exceed the landfill's daily permitted capacity, thus a violation of State regulations and an impact to County landfill operation. The DEIR/DEIS should quantitatively analyze this potential solid waste impact.

2. Build-out of the Project may have the potential to increase the amount of waste that might adversely affect solid waste facilities. To assess waste impacts, the DEIR/DEIS will need to include the projected maximum amount of waste generated from build-out of the Project, using appropriate waste generation factors for the proposed land use. Note: Consult the CalRecycle website to determine waste generation factors at:

   https://www2.calrecycle.ca.gov/WasteCharacterization/General/Rates

3. The following information can be useful in the analysis of solid waste impacts:

   a) CR&R is the franchise waste hauler for the project area. This hauler operates under a waste delivery agreement (WDA) which stipulates that any waste generated within the franchise area, including solid waste generated from the Project area, will be disposed of at the Blythe Landfill. The Blythe Landfill is described below:

      Blythe Landfill

      The Blythe Landfill is located at 1000 Midland Road, Blythe CA 92225. The landfill is owned and operated by the RCDWR. The landfill property encompasses approximately

365-acres, of which 78.1 acres are permitted for waste disposal. The landfill is currently permitted to receive a maximum of 400 tons per day of refuse, and as of January 1, 2018, had a remaining capacity of approximately 1.6 million tons. It is estimated that the remaining disposal capacity will last until approximately 2047. During 2017, the Blythe Landfill accepted a daily average volume of 85 tons, for a period total of approximately 22,843 tons.

b) In order to preserve landfill capacity and support efforts to recycle, reuse, and/or reduce the amount of recyclable material going to the landfill, the Project will be conditioned to implement the following measures:

- **Prior to issuance of a grading and/or building permit:** A Waste Recycling Plan (WRP) shall be submitted to the Riverside County Department of Waste Resources for approval. At a minimum, the WRP must identify the materials (i.e., solar panels, cardboard, concrete, asphalt, wood, etc.) that will be generated by construction and development, the projected amounts, the measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials, the facilities and/or haulers that will be utilized, and the targeted recycling or reduction rate. During project construction, the project site shall have, at a minimum, two (2) bins; one for waste disposal and the other for the recycling of Construction and Demolition (C&D) materials. Additional bins are encouraged to be used for further source separation of C&D recyclable materials. Accurate record keeping (receipts) for recycling of C&D recyclable materials and solid waste disposal must be kept. Arrangements can be made through the franchise hauler.

- **Prior to final building inspection:** Evidence (i.e., receipts or other type of verification) to demonstrate project compliance with the approved WRP shall be presented by the project proponent to the Planning Division of the Riverside County Department of Waste Resources. Receipts must clearly identify the amount of waste disposed and Construction and Demolition (C&D) materials recycled.

- **Prior to County Approval of the Decommissioning and Closure Plan:** A Waste Recycling Plan (WRP) shall be submitted to the Riverside County Department of Waste Resources for approval. At a minimum, the WRP must identify the materials (i.e., solar panels, cardboard, concrete, asphalt, wood, etc.) that will be generated by the decommissioning and closure of the facility, the projected amounts, the measures/methods that will be taken to recycle, reuse, and/or reduce the amount of materials, the facilities and/or haulers that will be utilized, and the targeted recycling or reduction rate. During the decommissioning and closure, the project site shall have, at a minimum, two (2) bins: one for waste disposal and the other for the recycling of Construction and Demolition (C&D) materials. Additional bins are encouraged to be used for further source separation of C&D recyclable materials. Accurate record keeping (receipts) for recycling of C&D recyclable materials and solid waste disposal must be kept. Arrangements can be made through the franchise hauler.

4. Hazardous materials are not accepted at Riverside County landfills. In compliance with federal, state, and local regulations and ordinances, any hazardous waste generated in association with the project shall be disposed of at a permitted Hazardous Waste disposal facility. Hazardous waste materials include, but are not limited to, paint

batteries, oil, asbestos, and solvents. For further information regarding the determination, transport, and disposal of hazardous waste, please contact the Riverside County Department of Environmental Health, Environmental Protection and Oversight Division, at 1.888.722.4234.

5. Consider xeriscaping and using drought tolerant/low maintenance vegetation in all landscaped areas of the project.

Thank you for allowing us the opportunity to comment on the NOP. We would appreciate a copy of the Draft EIS/EIR on CD for review and comment when available. Please continue to include the RCDWR in future transmittals. Please call me at (951) 486-3200 if you have any questions regarding the above comments.

Sincerely,

Jose Merlan

Hello Magdalena,

Thank you for contacting the San Manuel Band of Mission Indians (SMBMI) regarding the above referenced project. SMBMI appreciates the opportunity to review the project documentation, which was received by our Cultural Resources Management Department on 16 March 2018. The proposed project area is located outside of Serrano ancestral territory and, as such, SMBMI will not be requesting consulting party status with the lead agency or requesting to participate in the scoping, development, and/or review of documents created pursuant to these legal and regulatory mandates.

Regards,

Jessica Mauck

Alex,

Thanks for the docs. Two more are attached are for your re-view. Still I am requesting the documents and deeds that established the Coyote Canyon Herd Area in compliance with the 1971 Free Roaming Wild Horse and Burro Act. Was FLPMA applicable? **The Federal Land Policy and Management Act of 1976** *www.wildhorserange.org/the-federal-land-policy-and-management-act-of-1976.html* Governs the way in which the public *lands* administered by the Bureau of *Land* Management are managed by creating a single, unified statutory scheme for management. Recognized the value of the public *lands*, declaring that these *lands* would remain in federal ownership.

When the Anza Borrego State Park acquired land from BLM, the Coyote Canyon horses had already occupied the area since the Garra Revolt of 1850 and the treaty of Hidalgo.

You indicated that in 1993, the BLM land was transferred to the State Park and eliminated any use of public lands by these wild horses. Yet in 1995 statement signed by signed by State Park Director of Parks and Recreation Donald Murphy "*The herd of 25-40 wild horse in upper Coyote Canyon is causing observed impact on natural and cultural resources. These animals are protected under the federal Wild Horse and Burro Protection Act thereby limiting our management activities.*" Tim Salts

subsequent unsubstantiated assumptions and allegations are refuted (see attached Trudy summation from Senator Morrow.

Does BLM possess the 1993 deeds of transfer of the Coyote Canyon herd area to state parks? If so why would Parks claim that the wild horses (not feral) *are protected under the federal Wild Horse and Burro Protection Act thereby limiting our management activities?*

In the attached letters Tom Pogacnik states" Unfortunately, when BLM began revisiting the Coyote Canyon horse situation, I also worked with the Solicitor's Office about the NPS animals as there were strong parallels. The Solicitor (*the same one who said BLM erred in relinquishing control of the Coyote Canyon animals to State Parks*) said The Desert Protection Act pretty much gave control of the land and all resources to NPS. " Isn't NPS still responsible for FLPMA compliance?

Please provide me with a copy of the Solicitors letters pertaining to the Coyote Canyon herd area, and the wild horses.

Tom also says "The decision to not manage for a herd area is NEPA document which is subject to change should new, prevailing data become available. As such through NEPA."

Please explain how CDCA complied with pre existing reservations requisites of NEPA/ FLPMA with the official action taken to eliminate and entire protected federal resource.

In 2010 Tom Pogacnik subsequently writes "If the public has quantifiable data which shows there may be an error, they need to provide those data to petition BLM to reconsider the decision."

Extinction of protected resource by a management plan must be documented as a significant environmental impact. The data as requested by BLM are the voluminous documents previously provided to BLM of new and/or prevailing evidence. Amendments are necessary and imperative to restore a Coyote Canyon Herd area, and the animals that BLM delivered to our CCCDA non profit for the purpose of historic and genetic preservation.

The CDCA land use plan provides the public with an opportunity to correct the accumulative deficiencies caused by the intentional elimination of a protected natural and historic resource. Amendments will be effective ONLY IF DOI/BLM are responsive to citizens that draw attention to oversights in previous plans that extinguished rights granted through the mandates of the National Historic Preservation Act, SHPO programmic agreements., NEPA, CESA, FLPMA, Free Roaming wild horse and burro Act, et al.

As James B. Ruch California State Director Bureau of Land Management stated: " Managing the public lands in the California Desert in a spirit of service, productivity, and concern for the public interest is the foundation upon which the implementation of the Desert Plan is based. To do this, the dedicated professional men and women of the Bureau of Land Management are committed to work for you and with you, the owners of the public lands in the California Desert Conservation Area."

(Excerpt) : INTENT OF THE PLAN: " Based upon these principles and concepts, the intent of the CDCA Plan is to ensure as nearly as humanly possible that the recognition brought by Congress and the people into law—that the California Desert is not a wasteland but a precious public resource—is effectively guaranteed in its management, *that the uses of today do not preclude the users of tomorrow, and that* we preserve and develop these assets wisely with full regard for their social and environmental as well as economic values*."*

In reference to Solicitor_Memo_1977.pdf see also From: Miner, Karen@Wildlife... - Coyote Canyon Heritage Herd *https://www.facebook.com/permalink.php?story_fbid=1061061357280881&id..*..

Much more of the CA historic herds' habitats are documented in "*Born of Horses*:" Missionaries, Indigenous Vaqueros, and Ecological Expansion during the Spanish Colonization of California by *Paul Albert Lacson* (http://www.sandiegohistory.org/node/58209)

Alex, please forward this information to the authorized officers: California State Director of the Bureau of Land Management, the California Desert District Manager, or any other BLM official so

delegated in accordance with Bureau Order 701 and amendments thereto.

Sincere thanks to you for your patience and kind assistance and interest over the years.

Kathleen

Hi Kathleen, I received a response from your inquiry regarding: BLM patent to Anza Borrego Desert State Parks. Please see below.

If you have any further questions, please do not hesitate to contact our office.

Thank you.

Lori Brown
619/596-3136
Constituent Affairs Specialist for
Senator Joel Anderson

RESPONSE FROM STATE PARKS:

Ms. Brown,

I have reviewed the emails I received November 30.

One specific request by Kathleen Hayden was the Senator obtain a copy of the Land Patents transferring the property from BLM to the State of California. I have attached those land patents to this email. These patents are public record and can be obtained at the County Recorder's office.

The other direct questions Kathleen Hayden asks are in reference to the 1971 wild horse and burro act, and to the BLM programmatic agreement from 2012.

The land patents from BLM to the State of California all predate these requirements and the land was already in State ownership at the time of their enactment. Therefore the patents could not contain any restrictions for wild horses or burros as the land was not in

BLM's ownership.

STATE PARK SELECTION

Act of March 3, 1933
(47 Stat. 1487).

Los Angeles Land District.

California.

1092770

List No.2. 4—1043-B

The United States of America,

To all to whom these presents shall come, Greeting:

WHEREAS, There has been deposited in the General Land Office of the United States an Order of the Secretary of the Interior, directing that a patent issue to the State of California, under the provisions of the Act of Congress of March 3, 1933 (47 Stat. 1487), entitled, "An Act To provide for the selection of certain lands in the State of California for the use of the California State Park system", for the tracts of land described as follows, to wit:

San Bernardino Meridian, California.

Township nine south of Range four east,

The Section thirty-six.

Township nine south of Range five east,

The fractional Sections two, four, and six, the Sections eight, ten, twelve, and fourteen, the fractional Section eighteen, and the Section twenty.

Township nine south of Range six east,

The fractional Sections two, four, and six, the Sections eight, ten, twelve, fourteen, and sixteen, the fractional Section eighteen, the Sections twenty and twenty-two, the southwest quarter of Section twenty-four, the Sections twenty-six and twenty-eight, the Lot one, the north half of the Lot two, the Lots three and four, the east half of the northwest quarter, and the east half of Section thirty, and the Sections thirty-two and thirty-four.

Township nine south of Range seven east,

The fractional north half of Section one and the fractional Sections two, three, and four.

Township nine south of Range eight east,

The Sections twenty, twenty-two, twenty-four, twenty-six, and twenty-eight, the fractional Section thirty, and the Sections thirty-two, thirty-four, and thirty-six.

CORD OF PATENTS: Patent Number 1092770

List No.2.

Township ten south of Range five east,

The Sections twenty-four, twenty-six, twenty-eight, twenty-nine, thirty-two, thirty-three, and thirty-four, the west half of the northwest quarter and the southwest quarter of the southwest quarter of Section thirty-six.

Township ten south of Range six east,

The fractional Section two, the fractional northeast quarter of Section four, the Lot seven of Section six, the east half of Section ten, the Section twelve, the northwest quarter of Section fourteen, the south half of the Lot two of the northwest quarter, the Lot two of the southwest quarter, the northwest quarter of the northeast quarter, the south half of the northeast quarter, and the southeast quarter of Section eighteen, and the south half of the Lot two of the northwest quarter, the Lot two of the southwest quarter, and the southeast quarter of the northwest quarter of Section thirty.

Township ten south of Range seven east,

The fractional Section two, the fractional north half of Section four, the fractional Section six, the southeast quarter of Section eight, the Sections ten, twelve, and fourteen, the fractional west half of Section eighteen, and the Section twenty.

Township twelve south of Range six east,

The fractional Section six, the northeast quarter and the fractional northwest quarter of Section seven, the north half of Section eight, the north half, the north half of the southeast quarter, and the northeast quarter of the southwest quarter of Section nine, the north half and the north half of the south half of Section ten, the north half, the southeast quarter, the north half of the southwest quarter, and the southeast quarter of the southwest quarter of Section eleven, the north half, the north half of the southwest quarter, and the southwest quarter of the southwest quarter of Section twelve, the south half of the north half and the south half of Section thirteen, the south half of the north half and the south half of Section fourteen, the south half of the north half and the south half of Section fifteen, the Section seventeen, and the fractional Section eighteen.

1092770

List No.2.

Township twelve south of Range five east,

The northeast quarter, the north half of the northwest quarter, the northeast quarter of the southeast quarter, and the south half of the southwest quarter of Section eleven, the north half and the north half of the southwest quarter of Section twelve, the east half of the northeast quarter, the southwest quarter of the northeast quarter, and the south half of Section thirteen, the north half of the northeast quarter, the west half, the northeast quarter of the southeast quarter, and the south half of the southeast quarter of Section fourteen, the Sections fifteen and seventeen, the fractional Section eighteen, the Lots one, two, and three, the east half of the northeast quarter, and the northwest quarter of the northeast quarter of Section nineteen, the fractional Section twenty, the Section twenty-one, the north half, the northwest quarter of the southeast quarter, and the southwest quarter of Section twenty-two, the fractional Sections one and two, the Lots one, two, three, and four, the south half of the north half, the southeast quarter, and the north half of the southwest quarter of Section three, the Lots one, two, three, and four and the south half of the southwest quarter of Section five, the Lots one, four, five, six, and seven, the south half of the southeast quarter, and the east half of the southwest quarter of Section six, the Section eight, the southeast quarter of the northeast quarter, the east half of the southeast quarter, and the southwest quarter of Section nine, and the south half of the northwest quarter and the south half of Section ten.

Township eleven south of Range eight east,

The fractional Sections four and six and the Section fourteen.

Township eleven south of Range six east,

The fractional Section six, the fractional northwest quarter of Section nineteen, the southwest quarter of Section twenty, the east half of the northeast quarter, the southeast quarter of the southeast quarter, and the northwest quarter of the southwest quarter of Section twenty-four, the west half and the southeast quarter of Section twenty-nine, the fractional Sections thirty and thirty-one, the Section thirty-two, the west

half and the southeast quarter of Section thirty-three, and the west half of Section thirty-four.

Township eleven south of Range seven east,

The south half of Section two and the fractional Section four.

Township twelve south of Range five east,

The east half, the northwest quarter, the east half of the southwest quarter, and the southwest quarter of the southwest quarter of Section twenty-three, the Sections twenty-four and twenty-five, the east half, the northwest quarter, the north half of the southwest quarter, and the southeast quarter of the southwest quarter of Section twenty-six, the Lot one, the east half of the northeast quarter, the north half of the northwest quarter, and the northeast quarter of the southeast quarter of Section twenty-seven, the Lots one, two, three, and four, the north half of the northeast quarter, and the north half of the northwest quarter of Section twenty-eight, the fractional Sections twenty-nine, thirty-one, and thirty-two, the Lots two, three, and four, the southeast quarter of the northeast quarter, and the south half of the southeast quarter of Section thirty-three, the southwest quarter of the northwest quarter of Section thirty-four, and the northeast quarter, the east half of the northwest quarter, and the north half of the southeast quarter of Section thirty-five.

Township twelve south of Range six east,

The fractional Sections two, three, four, and five, the Sections twenty-eight and twenty-nine, the fractional Sections thirty and thirty-one, and the Sections thirty-two, thirty-three, thirty-four, and thirty-five.

Township twelve south of Range seven east,

The fractional Section two and the fractional northwest quarter and the west half of the southwest quarter of Section four.

Township nine south of Range five east,

The southwest quarter of Section sixteen.

Township eleven south of Range five east,

The Lot four of Section thirty-one.

1092770

List No.2.

Township twelve south of Range five east,

The south half of the southwest quarter of Section three, the southwest quarter of the northeast quarter, the south half of the northwest quarter, the northwest quarter of the southeast quarter, and the north half of the southwest quarter of Section five, the southeast quarter of the northeast quarter and the north half of the southeast quarter of Section six, the fractional Section seven, the north half of the north half of Section nine, the northeast quarter and the north half of the northwest quarter of Section ten, the south half of the northwest quarter, the northwest quarter of the southeast quarter, the south half of the southeast quarter, and the north half of the southwest quarter of Section eleven, and the southeast quarter and the south half of the southwest quarter of Section twelve.

Township twelve south of Range six east,

The north half of the southeast quarter and the southwest quarter of of the southeast quarter of Section seven, the southeast quarter and the northeast quarter of the southwest quarter of Section eight, the south half of the southeast quarter, the northwest quarter of the southwest quarter, and the southeast quarter of the southwest quarter of Section nine, the south half of the south half of Section ten, the southwest quarter of the southwest quarter of Section eleven, the southeast quarter and the southeast quarter of the southwest quarter of Section twelve, the north half of the north half of Section thirteen, the north half of the north half of Section fourteen, and the north half of the north half of Section fifteen.

Township nine south of Range seven east,

The fractional Section five.

Township twelve south of Range seven east,

The north half of Section eight, the south half of the north half and the north half of the south half of Section ten, the southwest quarter of the southwest quarter of Section twelve, and the northeast quarter of the northeast quarter of Section fourteen, containing in the aggregate, seventy-six thousand five hundred ninety-six acres and fifty

1092770

hundredths of an acre, as shown by the Official Plats of the Survey of the said Land, on file in the General Land Office:

NOW KNOW YE, That the UNITED STATES OF AMERICA, in consideration of the premises, HAS GIVEN AND GRANTED, and by these presents DOES GIVE AND GRANT, unto the said State of California the tracts of land above described; TO HAVE AND TO HOLD the same, together with all the rights, privileges, immunities, and appurtenances of whatsoever nature, thereunto belonging, unto the said State of California, forever, for State park purposes; excepting and reserving, however, to the United States all coal, oil, gas, or other mineral contained in said lands, together with the right to prospect for, mine, and remove the same at such times and under such conditions as the Secretary of the Interior may prescribe. Reserving unto the United States, its permittee or licensee, the right to enter upon, occupy and use, any part or all of that portion of Lot four of said Section thirty-one in Township eleven south of Range five east, the south half of the southwest quarter of said Section three, the southwest quarter of the northeast quarter, the south half of the northwest quarter, the northeast quarter of the southwest quarter, and the northwest quarter of the southeast quarter of said Section five, the southeast quarter of the northeast quarter of said Section six, the north half of the north half of said Section nine, the north half of the northwest quarter and the northeast quarter of said Section ten, the southwest quarter of the northwest quarter, the north half of the southwest quarter, the north half of the southeast quarter, and the southeast quarter of the southeast quarter of said Section eleven, and the south half of the southwest quarter and the southeast quarter of said Section twelve in Township twelve south of Range five east, the north half of the southeast quarter of said Section seven, the northeast quarter of the southwest quarter and the north half of the southeast quarter of said Section eight, the northwest quarter of the southwest quarter and the southeast quarter of the southwest quarter of said Section nine, the southeast quarter and the southeast quarter of the southwest quarter of said Section twelve, the north half of the north-

west quarter and the northwest quarter of the northeast quarter of said Section thirteen, the north half of the north half of said Section fourteen, and the north half of the north half of said Section fifteen in Township twelve south of Range six east, and the north half of the northwest quarter, the southwest quarter of the northwest quarter, and the northeast quarter of said Section eight, the south half of the northwest quarter, the south half of the northeast quarter, and the north half of the southeast quarter of said Section ten, and the southwest quarter of the southwest quarter of said Section twelve in Township twelve south of Range seven east, lying within 25 feet of the center line of the telephone line right of way of the Southern Sierras Power Company, and that portion of the north half of the southwest quarter and the northwest quarter of the southeast quarter of said Section five, the southeast quarter of the northeast quarter and the north half of the southeast quarter of said Section six, the north half of the north half of said Section nine, the northwest quarter of the northeast quarter, the south half of the northeast quarter, the north half of the northwest quarter of said Section ten, the southwest quarter of the northwest quarter, the north half of the southwest quarter, the northwest quarter of the southeast quarter, and the south half of the southeast quarter of said Section eleven, and the south half of the south half of said Section twelve in Township twelve south of Range five east, the southwest quarter of the southeast quarter of said Section seven, the northeast quarter of the southwest quarter, the northwest quarter of the southeast quarter, and the south half of the southeast quarter of said Section eight, the south half of the southeast quarter and the southeast quarter of the southwest quarter of said Section nine, the south half of the south half of said Section ten, the southwest quarter of the southwest quarter of said Section eleven, the southeast quarter of the southeast quarter of said Section twelve, the north half of the north half of said Section thirteen, the north half of the north half of said Section fourteen, and the north half of the northeast quarter of said Section fifteen in Township twelve south of Range six east, and the south half of the north half of said Section eight, the north half of the

List No.2.

A- 1013-(c)

south half of said Section ten, and the northeast quarter of the northeast quarter of said Section fourteen in Township twelve south of Range seven east, lying within 50 feet of the center line of the transmission line right of way of the Southern Sierras Power Company for the purposes provided in the Act of June 10, 1920 (41 Stat. 1063), and subject to the conditions and limitations of Section 24 of said Act, as amended by the Act of August 26, 1935 (49 Stat. 846), and included in power project No.544.

This grant is made subject to valid rights existing on the date of said act and upon the express condition that the lands hereby granted shall be used by the State of California for State park purposes, and upon the further express provision and condition that upon a finding by the Secretary of the Interior that for a period of more than one year the land has not been used by the State for park purposes the title to the same shall revert to the United States. And there is reserved from the lands hereby granted, a right of way thereon for ditches or canals constructed by the authority of the United States.

IN TESTIMONY WHEREOF, I, **Franklin D. Roosevelt**,

President of the United States of America, have caused these letters to be made Patent, and the Seal of the General Land Office to be hereunto affixed.

GIVEN under my hand, at the City of Washington, the TWENTY-SEVENTH

(SEAL) day of SEPTEMBER in the year of our Lord one thousand

nine hundred and THIRTY-SEVEN and of the Independence of the

United States the one hundred and SIXTY-SECOND.

By the President: Franklin D. Roosevelt

The Sections twenty-four, twenty-six, and twenty-eight, the southeast quarter of the northeast quarter and the west half of the southeast quarter of Section twenty-nine, and the Sections thirty, thirty-two, thirty-four, and thirty-six.

Township ten south of Range five east,

The Sections two, four, eight, ten, twelve, fourteen, twenty, and twenty-two.

Township eleven south of Range five east,

The Sections two, three, and four, the Lots one, two, three, and four, the south half of the north half, the southeast quarter, and the north half of the southwest quarter of Section five, the northeast quarter, the southeast quarter, and the southeast quarter of the southwest quarter of Section eight, the Section nine, the north half, the southeast quarter, the north half of the southwest quarter, and the southeast quarter of the southwest quarter of Section ten, the west half and the southeast quarter of Section eleven, the Section twelve, the west half of Section thirteen, the Section fourteen, the north half of Section fifteen, the northeast quarter, the southeast quarter of the northwest quarter, the northeast quarter of the southwest quarter, and the north half of the southeast quarter of Section seventeen, the west half of the northeast quarter, the east half of the west half, and the southeast quarter of Section twenty-one, the south half of Section twenty-two, the Section twenty-three, the west half and the southeast quarter of Section twenty-four, the Sections twenty-five, twenty-six, and twenty-seven, the east half and the east half of the west half of Section twenty-eight, the west half of the west half of Section twenty-nine, the east half, the southeast quarter of the northwest quarter, and the northeast quarter of the southwest quarter of Section thirty, the south half of the northeast quarter,

the southeast quarter of the northwest quarter, the southeast quarter, the east half of the southwest quarter, and the Lot three of Section thirty-one, the east half, the southwest quarter, the south half of the northwest quarter, and the northeast quarter of the northwest quarter of Section thirty-two, and the Sections thirty-three, thirty-four, and thirty-five.

Township twelve south of Range six east,

The Sections nineteen, twenty, twenty-one, twenty-two, twenty-three, twenty-four, twenty-five, twenty-six, and twenty-seven.

Township nine south of Range seven east,

The Sections six, seven, eight, nine, and ten, the north half and the southwest quarter of Section eleven, the Section twelve, the west half and the southeast quarter of Section thirteen, the Sections fourteen, fifteen, sixteen, seventeen, eighteen, twenty, twenty-two, twenty-four, and twenty-six, the east half and the northwest quarter of Section twenty-eight, the northeast quarter of Section thirty, the south half of Section thirty-two, and the Section thirty-four.

Township ten south of Range seven east,

The Sections twenty-two, twenty-four, twenty-six, twenty-eight, thirty-two, and thirty-four.

Township twelve south of Range seven east,

The Section six, the south half of Section eight, the north half of the north half and the south half of the south half of Section ten, the north half, the north half of the southwest quarter, the southeast quarter of the southwest quarter, and the south half of the southeast quarter of Section twelve, the northwest quarter, the northwest quarter of the northeast quarter, the south half of the northeast quarter, and the south half of Section fourteen, the west half and the southeast quarter of Section seventeen, the Sections eighteen, nineteen, twenty, twenty-one, and twenty-two, the Lots seven, eight, nine, and ten of Section twenty-three, the Section twenty-four, the south half of Section twenty-five, and the Sections twenty-six, twenty-seven,

twenty-eight, twenty-nine, thirty, thirty-one, thirty-two, thirty-three, thirty-four, and thirty-five.

Township nine south of Range eight east,

The Sections two, four, six, eight, ten, twelve, fourteen, sixteen, and eighteen.

Township ten south of Range eight east,

The Sections two, four, six, eight, ten, twelve, and fourteen, the northwest quarter of the northeast quarter, the south half of the northeast quarter, the southwest quarter of the southwest quarter, the southeast quarter, and the northwest quarter of Section sixteen, and the Sections eighteen, twenty, twenty-two, twenty-four, twenty-six, twenty-eight, thirty, thirty-two, thirty-four, and thirty-six, containing in the aggregate, eighty-nine thousand two hundred three acres and ten hundredths of an acre, as shown by the Official Plats of the Survey of the said Land, on file in the General Land Office:

NOW KNOW YE, That the UNITED STATES OF AMERICA, in consideration of the premises, HAS GIVEN AND GRANTED, and by these presents DOES GIVE AND GRANT, unto the said State of California the tracts of land above described; TO HAVE AND TO HOLD the same, together with all the rights, privileges, immunities, and appurtenances of whatsoever nature, thereunto belonging, unto the said State of California, forever, for State park purposes; excepting and reserving, however, to the United States all coal, oil, gas, or other mineral contained in said lands, together with the right to prospect for, mine, and remove the same at such times and under such conditions as the Secretary of the Interior may prescribe.

This grant is made subject to valid rights existing on the date of said act and upon the express condition that the lands hereby granted shall be used by the State of California for State park pur-

STATE PARK SELECTION

Act of March 3, 1933
(47 Stat. 1487).

Los Angeles Land District.

California.

List No. 1.

4—1043-R

The United States of America,

To all to whom these presents shall come, Greeting:

WHERREAS, There has been deposited in the General Land Office of the United States an Order of the Secretary of the Interior, directing that a patent issue to the State of California, under the the provisions of the Act of Congress of March 3, 1933 (47 Stat. 1487), entitled, "An Act To provide for the selection of certain lands in the State of California for the use of the California State Park system", for the tracts of land described as follows, to wit:

San Bernardino Meridian, California.

Township nine south of Range four east,

The Lots one, two, three, and four, the south half of the northeast quarter, the southeast quarter, the southeast quarter of the northwest quarter, the south half of the southwest quarter, and the northeast quarter of the southwest quarter of Section two, the Sections four and six, the Lots one, two, three, and four of Section seven, the Sections eight, ten, twelve, fourteen, and sixteen, the west half and the south half of the southeast quarter of Section seventeen, the Section eighteen, the north half of the northeast quarter, the southeast quarter of the northeast quarter, the southeast quarter, the northeast quarter of the northwest quarter, the east half of the southwest quarter, and the Lots one and three of Section nineteen, the Sections twenty, twenty-one, twenty-two, twenty-three, twenty-four, and twenty-six, the east half, the north half of the northwest quarter, the southeast quarter of the northwest quarter, the east half of the southwest quarter, the east half of the northwest quarter of the southwest quarter, and the northeast quarter of the southwest quarter of the southwest quarter of Section twenty-seven, the northeast quarter, the south half of the northwest quarter, the northeast quarter of the northwest quarter, the south half, and the south half of the

RECORD OF PATENTS: Patent Number 1084149

northwest quarter of the northwest quarter of Section thirty-four, and the Section thirty-five.

Township nine south of Range five east,

The Sections twenty-four, twenty-six, and twenty-eight, the southeast quarter of the northeast quarter and the west half of the southeast quarter of Section twenty-nine, and the Sections thirty, thirty-two, thirty-four, and thirty-six.

Township ten south of Range five east,

The Sections two, four, eight, ten, twelve, fourteen, twenty, and twenty-two.

Township eleven south of Range five east,

The Sections two, three, and four, the Lots one, two, three, and four, the south half of the north half, the southeast quarter, and the north half of the southwest quarter of Section five, the northeast quarter, the southeast quarter, and the southeast quarter of the southwest quarter of Section eight, the Section nine, the north half, the southeast quarter, the north half of the southwest quarter, and the southeast quarter of the southwest quarter of Section ten, the west half and the southeast quarter of Section eleven, the Section twelve, the west half of Section thirteen, the Section fourteen, the north half of Section fifteen, the northeast quarter, the southeast quarter of the northwest quarter, the northeast quarter of the southwest quarter, and the north half of the southeast quarter of Section seventeen, the west half of the northeast quarter, the east half of the west half, and the southeast quarter of Section twenty-one, the south half of Section twenty-two, the Section twenty-three, the west half and the southeast quarter of Section twenty-four, the Sections twenty-five, twenty-six, and twenty-seven, the east half and the east half of the west half of Section twenty-eight, the west half of the west half of Section twenty-nine, the east half, the southeast quarter of the northwest quarter, and the northeast quarter of the southwest quarter of Section thirty, the south half of the northeast quarter,

the southeast quarter of the northwest quarter, the southeast quarter, the east half of the southwest quarter, and the Lot three of Section thirty-one, the east half, the southwest quarter, the south half of the northwest quarter, and the northeast quarter of the northwest quarter of Section thirty-two, and the Sections thirty-three, thirty-four, and thirty-five.

Township twelve south of Range six east,

The Sections nineteen, twenty, twenty-one, twenty-two, twenty-three, twenty-four, twenty-five, twenty-six, and twenty-seven.

Township nine south of Range seven east,

The Sections six, seven, eight, nine, and ten, the north half and the southwest quarter of Section eleven, the Section twelve, the west half and the southeast quarter of Section thirteen, the Sections fourteen, fifteen, sixteen, seventeen, eighteen, twenty, twenty-two, twenty-four, and twenty-six, the east half and the northwest quarter of Section twenty-eight, the northeast quarter of Section thirty, the south half of Section thirty-two, and the Section thirty-four.

Township ten south of Range seven east,

The Sections twenty-two, twenty-four, twenty-six, twenty-eight, thirty-two, and thirty-four.

Township twelve south of Range seven east,

The Section six, the south half of Section eight, the north half of the north half and the south half of the south half of Section ten, the north half, the north half of the southwest quarter, the southeast quarter of the southwest quarter, and the south half of the southeast quarter of Section twelve, the northwest quarter, the northwest quarter of the northeast quarter, the south half of the northeast quarter, and the south half of Section fourteen, the west half and the southeast quarter of Section seventeen, the Sections eighteen, nineteen, twenty, twenty-one, and twenty-two, the Lots seven, eight, nine, and ten of Section twenty-three, the Section twenty-four, the south half of Section twenty-five, and the Sections twenty-six, twenty-seven,

twenty-eight, twenty-nine, thirty, thirty-one, thirty-two, thirty-three, thirty-four, and thirty-five.

Township nine south of Range eight east,

The Sections two, four, six, eight, ten, twelve, fourteen, sixteen, and eighteen.

Township ten south of Range eight east,

The Sections two, four, six, eight, ten, twelve, and fourteen, the northwest quarter of the northeast quarter, the south half of the northeast quarter, the southwest quarter of the southwest quarter, the southeast quarter, and the northwest quarter of Section sixteen, and the Sections eighteen, twenty, twenty-two, twenty-four, twenty-six, twenty-eight, thirty, thirty-two, thirty-four, and thirty-six, containing in the aggregate, eighty-nine thousand two hundred three acres and ten hundredths of an acre, as shown by the Official Plats of the Survey of the said Land, on file in the General Land Office:

NOW KNOW YE, That the UNITED STATES OF AMERICA, in consideration of the premises, HAS GIVEN AND GRANTED, and by these presents DOES GIVE AND GRANT, unto the said State of California the tracts of land above described; TO HAVE AND TO HOLD the same, together with all the rights, privileges, immunities, and appurtenances of whatsoever nature, thereunto belonging, unto the said State of California, forever, for State park purposes; excepting and reserving, however, to the United States all coal, oil, gas, or other mineral contained in said lands, together with the right to prospect for, mine, and remove the same at such times and under such conditions as the Secretary of the Interior may prescribe.

This grant is made subject to valid rights existing on the date of said act and upon the express condition that the lands hereby granted shall be used by the State of California for State park pur-

This grant is made subject to valid rights existing on the date of said act and upon the express condition that the lands hereby granted shall be used by the State of California for State park purposes, and upon the further express provision and condition that upon a finding by the Secretary of the Interior that for a period of more than one year the land has not been used by the State for park purposes the title to the same shall revert to the United States. And there is reserved from the lands hereby granted, a right of way thereon for ditches or canals constructed by the authority of the United States. Reserving unto the United States, its permittee or licensee, the right to enter upon, occupy and use, any part or all of that portion of the south half of the south half of said Section four in Township twelve south of Range five east and the Lot two of the northwest quarter of said Section eighteen in Township twelve south of Range eight east of the San Bernardino Meridian, lying within 25 feet of the center line of the telephone line right of way of the Southern Sierras Power Company, and as to any part or all of that portion of the southwest quarter of the southwest quarter and the south half of the southeast quarter of said Section four in Township twelve south of Range five east and the Lot two of the northwest quarter of said Section eighteen and the north half of the northwest quarter of said Section twenty in Township twelve south of Range eight east of the San Bernardino Meridian, lying within 50 feet of the center line of the transmission line right of way of the Southern Sierras Power Company for the purposes provided in the Act of June 10, 1920 (41 Stat. 1063), and subject to the conditions and limitations of Section 24 of said Act, as amended by the Act of August 26, 1935 (49 Stat. 846).

IN TESTIMONY WHEREOF, I, **Franklin D. Roosevelt,**

President of the United States of America, have caused these letters to be made Patent, and the Seal of the General Land Office to be hereunto affixed.

GIVEN under my hand, at the City of Washington, the SEVENTH

(SEAL) day of DECEMBER in the year of our Lord one thousand nine hundred and THIRTY-EIGHT and of the Independence of the United States the one hundred and SIXTY-THIRD.

By the President: Franklin D. Roosevelt

By Jeanne Kavanagh, Secretary.

R. L. Clinton

Acting *Recorder of the General Land Office.*

RECORD OF PATENTS: Patent Number 1100418

5—2186 GOVERNMENT PRINTING OFFICE

Form 4-1040
(January 1963)

Los Angeles 053209

The United States of America,

To all to whom these presents shall come, Greeting:

WHEREAS, There is now deposited in the Bureau of Land Management, a Certificate of the Land Office at Riverside, California, directing that a patent issue to the State of California, under the provisions of the Act of Congress of March 3, 1933 (47 Stat. 1487), as amended by the Act of June 5, 1936 (49 Stat. 1482), entitled "An Act To provide for the selection of certain lands in the State of California for the use of the California State Park system", for the following described land:

San Bernardino Meridian, California.
T. 9 S., R. 5 E.,
Sec. 23, SW¼NE¼, NE¼NW¼, S½NW¼.

The area described contains 160.00 acres, according to the Official Plat of the Survey of the said Land, on file in the Bureau of Land Management:

NOW KNOW YE, That the UNITED STATES OF AMERICA, in consideration of the premises, HAS GIVEN AND GRANTED, and by these presents DOES GIVE AND GRANT, unto the said State of California, the tract of land above described; TO HAVE AND TO HOLD the same, together with all the rights, privileges, immunities, and appurtenances, of whatsoever nature, thereunto belonging, unto the said State of California, forever, for State Park purposes; excepting and reserving, however, to the United States all coal, oil, gas, or other mineral contained in said land, together with the right to prospect for, mine, and remove the same at such times and under such conditions as the Secretary of the Interior may prescribe.

This grant is made subject to valid rights existing on the date of said act and upon the express conditions that the land hereby granted shall be used by the State of California for State Park purposes, and upon the further express provision and condition that upon a finding by the Secretary of the Interior that for a period of more than one year the land has not been used by the State for park purposes the title to the same shall revert to the United States. And there is reserved from the land hereby granted, a right-of-way thereon for ditches or canals constructed by the authority of the United States.

IN TESTIMONY WHEREOF, the undersigned authorized officer of the Bureau of Land Management, in accordance with the provisions of the Act of June 17, 1948 (62 Stat., 476), has, in the name of the United States, caused these letters to be made Patent, and the Seal of the Bureau to be hereunto affixed.

GIVEN under my hand, in **District of Columbia** the **SIXTEENTH** day of **APRIL** in the year of our Lord one thousand nine hundred and **SIXTY-FOUR** and of the Independence of the United States the one hundred and **EIGHTY-EIGHTH**.

From: Russ Kaldenberg **To:** CCCDA ; **Sent:** Tuesday, October 07, 2008 1:47 PM
Subject: RE: Beauty Mt Grazing allotment
(Cheyenne resident, Russell Kaldenberg, RPA, former State Archaeologist for the BLM in California, and who received the Lifetime Acheviement Award from The California Society of Archaeology (2009)

I was the Project Manager for the South Coast, or Escondido Project, as it was called in 1983-1985. Ralph Cisco was the Forest Supervisor then. Gerry Hillier was the District Manager, Ed Hastey was State Director and Zane Smith was the Regional Forester. I moved from there to Milwaukee, Wisconsin. Records may be in the BLM's Palm Springs Office or at the Cleveland NF in San Diego. I doubt many folks are around who actually worked on this in 1985, that is 23 years ago. I have racked my brain but I come up with nothing on this....perhaps Mr. Doran might find records. The lands were transferred for administration to the FS from BLM for a year or two from 1985-maybe 1987. They were returned to BLM administration in 1986 or 1987 as I recall.
I spent a lot of time in the Beauty Mountains of South Riverside County. I know there were horses there in the 1980s but I do not know if they would have been considered Wild. You might want to look at the South Coast Management Plan put out by the BLM in about 1990, it might help. Also, Gracie Cox, EquestrianTrails, INc, 10723 Riveside Drive, North Holywood, CA, 91602 (213) 769-2988; P. O. Box 300774, Escondido, CA 92030-0774 could have information. Address is also given as 26535 Lake Wohlford

The Cooper Cienaga Truck Trail was in part the original route of the Pacific Coast Trail through Beauty Mountain. During much of the 1980s private property owners locked gates so there was no, or very limited access to the area. Talking with Mr. Ed Hastey recently, he has informed me that most of the lands in the Beauty Mountain area are now public lands being managed by the BLM. That is fantastic. The horses were nearly always east of the Beauty Mountain dirt road which parallalled the original alignment of the PCT (Cooper Cienaga Truck Trail) because there was generally water there, also horses west of that at the old mine; water often ponded there. I cannot believe that it was not historic range since the tribal use of the area certainly lasted until they were placed on reservations.

I cannot think of any connection in FLPMA other than the identification of Areas of Critical Environmental Concern, where the agency, under sufficient public pressure, should set aside areas for resources. I think that Section 103 (a) describes areas of critical environmental concern in such a manner to "protect and prevent irreparable damage to important histoirc, cultural, or scenic valuse, fish and wildlife resources or other natural systems or processes....

The way the grazing allotments works is that they are identified and specified by AUM (Animal Unit Month-how many can the range sustain) and are specified cow/calf; sheep, horses, goats, etc. The administering agency has to agree to changes its use; that can be done by differences in forage, requests of the allottee, climatic condition (drought, soil erosion) etc. Ag Empire is supposed to use their allottment but maybe the BLM has agreed he can rest the forage without loosing his allotment. The administrative record would need to be checked.
If Ag Empire wants to graze horses and not cattle they would have apply for that change with the BLM who should look at forage needs, range condition etc and say yes or no. If he is paying the lease fee then someone would have to make the argument that he is paying fees for the AUMs but is not using the forage so his lease should not be valid. I would ask BLM when the last turn out was; if Ag Empire has paid for the use of the lease; or whether Ag Empire is in jeopardy of forfeiting their lease. Then...is there someone else who wants the lease for a cow/calf operation and has some priority identified in some Plan somewhere.I would do this formally, in a dated letter sent by certified mail so you have a record. I would not chit chat with someone on the phone or send an email with vague references. Get the allotment number, write a letter requesting a Finding of Facts, and see exactly what you know, not just gabbing information, and ask for a response from the BLM within 45 days. That is not unreasonable. If you have a relationship with the locally elected federal official, like a Congressperson, send the letter to them also with a cover letter telling them you are making an inquiry and hope that they can assist. Put in your letter to the BLM the CC to the local elected official. If not, being an understaffed agency, you may not get a response to the letter.

What they do not want to happen is to have the lease cancelled and opened up to a notice in the FR which invites others to put their operation on the lands. The grazing improvements paid for by PLT monies to the county belong to the leasee and if abandoned belong to the BLM (govt). who can then assign them to the new leasee. Some of what happens depends on what kind of grazing lease it is, whether is is older than FLPMA etc.

The decision to not manage for a herd area is NEPA document which is subject to change should new, prevailing data become available. As such through NEPA,

Tom's reply
Kathleen,
The Wild Free-Roaming Horses and Burros Act of 1971, as amended, states in the preamble, "It is the policy of Congress that wild free-roaming horses and burros shall be protected from capture, branding, harassment, or death; and to accomplish this they are to be considered in the area where presently found, as an integral part of the natural system of the public lands. (emphasis added)"

43 CFR 4700.0-5 (d) "Herd area means the geographic area identified as having been used by a herd as its habitat in 1971."

43 CFR 4710.2 Inventory and monitoring. "The authorized officer shall maintain a record of the herd areas that exited in 1971, and a current inventory of the numbers of animals and their areas of use. When herd management areas are established, the authorized officer shall also inventory and monitor herd and habitat characteristics."

As these inventories are public record, they are maintained in perpetuity.

The decision to not manage for a herd area is NEPA document which is subject to change should new, prevailing data become available. As such through NEPA,

I hope this helps. Tom

Subject: Re: BLM transfer to State Parks

Hi Kathleen,

In response to your last e-mail and the meeting you had with Tom. Tom had talked to my supervisor (Dave Sjaastad) and indicated that he heard that the horses were being actively gathered by a contractor as of yesterday (March 17). I got this information from my supervisor and he was not sure how accurate it is.

The Coyote Canyon HMA was addressed in the 1980 California Desert Conservation Area (CDCA) Plan. It established a management level for 20 wild horses.

In 1985, the CDCA plan amendment #18, was approved to reduced the wild horse population to zero for the Coyote Canyon HMA as prescribed in the Santa Rose Habitat Management Plan for the protection of bighorn sheep.

In 1993, the BLM land was transferred to the State Park and eliminated any use of public lands by these wild horses.

When I find out more information, I will pass it along.

Alex

Subject: RE: pictures of horses on roundup day taken by State Parks

Yes, the animals could still be returned with the proper planning. But, as mentioned before, the timing would be critical. The closer it gets to the summer heat and dry season, the more difficult it will be to transition back to a diet on native range.

Another thought on the condition of the animals. I'm not clear about when the animals left Southern California for South Dakota, but if it was mid to late last week, that would have had them either driving through the blizzard that hit Wyoming and Colorado last Thursday or they would have arrived just as or immediately after the storm hit. That would have had an impact on their condition when they arrived. Tom

Kat,
Unfortunately, when BLM began revisiting the Coyote Canyon horse situation, I also worked with the Solicitor's Office about the NPS animals as there were strong parallels. **The Solicitor (the same one who said BLM erred in relinquishing control of the Coyote Canyon animals to State Parks**) said The Desert Protection Act pretty much gave control of the land and all resources to NPS.

Subject: Re: duty to manage herd??

Kathleen,
If BLM was correct in transferring ownership of the animals to the California, then the State would have taken all responsibility for management and the associated costs.

If BLM was incorrect in transferring the animals to the State, then BLM would probably be responsible for reimbursing CA for costs to manage the animals to date. That'll be up to the lawyers and politicians to work through.

Keep in mind, when the WH&B Act referrs to public land/assets, it is only relative to lands administered by BLM and the Forest Service, not public lands controlled by other federal or state agencies. Tom

Subject: RE: SB 1294 killed in committee

Long story short: Last year BLM revisited its jurisdiction over these horses at the Senator's request and found that their agent Tim Salt had acted in error and in bad faith in an old report telling the State that BLM no longer had jurisdiction or interest in this herd. It was vital for BLM to reassert its jurisdiction over the herd if we were to preserve the gene pool looking towards restoration of the herd to its native range since State Parks twice last year tried to have the stallions gelded in order to assure no reintroduction could be made. We stopped them in their evil plan to geld the stallions. They are now back under the jurisdiction and the protection of BLM.

I know a lot of you who received my e-mail have no use for BLM. We have our quarrels with them here in California as well. **But the new California Wild Horse and Burro Program Manager, Tom Pogacnik, has been a true friend to our folks on this and other issues and BLM will come to the table on finding an Administrative remedy for restoration of the herd. They are extremely interested in a public/private partnership for restoration and management of the herd in its native range. State Parks is the obstructionist here, not BLM.**
That's all I have time for. If you want further information, talk to Kathleen.

Land Use Plan Amendments for the California Desert Conservation Area are ongoing and its (not so hidden) agenda is to re- write history by ignoring the evolution of our culture.
The Southcoast RMP was part of the CDCA
The 2011 Southcoast RMP and EIS update was part of the CDCA.

The ESA Petition to list Wild horses was filed with FWS and BLM on June 10, 2014.

The 2014 Draft DRECP includes Draft BLM Land Use Plan Amendments for the California Desert Conservation Area (CDCA) filed Sept 26, 2014.

Are these plans flawed that neglected to consider the ESA petition to list distinct population segments of wild horse herds in their inventories, cultural and native resources as we requested in our Southcoast RMP/EIS joint comments

I believe that Tom, (as Deputy State Director of Natural Resources, Lands, Planning & Renewable Energy) has the authority to direct the Palm Springs Southcoast Office to amend the Southcoast Resource Management plan...both before and after the 2011 EIS update.

Over the past decade in numerous correspondence, Tom stated that amendments are everyday part of BLM business to accommodate needed changes.

He has been battling with the Colorado River Indian Tribes for the past several years regarding their complaints of NEPA violations relating to its participation in the development of the California Desert Conservation Area Plan. The same plan that zeroed out the Coyote Canyon Herd and transferred the Herd Area to State Parks.

Last week Tom instructed the Southcoast office to make a compliance check on the horses in our care and they jumped through the hoop lickety split.. However they did not return the foundation mares. And now the goody two shoe advocates think they can "re home" the mares, By doing so they destroy a decade of restoring very rare genetics
kat

Ray Field commented on your status.

Ray wrote: "Kathleen,

Tom introduced us to you many years ago to help with his plan he promoted to protect your band of wild horses.
His pitch to us at the Wild Horse Foundation was to help you and Robert build and maintain a operational plan. You needed no help with us on this as your first steps developing were fruitful.

I sat in Tom's office in a cubicle corner, telling how he made a plan to protect som wild horses. He told us in no uncertain terms that the bulk of these wild horses we moved to North Dakota and you had a few to start with and as you grew the remaining would be shipped and transferred to you.

Tom has always been a man I thought was honest, had integrity and loyalty to the wild horses. As he was thrown under-the-bus after the John Fend dynasty, Tom wa open and honest.
It would seem if Tom would make a simple phone call, this would solve this whole issue. Tom is in a power position that wouldn't cost the State Director a single dim straighten this mess out. No more excuses about budgets or finance - this is a no-brainer for Tom. Tom, I asking you politely to do the right-thing before you retire. F up the phone and do-it

please share this, anyway you like. It's not my first rodeo going head to head wit the blm and the blm knows they will not defeat me."

Prepared Remarks of BLM Director Bob Abbey at "Summit of the Horse"
http://www.blm.gov/wo/st/en/info/newsroom/extras/summitstatement.htm
excerpt "Essentially, with the exceptions I just noted, we have placed everythi

on the table for discussion. This includes:
o Taking whatever steps are necessary to ensure an accurate census of wild horses and burros (the methodology we use today to count horses was developed in partnership with the USGS, the most respected scientific agency in all of government).
o Pursuing more aggressive fertility control strategies to slow the reproduction rate of wild horses and burros on public lands.
o Making sure that Herd Management Areas are appropriately designated (this includes revisiting land use planning decisions which had zeroed out wild horses in difficult to manage herd areas).
o Providing greater opportunities for members of the public to volunteer their time in monitoring herds and rangeland conditions.
o Pursuing public and private partnerships designed to provide appropriate areas for wild horses and burros which are removed from over populated Herd Management Areas."

Obviously these statements are supportive of BLM's original offer to partnership with us to restore the Coyote Canyon Herd. BLM acquisitions of habitat in the Beauty Mt/Chihuahua area is an ideal example of grazing habitat. It is within the native ranges of the herd, as Russ Kaldenberg and Art Digrazi indicated to me. We have additional references and documentation sufficient to warrant a RMP amendment.

All of the Chihuahua preserve property is fenced that BLM obtained near Chihuahua Valley Road. It connects to the vacant allotment via the Historic California Riding Trail, aka Cooper Cienaga Truck Trail. This is ideal historic wild horse territory and provides access for eco- tourism. Come on down and we can explore this area.

"Born of Horses:" Missionaries, Indigenous Vaqueros, and Ecological Expansion during the Spanish Colonization of California

By Paul Albert Lacson

Introduction

In June 1774, Evangelista, a Costanoan Indian boy, explained to Father Junípero Serra the reaction of his people to the arrival of Spanish horses in 1769. Costanoans, who considered horses and mules to be the same animal, believed that mules had given birth to Spanish colonists.[1] Evangelista theorized that missionaries, soldiers, and settlers "were the sons of the mules on which they rode." He also supposed that the Spaniards were not quite newcomers, surmising that the people-born-of-mules were actually returning souls of Indians from "surrounding countries, who have come back this way," only this time as the offspring of strange animals.[2]

Spanish pioneer woman ca. 1650. Painting by José Cisneros in Riders Across the Centuries *(El Paso: University of Texas Press, 1984), p. 45.*

A graduate of Castle Park High School in Chula Vista, **Albert Lacson** earned his Ph.D. in History from UC Davis and currently holds the position of Assistant Professor of History at Grinnell College, Iowa. The histories of race and ethnicity in the United States are central to his teaching and research, especially the experiences of Native Americans.

Leather jacket soldier, ca. 1775. Painting by José Cisneros in Riders Across the Centuries *(El Paso: University of Texas Press, 1984), p. 75.*

In 1769, Spanish colonists initiated a revolution in the relationship of California Indians to their environment when they introduced new crops, domesticated animals, and agriculture. Horses proved especially influential in transforming the economies, social hierarchies, political structures, and inter-tribal relationships of Native Californians. This article examines the key factors that led California Indians to embrace horses and caused Spanish colonists to entrust Indians with the powerful creatures—animals that could facilitate Indian rebellions against mission, presidio, or pueblo settlements. At the center of both processes were the Indian vaqueros who seized the opportunity to work with the new animals and who displayed the traits necessary for Spanish missionaries to give them access to the animals.

Given the thriving horse cultures that developed among Indian peoples throughout North America by the nineteenth century, especially in the Southwest and Great Plains, it may seem natural that California Indian peoples should welcome horses. Their embrace, however, of the horse, first introduced by the Spaniards, is complicated by the fact that other biological introductions wreaked havoc on the native population of the region. Historians of American Indian history have produced a healthy spate of scholarship that drives home the point that North America's native peoples readily adopted European goods, ideas, and practices that benefited them—a necessary corrective to the view of American Indians as primitive peoples left behind by history.[3] They have given the impression, however, that American Indians did not welcome the introduction of new biota in the same way that they greeted metal tools or woven cloth shirts. Following the lead of the renowned environmental historian, Alfred Crosby, scholars have stressed the destructive impact of European-introduced biota. They have emphasized that European colonies depended on the biological success of non-human migrants, like plants, animals, and microbes. In other words, it took more than an enterprising spirit and providential grace to wrest control of North America from the continent's native peoples.

By including plants, animals, and diseases as "allies" of Europeans, historians have advanced our understanding of the processes by which native peoples

The Spaniards distributed horses and other livestock throughout the territory of San Diego County native Indian bands.

were dispossessed of their land. Pekka Hämäläinen, however, has convincingly identified a problem with the emphasis on the destructive impact of European-introduced biota, pointing out that the story is dangerously close to biological determinism. It represents what he calls "the biological turn of American colonial history" in which "all the conquerors often had to do was to show up and somehow stay alive; their microbes did the rest."[6] No longer stressing the benevolence of God

Mission San Diego de Alcalá. Editors' collection.

or superior technology, the new narrative gives the impression that humans, whether European or indigenous, had less agency in determining the outcomes of European-Indian contact than previous generations of scholars had recognized. While such a view has gone a long way towards de-emphasizing an exaggerated degree of control held by Europeans, this spate of scholarship minimizes the extent to which American Indians readily incorporated certain aspects of European-introduced biota for their benefit.

This article builds on the study of Hämäläinen's Comanche incorporation of horses by stressing that indigenous peoples did not just passively accept or endure the introduction of European biota, especially horses. By examining the experiences of California Indian vaqueros (cowboys), it argues that Native Californians sought to take advantage of horses and other livestock in the same way that they incorporated metal tools and woven cloth; they put the new creatures and their newly acquired equestrian skills and knowledge to use in ways that furthered native goals. By integrating new animals into California Indian societies, Indian vaqueros aided the Spanish in their initial colonizing efforts, especially in the creation of mission communities based on agriculture and livestock raising. Indian access to horses, however, also created obstacles to the Spanish colonization project, especially as envisioned by Franciscan missionaries. Throughout the Spanish period, missionaries found it difficult to maintain a geographical divide between "civilization" and "savagery," between the coastal communities of Christian neophytes and the inland communities of Indians who chose not to join missions. Vaqueros developed the knowledge and equestrian skills necessary to challenge the spatial arrangement envisioned by Franciscan missionaries in which "civilized" communities existed along the coast while "savagery" was limited to the interior regions of California's Central Valley (the modern San Joaquin Valley).[5]

Unlike other parts of North America, where the dearth of records does not allow historians to identify the specific Indian individuals who played the most influential roles in incorporating horses into their societies, the meticulous record keeping of Franciscan missionaries in Alta California makes it possible to explore the histories of specific Indian individuals crucial to the spread of horse knowledge and skills among California Indians, mission and non-mission Indians alike. For example, an examination of an 1835 census of the Kumeyaay Indian pueblo in San Pascual, situated along the San Dieguito River between the modern cities of Escondido and Poway, illustrates the penetrating changes in Kumeyaay society wrought by the Spanish introduction of horses.[8] Among the thirty-four men listed in the census, many pursued "trades or pursuits" connected in some way to the new culture of horses: seven vaqueros, ten muleteers, one blacksmith, two weavers, two millers, one carder of wool, five farmers, and one cheesemaker. Some worked directly with horses (the vaqueros and muleteers); others supported the ability of people to ride horses (blacksmiths); some made items like cheese and woven cloth products that required the work of horses to herd cattle and sheep (the cheesemaker, weavers, and carder); and others worked with agricultural products that depended on horses and oxen to plow the soil that nourished agricultural products (millers).

By 1835, inhabitants of San Pascual took for granted the consumption of woven cloth and dairy products, as well as the sight of Indian vaqueros taming horses and herding the sheep and cattle necessary to produce such goods. An 1827 report by Franciscan missionaries passing through San Pascual described a scene that had come to seem quite natural along other parts of Alta California's west coast: "In these districts pasture the horses and mules and the sheep of this [San Diego] Mission."[9] While nothing could seem more natural than horses eating grass or weavers making cloth out of the wool from sheep that vaqueros had herded, these animals were not native to Alta California. Their existence—and the human effort necessary to ensure their survival—requires an explanation.

This article illustrates the emergence of California Indian vaqueros in spreading a new relationship with the land—a relationship in which domesticated animals, especially horses, radically reshaped the lives of California's indigenous peoples.

Reactions

Knowledge of sheep, cows, pigs, chicken, and horses may not have made its way to Alta California until 1769, despite the fact that the Spaniards had introduced domesticated livestock to northwestern New Spain in the mid-seventeenth century. The Costanoan boy's belief that mules gave birth to Spanish colonists suggests

Generated by Foxit PDF Creator © Foxit Software
http://www.foxitsoftware.com For evaluation only.

that the animals from the exploratory expeditions of 1769 may have been the first domesticated livestock that he or his neighbors had encountered. Evangelista's views may not have been representative of every Costanoan, and certainly should not necessarily be taken to reflect a theory held by every California Indian, but his assessment of horses does illustrate a lack of experience with domesticated livestock among all Native Californians.

From the perspective of Indians, regardless of their knowledge about horses, one thing was clear: Native Californians associated horses and other livestock with the Spanish newcomers. While a seemingly obvious point, the association is worth emphasizing since Indian peoples resistant to Spanish colonization violently targeted animals in efforts to expel the Spanish. For instance, when Kumeyaay Indians attacked Mission San Diego in 1775, in addition to burning buildings and killing a Franciscan missionary, they also targeted livestock. According to Father Vicente Fuster, who survived the attack, "[O]ur enemies fired arrows at all the livestock both large and small and at the horses. They had not even overlooked the hogs."[9]

In 1785, Tongva Indians rebelled against missionaries at Mission San Gabriel and killed several sheep and goats as part of the rebellion.[10] Along with mission buildings and people, the new animals symbolized an unwelcome presence that became targets of violence during Indian rebellions against Spanish colonization.

Over time, however, whether California's native peoples approved of Spanish colonization or not, most willingly incorporated livestock, especially horses, into their lives. Relatively soon after the arrival of Spanish newcomers, California Indians became the primary caretakers of horses, mules, cattle, oxen, and other Spanish-introduced livestock. Less than a decade after the establishment of Mission San Diego, Father Fermín Francisco de Lasuén reported Indians from that mission rounding up livestock in his 1778 annual report to New Spain's viceroy.[11] At the end of the nineteenth century, Kitsepawit, a Chumash Indian from Mission San Buenaventura, bragged that Native Californians had become the best horse riders in the region.[12] By the early twentieth century, it was common to

Fray Fermín Francisco de Lasuén, Mission San Carlos Borromeo.

Beginning with a seed population of fewer than 1,000 animals in 1769, the number of Spanish-introduced livestock in what would become the state of California grew precipitously in less than a century. In 1850, there were approximately 295,000 such animals in the state (approximately 254,000 cattle, 18,000 sheep, and 23,000 horses and mules). By 1860, the numbers rose even more dramatically: 1,000,000 cattle, 1,100,000 sheep, and 170,000 horses and mules.[12] At Mission San Diego, there were 102 cattle, 304 sheep, and 54 horses in 1776. At the end of the Spanish period in 1821, the growth of the livestock population mirrored the increase in population throughout Alta California; missionaries reported 8,436 cattle, 17,000 sheep, and 1,060 horses.[13] Of course, no biological population, whether human or animal, arrives at a particular population size "naturally." Like the fields of wheat, barley, and beans that depended on the hard labor of the natives, California's livestock population would not have flourished without the work of California Indian vaqueros.

By learning equestrian skills, neophyte Indians could contribute immeasurably to the creation of agricultural communities that would form the centerpiece of the civilizing program of Franciscan missionaries. Military leaders worried, however, that mounted Indians might use their new skills and access to horses against the Spaniards. In 1787, Alta California's governor accused Franciscan missionaries of ignoring a 1786 decree by the Viceroy of New Spain Bernardo de Gálvez that prohibited the "use and management of horses" by Indians. Father-President of the Franciscan missions Father Lasuén acknowledged that neophyte Indians did indeed have access to horses, but assured the governor that a scarcity of labor gave missionaries little choice in the matter:

> No one is more concerned or more interested than the missionariese that the Indian should continue in his native ignorance of horsemanship. But Your Lordship is well aware of the cattle and horses which, with the King's pleasure, every one of the missions possesses, and that horsemen are needed to look after them. And these have to be Indians, for there are no others.[14]

Hi Kevin, good talking with you today. Here's the information on the upcoming public meetings for Crimson Solar.

Wednesday, April 11, 5:00 pm to 8:00 pm

UCR Palm Desert

75080 Frank Sinatra Drive

Palm Desert, CA 92211

Thursday, April 12, 12:00 noon to 3:00 pm

City of Blythe City Hall, Multipurpose Room

235 North Broadway

Blythe, CA 92225

Please feel free to contact me if you have any further questions.

Miriam Liberatore

Bureau of Land Management

RE: **Crimson Solar Project NOP Scoping Comments**

Dear Ms.Rodriguez -

Thank you for the opportunity to offer input concerning the development of the above-identified project. We appreciate your sensitivity to the cultural resources that may be impacted by your project, and the importance of these cultural resources to the Native American peoples that have occupied the land surrounding the area of your project for thousands of years. Unfortunately, increased development and lack of sensitivity to cultural resources has resulted in many significant cultural resources being destroyed or substantially altered and impacted. Your invitation to consult on this project is greatly appreciated.

At this time we are unaware of specific cultural resources that may be affected by the proposed project. We encourage you to contact other Native American Tribes and individuals within the immediate vicinity of the project site that may have specific information concerning cultural resources that may be located in the area. We also encourage you to contract with a monitor who is qualified in Native American cultural resources identification and who is able to be present on-site full-time during the pre-construction and construction phase of the project. Please notify us immediately should you discover any cultural resources during the development of this project.

Very truly yours,

Amanda Vance

Hi Ms. Liberatore and Ms. Rodriguez,

Please find attached the scoping comments from the Center for Biological Diversity regarding the Crimson Solar project west of Blythe, CA. I will also be submitting these through BLM's e-planning portal.

Please feel free to contact either Lisa or I with any questions. We look forward to working with you on this project.

Sincerely,

Ileene

RE: Comments on the Notice of Intent ("NOI") To Prepare a Joint Environmental Impact Statement/ Environmental Impact Report and Possible Land Use Plan Amendment for the Proposed RE Crimson Solar Project, Riverside County, CA 83 FR 10516 and the California Department of Fish and Wildlife ("CDFW") Notice of Preparation ("NOP") of a Joint Draft Environmental Impact Statement/Environmental Impact Report and Notice of Public Scoping Meetings issued March 8, 2018

Dear Ms. Liberatore and Ms. Rodriguez,

Please accept the Center for Biological Diversity's comments on the Bureau of Land Management ("BLM") Notice of Intent ("NOI") to prepare a Joint Environmental Impact Statement/ Environmental Impact Report (EIS/R) and Possible Land Use Plan Amendment for the Proposed RE Crimson Solar Project, Riverside County, CA (83 Fed. Reg. 10516-18 (March 9, 2018)), and the California Department of Fish and Wildlife ("CDFW") Notice of Preparation ("NOP") of a Joint Draft Environmental Impact Statement/Environmental Impact Report and Notice of Public Scoping Meetings issued March 8, 2018.

The Center is a non-profit environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. These scoping comments are submitted on behalf of the Center's 1.6 million staff, members and supporters throughout California and the western United States many of whom live in southern California and enjoy visiting, studying, photographing and hiking in the California Desert Conservation Area, including the areas on and around the project site.

Ileene Anderson, Senior Scientist
660 S. Figueroa Street, Suite 1000, Los Angeles, California 90017
tel: (213) 785-5407 email: ianderson@biologicaldiversity.org
www.biologicaldiversity.org

The development of renewable energy is a critical component of efforts to reduce greenhouse gas emissions, avoid the worst consequences of global warming, and to assist California in meeting emission reductions. The Center strongly supports the development of renewable energy production, and the generation of electricity from solar power, in particular. However, like any project, proposed solar power projects should be thoughtfully planned to minimize impacts to the environment. In particular, renewable energy projects should avoid impacts to sensitive species and habitat, and should be sited in proximity to the areas of electricity end-use in order to reduce the need for extensive new transmission corridors and the efficiency loss associated with extended energy transmission. Only by maintaining the highest environmental standards with regard to local impacts, and effects on species and habitat, can renewable energy production be truly sustainable.

The Crimson Solar Project proposed by Sonoran West Solar Holdings, LLC, a wholly owned subsidiary of Recurrent Energy, LLC, would construct, maintain and decommission a proposed solar photovoltaic (PV) 350 megawatt generating facility and ancillary facilities with a project footprint covering approximately 2,700-acres of BLM-administered public land on in-tact desert landscape within the California Desert Conservation Area ("CDCA"). The proposed project would lie within the Riverside East Solar Energy Zone (SEZ) and the area is also designated as a Development Focus Area (DFA) under the Desert Renewable Energy Conservation Plan (DRECP). Because the project application predated the DRECP it requires a proposed land use plan amendment to the CDCA Plan, as amended. In considering that plan amendment and the proposed project we urge the BLM to fully consider the science used to develop the requirements of the DRECP, so that the landscape level analysis used in formulating those requirements to meet the goals of the DRECP will not be compromised by this proposed project if it moves forward. Similarly, CDFW must consider all of the science and information gathered during the DRECP process, and other new information, in considering any incidental take permit ("ITP") or Lake and Streambed Alteration Agreement ("LSAA") for the proposed project

The CDCA plan Energy Production and Utility Corridors section requires at minimum that the following resource issues be addressed:

1) Consistency with the Desert Plan, including designated and proposed planning corridors;
2) Protection of air quality;
3) Impact on adjacent wilderness and sensitive resources;
4) Visual quality;
5) Cooling-water source(s);
6) Waste disposal;
7) Seismic hazards; and
8) Regional equity.

This joint EIS/R must meet the requirements of NEPA and CEQA regarding baseline information, identification and analysis of impacts, and consideration of alternatives. Under CEQA, alternatives must fully consider avoidance of all significant impacts as well as minimization and migration measures for any remaining unavoidable impacts. In addition, because species protected under both the federal ESA and California ESA (CESA") are present,

the joint EIS/R must consider the impacts to these species, avoidance, minimization and mitigation measures. CDFW must also consider whether the project could impact any fully protected species under California law, such as golden eagles. If so, then the EIS/R must consider whether take could occur and if a NCCP is also needed rather than only an ITP.

Specifically, there are a number of potentially significant impacts to resources that are of concern to the Center and need to be addressed in detail as follow below.

Biological Resources

Based on the proposed project description and our knowledge of the public lands resources, this site is proposed on ecologically functional desert landscape that may provide habitat a suite of rare species. Careful documentation of the current site resources is imperative in order to analyze how to best site the project to *avoid and minimize* impacts and then to mitigate any unavoidable impacts.

Biological Surveys and Mapping

The Center requests that thorough, seasonal surveys be performed for sensitive plant species and vegetation communities, and animal species under the direction and supervision of the BLM and resource agencies such as the US Fish and Wildlife Service and the California Department of Fish and Wildlife. Full disclosure of survey methods and results to the public and other agencies without limitations imposed by the applicant must be implemented to assure full NEPA/CEQA/ESA compliance.

Confidentiality agreements should not be allowed for the surveys in support of the proposed project. Surveys for the plants and plant communities should follow California Native Plant Society (CNPS) and California Department of Fish and Wildlife (CDFW) floristic survey guidelines.[1] A full floral inventory of all species encountered needs to be documented and included in the EIS/R. Surveys for animals should include an evaluation of the California Wildlife Habitat Relationship System's (CWHR) Habitat Classification Scheme[2]. All rare species (plants or animals) need to be documented with a California Natural Diversity Data Base form and submitted to the California Department of Fish and Game using the CNDDB Form as per the State's instructions[3].

The Center requests that the vegetation mapping be done on the whole site and adjacent areas that would be impacted through indirect impacts. The mapping must be at a large enough scale to be useful for evaluating the impacts. Vegetation/wash habitat/sand transport corridor mapping should be at such a scale to provide an accurate accounting of wash areas, sand transport corridor areas and adjacent habitat types that will be directly or indirectly affected by

---

1 https://cnps.org/wp-content/uploads/2018/03/cnps_survey_guidelines.pdf and https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=18959 (respectively)
2 https://www.wildlife.ca.gov/Data/CWHR/Wildlife-Habitats
3 https://www.wildlife.ca.gov/data/CNDDB/submitting-data

the proposed activities. A half-acre minimum mapping unit size is recommended, such as has been used for other development projects. The mapping protocol needs to follow CDFW's Vegetation Classification and Mapping Standards[4] and implement Alliance Level Mapping using a downloadable, blank geodatabase from California Dept. of Fish and Wildlife's VegCAMP[5]. If rare vegetation types are encountered, the survey needs to implement CNPS' protocol for mapping of rare vegetation types[6]

Adequate surveys must be implemented, not just a single season of surveys, in order to evaluate the existing on-site conditions. Due to unpredictable and sparse precipitation, desert organisms have evolved to survive in these harsh conditions. If surveys are performed at inappropriate times or year or in particularly dry years many plants that are, in fact, on-site, but may not be apparent during surveys (ex. annual and herbaceous perennial plants). Importantly in this part of the CDCA, plant surveys should also be implemented after the monsoon season to evaluate the presences of fall blooming rare plants

Impact Analysis

The EIS/R must evaluate all direct impacts due to loss of habitat and also indirect and cumulative impacts to sensitive habitats, including impacts associated with the introduction of non-native plants, the introduction of lighting and noise, increased predation due to attraction of predators to new perching sites and trash, and the loss and disruption of essential habitat due to edge effects.

A number of rare plants and animals have high potential to occur on this site and include but are not limited to:

State Designation

FP Fully Protected under State
CE State listed as endangered.
CT State listed as threatened. Species that although not presently threatened in California with extinction are likely to become endangered in the foreseeable future.
SSC California Department of Fish and Wildlife's "Species of Special Concern." Species with declining populations in California.
WL – Watch List
CFBM – State Fur Bearing Mammal
1B.2 Plant rare, threatened or endangered in California and elsewhere, and fairly threatened in CA.
2B.1 Plant rare, threatened or endangered in California, but more common elsewhere, and very threatened in CA
2B.2 Plant rare, threatened or endangered in California, but more common elsewhere, and fairly threatened in CA.
2.3 Plant rare, threatened or endangered in California, but more common elsewhere, and not very threatened in CA.

All of these species and others have been identified as occurring in the general vicinity of the project site.[7] Therefore, the EIS/R must adequately address the impacts and propose effective ways to avoid, minimize, and mitigate the impacts to these resources through a robust slate of alternatives including alternative siting and alternative on-site configurations.

Desert Tortoise

The desert tortoise is continuing to decline throughout its range in California despite being under federal and state Endangered Species Acts protection as threatened and particularly in the area of the proposed project site[8]. The proposed Crimson project, despite being outside desert wildlife management areas (DWMAs) as identified in the Northern and Eastern Colorado Plan[9], will likely have desert tortoise occurring on site, because 1) tortoise are known from areas surrounding the proposed project, 2) it lies partially on an alluvial fan coming down from the Mule Mountains, and 3) it may lie within one of the required north-south wildlife connectivity corridors required under the Solar PEIS, which established the Solar Energy Zones that the project is being proposed in. Under the PEIS, not all of the lands within those zones are suitable for development, and in particular the required north-south wildlife connectivity linkages should be maintained as habitat. The EIS/R must clearly address alternative proposals for avoiding, minimizing and mitigating the impacts to the desert tortoise and any occupied habitat.

The BLM and CDFW must first look at ways to avoid impacts to the desert tortoise, for example, by identifying and analyzing *alternative sites* outside of desert tortoise occupied habitat or in areas that have already been severely disturbed by other prior land use as well as alternative project configurations that would avoid or significantly reduce impacts. The BLM and CDFW must also look at ways to minimize any impacts that the EIS/R finds are unavoidable, for example, by limiting the ground disturbing activities from the project and limiting access roads to the project. Acquisition of lands that will be managed in perpetuity for conservation must be included as part of the strategy to mitigate impacts to the tortoise, mitigation lands should also be high-quality habitat and, at minimum 5:1 mitigation should be provided of all acres of desert tortoise habitat destroyed. Set-aside conservation lands are particularly important because the project as proposed appears to have little or no compatibility with on-site conservation for desert tortoise.

Translocation as a long-term strategy for minimizing and mitigating impacts to desert tortoise may be a tool for augmenting conservation of the desert tortoise[10], but it cannot substitute for other mitigation such as preservation of habitat. Moreover, to date, translocation does not have a proven track record of success and translocation as mitigation has been questioned for its effectiveness in aiding recovery[11]. If translocation (for any species) is to be a part of the mitigation strategy, a detailed final plan must be included as apart of the EIS/R, and

[10] Field et al 2007 https://digitalcommons.unl.edu/cgi/viewcontent.cgi?article=1092&context=usgsstaffpub

11 Germano et al. 2015 https://www.fws.gov/nevada/desert_tortoise/documents/publications/germano-et-al-2015-mitigation.pdf

include methodologies for determining appropriate conservation area where tortoises may be translocated, impacts to existing "host" tortoise populations that occur on the translocation site, when/how the tortoise are to be translocated, how tortoise diseases will be addressed, and requisite monitoring of host and translocated tortoises, etc. Monitoring of the translocated and existing "host" tortoises needs to occur for a long enough time period that is realistic to evaluate success of the translocation –10 years may be a more realistic minimum for tracking impacts to this long lived species. Success criteria for translocation must also be clearly identified. Any temporary project site and construction lay down and staging areas need to be fenced with tortoise proof fencing during construction and the permanent project sites need to be fenced to prevent tortoise mortality. All associated roads also need to be fenced to prevent roadkill.

An aggressive raven prevention plan also needs to be developed as part of the EIS/R and followed during project development and implementation. This must include reducing perching opportunities and trash reduction and control. Open water sources should be strictly prohibited as well to reduce attraction of ravens and other tortoise predators.

Burrowing Owl

Burrowing owls are continuing to decline in California. If burrowing owls are identified on the site, at least one alternative should evaluate the reduction of impacts to this rare species by moving the project away from the nesting burrows. Additionally, acquisition lands may be required as part of the mitigation and will need to be managed in perpetuity for conservation. Mitigation lands should be high-quality habitat and, at minimum 5:1 mitigation should be provided of all acres of burrowing owl habitat destroyed. Additional measures for avoidance and minimization should also be incorporated into the evaluation of impacts to this species.

Mojave Fringe-toed Lizards

The proposed Crimson project lies within the important and irreplaceable sand transport corridor that originates in Joshua Tree National Park and terminates at the agricultural area surrounding Blythe. This sand river provides important habitat for a variety of sand dune specialists – both plants and animals. The Mojave fringe-toed lizard reaches its southern-most range in the proposed project area – the hottest and driest part of its range. The construction and operation of the Colorado River substation, which this project, as proposed, will surround on three sides, has experienced significant mortalities of Mojave fringe-toed lizards (initially over 103 animals during construction).[12] Despite implementing additional mitigation measures to reduce mortalities, additional mortalities to this species continued to occur[13]. The DEIS/R needs to carefully evaluate all measures to avoid impacts to this rare lizard during construction and operations, including alternative siting outside of the sand transport corridor, alternatives that reduce the use of heavy equipment and trucks crossing MFTL habitat, clearing roads of MFTL before each pass of heavy equipment and others. The DEIS/R must also consider the impact from the infrastructure which will create of perching opportunities for lizard predators on fencing and other infrastructure and describe ways to avoid these predation threats and impacts to this

12 http://www.cpuc.ca.gov/Environment/info/aspen/dpv2/reports/final_monitoring_report.pdf
13 See DVP2 Monitoring Report (attached)

species. BLM required another project - Desert Sunlight, which sits farther away from the sand transport corridor than this project - to prepare a Mojave Fringe-toed Lizard Protection Plan (Desert Harvest FEIS at Wil-4). Unfortunately that plan was not provided for public review and is not as robust as it should be. BLM and CDFW can correct those shortcomings here; this DEIS/R needs to require a Mojave Fringe-toed Lizard Protection Plan and provide the draft plan for public review along with the Draft EIS/R.

Avian Species

Large-scale renewable energy facilities in California are having direct and indirect impacts on migratory birds[14]. The scale of the impacts and the significance to the overall population abundance and ecology of migratory bird species is potentially significant, yet due to a lack of standardized monitoring and analysis, the scale of the impacts remains unknown. Surveys have found low background mortality in the California desert overall.[15] In order to account for project impacts to avian species at a specific site, it is essential that standardized before-after-control-impact surveys of migratory birds are conducted when developing projects, including the proposed project, in order to understand how renewable energy projects are affecting our migratory bird populations and to ensure that projects are developed in accordance with federal law and international treaties.

At this time, there are numerous large-scale solar energy projects operational in the California desert with others moving forward. The land being developed for renewable energy is habitat used by migratory bird species as they migrate and periodically stopover at various sites. These areas are crucial for the viability of the migratory populations. At solar facilities in California that are either under construction or operational, individuals of over 40 species of migratory birds have been found injured or dead[16] and this is far above the background mortality found during control surveys.[17] Avifauna impacted by the nearby solar PV facilities include multiple species of raptors, passerines, and water birds, such as the endangered Ridgway's clapper rail (*Rallus longirostrix yumanensis*), and the federally threatened Yellow-billed cuckoo (*Coccyzus americanus*)

The proposed project needs to incorporate at a minimum, collect baseline avian information over all seasons, avoidance and minimization measures, and a robust avian monitoring program with a commitment to implement additional minimization measures as new information emerges. For example, one approach to implement avoidance and minimization would be by incorporating technologies that make the solid photovoltaic panel visible and avoidable to birds. This is a potential technological "fix" that should be considered in the alternatives analysis for incorporation into the project design.

Desert Dry Wash Woodland and Other Natural Communities

The analysis of impacts to species must include impacts to natural communities such as desert dry wash woodland that provide habitat for many other species as well. DDWW is a rare habitat type (as recognized in the DRECP) and particularly associated with streambeds in these arid areas. Any potential impacts (direct, indirect or cumulative) to this natural community must be identified and analyzed along with alternatives to avoid these critically important landscape features. Further, all rare vegetation communities on the site and adjacent lands must be fully considered in the EIS/R. We support and fully incorporate the scoping comments submitted by the California Native Plant Society for this project.

In preparing the environmental setting and baseline information regarding streambed locations and extent, CDFW should use robust delineation methodology such as the MESA.[18]

Pursuant to California law, CDFW must also consider avoidance, minimization and mitigation for all sensitive plant communities. The CDFW has identified numerous rare plant communities[19], including communities that are found in the California deserts and possibly on the proposed project site. The CDFW also provides guidance on impact analyses to these sensitive plant communities[20] and the DEIS/R needs to incorporate this impact analysis methodology into the environmental review for this proposed project.

Other Rare Species

The diversity of rare species found across the landscape near and on the proposed Crimson site is impressive and suggests that the proposed project site is part of a larger ecologically intact and functioning unit[21]. The BLM and CDFW must clearly address proposals for avoiding, minimizing and mitigating the impacts to all of the rare species that utilize the sites for part or all of their lifecycle.

Acquisition of lands that will be managed in perpetuity for conservation must be included as part of the strategy to avoid, minimize and mitigate impacts to the other species found on site as well. Acquisition is particularly important for these species because the proposed project appears to have little compatibility with any type of on-site conservation of plant communities or wildlife.

For the rare plants, for example, large old-growth yuccas and microphyllous trees, avoidance is preferable because of the general lack of success in transplanting rare plants[22]. If transplantation is to be a part of the mitigation strategy, a detailed final transplantation plan must

22 Fiedler 1991 https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=3173

be included as part of the EIS/R on the methodology for determination of appropriate conservation area where plants may be transplanted, when/how plant are to be transplanted and identification of success criteria for transplantation. Monitoring of the transplanted plants needs to occur for a time period that is realistic to evaluate long-term success of the plants.

Locally Rare Species

The Center requests that the EIS/R also evaluate the impact of the proposed project on locally rare species (not merely federal- and state-listed threatened and endangered species). The preservation of regional and local scales of genetic diversity is very important to maintaining species in perpetuity especially in light of global climate change. Therefore, we request that all species found at the edge of their ranges or that occur as disjunct locations be evaluated for impacts by the proposed permitted activities.

Sand Transport Corridor

The site is known to be within the sand transport corridor that originates in Joshua Tree National Park, through the Palen and Ford Dry Lake Valleys, across Interstate 10 to the agricultural areas adjacent to Blythe. This corridor provides sand habitat for a suite of sand-specialists, including the Mojave fringe-toed lizard and endemic insects. Baseline data should be collected on all of these sand-dependent species. Avoidance through alternative project design or siting must be the first step, and if any remaining impacts to habitat as well as disruption to the sand transport corridor are anticipated they must be identified, minimized and analyzed.

Water Resources

The project will impact many on-site drainages on the project site. The EIS/R document must clarify the impacts to the jurisdictional Waters of U.S. and the Water of the State of California (as noted above, the delineation for waters of the state should use the MESA protocol to ensure robust analysis), and avoid, minimize and mitigate any impacts. Impacts should be avoided to the greatest extent possible and if impacts remain they must be minimized and mitigated. In doing so, any reroute of waters and drainage on the site must assure that downstream processes are not impacted.

An evaluation of the effect of additional groundwater pumping (in conjunction with other groundwater issues [pumping, nitrate plume etc.] in the basin) on the water quality in the basin and surface water resources, and its effect on the native plant and animal species and their habitats need to be included in the EIS/R.

Alternatives

The EIS/R must include a robust analysis of alternatives, including alternative siting (both public and private lands alternatives), and alternatives using other technologies including distributed generation. The stated objectives of the project must not unreasonably constrain the range of feasible alternatives evaluated in the EIS/R. The BLM and CDFW must establish an independent set of objectives that do not unreasonably limit the EIS's analysis of feasible

alternatives including alternative sites. At a minimum alternatives including the no-action alternative, an alternative that avoids all sand transport corridors and semi-stabilized sand habitats as well as all DDWW, alternatives sties, and an alternative where power generation is sited adjacent to power consumption need to be included.

Other Resources

The construction and operation of the proposed facilities will also impact air quality and traffic in the area and these impacts should be disclosed, minimized and mitigated as well. For mobile sources, since consistency with the AQMP will not necessarily achieve the maximum feasible reduction in mobile source greenhouse emissions, the EIS/R should evaluate specific mitigation measures to reduce greenhouse emissions from mobile sources. Soil disturbance should be kept to a minimum to limit additional contributions to PM in this area as well.

The project may directly, indirectly and cumulatively impact cultural resources and these must be fully addressed in the EIS/R including alternatives to avoid impacts, and to minimize and mitigate any impacts that cannot be avoided.

Fire Impacts

Because the any industrial project increases the potential for human-caused fire to occur on site, fire prevention including best management practices must be addressed and clearly identified in the EIS/R - not only on-site protection of resources, but also preventing fire from moving into the adjacent lands. Fire is incredibly detrimental to desert ecosystems, resulting in degradation of the habitat and if frequently reburned results in a type conversion to non-native vegetation[24].

Non-Native Plants

The EIS/R must identify and evaluate impacts to species and ecosystems from invasive exotics species. Many of these species invade disturbed areas, and then spread into wildlands. Fragmentation of intact, ecologically functioning communities further aides the spread and degradation of plant communities[24]. These factors for wildland weed invasions are present in the project, and their effect must be evaluated in the EIS/R. Additionally, landscaping with exotic species is often the vector for introducing invasive exotics into adjacent habitats. Invasive landscape species displace native vegetation, degrade functioning ecosystems, provide little or no habitat for native animals, and increase fire danger and carrying capacity[25] and should be banned from the project site.

Wildlife Movement

Because the project site is located within a required wildlife connectivity corridor discussed above, a thorough and independent evaluation of the project's impacts on wildlife movement is essential. The EIS/R must evaluate all direct, indirect, and cumulative impacts to wildlife movement corridors. The analysis should cover movement of large mammals, as well as other taxonomic groups, including small mammals, birds, reptiles, amphibians, invertebrates, and vegetation communities. The EIS/R should first evaluate habitat suitability within the analysis window for multiple species, including all listed and sensitive species. The habitat suitability maps generated for each species should then be used to evaluate the size of suitable habitat patches in relation to the species average territory size to determine the appropriate size and location of linkages and that they provide both live-in and move-through habitat. The analyses should also evaluate if suitable habitat patches are within the dispersal distance of each species. The EIS/R should address both individual and intergenerational movement (i.e., will the linkages support metapopulations of smaller, less vagile species). The EIS/R should identify which species would potentially utilize the proposed wildlife movement corridors under baseline conditions and after build out, and for which species they would not. In addition, the EIS/R should consider how wildlife movement will be affected by other planned approved, planned, and proposed development in the region as part of the cumulative impacts analysis.

The EIS/R should analyze any proposed on-site wildlife movement corridors are wide enough to minimize edge effects and allow natural processes of disturbance and subsequent recruitment to function. The EIS/R should also evaluate whether the wildlife movement corridors would provide key resources for species, such as host plants, pollinators, or other elements. For example, many species commonly found in washes depend on upland habitats during some portion of their cycle. Therefore, in areas with intermittent or perennial streams, upland habitat protection is needed for these species. Upland habitat protection is also necessary to prevent the degradation of aquatic habitat quality.

Cumulative Impacts

Because of the number of currently permitted and proposed projects in the projects' vicinity, the region, and the CDCA, a thorough analysis of the cumulative impacts from all of these projects on the resources needs to be included. Because the project site is within solar energy zone designated in the Solar PEIS, projects located in the zone have the potential to cumulatively significantly impact the existing biological resources and ecological processes that currently exist within the zone. To date several projects have been permitted in the general vicinity, including the Desert Sunlight and Desert Harvest projects to the northwest, the Genesis project to the north and multiple projects to the east. Other nearby proposed projects are well into the environmental review process, including the Palen project. Additionally other applications are filed in the area. While the zone may be appropriate for some renewable energy development, especially on already disturbed lands, the EIS/R must evaluate if the cumulative impact from the projects will cause significant unmitigable impacts not only to the zone but to the surrounding resources including the Mule Mountains ACEC and Joshua Tree National Park,

which already is impacted by border development on the south, east and west boundaries. In addition, cumulative impacts to cultural resources across this landscape must be fully addressed. The EIS/R must evaluate if the cumulative impact from the projects will cause significant unmitigable impacts to BLM identified Areas of Critical Environmental Concern (ACECs), Wildlife Habitat Management Areas (WHMAs) and federally designated Wilderness.

Thank you for your consideration of these comments. Please add us to the distribution list for the EIS/R and all notices associated with this project.

Sincerely,

PROJECT MEMORANDUM
SCE DPV2 TRANSMISSION PROJECT

To: Billie Blanchard, Project Manager, CPUC
From: Vida Strong, Aspen Project Manager
Date: April 25, 2013
Subject: Weekly Report 89, March 25 to March 31, 2013

INTRODUCTION

This report provides a summary of the construction and compliance activities associated with the SCE DPV2 Transmission Line and Red Bluff Substation Projects. This report is organized as follows:

- Transmission Line Construction
- Substation Construction and Upgrades
- Construction Yards and Other Workspaces

A summary of the Notices to Proceed (NTPs) with construction and Variance Request activity are also provided (see Tables 1 and 2, respectively, near the end of this report). Additionally, a summary of Temporary Extra Workspace (TEWS) and non-compliance activities are provided in Tables 3 and 4, respectively. Table 5 provides a summary of transmission line construction progress to date.

CPUC/BLM/Aspen Environmental Monitors (EM): Ryann Loomis, Rosina Goodman, Jamie Miner, Carla Wakeman, and Scott Debauche.

TRANSMISSION LINE CONSTRUCTION

Summary of Activity

1. Colorado River Substation (CRS) to Red Bluff Substation
   - No construction activities were conducted during the subject period.
2. Red Bluff Substation to Devers Substation
   - Maintenance of Coachella Valley fringe-toed lizard fencing occurred at Towers 2122 and 2126.
   - Maintenance road grading occurred on the right-of-way (ROW) between Towers 2011 thru 2012, and 2221 thru 2225.
   - Wire stringing activities were conducted between Towers 2010 thru 2018, Towers 2257 thru 2326, and at associated wire stringing locations.
   - Telecommunication splicing occurred at Towers 2431, 2440, 2454, 2505, 2516, RB1-2E, and RB2-3E.
   - Foundation closeout activities were conducted at Tower 2443.
   - Site stabilization activities, including BMP removal, recontouring, and desert pavement/topsoil replacement were conducted at Towers 2134, 2137, 2202, 2203, 2205 thru 2225, 2227, 2228, 2327, 2328, 2330, 2331, and 2332, Pull Site 42, Wire Site 41, Splice Sites 29, 30, 38, and 42, Fiber Optic Reel Site 51, Guard Structures 54 and 55, Wire Site 53/Pull Site 54/Splice Site 41, and Wire Site 55/Pull Site 56/Splice Site 43.

3. Devers Substation to Valley Substation

Non-USFS Land

- Installation of BMPs occurred at Towers 1032, 1034, 1053, 1055 thru 1057, 1059, 1061, 1064, 1065, 1081, 1095, 1096, 1098, 1099, 1100, 1101, and 1140.
- Maintenance of BMPs occurred at Towers 1032 thru 1035, 1049 thru 1051, 1080, 1093, 1094, 1107 thru 1129, 1133 thru 1142, and 1145 thru 1155.
- Installation of guard poles occurred at Guard Structures GS1 thru 4, and 12 (see Figure 1).
- Site clearing occurred at Wire Site 36 (see Figure 2).
- Site clearing for permanent landing pads occurred at Tower 1034.
- Grading activities occurred on the ROW access road from HWY 79 to Tower 1101.
- Grading activities occurred at Guard Structures 19, 20A, and 20B, and Wire Site 37.
- Grounding wire trenching occurred at Tower 1064.
- Micropile foundation activities occurred at Towers 1070, 1101, 1102, 1103, 1108, and 1109.
- Tower assembly and/or steel deliveries occurred at Towers 1036, 1049, 1070, 1071, 1073, 1075, 1081, 1093, 1094, 1099, 1105, 1106, 1110, 1111, 1113, 1116, 1118, 1124, 1130, 1131, 1132, 1140, 1142, 1153, 1154, and 1155 (see Figure 3).
- Tower foundation close-out activities occurred at Towers 1055 through 1057, 1059, 1063, 1077, 1078, 1087, 1122, 1125, 1135, 1136, 1140, 1145, 1146, 1150, 1151, and 1154.
- Wire stringing activities were conducted between Towers 1001 and 1010, and at associated wire stringing locations.

USFS Land

- BMP maintenance occurred at Towers 1037 thru 1048.
- Site clearing for permanent landing pads occurred at Tower 1043.
- Micropile foundation activities occurred at Tower 1037 thru 1048.
- Tower assembly occurred at Towers 1037, 1040, 1042, 1045, and 1046.

Environmental Compliance

- Per the requirements of the Paleontological Monitoring and Treatment Plan, approved Paleontological Monitors were present during grading and foundation drilling activities where required throughout the subject period.
- The CPUC EMs confirmed that approved desert tortoise Authorized Biologists were available at all applicable sites.
- The CPUC EMs confirmed Authorized Coachella Valley fringe-toed lizard (CVFTL) Monitors and handlers were onsite during construction activities at applicable sites.
- The CPUC EMs confirmed permitted California gnatcatcher (CAGN) Biologists were onsite during construction activities at applicable sites.
- On March 28, dust plumes were observed originating from (Helicopter Landing Zone) HLZ H7 disturbance area upon K-Max helicopter approach to site to return a tower leg sections during two picks. As soon as the tower leg was released from the longline during the second pick and secured by ground crews, the onsite water truck began watering the areas where dust plumes were generated.
- There were two incidents of crews working outside of the approved disturbance area boundaries.

- On March 27, the CPUC EM observed a contractor vehicle towing guard poles from a yard that was not approved for the DPV2 project. The CPUC LEM notified the SCE Environmental Coordinator (EC) of the observation. The SCE Environmental Coordinator (EC) confirmed that the contractor was using an unapproved yard and were notified to vacate that yard and move all equipment and materials to an approved DPV2 yard.
- On March 28, the CPUC EM observed a truck and trailer staged in an unapproved area near Tower 1094. The SCE EC was notified and informed the CPUC EM the truck and trailer would be moved. The next day the CPUC EM observed the truck and trailer were moved into an approved disturbance area (see Figure 4).

- On March 26, the sockline used to pull OPGW broke and fell to the ground between Towers 2265 and 2305. The small diameter line contacted the ground for approximately 100 feet. Recovery of the line did not require any off road work. Upon inspection of the area, the SCE Biological Monitor determined that there were no impacts to biological resources (see Figure 5).

No Non-Compliance Reports or Project Memoranda were issued during the subject period for substation construction and upgrade activities. Non-Compliance activities for the project to date are summarized in Table 4.

Agency Representatives during Construction (Other than CPUC EMs):

None.

SUBSTATION CONSTRUCTION AND UPGRADES

Summary of Activity

1. Colorado River Substation (CRS) (BLM Lands) – Activities that occurred at CRS during the subject period included foundation excavation, construction of the MEER building and switchracks, installation of conductor cable and other conduit, trenching for grounding and backfilling of trenches, storm drain installation, steel erection, and telecomm splicing. Activities associated with the CRS access road improvements included key trenching and installation of riprap and culverts.
2. Southeast (SE) Telecomm Line (BLM and Private Lands) – Activities that occurred during the subject period were limited to fiber optic cable splicing.
3. Desert Center Telecomm Site (BLM and Private Lands) – Activities that occurred during the subject period included civil grading, retaining wall construction, distribution pole and line installation, driveway access construction, and running conduit cable.
4. Red Bluff Substation (BLM Lands) – Activities that were conducted at the Red Bluff site included foundation excavation; construction of the MEER building, transformer pads, and switchracks; installation of conductor cable and other conduit; trenching for grounding; steel erection; and telecomm splicing (see Figure 6).
5. Chuckwalla Telecomm Site (BLM Lands) – Activities that occurred during the subject period were limited to MEER building electrical work and tower erection.
6. Series Capacitor (BLM Lands) – Activities that were conducted during the subject period included construction associated with the capacitor and MEER building, foundation excavation, security equipment installation, grounding well construction, transmission line bypass jumper installation, and telecomm fiber optic cable splicing (see Figure 7).
7. Mirage Substation Loop-ins (Private Lands) – Construction activities included telecommunication fiber optic stringing and splicing from the Mirage Substation to Tower 2130.
8. Devers Substation (Private Lands) – Activities that were conducted for the Devers Substation expansion and upgrades included work associated with the extension of the 500 kV switchrack 2 positions and MEER building electrical improvements.

9. Valley Substation (Private Lands) – No construction activities occurred during the subject period.

Environmental Compliance

- SCE General, Biological, and Archeological Monitors were onsite, as appropriate, throughout all construction activities associated with the above listed sites.
- There were fourteen reported mortalities of Mojave fringed-toed lizards along the CRS access road during the subject period.
- There was one incident associated with excessive vehicle speed along the CRS access road reported during the subject period.
- There was one incident associated with improper disposal of trash (including food scraps) reported at CRS during the subject period.

No Non-Compliance Reports or Project Memoranda were issued during the subject period for substation construction and upgrade activities. Non-Compliance activities for the project to date are summarized in Table 4.

Agency Representatives during Construction (Other than CPUC EMs):

None.

Construction YARDS AND OTHER WORKSPACES

Summary of Activity:

Non-Federal Lands:

Blythe Yard (Material Yard/Contractor Show-Up Yard) – There were no construction activities conducted during the subject period. The process of closing out this yard is underway.

Desert Center 1 Yard (Material Yard) – There were no construction activities conducted during the subject period. The process of closing out this yard is underway.

Desert Center 2 Yard (Material Yard/Contractor Show-Up Yard) – There were no construction activities conducted during the subject period. The process of closing out this yard is underway.

Chiriaco Summit Yard (Material Yard) – Activities are limited to minor maintenance, implementation of BMPs, and material deliveries.

Indio Yard (Material Yard) – Activities are limited to minor maintenance, implementation of BMPs, and material deliveries.

Indio 2 Yard (Material Yard) – Activities are limited to minor maintenance, implementation of BMPs, and material deliveries.

Devers Yard (Material Yard) – Activities are limited to minor maintenance, implementation of BMPs, and material deliveries.

Devers 2 Yard (Contractor Show-Up Yard) – Activities are limited to minor maintenance, implementation of BMPs, temporary storage of construction equipment and materials, and worker vehicle parking.

Beaumont Yard (Material Yard) - Activities are limited to minor maintenance, implementation of BMPs, and material deliveries.

Beaumont 2 Yard (Contractor Show-Up Yard) – Activities are limited to minor maintenance, implementation of BMPs, temporary storage of construction equipment and materials, and worker vehicle parking.

Menifee Yard (Contractor Show-Up Yard) – Activities are limited to minor maintenance, implementation of BMPs, temporary storage of construction equipment and materials, and worker vehicle parking.

Perris Yard (Contractor Show-Up Yard) – Activities are limited to minor maintenance, implementation of BMPs, temporary storage of construction equipment and materials, and worker vehicle parking.

Environmental Compliance:

- SCE Biological Monitors conducted biological sweeps at all construction yards throughout the subject period.

No Non-Compliance Reports or Project Memoranda were issued during the subject period for Construction yard activities. Non-Compliance activities for the project to date are summarized in Table 4.

Agency Representatives during Construction (Other than CPUC EMs):

None.

CPUC/BLM NOTICES TO PROCEED (NTPS)

Table 1 summarizes the CPUC/BLM Notices to Proceed (NTPs) for the DPV2 and Red Bluff Projects, to date.

TABLE 1
NTPs
(Updated 4/25/13)

NTP #/ Permit	Date Requested	Date Issued	Segment	Description
CPUC NTPs				
NTP #1	04/28/11	06/23/11	Yards	Authorization to proceed with the development of the Devers, Desert Center 1, Desert Center 2, Summit, Blythe, Perris, Beaumont, and Menifee Construction Yards.
NTP #2	08/05/11	09/09/11	T/L	Installation of exclusionary fencing, Devers to Blythe. No cultural resources affected. Bio pending.
NTP #3	08/26/11	09/19/11	Yards	Construction of Beaumont Construction Yard #2.
NTP #4	09/09/11	09/20/11	Yards	Construction of Indio Construction Yard.
NTP #5	09/16/11	10/11/11	Red Bluff Distribution Line	Upgrades to a segment of the existing SCE 12 kV circuit overhead distribution line to supply light and power to the Red Bluff Substation, non-BLM lands.
NTP #6	09/16/11	10/17/11	Substation	Authorization to proceed with improvements to the new Colorado River Substation on private lands, including extension of the existing 33 kV distribution line, installation of a new telecommunication line, and access road improvements.
NTP #7	09/09/11	12/01/11	T/L – DPV1	Construction activities associated with a minor relocation of the Devers-Valley No. 1 Line (DV1).
NTP #8	10/08/11	12/02/11	T/L – CRS to Red Bluff	Construction of the DPV2 transmission line between Red Bluff and Colorado River Substations and replacement of existing DPV1 overhead ground wire; non-BLM lands.
NTP #9	10/08/11	12/02/11	T/L – Devers to Red Bluff	Construction of the DPV2 transmission line between the existing Devers Substation and the new Red Bluff Substation; non-BLM lands.
NTP #10	10/08/11	12/02/11	T/L – Devers to Valley	Construction of the DPV2 transmission line between existing Devers and Valley Substations; not including San Bernardino National Forest lands.
NTP #11	11/08/11	12/10/11	Yards	Construction of Devers 2 and Indio 2 Construction Yards.

NTP #/ Permit	Date Requested	Date Issued	Segment	Description
NTP #12	01/20/12	02/03/12	Yards	Construction of Desert Center 3 Construction Yard.
NTP #13	04/12/12	05/09/11	Substation	Devers Substation upgrades
NTP #14	06/13/12	06/20/12	Substation	Valley Substation upgrades
__	06/19/12	Retracted	T/L- Devers to Valley	H10- Helicopter Landing Zone
NTP #15	07/16/12	11/15/12	Substation	Colorado River Substation to Blythe South East Telecommunication Route
NTP #16	11/07/12	12/03/12	Substation	Mirage loop in.
BLM NTPs				
BLM NTP #1	08/26/11	09/19/11	DPV2 Substation, T/L	Authorization to proceed with construction of the DPV2 Transmission Line, Colorado River Substation, and associated project components on BLM lands.
BLM NTP #2	08/26/11	09/19/11	Substation	Construction of Red Bluff Substation and associated project components, BLM lands.

VARIANCE & TEMPORARY EXTRA WORKSPACE REQUESTS

Table 2 presents Variance Requests submitted to CPUC, BLM and/or USFS for review and approval. Table 3 presents CPUC Temporary Extra Workspace (TEWS) and BLM Level 1 requests that are submitted to the CPUC EMs for review and approval. Variance Requests and CPUC TEWS/BLM Level 1/2A requests submitted to date are summarized in Tables 2 and 3, respectively.

TABLE 2
VARIANCE REQUESTS
(Updated 4/25/13)

Variance Request	Date Requested	Date Issued	Segment	Description
Private Lands (CPUC Jurisdiction)				
VR #1	05/06/11	05/24/11	Devers-Valley	Construction of traditional lattice towers instead of "Tetra" towers at two locations (Structures #1139 and #1140)
VR #2	04/21/11	05/26/11	All	Revisions to Mitigation Measure B-7d pertaining to seasonal restrictions for Coachella Valley fringe-toed lizard and flat-tailed horned lizard to support consistency with conditions provided in the Biological Opinion.
VR #3	07/12/11	07/18/11	DC 1 & DC 2 Yards	Utilize offsite well location and installation of 12,000-gallon water tank for filling trucks.
VR #4	07/06/11	07/21/11	Menifee Yard	Expansion of Menifee Construction Yard, which would include approximately 5 acres of additional disturbance within the western portion of the parcel, for material storage and other activities.

Variance Request	Date Requested	Date Issued	Segment	Description
VR #5	04/22/11	07/28/11	CRS Devers and Valley Substations, Series Capacitor Site	Modification of APM A-7 regarding carpooling for construction at substations.
VR #6	07/07/11	08/01/11	Menifee, Beaumont, Perris Yards	Request to remove Mitigation Measures B-13a and B-13b, and to modify B-1a, B-1a (revised), and B-7e pertaining to Western Riverside County MSHCP compliance.
VR #7	08/11/11	08/22/11	Perris, Beaumont, Menifee, Blythe Yards	Request to utilize offsite water hydrants at Perris, Beaumont, Menifee, and Blythe Construction Yards.
VR #8	08/26/11	08/27/11	Beaumont Yard	Request to install seeded jute netting along the property frontage at Beaumont Construction Yard.
VR #9	08/24/11	09/01/11	DC 2 Yard	Request for installation of temporary power poles outside of Desert Center 2 Construction Yard.
VR #10	08/26/11	09/01/11	Devers & Summit Yards	Utilize offsite water locations needed for dust suppression at Devers and Summit Construction Yards.
—	09/21/11	Retracted	Perris Yard	Request for additional workspace involving vegetation clearing, installation of BMPs, and temporary driveway installation at Perris Construction Yard.
VR #11	09/26/11	09/28/11	T/L	Two water sources for exclusionary fencing work.
VR #12	10/13/11	10/18/11	T/L	Request for parking/temporary staging of vehicles along existing access road within the Coachella Valley Preserve during exclusionary fencing activities.
VR #13	10/26/11	11/10/11	Devers Yard	Request for temporary power supply to provide power to construction trailer at the Devers #1 Construction Yard.
VR #14	11/10/11	11/28/11	Substation	Request for increased well pumping to support civil work, including access road improvements, at Colorado River Substation.
VR #15	12/13/11	12/14/11	Summit Yard	Request for temporary power outside yard boundaries required to power office trailers.
VR #15 Mod	04/25/12	05/02/12	Summit Yard	Request for temporary power modification.
VR #16	12/22/11	01/04/12	Project-wide	Request to approve alternate/extended work hours project-wide.
VR #17	01/04/12	01/09/12	Project-wide	Request to utilize existing approved construction yard and/or exclusionary fencing water sources for transmission line construction needs.
VR #18	10/25/12 10/26/12	Denied 01/13/12	Substation	Request to formalize changes to the Red Bluff MMCRP Mitigation Measure BIO-4 and Applicant Measure BIO-5.

Variance Request	Date Requested	Date Issued	Segment	Description
VR #19	01/06/12	01/18/12	T/L	Request to allow the usage of helicopter landing zone H9-DV as a replacement for H8-DV.
VR #20	01/13/12	01/19/12	T/L	Request for the use of offsite water hydrants located in the Cabazon area for dust suppression.
VR#21	01/20/12	02/02/12	T/L	Request for the use of offsite water hydrants located in the Lake Tamarisk area for dust suppression
VR #21 Mod	03/16/12	03/21/12	T/L	Modification to VR #21. Request installation of two driveways and an underground water line adjacent to the approved stand tank locations at the Lake Tamarisk Resort water source.
VR #21 Mod	09/24/12	10/03/12	T/L	Request for a modification to Variance #21 for the expansion of the egress at the Lake Tamarisk water source.
VR #22	01/25/12	02/02/12	T/L	Request to install 10,000-gallon standing water tanks at three locations.
VR #23	01/27/12	02/21/12	T/L	Request to modify NTP #10 and MM AQ-1g for additional t-line helicopter construction.
VR #24	02/08/12	02/21/12	T/L	Request for approval to purchase MWD water credits in lieu of Colorado River water credits due to the unavailability of water allotments within the Colorado River Basin.
VR #25	02/10/12	02/28/12	T/L	Request for use of existing DPV1 access roads and spur/stub roads for parking and staging of vehicles and equipment.
VR #26	03/09/12	03/16/12	Substation	Request for the use of offsite water source located on a private date farm.
VR #27	03/09/12	03/20/12	Substation	Request for the use of offsite water source located off Corn Springs Road.
VR #28	03/22/12	03/30/12	T/L	DPV2 Gas Line Road.
VR #29	03/22/12	04/04/12	T/L	DVP1 minor relocation of outage pull sites.
VR #30	03/23/12	04/10/12	Substation	CRS pull sites.
VR #31	04/24/12	05/05/12	T/L	Helicopter landing zone H2 disturbance area revision
VR #32	03/16/12	05/08/12	T/L	HLS H7-DV boundary modification.
VR #33	04/26/12	05/17/12	T/L	Additional water hydrant locations
VR #35	05/11/12	05/15/12	Substation	Request to eliminate construction screening of the Devers Substation Expansion area.
VR #36	05/17/12	05/29/12	T/L	Three additional water stand tanks from Devers to Red Bluff
VR #37	06/20/12	06/30/12	T/L	Request a disturbance area shift for Tower 1013 due to engineering changes.
VR #38	08/09/12 Revised	08/21/12	T/L	Request for additional water source locations in the Thousand Palms area.
VR #39	08/14/12	09/05/12	T/L	Request for additional access road use near Towers 2103, 2112, and 2260.

Variance Request	Date Requested	Date Issued	Segment	Description
VR #40	08/22/12	09/11/12	T/L	Request for the use of an existing spur road to Tower 2242.
VR #41	09/10/12	09/12/12	T/L	Request for the use of additional access routes to Towers 1118-1122 and HLZ H9. These roads were previously approved through the TEWS process.
__	04/12/12	Retracted	T/L	Preconstruction survey extension request from 14 days to 30 days. Petition for Modification required.
__	08/09/12 revised	Retracted	T/L	APM A-6 - Eliminate tarping on bottom dump trucks. Petition for Modification required.
VR #42	08/14/12	09/21/12	T/L	Request for a road to be used as a helicopter picking site near Tower 1031.
VR #42 Mod	02/28/13	03/05/13	T/L	Request to modify Variance 42 to allow equipment and material to be staged on the access road near Tower 1031 for helicopter picks.
__	08/14/12	Retracted	T/L	Request that Helicopter Landing Zones (HLZs) on Devers to Valley be exempt from construction screening MM V-1a.
VR #43	09/18/12 (revised)	09/21/12	T/L	Request revisions to pull sites from Devers to Red Bluff.
VR #44	09/24/12	09/28/12	T/L	Request a stub road revision at Tower 1147.
VR #45	09/25/12	10/04/12	T/L	Request for the use of additional access roads on the Devers to Valley section.
VR #46	09/20/12	10/10/12	T/L	Helicopter Picking Locations for Sites 1112 and 1108.
VR #47	10/09/12 (revised)	10/18/12	T/L	Relocation of guard structures and an addition of an access road in the Devers to Red Bluff section.
VR #48	10/02/12	10/18/12	T/L	Request for an additional water source in the Devers to Valley section.
VR #49	11/02/12	11/07/12	T/L	Request additional disturbance area at Tower 2000X.
VR #50	10/19/12	11/11/12	T/L	Request for the expansion of splice site 57 (near Tower 2557) and expansion and shift of splice site 64 (near Tower 2614).
VR # 51	10/24/12	11/15/12	T/L	Request to convert two conventional tower sites to helicopter sites from Devers to Red Bluff. In addition, SCE is requesting to add temporary helicopter platforms to access three sites.
VR #52	11/13/12 (revised)	11/15/12	T/L	Request to revise the disturbance area for Fiber Optic Site 59.
VR #53	10/30/12	11/20/12	Substation	Request access road improvements along the CRS access road.
VR #54	11/27/12	12/07/12	T/L	Request to revise pull site on Devers to Valley (pull Package 1).
VR #55	11/28/12	12/10/12	T/L	Request to revise pull sites from Devers to Red Buff (Pull Site Revision III-B).
VR #56	12/17/12	01/07/13	T/L	Request for an additional HLZ site near Tower 1051.

Variance Request	Date Requested	Date Issued	Segment	Description
VR#57	01/03/13 and 01/07/13	01/10/13	T/L	Request to shift guard structures from Red Bluff to Devers (Priority #1). Request to shift guard structures from Red Bluff to Devers (Minor Modification).
VR #58	01/04/13	01/15/13	T/L	Request to shift pull sites from Red Bluff to Devers (Pull Site Priority #2).
VR #59	01/08/13	01/15/13	Substation	Request for a temporary work area for the Mirage Substation Telecommunication Loop-In.
VR #60	01/18/13	01/22/13	Substation	Request for an additional disturbance area for CRS SE Telecom Route Anchor Rod Installation.
VR #61	01/18/13	01/23/13	Substation	Request to use Gravel Pit Road to access pole installation locations east of TL tower M123-T1 for the SE Telecom Route.
VR #62	01/30/13	02/07/13	T/L	Request to shift Devers to Valley Pull 102 for Towers 1002-1010.
VR #63	01/30/13	02/07/13	T/L	Request to shift Devers to Valley Pulls 103 for Towers 1010-1019.
VR #64	01/29/13	02/12/13	T/L	Request to shift Devers to Valley Pulls 104-105 for Towers 1019-1031.
VR #65	01/31/13	02/12/13	T/L	Request to shift Devers to Valley Pulls 101 for Towers 1000-1002.
VR #65 MOD	03/22/13	03/25/13	T/L	Request to modify Guard Structure Sites GS3 and GS4 previously approved in Variance #65.
VR #66	02/14/13 Revised on 02/25/13	02/28/13	T/L	Request to expand Tower 1077 disturbance area.
VR #67	02/25/13	02/28/13	T/L	Suppress fugitive dust outside of HLZs H2 and H2A disturbance areas, including required access roads.
VR #68	02/13/13	03/07/13	T/L	Request to shift Devers to Valley Pulls 109 for Towers 1083-1090.
VR #69	03/07/13	03/08/13	T/L	Request to use Gasline Road to Tower 2249 to avoid an active nest.
VR #69 MOD	03/26/13	04/01/13	T/L	Request to modify Variance #69 by adding an access road between the Gasline Road and the ROW road near Tower 2249.
VR #70	03/05/13	03/13/13	Substation	Request to use access roads by Devers Substation.
VR #71	03/08/13	03/14/13	T/L	Request to modify the turning radius at HLZ H7.
VR #72	03/13/13	03/18/13	T/L	Request to shift Devers to Valley Pulls 115 for Towers 1132 to 1143.
	03/11/13	Under Review	T/L	Request for the following yards (Beaumont 1, Perris, Devers, Indio 1 and Desert Center 2) to stay as permanent construction yards.
VR #73	03/13/13	03/24/13	T/L	Request to shift Devers to Valley Pulls 110-113 for Towers 1090 to 1122.
VR #74	03/22/13	03/29/13	T/L	Request to shift Devers to Valley Pulls 116-117 for Towers 1143-1157.

Variance Request	Date Requested	Date Issued	Segment	Description
VR #75	03/22/13	04/01/13	T/L	Request to shift Devers to Valley Pulls 107-108 for Towers 1065 thru 1082.
VR #76	03/28/13	04/04/13	T/L	Request to increase Wire Site 42 near Tower 1122.
VR #77	04/04/04	04/10/13	T/L	Request to modify Guard Structure Sites GS22A and GS22B on Devers to Valley.
VR #78	04/05/13	04/10/13	T/L	Request to relocate the approved access road to DV Fiber Option Optional Setup 34 to within SCE's right-of-way along the Devers-Valley segment.
VR #79	04/11/12	04/16/13	T/L	Request to use an alternate access route to Power Line Road at Diablo Road to maintain access between Towers 1003 and 1004 along the Devers-Valley segment.
VR #80	04/16/13	04/18/13	T/L	Request for Disturbance Area Adjustments at GS52A and GS52B on the Devers to Valley segment.
	04/23/13	Under Review	T/L	Request for Disturbance Area Adjustments at GS89A and GS89B on the Devers to Valley segment.
	04/23/13	Under Review	T/L	Request to use walking paths from Towers 1031 to 1032, 1034 to 1037 and 1048 to 1051 on the Devers to Valley segment.
BLM				
BLM #1	10/18/11	10/27/11	Substation	Request to install a temporary guard structure along the entrance of the existing transmission line access road for Colorado River Substation.
BLM #2	10/19/11	10/27/11	Substation	Request to approve 24-hour drilling operations at the CRS site.
BLM #3	01/24/12	02/28/12	Red Bluff	Rock Crushing
BLM #4	03/16/12	03/30/12	Substation	Red Bluff Loop-in pull site modifications.
BLM #5	03/22/12	05/18/12	T/L	DPV2 Gas Line Road.
BLM #6	03/23/12	04/10/12	Substation	CRS pull sites.
BLM #7	03/28/12	04/11/12	Substation	Request for HLZ (helicopter landing zone) at Red Bluff Loop-in Tower site RB1-2W.
BLM #8	04/06/12	05/16/12	Substation	Additional water sources @ Red Cloud Road, Red Bluff Substation.
DNA #1	10/27/11	12/07/11	Series Capacitor	Request for a slight expansion of the Series Capacitor site due to engineering conflicts.
DNA #2	12/21/11	02/01/12	Red Bluff	Request to install secondary well at Red Bluff Substation site.
DNA #3	12/22/11	05/24/12	Series Capacitor	Request to relocate a portion of the Imperial Irrigation District distribution line located at the Series Capacitor site.
DNA #4	02/01/12	05/24/12	T/L	Request for the addition of proposed helicopter construction and maintenance platforms to the description included in the Project Refinements 1 and 2 documents.

Variance Request	Date Requested	Date Issued	Segment	Description
DNA #5	03/05/12	05/22/12	Red Bluff Loop-ins	Request to revise road locations.
DNA #6	04/04/12	04/17/12	Substation	Red Bluff Substation access road realignment.
DNA #7	04/12/12	05/22/12	Series Capacitor	Certain activities to be constructed within the footprint of the Series Capacitor bank.
DNA #8	05/02/12	07/31/12	T/L	Additional access route between Towers 2528X and 2527.
DNA #9	05/19/12	06/15/12	CRS	Request for a permanent turning radius along the CRS access road.
DNA #9	06/04/12	06/15/12	CRS	300-foot driveway along the CRS access road.
DNA #11	07/02/12	07/31/12	T/L	A Level 2 Variance request for a disturbance area shift at Tower 1013 due to engineering changes. This tower is located on BLM land.
__	07/24/12	Retracted	T/L	APM A-6 - Eliminate tarping on bottom dump trucks.
BLM #9	04/04/12	09/21/12	T/L	Request for a HLZ and temporary disturbance area shifts near CRS.
DNA #10	06/18/12	09/25/12	Substation	Request to build a telecom site near Desert Center for Red Bluff Substation.
DNA #12	07/30/12	09/26/12	Substation	DNA for Colorado River Substation Telecommunication Distribution Line.
BLM #10	10/24/12	11/20/12	T/L	Request to construct Tower 2413 using both conventional and helicopter construction methods.
USFS				
USFS-1	03/15/12	03/20/12	T/L	SBNF engineering modifications (revised disturbance areas).

TABLE 3
TEMPORARY EXTRA WORKSPACE (TEWS) REQUESTS
(Updated 4/25/13)

TEWS Request	Date Requested	Date Approved	Segment	Description
CPUC				
#1	07/20/11	07/27/11	Blythe Yard	Use of offsite hydrant and installation of water tank at location adjacent to Blythe Construction Yard
#2	07/28/11	08/04/11	Menifee Yard	Use of offsite hydrant, located along the frontage of the Menifee Construction Yard, and a flexible hose to supply water to a 4,000 gallon water truck.
#3	08/16/11	08/16/11	Menifee Yard	Revised use of offsite hydrant, located along the frontage of the Menifee Construction Yard, approximately 200 yards north of previously approved location.
—	09/06/11	Retracted	Devers Yard	Revised use of offsite hydrant, including installation of above ground pipeline and water towers.

TEWS Request	Date Requested	Date Approved	Segment	Description
#4	09/29/11	09/29/11	T/L	Use of parking areas along primary access road within 400-ft total distance exclusionary fencing locations with exception of sites within the Coachella Valley Preserve.
#5	07/13/12	07/17/12	T/L	Request to use two existing access roads near Tower 1118 and 1119.
#6	07/31/12	08/03/12	T/L	Request to use an existing access road to Tower 1122
#7	08/01/12	08/03/12	T/L	Request to use an existing access road to H9
#8	11/07/12	11/08/12	T/L	Request to use an existing access road near Tower 1141.
#9	03/27/13	03/28/13	T/L	Request to use a turnout off Highway 79.
#10	03/29/13	03/29/13	T/L	Request to use an existing road near Tower 1099.
BLM Level 1				
Level 1 #1	06/06/12	06/11/12	Red Bluff Loop In	RB1-4E disturbance area shift.
Level 1 #2	07/12/12	08/06/12	T/L	Request for two stand tank locations. Received revised request from SCE on 08/06/12.
Level 1 #3	09/13/12	Partial Approval on 09/17/12, Complete Approval on 09/24/12	T/L	Remove visual screening at Helicopter Landing Zones H1E H4 and H5. *Approved the removal of screening at H4 on 09/17/12. Approval of the removal of screening at H1E and H5 on 09/24/12.
Level 1 #4	09/14/12	09/17/12	T/L	Request to shift the tower disturbance area at Tower 2644.
Level 1 #5	09/14/12	09/19/12	T/L	Request to use an existing road (Ford Dry Lake Road) as access.
Level 1 #6	09/25/12	09/26/12	T/L	Request the use of an additional access route to Tower 1130.
Level 1 #7	10/09/12	10/11/12	T/L	Request to use an access road (Chuckwalla Valley road) near Tower 2574.
Level 1 #8	12/20/12	01/16/13	Substation	Request to export the excess excavation soil from Red Bluff Substation to a local approved disposal site.
Level 1 #9	01/18/13	02/04/13	Substation	Request to use Gravel Pit Road to access pole installation locations east of TL tower M123-T1 for the SE Telecom Route.
Level 1 #10	02/07/13	02/08/13	Substation	Request for a temporary work space for the Red Bluff Desert Center Telecom.
Level 1 #11	02/20/13	02/22/13	Substation	Request for a temporary work area at the Series Capacitor Site.
Level #1 #12	02/28/13	03/04/13	Substation	Request for two additional temporary work areas at the Series Capacitor Site for an underground conduit.
Level #1 #13	03/07/13	03/08/13	T/L	Request to use Gasline Road to Tower 2249 to avoid an active nest.
	04/23/13	Under Review	T/L	Request to use walking paths from Towers 1031 to 1035 on the Devers to Valley segment

TEWS Request	Date Requested	Date Approved	Segment	Description
BLM Level 2A				
Level 2A #1	09/20/12	09/24/12	T/L	Request for pull site revisions from Devers to Red Bluff.
Level 2A #2	10/04/12	10/05/12	T/L	Request for an access road to RB14 pull site near Red Bluff.
Level 2A #3	10/04/12	10/25/12	T/L	Request for additional disturbance area for pull sites and an access road near Red Bluff RB2-5E. Revised on 10/11/12 and 10/22/12.
Level 2A #4	10/05/12	10/10/12	T/L	Request to relocate two guard structures near Red Bluff.
Level 2A #5	10/10/12	10/10/12	T/L	Request for additional disturbance area at Tower RB1-2W in order to build the tower prior to the scheduled outage.
Level 2A #6	10/19/12	10/25/12	T/L	Request for temporary disturbance area shifts at wire sites, splice sites, pull sites, guard structures and access roads from CRS to RB.
Level 2A #7	10/19/12	10/25/12	T/L	Request for temporary disturbance area shifts at splice site 53 (near Tower 2535) and access road to Wire Site 69/Pull Site 70/54 (near tower 2540).
Level 2A #8	10/30/12	Awaiting revised request from SCE	T/L	Request additional disturbance area at Guard Sites GS05 and GS05A.
Level 2A #9	11/14/12	11/16/12	T/L	Request to shift Fiber Optic Site 63.
Level 2A #10	11/09/12	11/16/12	T/L	Request for the shift of Wire Site No 73/Pull Site No 74/Splice Site No 58, Wire Site No 81/Pull Site No 82/ Splice Site No 65, and Wire Site No 83/Pull Site No 84/ Splice Site.
Level 2A #11	11/14/12	11/16/12	T/L	Request for the shift Splice Site 55, Access Rd to Splice Site No. 55, Guard Structures 126 and 127, and Pull Sites 71 and 72.
Level 2A #12	11/19/12	11/28/12	T/L	Request to widen Guard Structures CRD-GS132, CRD-GS133, CRD-GS137, CRD-GS138, and CRD-GS138A (Pull Site 78, Wire Site 77).
Level 2A #13	11/28/12	12/05/12	T/L	Request to revise pull sites from Devers to Red Bluff (Pull Site Revision III-A).
Level 2A #14	12/05/12	12/11/12	T/L	Request to expand Splice Site 40
Level 2A #15	01/07/13	01/10/13	T/L	Request to shift guard structures from Red Bluff to Devers (Minor Modification).
Level 2A #16	01/31/13	02/13/13	T/L	Request to shift Devers to Valley Pulls 103 for Towers 1014-1016.
Level 2A #17	04/01/13	04/03/13	Substation	Request a work area for the Red Bluff Telecommunication Manhole.

NON-COMPLIANCES & INCIDENTS

Table 4 provides a summary of reported non-compliance incidents.

TABLE 4
CPUC NON-COMPLIANCE REPORTS & PROJECT MEMORANDA
(Updated 4/25/13)

Type	Date Issued	Location	Description
CPUC Project Memoranda (PM)			
PM #1	10/28/11	CRS Dist. Line	Construction vehicles leaving marked disturbance limits at two locations along CRS distribution line.
PM #2	01/18/12	Tower 2649/ CR1-2W	DPV2 Construction contractor vehicle driving outside of the approved tower and access road disturbance area limits.
PM #3	03/08/12	Tower 1059 & 1060	Failure to comply with MM B-5 which requires that 300-foot buffers are established around active bird nests. Working within unapproved active nest buffers.
PM #4	04/04/12	Tower 2515, 2520, & 2526	Impacts to desert pavement at Towers 2520 and 2526 by not implementing one of the approved methods stated in the revised Desert Pavement Plan. Impacts to desert tortoise habitat when a road was built near Tower 2515 that was not approved.
PM #5	04/18/12	Along the main access road near Red Bluff	Excessive fugitive dust observed on multiple locations along the main access road near Red Bluff Substation. Violation of MM AQ-1a.
PM #6	05/08/12	Along the T/L access roads	Construction vehicles observed driving off the approved access road limits at various locations along the T/L.
PM # 7	06/01/12	Near Tower 2317	Two stand tanks were installed in an area that was not approved for the Project along the access road near Tower 2317.
PM #8	06/01/12	Along the access road near Tower 2310	Road base was installed along a portion of the access road to protect the utility crossing south of Tower 2310. This work was completed prior to the pre-construction verification and release of this road from the CPUC.
PM #9	06/19/12	Tower 2126	Inadequate covering of foundation excavations at Tower 2126. Violation of BO-13.
PM #10	09/21/12	Tower 1037	Work occurred at Tower 1037 without the Fire Patrol Representative on site, a requirement on the Fire Plan.
PM #11	12/05/12	Tower 1070	Excessive Fugitive Dust during Helicopter Picks at Tower 1070. Violation of MM AQ-1a and the Fugitive Dust Emission Control Plan.
PM #12	03/19/13	Towers 1001 and 1077	Construction work occurring prior to a biological monitor present at Towers 1001 and 1077.
PM #13	03/21/12	Various Locations along the T/L	Helicopter construction operations occurring within ESA nest buffers.
CPUC Non-Compliance Reports (NCR)			
NCR #1	01/13/12	Project-wide	Unapproved removal of stick nests from DPV1 Transmission Line towers.

Type	Date Issued	Location	Description
NCR #2	05/18/12	Tower 2333	Failure to protect wildlife during construction which resulted in the death of a kit fox.
NCR #3	06/04/12	Near Tower 2310	Road base was installed at two locations along the access road to protect the utility crossings near Tower 2310. This work was completed prior to the pre-construction verification and release of this road from the CPUC.
NCR #4	07/02/12	Near 2303X	Road base installed along a portion on a road not approved for the Project.
NCR #5	07/02/12	Near 2204 and 2205	Project equipment drove outside the approved road width along the access road near Towers 2204 and 2205. These towers are located within the Coachella Valley Preserve.
NCR #6	07/06/12	Near Tower 1083	Project equipment drove outside the existing road width along the access road near Tower 1083.
NCR #7	07/12/12	Tower 2437	Inadequate covering of a foundation excavation at Tower 2437. Violation of BO-13.
NCR #8	07/23/12	Near Tower 2604	Project equipment drove outside the approved road limits along Chuckwalla road west of Tower 2604.
NCR #9	08/28/12	Tower 2644	Construction work conducted outside the approved project limits.
NCR #10	09/10/12	Towers 1153 and 1155	Construction work conducted at Towers 1153 and 1155 prior to the CPUC site verification and release to SCE.
NCR #11	10/18/12	Tower 1036	Excavations at Tower 1036 were left uncovered and no proper means for wildlife to escape entrapment had been installed. Violation of BO-13.
NCR #12	11/02/12	Tower RB2-4E	Work occurred at an unapproved location near RB2-4E.
NCR #13	01/29/13	Access road to Tower 1130	Violation of the conditions of BLM Variance Approval #6, which stated no road improvement to the existing road could be made. Road improvements were conducted on 01/19/13.
NCR #14	03/19/13	Tower 1078	Construction work occurring within an ESA buffer near Tower 1078, which is a violation to Mitigation Measure B-5a.
NCR #15	03/21/13	Guard Structure Sites near Towers 1001 and 1003	Construction work occurring outside the approved work area limits at the Guard Structure Sites near Tower 1001 and 1003.

CONSTRUCTION PROGRESS

Table 5 provides a summary of transmission line construction progress.

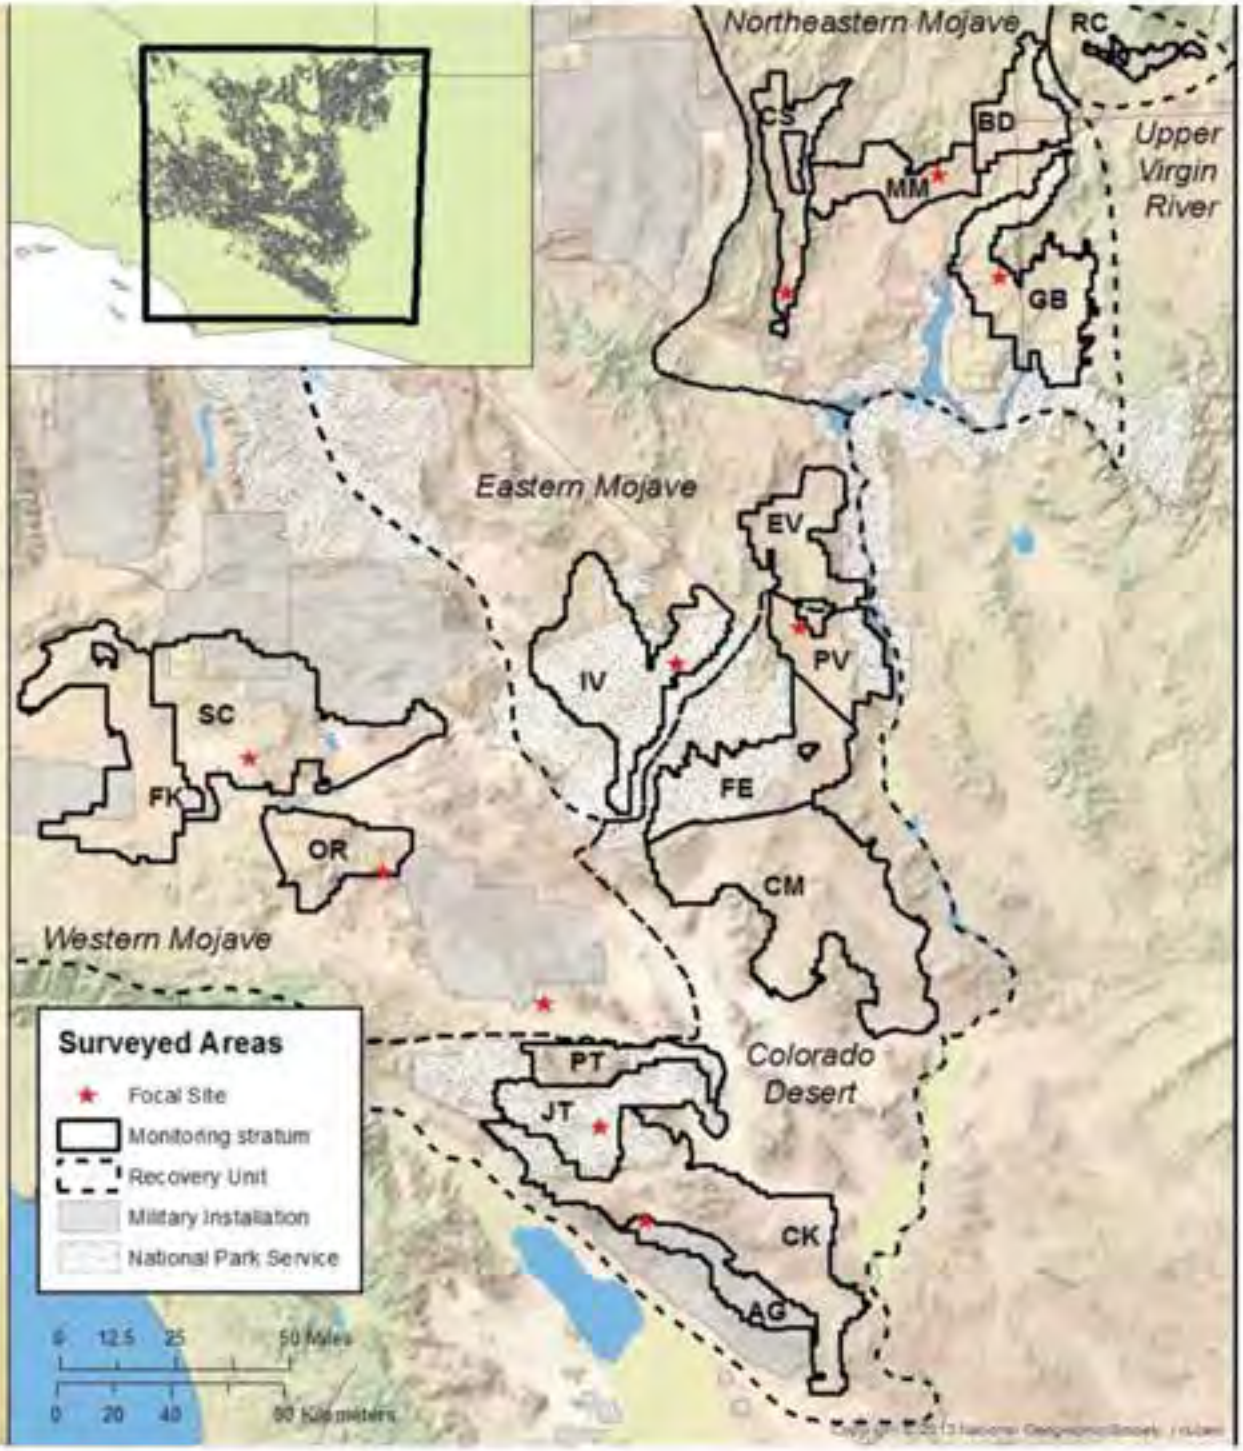
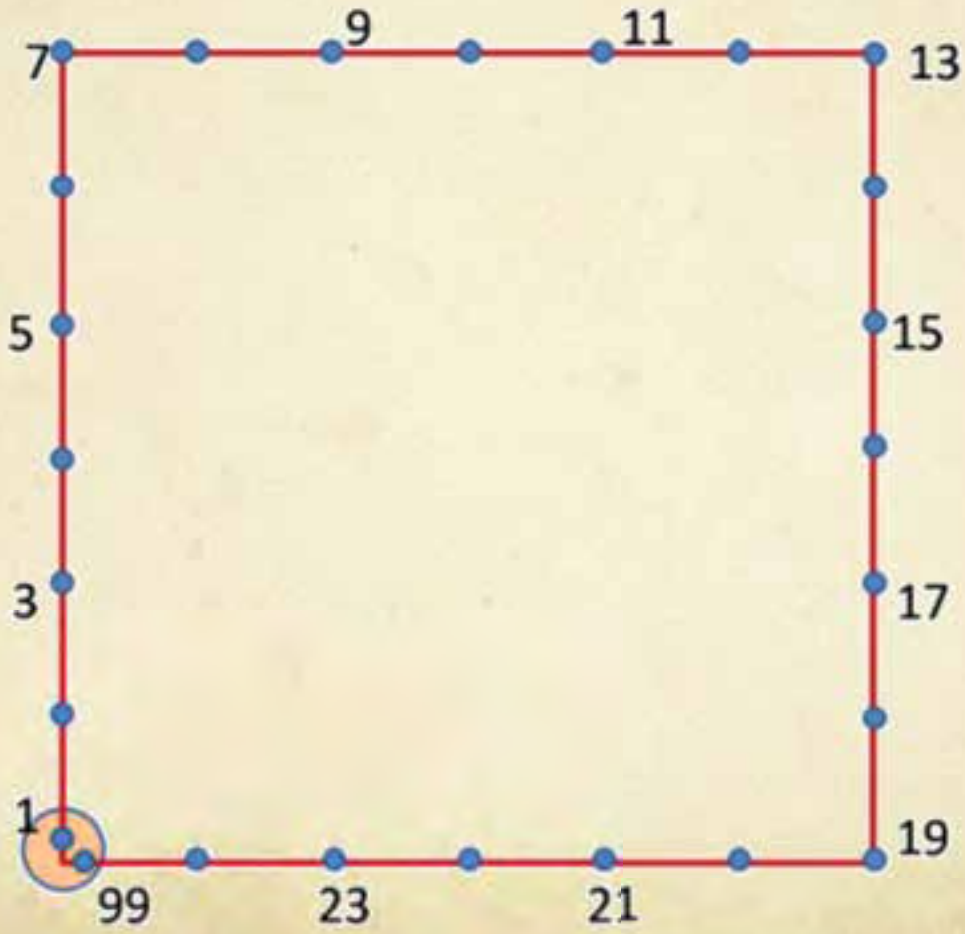
Background Avian Mortality across the California Desert Region: A Pilot Study



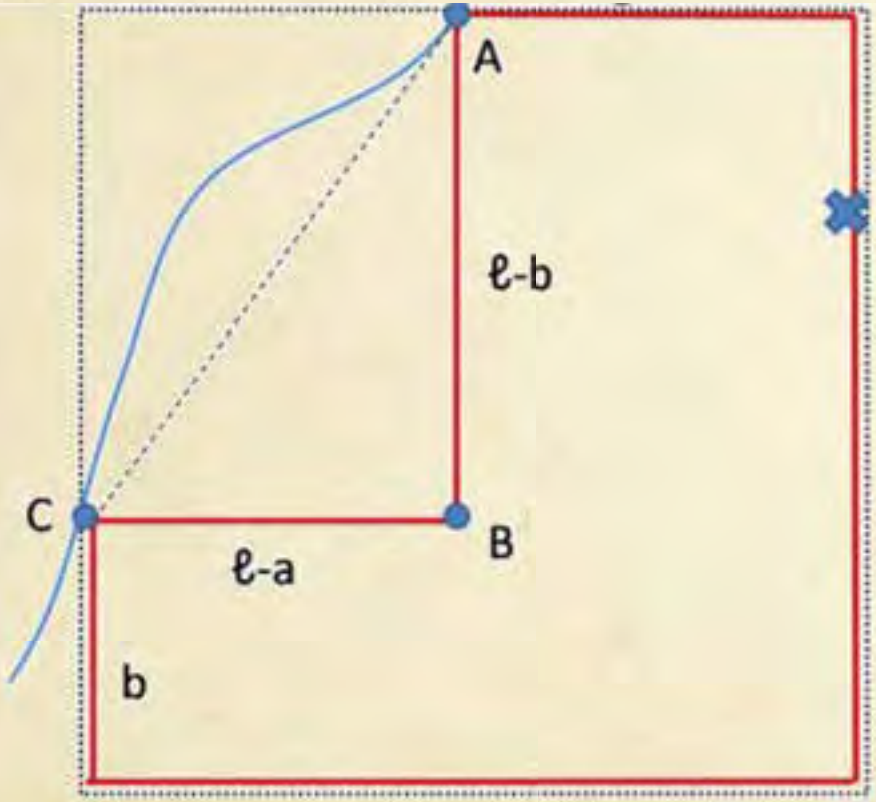
Amy L Fesnock, CA BLM
Manuela Huso, USGS-FRESC
Linda Allison, Region 8 USFWS

Purpose and Need for the Pilot Study

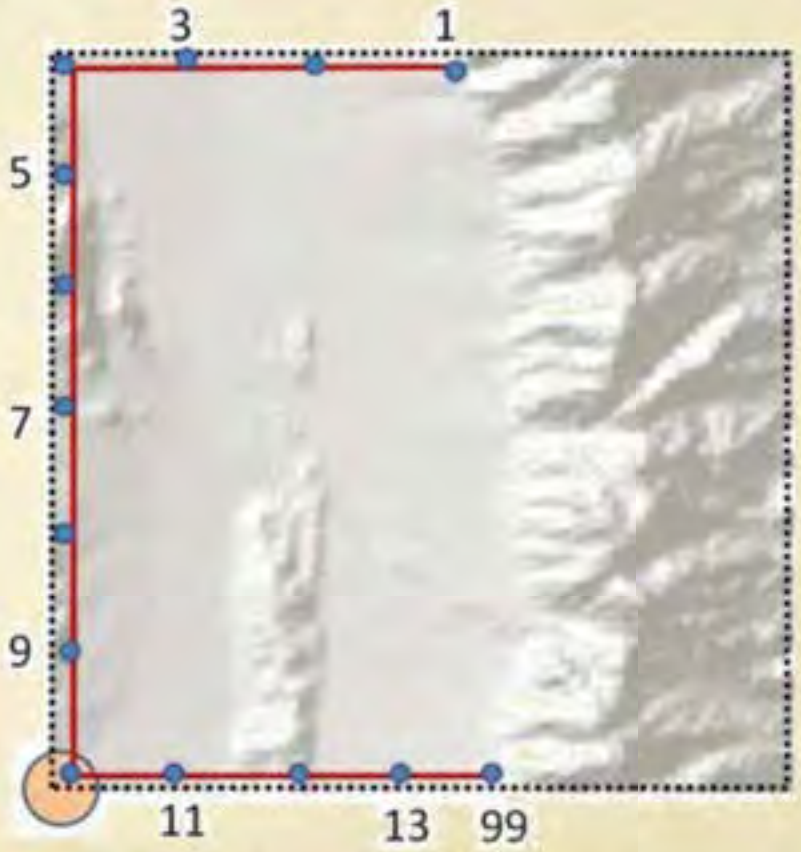


- 2010-Major push for renewable energy (especially solar)
- Monitoring from first projects documented avian fatalities
- Mortalities rates at RE facilities are corrected for
  - Observer Detection Probabilities
  - Scavenger Rates/Carcass Persistence
- Questions were raised as to what is the "normal" detectable mortality rate across the California desert region
- How would the "background mortality rate" provide context to inform our understanding of avian mortalities at facilities

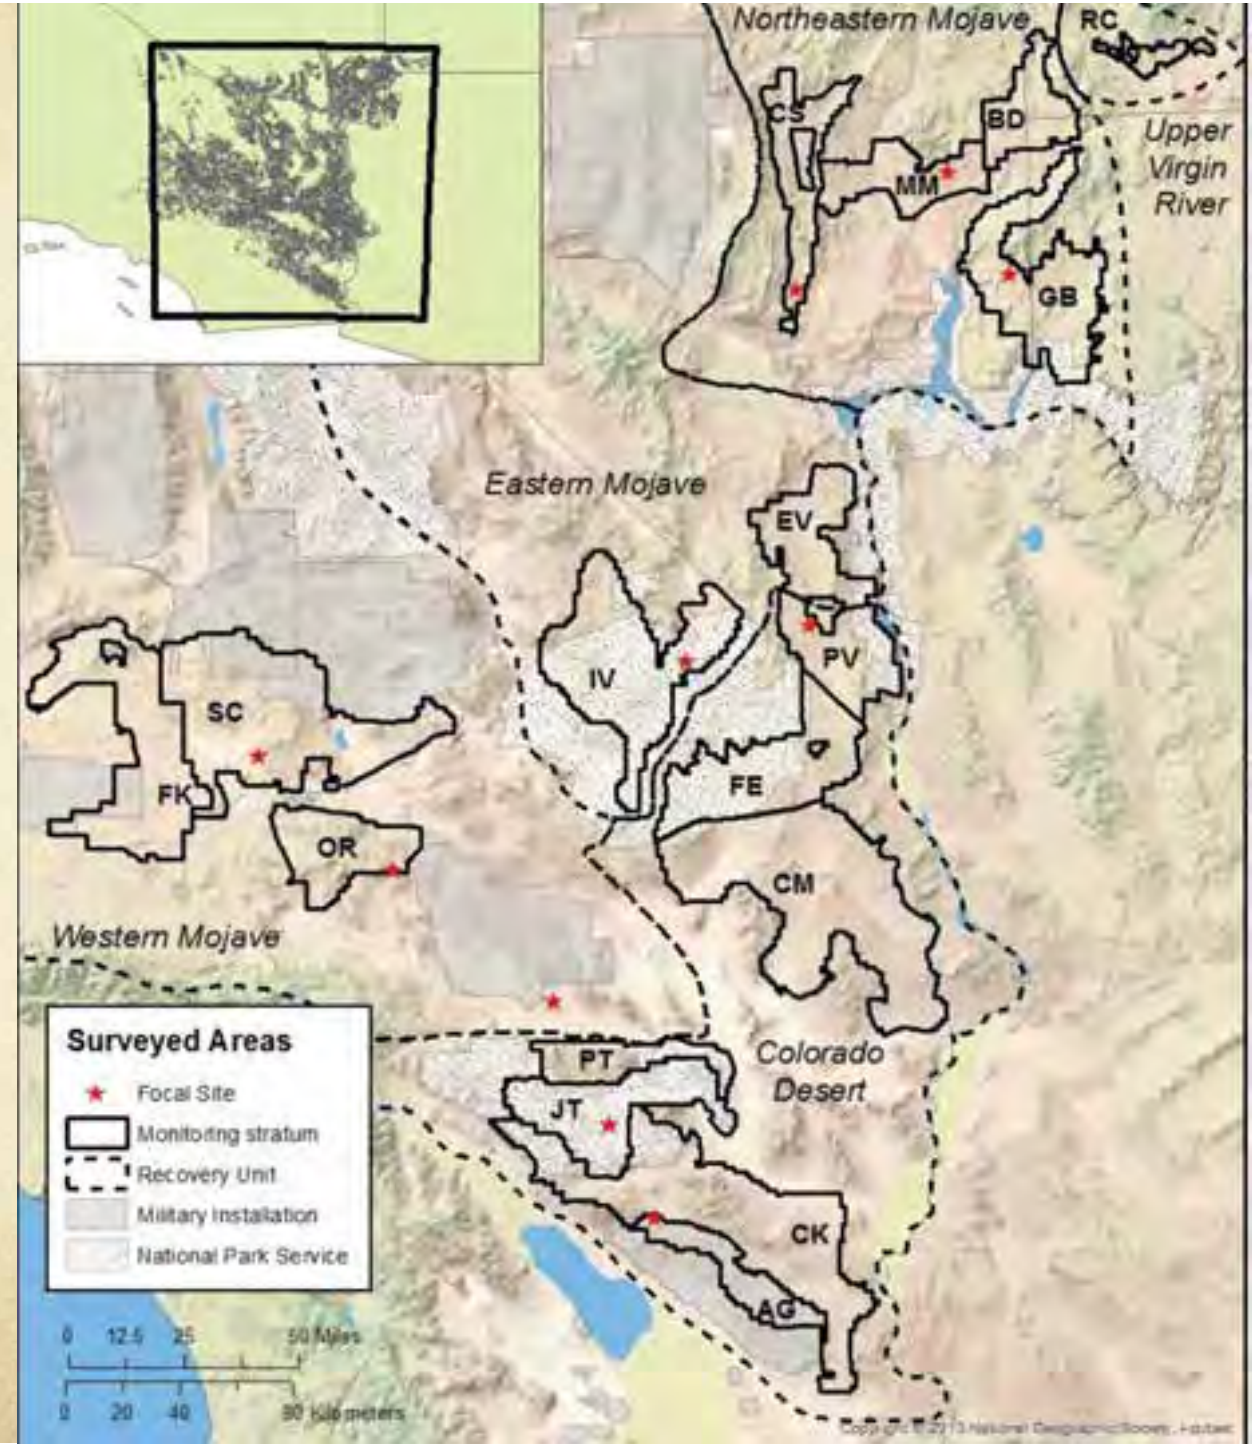
Study Design



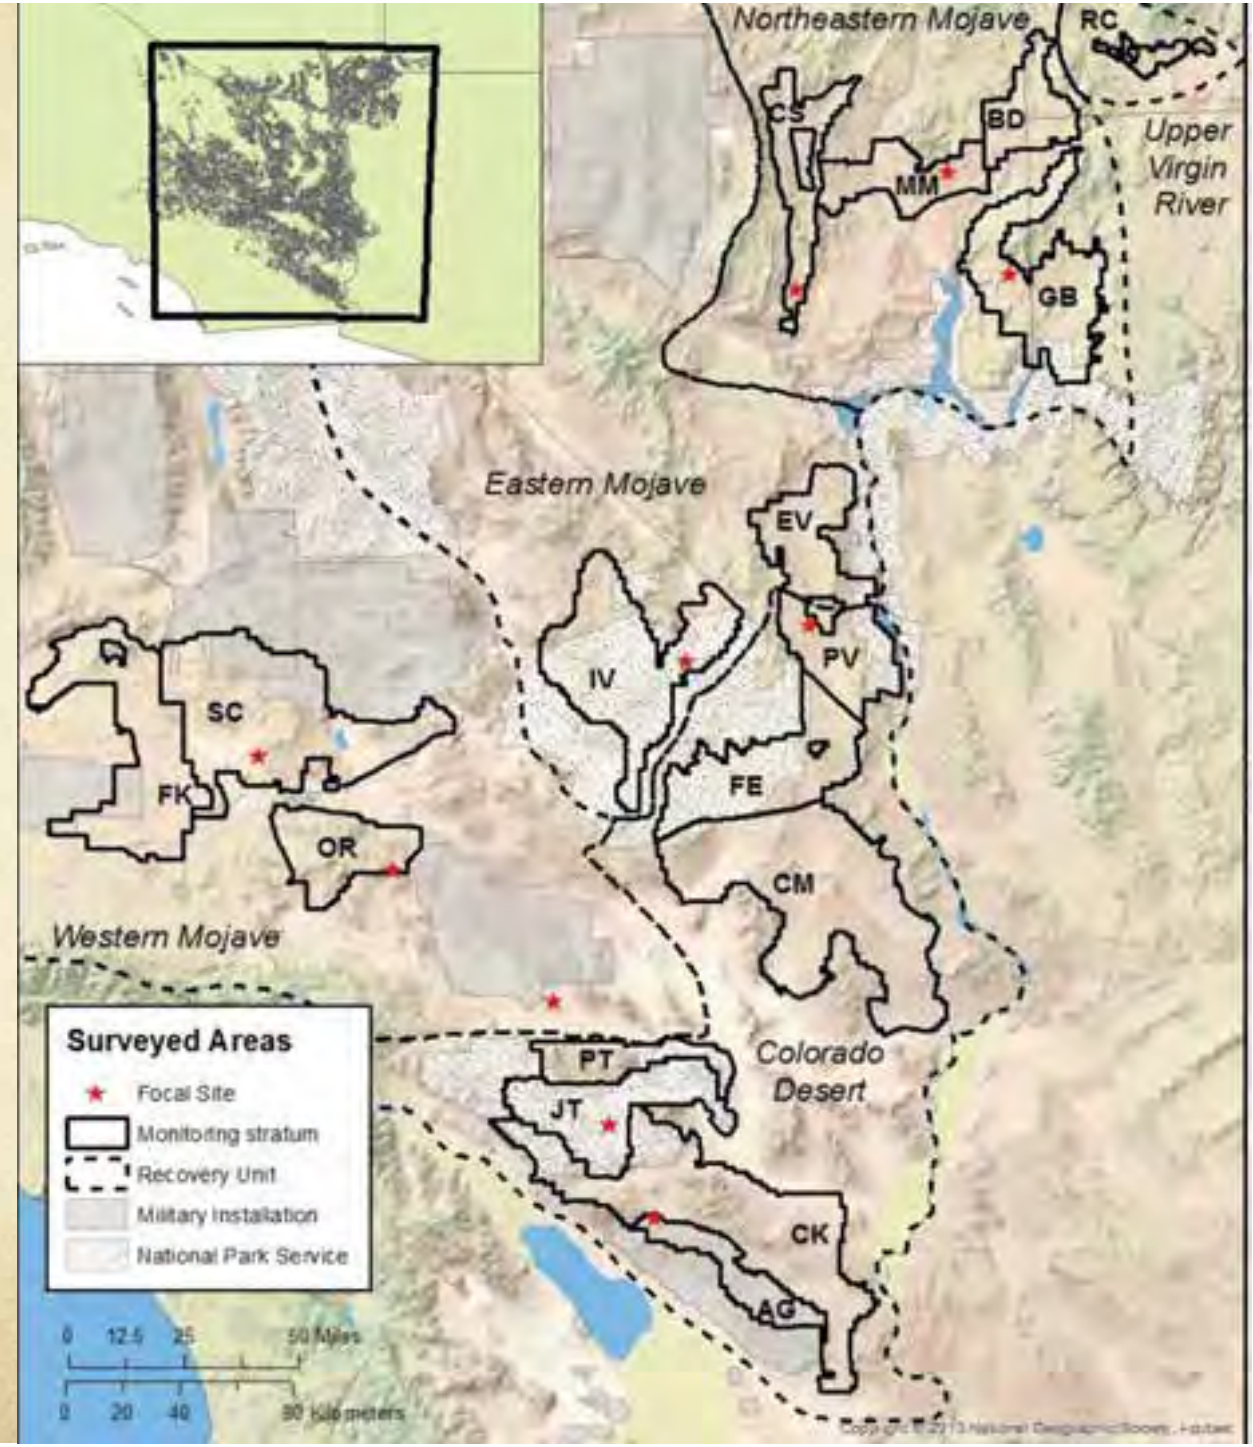
- Paired with Tortoise LDS
  - Range-wide
  - Natural Areas
- Observer Trials incorporated in LDS training
- Scavenger Trails Conducted



The Normal 12-km LDS transect



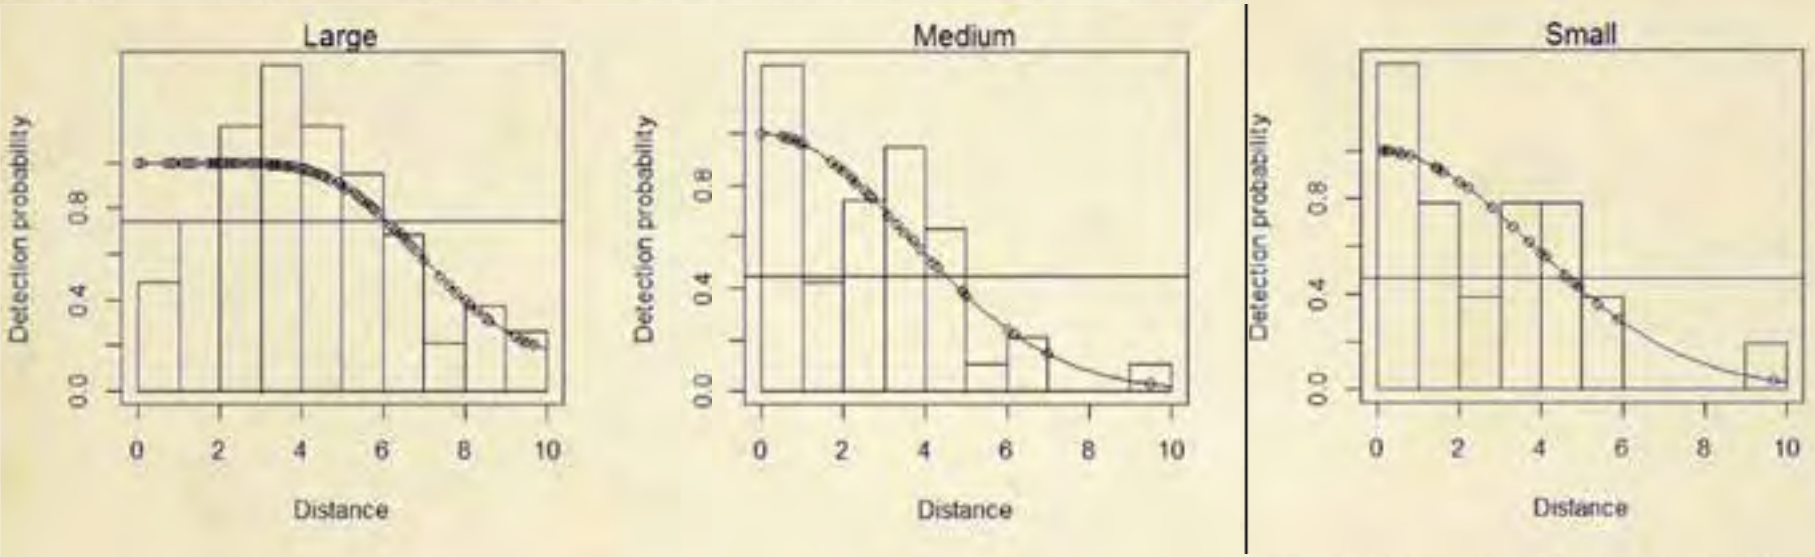
Established Means to Alter Transect



Range Wide

- Freemont-Kramer
- Superior-Cronese
- Ord-Rodman
- Pinto Mountains
- Joshua Tree NP
- Chuckwalla
- Chocolate Mtns
- Ivanpah
- Piute Fenner
- Chemehuevi

Range Wide



- Freemont-Kramer
- Superior-Cronese
- Ord-Rodman
- Pinto Mountains
- Joshua Tree NP
- Chuckwalla
- Chocolate Mtns
- ~~Ivanpah~~
- ~~Piute Fenner~~
- ~~Chemehuevi~~

Observer Detection Probability

- Desert Tortoise LDS technicians were trained to search for dead birds at the same time as they looked for tortoises.
- On the training transects, 62 large, 28 medium and 34 small bird carcasses were placed at varying distances from the training transects (spaced 25 m apart).
- When a bird carcass was detected, searchers recorded
  - perpendicular distance from the transect to the bird
  - distance from the observer to the bird at the time of discovery.
- During the detection trials, 97% detections were within <10 m, so we used 10 m as the effective sampling width.

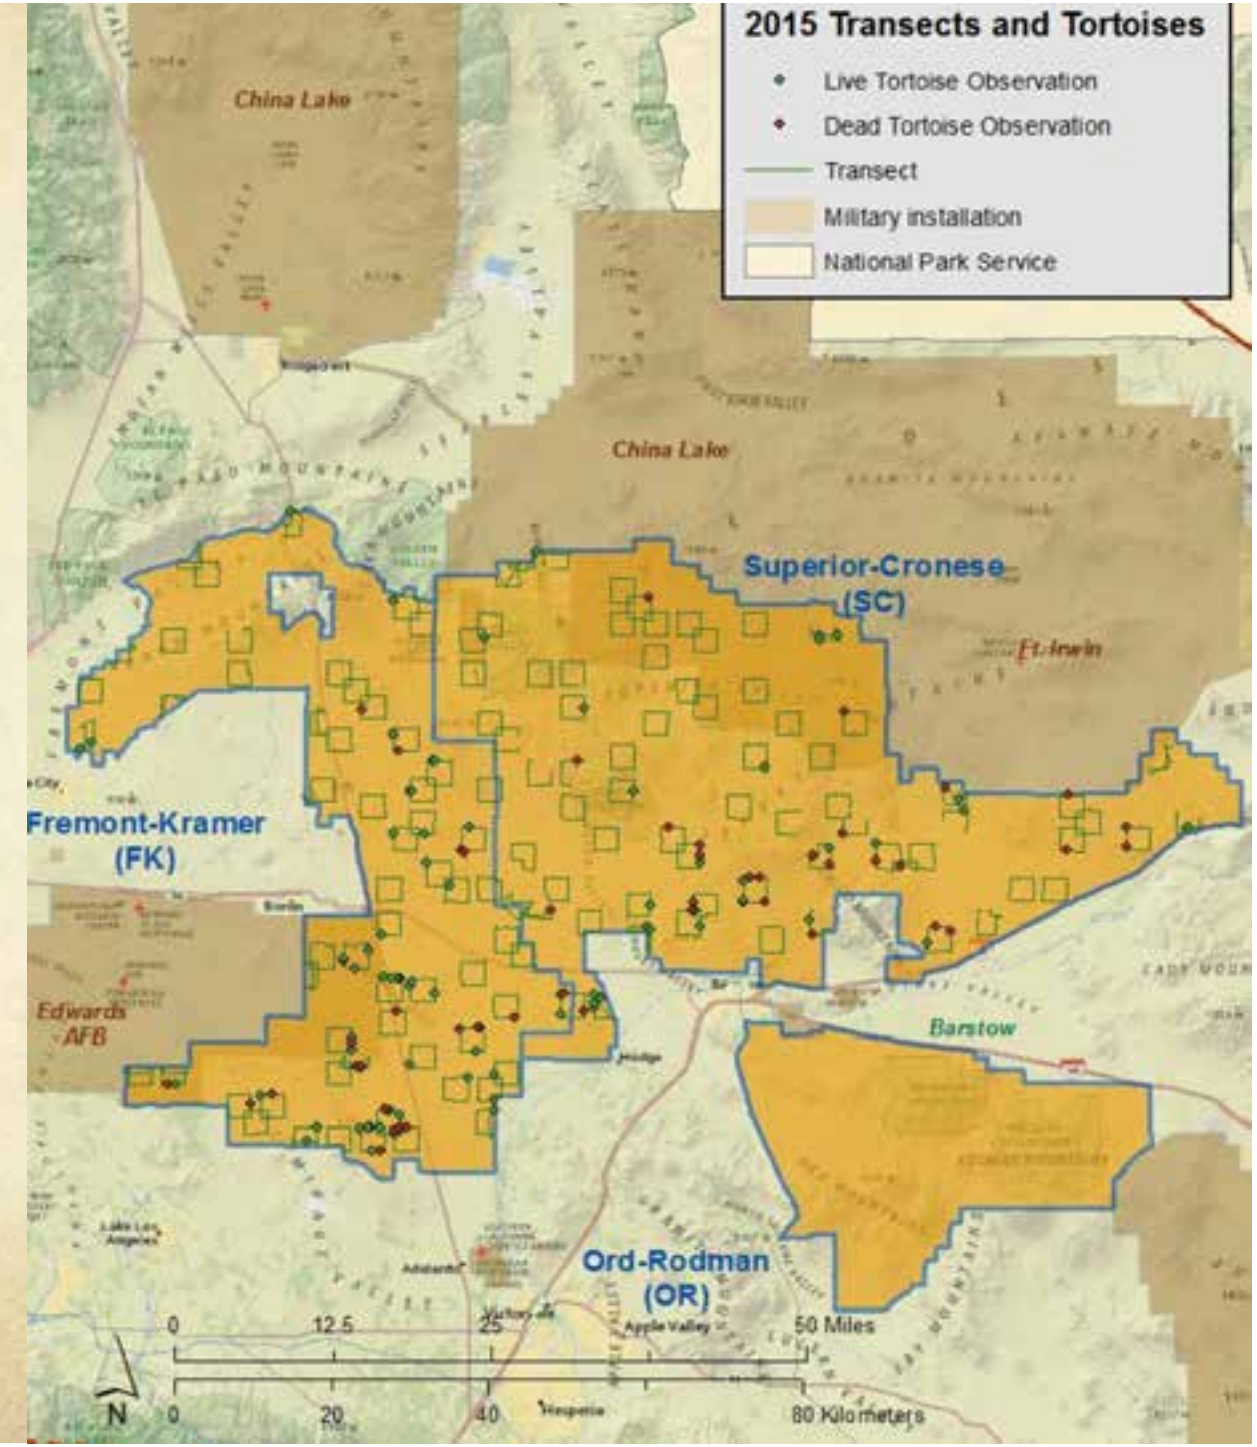
Observer Detection Probability

Carcass Persistence Trials

- Conducted in three areas
  - Chuckwalla ACEC
  - Joshua Tree National Park
  - Fremont-Kramer ACEC
- At each site, 10 large, 20 medium and 30 small bird carcasses were placed in random locations and checked daily for continued persistence.
- Persistence times were modeled using the R package survival.
- Effective search interval (Huso 2011) was calculated
  - the time at which 99% of carcasses would have been removed, or no longer detectable to an observer.

Searcher Efficiency/Carcass Persistence

- Average searcher efficiency (and 95% confidence limits) within 10m of the transect
- Average proportion of carcasses persisting through the effective interval (and 95% confidence limits).



Size	SE	95%LCL	95%UCL	Prop Persist	95%LCL	95%UCL	Effective Interval (d)
L	0.77	0.43	0.96	0.22	0.10	0.44	318
M	0.44	0.35	0.55	0.22	0.15	0.30	77
S	0.47	0.34	0.59	0.21	0.17	0.26	30

Overall Probability of Detection

Size	Pr (detection)	95%LCL	95%UCL

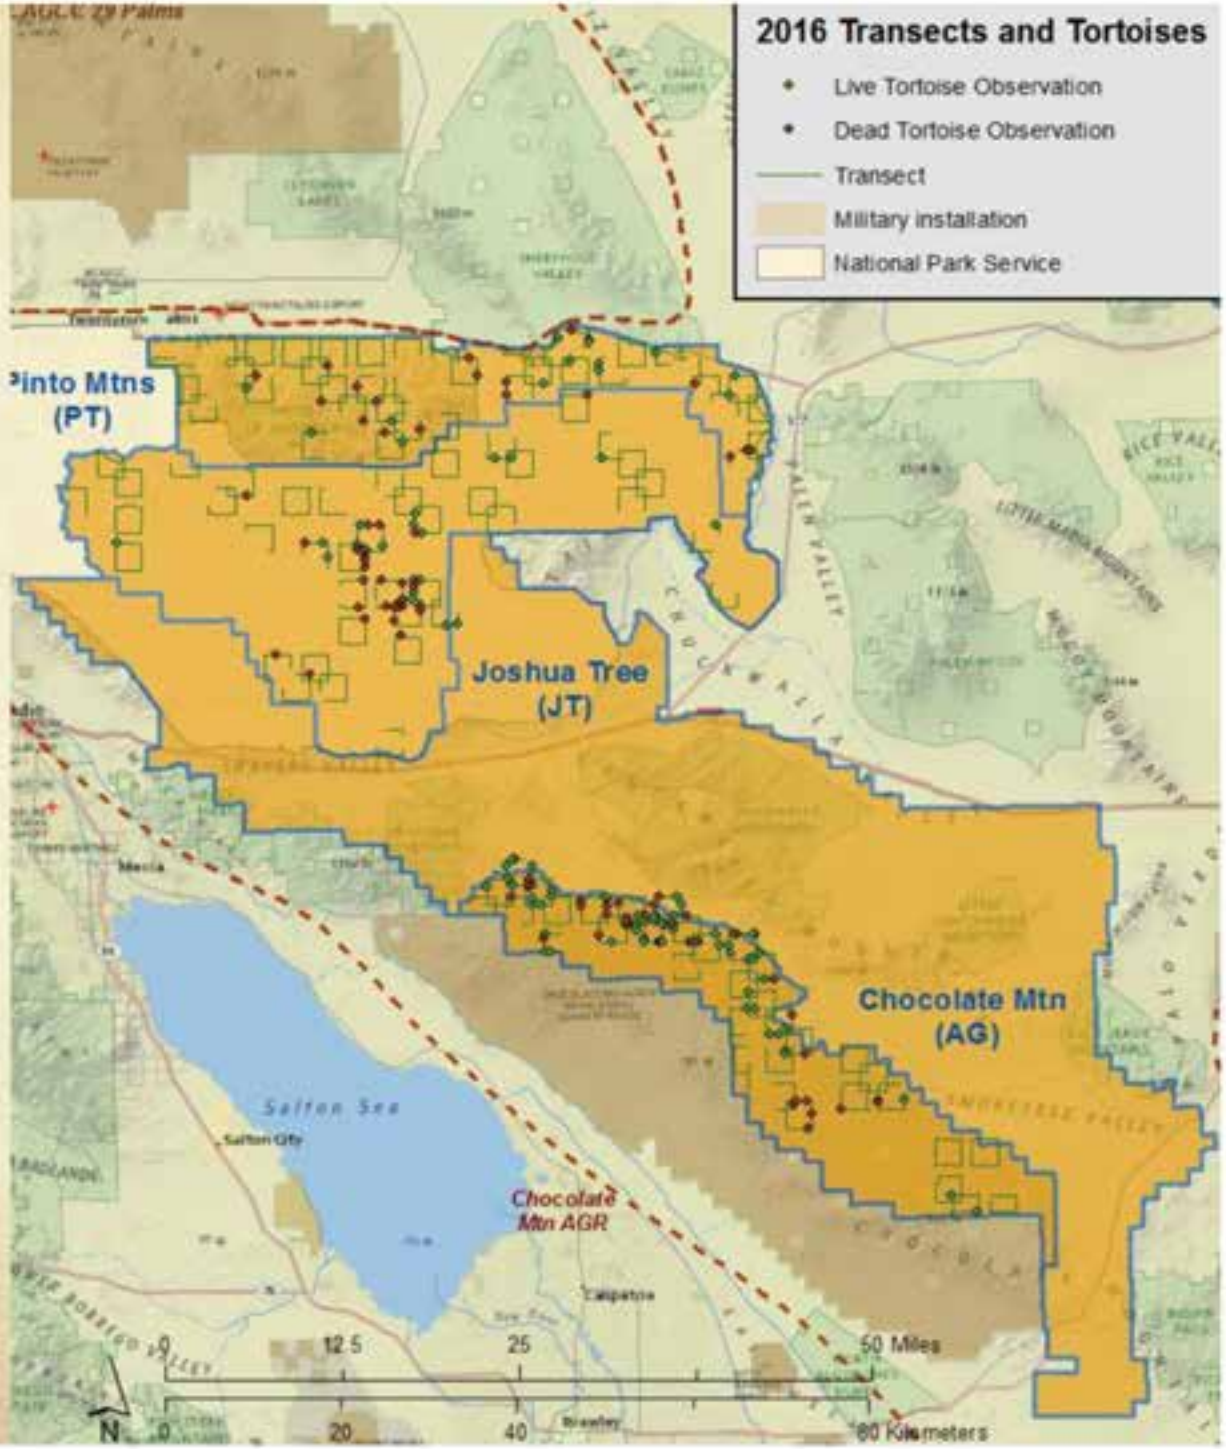
M	0.095	0.062	0.135
S	0.100	0.070	0.138



Transect Distribution

- Freemont-Kramer
  - 57 transects
  - 677.7 km
- Superior-Cronese
  - 70 transects
  - 780.5 km
- Ord-Rodman
  - 60 transects
  - 677.7 km

Transect Distribution

- Pinto Mtns
  - 50 transects
  - 451.7 km
- Joshua Tree
  - 60 transects
  - 614.5 km
- Chuckwalla
  - 120 transects
  - 1270.0 km
- Chocolate Mtn
  - 36 transects
  - 375.7 km

Results

- 453 transects covering 4,847.8 km surveyed March to May
- With the 10-m transect width, area of ground surveyed
  - 96.74 km^2 or 37.35 $mile^2$ of area searched
- Avian Mortalities Observed – 6
  - 1 Red-tailed Hawk adult (L), predated, base of nest
  - 1 Red-tailed Hawk juvenile (M),
  - 1 rock wren (S), shrike impaled on cactus
  - 3 feather spots.

Estimates of Median Fatality

		Searched Area				Searched Period/mi2		
Size	X	M* (median)	95%LCL	95%UCL	eff.int	Period M*/mi2	95%LCL	95%UCL
L	4	31	9	142	318	0.83	0.24	3.80
M	1	13	1	43	77	0.35	0.03	1.15
S	1	12	1	40	30	0.32	0.03	1.07
L	1	9	1	44	318	0.24	0.03	1.18
M	4	45	15	109	77	1.20	0.40	2.92
S	1	12	1	40	30	0.32	0.03	1.07
L	1	9	1	44	318	0.24	0.03	1.18
M	1	13	1	43	77	0.35	0.03	1.15
S	4	42	14	99	30	1.12	0.37	2.65

Estimates of Median Fatality

	Full Yr/mi2			Full Yr/acre		
Size	Year M/mi2	95%LCL	95%UCL	Year M/acre	95%LCL	95%UCL
L*	0.95	0.28	4.36	0.0015	0.0004	0.0068
M	1.65	0.13	5.46	0.0026	0.0002	0.0085
S	3.91	0.33	13.03	0.0061	0.0005	0.0204
L	0.28	0.03	1.35	0.0004	0.0000	0.0021
M*	5.71	1.90	13.83	0.0089	0.0030	0.0216
S	3.91	0.33	13.03	0.0061	0.0005	0.0204
L	0.28	0.03	1.35	0.0004	0.0000	0.0021
M	1.65	0.13	5.46	0.0026	0.0002	0.0085
S*	13.68	4.56	32.25	0.0214	0.0071	0.0504

In Summary

- Median background mortality (large, medium, small birds)
  - 0.95, 5.71 and 13.68 per square mile per year
- Upper 95% confidence limits
  - 4.36, 13.83 and 32.25 per square mile, respectively
- In practice, the most reasonable category in which to place them might be the one with the shortest effective interval, i.e., small birds… which results in
  - 0.28, 1.65 and 13.68 per square mile per year, for large, medium and small birds, respectively.
- Translated per acre
  - 0.0004, 0.0026, 0.0214, for large, medium, and small birds
  - Total – 0.024 birds per acre

Comparing Data from Solar Facilities

Annual Avian Mortality per acre, all bird sizes combined

- Solar Facility A –1.7 birds/acre
- Solar Facility B –0.4 birds/acre
- Solar Facility C –0.6 birds/acre
- Background Mortality Across the Region –0.024 birds/acre

In Conclusion

- Only 3 bird carcasses were found in >35 square miles.
- 3 feather spots were found
  - Potentially remnants of a dead bird that was removed by scavengers or simply a preening station for a live bird.
- Conservative approach to Median background mortality was on the order of 0.95, 5.71 and 13.68 per square mile per year, for large, medium and small birds, respectively.
- Background Mortality Rate Across the Region – 0.024 birds/acre
- When compared to mortality rates from solar projects, background mortality does not appear to be a significant factor and could easily be accounted in the sampling design error rates.

To Ms. Miriam Liberatore,

Attached please find our comment letter in response to the NOI to Prepare a Joint EIS/EIR and Possible Land Use Plan Amendment for the proposed RE Crimson Solar Project in Riverside County, California. Thank you for the opportunity to provide comments on the proposed project. If you have any questions, please do not hesitate to contact me.

Regarding: Notice of Intent to Prepare a Joint Environmental Impact Statement/Environmental Impact Report and Possible Land Use Plan Amendment for the Proposed Recurrent Energy (RE) Crimson Solar Project, Riverside County, CA and Notice of Preparation (NOP) of a Joint Draft Environmental Impact Statement/Environmental Impact Report for the Recurrent Energy Crimson Solar Project and Notice of Public Scoping meetings (NEPA Tracking # DOI-BLM-CA-D060-2017-0029-EIS and CA State Clearinghouse No. 2018031027)

To Whom It May Concern:

The Colorado River Board of California (Board) appreciates the opportunity to submit comments for consideration on the Notice of Intent to Prepare a Joint Environmental Impact Statement/Environmental Impact Report and Possible Land Use Plan Amendment for the Proposed Recurrent Energy Crimson Solar Project, Riverside County, California, and on the Notice of Preparation (NOP) of a Joint Draft Environmental Impact Statement/Environmental Impact Report for the Recurrent Energy Crimson Solar Project and Notice of Public Scoping meetings.

Sonoran West Solar Holdings, a wholly owned subsidiary of Recurrent Energy, proposes to construct, operate, and decommission a 350-megawatt utility-scale solar photovoltaic project on approximately 2,500 acres of public lands administered by the Bureau of Land Management (BLM). The proposed project is located 13 miles west of Blythe in Riverside County within the California Desert Conservation Area planning area. It is also located within the Riverside East Solar Energy Zone and within a Desert Renewable Energy Conservation Plan Development Focus Area.

According to the Consolidated Decree of the Supreme Court of the United States in the case of *Arizona v. California, et al.* entered March 27, 2006, (547 U.S. 150 (2006)), the consumptive use of water means "diversion from the stream less such return flow thereto as is

available for consumptive use in the United States or in satisfaction of the Mexican treaty obligation" and consumptive use "includes all consumptive uses of water of the mainstream, including water drawn from the mainstream by underground pumping." Also, pursuant to the 1928 Boulder Canyon Project Act (BCPA) and the Consolidated Decree, no water shall be delivered from storage or used by any water user without a valid contract between the Secretary of the Interior and the water user for such use, i.e., through a BCPA Section 5 contract.

Within California, BCPA Section 5 contracts have previously been entered into between users of Colorado River mainstream water and the Secretary of the Interior for water from the Colorado River that exceeds California's basic entitlement to use Colorado River water as set forth in the Consolidated Decree. Thus, no additional Colorado River water is available for use by new project proponents along the Colorado River, except through the contract of an existing BCPA Section 5 contract holder, either by direct service or through an exchange of non-Colorado River water for Colorado River water.

Based on the description of the project location provided in the NOP, the proposed Crimson Solar Energy project site is located within the delineation of the Accounting Surface area as designated by the U.S. Geological Survey (USGS) Water Investigation Report No. 2008-5113. The Chuckwalla Valley Groundwater Basin groundwater aquifer beneath the project site is considered by the USGS report to be hydraulically connected to the Colorado River and groundwater withdrawn from lands underlying the Accounting Surface would be replaced by Colorado River water, in total or in part. This means that if it is determined that any wells on or near the project site intended to supply water for the project are, in fact, pumping groundwater that would be replaced by Colorado River water, a contract with the Secretary of Interior is required before such a use is deemed to be a legally authorized use of this groundwater.

The Board requests that the EIS/EIR must address and analyze proposed water uses as well as the potential impact to Colorado River water resources as a result of construction, operations, maintenance, and decommissioning activities for the project. If it is determined that groundwater pumping would yield water that would be replaced by water from the Colorado River, a legally authorized and reliable water supply for the project can be obtained through the project owner contracting with an existing BCPA Section 5 contractor holder – The Metropolitan Water District of Southern California.

The Board requests that the mitigation measures for the Crimson Solar Project be consistent with those of the Desert Harvest Solar Project, for which BLM published a Record of Decision (ROD) in March 2013 (see https://eplanning.blm.gov/epl-front-office/projects/nepa/65699/79579/92204/Desert_Harvest_ROD.pdf). The Board supports the proposed implementation of mitigation measures to avoid or offset any potential impacts to Colorado River water resources as outlined in Appendix 3 of the ROD, which includes the requirement that prior to the onset of water-consuming construction activities, the project owner shall prepare a "Colorado River Water Supply Plan" to identify measures that will be taken to replace water on an acre-foot to acre-foot basis, if the project results in consumption of any water from below the Accounting Surface, towards the purpose of ensuring that no allocated water from the Colorado River is consumed without an entitlement to that water.

The Board requests to be notified and provided an opportunity to review and comment on the Colorado River Water Supply Plan and any future water supply investigation associated with the proposed Crimson Solar Project. If you have any questions or require further information, please feel free to contact Mr. Vic Nguyen at (818) 500-1625.

Sincerely,

Christopher S. Harris

To Whom It May Concern:

RE Crimson Solar Project Notice of Preparation (NOP) Scoping Comments

The Metropolitan Water District of Southern California (Metropolitan) has reviewed the California Department of Fish and Wildlife's (CDFW) March 8 Notice of Preparation (NOP) and the Bureau of Land Management's (BLM) March 9 Federal Register Notice of Intent to prepare a Joint Draft Environmental Impact Statement/Environmental Impact Report for the RE Crimson Solar Project (proposed Project). Metropolitan is pleased to submit comments for consideration by CDFW and BLM. Metropolitan provides these comments to ensure that any potential impacts on its facilities in the vicinity of the proposed Project and on Colorado River water resources are adequately addressed.

Background

Metropolitan is a public agency and regional water wholesaler. It is comprised of 26 member public agencies serving approximately 19 million people in six counties in southern California. One of Metropolitan's major water supplies is the Colorado River via Metropolitan's Colorado River Aqueduct (CRA). Metropolitan holds an entitlement to water from the Colorado River. The CRA consists of tunnels, open canals and buried pipelines. CRA-related facilities also include above and below ground reservoirs and aquifers, access and patrol roads, communication facilities, and residential housing sites. The CRA, which can deliver up to 1.25 million acre-feet

of water annually, extends 242 miles from the Colorado River, through the Mojave Desert and into Lake Mathews. Metropolitan has five pumping plants located along the CRA, which consume approximately 2,400 gigawatt-hours of energy when the CRA is operating at full capacity.

Concurrent with its construction of the CRA in the mid-1930s, Metropolitan constructed 305 miles of 230 kilovolt (kV) transmission lines that run from the Mead Substation in southern Nevada, head south, then branch east to Parker, California, and then west along Metropolitan's CRA. Metropolitan's CRA transmission line easements lie on federally-owned land, managed by BLM. The transmission lines were built for the sole and exclusive purpose of supplying power from the Hoover and Parker projects to the five pumping plants along the CRA.

Metropolitan's ownership and operation of the CRA and its 230 kV transmission system is vital to its mission to provide Metropolitan's 5,200-square-mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way.

Project Understanding

Pursuant to the information contained in the NOP, Sonoran West Solar Holdings LLC (Applicant), a wholly owned subsidiary of Recurrent Energy LLC, proposes to construct, operate, and decommission the proposed 350 megawatt (MW) utility-scale solar photovoltaic (PV) facility and would include up to 350 MW energy storage on approximately 2,500 acres of public lands administered by the BLM within the California Desert Conservation Area (CDCA) planning area. The proposed Project is also located within the Riverside East Solar Energy Zone (SEZ) and within a Desert Renewable Energy Conservation Plan (DRECP) Development Focus Area (DFA).

The proposed Project would interconnect to the regional electrical grid at the Southern California Edison (SCE) 230- kV Colorado River Substation. The proposed Project would generate up to 350 MW of renewable energy using PV technology and would include up to 350 MW of integrated energy storage capacity.

According to the Federal Register notice, the Crimson Solar Project site consists of approximately 2,500 acres of BLM-administered land according to the Federal Register notice, located in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, just north of Mule Mountain and just south of Interstate 10. The proposed Project is comprised of the following components/facilities: photovoltaic modules and support structures, inverters, transformers, and electrical collection system, project substations and gen-tie line, and an operations and maintenance building. Other features/components of the proposed facility include a supervisory control and data acquisition system, an optional battery or flywheel storage

system capable of storing up to 350 MW of electricity, a meteorological data collection system, and telecommunications facilities. If provided, the storage system would consist of up to 3,000

electrical enclosures measuring approximately 40 feet by 8 feet by 8.5 feet high and installed on concrete foundations.

Land Use Issues: Potential Impacts on Metropolitan Facilities

Although Metropolitan has not yet identified any direct impacts, the proposed Project is in the general vicinity of Metropolitan facilities, perhaps as close as 6 miles. As described above, Metropolitan currently has a significant number of facilities, real estate interests, and fee-owned rights-of-way, easements, and other properties (Facilities) located on or near BLM-managed land in southern California that are part of our water supply or distribution system. Metropolitan is concerned with potential direct or indirect impacts that may result from the construction and operation of any proposed solar energy project on or near our Facilities. In order to avoid potential impacts, Metropolitan requests that the project review documents include an assessment of potential impacts to Metropolitan's Facilities with proposed measures to avoid or mitigate significant adverse effects.

Metropolitan is also concerned that locating solar projects near or across its electrical transmission system could have an adverse impact on Metropolitan's electric transmission-related operations and Facilities. From a reliability and safety aspect, Metropolitan is concerned with development of any proposed Project and supporting transmission systems that would cross or come in close proximity with Metropolitan's transmission system. Metropolitan requests that the propose Project review documents analyze and assess any potential impacts to Metropolitan's transmission system. Metropolitan also requests that the proposed Project proponent ensure that the California Independent System Operator (CAISO) includes Metropolitan as a Potentially Affected System for this proposed Project in accordance with the CAISO Tariff and Business Practice Manuals for the Generation Interconnection Procedures. This allows Metropolitan's Power System Operations and Planning Section the opportunity to participate in scoping meetings and study result meetings with SCE and CAISO for any related technical generation interconnection studies.

Water Resources: Potential Impacts on Colorado River and Local Water Supplies

Metropolitan is also concerned about the proposed Project's potential direct and cumulative impacts on water supplies, specifically potential impacts on Colorado River and local groundwater supplies. As noted above, Metropolitan holds an entitlement to imported water supplies from the Colorado River. Water from the Colorado River is allocated pursuant to federal law and is managed by the Department of the Interior, Bureau of Reclamation (USBR).

In order to lawfully use Colorado River water, a party must have an entitlement to do so. *See* Boulder Canyon Project Act of 1928, 43 U.S.C. §§ 617, et seq.; Arizona v. California, 547 U.S. 150 (2006).

CDFW's NOP and BLM's Notice of Intent do not provide any information regarding a source of water to be used during construction, operation, maintenance, and decommissioning. If the

proposed Project intends to utilize groundwater from on-site or off-site wells, Metropolitan is concerned that the wells would draw water from a groundwater basin that is hydro-geologically connected to the Colorado River, within an area referred to as the "Colorado River accounting surface." The extent of accounting surface area for the Colorado River was determined by the U.S. Geological Survey (USGS) and USBR prior to a proposed rule-making process. *See* Notice of Proposed Rule Regulating the Use of the Lower Colorado River Without an Entitlement, 73 Fed. Reg. 40916 (July 16, 2008); USGS Scientific Investigation Report No. 2008-5113. To the extent the proposed Project uses Colorado River water, it must have a documented right to do so.

Entities in California are using California's full apportionment of Colorado River water, meaning that all water is already contracted and no new water entitlements are available in California. Thus, Proponents would have to obtain water from the existing junior priority holder, Metropolitan, which has the authority to sell water for power plant use. Metropolitan is willing to discuss the exchange of a portion of its water entitlement subject to any required approvals by Metropolitan's Board of Directors through an agreement with Metropolitan.

Metropolitan requests that CDFW and BLM also assess the potential cumulative impacts of the use of the scarce Colorado River and local groundwater supplies in light of other pending renewable energy projects within the Colorado River Basin and the local groundwater regions. Metropolitan requests the proposed Project review documents address the proposed water supply for this project and any potential direct or cumulative impacts from this use.

We appreciate the opportunity to provide input to your planning process and we look forward to receiving and reviewing the project review documents in the future. If we can be of further assistance, please contact Ms. Malinda Stalvey at (213) 217-5545.

Very truly yours,

Jennifer Harriger

Hello, Mike,

Thank you for your email. There are no documents to review yet. We currently are collecting public input to help define the issues we will address in the draft EIS. As documents are released for comment they will be posted on our e-planning site:

https://eplanning.blm.gov/epl-front-office/eplanning/planAndProjectSite.do?methodName=renderDefaultPlanOrProjectSite&projectId=88925&dctmId=0b0003e880f99e9a

We will continue accepting comments even though the posted comment period is over. Please feel free to contact me again if you have any further questions.

RE: Comments in opposition to the proposed Crimson Solar Project

Dear Miriam Liberatore:

Our organization, La Cuna de Aztlan Sacred Sites Protection Circle is a Native American organization whose mission is to protect and preserve sacred indigenous sites that are located along the Colorado River. Our organization has a Memorandum of Understanding (MOU) with the Bureau of Land Management to be guardians of these sacred sites that begin in Needles, CA down to the Gulf of California and centered in the Palo Verde/Parker Valleys. These sites include the world-famous Blythe Giant Intaglios, Kokopilli, Cicimitl, El Tosco and Bouse Fisherman geoglyphs as well as over 300 other geoglyphs (intaglios), thousands of petroglyphs, hundreds of pictographs and mountains images.

We are totally against the new proposed Crimson Solar Project that is to be located west of the Mule Mountains. We are attaching a power point we presented at Palo Verde College on March 15, 2016.

Our opposition of the project is the same reason we opposed the Rio Mesa Solar Project on the east side of the Mule Mountains. The Mule Mountains represent "Calli" in Nahuatl. Calli means "earth/house" and its glyph is the 3rd glyph left on top on the Aztec Sunstone calendar with the 20-day glyphs. The origin of the word "California" is derived from "Calli-Fornax" meaning "the hot house". In the Aztec cosmic tradition when the body of a person dies they first go to "Calli". There at Calli, "The Great Spirit, Cicimitl (El Cucuy, ET)" takes the spirit to one of the four final resting places all based on how the person died and how they lived during their life. In the beginning of the 19th century, the Mule Mountains were referred to as the upside-down mountains and as the "Molcajete Mountains because of their 3 peaks.

As John Kalish and George Kline are well aware, the Cicimitl Giant geoglyph is in the Kokopilli geoglyph group. Cicimitl is 10 miles north of and in line with the Mule Mountains and going northeast approximately 90 miles, it is directly 13 magnetic north with Topock Maze south east of Needles. The Maze is where most of the spirits go to repose. Before the Spanish invasion, the Natives would place the calcinated remains of the deceased in an olla with an upside down 3 legged molcajete put on top. This was done in accordance with their belief that their spirits first have to go to the Molcajete (Calli) Mountain before Cicimitl takes them to their final resting place. Ollas with molcajete thousands of years old, have been found in Northwest Sonora all the way down to Bonampak Yucatan.

The Mule Mountains have an abundance of petroglyphs and geoglyphs that relate to the 20 days of the Aztec calendar. They are mostly on the north east side of the Mountains not far from the proposed Solar project site. The main trail that leads northwest toward Corn Springs will be destroyed by the project.

Ron Van Fleet, a Mojave Elder descendent of the last Traditional Mojave Chief Peter Lambert, explains that the Creator, Maslumho with his magic want stirred the contents of a three-legged pot or molcajete. He threw the contents behind him, thus creating the Milky Way, the entire universe, water and air. When he was finished, he placed the empty pot upside down on earth, with the three legs up, which created the three peaks of "Hamock Avi", the Mule Mountains (15 miles southwest of Blythe, CA). In the Mojave oral creation story Hamock Avi is similar to the Aztec Creation story in the Mule Mountains.

The molcajete (grinding mortar) site is located on the north side of the Bradshaw Trail Road on a small hill. It is approximately 4' deep and 15' in diameter.

The Mule Mountains were given this English name because they thought the Cahuillas said "Mule" when they said "mul-al" in reference to the molcajete Aztec name

The Bureau of Land Management has designated the Mule Mountains as an Area of Critical Environmental Concern (ACEC) and is included in their maps because this area includes geoglyphs, hundreds of petroglyphs, cremation/burial sites, major trails and many other indigenous ritual artifacts.

Because of the Mule Mountains sacredness, we organized against construction on site and around them since the 70s. In 1975, San Diego Gas & Electric proposed to construct the Sun Desert Nuclear Power Plant that was going to be built within the same area as the proposed Rio Mesa Solar project site. After 5 years of protest by members of the Riverside County Tribes and environmentalist and our group, we were able to stop the construction of this nuclear plant. The SDG&E had already bought the John Norton 10,000-acre ranch that was to provide water to run the nuclear power plant. During Jerry Brown's first term as California governor, he was able to establish the California Atomic Energy Commission and they would schedule their meetings in Blythe, CA so that the community could be well informed of the pros and cons of the construction of the nuclear power plant that was eventually the first nuclear power plant to be stopped in the United States.

Again in 2001, the Pacific Gas & Electric was going to construct a natural gas power line called the North Baja Pipeline that was going to traverse through the base of the Mule Mountains and Palo Verde Peaks that would eventually destroy some of the sacred sites that are within the area. In June 2001, Native Americans from the Colorado River, Chumash, Chemehuevi, Mojave, Quechan, the EDAW Inc., representatives of the Bureau of Land Management (El Centro, CA & Yuma AZ offices), archaeological, anthropological consultants and our group toured the area. After seeing the significance and sacredness of the area, the Pacific Gas & Electric circumvented the sacred sites. In appreciation of our tour, Dr. James H. Cleland from the EDAW Inc. sent the following recommendation to our organization:

I would like to take this opportunity to wish you well in your future endeavors (1) to educate the public about the importance of cultural heritage and (2) to work within the context of environmental and historic preservation programs to protect these unique and non-renewable resource from unnecessary damage.

Currently the community of Mesa Verde that is 8 miles west of Blythe, has one of the highest per capita rate of Asthma, Valley Fever, Bronchitis and Pneumonia. This is all due to the fungus that is being disrupted in the pristine desert when they scraped all the soil and the fungus is released when the winds carry it and the people inhale it. Prisoners at Chuckawalla and Ironwood State are suffering an increase of Valley Fever. If more solar projects are constructed, the health for the surrounding area of the Palo Verde Valley will become more critical. The Palo Verde Times published an article on March 25 relating to the seriousness of the Valley Fever in the Quartzsite/Blythe area. The author was Jackie Deal, a registered nurse for 40 years.

The Crimson Solar project will be constructed on open lands at the base of the Northwest corner of the Mule Mountains in the Lower Colorado River Valley approximately 15 miles from the Colorado River. The United States Fish and Wildlife Service (USFWS) analysis states this area is an important migratory route for numerous species as well as breeding and wintering stopover destination. This area has been designated as a Globally Important Bird Area (see California Audubon http://ca.audubon.org/iba/). In addition, four National Wildlife Refuges (NWR) have been established to restore and protect habitat and wintering grounds for migratory birds and wildlife along the Colorado River.

Based on available information from Cibola NWR at least 288 bird species including numerous species of migratory passerine species (songbirds), upland species (quail, roadrunners, mourning and white-winged doves; waders/shorebirds and waterfowl (greater sandhill cranes, Canada and snow geese, ibis, egrets, herons, ducks), and raptors (buteos, accipiters, falcons, eagles, vultures) (see http://www.npwrc.usgs.gov/resource/birds/chekbird/r2/cibola.htm). The importance of this habitat for migratory birds is known, and is further highlighted by the use of the area by birds designated by the USFWS as Birds of Conservation Concern and by the California Department of Fish an Game as Species of Special Concern.

Given the area's importance for maintaining health and breeding fitness of migratory and resident birds, the USFWS and California Department of Fish and Game (CDFG) are concerned that avifauna protected by the Migratory Bird Treaty Act (MBTA), migrating Swainson's hawks(state listed as threatened under the California Endangered Species Act), and eagles protected by the MBTA, the Bald and Golden Eagle Protection Act and designated as fully protected under Section 3511 of the Fish and Game Code may be impacted by the construction and operations of the proposed Crimson Solar project.

Special status species at risk also include the state listed Gila Woodpecker, the nahualli (animist) of Quetzalcoatl the Creator (occurs on site) and elf owl (suitable habitat is on the site) and burrowing owls.

We do not oppose solar panels. We feel that they should be place in areas that have already been disturbed as well as placing them of rooftops and in urban areas where energy is mostly needed (warehouses, supermarkets, apartment complexes, abandoned air bases, and along the current electrical transmission lines). This will exclude the need for transmission lines which has now presented major terrorist threats like the blackout that occurred on September 8, 2011 in Mexico, Yuma, Imperial, San Diego and Riverside Counties.

We are opposing the construction of Crimson solar project because of their gross violations to the following Indigenous State, Federal, Mexico and United Nation laws that support our demands and why these projects should not be constructed within sacred areas:

*United Nations Declaration on the Right of Indigenous People. Resolution adapted by the general Assembly during the 107th plenary meeting, September 13, 2007. (61/295) (Includes: Article 11 that stipulates Indigenous archaeological rights.)
*Native American Sacred Places, March 6, 2003 (S.B. 18)
*Native American Sacred Lands Acr, June 11, 2003 (H.R. 2419)
*The Sacred Land Protection Act, July 18, 2002 (H.R. 5155)
*The Native American Sacred Sites Protection Act, February 22, 2002 (S.B. 1828)
*Accommodations of Sacred Sites and Federal Land, Signed by7 President Bill Clinton om May 24, 1996 (Executive Order 13007)
*Native American Graves Protection and Repatriation Act of 1990
*Archaeological Resource Protection Act of 1979
*American Indian Religious Freedom Act, August 11, 1978
*The Civil Right Act of 1968
*Antiquities Act of 1906

For all of these reasons, we are opposing the construction of the Crimson Solar Project and Right-of-way that is proposed to be placed within sacred sites and pristine desert environment.

Sincerely
Alfredo A. Figueroa, Founder
Alfredo G. Figueroa

Re: Scoping comments on proposed RE Crimson Solar Project

Dear Ms. Liberatore;

Thank you for the opportunity to submit issue scoping comments to assist in guiding the analysis of the effects of the proposed Crimson Solar Energy Project (Project) under the National Environmental Policy Act (NEPA). These comments are submitted by Defenders of Wildlife (Defenders), and the California Wilderness Coalition (CalWild).

Defenders is a national conservation organization dedicated to the protection of native species of plants and animals and their habitats. Defenders has approximately 1.8 million members and supporters in the U.S. including approximately 120,000 in California. The California Wilderness Coalition (CalWild) is a nonprofit public benefit corporation organized under the laws of the State of California in 1976 and composed of hundreds of members that include conservation organizations, businesses and individuals.

The Project would be located within a 4,000-acre application area on public lands near Blythe, California, and would entail construction, operation, maintenance, and decommissioning a 350-megawatt solar photovoltaic facility and necessary ancillary facilities, including battery storage, project substations, access roads, operations and maintenance buildings, and lay down areas. The project footprint would be approximately 2,700-acres within the Riverside East Solar Energy Zone (SEZ).

Electricity generated would be delivered to the existing Colorado River Substation via a gen-tie transmission line approximately 3,000 feet in length. The Project right of way application predates both the Programmatic Solar Energy Development Plan (PSEDP) and Desert Renewable Energy Conservation Plan DRECP), and is considered by BLM to be an existing application and not necessarily subject to the provisions of these plans.

We recommend the NEPA analysis of the environmental effects of the Project include the following.

1. **The NEPA process**. The Project is not necessarily subject to the provisions of the PSEDP or DRECP regarding best management practices, impact avoidance and mitigation measures and Conservation Management Actions (CMAs) because of its early application date. An environmental impact statement (EIS) will be prepared for the Project as has been done for many other solar projects considered by BLM as existing applications.

Recommendation. The BLM should utilize the existing information in the PSEDP and DRECP regarding the Project site and lands affected by other nearby projects in developing a description of the affected environment, cumulative impacts, and specific measures to avoid, minimize and mitigate significant environmental impacts. The information in the PSEDP and DRECP comprises some of the best available science and information available. Additional site-specific information will be necessary to complete the NEPA analysis, such as that obtained from protocol surveys for special status species of plants and animals, cultural resources, etc.

The range of alternatives should be based on resource occurrence and sensitivity, with a goal of avoiding or minimizing impacts by modifying the project size and location accordingly. One of the alternatives should include compliance with the requirements for projects developed under the DRECP. The environmentally superior alternative should be one that avoids sensitive resources, including habitat linkages, the sand transport corridor and dunes, and microphyll woodlands to the maximum extent practicable which, in turn, would likely require fewer mitigation measures to reduce impacts to the less-than-significant level.

2. **Impact analysis and mitigation measures**. The Project is located south of I-10 within the Riverside East Solar Energy Zone (SEZ) and Development Focus Area (DFA) which is undergoing rapid change due to multiple large-scale PV solar projects and infrastructure. Besides the Project, others under application, permitted or under development both north and south of I-10 within the SEZ and DFA that affected largely undisturbed public land include:

- Colorado River Substation (existing)
- Desert Sunlight (existing)
- Genesis solar thermal (existing)
- Blythe Mesa four-mile long gen-tie (approved)
- Desert Harvest PV solar (approved)
- Blythe PV solar (under construction)
- McCoy PV solar (under construction)
- Desert Quartzite PV solar (proposed)
- Mule Mountain III PV solar (under application)
- Palen solar (under application)

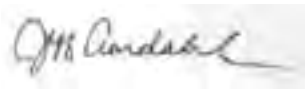
Among the most common features affected by these projects is the Palen-Ford sand transport corridor and, to varying degrees, the presence of sand-based habitats that support the BLM Sensitive Mojave fringe-toed lizard. Habitat linkages across the I-10 corridor that provide for connectivity among populations of plants and animals may also be affected.

Recommendation. The cumulative effects analysis should be derived from information included in the PSEDP and DRECP, and NEPA documents associated with projects that have been approved by BLM, plus the incremental impacts of the Project.

Mitigation for unavoidable impacts to the sand transport corridor, Mojave fringe-toed lizard, desert tortoise, burrowing owl, and habitat features such as Microphyll woodlands, desert washes and habitat linkages, should conform to requirements for other similar projects that were established by either the California Energy Commission or the California Department of Fish and Wildlife. These requirements included compensatory mitigation for unavoidable impacts. If compensatory mitigation opportunities for unavoidable impacts are found to not be available, the project should be further modified to completely avoid those impacts.

3. **Habitat linkages and movement corridors**. The Project application area appears to fall within habitat linkages and movement corridors as mapped in the BLM's DRECP and shown on Figure H-1 in Appendix H: Eastern Riverside SEZ Linkages. Based on Figure H-1, the entire Project appears to be located within a dune/sand habitat linkage.

Recommendation. Consistent with our recommendation regarding using alternatives to avoid adverse impacts to sensitive resources, we recommend that when alternatives to the proposed project are developed, they should be designed specifically to avoid impacts to the mapped habitat linkages and wildlife movement corridors. Although the proposed project and some alternatives may adversely impact these linkages and movement corridors, at the minimum, adverse impacts should be avoided to the extent that the corridors remain functional in perpetuity, with sufficient habitat left intact to provide assurances that stochastic events and effects of climate change will not render the linkage and corridor non-functional. We recommend that impact and avoidance measures in the CMAs contained in the DRECP LUPA be applied to the Project (e.g., CMA LUPA-BIO-13).



4. **Bird mortality**. Bird mortality at various solar energy projects in the Mojave and Sonoran Deserts is under investigation by state and federal agencies. Some of the projects are located within the SEZ/DFA, which studies indicate is used by migratory birds traveling between the Colorado River and Salton Sea, as well as into the Western Mojave Desert. Migratory birds are protected under state and federal law, and those federally listed as threatened or endangered are protected under the Endangered Species Act.

Bird mortality is known to occur at two projects in the SEZ, Desert Sunlight and Genesis. Mortalities at the Desert Sunlight include numerous species of water-related birds. They include the Yuma clapper rail, federally listed as endangered.

Recommendation. We recommend robust bird monitoring and reporting be required for the project as long as mortality remains higher than background levels. Furthermore, all sources of existing information on project design and documented mortality should be utilized developing conservation measures in a bird and bat conservation plan for the Project. Compensatory mitigation for bird mortality attributed to the Project should be required and associated with the habitat characteristically used by the affected bird groups.

This concludes our scoping comments for the Project. Thank you for the opportunity to participate in the environmental issue identification phase of the analysis.

Sincerely,

Scoping comments on the proposed RE Crimson Solar Project

Dear Ms. Liberatore,

Thank you very much for the opportunity to provide scoping comments on the proposed RE Crimson Solar Project (the Project) in Riverside County, California. As proposed, the Project includes the construction, maintenance, operation, and decommissioning of a 350-MW solar energy generating facility on approximately 2,700 acres of desert habitat. The Project is located on land owned and administered by the Bureau of Land Management (BLM). In compliance with the National Environmental Policy Act (NEPA) and California Environmental Quality Act (CEQA), the potential impacts of the Project will be evaluated in a joint EIS/EIR by the BLM and the California Department of Fish and Wildlife (CDFW). The Project application predates the Desert Renewable Energy Conservation Plan (DRECP), adopted in 2016, and the Programmatic Solar Energy Development Plan. It will thus be evaluated under California Desert Conservation Area (CDCA) land use plan and the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO), and applicable state and local laws. Depending on the findings of the EIS/EIR, amendments to the CDCA land use plan may be necessary.

The California Native Plant Society (CNPS) is a statewide, non-profit organization with 10,000 members distributed across 35 local chapters. The mission of CNPS is to conserve California native plants and their natural habitats, and to increase their understanding, appreciation, and horticultural use.

The California Wilderness Coalition (CalWild) is a nonprofit public benefit corporation organized under the laws of the State of California in 1976 and composed of conservation organizations, businesses and individual members. Through advocacy and public education, CalWild builds support for the protection of California's wildest remaining places, primarily those managed by the federal government.

Our concerns regarding the Project include, but are not limited to, impacts to rare plants, vegetation, jurisdictional waters, and ecological processes. Given the scale of the Project and existing site conditions, impacts to native plants and plant communities are unavoidable. Importantly, the Project is sited in the northern

Sonoran Desert near the area in which this desert intergrades with the Mojave Desert to the north. The deserts of Western North America represent one of Earth's last remaining large, intact ecosystems. These habitats are a reservoir of biodiversity, ecosystem services, and evolutionary processes. In the face of climate change, and a myriad of other impacts including renewable energy development, the maintenance of the primary roles of desert habitats is of utmost importance. Furthermore, renewable energy projects should be sited to avoid direct and indirect impacts to plant species (including transmission lines and roads), such as habitat reduction, alteration, fragmentation, exposure to contaminants or fires, and introduction of non-native species.

With that in mind, we recommend that the following potential impacts be evaluated comprehensively in the EIS/EIR.

1. **Impacts to Rare Plants.** Based on a review of existing sources (the California Natural Diversity Database[1], Consortium of California Herbaria[2], and CNPS Inventory of Rare and Endangered Plants[3]) the Project site is home to populations of Harwood's eriastrum (*Eriastrum harwoodii* [CRPR 1B.2, BLM Sensitive]) and Harwood's milk-vetch (*Astragalus insularis* var. *harwoodii*, CRPR 2B.2]). Additionally, based on a review of rare plants found in adjacent areas, the Project potentially supports suitable habitat for the following rare plants:

Common Name	**Scientific Name**	**CRPR**
gravel milk-vetch	*Astragalus sabulonum*	2B.2
pink fairy-duster	*Calliandra eriophylla*	2B.3
Emory's crucifixion-thorn	*Castela emoryi*	2B.2
sand evening-primrose	*Chylismia arenaria*	2B.2
Las Animas colubrina	*Colubrina californica*	2B.3
spiny abrojo	*Condalia globosa* var. *pubescens*	4.2
Abrams' spurge	*Euphorbia abramsiana*	2B.2
Utah vine milkweed	*Funastrum utahense*	4.2
ribbed cryptantha	*Johnstonella costata*	4.3
winged cryptantha	*Johnstonella holoptera*	4.3
Parish's desert-thorn	*Lycium parishii*	2B.3
roughstalk witch grass	*Panicum hirticaule* subsp. *hirticaule*	2B.1
desert unicorn-plant	*Proboscidea althaeifolia*	4.3
dwarf germander	*Teucrium cubense* subsp. *depressum*	2B.2
Chocolate Mountains tiquilia	*Tiquilia canescens* var. *pulchella*	3.2

[1] https://www.wildlife.ca.gov/Data/CNDDB
[2] http://ucjeps.berkeley.edu/consortium/
[3] http://www.rareplants.cnps.org/

Given that the Project will be evaluated under a joint CEQA/NEPA document, complete and comprehensive botanical surveys should be conducted in line with CDFW Botanical Survey Guidelines[4]. This also means that the impacts to all plants included on the CDFW Special Status Plant List[5] need to be evaluated, including those that occur on CRPR Ranks 2B, 3, and 4. In line with these guidelines, botanists should conduct inventories of all plants on the Project site. Also, surveys need to be conducted following adequate amounts of precipitation timed appropriately to ensure that rare plants are detectable. The list of rare plants with the potential to occur on the Project site includes numerous annuals that germinate following summer/fall precipitation. This means that surveys must be completed not only in the spring following adequate precipitation, but also in the fall following adequate precipitation. The detectability of special status plants with potential to occur on a project site can be verified by botanists visiting nearby reference populations of rare plants. The timing and details of visits to reference populations of special status plants should be detailed in the EIS/EIR. Lastly, details of the rare plant survey effort should also be included in the EIS/EIR including information on the dates of surveys, number of surveyors, names of surveyors, and the survey methods used.

For rare plants found on the site, the analysis of impacts from the Project needs to be conducted in combination with the impacts to the same species on other renewable energy project sites in the region. Numerous solar energy development projects that are at various stages in the development process from existing and operational to the early planning stages are located in the region surrounding the Project site. Given that the Project is located in a DRECP Development Focus Area (DFA), additional solar energy development projects may be sited adjacent to the 556Project, and the cumulative impacts to rare species in the region remain a primary concern. Solar energy development projects and associated infrastructure projects located close to the Project site include:

- Colorado River Substation (existing)
- Desert Sunlight (existing)
- Genesis solar thermal (existing)
- Blythe Mesa four-mile long gen-tie (approved)
- Desert Harvest PV solar (approved)
- Blythe PV solar (under construction)
- McCoy PV solar (under construction)
- Desert Quartzite PV solar (proposed)
- Mule Mountain III PV solar (under application)
- Palen solar (under application)

---

[4] https://www.wildlife.ca.gov/Conservation/Survey-Protocols#377281280-plants
[5] https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109383&inline

An analysis of cumulative impacts should include the effects of already-implemented projects in addition to the effects of projects that will be implemented in the future. Care should also be taken to ensure that ecological processes that maintain the habitat for rare species are also maintained (e.g. aeolian transport of sand in the case of Harwood's eriastrum). Also, the Project should ensure the maintenance of biological corridors necessary for the movement of species in the face of climate change. The cumulative impact of the large number of proposed and already-implemented solar energy development projects in the region on ecological processes and biological corridors needs to be addressed. Lastly, we recommend that the Project maintain a 0.25-mile buffer for occurrences of rare plants, in line with the Conservation and Management Actions (CMAs) adopted in the DRECP.

2. **Impacts to Vegetation.** Based on a review of aerial imagery, the Project site contains numerous washes that contain "microphyll woodland" vegetation. Microphyll woodland vegetation types, including Blue Palo Verde-Ironwood Woodland (Parkinsonia florida-Olneya tesota), are rare (see CDFW's list of California Sensitive Natural Communities[6]), and play an important role as habitat for avian species. The long-term persistence of these habitats is maintained by active hydrological processes, which require intact stream courses and adjacent upland habitats.

Vegetation types on the Project site should be mapped to the Alliance level in accordance with CDFW's Vegetation Classification and Mapping Standards[7]. Mapping to the Alliance level is necessary to determine the potential impact to sensitive natural communities. Impacts to microphyll woodland vegetation should be avoided, employing a 200-foot setback, as is mandated in DRECP CMAs. Lastly, the methods used to classify and map vegetation types on the Project site should be clearly reported in the EIS/EIR.

3. **Impacts to jurisdictional waters.** The Project site includes numerous washes that are classifiable as jurisdictional waters of the State of California and/or the United States. The maintenance of washes and stream courses is essential to maintaining the hydrological function of desert ecosystems and sensitive habitats, such as Blue Palo Verde-Ironwood Woodland. In order to accurately document the episodic streams on the Project site we recommend that surveyors employ the Mapping Episodic Stream Activity (MESA)[8] protocols developed by CDFW and the California Energy Commission. The methods used to identify and map jurisdictional waters and wetlands on the Project site should be clearly reported in the EIS/EIR.

Re: RE Crimson Solar Project NOI/NOP Scoping Comments

Dear Ms. Liberatore and Ms. Rodriguez:

Per the Bureau of Land Management's ("BLM") March 9, 2018 Notice of Intent ("NOI"), 47 Fed. Reg. 10,516, and per the California Department of Fish and Wildlife's ("CDFW") March 8, 2018 Notice of Preparation ("NOP"), the Colorado River Indian Tribes ("CRIT" or "Tribes") submit these comments to help guide the scoping and content of the Joint Environmental Impact Statement ("EIS")/ Environmental Impact Report ("EIR") and Possible Land Use Plan Amendment for the Proposed RE Crimson Solar Project ("Project") in Riverside County, CA. The Project, a 350-MW photovoltaic energy-generating facility with an optional 350-MW storage system, is proposed on 2,500 to 2,700 acres of public lands administered by the BLM within the California Desert Conservation Area ("CDCA") planning area. The Project would be located approximately 16 miles from the Colorado River Indian Reservation.

As a preliminary matter, the Colorado River Indian Tribes are a federally recognized Indian tribe comprised of over 4,440 members belonging to the Mohave, Chemehuevi, Hopi and Navajo Tribes. The almost 300,000-acre Colorado River Indian Reservation sits astride the Colorado River between Blythe, California and Parker, Arizona. The ancestral homelands of the Tribes' members, however, extend far beyond the Reservation boundaries. Significant portions of public and private lands in California, Arizona, and Nevada were occupied by the ancestors of the Tribes' Mohave and Chemehuevi members since time immemorial. These landscapes remain imbued with substantial cultural, spiritual, and religious significance for the Tribes' current members and future generations. For this reason, we have a strong interest in ensuring that

potential cultural resource and other environmental impacts associated the proposed Project are adequately analyzed and mitigated.

I. The Project is Likely to Significantly Impact Cultural Resources.

Because of the Tribes' past, present, and future connection to the land on which the Project is proposed, CRIT has grave concerns about the Project's potential for significant cultural resource impacts. The RE Crimson Solar Project is one of dozens of renewable energy projects either approved or under consideration by BLM, state, and local agencies in the area. The collective impact of this transformation of the desert has had, and will continue to have, considerable adverse impacts on the Tribes and the cultural, spiritual, and religious practices of CRIT members. CRIT continues to be concerned that federal and local governments intend to approve all renewable energy projects, no matter what the cost to affected tribes, native plants and animals, and the desert ecosystem as a whole.

The proximity of the proposed Project to the Mule Mountains, also known as Avi Ismalyk, is alarming to the Tribes. The dance circles, trails, petroglyphs, and intaglios associated with Avi Ismalyk play an integral role in Mohave cultural and spiritual beliefs, in addition to the plants and animals of the area. The landscape is identified in Mohave songs and stories. The Mule Mountains are already a designated Area of Critical Environmental Concern ("ACEC") and the need to protect the area and prevent irreparable harm are undeniable.

In addition, the Tribes remained troubled by the Project's potential to remove, damage, or destroy cultural resources and artifacts. These resources are sacred and finite. According to the belief system of CRIT's Mohave members, the disturbance of any cultural resources affiliated with their ancestors is taboo, and thus considered a severe cultural harm. CRIT therefore cannot support any project that will likely result in the disturbance or destruction of cultural resources and artifacts.

II. The DEIS/DEIR Must Broadly Consider Impacts to Cultural Resources

CRIT is concerned about the cultural harm that will result from both the unearthing and destruction of prehistoric archaeological resources and the Project's impacts on other cultural resources. In preparing EISs and EIRs for other solar energy facilities in the region, BLM, state, and local agencies have artificially constrained the definition of "cultural resources," thereby undermining the accuracy and quality of subsequent analysis.

In particular, BLM has taken the position that significant cultural resources are only those buildings, sites, structures, objects, and districts eligible for inclusion on the National Register of Historic Places ("NRHP"). However, National Environmental Policy Act ("NEPA") guidelines specify that EISs must address impacts to "historic *and* cultural resources" (40 C.F.R. § 1502.16(g) (emphasis added)), thus requiring a more expansive analysis than the one required by the National Historic Preservation Act ("NHPA"). Further, in preparing EIRs for other solar

energy facilities in the region, state and local agencies have sometimes also artificially constrained the definition of "historic resources," thereby undermining the accuracy and quality of their subsequent analysis. However, the California Environmental Quality Act ("CEQA") Guidelines explain that a historic resource need not be eligible for the California Register of Historical Resources ("CRHR") to be a "historic resource" under Public Resources Code sections 5020.1(j) or 5024.1; "historic resources" thus require a more expansive analysis than that required under the CRHR criteria. CEQA Guidelines § 15064.5(a)(4). Specifically, the DEIS/DEIR must take into consideration California Assembly Bill 52's amendments to CEQA by recognizing the proposed project's effect(s) on "tribal cultural resources" as defined in California Public Resources Code section 21074.

Such resources under either definition necessarily include viewsheds and landscapes, plants and animals used in and/or central to cultural and religious practices and creation stories, and religious and customary practices (e.g., hunting and gathering, religious ceremonies, and trail-walking). By using the correct definition of cultural resources for this Project, BLM and CDFW will ensure that impacts to a host of important tangible and intangible resources are properly considered.

In addition, the DEIS/DEIR must avoid conflating eligibility for the NRHP under the NHPA and significant adverse effect under NEPA. It must also avoid conflating eligibility for the CRHR and significant impacts under CEQA. Impacts to archaeological resources considered ineligible for listing on the NRHP or CRHR—perhaps because of their lack of integrity—may nevertheless be significant for NEPA and CEQA purposes.

III. The DEIS/DEIR Must Ensure that Potential Impacts to Known and Unknown Cultural Artifacts Are Analyzed and Avoided.

Given CRIT's ongoing experience with utility-scale solar development on land near its Reservation, the Tribes are concerned about the Project's likely impact on both known and unknown archaeological resources. Many of these cultural artifacts are intimately linked to current CRIT members, who consider their disturbance and/or damage to be a significant cultural harm. While cremation sites are of unique importance to the Tribes, other types of artifacts, including groundstones, ceramics, and lithics, are also held sacred. CRIT is also concerned about visual impacts to cultural resources, which have the potential to degrade significant cultural resource values.

BLM has typically relied on Programmatic Agreements or Memoranda of Agreement to comply with Section 106 of the NHPA for utility-scale solar projects, which often improperly defer consideration of cultural resource impacts until after a project has already been approved. A programmatic agreement is *not* appropriate for this Project, as effects on known historic properties can, and must, be fully determined prior to Project approval. 36 C.F.R. § 800.14(b)(1). All cultural resources should be surveyed, inventoried, and evaluated in a manner that does not harm the resources or remove them from the site prior to preparation of the DEIS/DEIR so that

the environmental analysis fully and adequately takes cultural resource impacts into account. BLM and CDFW must also ensure that cultural resource mitigation and treatment plans are in place prior to any ground disturbing activities at the site.

CEQA requires lead agencies to identify significant impacts to "historic resources" and mitigate these impacts. *See, e.g.*, CEQA Guidelines § 15064.5. Moreover, CEQA *requires* lead agencies to use preservation in place for archaeological resources if feasible, unless other mitigation would be more protective. CEQA Guidelines § 15126.4(b); *Madera Oversight Coal. v. County of Madera* (2011) 199 Cal.App.4th 48, 82-87. The law requires BLM and CDFW to fully analyze the Project's impacts to cultural resources before it publishes the Draft EIS/EIR and to prepare and present mitigation measures to avoid or lessen impacts on cultural resources.

The mitigation measures must first require avoidance of cultural resources. Only if avoidance is infeasible may the Project impact cultural resources. This feasibility assessment must be defined in the EIR/EIS as requiring a written evaluation, supported by substantial evidence, and available for tribal review and comment. During all activities that have the potential to impact cultural resources, including but not limited to grading and excavation, tribal monitors will be present. And if cultural resources are unearthed, the Tribes must be allowed to rebury them.

IV. The DEIS/DEIR Must Adequately Consider Cumulative Impacts to Cultural Resources.

The BLM must take a hard look at cumulative impacts to cultural resources. NEPA requires agencies to consider cumulative impacts, meaning "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions." 40 C.F.R. §§ 1508.7, 1508.25(c)(3). "Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." 40 C.F.R. § 1508.7. CDFW is also required to consider cumulative impacts to cultural resources under CEQA. *See, e.g.*, CEQA Guidelines, §§ 15130, 15355. "Cumulatively considerable" means that the incremental effects of a project are significant when viewed in connection with the effects of past projects, other current projects, and probable future projects. CEQA Guidelines § 15130(a)(3); Pub. Resources Code, § 21083(b)(2).

As CRIT has explained, the collective and continual destruction and removal of cultural resources from the Tribes' ancestral lands due to renewable energy projects has already caused tremendous spiritual harm to CRIT members. In addition to triggering extensive cultural resource removal, these renewable energy projects are often sited in a way that severs the connectivity between cultural resource sites—a connectivity that is vital to the traditional value of these cultural resources. In considering the potential cultural resources impacts of the RE Crimson Solar Project, BLM and CDFW must analyze those impacts in light of other past, present, and reasonably foreseeable future actions impacting cultural resources in this region.

BLM and CDFW must also describe the methodology used to assess cumulative impacts and list out the other projects considered in analyzing cumulative impacts.

Additionally, CRIT noted that the satellite image used in NOP Figure 1 showing the Project's location is significantly out of date. Current satellite imagery of the same area shows multiple large-scale solar developments close by. Using current satellite imagery is necessary to convey to decisionmakers and the public the Project's location and cumulative significance. The outdated satellite base image gives the impression that the RE Crimson Solar Project will be the only solar installation within the Project Location Map. This is extremely misleading. As can be seen in Attachment 1: Current Satellite Imagery, there are at least five separate solar installations within the Project Location Map's boundaries. Each of these installations has resulted in extensive cultural resource removal and has severed connectivity between the cultural resource sites. A first step to analyzing these impacts is having a map that is up to date.

Finally, CRIT is aware that a number of new projects have been proposed in the vicinity of the Project in the last three years. These must be listed and thoroughly studied in the cumulative impact section.

V. BLM Must Consider the Environmental Justice Impacts from the RE Crimson Solar Project.

The vast transformation of an entire cultural landscape has significant environmental justice implications. The renewable energy benefits of the Project will flow to energy customers in southern California and the shareholders of large energy companies. The impacts of the Project, however, will be uniquely felt by CRIT and other area tribes and their members whose interests in this area extend beyond economics to its cultural and spiritual value. As acknowledged by California Energy Commission Commissioner Karen Douglas in a siting proceeding for another utility-scale solar project proposed in this region, "Indian tribes maintain long-standing ancestral and traditional practices that connect their identities as Indian people to the environment, unlike other populations that do not have territories linked to their collective identities." Palen Solar Electric Generating System Revised PMPD at 6.3-60 to -61. Shifting the burden of renewable energy development to unique communities that have occupied this landscape since time immemorial, while providing such communities with no identified benefits, is the very definition of environmental injustice. BLM must both recognize and address such realities.

In addition, as part of the California Resources Agency, CDFW must comply with its Environmental Justice Policy. This document directs CDFW to "consider environmental justice in [its] decision-making process if [its] actions have an impact on the environment, environmental laws, or policies." Such actions specifically include discretionary decisions that affect the environment, such as CDFW's review of the Project. Consequently, the Tribes urge CDFW to appropriately consider environmental justice issues, including disproportionate cultural resource impacts on the Tribes, in its environmental review documents.

VI. The DEIS/DEIR Must Include Distributed Generation and Disturbed Lands Alternatives.

BLM and CDFW must take care in crafting its project objectives and "Purpose and Need" to ensure that the DEIS/DEIR properly considers an adequate range of alternatives. *Cal. Oak Foundation v. Regents of Univ. of Cal.* (2010) 188 Cal.App.4th 227, 277 ("CEQA clearly recognizes the agency will look to the proposed project's particular objectives when developing its range of project alternatives."); *Mt. Shasta Bioregional Ecology Center v. County of Siskiyou* (2012) 210 Cal.App.4th 184, 196-97 ("The process of selecting the alternatives to be included in the EIR begins with the establishment of project objectives by the lead agency."); *see also* CEQA Guidelines §§ 15124(b), 15126.6(f). For other large-scale solar energy projects in the Mohave Desert, however, agencies have artificially constrained their alternatives analyses by stating that the purpose and need for solar energy projects is to "respond to the Applicant's application" for a right of way grant. *See, e.g.*, DEIS for the McCoy Solar Energy Project at ES-2. But under Ninth Circuit precedent, BLM is prohibited from "adopting private interests to draft a narrow purpose and need statement that excludes alternatives that fail to meet specific private objectives." *National Parks & Conservation Ass'n v. Bureau of Land Management*, 606 F.3d 1058, 1072 (9th Cir. 2010). For this Project, BLM must identify the *public purposes* to be achieved, rather than simply reacting to the whims of the developer.

In addition, BLM has frequently stated that it is mandated to develop utility-scale renewable energy projects on public land in order to meet requirements set forth in the Energy Policy Act of 2005, Executive Order 13212, and Secretarial Order 3285A1. However, these federal laws and policies, while encouraging such development, do not require it, particularly when renewable energy projects will have significant and adverse environmental consequences. The "Purpose and Need" for the project should also include a commitment to protecting cultural and biological resources, as well as the visual integrity of the desert landscape.

For these reasons, CRIT urges BLM and CDFW to adopt project objectives and define the Project's "Purpose and Need" such that all allow for the consideration of a broad range of alternatives. In particular, the objectives should focus on the public benefits to be achieved: reduction in greenhouse gas emissions, increased energy independence, and economic development. Project objectives focused on these topics will allow the DEIS/DEIR to properly include both a distributed generation and disturbed lands alternative. Such Projects can achieve the same goals as utility-scale solar projects, but with far fewer impacts to cultural resources and other environmental resources. The Tribes also urge BLM to consider the environmental justice impacts of the proposed Project, as described in Section V, in its consideration of alternatives. One mechanism for starting to address the disproportionate benefits and impacts of utility-scale solar energy development is to encourage development of such projects in cooperation with federally recognized tribes. For this reason, the DEIS/DEIR should include a tribal lands alternative, which would involve construction of a similar project on reservations or federal lands acquired or leased in conjunction with a federally recognized tribe, as well.

VII. The NOI/NOP Describes Two Very Different Projects.

As written, the NOI/NOP describes the Project as a utility-scale solar PV and energy storage project. NOP at 3. However, the energy storage part of the project is later described as "optional." NOP at 4. The inclusion or exclusion of energy storage greatly changes the scale of the Project. If the Project is limited to the 350-MW solar PV facility, the most significant installation would be 175 2-MW increments measuring 40 by 25 feet. NOP at 4. On the other hand, if the storage system were included in the Project, this would add 3,000 enclosures each measuring 40 by 8 feet and 8.5 feet tall. NOP at 4.

The Tribes are concerned about the grading required for the storage system and the potential for this grading to have a greater impact on cultural resources than the grading required for the solar PV increments. Because the addition of the storage system nearly quadruples the amount of land used at the site, the DEIS/DEIR must fully examine the impacts of the Project both with and without the storage system.

VIII. More Information Is Needed Before the Tribes Can Comment on the Need for a CDCA Plan Amendment.

The NOI states that the EIS/EIR may contain a CDCA Plan Amendment and requests comments on the possible amendment. 47 Fed. Reg. at 10,517-18. The Tribes need more information before making any substantive comments on a potential amendment because it is not clear what would need to be changed in the CDCA Plan. CRIT strongly opposes any change to the CDCA Plan which would remove or weaken protections in this area.

In fact, CRIT believes that the Mule Mountains ACEC should be expanded, as the current designation is not broad enough to protect all resources. Numerous cremation sites have been identified in the area *outside* of the ACEC (*see* DRECP EIR/EIS, Appendix L at 1). The Mule Mountains hold nationally significant cultural resource values and the DRECP recognized that the site could reveal new information about past life in the area. *Id.* Failing to expand the boundaries of the ACEC will likely result in the loss of cultural resources of CRIT. This necessary expansion should be considered *before* BLM takes any action with respect to the Project. The CRIT Tribal Historic Preservation Officer has discussed this issue with Fort Mojave and Quechan, and understands that both tribes likewise support the expansion of this designation.

IX. BLM and CDFW Must Implement Early Consultation.

CRIT requested by letter government-to-government consultation with BLM on April 22, 2016 and with CDFW on September 25, 2017. CRIT has also developed and shared with both BLM and CDFW its Government-to-Government Consultation Policy and requested that prior to scheduling an in-person consultation with Tribal Council both agencies review and acknowledge

the Policy. To the Tribes' knowledge, neither BLM nor CDFW has acknowledged CRIT's Policy.

According to the NOI, "BLM will consult with Indian tribes on a government-to-government basis in accordance with Executive Order 13175 and other policies," presumably including the NHPA and its implementing regulations. 47 Fed. Reg. at 10,517. This language implies that BLM will begin consultation at some point in the future—perhaps after the DEIS/DEIR has been developed. But the regulations implementing Section 106 of the NHPA state that "[a]gencies should consider their section 106 responsibilities *as early as possible* in the NEPA process." 36 C.F.R. § 800.8(a)(1) (emphasis added); *see also id.* § 800.2(c)(2)(ii)(A) ("The agency official shall ensure that the section 106 process is initiated early in the undertaking's planning, so that a broad range of alternatives may be considered during the planning process for the undertaking."); *id.* § 800.2(c)(2)(ii)(A) ("Consultation should commence early in the planning process . . . .").

Though BLM has sent CRIT written notifications regarding the early stages of the application process, these documents and invitations to public meetings are not a substitute for BLM's Section 106 consultation obligations. And while BLM appears to believe that a November 28, 2016 meeting qualified as government-to-government consultation, this meeting does not. The BLM attendees at that meeting were unprepared to substantively respond to the points raised by the Tribes at that time, even though the Tribes had provided BLM with comment letters outlining the Tribes' primary concerns in advance. Without back-and-forth communication, such meetings do not meet the definition of government-to government consultation. For numerous renewable projects throughout the region, including the Genesis Solar Energy Project, the Modified Blythe Solar Energy Project, and the Six-State Solar Programmatic EIS, BLM utterly failed to engage CRIT in meaningful consultation regarding the impacts of the projects. Instead, the agency has resorted to generic form letters arriving late in the process to fulfill its responsibility under the NHPA and other federal policies.

CRIT requests that BLM review and acknowledge the Tribes' Consultation Policy and promptly engage with the Tribes on a meaningful, government-to-government level for this Project. Additionally, to the Tribes' knowledge, CDFW has not yet begun consultation on this Project, despite widespread awareness that this is an area of great cultural resource sensitivity. Thus, CRIT requests that CDFW promptly acknowledge the Tribes' Consultation Policy and then engage with the Tribes on a meaningful, government-to-government level for this Project, consistent with the policies expressed in the Tribes' Policy and Assembly Bill 52.

Finally, the DEIS/DEIR should also address Executive Order 13007, distinguish it from Section 106 consultation, and discuss how BLM will avoid adversely affecting the physical integrity, accessibility, and use of sacred sites in the Project area.

Thank you for considering CRIT's comments. To best understand how these comments are taken into account in the DEIS/DEIR, we request that BLM and CDFW provide written

responses to our concerns, either in a letter to the Tribe and/or in the DEIS/DEIR. Please copy Rebecca A. Loudbear, CRIT Attorney General, at rloudbear@critdoj.com on any written correspondence to the Tribe.

Respectfully,

ACTING

Dennis Patch

We protect wilderness and inspire Americans to care for our wild places

April 18, 2018

Submitted via email to (blm_ca_crimsonsolar@blm.gov)

Miriam Liberatore
Project Manager
Bureau of Land Management

Re: Crimson Solar Scoping Comments

Dear Ms. Liberatore,

The Wilderness Society and California Wilderness Coalition support responsible, well-planned and sited renewable energy development, including on appropriate public lands, as part of a strategy for addressing climate change, along with aggressive efforts to increase energy efficiency, build distributed generation such as rooftop solar, and reduce demand with demand-side management. Areas with important and sensitive resources and values are inappropriate for development, and disturbed and degraded lands, including both public and private lands, will best serve as areas for focusing renewable energy development away from areas of greatest importance or sensitivity for ecological and other resources and values.

We support the guided development approach established in BLM's Solar Programmatic Environmental Impact Statement (Western Solar Plan), including the focus on development in appropriate areas and with appropriate mitigation within Solar Energy Zones (SEZs). The Desert Renewable Energy Conservation Plan (DRECP) built on the Western Solar Plan by establishing a balanced plan for the California Desert, protecting areas of high conservation importance and facilitating development in Development Focus Areas (DFA). While the application for the proposed Crimson Solar Project (Crimson Solar) was submitted before the DRECP was finalized and thus is not required to comply with the DRECP, the project footprint is within the physical boundary of the Riverside East DFA. We understand that the developer has already significantly modified the project boundary to limit impacts to some important wildlife and habitat resources and values, which we appreciate.

All energy development should follow the mitigation hierarchy of avoiding, minimizing and mitigating impacts through compensatory, off-site mitigation. Implementation of the mitigation hierarchy is a fundamental requirement under the Federal Lands Policy and Management Act (FLPMA) and the National Environmental Policy Act (NEPA) to protect the diverse resources of our public lands.

These scoping comments focus on requirements the BLM has under federal laws for inventory and management of lands with wilderness characteristics; we also recommend that BLM develop an alternative that analyzes Crimson Solar under the DRECP. Other groups are submitting comments that address potential impacts wildlife and other resources and values, and we strongly recommend that the BLM address those important issues as well.

Unfortunately, most of the Crimson Solar project area overlaps with the Mule Mountains BLM and Citizen lands with wilderness characteristics (LWC) unit, as shown in the attached map (Attachment 1). In general, energy development is not appropriate in LWC because of the sensitive and important resources and values found in LWC, and we recommend that BLM and energy developers avoid development in LWC.

However, because Crimson Solar is within the boundary of the Riverside East DFA which was designated as part of the balanced DRECP, BLM may be able to approve the project in an acceptable way so long as mitigation for impacts to LWC is required (and other resource impacts are appropriately addressed).

I. BLM must ensure the lands with wilderness characteristics inventory is up to date for the Crimson Solar project area and analyze potential impacts

a. LWC inventory requirements

FLPMA requires BLM to inventory and consider lands with wilderness characteristics during the land use planning process. 43 U.S.C. § 1711(a); s*ee also Ore. Natural Desert Ass'n v. BLM,* 625 F.3d 1092, 1122 (9th Cir. 2008) (holding that "wilderness characteristics are among the values the FLPMA specifically assigns to the BLM to manage in land use plans"). Lands with wilderness characteristics are identified as roadlessness, naturalness, and having outstanding opportunities for solitude or outstanding opportunities for a primitive and unconfined type of recreation. See, BLM Manual 6320, pp. 5-9.

BLM's guidance for implementing this requirement of FLPMA is currently set forth in BLM Manual 6310. BLM must ensure that all LWC inventories are conducted compliant with this manual, including the documentation of the inventory findings. Manual 6310 reiterates that, "[r]egardless of past inventory, the BLM must maintain and update as necessary, its inventory of wilderness resources on public lands." BLM Manual 6310 at .06(A).

In addition to FLPMA requiring the agency to maintain an inventory of lands with wilderness characteristics, an accurate and comprehensive inventory of lands with wilderness characteristics is necessary to inform management alternatives, impact analysis and decision-making under the National Environmental Policy Act (NEPA). NEPA, 42 U.S.C. § 4321 *et seq*., requires agencies to "describe the environment of the areas to be affected or created by the alternatives under consideration." 40 C.F.R. § 1502.15; *see also Half Moon Bay Fisherman's Marketing Ass'n v. Carlucci*, 857 F.2d 505, 510 (9th Cir. 1988) ("without establishing . . . baseline conditions . . . there is simply no way to determine what effect [an action] will have on the environment, and consequently, no way to comply with NEPA").

b. BLM is required to respond to wilderness inventory information submitted by the public.

We appreciate that BLM has inventoried many lands with wilderness characteristics (LWC) units through development of the DRECP, as required by FLPMA. We also appreciate that BLM found wilderness characteristics in the majority of the Crimson Solar project area, as documented in the agency's inventory reports for inventory units CDCA WIU 351 and 351A and shown in the attached map (Attachment 1). However, the California Wilderness Coalition has submitted LWC inventory information for the project area that found additional lands with wilderness characteristics, which BLM has not yet responded to as far as we're aware. As shown in the detailed LWC inventory report for the Mule Mountains unit completed by the California Wilderness Coalition (Attachment 2), additional areas outside the BLM inventory do in fact have wilderness characteristics – meeting the minimum size requirement, being primarily affected by the forces of nature, and providing outstanding opportunities for solitude and primitive recreation. The unit also has supplemental values, including hosting several species of plants and animals such as the endangered desert tortoise and a plethora of others. The area also has an abundance of cultural resources and extensive woodlands along its washes that are a haven for songbirds and other creatures.

The California Wilderness Coalition inventory information meets the minimum standards for review of new information set forth in BLM Manual 6310:

i. a map of sufficient detail to determine specific boundaries of the area in question;

ii. a detailed narrative that describes the wilderness characteristics of the area and documents how that information substantially differs from the information in the BLM inventory of the area's wilderness characteristics; and

iii. photographic documentation.

BLM Manual 6310 at .06(B)(1)(b). When BLM receives information that meets these minimum standards, the agency is directed to review the information "as soon as practicable," "make the findings available to the public," and "retain a record of the evaluation and the findings as evidence of the BLM's consideration." *Id.* at .06(B)(2). If BLM took these steps, the agency did not make California Wilderness Coalition aware that it had reviewed the citizen inventory or shared its findings.

BLM must respond to public input on affected wilderness resources in order to meet the "hard look" requirement of NEPA. *See* 42 U.S.C. § 4332(2)(C). Numerous courts have applied the hard look mandate to overturn agency decisions that ignored substantive, relevant wilderness information provided by the public, including citizen-submitted wilderness inventories. *See, e.g.*, *Or. Natural Desert Ass'n v. Rasmussen,* 451 F. Supp. 2d 1202, 1211-13 (D. Ore. 2006) (holding that BLM violated the hard-look requirement of NEPA when it dismissed a citizen-submitted inventory "[w]ith a broad brush"); *SUWA v. Norton*, 457 Supp. 2d 1253, 1263-65 (D. Utah 2006) ("…Utah BLM ignored significant new information…information provided by the Southern Utah Wilderness Alliance…presented a textbook example of significant new information about the affected environment (the wilderness attributes and characteristics…)"). BLM must therefore update its LWC inventory for the Mule Mountains unit to take into account the California Wilderness Coalition's inventory of the unit; we expect that when BLM does so, the agency will update its findings to confirm that those additional portions of the unit do have wilderness character.

We have identified errors in several of BLM's LWC inventory reports for the DRECP area that, when corrected, require acknowledgment of additional areas as lands with wilderness characteristics. As stated above, FLPMA requires BLM to inventory and consider LWC in the planning process, and IM 2011-154 and subsequent Manuals 6310 and 6320 contain the mandatory guidance for implementing that requirement. Although BLM has conducted wilderness inventories for decades, IM 2011-154 and Manual 6310 clarify when and how lands with wilderness inventories should occur while providing detailed instructions in both delineating wilderness inventory units and assessing the presence or absence of wilderness characteristics present therein. These updated policies were issued in 2011-2012 (IM 2011-154 was published in July 2011 with detailed instructions for inventory and management of LWC similar to Manuals 6310 and 6320, and Manuals 6310 and 6320 were released in March 2012).

While many of the LWC inventories conducted as part of the DRECP planning effort occurred after the issuance of Manual 6310, many of the policies and procedures for identifying lands with wilderness characteristics that are described in that Manual are not adhered to in the subsequent inventories. These include factors such as polygon size for units adjacent to existing protected areas, drawing unit boundaries based on arbitrary features such as section lines, and disqualification of units based on the appearance of linear features in satellite imagery that are not actually disqualifying development or impacts on the ground. Therefore, BLM must ensure it has an accurate inventory for the project area by reviewing and considering the inventory information submitted by the California Wilderness Coalition.

c. BLM must analyze impacts to lands with wilderness characteristics as part of the Crimson Solar EIS

NEPA is our "basic national charter for the protection of the environment." 40 C.F.R. § 1500.1 NEPA achieves its purpose through "action forcing procedures. . . requir[ing] that agencies take a hard look at environmental consequences." Id.; Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 350 (1989) (citations omitted). This includes the consideration of best available information and data, as well as disclosure of any inconsistencies with federal policies and plans.

BLM has identified lands with wilderness characteristics in the project area, documented in the agency's inventory reports for inventory units CDCA WIU 351 and 351A. As stated above, we believe there are additional lands in the project area that meet the criteria for lands with wilderness characteristics which the agency must also consider. All areas found to possess wilderness characteristics must be analyzed in the impact analysis in the EIS.

NEPA requires federal agencies to consider "any adverse environmental effects which cannot be avoided." 42 U.S.C. § 4332(C)(ii). Effects that must be considered include "ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative." 40 C.F.R. § 1508.8.

Therefore, BLM must analyze the potential impacts to lands with wilderness characteristics from Crimson Solar, as well as the beneficial impacts that avoiding lands with wilderness characteristics would have on other resources, including scenic viewsheds, cultural resources, wildlife habitat, recreation opportunities and nonmarket economic values.

II. BLM is required to consider ways to avoid, minimize and offset impacts to lands with wilderness characteristics

The BLM is subject to a broad range of authorities supporting mitigation measures to avoid and minimize impacts, and to offset unavoidable impacts. FLPMA requires the BLM to manage for multiple use and sustained yield, and to avoid unnecessary or undue degradation of resources and values.[1] NEPA and associated Council on Environmental Quality (CEQ) regulations require the BLM to analyze potential impacts and consider ways to avoid, minimize and mitigate impacts – in accordance with the mitigation hierarchy.[2] BLM has identified lands with wilderness characteristics in the project area which must be considered in the context of the mitigation hierarchy.

a. BLM should consider ways to avoid and minimize impacts to lands with wilderness characteristics

We understand that the project developer has already significantly adjusted the project footprint to limit impacts to sensitive ecological resources, which we appreciate. We recommend that the BLM and the project developer consider ways to avoid impacts to LWC as much as possible by further adjusting the project footprint to limit the overlap with LWC. As shown in Attachment 1, the land north and east of the current project boundary does not include LWC, and we recommend that the BLM consider expanding the project area into this region to allow constricting the project area in the areas where it overlaps with LWC.

[1] *See* 43 C.F.R. §§ 1701, 1732(b).
[2] 40 C.F.R. §§ 1508.8, 1502.14, 1502.16.

We recognize that adjusting the project footprint to reduce impacts to one resource (LWC) may result in increased impacts to other resources and values (e.g. wildlife habitat). We also recognize that the Desert Quartzite solar project covers some of the land north and east of Crimson Solar, which affects project siting flexibility. Because we are not familiar with the other resources and values present in the land north and east of the existing project application, we underscore that BLM should ensure that any project footprint adjustments balance reduction of LWC impacts with potential increases in impacts to other resources and values, and recommend that BLM ultimately select a project footprint that provides the best balance with regards to limiting impacts across important resources and values.

BLM should also require on-site minimization of impacts through use of Best Management Practices for construction, operation and maintenance.

b. BLM and the project developer should commit to compensatory mitigation to offset any unavoidable impacts to lands with wilderness characteristics

Given that the agency's current inventory of lands with wilderness characteristics encompasses much of the project area, it seems inevitable that there will be unavoidable impacts to LWC from Crimson Solar. Therefore, BLM and the project developer should commit to offsetting them through compensatory mitigation. The Western Solar Plan established several measures for avoiding, minimizing and mitigating impacts to LWC which BLM and the project developer should use to address potential impacts from Crimson Solar. Western Solar Plan Record of Decision pp. 54-56; excerpt included as Attachment 3.

Two examples of compensatory mitigation for impacts to LWC from other energy development on public lands illustrate how compensatory mitigation can address impacts to LWC. For the McCoy Solar Project, the construction of Unit 2 would cause the loss of 1,089 acres of LWC. To address these impacts, the final decision documents required that the Notice to Proceed for Unit 2 will provide that, before any ground disturbance occurs in the area inventoried to have wilderness characteristics, McCoy Solar shall pay BLM to fund work to mitigate these impacts and that the work shall be completed no later than 18 months from the commencement of construction for the relevant portion of Unit 2. McCoy Solar Project Protest Resolution Agreement pp. 2-3. The mitigation shall be focused in the Big Maria Mountains Wilderness Area, Palen-McCoy Wilderness Area or other designated wilderness areas in general proximity to the project, as identified with BLM. Mitigation will be implemented by:

- Removal and restoration of approximately 15 miles of unauthorized vehicle routes;
- Conversion of approximately 3 miles of vehicle route into a hiking trail; and
- Installation of vehicle barriers and signing along publicly accessible portions of the wilderness boundaries.

The final decision documents further required that McCoy Solar shall make a not-to-exceed payment of $251,000 to fund the mitigation. Such payment shall be made prior to any ground disturbance in the area inventoried to have wilderness characteristics and will complete McCoy Solar's obligations regarding this mitigation measure.

In a second example, BLM's Record of Decision for the TransWest Express Transmission Project required that unavoidable impacts to LWC be offset by either 1) purchasing and protectively managing private land inholdings from willing sellers in existing Wilderness Areas and Wilderness Study Areas (WSAs); or 2) completing restoration projects inside existing Wilderness Areas and WSAs. TransWest Express ROD pp. F-20-F-21.

We look forward to working with BLM and the project developer to offset any unavoidable impacts to LWC through compensatory mitigation.

III. BLM should develop an alternative that analyzes Crimson Solar under the DRECP

Although Crimson Solar is a "grandfathered" project and thus is not required to comply with the DRECP decisions and policies, we strongly recommend that BLM develop an alternative that analyzes Crimson Solar under the DRECP and compares the impacts to resources and values to the impacts under other action alternatives.

The DRECP was designed to facilitate responsible development in DFAs by focusing agency resources on permitting projects in DFAs, tiering to the DRECP NEPA analysis to increase permitting efficiency, and ensuring that potential impacts are addressed through use of Conservation Management Actions and the mitigation hierarchy.

By developing an alternative that analyzes Crimson Solar under the DRECP, BLM can determine whether permitting the project using the DRECP decisions and policies would provide improved outcomes for both resource impacts and efficient project permitting. If BLM finds that permitting Crimson Solar under the DRECP decisions and policies would on balance lead to improved outcomes, we recommend that BLM select this alternative as the agency-preferred alternative.

We appreciate the opportunity to comment and look forward to working with you.

Sincerely,

Alex Daue

Lands with Wilderness Characteristics Recommendations for the Desert Renewable Energy Conservation Plan Process: Mule Mountains Lands with Wilderness Characteristics

Mule Mountains LWC, Photo by Cameron McLeod

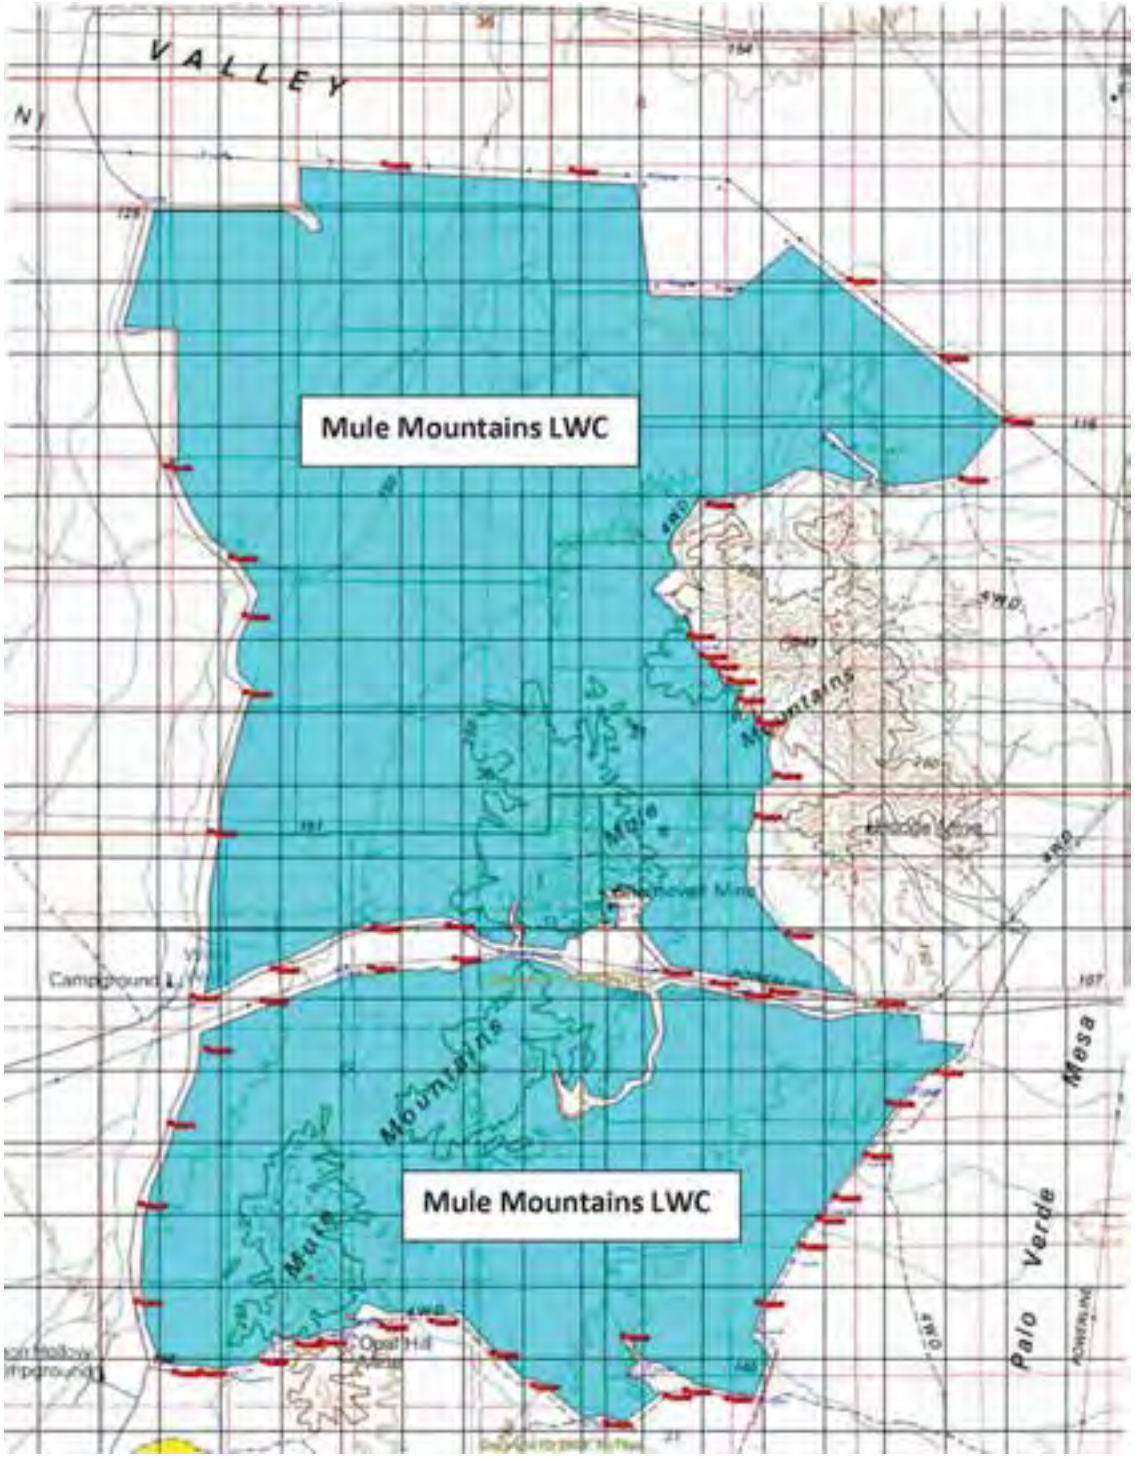
Lands with Wilderness Characteristics Recommendations for the Desert Renewable Energy Conservation Plan Process: Mule Mountains Lands with Wilderness Characteristics

Prepared by Ryan Henson, California Wilderness Coalition, 3313 Nathan Drive, Anderson, CA 96007, 530-365-1455, rhenson@calwild.org

The purpose of this report is to document that the area in question meets the criteria laid out in BLM Manual's 6310 and 6320 as Lands with Wilderness Characteristics (LWC). This information should be considered new information, as the BLM has yet to conduct and/or publish a full field inventory of this unit to document the wilderness characteristics of the unit and/or to assess whether boundary adjustments need to be made to better meet the intent of the BLM's LWC policies.

Methodology

The Mule Mountains LWC was initially selected by Ryan Henson for on-the-ground surveys after being deemed sufficiently primitive through the careful review of high-resolution aerial photographs provided by the Terrain Navigator Pro and Google Earth pro subscription services. The area was then surveyed in the field to determine if it met the definition of LWC using the criteria detailed in BLM Manual 6310 and 6320. The survey was conducted by Cameron McLeod. After a careful field review using BLM protocols, it was determined that the area met the definition of LWC.



Overview and boundary delineation

As is shown on the maps included in this narrative, the Mule Mountains LWC is:

- Approximately 24,577 acres in size in two units (Northern unit at 16,186 acres and the Southern unit at 8,391 acres);
- Less than a mile north of the Palo Verde Mountains Wilderness and 2.4 miles east of LWC lands adjacent to the Little Chuckwalla Mountains Wilderness that the BLM found eligible;
- Located in Riverside County; and
- Managed by the Palm Springs-South Coast Field Office.

The Northern LWC unit is bounded on the north and east by unnamed four-wheel drive routes and mining scars, while the western boundary is defined by Wiley Well Road. The southern boundary is defined by a powerline and the Bradshaw Trail. Mining damage has been cherrystemmed.

The boundaries of the Southern LWC unit are defined on the north by a powerline and the Bradshaw Trail, on the east and south by unnamed four-wheel drive routes, and on the west by Wiley Well Road. As with the northern unit, mining damage has been cherrystemmed.

The units are dominated by the Mule Mountains and the bajadas and washes flowing down from it. Elevations in the units range from 885 to 613 feet, with an average of 718 feet.[1]

According to the California Department of Fish and Wildlife's (CDFW) Natural Diversity Database, the following species of interest have been either been recorded or have suitable habitat in the area: Abrams' spurge, American badger (a state species of special concern), bitter hymenoxys, black-tailed gnatcatcher, burrowing owl (a state species of special concern), California leaf-nosed bat, California mellitid bee, cave myotis, Colorado River cotton rat (a state species of special concern), Colorado Valley woodrat, Couch's spadefoot (a state species of special concern), Crissal thrasher (a state species of special concern), desert beardtongue, desert tortoise (a state and federal threatened species), dwarf germander, Emory's crucifixion-thorn, Gila woodpecker (a state endangered species), gravel milk-vetch, Harwood's eriastrum, Harwood's milk-vetch, hoary bat, Le Conte's thrasher (a state species of special concern), loggerhead shrike (a state species of special concern), merlin (a state watch list species), Mojave fringe-toed lizard (a state species of special concern), pallid bat (a state species of special concern), pallid San Diego pocket mouse (a state species of special concern), pink fairy-duster, prairie falcon, Riverside cuckoo wasp, roughstalk witch grass, Townsend's big-eared bat (a state candidate threatened and species of special concern) and vermilion flycatcher (a state species of special concern).[2] Both units are also designated critical habitat for the desert tortoise, and they contain eight distinct plant communities.[3] The area also has extensive woodlands along its washes. These woodland thickets are a haven for songbirds and other creatures. There is also some evidence that bighorn sheep use the mountains.[4] A remarkable 44% of the LWC is composed of north-facing slopes.[5] In the Northern Hemisphere, north-facing slopes tend to be cooler and to hold moisture longer than other aspects. This is especially important in arid landscapes.

Description of wilderness characteristics

I. Mule Mountains LWC meets the minimum size criteria for roadless lands

The Mule Mountains LWC is composed of two single, contiguous blocks of roadless BLM land. BLM's Manual 6310 states that a "way" maintained solely by the passage of vehicles does not constitute a "road" for purposes of inventorying wilderness characteristics. Further, the fact that a "way" is used on a regular and continuous basis does not make it a road. A vehicle route that was constructed by mechanical means but is no longer being maintained by mechanical methods

---

[5] Ibid.

is not a road. A road, by comparison, is a vehicle route that has "been improved and maintained by mechanical means to ensure relatively regular and continuous use" (Manual 6310, p. 11). All significant disturbances have been cherrystemmed out of the boundaries. As the California Wilderness Coalition's (CWC) survey, described below, reveals, the Mule Mountains LWC only contains ways. All photo points referred to in the narrative below can be seen in the attached photo points sheet for the Mule Mountains.

II. Mule Mountains LWC is primarily affected by the forces of nature

The Mule Mountains LWC has been affected primarily by the forces of nature and all human impacts within the unit are substantially unnoticeable. We offer several photographs, below, of the natural landscape. There are several old vehicle tracks and other minor disturbances that are recovering to a natural state through erosion, revegetation and a lack of subsequent disturbance.

III. Mule Mountains LWC provides outstanding opportunities for solitude and primitive recreation

The most subjective and frequently abused definition of "wilderness" involves the question of whether or not a roadless area provides "outstanding opportunities for solitude or a primitive and unconfined type of recreation." America—including its public lands—is a nation dominated by roads. Roadless areas of sufficient size to meet the definition of wilderness therefore provide the best, most outstanding opportunities still available in this country for both solitude and primitive recreation.

In our view, nothing destroys the wilderness character of an area like development within that area. Mere noises or views of development elsewhere, outside of a wild area's boundaries, while admittedly unpleasant to some, has no bearing whatsoever on the wild character of a stretch of land. Congress has proven this point many times over by designating countless wilderness areas near highways, mines and other major external developments. In the 1990 Statewide Wilderness Study Report the BLM placed an inordinate emphasis on the sights and sounds originating from roads, mines, railroads, military bases, etc.–all outside of the WSAs in question of course--that allegedly affected the WSAs' wilderness character. The actual undeveloped character of the land itself within a WSA's boundaries, and the capability of undeveloped land to provide for solitude and recreation, appeared to be an afterthought for the agency.

BLM Manual 6310 provides clear direction on the inappropriateness of considering outside impacts, such as external sights and sounds, to discount the wilderness characteristics inside an area. Unless developments are "pervasive and omnipresent," BLM is obligated to ignore outside impacts when assessing wilderness characteristics for an area. The BLM training module for 6310 provides good context – it shows a photograph of a designated wilderness in southern

California and notes that it was taken from an interstate highway, several feet away from the boundary. The point BLM is making is that to disqualify an area based on adjacent/outside impacts, "it has to be more pervasive and omnipresent than that." (See slide 8 of BLM LWC training module IIE). A wilderness area in every state includes boundaries that are adjacent to well-used roads–evidence to reinforce why the BLM may not employ a higher bar in LWC inventories.

Relevant 6310 policy excerpts include:

> 6310.2(B)(iii)–Naturalness -
> Outside Human Impacts. Human impacts outside the area will not normally be considered in assessing naturalness of an area. If, however, a major outside impact exists, it should be noted in the overall inventory area description and evaluated for its direct effects on the area.
>
> 6310.2(c)(i)(1)–Solitude -
> Only consider the impacts of sights and sounds from outside the inventory area on the opportunity for solitude if these impacts are pervasive and omnipresent.
>
> 6310.3(b)–Boundary Delineation -
> When establishing the boundary, do not create a setback or buffer from the physical edge of the imprint of man.
>
> 6310.2(e)–Boundary Delineation -
> An area can have wilderness characteristics even though every acre within the area may not meet all the criteria. The boundary should be determined largely on the basis of wilderness inventory roads and naturalness rather than being constricted on the basis of opportunity for solitude or primitive and unconfined recreation. The location of boundaries should primarily be set to exclude the unnatural portions of the area.

Since roads are the norm in America today, roadlessness is a rare treasure indeed. While the average road density for non-wilderness BLM lands in the CDCA is 3.09 miles of roads and ways per square-mile, the roadless area, by definition, has a road density of 0 miles within its boundaries.[3] By contrast, the average road density for BLM non-wilderness lands within 5 miles of the LWC is 0.72 miles of roads and ways per square-mile.[4] This roadlessness is obviously good for solitude, primitive recreation and species of plants and wildlife that are sensitive to human disturbance. Visitors to the LWC have over 38.4 square-miles of roadless

---

[3] Ibid.
[4] Ibid.

land to explore. Such a landscape can provide outstanding opportunities for solitude for any reasonable person who seeks it out.

IV. Mule Mountains LWC has supplemental values that would enhance the wilderness experience and should be recognized and protected

As is stated above, the Mule Mountains LWC hosts several species of plants and animals, including the desert tortoise and a plethora of others. The area also has extensive woodlands along its washes. These woodland thickets are a haven for songbirds and other creatures.

These supplemental natural values should be preserved along with the rest of the area's wilderness characteristics.

Summary Conclusion

The forgoing narrative provides new information, including maps and photographs, documenting the fact that the Mule Mountains LWC unit meet wilderness criteria. Our on-the-ground inventory of the roadless lands shows that the area clearly possesses wilderness characteristics. For example, it is:

- Composed of federal public land;
- Near two other large roadless areas;
- Primarily affected by the forces of nature;
- Capable of providing solitude and opportunities for primitive recreation; and
- In possession of supplemental values, including recreational, scientific, cultural and wildlife values.

Taken in the context of the larger California desert landscape that is experiencing pressure from energy development, urbanization, off-road vehicle use and a host of other activities, protecting the LWC will not only provide people with the opportunity to experience this naturally beautiful landscape on its own terms, but it would also help to maintain the ecological integrity of the entire region. The staff and supporters of the CWC believe that the area deserves to be recognized as having WC by the BLM, and we hope that the agency will manage it in such a way as to protect and restore those values.

Waypoint 414: A view east into the LWC unit. Old vehicle routes parallel the main road. These tracks do not meet the definition if a "road." Note the plant life growing in the tracks.

Waypoint 415: A view east into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 416: A view east into the LWC unit. Note that it is primarily affected by the forces of nature. As is noted above, old vehicle tracks parallel the main road. These tracks do not meet the definition of a "road."

Waypoint 418: As is noted above, old vehicle tracks parallel the main road. These tracks do not meet the definition of a "road."

Waypoint 419: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 420: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 422: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 423: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 427: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 430: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 431: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 432: A view north into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 434: A view north into the LWC unit. Note that it is primarily affected by the forces of nature. Also, note the ecologically-significant woodlands that occur in the area.

Waypoint 435: A view north into the LWC unit. Note that it is primarily affected by the forces of nature. The tire tracks shown here are immediately adjacent to the road.

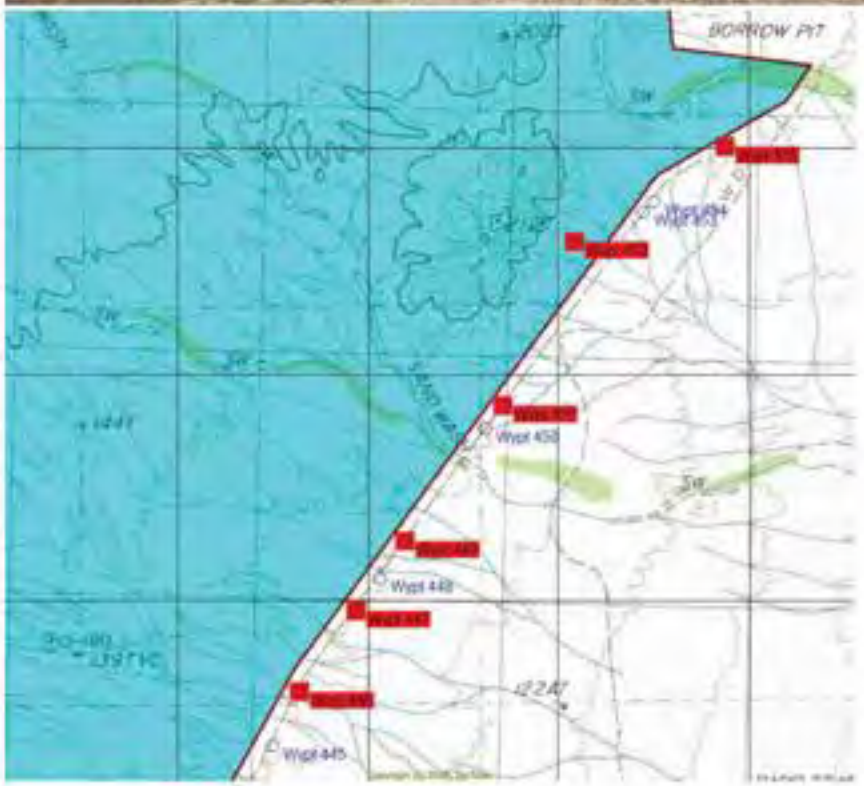
Waypoint 438: A view north into the LWC unit. Note that it is primarily affected by the forces of nature. Also, note the ecologically-significant woodlands that occur in the area.

Waypoint 441: A view northwest into the LWC unit. Note that it is primarily affected by the forces of nature.

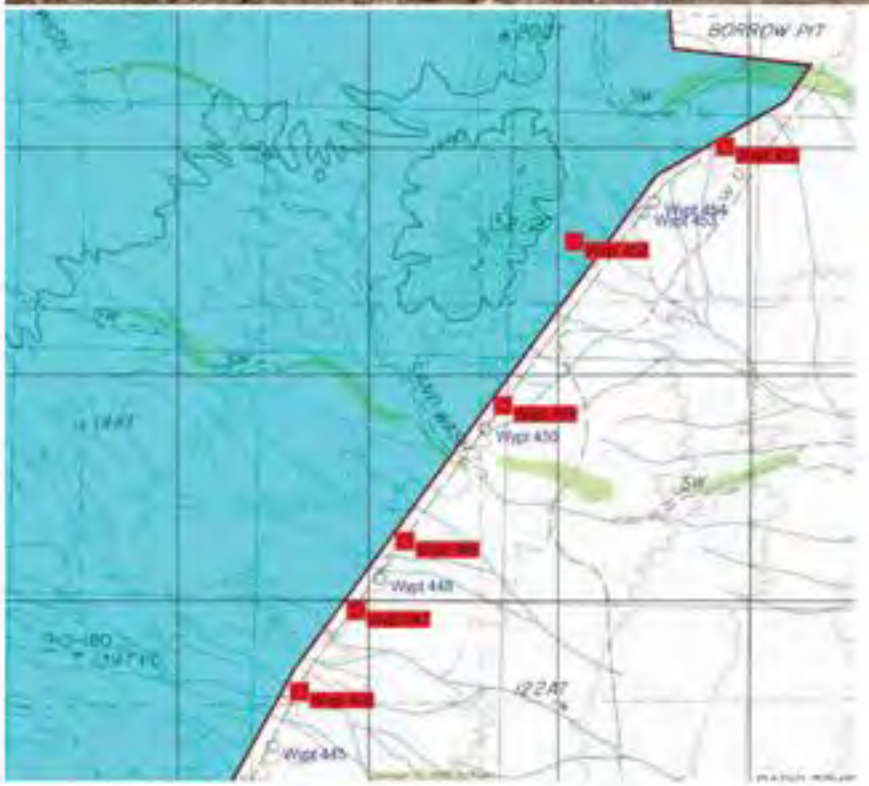
Waypoint 444: A view west into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 446: A view west into the LWC unit. Note that it is primarily affected by the forces of nature. Also, note the ecologically-significant woodlands that occur in the area.

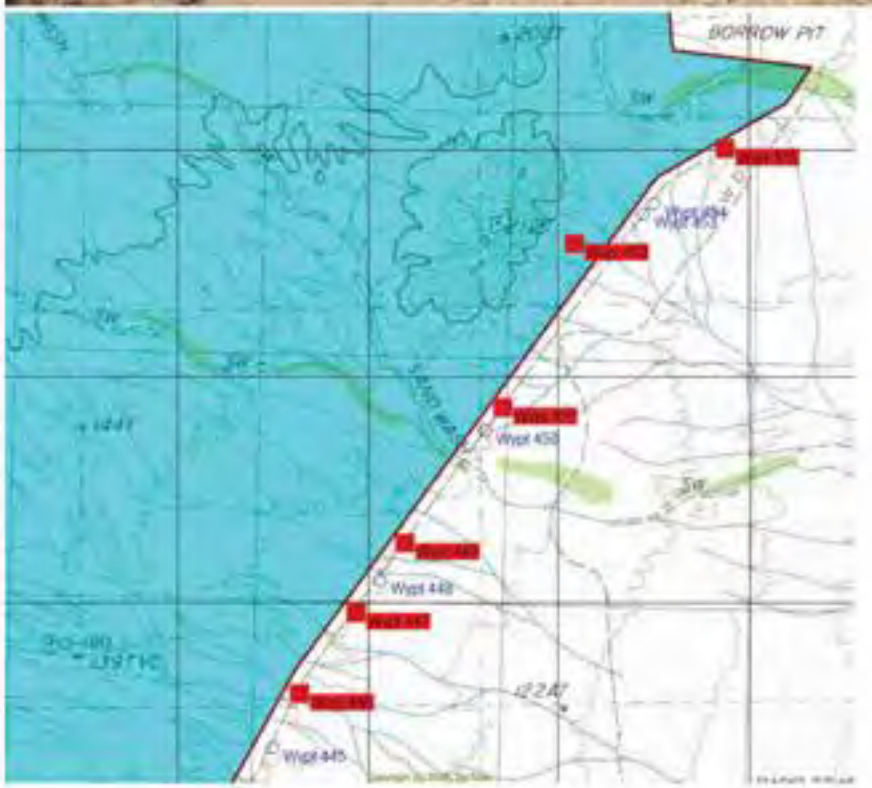
Waypoint 447: A view west into the LWC unit. Note that it is primarily affected by the forces of nature. Also, note the ecologically-significant woodlands that occur in the area.



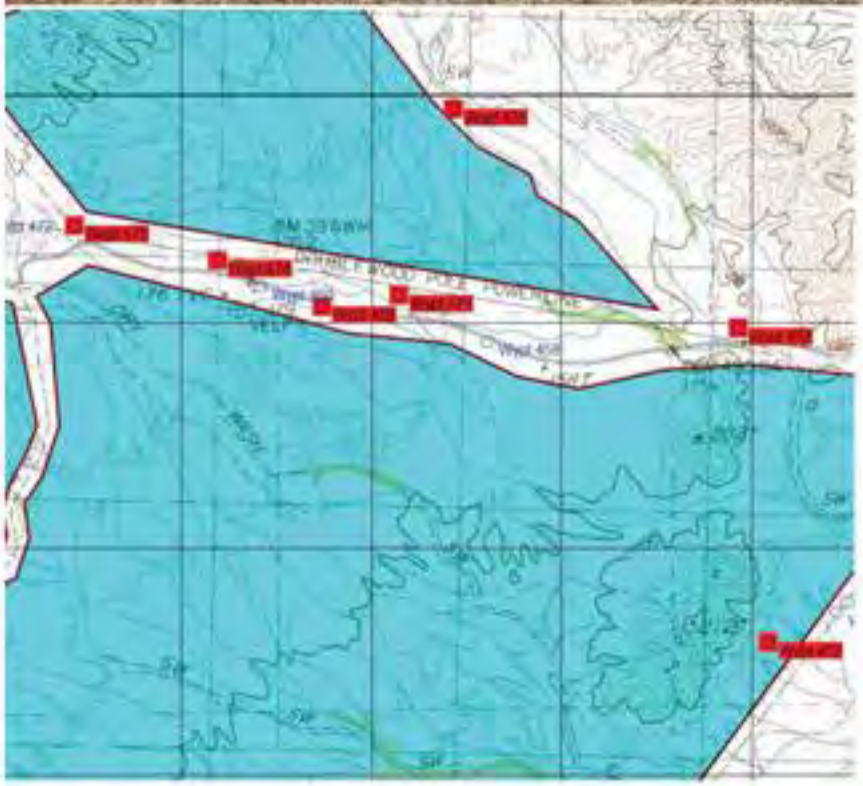
Waypoint 449: The woodlands in the Mule Mountains teem with life, as is shown by these tracks in the sand.



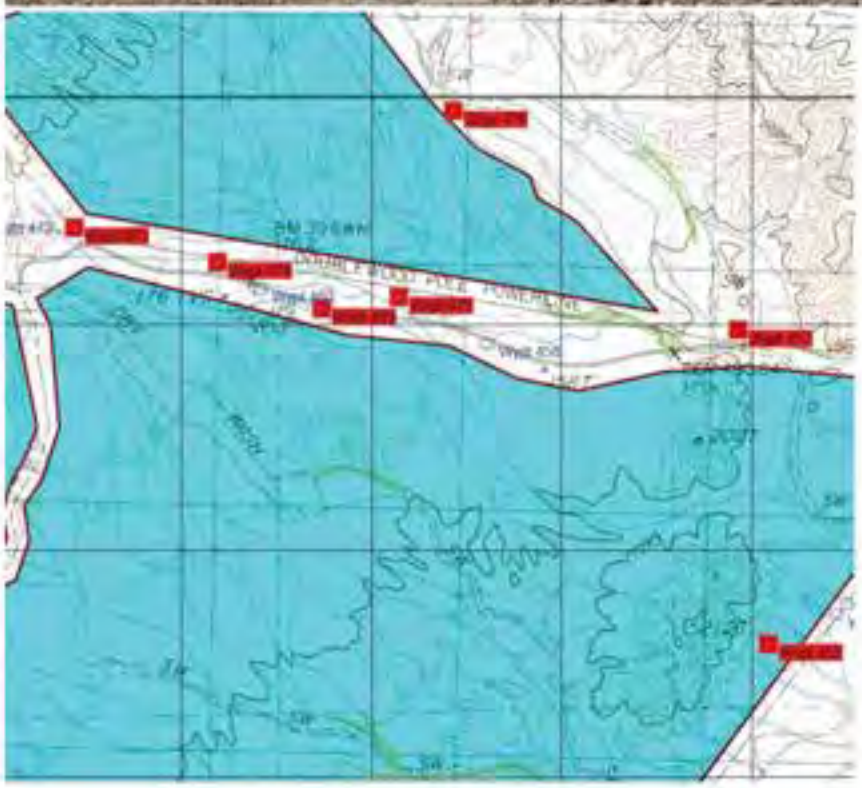
Waypoint 451: A view west into the LWC unit. Note that it is primarily affected by the forces of nature.



Waypoint 452: A view west into the LWC unit. Note that it is primarily affected by the forces of nature.



Waypoint 455: A view west into the LWC unit. Note that it is primarily affected by the forces of nature.



Waypoint 457: A view south into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 459: A view south into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 463: A view south into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 464: A view south into the LWC unit. Note that it is primarily affected by the forces of nature.

Waypoint 439: A view south into the LWC unit. Note that it is primarily affected by the forces of nature.

Attachment 3

Attachment 3 – excerpt from Western Solar Plan Record of Decision (pp. 54-56)

A.4.1.2 Design Features for Specially Designated Areas and Lands with Wilderness Characteristics

The following design features have been identified to avoid, minimize, and/or mitigate potential impacts on specially designated areas and lands with wilderness characteristics from solar energy development identified and discussed in Sections 5.3.1 and 5.3.2 of the Draft and Final Solar PEIS.

A.4.1.2.1 General

LWC1-1 Protection of existing values of specially designated areas and lands with wilderness characteristics shall be evaluated during the environmental analysis for solar energy projects, and the results shall be incorporated into the project planning and design.

(a) Assessing potential impacts on specially designated areas and lands with wilderness characteristics shall include, but is not limited to, the following:

• Identifying specially designated areas and lands with wilderness characteristics in proximity to the proposed projects. In coordination with the BLM, developers shall consult existing land use plans and updated inventories.
• Identifying lands that are within the geographic scope of a proposed solar project that have not been recently inventoried for wilderness characteristics or any lands that have been identified in a citizen's wilderness proposal in order to determine whether they possess wilderness characteristics. Developers shall consider including the wilderness characteristics evaluation as part of the processing of a solar energy ROW application for those lands without a recent wilderness characteristics inventory. All work must be completed in accordance with current BLM policies and procedures.
• Evaluating impacts on specially designated areas and lands with wilderness characteristics as part of the environmental impact analysis for the project and considering options to avoid, minimize, and/or mitigate adverse impacts in coordination with the BLM.

(b) Methods to mitigate unavoidable impacts on specially designated areas and lands with wilderness characteristics may include, but are not limited to, the following:

• Acquiring wilderness inholdings from willing sellers.
• Acquiring private lands from willing sellers adjacent to designated wilderness.
• Acquiring private lands from willing sellers within proposed wilderness or Wilderness Study Areas.
• Acquiring other lands containing important wilderness or related values, such as opportunities for solitude or a primitive, unconfined (type of) recreation.
• Restoring wilderness, for example, modifying routes or other structures that detract from wilderness character.
• Contributing mitigation monies to a "wilderness mitigation bank," if one exists, to fund activities such as the ones described above.
• Enacting management to protect lands with wilderness characteristics in the same field office or region that are not currently being managed to protect wilderness character. Areas that are to be managed to protect wilderness characteristics under this approach must be of sufficient

size to be manageable, which could also include areas adjacent to current WSAs or adjacent to areas currently being managed to protect wilderness characteristics.

A A.4.1.2.2 Site Characterization, Siting and Design, Construction

LWC2-1 Solar facilities shall be sited, designed, and constructed to avoid, minimize, and/or mitigate impacts on the values of specially designated areas and lands with wilderness characteristics.

Hi Miriam,

Please find attached EPA's scoping comments for Crimson Solar. Thank you again for the opportunity to provide our input.

Just let me know if you have any questions.

Thanks again,

Tom

Subject: Scoping comments for the proposed Crimson Solar Project, Riverside County, California

Dear Ms. Liberatore:

The U.S. Environmental Protection Agency (EPA) has reviewed the Federal Register Notice published on March 9, 2018 requesting comments on the Bureau of Land Management's (BLM) decision to prepare a joint Environmental Impact Statement/Environmental Impact Report (DEIS) for the subject project. Our comments are provided pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508) and our NEPA review authority under Section 309 of the Clean Air Act.

EPA serves as a Cooperating Agency for this project and has appreciated the opportunity to highlight our concerns and recommendations to BLM during a March 2016 site visit and the September 2017 pre-application meeting.

EPA continues to support renewable energy resource development. Using renewable energy resources, such as solar power, can help the nation meet its energy requirements without generating greenhouse gas emissions. To assist in the scoping process, we have identified several issues for your attention in the preparation of the EIS:

Purpose and Need
The DEIS should clearly identify the underlying purpose and need for the project and for which alternatives are being proposed (40 CFR 1502.13). When formulating the need, identify and describe the underlying problem, deficiency, or opportunity that the action is meant to address. For example, this section should clearly indicate the factors that are used to evaluate the size of the project, in terms of megawatts and land acreage, in relation to achieving the underlying need. Describe the criteria used to determine the minimum project size that would be considered feasible. The DEIS should discuss the proposed project in the context of the larger energy market that this project would serve; identify potential purchasers of the power produced; and discuss how the project will assist the State, and other potential purchasers of the energy, in meeting their renewable energy portfolio standards and goals.

Alternatives Analysis
A reasonable range of alternatives will include alternative options for avoiding environmental impacts. Reasonable alternatives could include, but are not necessarily limited to, alternative configurations and mountings, alternative capacities, and alternative photovoltaic (PV) and energy storage technologies. The CEQ Regulations for implementing NEPA state that alternatives should include appropriate mitigation measures not already included in the proposed action or alternatives (40 CFR 1502.14(f)). As

part of the development of alternatives, we recommend that BLM consider the latest science that was used to develop the Desert Renewable Energy Conservation Plan (DRECP), as well as any additional recent scientific studies, and consider evaluating an action alternative that would comply with the DRECP Conservation Management Actions (CMA). We recommend that the DEIS include a 'crosswalk' table highlighting how each alternative would meet or not meet the criteria for each CMA. Additionally, a reduced size alternative would allow the developer greater flexibility to avoid any environmentally sensitive areas and should be considered. The DEIS should provide a discussion of the reasons for the elimination of alternatives which are not evaluated in detail.

Water Resources

Water Supply and Water Quality

Estimate the quantity of water the project will require during the construction phase and during operations (cleaning the PV panels during routine maintenance, administration and sanitation uses in offices, etc.). Describe the source of this water and potential effects on other water users. If groundwater will be used, identify the potentially-affected groundwater basin(s) and impacts to groundwater recharge, springs or other surface water bodies, biologic resources, and the potential for subsidence. If water will be supplied from an off-site source, analyze environmental impacts associated with the transport and storage of such an alternative water supply. Identify available technologies to minimize or recycle water, and utilize xeric native plants in any landscaping around buildings. Describe water reliability for the proposed project and clarify how existing and/or proposed sources may be affected by changing precipitation patterns.

Clean Water Act Section 404

It appears, based on the National Wetlands Inventory[1], that there are wetland features in the vicinity of the project location, including riverine and fresh water ponds. Avoidance of wetlands/waters of the U.S is strongly recommended. If avoidance is not possible, we recommend consulting early with the U.S. Army Corps of Engineers (Corps) to determine if the proposed project requires a Section 404 permit under the Clean Water Act. If so, it is advisable to craft the NEPA alternatives consistent with the alternatives analysis required under CWA Section 404 to demonstrate the project's compliance with the CWA Section 404(b)(1) Guidelines. In comparing alternatives, we recommend the discussion include the acreages and channel lengths, habitat types, values, and functions of the waters that would be affected. We recommend including a verified jurisdictional determination from the Corps in the DEIS, as necessary.

Avoiding Desert Washes Regardless of Jurisdiction

In additional to avoiding wetlands and waters of the U.S., we recommend careful micro-siting of project components to avoid ephemeral drainages or desert washes to the maximum extent possible. These waters are being cumulatively impacted by the numerous large-scale solar projects in the desert. Desert washes perform a diversity of hydrologic, biochemical, and geochemical functions that directly affect the integrity and functional condition of higher-order waters downstream. Healthy ephemeral waters with characteristic plant communities control rates of sediment deposition and dissipate the energy associated with flood flows. Ephemeral washes also provide habitat for breeding, shelter, foraging, and movement of wildlife. Many plant populations are dependent on these aquatic ecosystems and adapted to their unique conditions. These values are present regardless of whether the washes are deemed jurisdictional waters of the U.S. under Section 404 of the Clean Water Act.

[1] http://www.fws.gov/wetlands/data/mapper.html

We recommend: 1) avoiding placement of support structures in washes; 2) utilizing existing natural drainage channels on site, such as earthen berms or channels, rather than concrete-lined channels; 3) committing to the use of natural washes, in their present location and natural form, and the avoidance of microphyll woodlands; 4) including adequate natural buffers, for flood control, to the maximum extent practicable and applying the recommended buffer distances, as prescribed by the DRECP CMAs, for the four primary drainages that transect the project site, 5) minimizing the number of road crossings over washes and designing necessary crossings to provide adequate flow-through during storm events, and 6) avoiding complete clearing and grading of the site by evaluating the mounting of PV panels at sufficient height above ground to maintain natural vegetation and reduce impacts to drainages. EPA is concerned about the effect on site hydrology due to changes to the microtopography and the potential for increased erosion and sedimentation, particularly in light of the extensive animal burrow networks on site.

As PV technology improves, less land is needed per megawatt generated. During past solar site visits, we have seen large acreage graded that ultimately was no longer needed to meet the megawatt goals for a project. This land now sits idle, fenced in and may take decades to restore. To avoid a similar outcome, we recommend a mitigation measure or permit condition that would require a phased approach to construction that ensures only the necessary acreage is built upon.

Sizing Stormwater Infrastructure

We recommend that the BLM assess the impacts of changing precipitation patterns on the project. There may be important design considerations needed to accommodate future anticipated effects such as increased intensity and severity of storms, which would require an appropriately-sized stormwater management system.

Desert Biodiversity/Aquatic Resources

Cumulative impacts to biological resources can be substantial in desert habitats. Unless projects establish strict conservation goals for desert aquatic resources, renewable energy production may come at the expense of desert biodiversity. Less than 1% of the vegetation in deserts is riparian (streamside), yet most desert animal species, whether birds, mammals, reptiles or amphibians, rely on riparian habitat for at least part of their life cycle. In arid areas, disturbed vegetation is slow to recover.

We recommend that this project consider feasible methods to avoid grading areas and removing vegetation prior to PV array installation. We support further evaluation of a "low-impact design" that the applicant is considering, in consultation with resource agencies, to avoid and minimize impacts to site hydrology, vegetation and habitat to the greatest extent possible. In particular, we note the challenge this site poses given the extensive network of animal burrows just below the surface throughout the site. We recommend practices that minimize disturbance of desert pavement, preserve habitat, and prevent erosion be incorporated into the project. Vegetation clearing, grading and compaction could result in a disruption of geomorphic process (e.g. sand transportation) essential to the function and integrity of certain desert habitats (e.g. sand dunes). Confirm, in the DEIS, the extent to which MFTL desert dune and non-sand dune habitat will be impacted.

Discuss impacts associated with an increase of shade on vegetation and species in the desert environment, and impacts associated with constructing fences around the project site. Soils under PV arrays are frequently sterilized with pesticides to prevent weed growth, which prevents the natural revegetation of native plants that could minimize erosion and provide wildlife habitat. We encourage wildlife-friendly fencing and the elimination of fencing altogether in the four primary drainages that transect the project site to allow for unimpeded flows during precipitation events.

The DEIS should include assurances that the design of the transmission line would be in compliance with current standards and practices that reduce the potential for raptor fatalities and injuries. The commonly referenced source of such design practices is found within the Avian Power Line Interaction Committee documents: *Suggested Practices for Avian Protection on Power Lines: State of the Art in 2006* manual and *Mitigating Bird Collisions with Power Lines: The State of the Art in 2012*.

Protected Species

The DEIS should identify all petitioned and listed threatened and endangered species and critical habitat that might occur within the project area. The document should identify and quantify which species or critical habitat might be directly or indirectly affected by each alternative. We recommend that the DEIS include a biological assessment, as well as a description of the progress or outcome of consultation with the USFWS under Section 7 of the Endangered Species Act. The DEIS should indicate what measures will be taken to protect important wildlife habitat areas from potential adverse effects of proposed activities.

The DEIS should describe how the corridor width for desert tortoise habitat and connectivity between the project site and the Mule Mountains was determined. A 1.5 mile corridor width for desert tortoise habitat connectivity was prescribed for the Silver State solar project (between the project boundary and the Lucy Gray Mountains) after a much narrower corridor was initially proposed. We suggest drawing on the experiences from that project and discussing, in the DEIS, how conclusions for the Crimson project may or may not differ, in comparison.

Analysis of impacts and mitigation on listed species should include: (1) baseline conditions of habitats and populations of the covered species; (2) a clear description of how avoidance, mitigation and conservation measures will protect and encourage the recovery of the covered species and their habitats in the project area; and (3) monitoring, reporting and adaptive management efforts to ensure species and habitat conservation effectiveness.

Invasive Species

Executive Order (E.O.) 13112, *Invasive Species* (February 3, 1999), mandates that federal agencies, whose actions may affect the status of invasive species, use their relevant authorities to prevent their introduction, provide for their control, and minimize the economic, ecological, and human health impacts that invasive species cause. The DEIS should describe how the project will meet the requirements of E.O. 13112. We recommend including an invasive plant management plan for the monitoring and control noxious weeds.

Air quality

We recommend the DEIS provide a detailed discussion of ambient air conditions (baseline or existing conditions), National Ambient Air Quality Standards (NAAQS) and nonattainment areas, and potential air quality impacts of the project, including cumulative and indirect impacts, for each fully evaluated alternative. Estimate criteria pollutant and greenhouse gas emissions for the construction phase, as well as for the operational phase from maintenance activities and ancillary operations. Construction-related mitigation measures should be considered.

Local significance thresholds for air quality may be exceeded during construction based on past solar project estimates. Given the potential for concurrent construction schedules for Crimson and other proposed projects in the area (e.g. Desert Quartzite, Palen), we recommend that BLM closely coordinate

with the Mojave Desert Air Quality Management District and provide an update on such coordination in the DEIS. Reasonable mitigation measures to reduce fugitive dust should be implemented, for the benefit of localized receptors such as construction workers and nearby residents, and to minimize potential exposure to *Coccidioides immitis* (see Valley Fever comment below).

Valley fever
The project site is located in an area that the Centers for Disease Control has classified as "suspected endemic" for *Coccidioides immitis*, a fungus causing Valley Fever in humans.[2] Ground disturbing activities associated with the proposed action may result in dispersal of *Coccidioides* spores. A discussion of this potential health and safety impact can be included in the DEIS. Measures can be identified to prevent or reduce the risk of exposure to workers and local residents.

Hazardous Waste and Pesticides
The DEIS should address potential direct, indirect and cumulative impacts of waste generation, including hazardous waste, from construction and operation of the solar farm as well as the proposed battery storage facility. The document should identify projected waste types and volumes, including from maintenance vehicles, and identify expected storage, disposal, and management. Identify the applicability of federal hazardous waste requirements. The generation of hazardous waste should be minimized. If PV panel trackers will utilize hazardous materials such as refrigerants, discuss and evaluate potential impacts from accidental or unexpected releases on environmental resources. Alternative tracking methods that minimize hazardous materials use should be evaluated. Identify whether any pesticides, including herbicides or rodenticides, would be used at the project site.

Environmental Justice
DEIS should assess impacts to local communities consistent with Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations* (February 11, 1994). The DEIS should address the potential for disproportionate adverse impacts to minority and low-income populations, and the approaches used to foster public participation by these populations. Assessment of the project's impact on minority and low-income populations should reflect coordination with those affected populations.

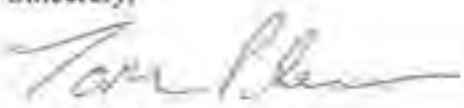
Cultural Resources and Tribal Consultation
The discussion of cultural resources in the DEIS should evaluate how both construction and operation activities may impact such resources, including Native American cultural resources. We recommend that the DEIS document any tribal consultations and any activities or mitigation measures to address any concerns identified by tribal governments.

Cumulative Impacts
Describe the methodology used to assess cumulative impacts. We recommend that the BLM consider the methodology developed jointly by EPA, the Federal Highway Administration, and the California Department of Transportation[3]. While this methodology was developed for transportation projects, the principles and steps in this guidance offer a systematic way to analyze cumulative impacts for any project.

There are currently many solar energy projects in operation, or being proposed and constructed, on public and private lands in the desert southwest. Consider impacts from nearby solar projects (e.g.

[2] See: http://www.cdc.gov/fungal/diseases/coccidioidomycosis/causes.html
[3] Available at: http://www.dot.ca.gov/ser/cumulative_guidance/approach.htm.

Desert Quartzite, Blythe, McCoy, Palen, Blythe Mesa), in addition to other developments in the area, on the resources that would be affected by the proposed project, as well as general resource trends. As mentioned, desert washes, ecosystems and air quality are experiencing cumulative effects from multiple large solar installations in the desert and this is relevant to the cumulative impact assessment.



Mitigation, Monitoring and Enforceability

The EPA recommends the DEIS include specific mitigation measures and a Mitigation Monitoring and Reporting Program. Mitigation measures are generally effective if they contain the following: Why: state the objective of the mitigation measure and why it is recommended; What: Explain the specifics of the mitigation measure and how it will be designed and implemented and identify measurable performance standards by which the success of the mitigation can be determined and provide for contingent mitigation as appropriate if monitoring reveals that the success standards are not satisfied; Who: Identify the agency, organization or individual responsible for implementing the measure; Where: Identify the specific location of the mitigation measure; When: Timing and schedule for implementation.

We recommend that all mitigation measures and the Mitigation Monitoring and Reporting Program be adopted in the ROD and be included as conditions in construction contracts and any other approvals or enforceable agreements (such as final design approval or enforceable terms, conditions and stipulations in the ROW grant), as appropriate, to minimize adverse environmental impacts to the greatest extent possible.

We appreciate the opportunity to provide comments on the preparation of the DEIS. If you have any questions, please contact me at (415) 972-3238 or plenys.thomas@epa.gov.

Sincerely,

Tom Plenys

RE: Scoping Comments on Joint Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR) for the RE Crimson Solar Project and Input on Potential Plan Amendments to the California Desert Conservation Area Plan

Dear Ms. Liberatore and Ms. Rodriguez,

The Desert Tortoise Council (Council) is a non-profit organization comprised of hundreds of professionals and laypersons who share a common concern for wild desert tortoises and a commitment to advancing the public's understanding of desert tortoise species. Established in 1975 to promote conservation of tortoises in the deserts of the southwestern United States and Mexico, the Council routinely provides information to individuals, organizations, and regulatory agencies on matters potentially affecting desert tortoises within their geographic ranges.

Scoping Comments for Crimson Solar Project

We appreciate this opportunity to provide comments on the above-referenced project. Given the location of the proposed project in habitats occupied by Agassiz's desert tortoise (*Gopherus agassizii*), our comments pertain to enhancing protection of this species during activities authorized by Bureau of Land Management (BLM) and California Department of Fish and Wildlife (CDFW). We would also like to thank Ms. Liberatore for providing us with baseline information and maps showing the proposed solar facilities.

1. The Council supports alternatives to reduce the need for additional solar energy projects in the Mojave Desert. That alternative is rooftop solar. The City of Los Angeles has implemented a rooftop solar Feed-in Tariff (FiT) program, the largest of its kind in America. The FiT program enables the owners of large buildings to install solar panels on their roofs, and sell the power they generate back to utilities for distribution into the power grid. This approach puts the generation of electricity where the demand is greatest, in populated areas. It may also reduce transmission costs, the number of affected resources that must be analyzed under the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA), and mitigation costs. The Draft EIS/EIR should include an analysis of where the energy generated by this project would be sent and the needs for energy in those targeted areas that may be satisfied by rooftop solar.

2. We request that an alternative be analyzed in the Draft EIS/EIR where electricity generation via solar energy is located much closer to the areas where the energy use has the greatest demand, including urban/suburban areas. Additionally, BLM's purpose and need statement in the Draft EIS/EIR should be broad enough to encourage solar energy development through the feasible alternatives of rooftop solar as well as better solar farm locations, and not so narrow that it precludes these alternatives.

3. We are very concerned with the placement of this 2,500-acre solar facility in a relatively narrow, five-to-six mile wide corridor located between the Mule Mountains to the south and Interstate 10 to the north. While the footprint of the proposed facility may occupy about half of this corridor that is used by the tortoise and other species of wildlife for connectivity between populations, its placement in the center fragments this corridor and may substantially reduce or destroy its function in the future as a wildlife corridor. We strongly request that the environmental consequences section of the Draft EIS/EIR include a thorough analysis of this indirect effect (40 Code of Federal Regulations 1502.16) and appropriate mitigation to maintain the function of population connectivity for the Agassiz's desert tortoise and other wildlife species.

4. The U.S. Fish and Wildlife Service (USFWS) defines "action area" in 50 Code of Federal Regulations 402.2 and their Desert Tortoise Field Manual (USFWS 2009) as "all areas to be affected directly or indirectly by proposed development and not merely the immediate area involved in the action (50 CFR §402.02)." To facilitate compliance with the Federal Endangered Species Act (FESA) and California Endangered Species Act (CESA), it is imperative that project proponent coordinate early with the USFWS and CDFW to determine what the action area is for this project. We believe the action area must include areas located east and west of the connectivity corridor that would be cut in half if the project is developed as currently proposed. It is necessary that the project proponent perform protocol level surveys (USFWS 2017) that determine tortoise densities and distribution in the USFWS-identified action area. CDFW may require similar or more detailed surveys. The results of this consultation should be included in the Draft EIS/EIR.

5. Given the above concerns, we expect that the Draft EIS/EIR will assess a range of alternative sites including other locations than the one depicted in Figure 1 of the notice. Too often proponents present only one intended location for a particular project, which undermines the

intent of selecting sites that may have minimal environmental impacts compared to the subject property. Please see our comment above about including an alternative that locates energy development in locations close to where it will be used.

6. Although the proposed site is located within a Development Focus Area (DFA) as defined by the Desert Renewable Energy Conservation Plan (DRECP) and Solar Energy Zone (SEZ) as defined by the Programmatic Solar Energy Development Plan (PSEDP), we are nevertheless concerned that the proposed location given in Figure 1 is five to six miles south of Interstate 10 in habitats that are very likely occupied by tortoises and in relatively pristine condition. The Draft EIS/EIR should include: (1) current data on and analysis of the presence and densities of special status species, particularly Agassiz's desert tortoise; (2) habitat quantity and quality in the action area; (3) the functions/viability of the populations in the action area with respect to current conditions and future development scenarios including viability of and connection with adjacent populations; and (4) appropriate actions to fully mitigate these effects to population viability, connectivity, and habitat loss/degradation.

7. There are specific survey protocols for Agassiz's desert tortoise (USFWS 2017), special status plant species (BLM 2009, CDFG 2009), and burrowing owl (CDFW 2012a), among others, that must be implemented to ensure that the Draft EIS/EIR is using reports employing the latest standards from qualified consultants for proposed energy projects that may affect these and other rare species. The literature review for rare species must provide current data including a review of the most recent version of the California Natural Diversity Data Base (CNDDB; CDFW 2018) and an assessment for each species as to their potential occurrence on the subject property.

8. The Draft EIS/EIR, based on the results of the tortoise protocol surveys, must discuss the displacement of tortoises from the impact area. Will these tortoises be relocated into adjacent areas or are they to be translocated into distant areas? The Draft EIS/EIR should present the intended approach to relocating/translocating displaced tortoises. Additionally, there should be an analysis of previous translocation efforts, such as at Fort Irwin National Training Center and more recently at Twentynine Palms Marine Corps Base, to ensure that translocation standards are up-to-date and acceptable to both USFWS and CDFW.

9. It is essential that qualified biologists address the likelihood of occurrence of all special status plant and animal species included in the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO Plan; BLM 2002). Following the literature review, field surveys during appropriate seasons for detection of identified plants and animals must be performed. The Draft EIS/EIR must address how this project fits within the management structure of the NECO Plan, and provide maps of Agassiz's desert tortoise Critical Habitat (USFWS 1994a), Areas of Critical Environmental Concern (ACECs), and other protective management areas designated in the DRECP, such as National Conservation Lands (NCLs).

10. We note that the DRECP (BLM 2016) considers 11 criteria for siting renewable energy facilities. These criteria include selecting lands with (1) disturbed or contaminated lands; (2) less ecologically intact lands; (3) non-critical habitat or non-crucial habitat linkage area; (4) not legislatively or legally protected lands; (5) few focal or covered species dependent upon lands; (6) more fragmented ownership; (7) proximity to transmission lines/grid/local communities needing electricity; (8) not immediately adjacent to residential areas; (9) away from crucial

military or commercial flight areas; (10) not previously acquired for the protection of imperiled species, benefit of military training, or long-term conservation; and (11) minimal impact to currently permitted or authorized uses. The Draft EIS/EIR must evaluate this project for each criterion particularly for Agassiz's desert tortoise and if a majority of the criteria is not met, reject this location for the project.

11. There are a dozen existing, approved, and pending renewable energy projects in the area between Blythe and Desert Center that must be included in the cumulative effects analysis of the Draft EIS/EIR. We also expect that the environmental documents will provide a detailed analysis of the "heat sink" effects of solar development on adjacent desert areas and particularly Agassiz's desert tortoise in addition to climate change. The document should also consider recently developed solar fields where soils have been bladed versus those facilities where the vegetation has been mowed and allowed to revegetate the area. In the latter case, it may be appropriate to allow tortoises to enter into the facilities and re-establish residency under the solar panels as vegetation recolonizes the area. This option should be designed as an experiment to add to the limited data on this approach to determine the extent of effects on Agassiz's desert tortoise populations and movements/connectivity.

12. The Mojave Desert Land Trust (MDLT) has acquired more than 200 parcels in the region that are managed for Agassiz's desert tortoise and other special status species. The management of these parcels is outlined in CDFG (2012b). When Frazier Haney, MDLT's Director of Land Conservation responded to our email on 3/29/2018, he stated, "Although Crimson solar would not directly impact our [MDLT] lands, since it is not directly adjacent or even within a few miles, I do believe there would be indirect effects from additional disturbance causing weeds, predator subsidy, and air quality problems, among the most pressing." As such, the Council expects that the Draft EIS/EIR will address these potential indirect impacts to the management of mitigation parcels by MDLT.

Input on Potential Plan Amendments to the California Desert Conservation Area Plan

In BLM's Notice of Intent for this project, BLM stated that it is seeking public input on any potential plan amendments to the CDCA Plan. We offer the following information in response to that request.

<u>Brief History of Major CDCA Plan Amendments</u>

In 2002, the BLM in California adopted the NECO Plan and the Northern and Eastern Mojave (NEMO) Plan, and in 2006, the West Mojave (WEMO) Plan. These three Plan Amendments to the California Desert Conservation Area (CDCA) Plan (BLM 1980) contained limited on-the-ground management actions for the Mojave desert tortoise. They identified public lands that were similar in size and location to designated Critical Habitat Units (CHUs). BLM's intent for these identified lands, called Desert Wildlife Management Areas (DWMAs) was to maintain much of the existing quantity of habitat for the Mojave desert tortoise while making the DWMAs available for other uses under BLM's multiple use mandate in the Federal Land Policy Management Act (FLPMA). The concept in these Plan Amendments was to reduce the amount of future human activities that resulted in new areas of surface disturbance for new discrete authorized projects that directly or indirectly contributed to tortoise mortality. This concept, while well intended, was without scientific support, and the Plan did not propose to use science to determine if this concept would be successful.

Status of the Populations of the Mojave Desert Tortoise

BLM's implementation of a conservation strategy for the Mojave desert tortoise in the CDCA through implementation of its previous Plan Amendments through 2014 has resulted in the following changes in the status for the tortoise throughout its range and in California from 2004 to 2014 (Table 1; USFWS 2015). There are 17 populations of Mojave desert tortoise described below that occur in the CHUs and Tortoise Conservation Areas (TCAs); 14 are on lands managed by the BLM; 8 of these are in the CDCA.

Table 1. Summary of 10-year trend data for 5 Recovery Units and 17 CHUs/TCAs for Agassiz's desert tortoise (= Mojave desert tortoise). The table includes the area of each Recovery Unit and CHU/TCA, percent of total habitat for each Recovery Unit and CHU/TCA, density (number of breeding adults/km^2 and standard errors = SE), and the percent change in population density between 2004 and 2014. Populations below the viable level of 3.9 breeding individuals/km^2 (10 breeding individuals per mi^2) (assumes a 1:1 sex ratio) and showing a decline from 2004 to 2014 are in red.

Recovery Unit Designated Critical Habitat Unit/Tortoise Conservation Area	Surveyed area (km^2)	% of total habitat area in Recovery Unit & CHU/TCA	2014 density/km^2 (SE)	% 10-year change (2004–2014)
Western Mojave, CA	**6,294**	**24.51**	**2.8 (1.0)**	**–50.7 decline**
Fremont-Kramer	2,347	9.14	2.6 (1.0)	–50.6 decline
Ord-Rodman	852	3.32	3.6 (1.4)	–56.5 decline
Superior-Cronese	3,094	12.05	2.4 (0.9)	–61.5 decline
Colorado Desert, CA	**11,663**	**45.42**	**4.0 (1.4)**	**–36.25 decline**
Chocolate Mtn AGR, CA	713	2.78	7.2 (2.8)	–29.77 decline
Chuckwalla, CA	2,818	10.97	3.3 (1.3)	–37.43 decline
Chemehuevi, CA	3,763	14.65	2.8 (1.1)	–64.70 decline
Fenner, CA	1,782	6.94	4.8 (1.9)	–52.86 decline
Joshua Tree, CA	1,152	4.49	3.7 (1.5)	+178.62 increase
Pinto Mtn, CA	508	1.98	2.4 (1.0)	–60.30 decline
Piute Valley, NV	927	3.61	5.3 (2.1)	+162.36 increase
Northeastern Mojave	**4,160**	**16.2**	**4.5 (1.9)**	**+325.62 increase**
Beaver Dam Slope, NV, UT, AZ	750	2.92	6.2 (2.4)	+370.33 increase
Coyote Spring, NV	960	3.74	4.0 (1.6)	+ 265.06 increase
Gold Butte, NV & AZ	1,607	6.26	2.7 (1.0)	+ 384.37 increase
Mormon Mesa, NV	844	3.29	6.4 (2.5)	+ 217.80 increase
Eastern Mojave, NV & CA	**3,446**	**13.42**	**1.9 (0.7)**	**–67.26 decline**
El Dorado Valley, NV	999	3.89	1.5 (0.6)	–61.14 decline
Ivanpah Valley, CA	2,447	9.53	2.3 (0.9)	–56.05 decline
Upper Virgin River	**115**	**0.45**	**15.3 (6.0)**	**–26.57 decline**
Red Cliffs Desert	115	0.45	15.3 (6.0)	–26.57 decline
Range-wide Area of CHUs - TCAs/Range-wide Change in Population Status	**25,678**	**100.00**		**–32.18 decline**

Important points from this table include the following:

Change in Status for the Mojave Desert Tortoise Range-wide

- Ten of 17 populations of the Mojave desert tortoise declined from 2004 to 2014.

- Eleven of 17 populations of the Mojave desert tortoise are no longer viable. These 11 populations represent 89.7 percent of the range-wide habitat in CHUs/TCAs.

Change in Status for the Mojave Desert Tortoise in California

- Eight of 10 populations of the Mojave desert tortoise in California declined from 29 to 64 percent from 2004 to 2014 with implementation of tortoise conservation measures in the NECO, NEMO, and WEMO Plans.

- Eight of 10 populations of the Mojave desert tortoise in California are no longer viable. These eight populations represent 87.45 percent of the habitat in California that is in CHU/TCAs.

- The two viable population of the Mojave desert tortoise in California are declining. If their rates of decline from 2004 to 2014 continue, these two populations will no longer be viable in about 2020 and 2031.

Change in Status for the Mojave Desert Tortoise on BLM Land in California

- Eight of eight populations of Mojave desert tortoise on lands managed by the BLM in California declined from 2004 to 2014.

- Seven of eight populations of Mojave desert tortoise on lands managed by the BLM in California are no longer viable.

Change in Status for Mojave Desert Tortoise Populations in California that Are Moving toward Meeting Recovery Criteria

- The only population of Mojave desert tortoise in California that is not declining is on land managed by the National Park Service. It increased 178 percent in 10 years.

DRECP Plan Amendment

In 2016, the BLM adopted the DRECP, which is another Plan Amendment, to allow for large-scale renewable energy development in the CDCA. The DRECP had several objectives regarding the management of desert tortoise conservation areas (TCAs, formerly called DWMAs); however, the focus of habitat management was no additional net loss of habitat quantity in the TCAs from the existing conditions. Thus, management actions to improve the status of the Mojave desert tortoise in the 2016 Plan Amendment were similar to those in the 2002 and 2006 CDCA Plan Amendments even though the USFWS' 2015 report documented continuing substantial declines in Mojave desert tortoise population densities in California from applying these management actions.

The Endangered Mojave Desert Tortoise

The Council believes that the Mojave desert tortoise meets the definition of an endangered species. In the FESA, Congress defined an "endangered species" as "any species which is in danger of extinction throughout all or a significant portion of its range…" In the CESA, the California legislature defined an "endangered species" as a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant, which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes (California Fish and Game Code § 2062). Because most of the populations of the Mojave desert tortoise were non-viable in 2014, most are declining, and the threats to the Mojave desert tortoise are numerous and have not been substantially reduced throughout the species' range, the Council believes the Mojave desert tortoise should be designated as an endangered species by the USFWS and CDFW.

Agassiz's desert tortoise is now on the list of the world's most endangered tortoises and freshwater turtles. It is in the top 50 species. The International Union for Conservation of Nature's (IUCN) Species Survival Commission, Tortoise and Freshwater Turtle Specialist Group, now considers Agassiz's desert tortoise to be Critically Endangered (Turtle Conservation Coalition 2018). It is one of three turtle and tortoise species in the United States to be critically endangered.

The summary of data above indicates that BLM's current management actions for the Mojave desert tortoise are inadequate to help recover the desert tortoise. BLM has been ineffective in halting population declines, which has resulted in non-viable populations. The Council believes that these management actions are inadequate in preventing the extirpation of the Mojave desert tortoise in California.

Federal Land Policy and Management Act

In 1976, Congress passed the FLPMA and established the CDCA Plan "to provide for the immediate and future protection and administration of the public lands in the California desert within the framework of a program of multiple uses and sustained yield, and the maintenance of environmental quality." Congress further declared "the California desert environment is a total ecosystem that is extremely fragile, easily scarred, and slowly healed; the use of all California desert resources [including rare and endangered species of wildlife, plants, and fishes] can and should be provided for in a multiple use and sustained yield management plan to conserve these resources for future generations…"

Congress wrote a lengthy definition of "multiple use" for the management of public lands and their various resource values. The definition included "… the use of some land for less than all of the resources; a combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and non-renewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land and the quality of the environment with consideration being given to the relative values of the resources and not necessarily to the combination of uses that will give the greatest economic return or the greatest unit output."

Congress defined "sustained yield" as the achievement and maintenance in perpetuity of a high-level annual or regular periodic output of the various renewable resources of the public lands consistent with multiple use. The Mojave desert tortoise and its habitats are renewable resources.

The definition of "environmental quality" is a set of properties and characteristics of the environment, either generalized or local, as they impinge on human beings and other organisms. It is a measure of the condition of an environment relative to the requirements of one or more species and or to any human need or purpose. Thus, BLM must consider the quality or condition of the environment of the Mojave desert tortoise with respect to the species' requirements for persistence and must maintain this habitat quality.

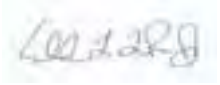
The Council believes that BLM's management of the Mojave desert tortoise and its habitats in California is not in compliance with FLPMA or the purposes for establishing the CDCA. The large number of non-viable populations and downward trend in population densities for the Mojave desert tortoise in the CDCA are the data that confirm non-compliance with the "immediate and future protection of public lands," "conserving resources for future generations," and definitions of multiple use, sustained yield, and environmental quality.

Section 7(a)(1) of the Endangered Species Act

Section 7(a)(1) of the Endangered Species Act states that all federal agencies "…shall… utilize their authorities in furtherance of the purposes of this Act by carrying out programs for the conservation of endangered species and threatened species listed pursuant to Section 4 of this Act." In Section 3 of the ESA, "conserve," "conserving," and "conservation" mean "to use and the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to this Act are no longer necessary. Such methods and procedures include, but are not limited to, all activities associated with scientific resources management such as research, census, law enforcement, habitat acquisition…"

The Council believes that the data above demonstrate that BLM's management of the Mojave desert tortoise and its habitat under the CDCA Plan and Plan Amendments has not been effective in meeting BLM's Section 7(a)(1) mandate of carrying out programs for its conservation. To meet its Section 7(a)(1) responsibilities, the BLM needs to adopt and implement the management actions of the one population of the Mojave desert tortoise in California that is increasing. This population is managed by the National Park Service. The NPS' land management practices are closer to managing areas of land as reserves, which is what the 1994 Recovery Plan (USFWS 1994b) described as part of the recovery strategy for the Mojave desert tortoise. While BLM designated DWMAs as one part of the recovery strategy, it did not implement the other parts of the recovery strategy. According to the Recovery Plan, DWMAs were to be managed as reserves; that is, they were areas of land to keep, save, preserve, or protect. BLM did not identify and implement needed recovery actions within each DWMA to manage the DWMAs as protected areas for the Mojave desert tortoise.

Request for Plan Amendment



The Council believes that the BLM should prepare, adopt, and implement a Plan Amendment to revise the management of the Mojave desert tortoise and desert tortoise habitat in the CHUs/TCAs for the following reasons:

- Most or all of the Mojave desert tortoise populations in the CDCA are below the level of viable populations and are declining;
- the Mojave desert tortoise in the CDCA represents a significant portion of the range of the species;
- the Mojave desert tortoise meets the definition of endangered under both FESA and CESA and should be managed as an endangered species even though the USFWS and CDFW's have not officially updated its status;
- the declining numbers and densities and large percentage of non-viable populations of Mojave desert tortoise in California indicate that planning and management actions by the BLM have been ineffective in halting the decline of the tortoise and degradation of its habitat;
- BLM has responsibilities under FLPMA regarding the CDCA and its management for "immediate and future protection of public lands," "conserving resources for future generations," and definitions of multiple use, sustained yield, and environmental quality; and
- BLM has section 7(a)(1) responsibilities under FESA and needs to comply with these under the FESA.

For these reasons, the Council formally requests that BLM propose a Plan Amendment to the CDCA Plan that will result in increases in population densities and quickly reverse the non-viable status of tortoise populations in the CDCA. Such a Plan Amendment must be scientifically based in its determination of appropriate and effective management actions, implementation of these management actions, monitoring of their effectiveness and compliance, and implementing adaptive management. This action must be implemented as soon as possible to prevent the extirpation of the Mojave desert tortoise in California. The Council is available to help the BLM in its development of such a Plan Amendment.

We appreciate this opportunity to provide input and trust that our comments will further protect tortoises during authorized project activities. Herein, we ask that the Desert Tortoise Council be identified as an Affected Interest for this and all other BLM projects that may affect species of desert tortoises, and that any subsequent environmental documentation for this particular project is provided to us at the contact information listed above.

Regards,

Edward L. LaRue, Jr., M.S.
Desert Tortoise Council, Ecosystems Advisory Committee, Chairperson

Subject: Scoping comments on the Crimson Solar Project (CACA 051967)

Basin and Range Watch is a 501(c)(3) non-profit working to conserve the deserts of Nevada and California and to educate the public about the diversity of life, culture, and history of the ecosystems and wild lands of the desert. Federal and many state agencies are seeking to open up millions of acres of unspoiled habitat and public land in our region to energy development. Our goal is to identify the problems of energy sprawl and find solutions that will preserve our natural ecosystems, open spaces, and quality of life for local communities. We support energy efficiency, better rooftop solar policy, and distributed generation/storage alternatives, as well as local, state and national planning for wise energy and land use following

the principles of conservation biology. We have visited the site of the proposed Crimson Solar Project.

Western Watersheds Project is a nonprofit environmental conservation group dedicated to protecting and restoring watersheds and wildlife throughout western public lands.

We support solar energy and renewable energy in order to offset the dangerous trends of increasing greenhouse gas emissions. But we have comments on how to better site these utility-scale projects in the places that minimizes impacts to natural and cultural resources of the deserts, analyze alternatives that would avoid impacts to natural communities and sensitive species.

Disorganized Scoping Process

The scoping Notice of Intent for the Crimson Solar Project was released on March 9, 2018 and one meeting was scheduled for April 3rd in Palm Springs. But the Bureau of Land Management (BLM) said the comment deadline was April 9th. As BLM is aware, they are required to accept comments two weeks after the last scoping meeting. BLM later scheduled two additional scoping meetings, the last on April 12th which would have made the comment deadline April 26th. But BLM has a PowerPoint presentation posted on the BLM website saying the comments will be accepted on the 23rd. This is not correct. Plus, the presentation is difficult to locate and BLM never corrected some of their pages that say the comment deadline was extended. The pages still list April 9th as the deadline. Most people will not have the patience or knowledge to know the comment has been extended. BLM refused to post this information after 4 requests from us. BLM should extend this comment period for two more weeks to compensate for the disorganized announcements.

Purpose and Need

The Crimson Solar Project would develop 2,700 acres of Colorado Desert habitat. The project will have impacts on sand transport, Mojave fringe-toed lizards, microphyll woodlands, cultural landscapes, archeology sites, air quality, public health and access and visual resources.

The Purpose and Need Statement should include a need to protect cultural, biological, hydrological, visual, and air quality. The Purpose and Need Statement should also include a need to protect the resources on this site and in Chuckwalla Valley by examining Distributed Generation and Brownfield alternatives.

Any Bureau of Land Management Purpose and Need Statement should not interpret the following orders to justify the project. These orders do not have to apply to the region:

Executive Order 13212 mandates transmission of energy in a *"safe and environmentally sound manner"*. But as we have seen from past approved BLM projects, large environmental

issues have created problems for wildlife, visual resources, cultural resources and many of the projects such as the Ivanpah Solar Electric Generating System Project have not delivered the promised capacity from the developer. Some photovoltaic projects are now curtailed to alleviate an over- generation problem from an the build-out of large-scale solar energy. The environmental impacts need to be considered more strongly, and conservation made a priority.

Secretarial Order 3285A1 is from 2010 and establishes the development of renewable energy as a priority for the Department of Interior (DOI), but it never says how much of that goal has been fulfilled since 2010. Thousands of megawatts of renewable energy have already been built on public lands. This order also does not specifically say that the location of the Crimson Project is required to meet this goal.

The Memorandum of Understanding between California and the DOI is for California Orders AB32 and SBX2. AB 32 requires California to reduce its GHG emissions to 1990 levels by 2020. These orders do not require the renewable energy to come from the Crimson site or even from public lands in general. These goals could be fulfilled with built environment alternatives and brownfield alternatives.

Competitive Processes, Terms and Conditions for Leasing Public Lands for Solar and Wind Energy Development – While this is for all public lands, it was really designed for Solar Energy Zones and similar designations. The Crimson Solar Project application is an old one from Sonoran West Solar Holdings LLC and predates the Western Solar Plan and there are no requirements for the BLM to approve a project based on these orders.

We request that the Purpose and Need statement be rewritten to emphasize BLM's commitments to protect valuable resources on public lands. A solar project of this size cannot avoid impacts to important resources.

The project is home to **BLM Sensitive Species**. The Mojave fringe-toed lizard and the Harwood's milkvetch are two BLM Sensitive Species. The BLM is required to protect BLM Sensitive Species as defined in BLM Manual 6840 (Special Status Species Management). The objectives of the BLM sensitive species policy are twofold, as follows:

> *1. To conserve or recover species listed under the Endangered Species Act of 1973 (ESA; 16 USC, Section 1531 et seq.), as amended, and the ecosystems on which they depend so that ESA protections are no longer needed for these species;*
>
> *2. To initiate proactive conservation measures that reduce or eliminate threats to BLM sensitive species to minimize the likelihood of and need for listing of these species under the ESA.*

The Crimson Solar Project site also will potentially impact species protected under the **Endangered Species Act**. These species include the Desert tortoise and the Yuma clapper rail. The BLM has a commitment to follow guideline of the Endangered Species Act. Signed into law

in 1973, *the original goal of the Endangered Species Act (ESA) was to preserve and recover key domestic species from the brink of extinction.*

Resources on the site are also protected by the **Archeological Resources Protection Act of 1979**. This statute (16 U.S.C. 470aa-470mm; Public Law 96-95 and amendments to it) was enacted:

> *...to secure, for the present and future benefit of the American people, the protection of archaeological resources and sites which are on public lands and Indian lands, and to foster increased cooperation and exchange of information between governmental authorities, the professional archaeological community, and private individuals.*

The **Migratory Bird Treaty Act of 1918** was an *Establishment of a Federal prohibition, unless permitted by regulations, to "pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird, included in the terms of this Convention . . . for the protection of migratory birds . . . or any part, nest, or egg of any such bird." (16 U.S.C. 703)*

Land Use Plan/ The California Desert Conservation Area: The lands lie within the California Desert Conservation Area legislated under the Federal Land and Policy Management Act (FLPMA). The region is designated as Class M which is designated for a *"controlled balance between higher intensity use and protection"* A variety of uses are listed in this class and the problem is that designating up to 6 square miles as a Right of Way for ONLY solar energy is inconsistent with Class M (Moderate Use) designation. The solar project would be more appropriate on lands with Class I (Intensive Use) designation – that is "lands managed for concentrated use to meet human needs".

The Council on Environmental Quality recently issued guidelines on August 1st, 2016 that urges Federal Agencies to consider the **impact of a proposed project on climate change**. The memorandum urges federal agencies to consider the project's GHG emissions. This should be factored in as the "construction carbon footprint." The amount of C02 sequestration lost in bulldozing the site for construction should also be considered. How much caliche and organic matter will be removed? Please calculate the amount of C02 released by all of this construction using the guidance document.[1]

---

1 https://www.whitehouse.gov/sites/whitehouse.gov/files/documents/nepa_final_ghg_guidance.pdf

The Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) is a landscape-scale, multi-agency planning effort that protects and conserves natural resources while simultaneously balancing human uses of the California portion of the Sonoran Desert ecosystem. The plan is another layer of California desert conservation and all conservation designations should be reviewed and included in the Crimson Solar Project review.

The Desert Renewable Energy Conservation Plan (DRECP) was approved in 2016 and is now under review again from the current administration. While the project lies in a Development Focus Area, the application predates the DRECP. The region is under no requirement to see this development under the DRECP.

Alternatives

The BLM can justify a No Action Alternative simply by examining the need by utilities for additional utility scale solar projects on public lands. The BLM should also examine the feasibility and problems with a plan to integrate 350 megawatts of battery storage on site.

The Draft Environmental Impact Statement should consider an alternative that utilizes degraded brownfields and distributed generation. Under the National Environmental Policy Act, agencies are required to consider alternatives outside of their jurisdiction. A no large-scale energy alternative can be justified with the California Energy Efficiency Strategic Plan (CEESP). This plan already exists as California state law and it can be fully implemented now.[2] It is a state plan that prioritizes implementing rooftop solar and energy efficiency prior to developing large-scale, remote solar and wind projects.

The Overgeneration Problem in California Due to Large-scale Solar Projects

The Need for this project is questionable, as it adds a large cumulative impact to grid congestion in California. The state is currently experiencing a worsening glut of solar power at peak times on the transmission grid system, as measured by the California Independent System Operator.[3] This has been shown as the Duck Curve, where renewable energy generation exceeds demand in the middle of the day, then causes the need to ramp up generation at the end of the day after the sun sets with inefficient natural gas peaker plants. At times, as much as 13,000 MW is needed in 3 hours in the evening hours, as solar projects go offline at night.

The National Renewable Energy Laboratory (NREL) examined the problem (Denholm et al. 2015, p. 8): "NREL has also examined higher renewable penetration scenarios in California using PLEXOS with a Western Interconnection database derived from the Western Electricity Coordinating Council (WECC) Transmission Expansion Policy Planning Committee (TEPPC), with additional modification based on the LTPP database (Brinkman et al. 2015). The NREL study examined cases where California achieves greater than 50% reduction in electric sector carbon dioxide emissions by 2030 with a variety of renewable energy technologies and flexibility

---

[2] www.basinandrangewatch.org/DRECP-CEESP-Alternative.html

[3] https://www.caiso.com/documents/flexibleresourceshelprenewables_fastfacts.pdf

assumptions, such as increased export limits and reduced minimum local generation requirements. Total annual curtailment estimates range from 0.2% (with a balanced portfolio in a more flexible grid) to almost 10% (with a high-solar portfolio in a less flexible grid)."

In other words, increased curtailment of solar projects (shutting them off during peak times) is likely under higher penetration of photovoltaics onto the California grid, despite storage options.

With increasing penetration of photovoltaic solar energy onto the grid, will instability problems be alleviated with battery storage?

Can an on-site battery storage project alleviate this problem? How many megawatt-hours of storage will these batteries provide?

Would the battery facility need to be cooled? How much energy would be required to do so? This is a hot desert with summer temperatures reaching 118 degrees F at times. How will this heat affect battery efficiency?

To conserve habitat, the BLM should consider a No Action Alternative based on local small-scale distributed battery technology in urban centers. Battery storage is making advances for smaller-scale solar energy and would not require such a large facility that would need cooling. Batteries will create a waste/recycling issue as well and the BLM should be asking if batteries will be recycled.

Environmental Consequences

Biological Resources

Avian Mortality/Lake Effect

There are some updated numbers that confirm there are significant numbers of bird mortalities found at solar projects. Photovoltaic project companies are turning in many of these numbers. Since the projects are very large, these numbers only likely represent a smaller percentage of what is actually taking place.

Updated information about avian-solar interactions by US Fish and Wildlife Service shows this is a concern. Solar projects can have significant impacts to sensitive species, and those listed under the federal Endangered Species Act.

Data reported and gathered from seven solar projects in the southern California desert and arid grassland habitats from 2012 through April 2016 show that 183 bird species have been killed at solar projects, a number that rises with new information. 3,545 individual birds were reported dead at solar projects, from a mix of incidental finds and systematic surveys (Dietsch 2016). This is likely an underestimate.

Birds that are of concern have been found dead at solar projects, and may be impacted by the Crimson Solar Project, including these Birds of Conservation Concern:

- Federal Endangered/Threatened – Yuma Ridgeway's (Clapper) rail (*Rallus obsoletus obsoletus*), Willow flycatcher (*Empidonax traillii*), and Yellow-billed cuckoo (*Coccyzus americanus*).
- Birds of Conservation Concern – Western grebe (*Aechmophorus occidentalis*), Horned grebe (*Podiceps auritus*), Eared grebe (*P. nigricollis*), American white pelican (*Pelecanus erythrorhynchos*), Burrowing owl (*Athene cunicularia*), and Calliope hummingbird (*Selasphorus calliope*).

Each of these Birds of Conservation Concern has been found in or in the vicinity of Chuckwalla Valley as migrants, permanent residents (in the case of the burrowing owl). Polarized light may attract birds to photovoltaic solar projects as they mistake the panels for water. US Fish and Wildlife Service says many of these birds of conservation concern may be at risk. A dead Blue-footed booby was even found on one of the solar projects south of the Salton Sea in Imperial Valley. For photovoltaic projects, avian mortality is caused by collision and possibly dehydration.

Because the proposed Crimson Solar Project would be situated in a significant location for migrating birds in the Pacific Flyway, we believe that the cumulative impacts that the project will cause along with other solar projects in the region would not be worth the approval of the project.

Desert Kit Fox

Desert kit fox (*Vulpes macrotis*) saw an outbreak of K9 distemper, possibly due to the poor mitigation for the Genesis Solar Project, which is located about 10 miles west of the proposed Crimson Solar Project in Chuckwalla Valley. This should be considered as a major potential impact from developing an energy project here.

Desert Bighorn Sheep and Burro Deer Wildlife Linkage

According to the Fish and Wildlife Service, the area is bordered on the west by the Chuckwalla ACEC, on the south by the Palo Verde Wilderness, and on the north by the Palen-McCoy Wilderness. Current management in the area includes the Mule Mountain Wildlife Habitat Management Area (WHMA) and Bighorn Sheep WHMAs under the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) and the Mule Mountain ACEC, a cultural resources ACEC. [4]

4

https://www.fws.gov/carlsbad/PalmSprings/DRECP/Appendix%20L_Bureau%20of%20Land%20Management%20Worksheets/Appendix%20L_BLM%20Worksheets%20-%20ACEC_Part5_5.pdf

The area contains wildlife linkage habitat between the Chuckwalla ACEC/ Palo Verde Wilderness and the Palen-McCoy Wilderness. The California Department of Fish and Game has identified the area as being critical for burro deer (*Odocoileus hemionus eremicus*) connectivity in eastern Riverside County.

Under the Northern and Eastern Colorado Desert Coordinated Management Plan the region is currently managed as a Bighorn Sheep Wildlife Habitat Management Area (WHMA) and as the Mule Mountain WHMA.

Special Status animal species

Within the Mule Mountain ACEC include Couch's spadefoot toad (*Scaphiopus couchii*), Mojave fringe-toed lizard (*Uma scoparia*), chuckwalla (*Sauromalus ater*), Townsend's big-eared bat (*Corynorhinus townsendii*), pallid bat (*Antrozous pallidus*), pocketed free-tailed bat (*Nyctinomops femorosaccus*), cave myotis (*Myotis velifer*), occult little brown bat (*Myotis lucifugus occultus*), California leaf-nosed bat (*Macrotus californicus*), fringed myotis (*Myotis thysanodes*), prairie falcon (*Falco mexicanus*), mountain plover (*Charadrius montanus*), Gila woodpecker (*Melanerpes uropygialis*), yellow warbler (*Setophaga petechia*), rosy boa (*Lichanura trivirgata*), Leconte's thrasher (*Toxostoma lecontei*), Yuma mountain lion (*Felis concolor browni),* burro deer, bighorn sheep (*Ovis canadensis nelsoni*), desert tortoise (*Gopherus agassizii*), and Colorado Valley wood rat (*Neotoma albigula venusta*).

The Mule Mountains are known to contain major bat colonies including a maternity roost for California leaf-nosed bats.

Desert tortoise

Desert tortoise are present on the site, especially on the south side up near the Mule Mountains. The project will impact individual animals as well as connectivity habitat.

Mojave fringe-toed lizard

A corridor of sand south of Interstate 10 is the eastern extension of the Palen-Ford sand transport corridor and is Mojave fringe-toed Lizard habitat. The north part of the project site contains the fine-grained sand habitat for this species. Development of the project will have direct impacts to the species as well as disrupt sand transport corridors. A cumulative analysis should be prepared for the impacts of this project as well as for all the other projects being built in the region. About 100 Mojave fringe-toed lizards were killed for the Devers Palo Verde Transmission Project in the region.

Microphyll Woodlands

Southern portions of the proposed project area contain extensive significant microphyll woodland and known habitat for several rare species including the California State Endangered Gila woodpecker. Microphyll woodland is a NECO sensitive plant community. The Draft EIS should consider impacts the California State Endangered Gila woodpecker and the Endangered elf owl (*Micrathene whitneyi*).

Visual Resources

The project will be visible from the Mule Mountains ACEC and the McCoy Mountains Wilderness Area. It will also be visible from residential areas. Due to the immense size of the project, impacts to VRM Class I and 2I standards should be analyzed in the Draft EIS.

VRM Class I Objective: To preserve the existing character of the landscape. Allowed Level of Change: This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention.

VRM Class II Objective: To retain the existing character of the landscape. Allowed Level of Change: The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.

East Riverside Solar Energy Zone/Development Focus Area

While this zone has been approved, BLM did a poor job on analyzing the region in the Solar Programmatic Environmental Impact Statement and Desert Renewable Energy Conservation Plan. The Crimson Solar Project should be reviewed with a full 90 day Environmental Impact Statement.

Socio-Economics/Environmental Justice

How will the project impact property values and quality of life of adjacent residents in Mesa Verde? Will the dust impact their health? Will the project hurt property values? A full analysis of the negative impacts this project would have on the community should be prepared.

Cultural Resources

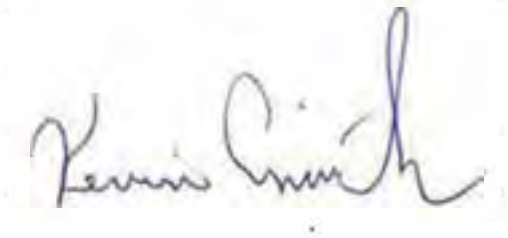
The project would be located adjacent to the Mule Mountain Area of Critical Environmental Concern which was designated to protect cultural resources. The visual impacts of the project should be evaluated as a threat to the "cultural landscape" of the region.

The Mule-McCoy Linkage area has shown to be rich in cultural resources. Transportation and trade trails follow the bases of the mountains and branch out across the valley floors

interconnecting the mountain range routes. Out in the valley center where wind-blown sand moves across the flats, these trails lose their physical visage but remain marked by their artifact scatters, such as pot drops (ceramic sherd scatters), lithic scatters, rock features, and isolated groundstone artifacts. Cremation sites are often revealed as dune sands move about. Desert Pavement features are extremely stable and preserve artifacts *in situ* for thousands of years.

Nearly all of the sites recorded in the area as prehistoric have been described as having potential for subsurface manifestation. In addition to their individual research potential properties, the distribution of many of these sites in conjunction with other prehistoric sites recorded between Desert Center and Blythe may provide links between vestiges of the Coco-Maricopa trail system as well as clues to activities associated with transportation along that route. As such, these sites could be considered as part of a complex archaeological district that would include evidence of trade, travel, interaction among the several cultural groups associated with the area (Cahuilla, Chemehuevi, Mojave, Serrano), resource use along travel routes, seasonality of habitation, and trail spurs between the primary coastal-interior route and the springs and associated rock art sites in the bordering mountain ranges.

Nextera's mitigation for cultural resources destruction for the Genesis Project has had extreme shortcomings. The project destroyed an entire archaeological village site on Ford Dry Lake. Preliminary surveys were apparently inadequate to detect this.

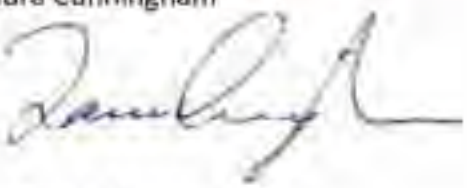


The BLM will need to consult with the Cahuilla, Chemehuevi, Mojave, and Serrano nations to address their concerns. Many of these people feel the entire region is a "cultural site" including the view-scape, the water and the biological resources.

Conclusion

Please select a No Action/No Project Alternative for this project. It will add to the cumulative impacts that so many of these large-scale projects have caused in the region. There are several, more environmentally friendly alternatives to this kind of development in our deserts.

Sincerely,



Kevin Emmerich

Abstract

In 2013, the California Independent System Operator published the "duck chart," which shows a significant drop in mid-day net load on a spring day as solar photovoltaics (PV) are added to the system. The chart raises concerns that the conventional power system will be unable to accommodate the ramp rate and range needed to fully utilize solar energy, particularly on days characterized by the duck shape. This could result in "overgeneration" and curtailed renewable energy, increasing its costs and reducing its environmental benefits. This paper explores the duck chart in detail, examining how much PV might need to be curtailed if additional grid flexibility measures are not taken, and how curtailment rates can be decreased by changing grid operational practices. It finds that under business-as-usual types of assumptions and corresponding levels of grid flexibility in California, solar penetrations as low as 20% of annual energy could lead to marginal curtailment rates that exceed 30%. However, by allowing (or requiring) distributed PV and storage (including new installations that are part of the California storage mandate) to provide grid services, system flexibility could be greatly enhanced. Doing so could significantly reduce curtailment and allow much greater penetration of variable generation resources in achieving a 50% renewable portfolio standard. Overall, the work described in this paper points to the need to fully integrate distributed resources into grid system planning and operations to allow maximum use of the solar resource.

1 Introduction

In 2013, the California Independent System Operator (CAISO) published a chart showing the potential for "overgeneration" occurring at increased penetration of solar photovoltaics (PV).[1] The "duck chart"[2] shows the potential for PV to provide more energy than can be used by the system, especially considering the host of technical and institutional constraints on power system operation.

During overgeneration conditions, the supply of power could exceed demand, and without intervention, generators and certain motors connected to the grid would increase rotational speed, which can cause damage. To avoid this, system operators carefully balance supply with demand, increasing and reducing output from the conventional generation fleet.[3] The overgeneration risk occurs when conventional dispatchable resources cannot be backed down further to accommodate the supply of variable generation (VG). Overgeneration has a relatively simple technical solution, often referred to as curtailment. Curtailment occurs when a system operator decreases the output from a wind or PV plant below what it would normally produce. For wind, this is performed by changing the energy captured from the wind (by changing the blade pitch angle) (Aho et al. 2012). For solar, generation is curtailed by either reducing output from the inverter or disconnecting the plant altogether. This of course requires a plant or system operator to have physical control of the generation resource, which is typically available for large renewable power plants but uncommon for smaller systems, particularly distributed or rooftop systems. While curtailment is technically easy, it has the obvious undesirable trait of reducing the economic and environmental benefits of VG. Each unit of VG curtailed represents a unit of energy not sold on to the grid and a unit of fossil fuel not avoided. As the amount of curtailment increases, the overall benefits of additional solar may drop to the point where additional installations are not worth the cost (Cochran et al. 2015).

Neither the potential for overgeneration, nor the resulting curtailment of variable generation resources is a new concern (Bird et al. 2014). However, the significant attention paid to the duck chart signals an important change in attitude toward integration of variable generation (VG). The duck chart represents perhaps the first major acknowledgement by a system operator that solar energy is no longer a niche technology (at least in California) and that curtailment will be a significant issue in the not-too-distant future. The chart has also raised general awareness of the issues associated with renewable curtailment and system flexibility.

The duck chart is largely illustrative in nature, representing only one day of the year, and it does not quantify the actual curtailment that may occur at increased penetration of solar energy. Nor does the chart reflect the impact of mitigation options.

In this work, we examine how the duck chart shape illustrates potential overgeneration risks in California at increased penetration of PV. We first review previous analyses of the impact of PV

[1] https://www.caiso.com/Documents/FlexibleResourcesHelpRenewables_FastFacts.pdf
[2] The name is derived from its resemblance to the profile of a duck.
[3] Throughout this document, we use the term system operator to refer to the balancing area authorities responsible for balancing supply and demand through generator scheduling and dispatch. In California, the largest of these is the CAISO, but there are several other system operators, including Los Angeles Department of Water and Power, Imperial Irrigation District, Balancing Authority of Northern California, and Turlock Irrigation District.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

on load in California and potential PV curtailment at increased penetration. We then use a production cost model to quantify the amount of overgeneration that can result from the increased PV without measures to increase system flexibility. Finally, we show how the duck shape can be accommodated with different measures to increase flexibility—including flexibility that is provided by the PV itself under appropriate market rules—and how overgeneration risks can be dramatically reduced by introducing multiple flexibility measures.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

2 Background: Why Ducks Lead to Overgeneration

The CAISO duck chart itself illustrates the general challenge of accommodating solar energy and the potential for overgeneration and solar curtailment. In the chart, each line represents the net load, equal to the normal load minus wind and PV generation. The "belly" of the duck represents the period of lowest net load, where PV generation is at a maximum. The belly grows as PV installations increase between 2012 and 2020. While the amount of PV in 2020 is not shown directly, it can be estimated by comparing the 2012 curve to the 2020 curve. In this case, the normal load (i.e., no PV and adjustments for load growth) at about 1-2 p.m. on March 31, 2020 appears to be about 22,000 megawatts (MW), while PV is generating about 10,000 MW, leaving about 12,000 MW to be met with other resources. In this case, PV provides perhaps 45% of the total demand in this one hour. The duck chart also points to the period of overgeneration risk, which could result in curtailed energy.

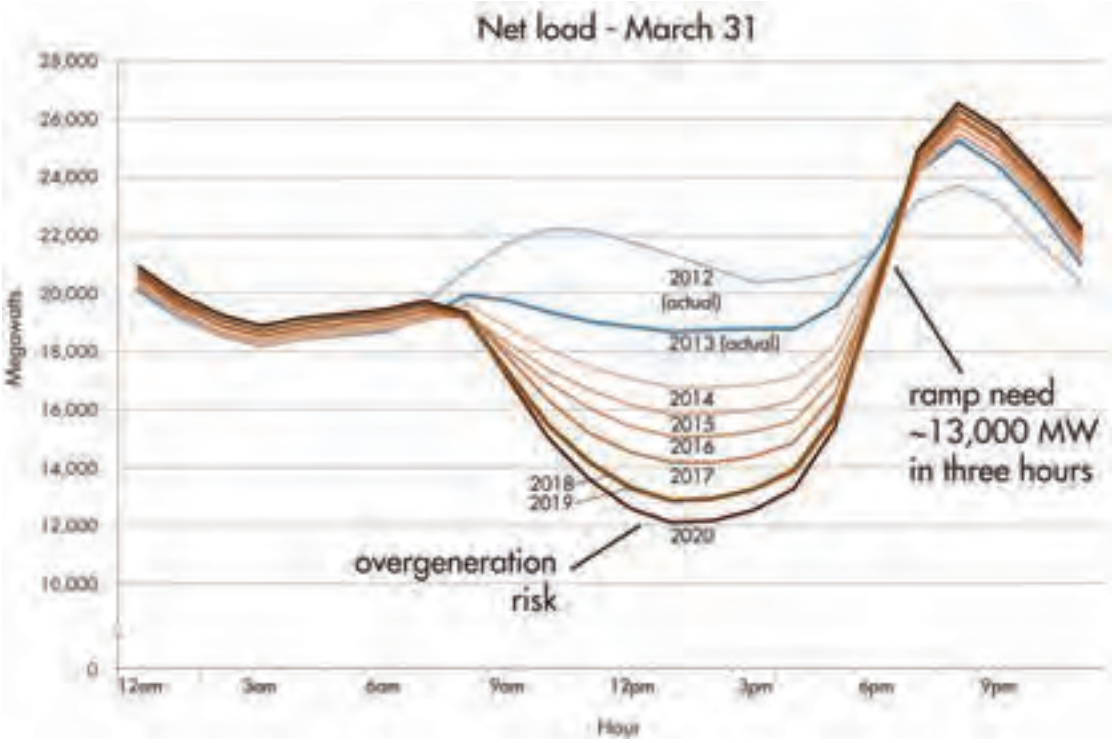

Figure 1. The CAISO duck chart

Source: CAISO 2013

The CAISO duck chart document does not explicitly quantify the amount of expected curtailment during this period, but it describes two main causes:

> The first occurs as the ISO [independent system operator] prepares to meet the upcoming upward ramps [using conventional generation] that occur in the morning and in the late afternoon. The existing fleet includes many long-start resources that need time to come on line before they can support upcoming ramps.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

> Therefore, they must produce at some minimum power output levels in times when this electricity is not needed.[4]

The second source of overgeneration and curtailment "occurs when output from any non-dispatchable/must-take resource further increases supply in times of low electricity need, typically in the nighttime hours. Historically, this condition was most likely to occur in the early morning hours when low demand combines with electricity and generation brought on line to prepare for the morning ramp." This second challenge includes the need to accommodate output of all generation resources such as wind and hydro, and plants that produce heat and electricity. Overgeneration can also result from "must-run" plants that are needed for local voltage support and reliability issues, and also from a number of institutional constraints, such as long-term contracts and self-scheduling from certain power plants (GE Energy 2015; Bouillon 2014).

Combined, these issues create an operational challenge which can be described as the "minimum generation" problem which represents the technical and economic limits of thermal and hydro power plants to reduce output or turn off, especially during relatively short periods, such as the few hours of peak solar output. Other factors can produce curtailed VG, including transmission constraints, and at increased penetration of VG, conventional generators that must be online to maintain system stability. (This latter issue is discussed in Section 6).

Because of the economic challenges posed by curtailment, it becomes important to examine how much curtailment may occur, as well as methods to reduce curtailment. The ability to accommodate VG is largely determined by the flexibility of the power grid, and flexibility can be changed over time. Examining the relationship between system flexibility and curtailment can help determine the potential contribution of solar to meeting the energy requirements of a region such as California.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

3 Previous Analysis of the California Duck and Estimates of Overgeneration

There are a number of discussions of the California duck chart, and several estimates of curtailment that may result in California from increased penetration of PV. Several of these discussions are part of larger planning and integration studies that consider broader impacts of VG on the system (e.g., system economic and environmental benefits), areas of operational challenges (e.g., additional reserve requirements), and integration costs. Integration studies, along with general grid planning studies use grid-simulation tools that model the operation of the entire generation fleet (Sterling et al. 2013). These have a number of names, including "production cost" and "security-constrained unit commitment and economic dispatch" models (Denholm et al. 2014).[5]

We use the term production cost model (PCM) to represent the class of models that simulate the chronological operation of the power grid, determining which power plants to commit and dispatch during each time interval on the basis of forecasted fuel costs, heat rates and other operational characteristics. In each time interval, the model selects the least-cost mix of generators needed to meet load while maintaining adequate reserves to meet contingency events and other reserve requirements. Such models typically simulate the grid for one year of operation in 8,760 one-hour time steps. PCMs calculate the total cost of system operation, including cost of fuel and cost of operation and maintenance.[6] To model the grid realistically, these tools require extensive databases of generator properties, transmission capacity, and system operational requirements, such as reserve requirements. In theory, a properly designed and implemented PCM simulation should produce results (such as generator dispatch, emissions, and total production costs) close to the dispatch resulting from the market operations or dispatch software used by independent system operators or balancing areas to actually control the grid. However, PCMs cannot completely simulate market environments because they typically do not capture self-scheduling, bilateral contracts, scarcity pricing, bidding strategies, and other factors that can alter system dispatch from the "least-cost" dispatch produced by a model.

An early attempt to model the increased penetration of PV in California using a production cost model is Denholm et al. (2008). This work uses the PROSYM PCM and demonstrates a "proto-duck" chart showing a deep drop in mid-day net demand (Figure 2) that is similar to that in the CAISO duck chart. The net load during this two-day period is from slightly later in the spring (May 6–7), and with the higher solar output, represents the lowest net load of any point during the year. Despite the lower net load and higher ramp range compared to the CAISO duck chart, this analysis did not demonstrate any significant overgeneration or PV curtailment. This is due to a variety of favorable assumptions, including "frictionless" exchange of energy with the surrounding regions without restrictions other than the thermal limits of the transmission network. At the highest level of penetration, nearly half of the incremental PV generation in

[5] Various entities, including independent system operators use these models to simulate system operations for planning purposes. However these are a number of differences between how these models work and the market management software used for actual unit commitment and dispatch. An example is the generation of the commitment and dispatch "stack" (or merit order). Production cost models use plant-level estimates of variable costs while ISO operations use market bids from individual generators

[6] Production cost models only consider the variable costs of operating the system. Fixed costs (capital costs, fixed O&M) are not considered.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

California is displacing out-of-state generation. In addition, while the model did include standard generator parameters (e.g., minimum generation and start-time constraints), it did not consider any institutional, contractual, or local reliability constraints that may exist within California.

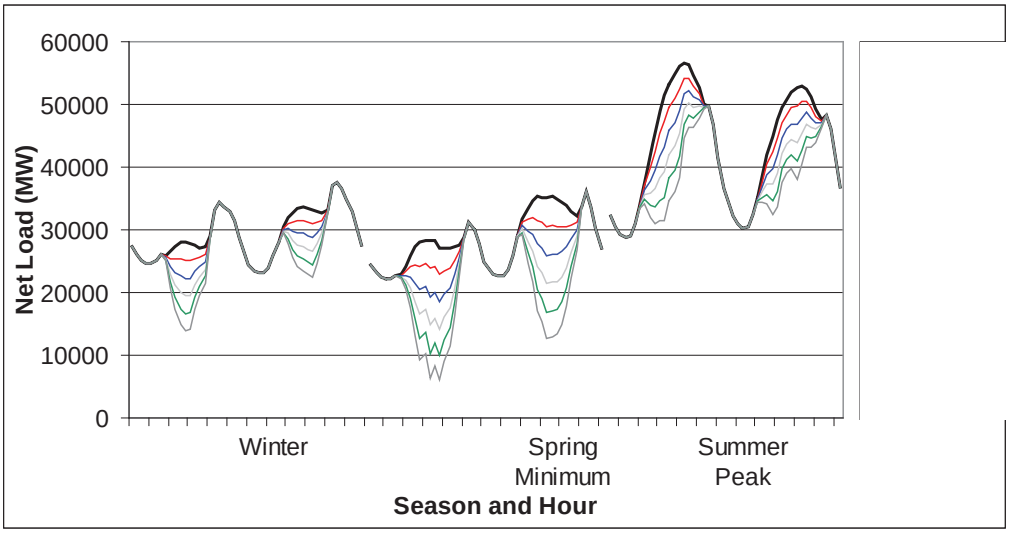

Figure 2. "Proto-duck" chart of California net load with increased penetration of PV

Source: Denholm et al. 2008

The 2013 duck chart and much of the concern regarding overgeneration originates with a series of studies published by the CAISO (CAISO 2010, 2011a, and 2011b, Liu 2014a, 2014b and 2014c) and by emergence of negative prices in the CAISO market driven in part by growth in wind generation (CAISO 2012). The CAISO studies have examined the impacts of an increasing renewable portfolio standard (RPS) starting with 20%, increasing to 33%, and then 40%, and they have demonstrated increasing levels of overgeneration risk. These studies use the PLEXOS production cost model, which is one of several commercially available grid simulation tools. CAISO produces and maintains a database for this model as part of the Long-Term Procurement Plan (LTPP).[7] This database includes generator-level details of California's electricity sector as well the rest of the Western Interconnection. The CAISO has made its PLEXOS databases publicly available, and in addition to California utility studies (Mao and Galjanic 2014), several non-utility research groups have used them directly or in modified forms to analyze sensitivities to various assumptions. Table 1 summarizes several of the previous analyses using some form of the LTPP model.

Southern California Edison	Mao and Galjanic 2014	Operational flexibility and flexible capacity requirements
Union of Concerned Scientists	Nelson 2014, Nelson and Wisland 2015	Multiple aspects of VG integration including options to minimize overgeneration

Several of the studies listed in Table 1 have identified the impact of various individual technologies on the duck chart shape of net load. For example, Jorgenson et al. (2014) examined the impact of two different solar technologies on imports into CAISO under increased VG penetration, as illustrated in Figure 3.

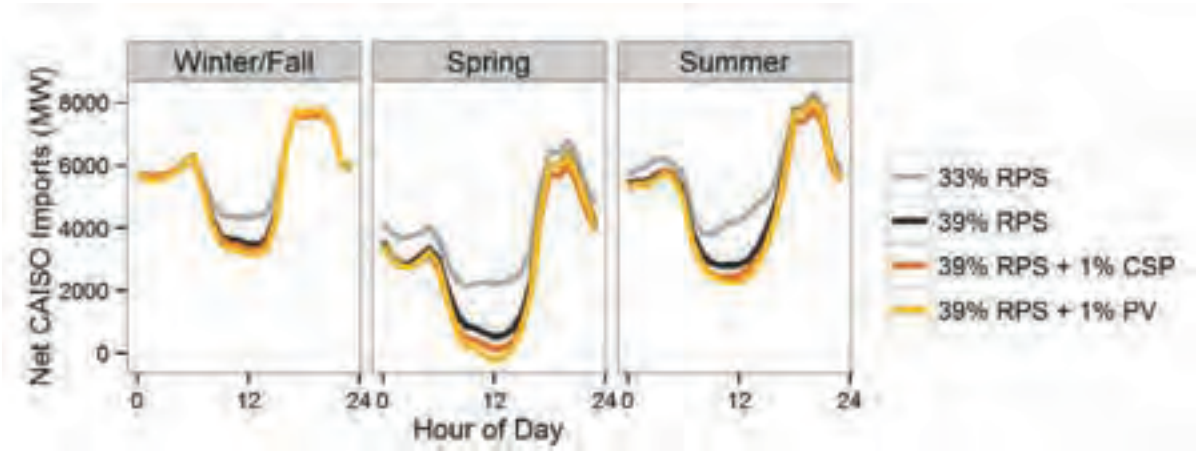

Figure 3. Example of an analysis of the impact of concentrating solar power (CSP) on the duck chart shape

Source: Jorgenson et al. 2014

Other groups have used the versions of the LTPP database to examine how increased grid flexibility could be used to minimize curtailment and enable higher levels of renewable penetration. For example, the Union of Concerned Scientists modified the LTPP database to simulate how increased flexibility could substantially reduce overgeneration risk in 40% and 50% RPS scenarios (Nelson 2014; Nelson and Wisland 2015).

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

Figure 4 illustrates an example from a 50% RPS scenario, where increasing the amount of "non-fossil" sources of flexibility—including demand response, storage, provision of reserves from renewables[8], and exports—reduced curtailments by more than 75% compared to a base "inflexible" scenario and by 63% compared to a flexible gas scenario (Nelson and Wisland 2015). This figure shows an example day where adding flexibility options, including providing reserves with non-conventional resources, can reduce the minimum generation needed from hydro and gas generation, thereby reducing renewable curtailments.

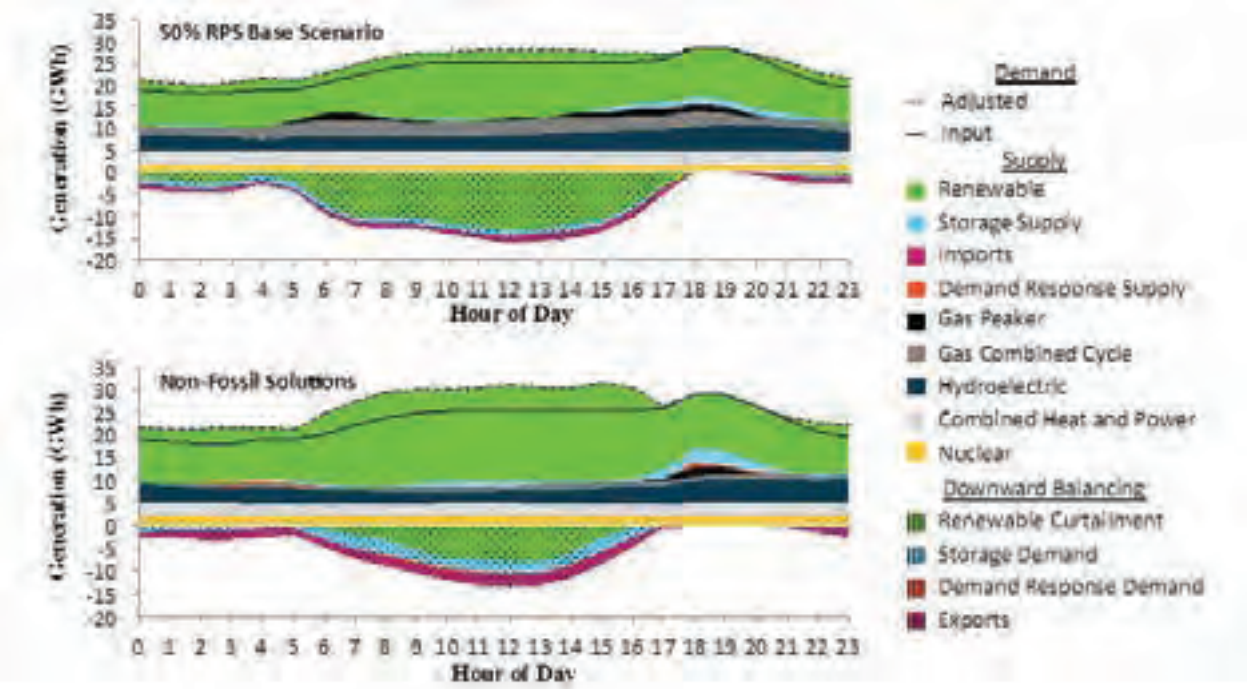

Figure 4. Example of the impact of changing system flexibility on demand shape and curtailment from an analysis by the Union of Concerned Scientists

(modified from Nelson and Wisland 2015)

Similarly, NREL has also examined higher renewable penetration scenarios in California using PLEXOS with a Western Interconnection database derived from the Western Electricity Coordinating Council (WECC) Transmission Expansion Policy Planning Committee (TEPPC), with additional modification based on the LTPP database (Brinkman et al. 2015). The NREL study examined cases where California achieves greater than 50% reduction in electric sector carbon dioxide emissions by 2030 with a variety of renewable energy technologies and flexibility assumptions, such as increased export limits and reduced minimum local generation requirements. Total annual curtailment estimates range from 0.2% (with a balanced portfolio in a more flexible grid) to almost 10% (with a high-solar portfolio in a less flexible grid).

Other modeling tools have been applied to examine the impact of PV on overgeneration in California. A study by Energy & Environmental Economics (E3 2014) using the ProMaxLT production cost model examined RPS levels higher than the previous CAISO studies. It

[8] Reserves from renewables, as discussed in later sections, involves using curtailed VG energy to provide upward reserve capacity, which is traditionally provided by partially loaded conventional generation.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

identified a significant increase in solar curtailment, particularly when mitigation options are not deployed. In one 50% RPS scenario evaluated (with PV penetration equal to about 26%), about 8.9% of available RPS energy is curtailed. The E3 study also observed that at the point that PV achieves this high level of penetration, the marginal curtailment (reflecting the curtailment rate of the last unit of PV added to the system) is as high as 65%. Figure 5 provides an example from the E3 study showing a duck-shaped chart with a significant hump representing overgeneration.

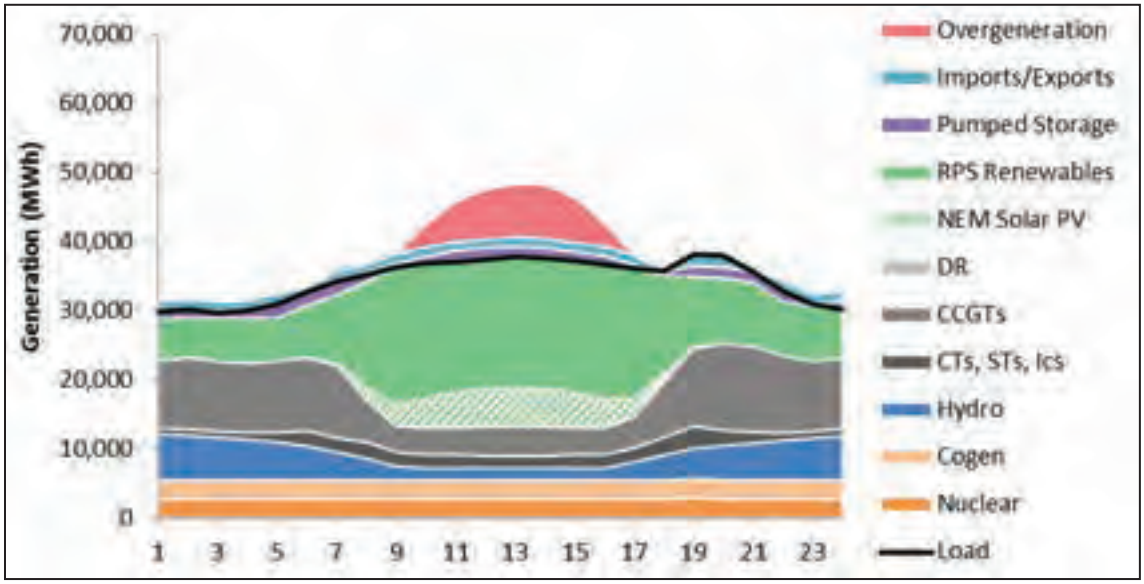

Figure 5. Example of an analysis of the impact of high VG on net load shape and resulting overgeneration

Source: E3 2014

This list includes only studies that have used commercial production cost models; however several other studies demonstrate the challenges associated with PV overgeneration in California. These include a study by Mills and Wiser (2012) that examines the overall decrease in value of PV as a function of penetration including the impacts of overgeneration, and a follow-on analysis that examines the impact of mitigation strategies including energy storage and demand response that effectively change the net load shape (Mills and Wiser 2014).

Finally, an extensive discussion of the duck chart shape and mitigation approaches is provided by Lazar (2014). While the analysis does not perform detailed operational simulations or estimate curtailment, it does provide a conceptual framework for changing the duck chart shape and flattening the net load through a total of 10 strategies including multiple types of energy storage and load shifting/demand response. An example of the analysis is provided in Figure 6, where the original duck shape is “streamlined” with the likely result of decreasing overgeneration and increasing the ability to integrate greater amounts of PV. Other discussions of mitigation options include Lew et al. (2015).

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

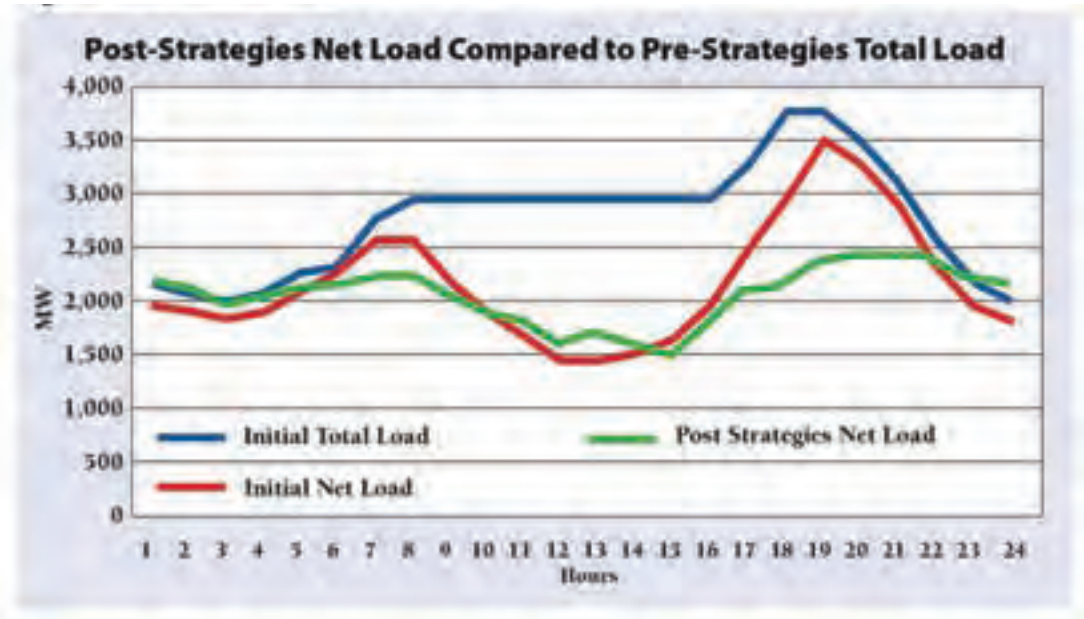

Figure 6. Example of an analysis of how the duck curve shape can be modified to minimize overgeneration

Source: Lazar 2014

It should also be noted that the impact of PV on net load and corresponding overgeneration risk have been studied in other parts of the United States, including Texas (Denholm and Margolis 2007), the entire Western Interconnection (GE 2010; Lew et al. 2013), and the Eastern United States (Bloom et al. 2015).

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

4 Study Methods and Data

The goal of this study is to explore the duck curve in detail and identify the overgeneration and curtailment challenges associated specifically with increased deployment of solar energy in the California system. The study uses the PLEXOS production cost model[9] to simulate grid operation with as more PV is added. It examines curtailment and considers how curtailment may change with alternative operational practices and technology deployment scenarios. The modeling framework and methods in this study are derived from the California 2030 Low Carbon Grid Study (Brinkman et al. 2015). The dataset for the analysis is based on a combination of the WECC TEPPC 2024 Common Case and the CAISO 2014 LTPP PLEXOS dataset. This dataset represents the power system in the entire Western Interconnection, while representing the California power system (transmission and generation) in more detail. Hurdle rates are included in the model based on the WECC 2024 Common Case to represent friction between balancing authorities. The analysis and results in this document represent all of California, including CAISO and the municipal utilities in California that are not part of CAISO.

The renewable generation is based on profiles developed for the Western Wind and Solar Integration Study and refined for Phase 2 of that study (Lew et al. 2012). The analysis performed hourly unit commitment and dispatch for 1 full year of simulation; however, sub-hourly renewable profiles were used to generate the day-ahead reserve requirements for up regulation and upward flexibility reserves.[10]

We begin by considering a scenario where wind provides about 11% of California's electricity. This represents a modest growth; in 2013, California generated 12.7 terawatt-hours (TWh) from wind in-state and imported another 12.7 TWh of wind for a total of 25.4 TWh, which provides about 8.6% of the total demand (296.6 TWh).[11] We also assume a total of about 1,900 MW of concentrating solar power (CSP), which provides about 1.5% of total demand. Most of this CSP capacity does not have thermal storage, so it is considered a variable generation resource for this analysis. Other qualifying renewables (geothermal, biomass, and small hydro) provide about 13.6% of total demand. As a result, our initial (base) scenario represents a renewable potential of about 36%, not including large hydro. To this base system, we incrementally add PV to analyze the progression of the duck chart shape and the resulting overgeneration, considering various changes to grid operation and conditions that can effect the net load shape. Table 2 summarizes the scenarios analyzed including renewable potential (before curtailment), and reserve requirements.

[9] Plexos V6.4 R01 x64 using the Xpress-MP 26.01.04 solver with a MIP relative gap of 0.5%

[10] Following Brinkman et al. (2015), we do not enforce a downward reserve constraint, under the assumption that downward reserves can easily be provided by curtailing renewable energy generation during times when downward reserves are called. This assumption needs further analysis considering the actual curtailment that would result when using renewables for down reserves.

5 Results: Base "Most Conservative" Case

We begin with an exploration of PV curtailment in a case with a set of conservative assumptions about power system operation based on a "2015 grid" without enhanced grid flexibility. These assumptions include:

- Wind and solar cannot provide upward reserves.
- No net exports of electricity from California are allowed and at least 70% of California owned or contracted generation (including Hoover, Palo Verde and certain renewable generation) from outside of the state must be imported.[12]
- Up to about 1.3% of peak demand (as much as about 900 MW during periods of peak demand) can be shifted via economic demand response programs.[13]
- No new storage is installed beyond what is in service in 2015.[14]
- Twenty-five percent of all generation within certain zones must be met with local thermal or hydro generation.[15]
- Diablo Canyon remains online as a baseload (non-dispatchable) generator. The plant does not contribute to the 25% local generation requirement.[16]
- Instantaneous penetration of VG (including PV, wind, and CSP without thermal energy storage) is limited to 60% of the normal load.

It should be noted that the CAISO does not include the 60% penetration limit in their formulation of the LTPP model; this limit is based on concerns stated in the CAISO duck chart fact sheet, indicating that at 60% penetration:

> the grid may not be able to prevent frequency decline following the loss of a large conventional generator or transmission asset. This situation arises because renewable generators are not currently required to include automated frequency response capability and are operated at full output (they can not increase power). Without this automated capability, the system becomes increasingly exposed to blackouts when generation or transmission outages occur.[17]

[12] Following Brinkman et al. (2015) we allow non-imported VG to meet the California renewable requirement through the purchases of unbundled renewable energy credits (RECs). In the very high penetration cases described in the results, up to about 2% of renewable energy is not directly imported and acquired through RECs.
[13] This value is about equal to the existing "price response" demand response available from the three investor-owned utilities in CAISO, as reported in the "Demand Response Monthly Reports" at (www.cpuc.ca.gov/PUC/energy/Demand+Response/Monthly+Reports/2015_DR.htm).
[14] The impact of storage mandated by California State Assembly Bill 2514 is discussed in the Section 6.
[15] In the database from which this study is derived (the Low Carbon Grid Study from Brinkman et al. 2015), the zones that require the 25% local generation limit are SDGE, SCE, PG&E (Valley Zone), and LADWP, which account for 77% of all California load. For additional analysis of the impact of the local generation requirement, see Nelson (2014) and Brinkman et al. (2015).
[16] This is a conservative assumption based on the fact that nuclear power plants typically do not vary load to provide operating reserves.
[17] https://www.caiso.com/Documents/FlexibleResourcesHelpRenewables_FastFacts.pdf

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

We added this limit to our base case explicitly to examine its impact and the importance of changing grid operations to allow greater penetration of VG at any moment in time.
The combination of constraints on system operations can result in significant overgeneration, particularly in the spring. Figures 7–11 demonstrate the drivers behind overgeneration and PV curtailment in greater detail. Figure 7 shows the normal load, wind, and solar (combined PV and CSP) profiles in a scenario with the potential to meet 11% of annual demand from wind and 11% of the annual demand from solar (9.5% from PV and 1.5% from CSP). This figure is for March 29, which is two days before the CAISO duck chart but actually the "worst" day in terms of PV-driven overgeneration for the load and PV demand patterns for this particularly meteorological year across all of California. (Because of the relatively low load, the potential generation from VG on this day is about 18% from solar and 16% from wind.) The figure also shows the resulting net load that would need to be met by the remaining generation fleet, assuming all solar and wind generation could be used. In this example, the new minimum load point (of about 7,700 MW) is shifted from 4 a.m. to noon.

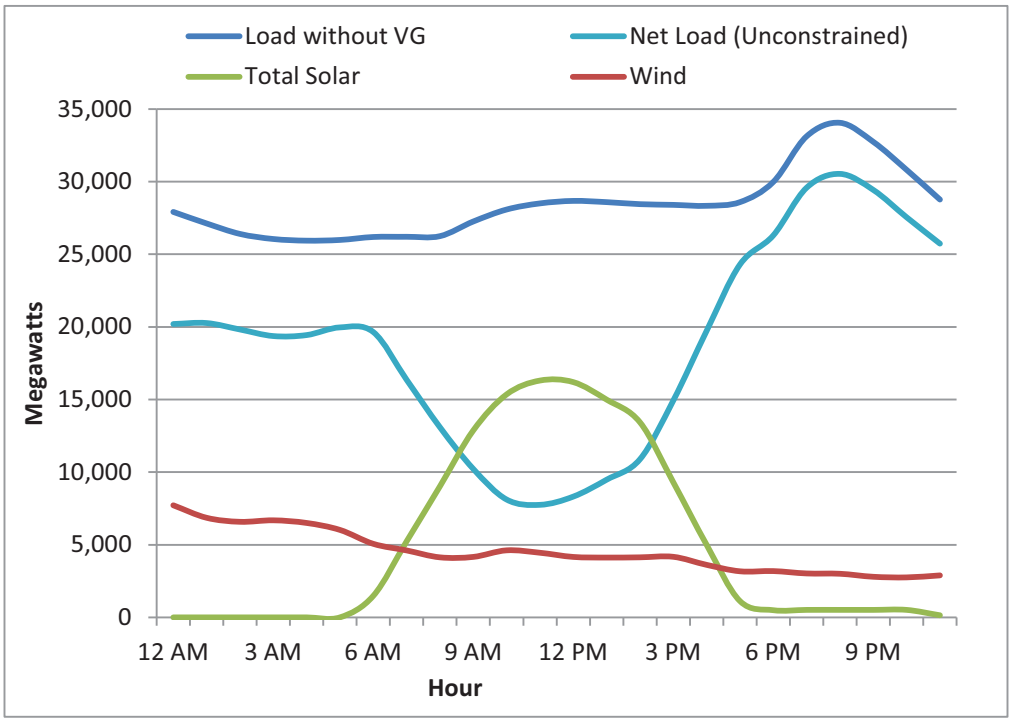

Figure 7. Load, solar, and wind profiles for California on March 29 in a scenario with 11% annual wind and 11% annual solar assuming no curtailment

The net load shown in Figure 7 does not consider the operational constraints that actually occur in the dispatch, and these constraints do not allow all renewable energy potentially generated on this day to be used.

The remaining figures in this sequence are from the results of the power system simulation. Figure 8 shows the net load resulting from the VG that can actually be used in the simulated system. In this case, the net load met by conventional generation is not allowed to drop below about 12,600 MW. This represents a California system-wide minimum generation constraint, meaning on-line generators in California—and certain contracted generators outside California—

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

cannot reduce output to below this level, considering the individual generator parameters and system limitations described at the beginning of this section.[18]

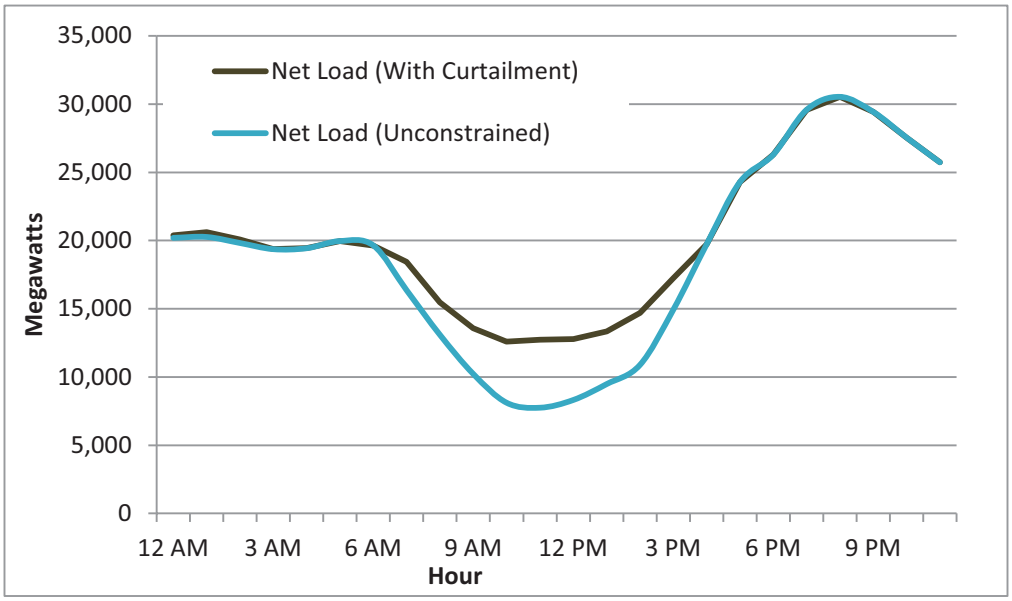

Figure 8. Modeled net load in California on March 29 in a scenario with 11% annual wind and 11% annual solar in a system with a 60% instantaneous penetration constraint

These constraints result in curtailed energy, illustrated in Figure 9, which includes the combined VG potential, the amount of VG used by the system to meet load, as well as the curtailed VG. Curtailment is defined as any VG that cannot be used for any reason. Overall, about 5% of the potential wind and solar energy on this day is curtailed. However, during most days, higher mid-day load does not produce a dramatic duck-curve shape and there little or no curtailment. Over the entire year, about 0.2% of VG is curtailed.

[18] This minimum generation value is already below a CAISO-only estimate of the lowest net load point of about 15,000 MW in the current system (Bouillon 2014). The lower minimum generation point in this analysis results from several factors including greater flexibility from customer-owned cogeneration assumed in the LTPP model. The LTPP model also does not include fixed-scheduling contractual limitations on plant dispatch. Also, Diablo Canyon unit 2 was out for maintenance on this day in the simulation, which removed 1,122 MW of non-dispatchable capacity. The net load in the system is less than 15,000 MW during only 12 hours of the year in this simulation.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

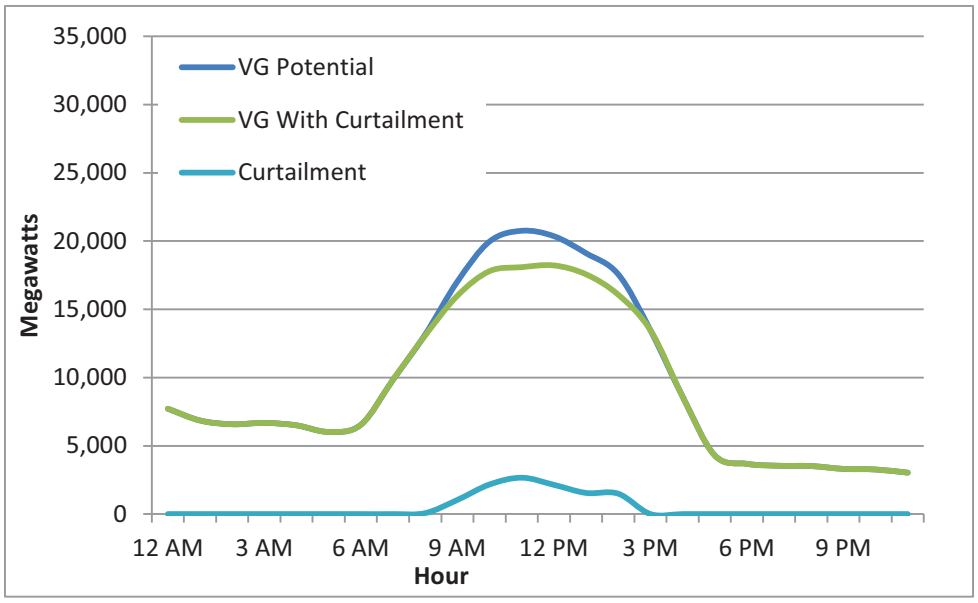

Figure 9. Used and curtailed VG in California on March 29 in a scenario with 11% annual wind and 11% annual solar

Figure 10 shows how the 60% instantaneous penetration limit results in overgeneration and curtailed VG. The bottom curve shows the instantaneous penetration of VG from the model, while the top curve shows the theoretical penetration if all VG could be used. In this case, the VG potential exceeds the 60% threshold for four hours.[19] In this scenario, the vast majority (about 95%) of all curtailment occurs during periods where the potential VG penetration would exceed 60%. During a few hours of the year there is curtailment at VG penetration levels significantly below 60%, indicating that ramping constraints might force some curtailment. However the total amount of curtailment during these periods is very small compared to the amount created by the 60% limit. While the average net load ramp rate increases, the existing system appears to be sufficiently flexible address these ramp rates. The normal load (without additional VG) achieves a maximum hourly upward ramp rate of 6,721 MW/hr on December 22th at 5 pm. In the 11% annual solar case, only 5 hours of the year demonstrate net load ramp rates that exceed this value, with the maximum net load ramp rate of 7,379 MW/hr. The maximum upward ramp rate on the duck curve day is 3,142 MW/hr. Analysis in later sections evaluates the relationship between a lower penetration limit and possible ramp rate constraints at higher PV penetration.

[19] The actual penetration of VG is slightly less than 60% because the constraint does not consider a small amount of schedulable load within the model.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

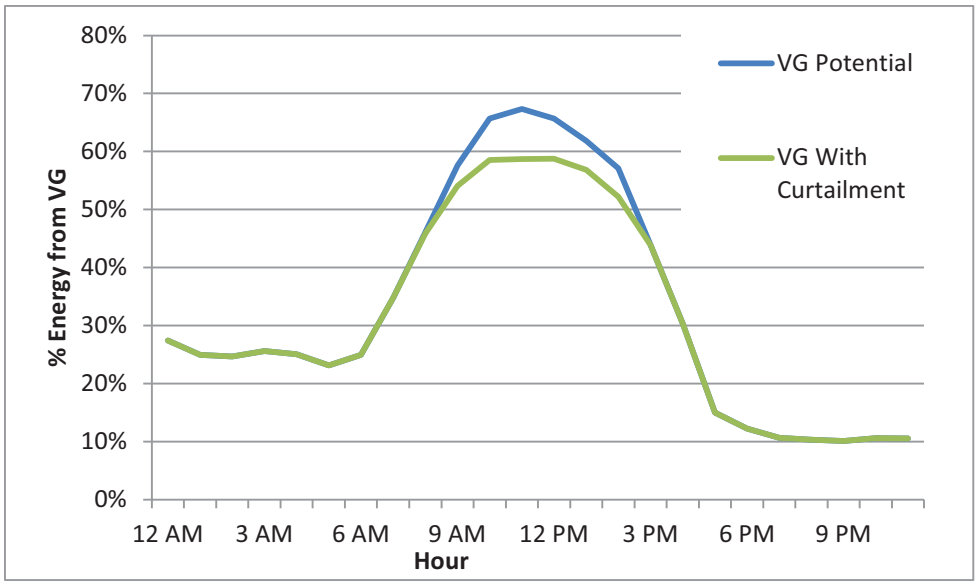

Figure 10. Instantaneous penetration of VG on March 29 with and without curtailment in a scenario with 11% annual wind and 11% annual solar

Of note in these results is the use of existing pumped storage in the California system, which represents a total of 2,518 MW of generation capacity[20] including 2,264 MW of schedulable pumping load that can be used to increase total demand during periods of high solar output.

Figure 11 shows the simulated storage pumping load that occurs, and how storage results in an increase in VG used. As noted previously, because this conservative base case considers grid conditions that approximate those of 2015, this simulation does not consider the 1,325 MW of additional storage that will be deployed as part of the California storage mandates, which is evaluated in later sections.

[20] These values are for the four existing California pumped storage plants in TEPPC common case (Castaic, Eastwood, Helms, and Lake Hodges). The CAISO LTPP model has a combined capacity of 2,728 MW for these four plants.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

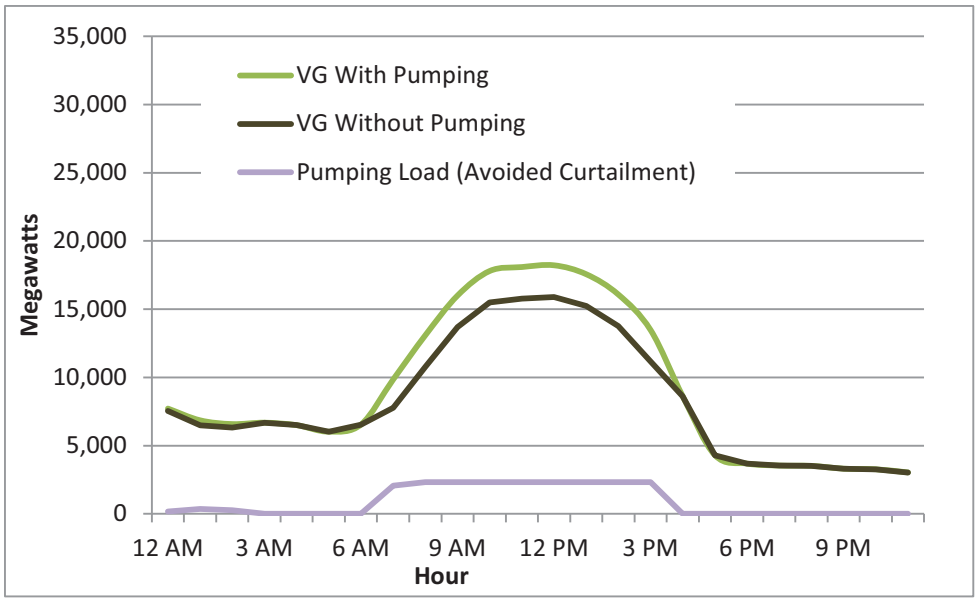

Figure 11. Increase in VG use resulting from schedulable pumped storage in a scenario with 11% annual wind and 11% annual solar

On most days of the year, significant additions of PV are possible without causing significant curtailment. Figure 12 duplicates Figure 7, but for July 27, the day with the highest demand (note the scale change on the y-axis due to the significant increase in demand). On this day, there is no VG curtailment, and instantaneous penetration is well below the 60% threshold, as illustrated in Figure 13.

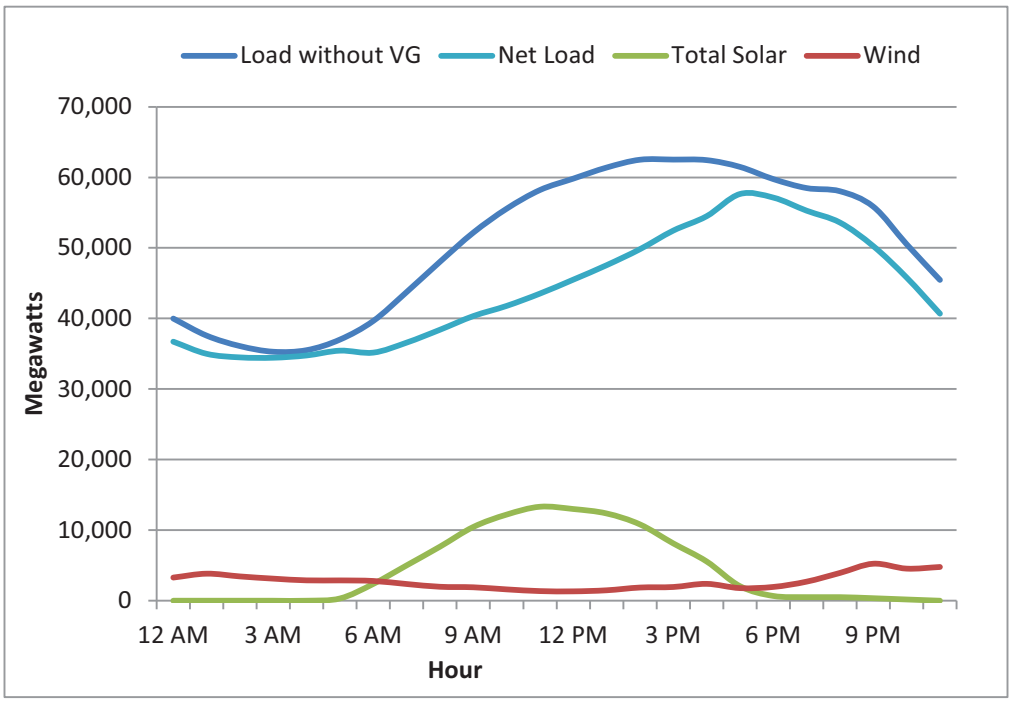

Figure 12. Load, solar, and wind profiles for California on July 27 in a scenario with 11% annual wind and 11% annual solar

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

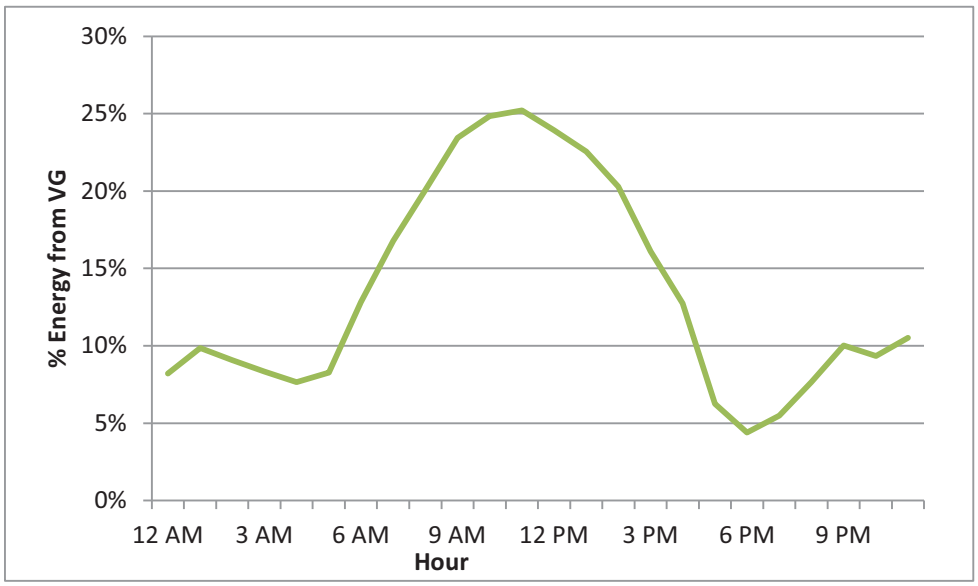

Figure 13. Instantaneous penetration of VG in California on July 27 in a scenario with 11% annual wind and 11% annual solar

The duck chart figures show the challenge of additional PV penetration without increasing system flexibility. Adding PV to help reduce the use of peaking capacity on July 27 also produces more energy on March 29. Without flexibility changes that will allow additional units to reduce output or be de-committed, only a relatively small amount of additional PV generation can be accommodated on March 29 (during the shoulder periods in the morning and evening). And as more PV is added, there will be a greater number of days with associated PV curtailment.

Figures 14–16 show the progression of the duck curve and associated overgeneration as additional PV is added. Figure 14 shows what the net load would be on March 29 without curtailment in both the base case illustrated previously and a case where we add sufficient PV to meet 15% of total annual demand (pre curtailment). In this case, the pre-curtailment net load drops significantly, to below 5,000 MW.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

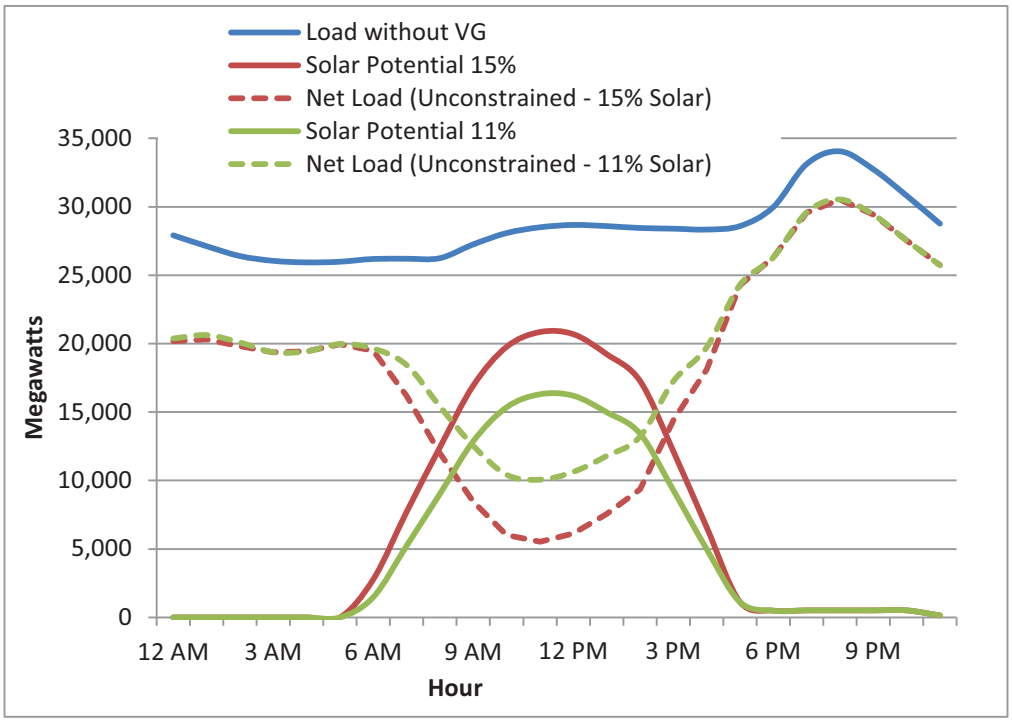

Figure 14. Load in California and VG Profiles on March 29 in a scenario with 11% and 15% annual solar assuming no curtailment

While Figure 14 shows the belly of the duck growing as more solar as added, the net load changes very little at the higher PV penetration due to the 60% penetration constraint in the base case. Figure 15 shows how the belly of the duck curve is prevented from growth due to this constraint, and very little additional PV can be used in the simulated system on this day. Figure 16 shows the hourly curtailment and the used PV in the two cases. At the lower penetration, nearly all the PV (95%) is used on this day, but in the case with additional PV, most of this additional PV is curtailed. Only a small amount of PV in the morning and late afternoon is actually useful, and the total curtailment on this day increases from 5% to about 13%. However, the marginal curtailment on this day, or curtailment of the additional PV added to the system between the two scenarios is about 65%. This illustrates the importance of differentiating the total curtailment and incremental, or marginal curtailment of PV. On an annual basis, the total curtailment increases from 0.2% to 0.9%, while the marginal curtailment is 5.5%.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

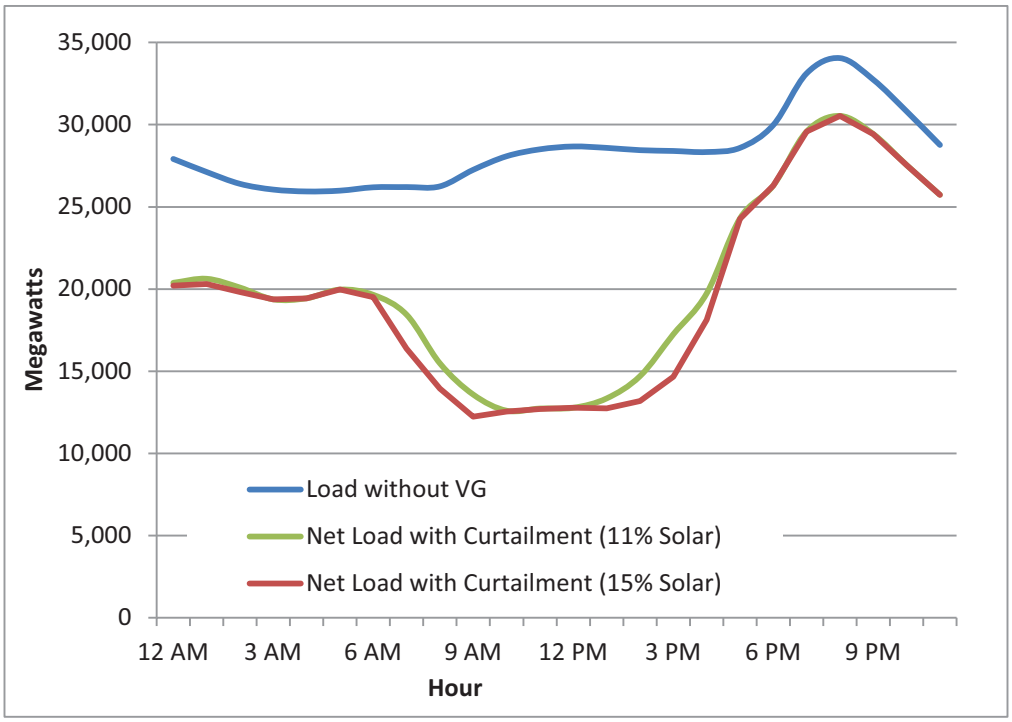

Figure 15. Net load on March 29 in a scenario with 11% and 15% annual solar considering operational constraints

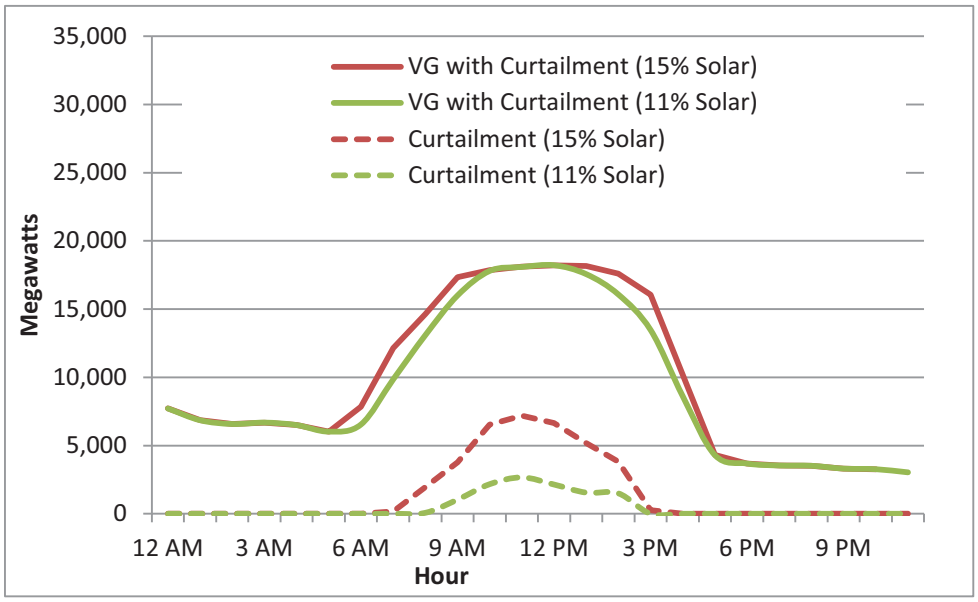

Figure 16. Usable and curtailed VG on March 29 in a scenario with 11% and 15% potential annual solar

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

As even more PV is added to the system, more days acquire the duck shape, and overgeneration increases. Figure 17 illustrates the resulting fraction of variable generation curtailment due to overgeneration as a function of penetration. The bottom x-axis shows the total penetration of solar energy sources (PV plus CSP), while the top x-axis shows the penetration eligible renewable resources (solar plus wind, geothermal, biomass, and small hydro). Only PV is added and the overall penetration is defined as the annual contribution of renewable energy to the total energy demand in California,[21] after removing curtailed energy.

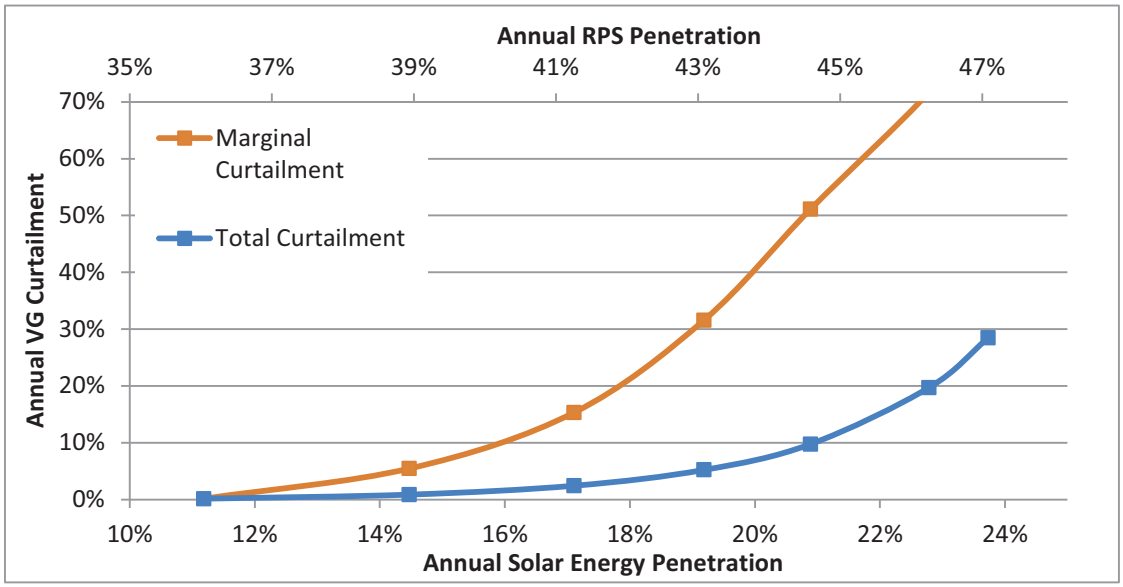

Figure 17. Marginal and average curtailment due to overgeneration under increasing penetration of PV in California with a 60% instantaneous penetration limit

The rapid increase in marginal curtailment rates as a function of PV penetration is a significant limitation for PV to remain competitive with other sources of low-carbon energy once it achieves a certain penetration (in this case perhaps 15%–20% of annual demand). This challenge can be observed by examining the impact of curtailment on the levelized cost of energy (LCOE) of PV. As curtailment increases, and capacity factors decrease, the LCOE increases. This is illustrated in Figure 18, which provides PV LCOE as a function of penetration for the base case scenario. In this figure, the PV cost is based on the DOE solar program goal of an LCOE equal to six cents per kilowatt-hour. This goal is largely dependent on being able to actually use all the energy available from PV and on minimizing curtailment.

[21] Where the total demand is equal to the consumer demand plus storage losses associated with pumped hydro

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

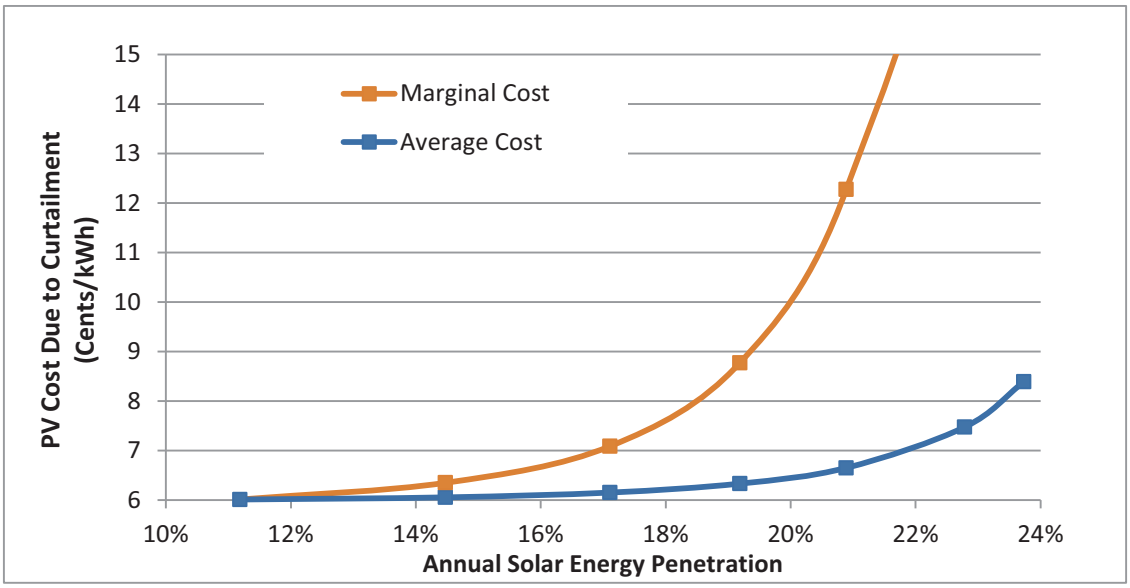

Figure 18. Marginal and average PV LCOE (based on SunShot goals) due to overgeneration under increasing penetration of PV in California with a 60% instantaneous penetration limit

Figure 18 shows the importance of examining marginal curtailment rates. While average rates can remain relatively low, marginal rates determine the cost and value of adding the next unit of solar to the grid. Actual investment decisions may be driven by these marginal values, with actual allocation of curtailment driven by a variety of factors, including local grid conditions, the underlying contractual agreements with suppliers, production tax credits, and other regulatory issues. It should be noted that in Figure 18 all incremental curtailments of non-zero cost renewable energy resources (CSP, wind, hydro, and geothermal) were assigned to PV. For example, if at the lowest penetration of PV there is no curtailment of wind, and when PV is added wind is curtailed, this wind curtailment is actually assigned to PV for accounting purposes.

The very high marginal curtailment rates of PV observed in Figure 17 would likely limit contribution from solar without changing system operation to accommodate variable generation resources. Examination of the duck curve provides insights into how improved flexibility can both accommodate and change the net load shape and increase penetration of solar energy resources.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

6 Enabling Greater Solar Penetration: Flatten or Fatten the Duck?

Accommodating greater amounts of PV will likely require multiple approaches to increasing the overall flexibility of the power system. Previous work by the CAISO (Bouillon 2014) and other groups (listed in Section 3) suggest many individual approaches, but these can be summarized by two more general approaches, which we illustrate below as *fattening* the duck and *flattening* the duck.

Fattening the duck represents all approaches that increase the flexibility of the grid and allow greater instantaneous penetration of variable generation resources. Typically, this means (1) changing operational practices to allow more frequent cycling, unit starts and stops, and (2) minimizing the amount of thermal units held at part load by improving accuracy of VG forecasts and not holding excessive reserves. This also means allowing VG to provide operating reserves and other services that stabilize system frequency (Gevorgian et al. 2015). These changes can reduce the overall system-wide minimum generation requirement, and they allow the natural belly shape of the duck to grow larger and provide a greater fraction of the normal load during periods of high solar output.

Figure 19 illustrates the change in minimum generation requirements that would be needed to eliminate curtailment on our lowest net load day in the 15% solar penetration scenario. The net load in this figure is from the constrained system illustrated in the previous section (Figure 15). In this case, the system's minimum generation point of about 12,600 MW results in significant curtailment. If the system were able to operate at a lower minimum generation level (about 5,400 MW), curtailment would be eliminated.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

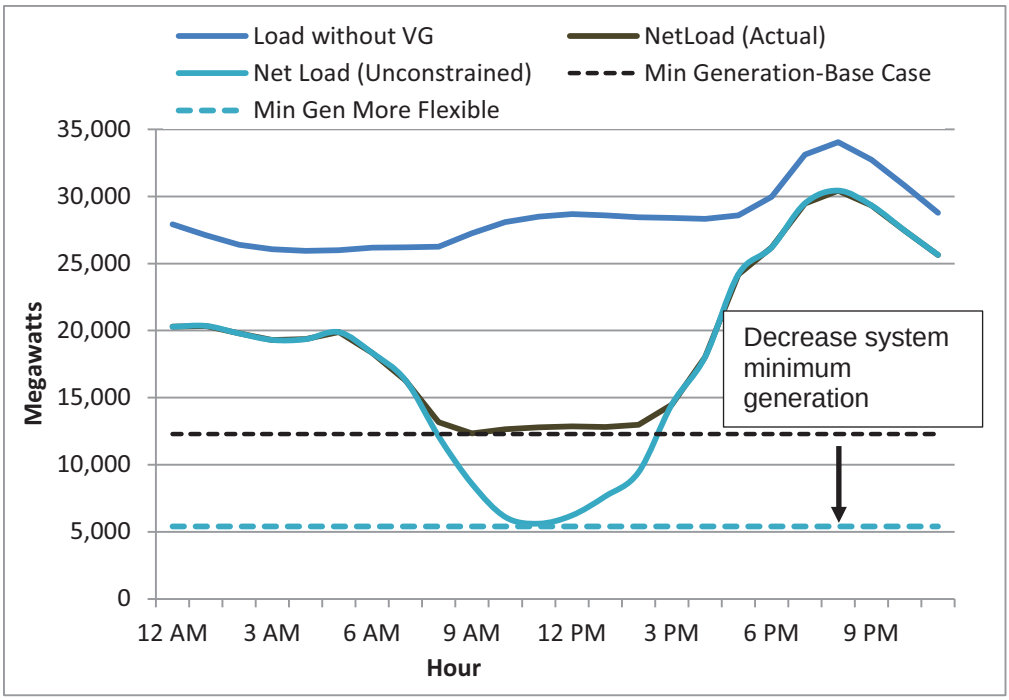

Figure 19. Accommodation of increased penetration of PV by reducing system minimum generation requirements and fattening the duck

Alternatively, flattening the duck acts to shrink the belly shape by shifting supply/demand patterns to allow solar energy to meet parts of the load that would not normally be provided in the middle of the day. This includes either shifting load via responsive demand or shifting supply by the use of energy storage (Lazar 2014).

Figure 20 illustrates the amount of load shifting that would be required to eliminate curtailment. In this example, we keep the 12,600 MW minimum generation level associated with the 60% instantaneous penetration limit. We add load (from shiftable demand or storage) with timing and amounts that exactly match curtailment of PV. As much as 7,200 MW of additional demand or storage charging would be required to eliminate all curtailment in this case. The impact of load shifting/storage is shown on both the normal (no VG) load (the top curve) as well as the net load with VG. On the normal load, additional demand produces a “hump” on the back of duck. This stored energy will be used later (or demand later in the day will be shifted earlier), reducing demand in the evening (represented by the flat line where the load has been reduced). The impact on the net load is to increase the net demand to the minimum generation level, with the added benefit of reducing peak demand in the late evening.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

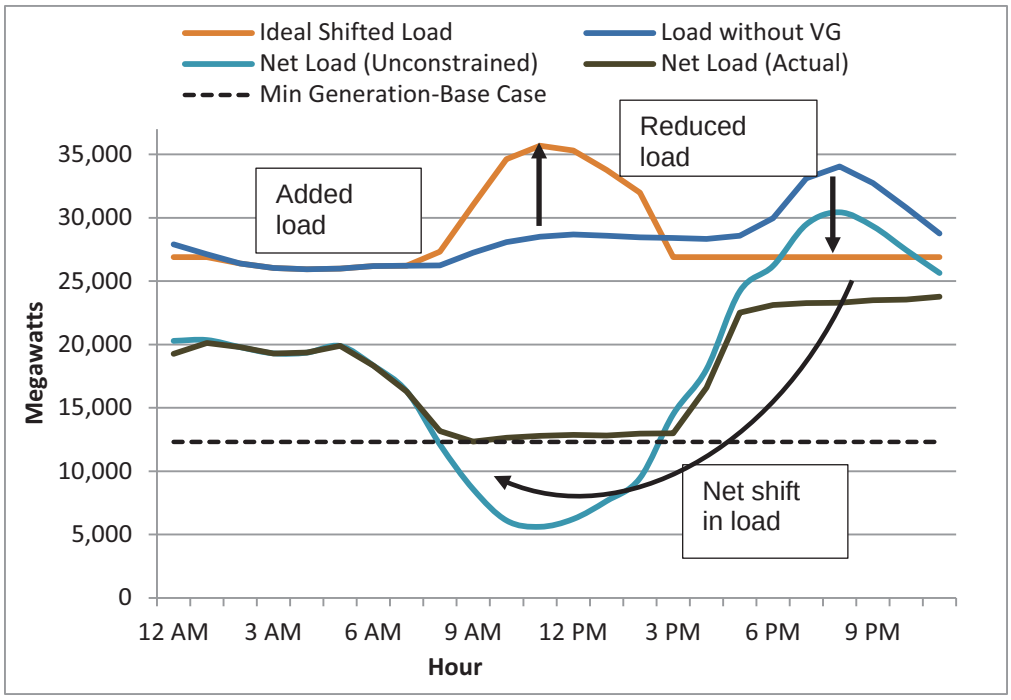

Figure 20. Accommodation of increased penetration of PV by flattening the duck (increasing mid-day demand)

Increased penetration of PV can occur by applying either approach individually, but the greatest impact will occur when the approaches are applied collectively.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

7 The Impact of Improved System Flexibility

Increasing Instantaneous Penetration and the Impacts of the California Storage Mandate

The base case analyzed in Section 5 does not consider several grid changes that will likely occur by 2020 that will help reduce the impact of solar generation on grid operations. Among these changes is the deployment of new energy storage. In October 2013, the California Public Utilities Commission (CPUC) finalized Decision 13-10-040, which adopts procurement targets and requirements for 1,325 MW of "viable and cost-effective" energy storage systems by 2020, as directed by the California State Legislature in 2010 (CPUC 2010; CPUC 2013).

This new storage can help accommodate increased use of VG by shifting load and flattening the duck. We consider the addition of 1,290 MW of storage, following the modeling assumptions of the TEPPC 2024 database.[22] The size and characteristics roughly follow CPUC R.13-12-010 and include 550 MW with two-hour discharge duration, 520 MW with four-hour discharge duration, and 220 MW with six-hour discharge duration. The devices are assumed to have 83% round-trip efficiency and are distributed among the three California investor-owned utility zones in accordance with the storage mandate. We assume all of the storage added is optimized by the system operator to minimize the overall cost of system operation and can provide multiple services including provision of reserves.[23] This is a critical assumption, and it would require optimization either (1) directly by a system operator in the case of utility-scale storage or (2) indirectly through real-time pricing or other mechanisms that would optimize behind-the-meter storage. Figure 21 illustrates how this additional storage shifts load to flatten the duck and reduce curtailment. This figure shows the normal load from the 15% PV case and load with the additional storage. The resulting curtailment is also shown, and is compared to the case without the added storage.

[22] The 40-MW Lake Hodges plant is eligible for the storage mandate, and it existed in the base case, so the additional storage is less than the 1,325-MW requirement.

[23] This is a deviation from the current assumptions in the LTPP model, which assumes a mix of transmission, distribution, and customer sited storage, of which only a fraction can provide reserves (Liu 2014a).

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

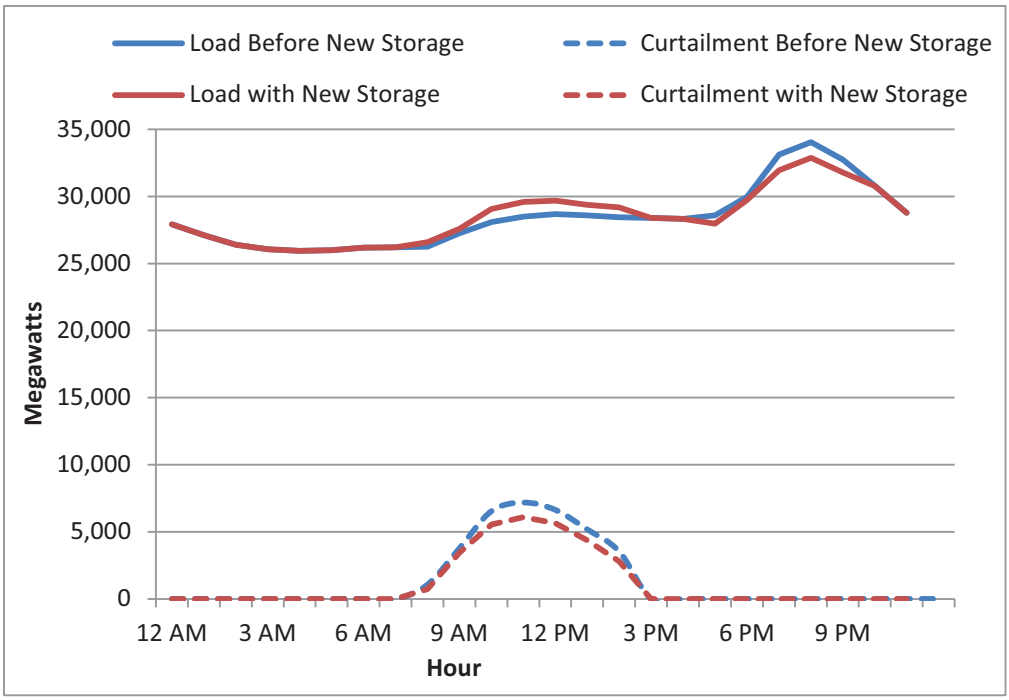

Figure 21. Impact of flattening the duck on March 29 with 1,285 MW of added storage in a scenario with 15% annual solar

The amount of avoided curtailment in Figure 21 is relatively modest, but it does not consider a potentially even greater benefit of distributed storage by provision of grid flexibility services. By providing these services (including grid stability), storage can help reduce the need to run partially loaded thermal generation to provide reserves.

The previous section shows the significant impact of the 60% instantaneous penetration limit, which creates the flat belly on the duck curve and results in significant overgeneration. While we impose the 60% limit in our base case, the CAISO LTPP model imposes a 25% local generation limit, which requires 25% of local load in all hours to be met by conventional generators (which we also include in our base case in the previous section). Renewables, demand response, and storage are ineligible in the CAISO model to meet this requirement. The motivation for this limit is described as:

> The constraint is necessary for the balancing authority to comply with the NERC control performance standards. A balancing authority must have at least 25% of its internal generation on-line with adequate available capacity for dispatch or risk non-compliance. Within the CAISO's footprint, a contingency that results in the tripping of Path 26 would separate the north from the south. Without a minimum amount of generation in southern California, there is a risk that the CAISO could completely lose the load if Path 26 were to open.[24]

[24] Liu 2014a

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

The common theme behind these concerns is the ability of a system operator to maintain system stability, including voltage stability and frequency stability.[25] While there is little direct experience in operating grids in the United States with extremely high levels of instantaneous VG penetration,[26] studies suggest a variety of approaches to maintaining system stability under increased VG penetration. One example is Phase 3 of the Western Wind and Solar Integration Study (WWSIS-3) (Miller et al. 2014), which examined frequency and transient stability at instantaneous VG penetrations of up to 53% across the Western Interconnection and 62% in California. The study simulated the frequency declines after severe disturbances, and found that at the levels of penetration simulated, the system was able to maintain enough primary frequency response to avoid under-frequency load shedding (blackouts). The study also concluded that the use of active power controls in wind turbines and PV could improve frequency response, which could allow greater instantaneous penetration of VG. Currently available wind turbines are now being deployed that can provide active power control, including both synthetic inertia and primary frequency response. Wind turbines can draw stored energy from the rotor to help arrest a frequency decline, or they can be operated at reduced output during periods of high VG penetration to provide primary frequency (governor) response. PV can also provide these services, although both require curtailment.

Fast-responding energy storage, such as batteries and flywheels, can provide rapid response to grid events. The amount of new storage in the California storage mandate significantly exceeds the WWSIS-3 estimated frequency response obligation for California, and WWSIS-3 found that a relatively small amount of storage (less than that in the California storage mandate) could provide significant benefits across the entire Western Interconnection.

As active power controls become more common on renewable generators, and if the system operator has greater control over the new storage being installed in California, these resources could be employed to replace the services now provided by conventional thermal resources.

To demonstrate how commercially available grid flexibility options can effectively fatten the duck, we consider a case where control of distributed resources allows for increased instantaneous penetration of VG. We also allow curtailed wind and solar to provide upward regulation, contingency, and flexibility reserves. While this provides a system benefit, we do not count curtailment that provides upward reserves as "used" energy. However this has a small impact as curtailed VG typically provides less than 4% of the total reserve requirement (During hours of large curtailment, there is typically a significant amount of partially loaded hydro or thermal plants that can provide upward reserves.)

[25] A summary of stability issues is provided by Kundur et al. (2004). They give the following definitions: "Voltage stability refers to the ability of a power system to maintain steady voltages at all buses in the system after being subjected to a disturbance from a given initial operating condition" and "Frequency stability refers to the ability of a power system to maintain steady frequency following a severe system upset resulting in a significant imbalance between generation and load."

[26] In October 2014, the Xcel service territory in Colorado provided 61.1% of demand with wind, which was partially enabled by utilizing wind to provide regulating reserves. However, because this system is connected to the larger Western Interconnection, it does not provide a realistic example of high-penetration of non-synchronous generation across a large balancing area or interconnection.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

Figure 22 shows an example of a fatter duck that results from increasing the allowable instantaneous penetration from 60% in the base case to 80% (with no local generation requirement). The top curve shows the net load in the 15% base solar case (the same curve as shown in Figure 15). The bottom curve shows the impact of increasing maximum penetration to 80%, which substantially reduces curtailment on this day.

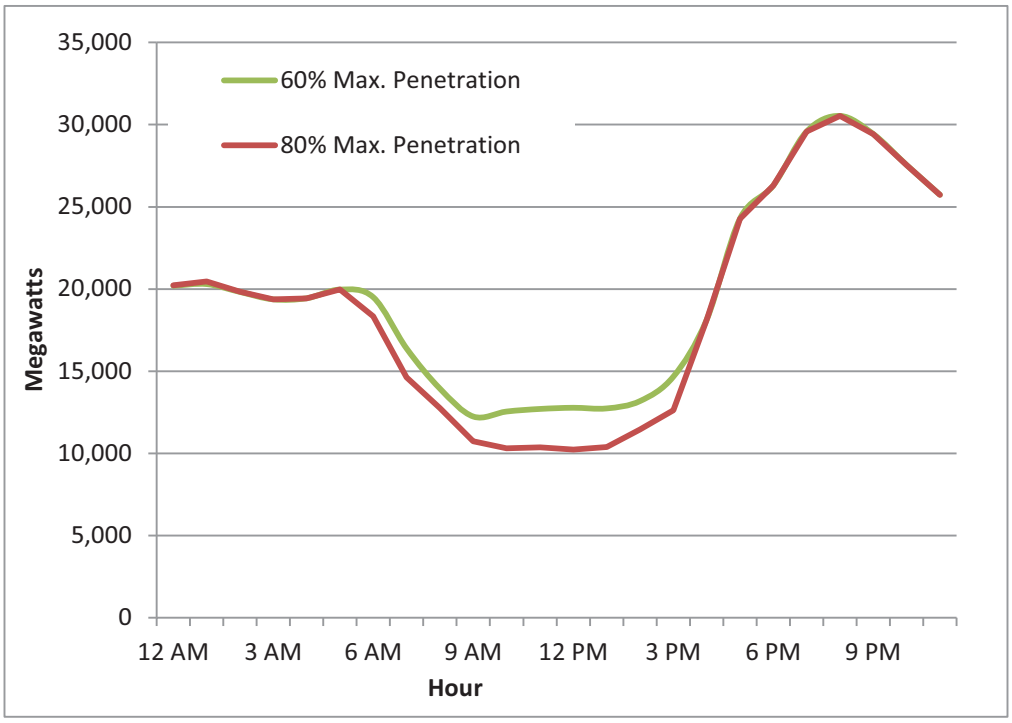

Figure 22. Net load on March 29 in a scenario with 15% annual solar increasing the maximum penetration of VG to 60% to 80%

The corresponding curtailment curves are provided in Figure 23. In this case, the curtailment of PV has been substantially reduced from about 13% on this day to about 7%.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

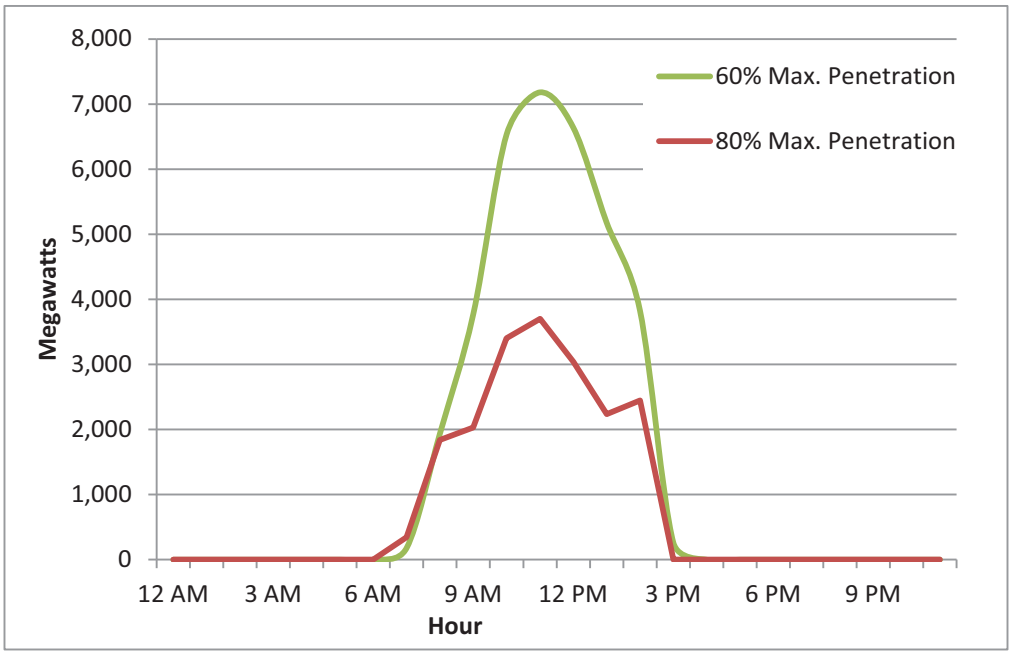

Figure 23. VG curtailment on March 29 in a scenario with 15% annual solar increasing the maximum penetration of VG to 60% to 80% and removing the local generation requirement

While curtailment has been reduced, it has not been completely eliminated due to other constraints on the system. The 10,000 MW net load in Figure 22 is close to the minimum output of "must-run" capacity in the system. Overall, the model identifies about 8,000 to 9,000 MW of minimum generation from nuclear, geothermal, hydro, biomass, and gas-fired combined heat and power (CHP) units.[27]

Overall, these changes to grid operation reduce curtailment and allow greater penetration of VG. Figure 24 compares the impact of replacing the original base case (including the 60% instantaneous limit and the 25% local generation constraint) with an overall 80% instantaneous VG penetration constraint. It is important to emphasize that this assumption requires the system operators to have greater visibility and control of multiple distributed resources, including both PV and storage. These distributed resources will likely be needed to perform many functions currently met by conventional generation resources, with appropriate controls and market mechanisms put in place to compensate owners for providing these services.

Compared to the base case, the curtailment curves are shifted to the right by about 8 percentage points, meaning greater energy penetration from solar can be achieved at the same level of curtailment. In this case, a solar penetration of 25% is achieved with a marginal curtailment rate of about 20%, with the total RPS level approaching 50%.

[27] As noted previously, this low level is made possible in part by the fact that one unit of Diablo Canyon nuclear units was out for maintenance on this simulated day.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

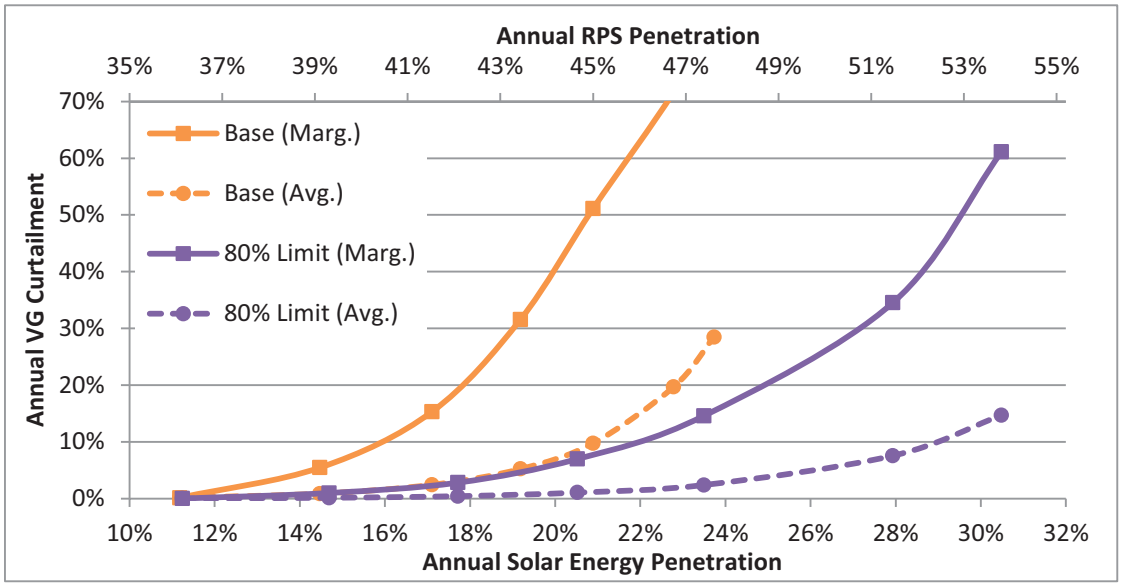

Figure 24. Marginal and average annual curtailment due to overgeneration under increasing penetration of PV in California after adding mandated storage, removing local generation constraint, and increasing maximum instantaneous VG penetration to 80%

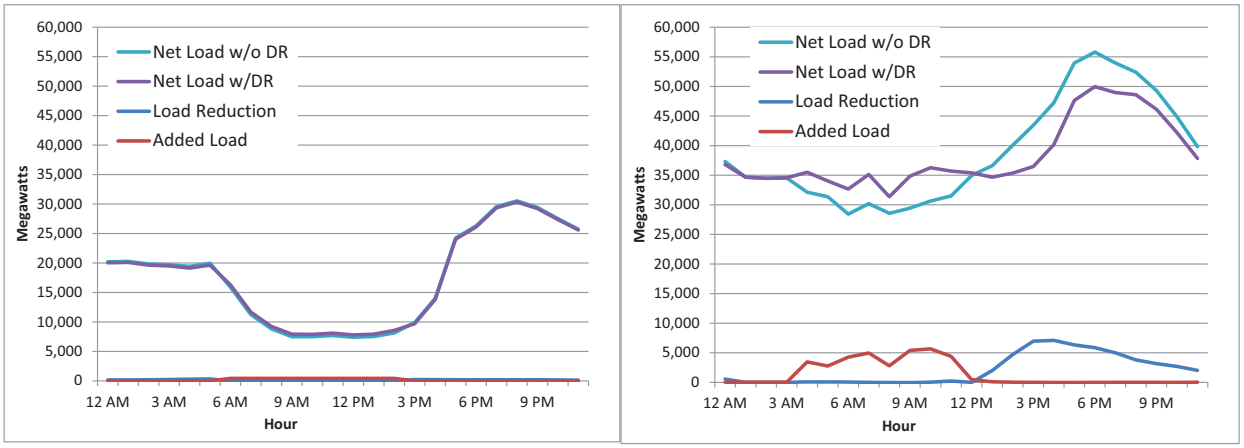
Engaging Further Demand Response

The solutions in the previous section fatten and flatten the duck by applying commercially available control technologies to local generation and storage resource. However, the base cases assume a very small amount of responsive demand that could allow greater PV penetration. As with energy storage, demand response (DR) can both flatten the duck (by shifting load) and fatten the duck (by providing grid services that reduce need to operate conventional plants at part load). Fattening the duck with DR will require provision of services not typically provided by loads. While demand shifting can occur through market-based incentives (e.g., time-varying prices), using DR to allow for increased VG penetration will likely require DR to provide grid stability services (e.g., primary frequency response). This will require loads to sense system frequency and automatically reduce load during low frequency events.[28] This incurs both an implementation cost and any costs associated with paying customers when load is curtailed.



To consider the possibility of how responsive demand could aid in PV integration, we consider two steps similar to the previous case. First, we assume a greater fraction of load (up to about 11% of instantaneous demand) can be incentivized to shift demand to times of lower energy prices (corresponding to low net demand).[29] Second, we increase the VG instantaneous penetration limit to 90%. This assumption reflects the possibility that directly controllable responsive demand can provide the system operator with increased flexibility including frequency stability measures such as primary frequency response.

[28] An example of an existing program that uses frequency-responsive loads is the ERCOT "Non-Controllable Load Resource" that provides Responsive Reserve Service. This program pays loads to reduce output automatically when the frequency drops below a certain threshold (ERCOT 2014).

[29] This and other changes to system operation will likely require new market mechanisms. Hogan and Paulos (2014) discuss several of these.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

Figure 25 illustrates the impact of the added demand response on net load shape in the 24% potential solar case. Figure 25a shows the result for the duck curve day (March 29), while Figure 25b shows the result for the peak load day (July 27). The scales are the same for comparison. The impact on March 29 is very small due to the assumptions regarding the amount of shiftable demand, which is based largely on heating and cooling demand. The basis for this is discussed in Brinkman et al. (2015). On March 29, there is little need for either cooling or heating in the middle of the day, meaning there is low potential for demand shifting on this day based on the model assumptions. The impact on July 27 is more significant, and while DR adds significant economic benefit from load shifting, no curtailment occurs on this day.

(a) March 29 (b) July 27

Figure 25. Impact of additional demand response on system net load on March 29 and July 27

Further analysis is needed to estimate the actual potential for demand shifting and associated costs; however, there likely are additional opportunities for shiftable loads. As an example, the CAISO LTPP model includes about 1,200 MW of schedulable pumping loads. The pumping load profile in the LTPP model is pre-scheduled and generally corresponds to match historical (low-VG) demand profiles. The scheduled pumping load is highest during the traditional off-peak period in the early morning, and it drops by about 700 MW in the late morning, exactly when the PV output increases and overgeneration may occur. Assuming there is flexibility when this pumping load can occur, re-scheduling this load could accommodate some additional PV.

Overall, based on the assumptions made in this simulation, the impact of load shifting and the increase in maximum penetration has modest impact on avoided curtailments. The impact of the added DR case on PV curtailment is illustrated in Figure 26.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

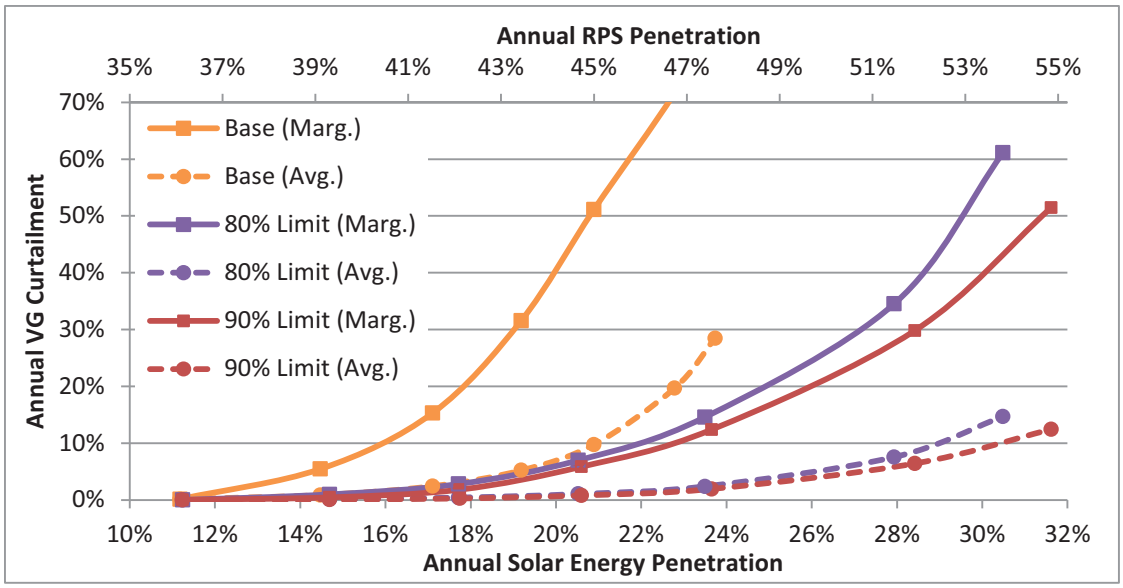


Figure 26. Marginal and average curtailment due to overgeneration under increasing penetration of PV in California after additional demand response and increasing maximum penetration to 90%

The relatively modest reduction in PV curtailment observed moving to the 90% penetration limits is due to the constraints on thermal and hydro plant operations. The presence of baseload non-carbon resources in the system, including nuclear, geothermal, and hydro, in addition to must-run combined heat and power plants limits the maximum penetration of wind and solar to well under 90%. During days with very high penetration of PV, nearly all the non-CHP fossil-fueled thermal capacity in California is turned off for the 11 hours of solar production. However, the results in this section imply that deploying new communications and control technologies that allow distributed resources to participate in grid functions and could significantly increase PV potential. In these examples, total penetration of about 25% solar on an annual basis appears possible with about 5% annual curtailment.

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

8 Additional Opportunities to Fatten and Flatten the Duck

In the previous section, we indicate that near-term technology options are capable of helping mitigate challenges of the duck chart and increase solar penetration to as high as 25% with limited curtailment. Moving beyond this point with exclusively solar resources becomes increasingly challenging; however, several additional options can help fatten and flatten the duck. While we evaluated demand response in this work, further analysis of load shifting potential is needed, as we assume that during the hours of high VG output, less than 1.5% of total demand may be shifted over a period of hours or more.

Other options that have been suggested to address overgeneration include regional interchange, more flexible generation, and energy storage. While this analysis has significant interaction between California and neighboring states, additional interchange, including exports from California, could potentially further reduce curtailment (Nelson and Wisland 2015). This may require broader implementation of various market mechanisms that allow for exchanging energy across regions.[30] A long-term challenge may occur when surrounding states also adopt increasing amounts of wind and PV, leading to regional surpluses of renewable energy during spring afternoons.

Finally, additional storage (beyond existing and mandated storage) could be used to shift load. In addition to electricity storage technologies such as batteries or pumped hydro, concentrating solar power using thermal energy storage can shift solar generation to periods of low PV output. Storage with high capacity value could enable further retirements of the thermal generation fleet that could reduce minimum generation constraints (Denholm and Mehos 2011). Finally, while this analysis focuses primarily on enabling high solar penetration, it should be noted that a more balanced portfolio could more generally reduce the challenges of integrating VG. When PV is at 25% penetration, additional wind (or non-VG renewables such as geothermal) has significantly lower levels of marginal curtailment than PV. This has been noted previously (E3 2014; Brinkman 2015), and it suggests the need for a more comprehensive analysis of different renewable portfolios to achieve the most cost effective mix of generation technologies.

[30] An example is the Western Energy Imbalance Market (https://www.caiso.com/informed/Pages/EIMOverview/Default.aspx).

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov/publications.

9 Conclusions

Accommodating increased levels of PV in California will require understanding and addressing changes in net load shape created by large power production over a relatively short period in the middle of the day. System planners and operators will need to consider changes to a system historically dominated by dispatchable thermal and hydro resources. In the near term, changes underway or proposed in California and elsewhere—such as shorter scheduling intervals, increased interaction across regions, and the creation of new market incentives for generator dispatch—will reduce the minimum generation challenge and enable greater utilization of VG. In the longer term, grid operators will need non-traditional resources to supply reserves and grid stability services. This shift in operating practices will in turn require system operators to have visibility and control of distributed PV, storage, and load, and it will likely require new market mechanisms to incentivize these resources to participate in providing grid services. Without utilizing PV or other distributed resources to provide grid services— which is technically feasible—excessive curtailment of PV could occur at penetrations well below 20% on an annual energy basis

Because of the limited coincidence of PV supply with demand, additional mechanisms will be needed to maximize load-shifting. Simple historical methods, such as time-of-use pricing with fixed price intervals will likely be insufficient to address the variability and uncertainty of the solar resource, which changes on a daily and hourly basis.

By using a combination of grid flexibility options, the duck shape of net load can be accommodated and shaped to allow annual PV penetrations that exceed 25%, with limited curtailment, even without considering the impact of large-scale energy storage. Many of the needed grid flexibility options are already being deployed in various locations around the United States. Additional portfolio analysis can assist in designing a mix of VG resources and associated “enabling” technologies that could achieve very high penetration while maintaining grid reliability.

Multiagency Avian-Solar Collaborative Working Group: Stakeholder Workshop

Welcome and Overview of Workshop Objectives

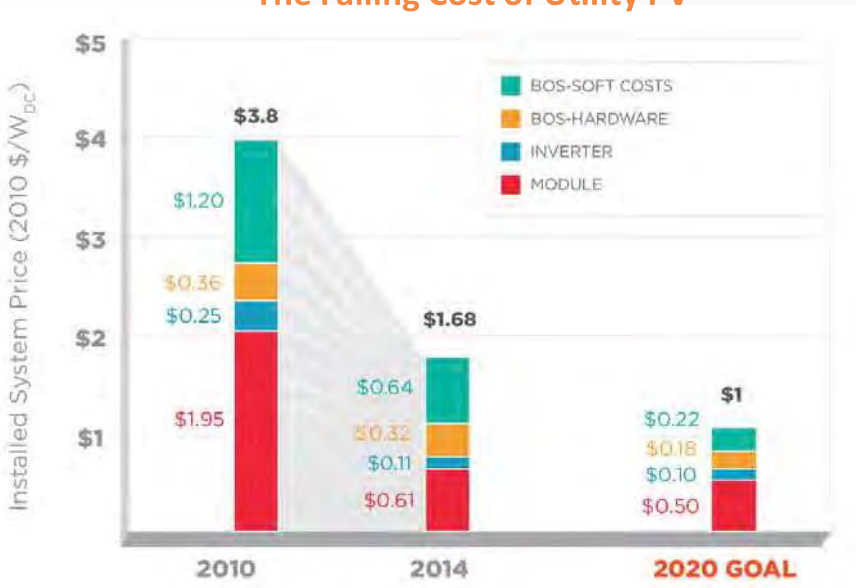
Dan Boff
U.S. Department of Energy
SunShot Initiative

May 10-11, 2016
Sacramento, California

SunShot

SunShot Goal: 5 - 6¢/kWh without subsidy.

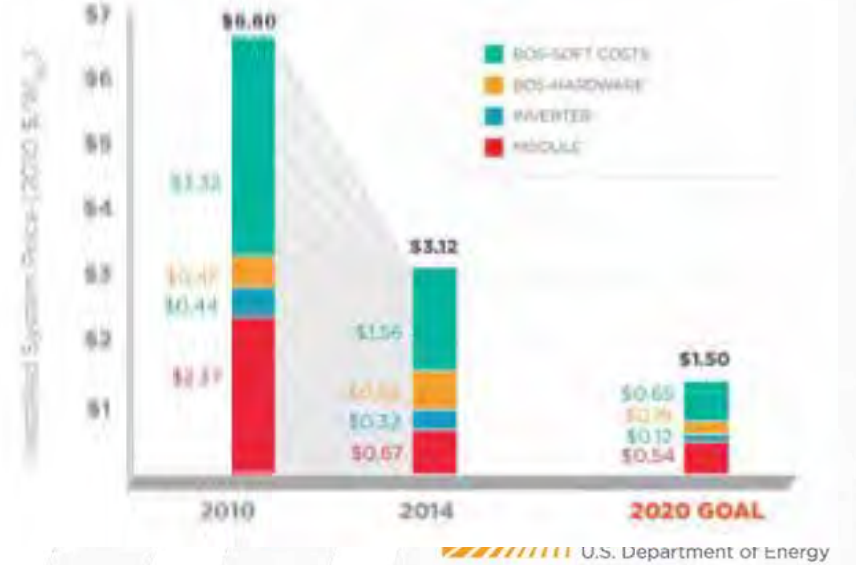
A 75% cost reduction by 2020.



SunShot
U.S. Department of Energy

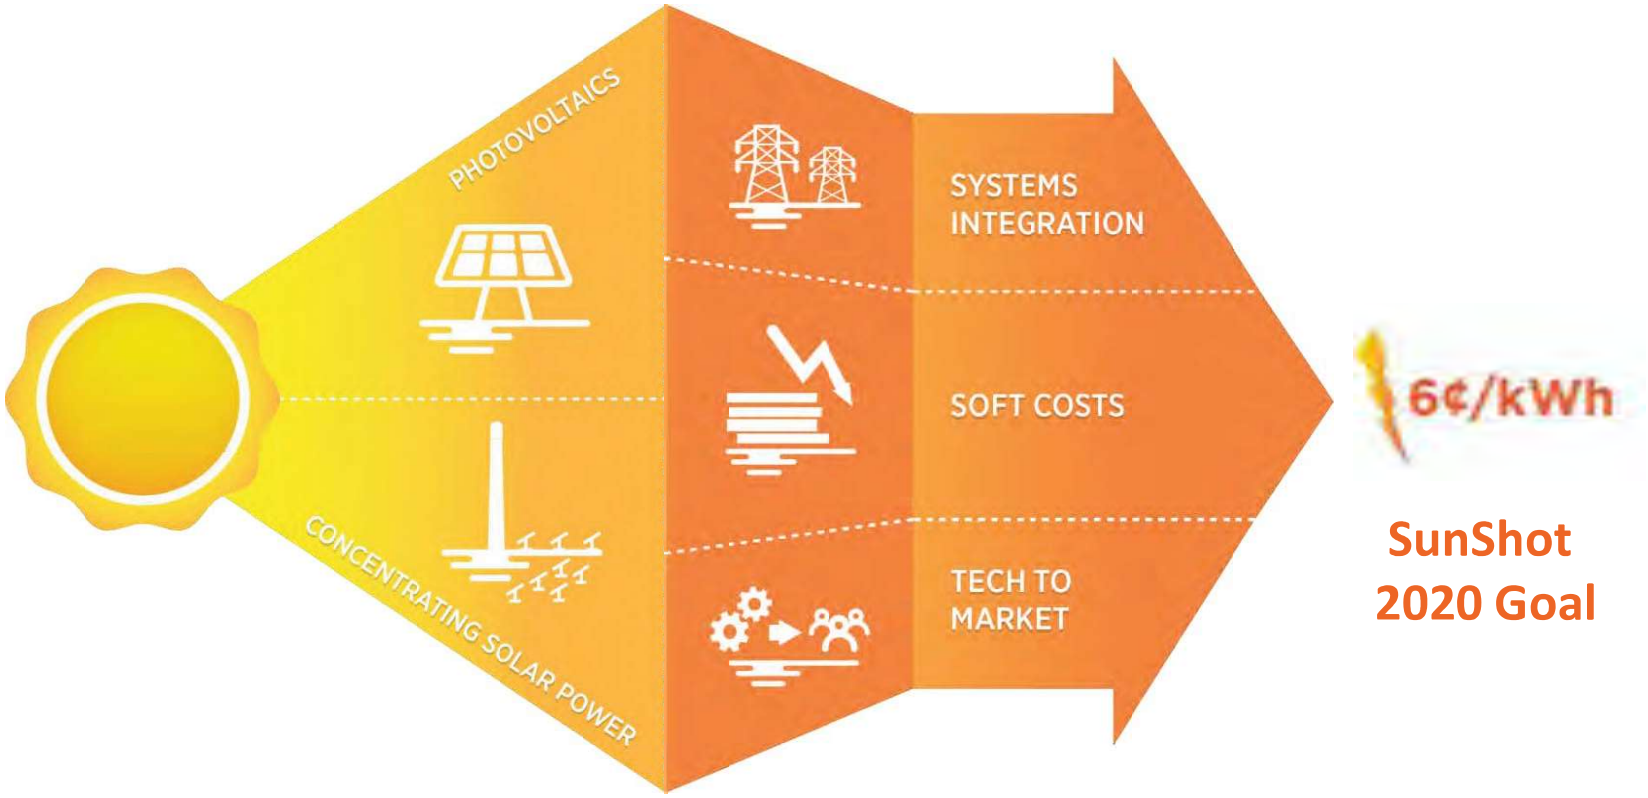
energy.gov/sunshot

The Falling Cost of Concentrating Solar Power



The Falling Cost of Utility PV

The Falling Cost of Commercial PV



The Falling Cost of Residential PV

U.S. Department of Energy

SunShot Program Structure

SunShot 2020 Goal

SunShot U.S. Department of Energy

Balance of Systems (Soft Costs)

NETWORKING AND TECHNICAL ASSISTANCE

Empowering state and local decision-makers through timely and actionable resources, peer networks, and technical assistance

BUSINESS INNOVATION

Developing solar finance and business solutions to expand access to capital and accelerate market growth

DATA ANALYSIS

Harnessing big data analysis and technical solutions to support the many stakeholders involved in solar deployment

TRAINING

Training an innovative solar workforce to enable the solar industry to meet growing demand

SunShot
U.S. Department of Energy

Objectives of this Meeting

Bring together CWG members and stakeholders to:

- Share information about the CWG objectives, scope, activities, and timeline
- Provide a forum for stakeholders to provide comments relevant to the CWG efforts:
  - Concerns about avian-solar issues
  - Relevant existing data and studies
  - Understanding of avian-solar interactions
  - Focus of future research
  - Priorities for research needs
  - Future activities of the CWG

Agenda - Day 1

Time Slot	Topic
9:30-10:00	Welcome & Workshop Objectives
10:00-10:30	Information About the Multiagency CWG
10:30-10:45	Break
10:45-11:00	Summary of Available Avian-Solar Information
11:00-12:30	Lunch
12:30-2:15	Ongoing Related Initiatives
2:15-2:30	Break
2:30-4:30	Break-out Discussions
4:30-5:00	Wrap Up

Agenda - Day 2

Time Slot	Topic
9:00-9:15	Recap of Day 1
9:15-9:45	Conceptual Framework of Avian-Solar Interactions
9:45-10:15	Agency Management Questions & Related Research Needs
10:15-10:30	Break
10:30-12:30	Break-out Discussions
12:30-1:00	Wrap Up & Next Steps

Logistical Details

- All handouts and presentations will be available on the CWG webpage: http://blmsolar.anl.gov/program/avian-solar/
- If you want to continue to receive information about the CWG efforts, subscribe for email updates
  - Send request to rollins@anl.gov
- Using the microphone ensures everyone can hear you
- Identify yourself and your affiliation when you speak
- Please mute or turn off cell phones

Argonne NATIONAL LABORATORY

Information About the Multiagency Avian-Solar Collaborative Working Group (CWG)

Greg Helseth
Bureau of Land Management

Multiagency CWG Stakeholder Workshop
May 10-11, 2016

U.S. DEPARTMENT OF ENERGY

Background

- Avian-solar concerns that have emerged in the past 2-3 years present potential barriers to utility-scale solar development
- Existing data are inadequate to define the magnitude and extent of potential avian impacts and causal factors
- Research is underway by multiple parties, including federal and state agencies, industry, and academics
- There is a growing consensus regarding the value of collaborating on defining research objectives and data needs, and on allocation of funding

Goal and Objectives

To develop better information to support future agency decisions regarding potential avian impacts at utility-scale solar facilities

OBJECTIVES

- Establish collaborative working group among federal and state agencies
- Develop multiagency avian-solar science plan
  - Document current and planned research activities
  - Identify cost implications and information gaps
  - Identify agency roles in funding and oversight
  - Develop feasible mitigation measures, if warranted
- Prepare education and outreach materials

CWG Members

Representatives of federal and state agencies with relevant missions and/or project authorization responsibilities

Federal Agencies	State Wildlife and Energy Agencies *
DOE Solar Energy Technologies Office	AZ Game and Fish Dept.
Bureau of Land Management	CA Dept. Fish and Wildlife
U.S. Fish and Wildlife Service	CA Energy Commission
U.S. Geological Survey	NV Dept. Wildlife
DOI Solicitor's Office	
U.S. Department of Defense	

** Other state energy agencies have been invited to participate*

Scope and Organization of the CWG

Scope

- Utility-scale solar technologies
  - All technologies
  - All facility components
- Initial geographic focus: Arizona, California, and Nevada

Organization

- CWG is led by a chair and co-chair
- Technical support and facilitation is provided by Argonne National Laboratory and the National Renewable Energy Laboratory

CWG Tasks, Deliverables, and Timeline

Task	Activities	Milestone(s) / Deliverable(s)
1 Establish the CWG and conduct meetings	Formalize CWG. Conduct quarterly CWG and stakeholder meetings.	Establish CWG charter, quarterly CWG meetings, and stakeholder events
2 Develop an Avian-Solar Science Plan	Summarize current activities, information gaps, and research needs; consolidate data and mitigation measures/BMPs. Develop hypothesis-based science plan applicable to all solar technologies and sites.	Avian-solar science plan by end of Oct. 2016
3 Prepare education and outreach materials	Prepare fact sheets or news items to inform the public of CWG activities, avian-solar data, and clarify information.	At least two in FY16: • Fact sheet • News item • Public webinar

Timeline & Progress in 2016

Red – complete; Black - anticipated

- **January**
  - Recruited agency participation
  - Held CWG kickoff meeting
- **February**
  - Finalized Charter
  - Assembled existing information
- **March**
  - Published 1st fact sheet
  - Launched CWG website
  - Developed conceptual framework
- **April**
  - Finalized workshop agenda
  - Developed CWG MQs
- **May**
  - Hold 1st public workshop
  - Incorporate stakeholder input
  - Finalize MQs & research needs
- **June**
  - Draft science plan
- **July-Oct**
  - Revise & finalize science plan
  - Hold public workshop or webinar
  - Release final public outreach publication

CWG = collaborative working group, MQ = management question

Avian-Solar Science Plan

Kirk LaGory, Argonne National Laboratory

Purpose: *Provide a consistent framework for research and monitoring of avian-solar interactions*

Objectives

- Define research questions and future research needs;
- Support development of monitoring protocols, evaluation of avian risk, and development of effective mitigation measures;
- Qualitatively discuss potential associated costs; and
- Define agency roles and processes for implementation.

Elements of an Avian-Solar Science Plan

- Executive Summary
- Introduction
  - Describe current solar energy development and trends, observed avian-solar interactions
  - Describe objectives of the plan, desired outcomes, CWG
  - Identify agency-specific management questions
- Conceptual Framework of Avian-Solar Interactions
  - Provides framework for science plan
  - Impacting factors
  - Technology-specific impacts
  - Direct, indirect, and cumulative effects
  - Factors that contribute to risk, including location, seasonality, type of birds
  - Local and population-level effects

Elements of an Avian-Solar Science Plan (Cont.)

- Summary of Existing Information
  - High-level summary with focus on published DOE "rapid report" and subsequent findings, technical reports, and communications with researchers
  - Which portions of the conceptual model are best understood?
- Information Gaps Related to Avian-Solar Interactions
  - Identify the information gaps that impede development of effective avoidance, minimization, and mitigation strategies
  - Which portions of the conceptual model are poorly understood?

Elements of an Avian-Solar Science Plan (Cont.)

- Research and Monitoring Needs
  - Based on management questions, conceptual model, and information gaps, identify research and monitoring that is needed to understand avian-solar interactions
  - Identify priorities for research and monitoring activities based on relative risk to birds
- Program Implementation
  - Identify best approaches to research and monitoring
  - Agency roles
  - Collaboration with ASWG and other stakeholders to ensure consistency and complementary activities
  - Role of adaptive management
  - Tiering from the plan
  - Approximate costs of activities

Stakeholder Engagement

- Agencies are seeking input from stakeholders on all matters relevant to the CWG objectives:
  - Concerns about avian-solar issues
  - Relevant existing data and studies
  - Understanding of avian-solar interactions
  - Focus of future research
  - Priorities for research needs
  - Future activities of the CWG
- Stakeholders can comment during this meeting and/or in writing following the workshop (target due date of June 1, 2016)
- A stakeholder webinar will be hosted to present and take comments on the draft avian-solar science plan (late summer 2016)
- For more information:
  - Subscribe for email updates: send request to rollins@anl.gov
  - CWG webpage: http://blmsolar.anl.gov/program/avian-solar/

QUESTIONS?

A Review of Avian Monitoring and Mitigation Information at Existing Utility-Scale Solar Facilities

Lee Walston*, Katherine Rollins,
Karen Smith, and Kirk LaGory
Environmental Science Division
Argonne National Laboratory

Karin Sinclair, Craig Turchi,
Tim Wendelin, and Heidi Souder
National Renewable Energy Laboratory

* lwalston@anl.gov

Powered by SunShot U.S. Department of Energy
U.S. DEPARTMENT OF ENERGY
Energy Efficiency & Renewable Energy

What is Utility-Scale Solar Energy Development?

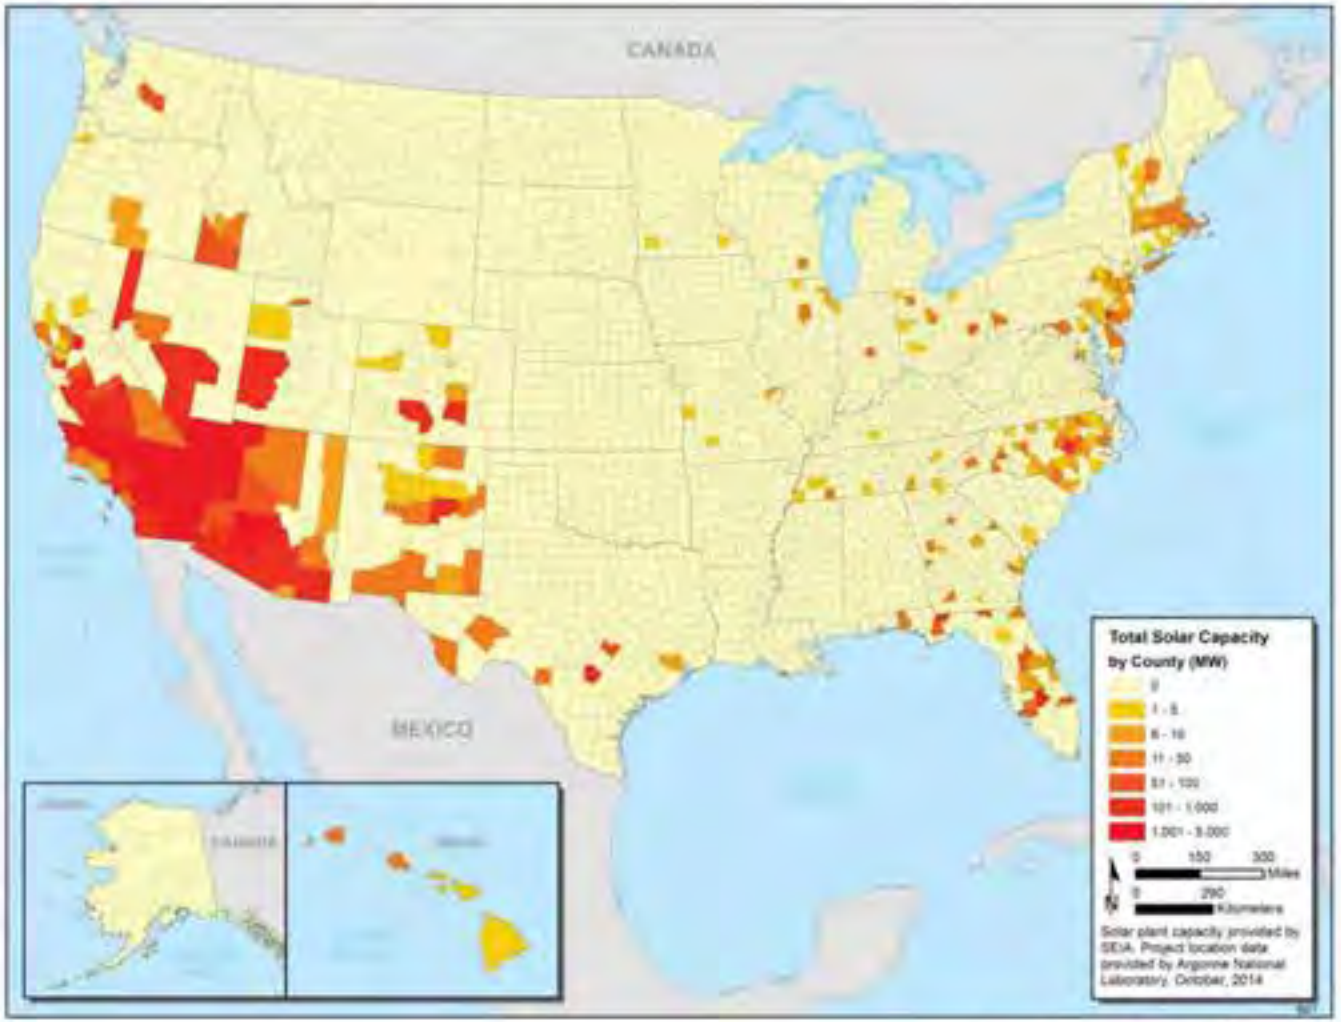
- Large solar fields – 10+ megawatt (MW); requires 5-10 acres per MW
- Three main technologies: 1) photovoltaic (PV) and concentrated solar power (CSP) technologies – 2) parabolic trough and 3) power tower

Desert Sunlight Solar Farm (PV)

- 550-MW project on over 4,000 acres of public land in southern California

What is Utility-Scale Solar Development? (cont'd)

What is Utility-Scale Solar Development? (cont'd)



Ivanpah Solar Energy Generation Station (SEGS)

- 3 Solar power towers (377 MW)
- >3,400 acres of public land

Utility-Scale Solar Energy Development in the U.S.

- >14 GW utility-scale solar capacity (in operation or under construction)
- >1,200 facilities (>1 MW)
- >50% of this electric capacity in southern CA, NV, and AZ.

Source: Walston et al. 2015

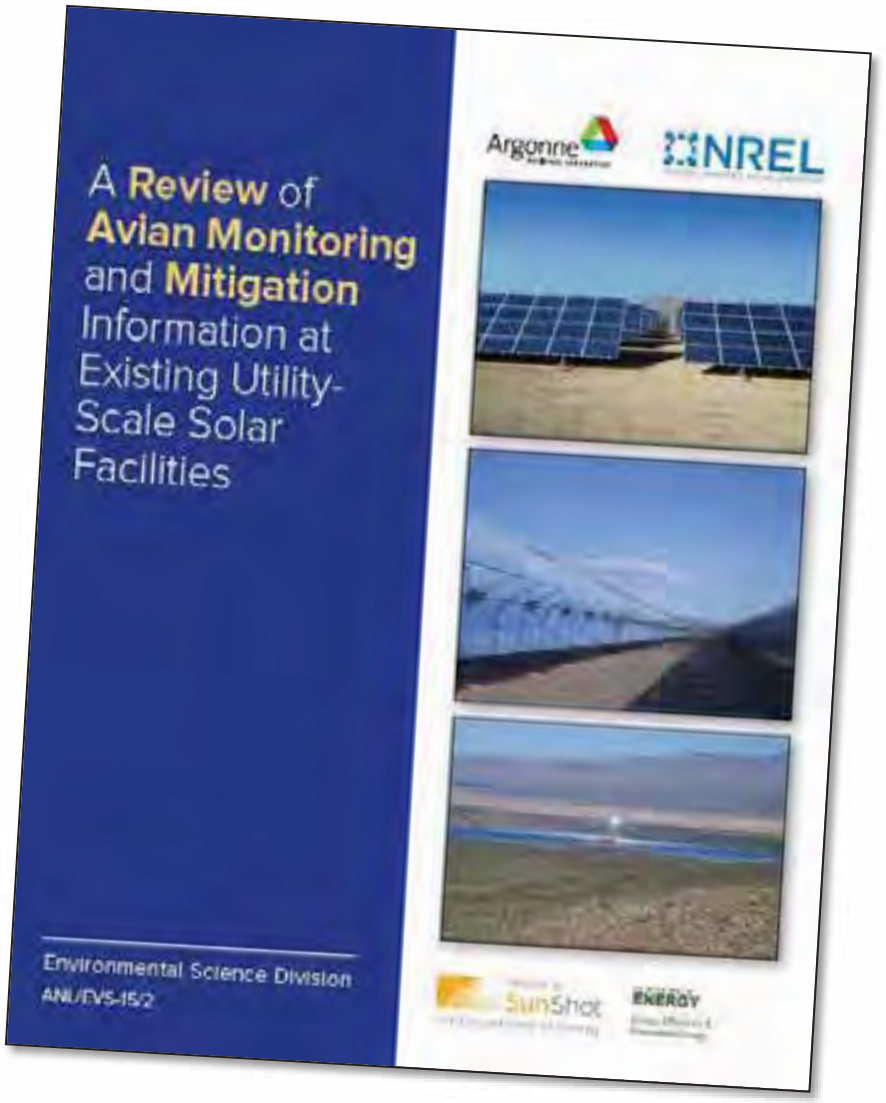
Avian Impacts of Solar Development

2 direct sources of solar-avian fatalities

- Collision-related: documented at solar projects of all technology types.
- Solar flux-related: resulting from the burning/singeing effects of exposure to concentrated sunlight. Observed only at facilities employing power tower technologies.

Photo Credit: Robert Sullivan, Argonne National Laboratory

Factors that Affect Mortality Risk



- Project location
  - Near aquatic/riparian areas, stopover sites, etc.
- Project size
- Project technology / design
  - PV vs CSP
  - Evaporation ponds
  - Ancillary infrastructure

Copper Mountain PV facility in southern Nevada. Example for the "lake effect" hypothesis.
Photo Credit: Robert Sullivan, Argonne National Laboratory

"A Review of Avian Monitoring and Mitigation Information at Existing Utility-Scale Solar Facilities"

- Objectives:
  - Summarize avian fatality issues at solar facilities
  - Summarize current monitoring and reporting activities
  - Evaluate mitigation measures and BMPs used for other industries
  - Examine solar technology-specific aspects of avian fatality
  - Identify information gaps and next steps

Avian Fatality Information at Solar Facilities (updated)

- 16 Facilities with available avian monitoring information.
- Collection of avian fatality information:
  - Incidental or unknown survey effort at 6 facilities
  - Systematic survey effort at 10 facilities

Summary of Current Avian Monitoring Activities at Utility-Scale Solar Facilities as of May 2016

Project Name	Location	Technology Type and MW (in Parentheses)	Current Status	Land Type	Available Avian Monitoring Plan	Known Collection of Avian Fatality Data
Blythe Solar	Riverside County, CA	PV (485)	Under Construction	Public	Yes	Yes – Incidental and systematic
California Solar One	Daggett, CA	CSP – Power Tower (10)	Decommissioned in 1987	Private	NA	Yes – Systematic
California Valley Solar Ranch	San Luis Obispo County, CA	PV (250)	Operational – Oct 2013	Private	Yes	Yes – Systematic
Campo Verde	Imperial County, CA	PV (139)	Operational – Oct 2013	Private	NA	Yes – Incidental
Centinela Solar Energy	Imperial County, CA	PV (170)	Operational – August 2013	Private	Yes	NA
Crescent Dunes	Nye County, NV	CSP – Power Tower (110)	Construction completed	Public	Yes	Yes – Systematic

Avian Monitoring at Solar Facilities

- Fatality monitoring (and reporting) at very few solar facilities
  - Not required at all facilities
- Differences in monitoring designs and survey effort
  - Affects the ability to compare and integrate data
- Systematic vs. incidental fatality information
  - Systematic information allows hypothesis testing
  - Incidental observations may still be useful in understanding patterns of fatalities

Barn swallow with singed feathers observed at the California Solar One demonstration facility (Source: McCrary et al. 1986).

Avian Monitoring at Solar Facilities, Cont'd

- Variation in factors influencing mortality rate estimation and evaluation
  - **Search effort and searcher efficiency**
  - **Feather spots**
  - **Predation and scavenging**
    - Potential for predators to influence mortality rates by transporting carcasses to the project footprint from offsite locations
  - **Background mortality**
    - Mortality estimates at some solar facilities include adjustments for background mortality

Conclusions & Recommendations

- Avian monitoring
  - Not all utility-scale solar facilities are required to prepare and comply with project-specific avian monitoring protocols
- Existing avian fatality data
  - Standardization is important for integration and comparison
- Flux-related factors (power tower technologies)
  - Various approaches to heliostat standby aiming could significantly reduce flux levels and their impact on avian fatality
- Better collaboration among agencies, industry, and stakeholders to (1) collect scientifically rigorous and comparable data; (2) identify research priorities; and (3) identify appropriate mitigation measures.

U.S. Fish & Wildlife Service

Update on Solar-Avian Interactions in Southern California

Thomas Dietsch
Migratory Bird Division
US Fish and Wildlife Service
CWG Public Meeting
Sacramento, CA
May 10, 2016

Objectives for Presentation

- Provide a review of solar-avian interactions in Southern California
- Discuss hypotheses for avian interactions
- Provide update on actions being taken

Avian Impacts

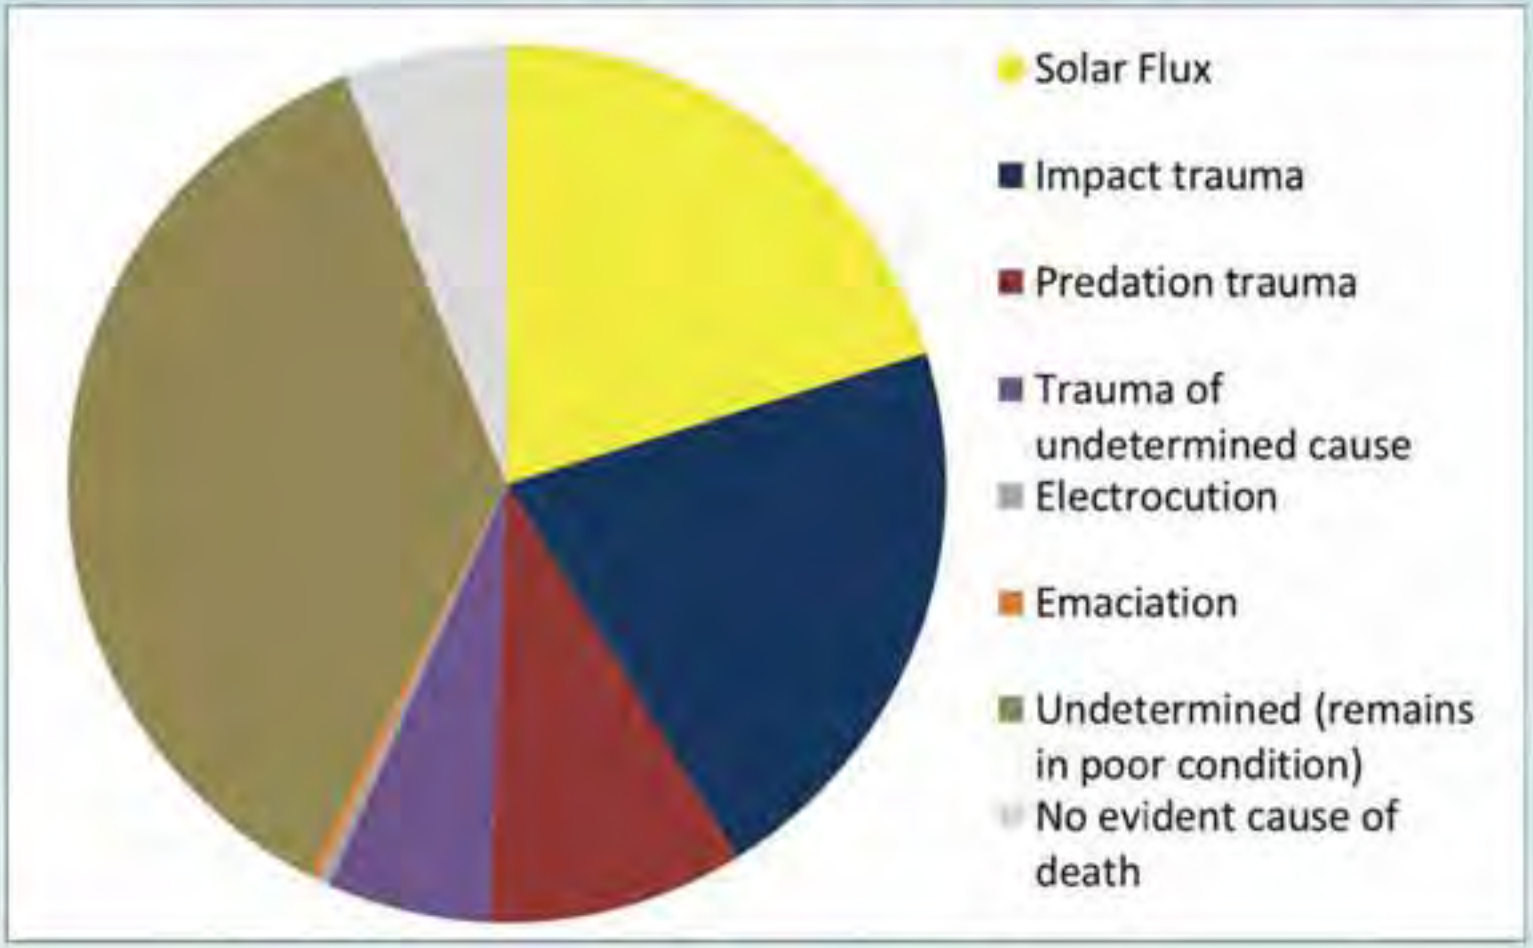
Direct Effects: Collisions

Collisions with panels are common

Concentrated Solar Technologies

Direct Effects

Solar Flux (power tower)



Cause of Death from National Fish and Wildlife Forensics Lab Report (Kagan et al. 2014)

From 3 solar projects, 233 carcasses from 71 species.

Data for Today's Presentation

- Mortality monitoring and reporting is required by lead agencies on many projects.
- Data from 7 projects in Southern California
  (4 Photovoltaic, 2 Solar Trough, 1 Power Tower)
- Data reported from 2012-April 2016.
- Each species was categorized by habitat, migratory group, and foraging guild.

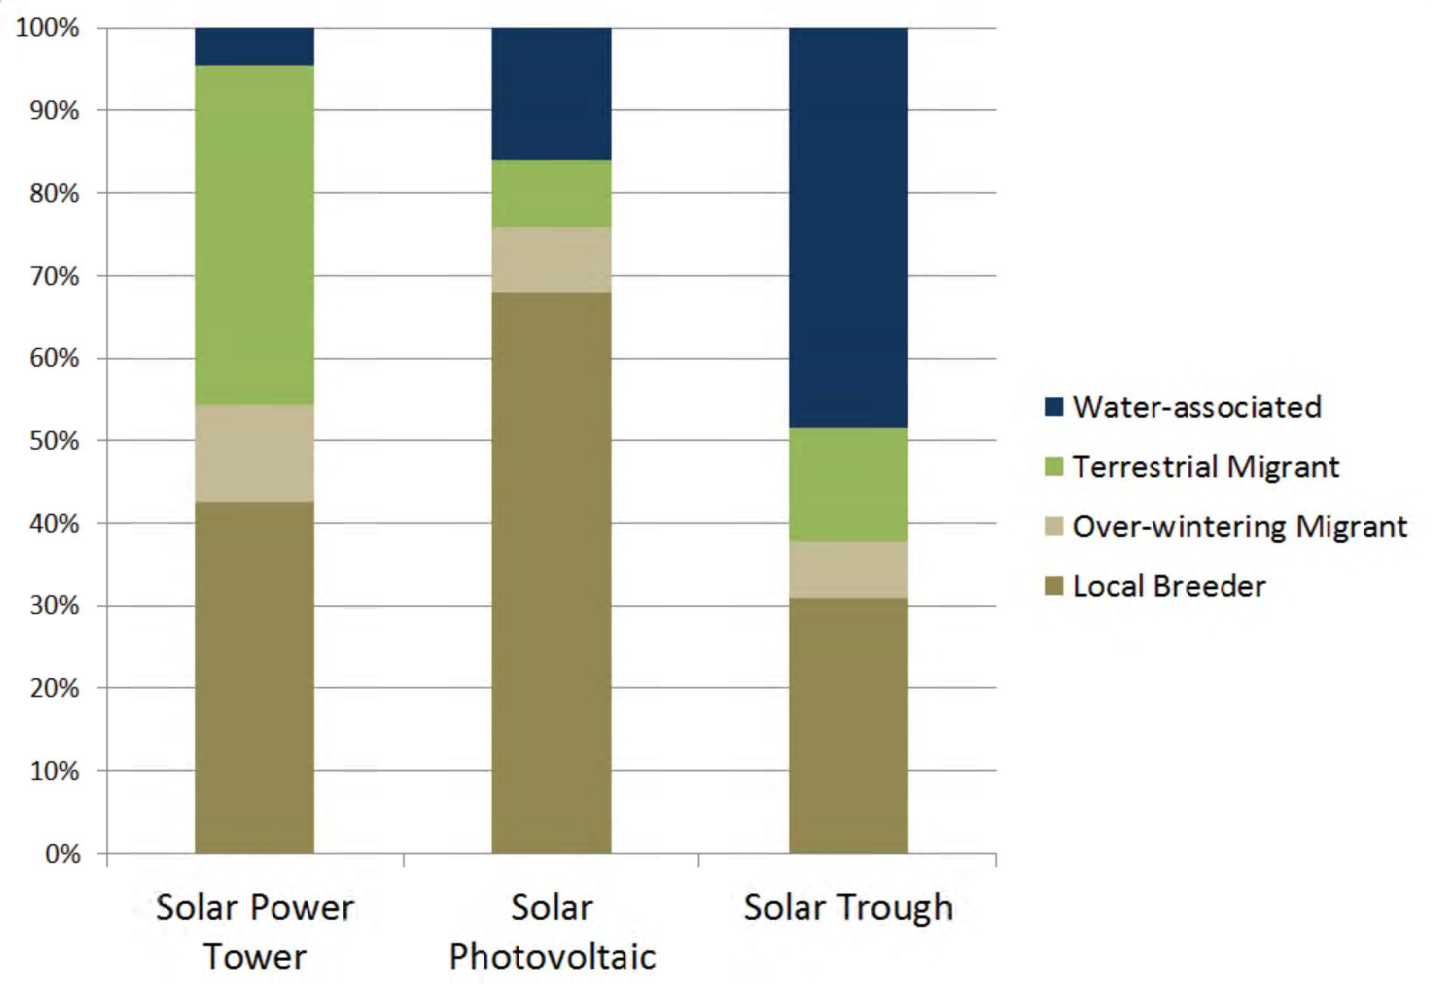
Caveats on Solar Avian Mortality data

- Data are from a mix of incidental reports and systematic surveys on several projects.
- Magnitude of mortalities are not reported here.
- Only projects in Southern California are included in this presentation.
- Data can provide information on which species or taxonomic groups may be at risk.
- Project features and types of injuries also indicated.

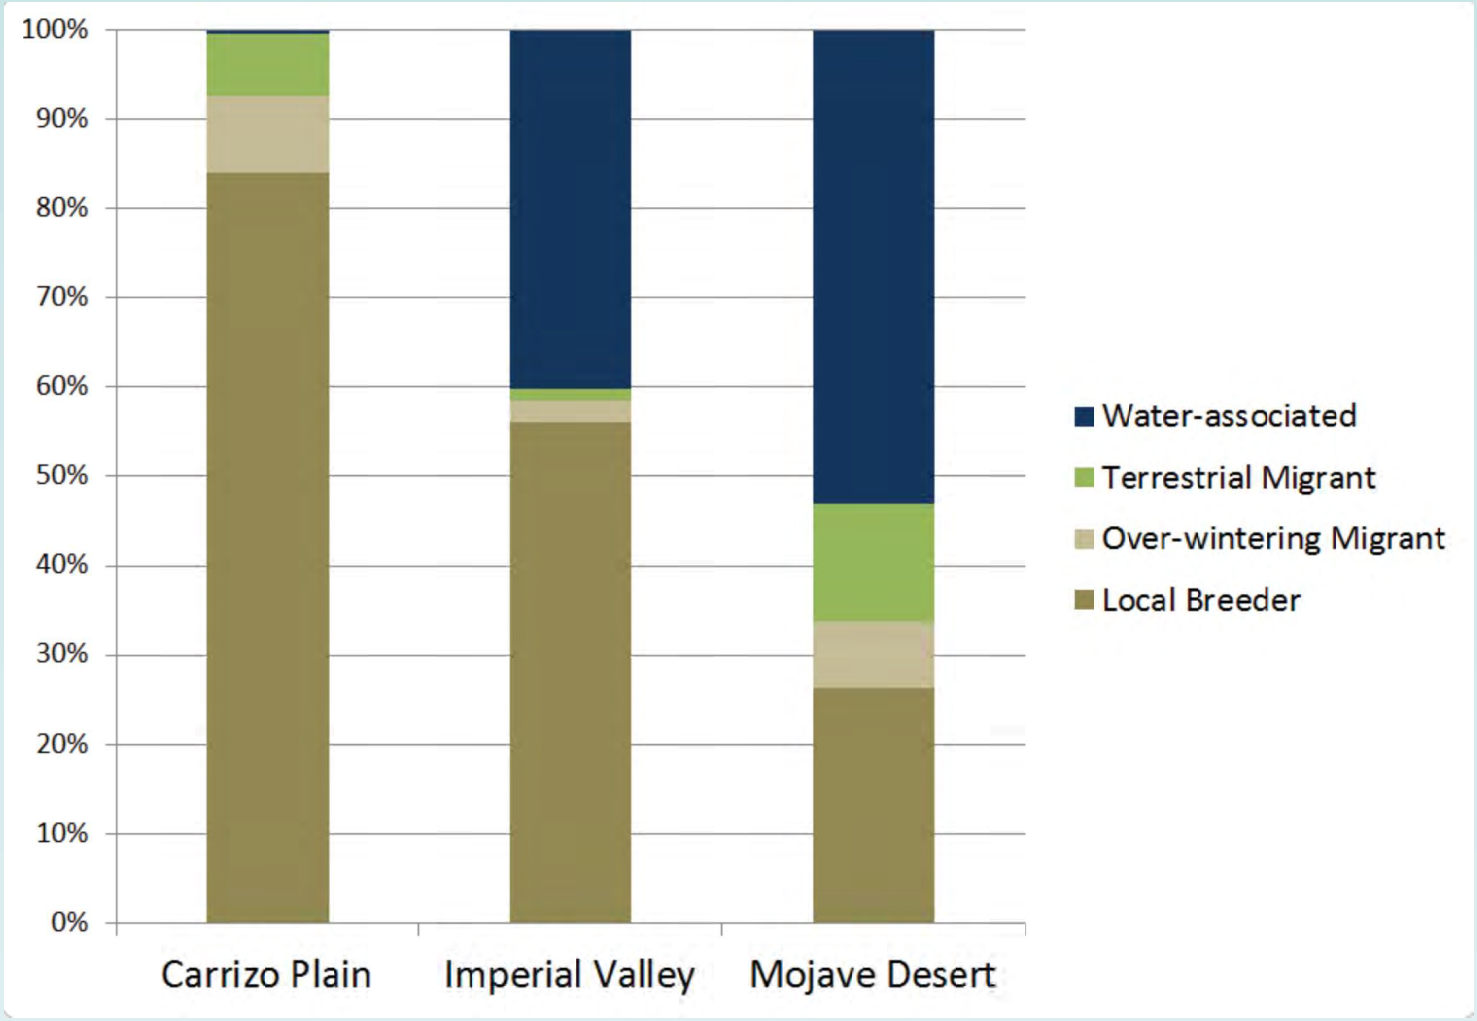
Initial Findings

- National Fish and Wildlife Forensics Lab Report (Kagan et al. 2014)
  - "Significant Bat and Insect Mortality, including Monarch Butterflies".
- 3545 mortalities from 183 species (2012-April 2016)
  - Only mortalities found and reported included, no estimation.
  - Mix of reports from incidental finds and systematic surveys.
  - Many mortalities occur due to dehydration/heat stress after initial injury/stranding.
- Birds of Conservation Concern

Species of Concern

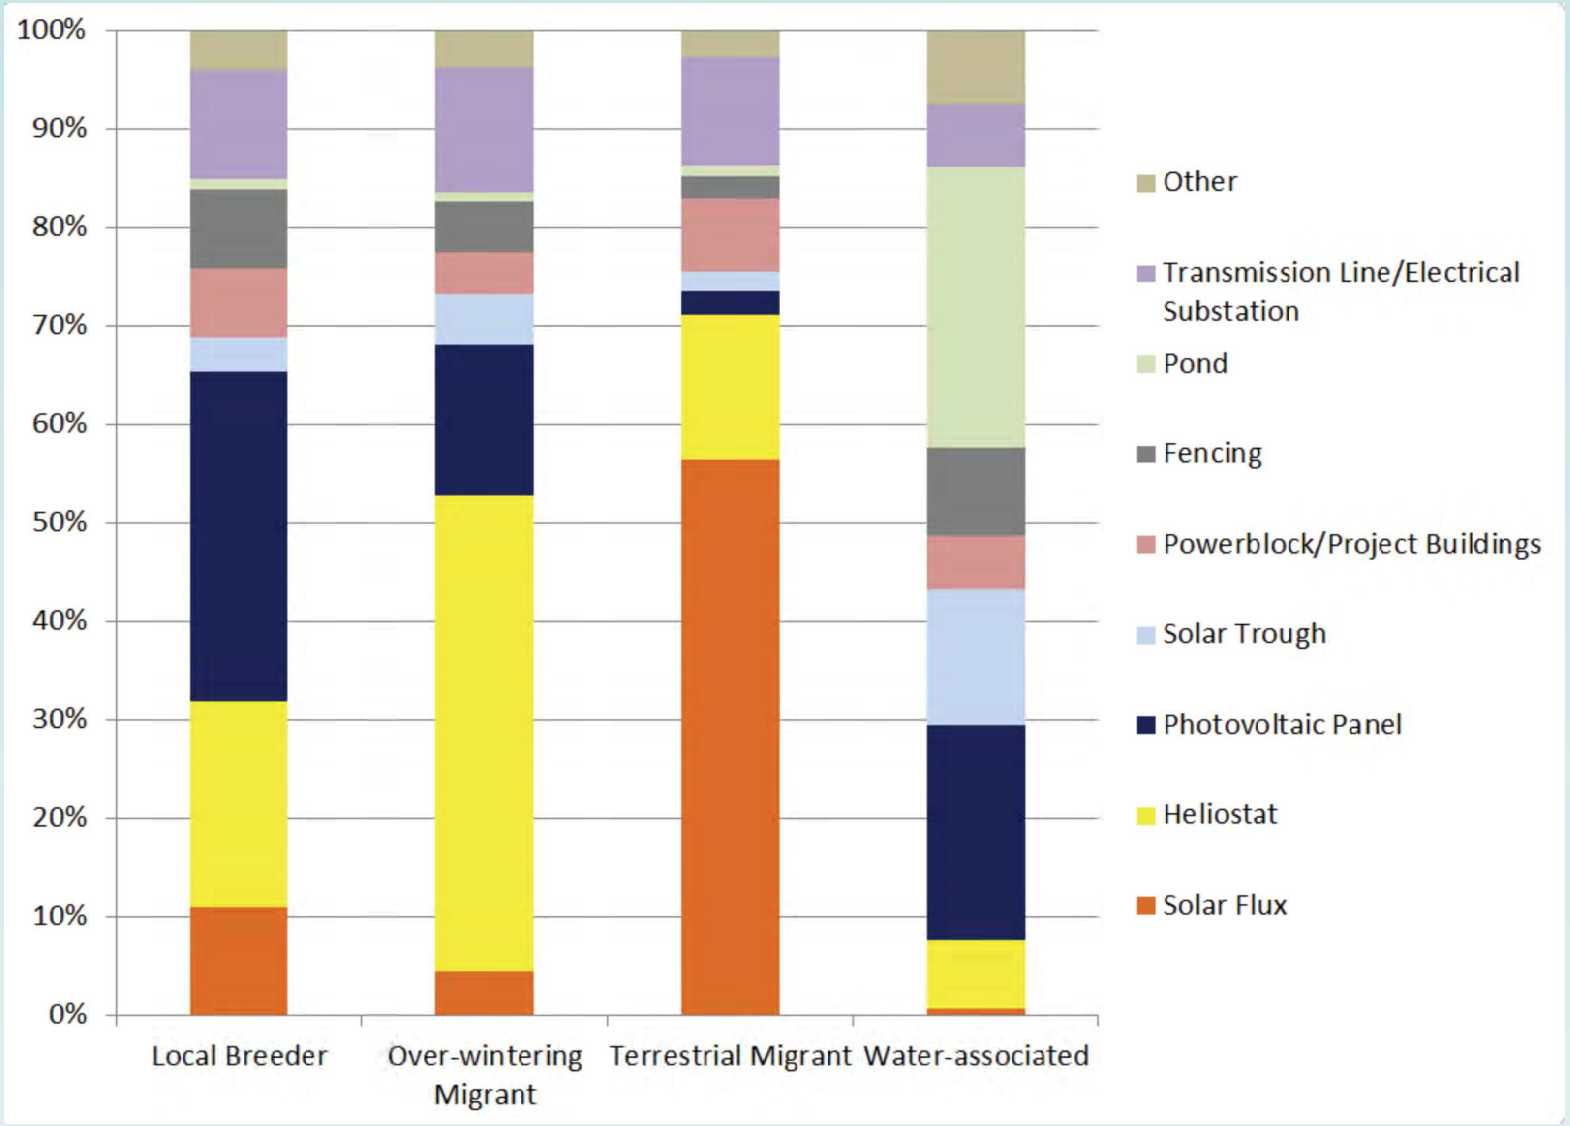


- Federal Endangered/Threatened
  - Yuma Ridgeway's (Clapper) Rail
  - Willow Flycatcher
  - Yellow-billed Cuckoo
- State-listed/Fully Protected
  - Peregrine Falcon
  - Bank Swallow
- 19 Birds of Conservation Concern
  - Western Grebe
  - Horned and Eared Grebes
  - American White Pelican
  - Burrowing Owl
  - Calliope Hummingbird

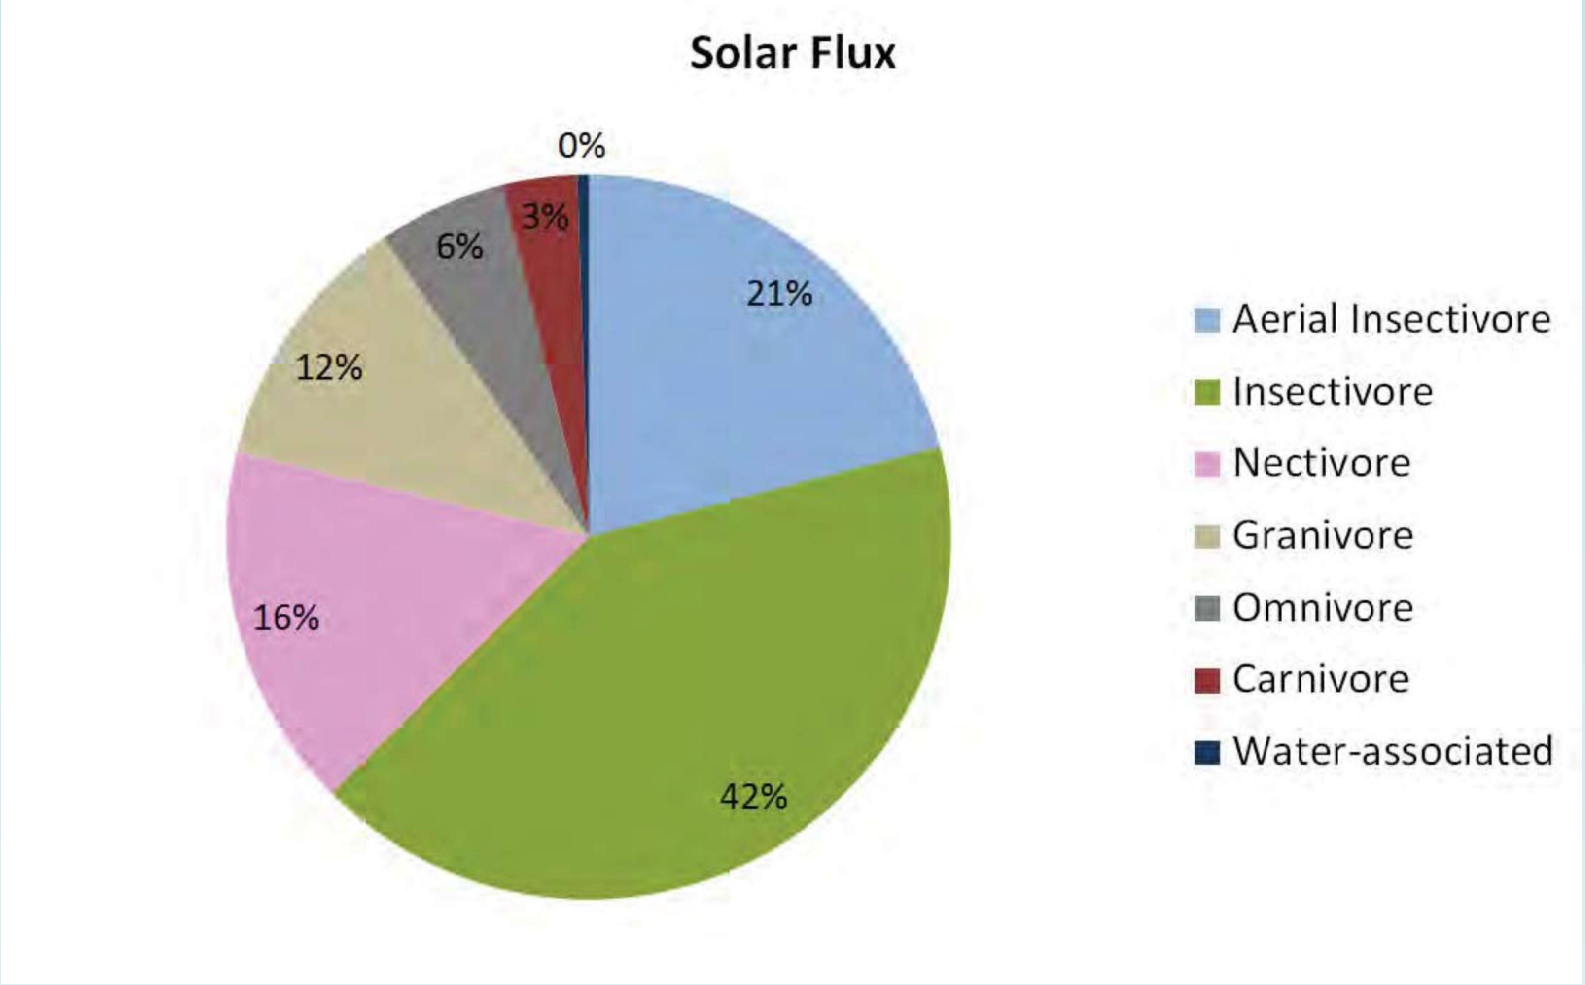


Hypotheses

- Mortalities represent background mortality.
- Mortalities occur during normal bird movements (Anthropogenic, no landscape-scale attraction).
- Polarized light may attract birds and insects to solar projects in the Mojave Desert (Horvath et al. 2009).
- Other resources attract birds to solar projects (Insects and Ponds).



Habitat/Migratory Status of Birds found injured on Solar Projects



Regional Differences for Photovoltaic

Solar Project Features Associated with Mortalities

Foraging Guilds of Birds with Solar Flux Injuries

Findings

- There may be a "lake effect" associated with utility-scale solar projects similar to that described by Horvath et al. 2009.
- Many birds of conservation concern may be at risk.
- Regional (and site-specific) differences may affect which species are at risk.
- Insects may be attracting some birds to areas with elevated levels of solar flux.
- Many species affected are long-distance migrants, thus population level effects may be difficult to determine.
- Robust monitoring needed to better understand these phenomena and to support adaptive management.

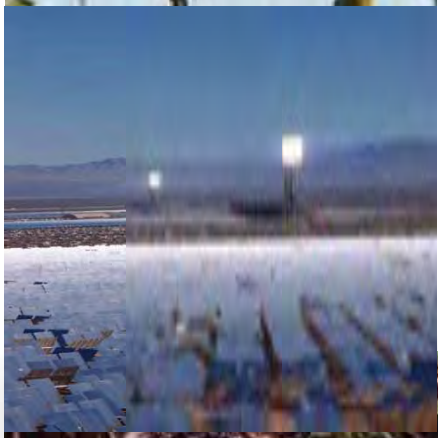
Mortality Monitoring Objectives

- Estimate the total number of birds and bats killed at a facility within a specified time period.
- Determine whether there are spatial or temporal/ seasonal patterns of total bird fatality.
- Evaluate species composition and which taxonomic groups may be at risk.
- Provide results that allow comparisons with other solar sites and to evaluate changes in fatality due to adaptive management.

Research Needs

- Project-scale information needs
- Mojave and Sonoran Desert Migratory Pathways
- Migratory Connectivity Research to identify populations affected
  - Populations affected may be distant from the source of mortalities
  - Stable Isotopes (USGS)
  - Genotypes (UCLA)
  - Telemetry of appropriate-sized birds
- Avian Behavior related to projects
  - Perception and Settling Response
  - Technological Fixes
- Identify Best Management Practices and Deterrent Methods

Update on actions being taken



- Working with solar industry to implement robust mortality monitoring.
  - Searcher Efficiency and Carcass Persistence Trials.
- Solar Bird and Bat Conservation Strategy Guidelines in development.
  - Public meeting on June 22nd in Sacramento.
- Collaborated with USGS to develop Mortality Monitoring Protocols for Solar
  - Protocols for monitoring at each technology type.
- Coordinating with other agencies to find ways to avoid and minimize avian mortalities.
- Coordinating with Avian Solar Working Group (industry and other stakeholders)
- Supporting ongoing research efforts by USGS and UCLA

Questions?

Research to Address Wildlife Interactions with Solar Energy Facilities

Avian-Solar Collaborative Working Group

May 10, 2016

USGS Ecosystems Mission Area

U.S. Geological Survey

Ecosystems

Natural Hazards **Energy and Minerals** **Core Science Systems**

Environmental Health **Water** **Climate and Land Use Change**

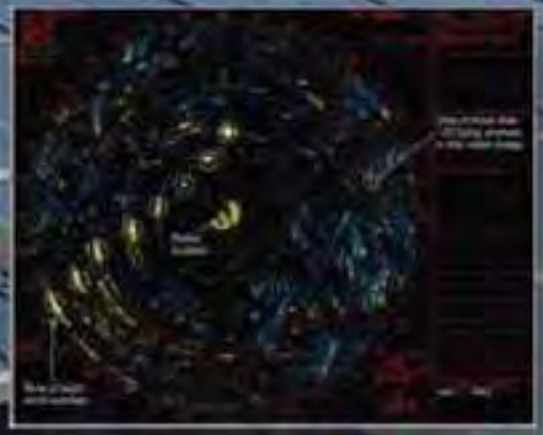
USGS Ecosystems Mission Area
17 Science Centers

+ 40 Cooperative Research Units

USGS

Energy and Wildlife Research

Goals



- **Understand risks:** when and where wildlife occur and how they use space
- **Measure impacts** to wildlife, both direct and indirect
- **Develop solutions:** minimize impacts through technological fixes, management, mitigation

USGS

Measuring Impacts

- Characterize direct and indirect impacts to wildlife
- Define sources of fatality
- Develop consistent and accurate methods to detect and estimate fatalities

USGS

Efficacy of Wildlife Monitoring Technologies at the Ivanpah Solar Electric Generating System

Objective:

- Evaluate efficacy of monitoring technologies to detect birds, bats, and insects flying in the vicinity of flux fields produced at the ISEGS
- Tested technologies concurrently (portable radar, surveillance video, thermal video). Also performed invertebrate sampling
- Monitoring period covered ~20 days in May and September 2014 during bird migration season
- Developing data handling and analysis software (presence/absence, speed, direction, abundance)

PIs: Robb Diehl (NRMSC), Paul Cryan & Ernie Valdez (FORT)

Status: In review. Full data release will accompany publication

USGS

Monitoring Methodology for Solar Facilities

- No guidance currently exists for addressing wildlife conservation concerns at solar energy facilities
- Published studies have not directly addressed the methodology needed to accurately estimate fatality of birds and bats at solar facilities

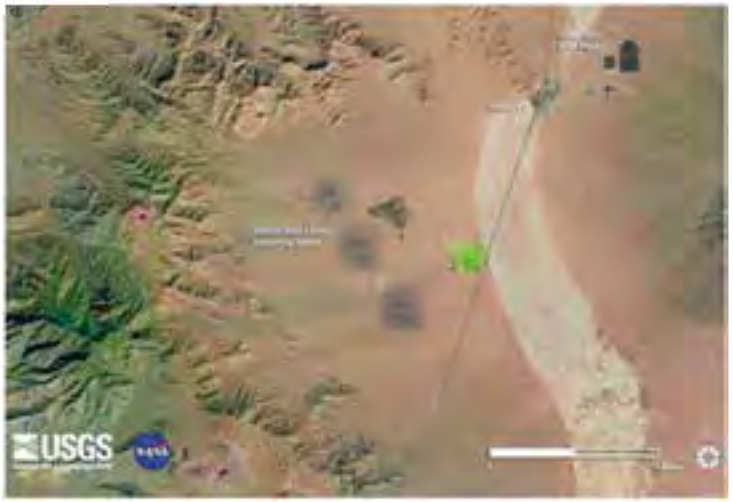
Objective:

- Develop monitoring methodology for solar facilities to produce a consistent carcass search methodology

PI: Manuela Huso (FRESC)

Project completion: May 2016

US FWS Pacific Southwest Region



USGS

Solar Fatality Estimator and *"Evidence of Absence"* Software

Need consistent and accurate methods to detect and estimate fatalities from carcass searches at solar facilities

Objective:

- Modify existing software to produce unbiased estimates of fatalities at utility-scale solar facilities and "Evidence of Absence" software for rare species
- Define sources of fatality
- Estimate searcher efficiency and carcass persistence
- Determine when thresholds have likely been exceeded and mitigation might be considered

Ivanpah Solar Electric Generating System

Golden eagle at wind farm in CA.
Credit: Jeff Lovich

PI: Manuela Huso (FRESC)

Anticipated completion: April 2017

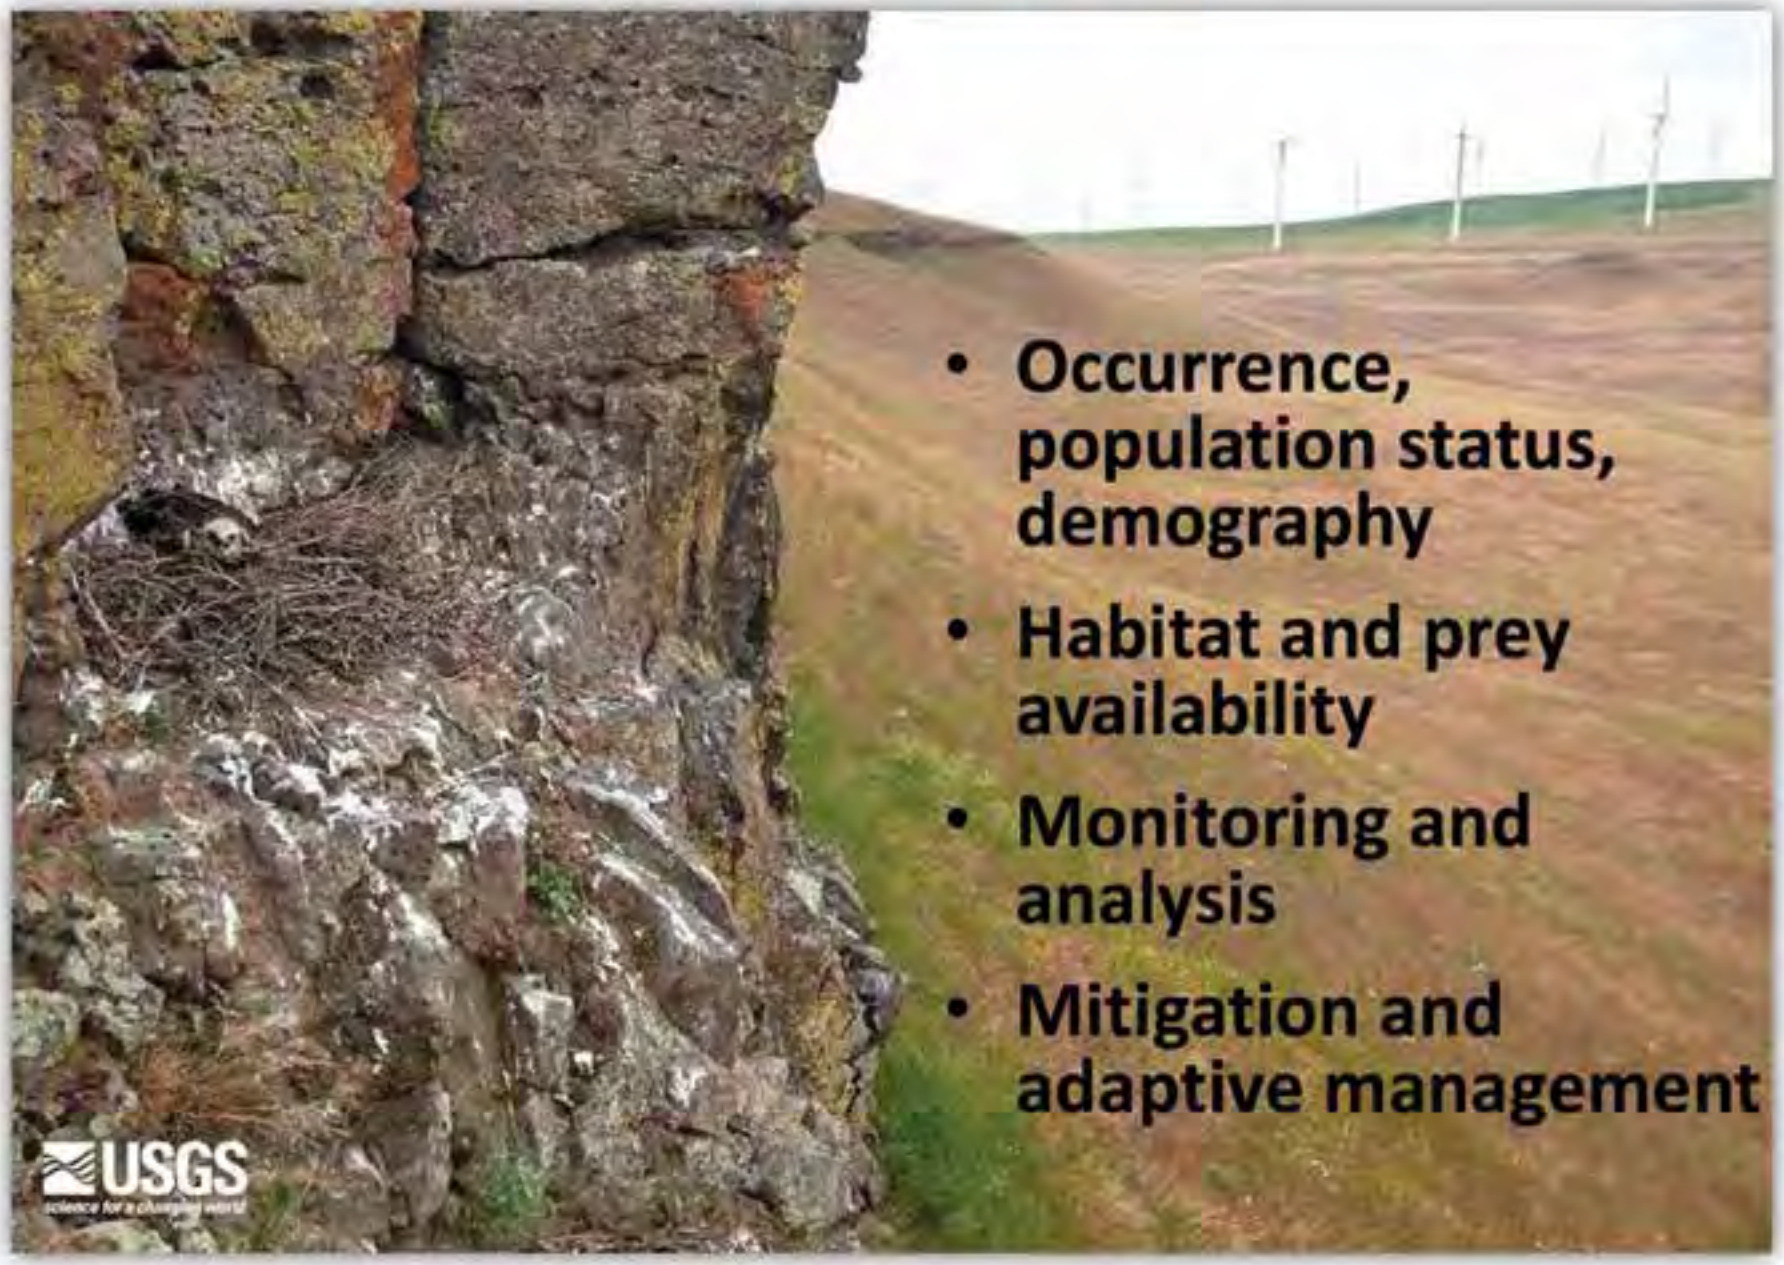
USGS

Assess Energy Development Impacts to Sensitive Bird and Bat Species and Populations

Need to more accurately estimate fatality rates and effectiveness of mitigation techniques

Project Objective:

- Estimate geographic scope of species impacted
- Use demographic modeling to assess how fatalities affect population increases or declines
- Determine best practices for conducting risk assessments and predicting mitigation outcomes



PI: Todd Katzner (FRESC)

Project period: 2015-2018

USGS

Understanding Risks

- Occurrence, population status, demography
- Habitat and prey availability
- Monitoring and analysis
- Mitigation and adaptive management

Habitat Modeling to Inform Energy Development

Renewable energy development in the Mojave Ecoregion is creating potential impacts to multiple species of wildlife

USGS Published Research

- Habitat suitability models for over 50 desert plant and animal species can be used to rank potential habitat loss
- Golden eagle status assessments and monitoring protocols

PIs: Todd Esque, Amy Vandergast (WERC)

Publication: Inman, R. D. et al., 2014. Mapping Habitat for Multiple Species in the Desert Southwest. Open File Report 2014-1134.

USGS

Linking Habitat and Prey Availability to Golden Eagle Ecology and Solar Energy in the Mojave

Inform energy and land-use planning ; assist with delineating conservation and development zones

Golden Eagle. Credit: USFWS

Objectives:

- Assess food habits, reproductive success and prey availability of nesting golden eagles in the Mojave
- Synthesize and review rabbit distribution and abundance in the Western US
- Develop a regional prey database for rabbit populations across 17 western states

PIs: Kathleen Longshore & Todd Esque (WERC)

Product completion: Spring/Summer 2016

USGS

Surveying and Monitoring Golden Eagles and Other Raptors in the DRECP Area

Effective surveys for eagles and status monitoring and mapping are needed to meet DRECP objectives

Objective:

- Develop survey designs and field procedures to determine the distribution of golden eagles
- Assess their occurrence and nesting success in the DRECP area
- Compile and analyze eagle population data for CA & NV, and the larger context of their full migratory range into a geospatial database

PI: David Wiens (FRESC)

Project Completion: Summer 2016

USGS

Helping Inform Siting Decisions

What are regional golden eagle nesting and foraging behaviors that may lead to eagle – infrastructure interactions?

Objectives:

- Population surveys, biotelemetry and genetics
- Focus on occupancy and movement
- Abundance and survival in relation to prey dynamics
- Regional understanding

PIs: Jeff Tracey & Robert Fisher (WERC)

Products: Biotelemetry data for 24 eagles released May 2016

USGS

Needs and Future Directions

- Expand research on wildlife interactions with large scale solar power facilities
- Understand direct and indirect effects on species and landscapes
- Expand knowledge of where species are on the landscape
- Continue efforts to develop deterrents to minimize interactions of wildlife with facilities and effective mitigation strategies

ASWG Mission

The ASWG is a collaborative group of environmental organizations, academics, solar companies, and solar industry representatives that will advance coordinated scientific research to better understand how birds interact with solar facilities. Given the threat that climate change poses to avian species, participants will work with the shared interests of protecting avian species and developing solar projects in an environmentally responsible and a commercially viable manner.

Participants and Roles

- Convener: Large-scale Solar Association
- Facilitation team: Pivot Point
- Decision-making members:
  - Audubon California
  - Defenders of Wildlife
  - Duke Energy
  - First Solar
  - Large-scale Solar Association
  - Natural Resources Defense Counsel
  - NextEra Energy Resources
  - Recurrent Energy
  - SunEdison
  - SunPower

Progress to Date

2016

January

- ASWG meeting with Research Panel (1/13)
- Finalizing Terms of Reference
- Multiagency CWG meeting

February

- Research panel works independently
- ASWG call with research panel

March

- ASWG meeting
- Progress report on Research Panel from Science Advisors

April

- Research Panel develops draft report

Ongoing Engagement with Multiagency Avian-Solar Collaborative Working Group

ASWG Next Steps

2016

May

- Multiagency CWG meeting (Week of 5/9)
- Research panel shares draft report with ASWG

June

- ASWG meeting with research panel (6/1-2)
- ASWG discussion of priorities

July-August

- ASWG and agency observers to meet to discuss final report
- Finalize priorities after agency input

Ongoing Engagement with Multiagency Avian-Solar Collaborative Working Group

Research Panelists

Science Advisors		
Thomas Smith	UCLA	Director, Center for Tropical Research
Kristen Ruegg	UCLA / UCSC	Institute for the Environment and Sustainability, Center for Tropical Research

Luke George	Colorado State University	Senior Research Associate
Rodney Siegel	Institute for Bird Populations	Executive Director

ASWG Research Questions

I. Siting

1) Do avian mortality rates at PV solar power plants differ from background rates at control sites?

2) What is the relationship of mortality rates to site characteristics (e.g., panels, fence lines, overhead transmission lines, scale/configuration of installations, proximity to other solar facilities or other natural or human landscape features such as levels of fragmentation and loss of habitat, migratory flyways and stop over sites, etc.)?

3) How might siting be optimized to reduce potential impacts on vulnerable bird populations in a cost-effective manner?

ASWG Research Questions

II. Population level effects

1) Are solar sites causing avian mortality that is significant at the scale of the population for individual species?

a) How should populations be defined in this context?

b) What research and data would be required to determine if mortality associated with solar sites is additive or compensatory?

c) How do population impacts differ by species, guild, migratory pathway, taxonomic unit and classification (threatened versus non-threatened), etc.?

ASWG Research Questions

III. Lake Effect

1) Are water or other birds attracted to solar panels because they perceive them as water bodies (i.e., a “Lake Effect”)?
2) Is a possible Lake Effect related to geographic and environmental/infrastructure characteristics of sites?
3) Do birds show evidence of attraction to large solar arrays (e.g. show changes in flight direction or behavior as they approach arrays)?
4) What types of birds are affected?
5) Is possible mortality due to stranding, strikes or some other process?
6) If the Lake Effect is demonstrated, what cues are causing the birds to mistake the solar array as a water body (e.g., what wavelength of reflected light are they responding to)?
7) If a Lake Effect can be demonstrated, how might the threat be mitigated or eliminated?

ASWG Research Questions

IV. Avian attraction/mitigation/deterrents

1) What are the avian risk-reduction options that might lower avian mortality?

V. Feather spots

1) What do feather spots represent? Can feather spots be better defined and quantified?

a) What methods can be used to identify the species and number of individuals that comprise feather spots? Are feather spots a reliable indicator of avian strikes and/or fatalities.

b) Do feather spots from larger carcasses persist in the environment longer than spots from smaller ones?

ASWG Research Questions

VI. Climate change and other broader impacts

1) What demographic effects may result from climate change in the absence of large-scale solar development, and how do these compare with the impacts of solar facilities for specific bird populations?

2) Using historical and contemporary data on the abundance and distribution of avian species with future climate projections, what are the predictions for the future avian distribution and population trends in California?

    a) How can this be used to mitigate the impacts of PV facilities?

Achieving Mutual Goals

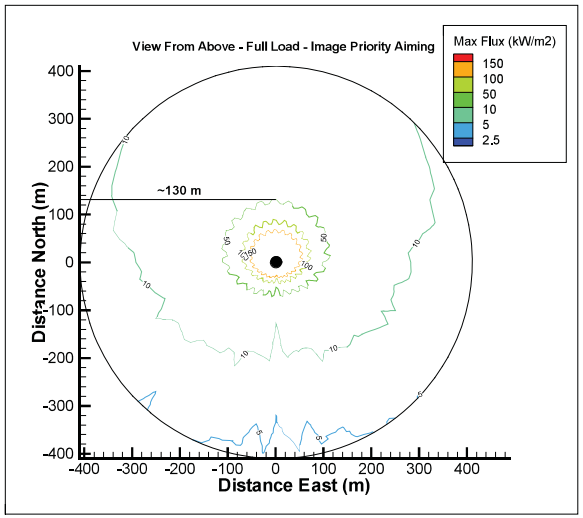
- Understanding common research interests
- Identifying key priorities
- Identifying funding mechanisms
- Continued collaboration to drive short and long term results

Development of Tools, Training, and Outreach to Address Solar Glare and Flux-Related Avian Impacts

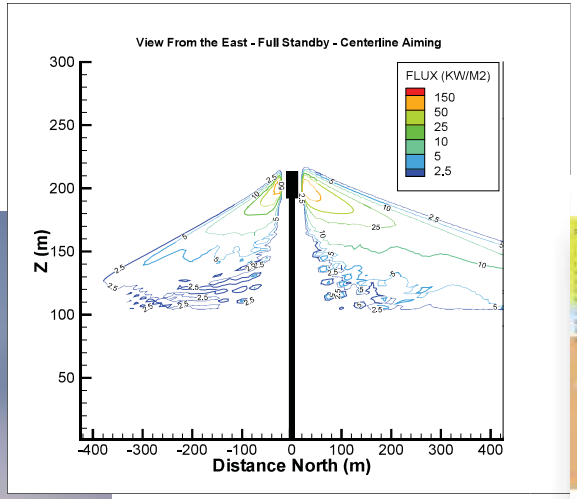
Multiagency Avian-Solar Collaborative Working Group Public Workshop

Timothy Wendelin
National Renewable Energy Laboratory

Clifford K. Ho
Sandia National Laboratories



Cianin Sims
Sims Industries

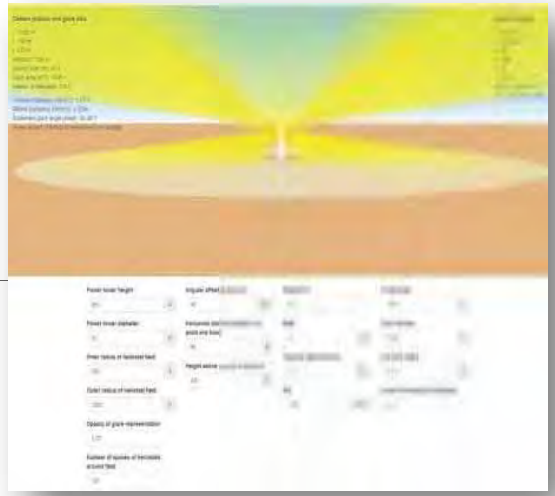


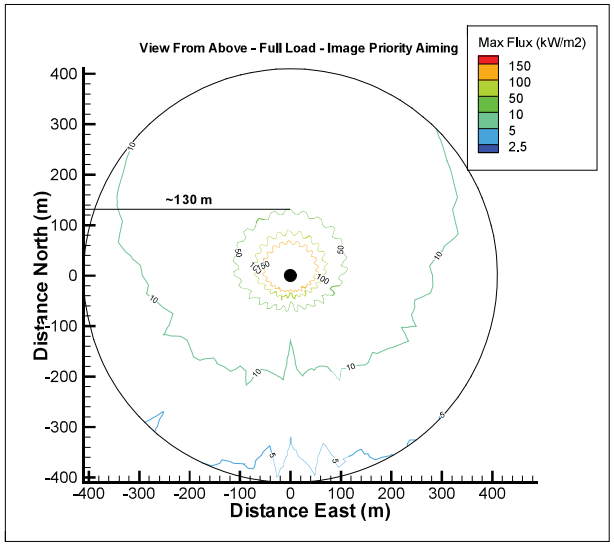
May 10, 2016

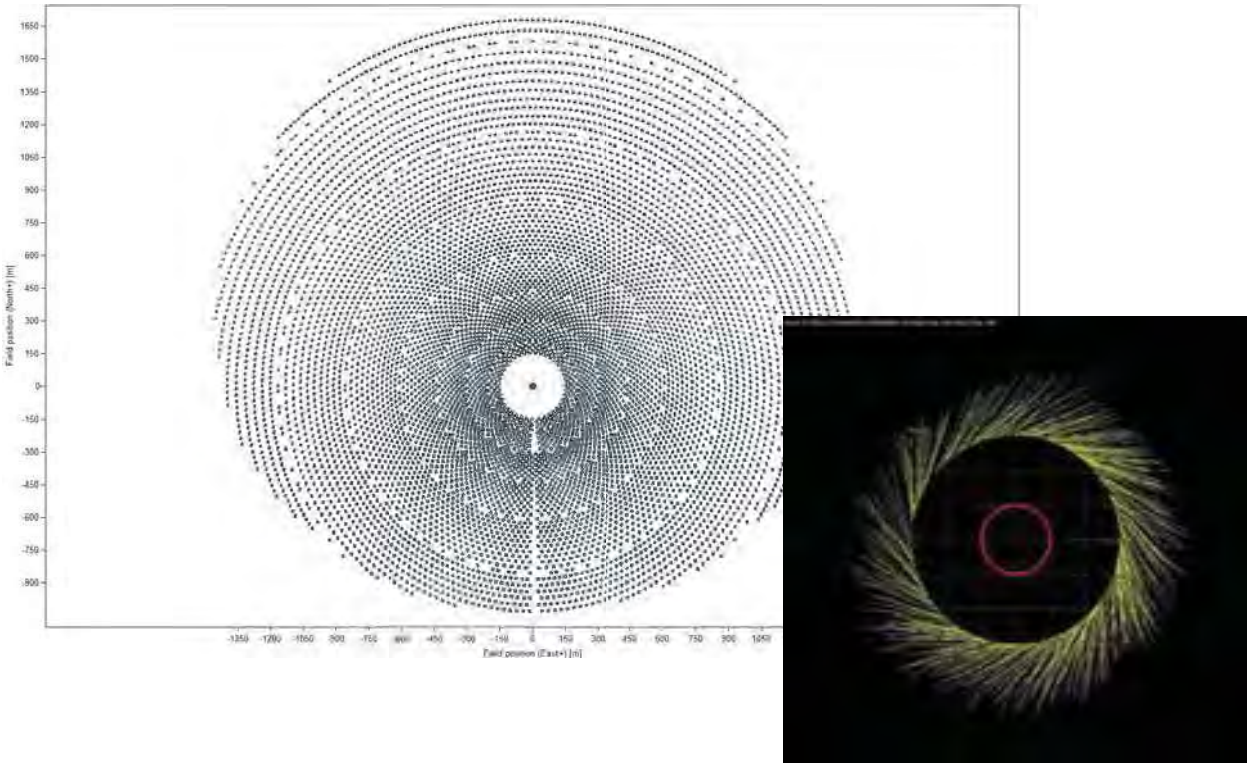
NREL is a national laboratory of the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, operated by the Alliance for Sustainable Energy, LLC.

Goals

- **DOE is funding work to address avian flux hazards**
  - Develop models and tools to quantify flux (power/unit area) from heliostat aiming strategies
  - Mitigate impacts of avian (and glare) hazards
  - Optimize operational performance







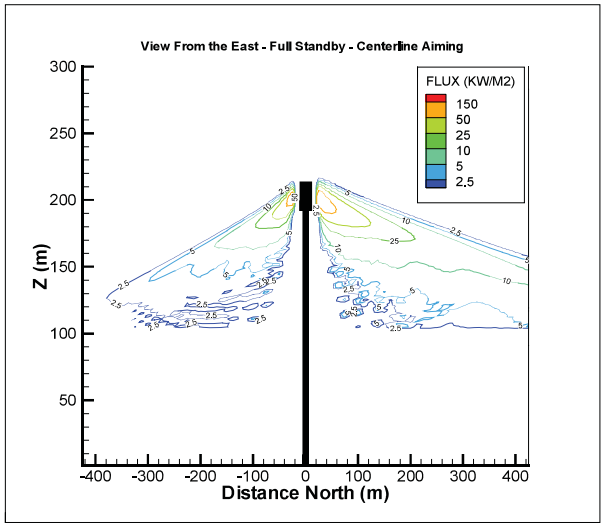


Photo and model of high-flux regions causing solar glare and avian hazards at Ivanpah Solar Electric Generating System

Previous Work

- **Argonne/NREL Study "A Summary Review of Issues Related to Avian Mortality at Utility-Scale Solar Facilities"**
  - Preliminary results compare well with previous analyses
  - Various approaches to standby aiming can significantly reduce flux levels and their impact on avian mortality.
  - Future work recommended to determine the impact of alternative aiming strategies which simultaneously minimize impacts to plant operations and avian health.

Approach

1. Identify metrics for safe solar flux levels

2. Develop tools to model solar flux in air space around power tower
   - Case studies: Ivanpah and NSTTF at Sandia (for validation)

3. Compare alternative heliostat standby-aiming strategies
   - Minimize solar flux according to metrics in (1) above
   - Minimize impact on plant operations

4. Develop user friendly assessment tool for agencies/stakeholders

Ivanpah Solar Electric Generating System

National Solar Thermal Test Facility (NSTTF)

Tower Illuminance Model

Solar Energy Development Center
(Negev Desert, Southern Israel)

- Tests conducted with bird carcasses exposed to different flux levels (Santolo, 2012)
  - "no observable effects on feathers or tissue were found in test birds where solar flux was below 50 kW/m^2 with exposure times of up to 30 seconds."
  - California Energy Commission analytical study found that "a threshold of safe exposure does not exist above a solar flux density of 4 kW/m^2 for a one-minute exposure"

Crescent Dunes (SolarReserve)

(Tonopah, Nevada)

- **110 MW_e molten-salt power tower**
- **In January 2015, 3,000 heliostats were aimed at standby points above receiver**
  - 115 bird deaths in 4 hours
  - SolarReserve spread the aim points to reduce peak flux to < 4 kW/m^2
    - Reported zero bird fatalities in months following change

Figure 1 – The halo created by the reflected light of 3,000 heliostats which caused the bird mortalities.

Images from http://cleantechnica.com

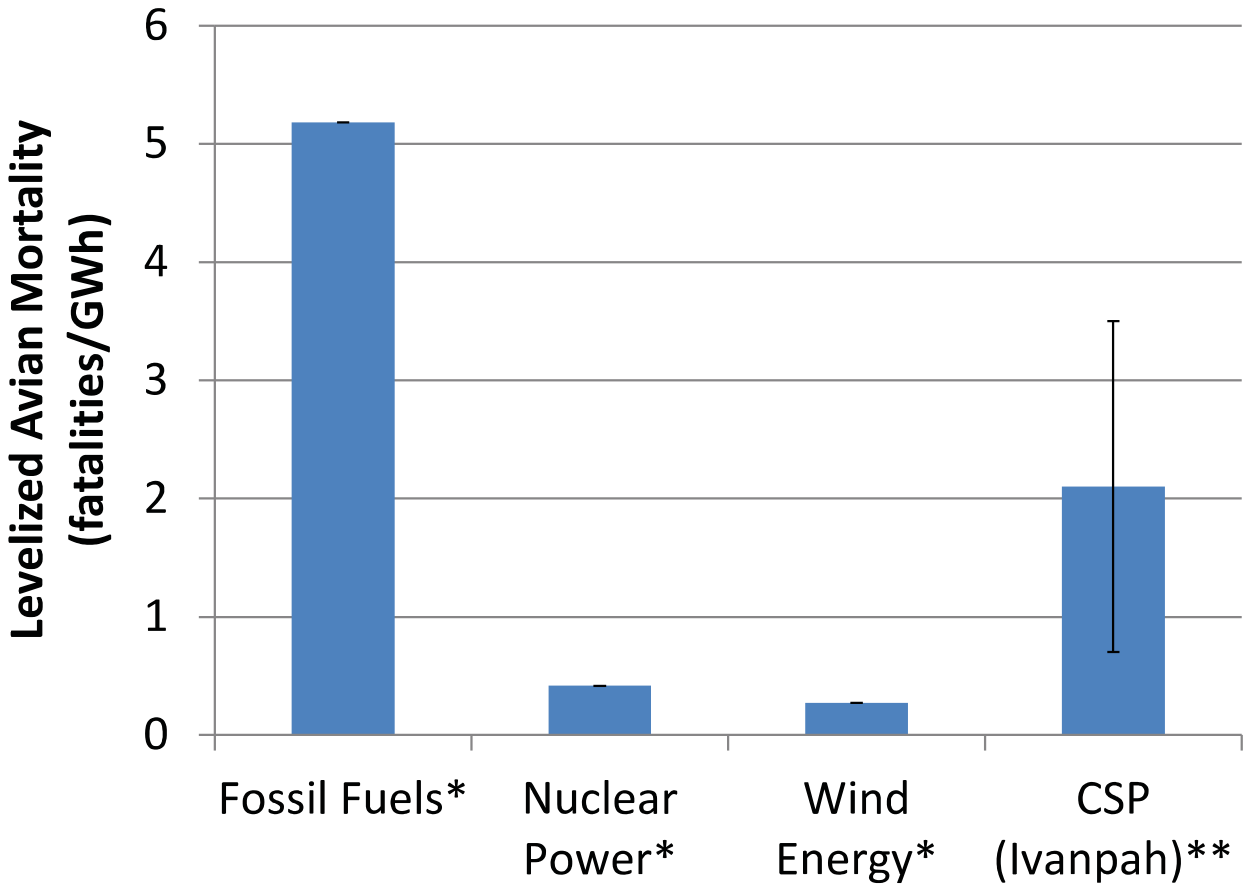
Ivanpah Solar Electric Generating System

(Ivanpah, California)

- **390 MW_e direct steam power-tower plant (3 towers)**
- **Kagan et al. (2014) found 141 bird fatalities Oct 21 – 24, 2013**
  - 33% caused by solar flux
  - 67% caused by collisions or predation
- **H.T. Harvey and Associates found 703 bird fatalities in first year at ISEGS**
  - Study estimated 3500 bird fatalities accounting for search efficiency and scavengers removing carcasses
- **ISEGS has since implemented new heliostat aiming strategies and bird deterrents**

	Number of Detections				
Cause	Winter	Spring	Summer	Fall	Total
Singed	27	100	42	147	316
Collision	14	15	10	45	84
Other*	5	5	2	3	15
Unknown	51	82	61	94	288
Total	**97**	**202**	**115**	**289**	**703**

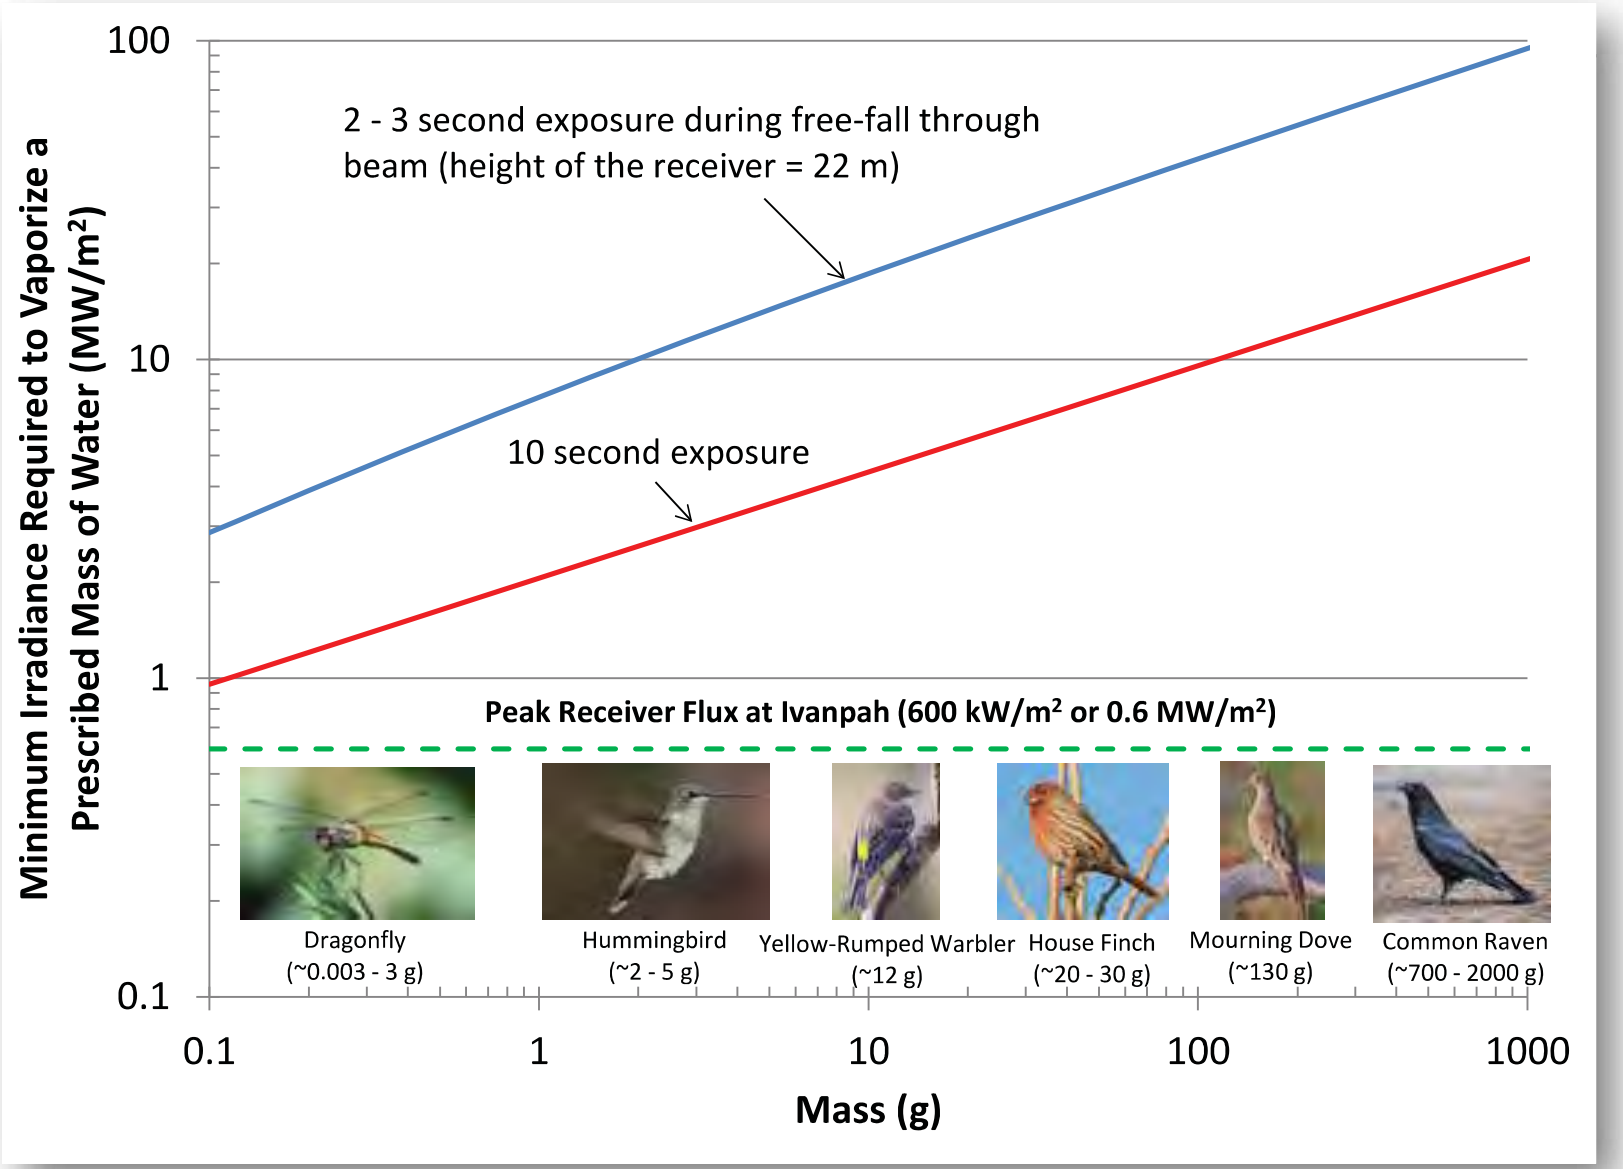
* Includes detections in ACC buildings without evidence of singeing or collision effects.



H.T. Harvey and Associates, 2013 - 2014

Gemasolar Thermosolar Plant
(Andalusia, Spain)

- 20 MW_e molten-salt power tower plant
- 14-month study revealed no avian fatalities in vicinity of tower (Dept. of Zoology, U. Granada)



Levelized Avian Mortality for Energy (LAME)

*Sovacool (2009)

**During first year of operation at Ivanpah (2013 – 2014) before mitigation measures and deterrents were implemented

Feasibility of Bird Vaporization

Deterrents

- **Acoustic**
  - Painful or predatory sounds
- **Visual**
  - Intense lights and decoys
- **Tactile**
  - Bird spikes, anti-perching devices
- **Chemosensory**
  - Grape-flavored powder drinks (methyl anthranilate)

Conclusions from prior studies

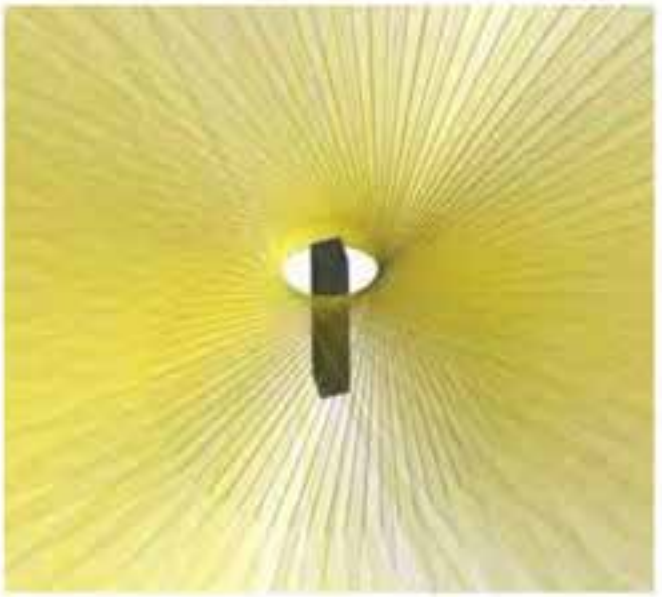
- The large number of "streamers," or smoke plumes, observed and attributed to vaporization of birds is likely caused by insects flying into the concentrated flux
- Complete vaporization of birds flying into concentrated solar flux is highly improbable
- Safe irradiance levels for birds have been reported to range from 4 kW/m^2 to 50 kW/m^2
- Mitigation measures and bird deterrents can and are being used

Flux Hazard Analysis

- Create computer model of baseline power tower design (Ivanpah Unit #2) in SolarPILOT / SolTrace.
  - Heliostat geometry, positions and tower height from NRG.
- Create computer model of National Solar Thermal Test Facility in SolarPILOT / SolTrace.
  - Validate model using flux measurement tools

Flux Hazard Analysis

- Obtain/establish relevant information/parametric data from industry/stakeholder workshop
  - Baseline/novel aiming strategies.
  - Heliostat control capabilities (slew rates, aiming algorithms/capabilities)
  - Metrics for safe solar flux levels (I_{haz}, $V > I_{haz}$)
  - Performance metrics



Flux Hazard Analysis

- Apply methodology to Ivanpah and NSTTF fields for analyzing baseline and alternative cases for standby conditions.
  - Generate volumetric flux maps for standby aim-point strategies for representative times and days of the year.
  - For representative flight paths through the volume, perform worse case thermal analysis to determine whether surface (feather) temperature exceeds 160° C along given flight path.
  - Consider number of flight paths exceeding 160°C or the total time of exceedance as metrics to determine the effectiveness of different stand-by aiming strategies.

Flux Hazard Analysis

- Evaluate successful aiming strategies for impact on annual performance
  - Quantify time from standby to operational for representative days of the year and for both baseline and alternative standby aiming strategies.
  - Quantify annual performance impact of alternative vs baseline cases with the goal of achieving zero loss of annual energy delivered.
- Provide both input and output data from methodology for validation of the enhanced Tower Illuminance Model (TIM)

Evolution of U.S. Commercial Wind Technology

Wind Turbines May Impact Wildlife & Habitats

The discussion of wind turbine impact on wildlife began at the Altamont Wind Resource Area, California, in the late 1980s and early 1990s

Junction Hill Top Wind Farm, Iowa. Five GE 1.6-megawatt (MW) turbines. *Photo by Tom Wind, NREL 26494*

Altamont Pass Wind Resource Area, California. Kenetech 56-100 kilowatt (kW) turbines. *Photo by Shawn Smallwood, NREL 17329*

Real or Perceived Wildlife Impacts can be a Challenge for Development

- Misinformation on potential of impacts is rampant
- Impacts are species- and habitat-specific
- Impacts are site-specific; micrositing is critical to reducing these impacts.

Combination of 221 Mitsubishi Heavy Industries 1-MW turbines and 53 GE 1.5-MW turbines at the Cedar Creek Wind Farm in Grover, Colorado. *Photo by Dennis Schroeder, NREL 30593*

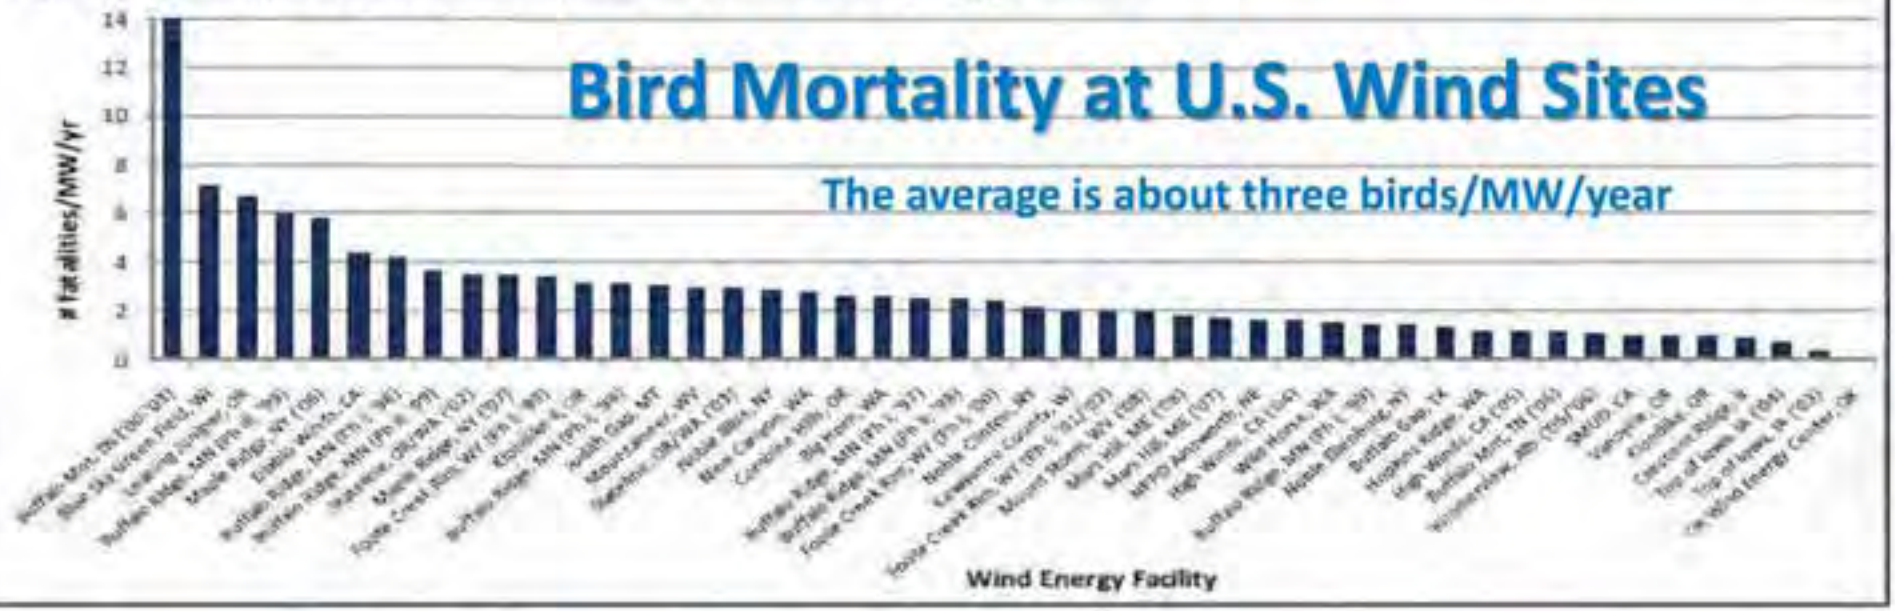
Figure 2: Summary of All Bird Mortality Rates at Various Wind Energy Facilities*



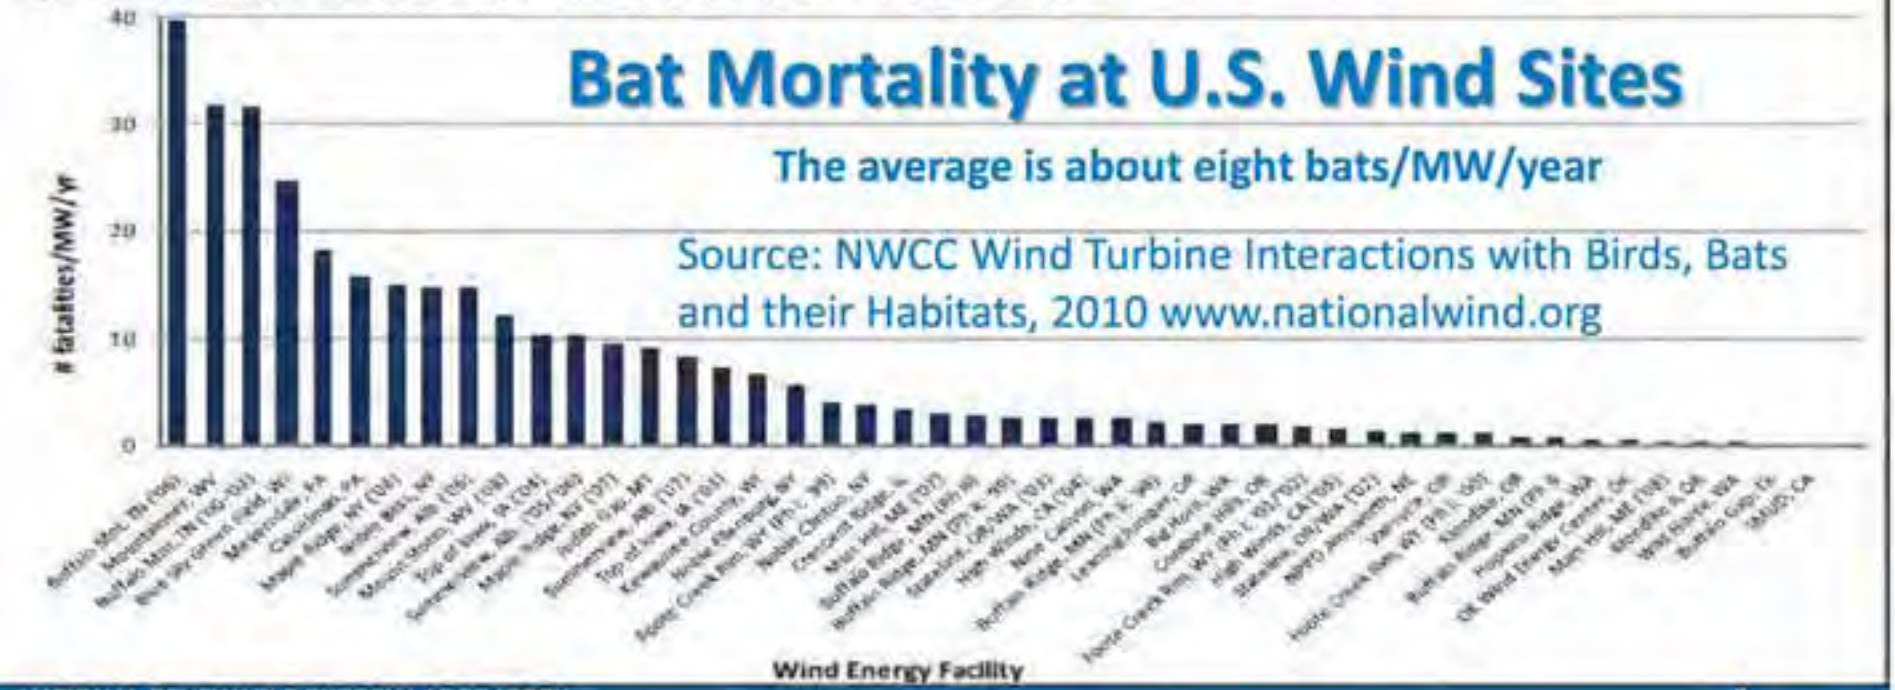


Figure 3: Summary of Bat Mortality Rates at Various Wind Energy Facilities**

U.S. Fish and Wildlife Service Statutory Authority for Wind Permitting Guidelines

- **Endangered Species Act:**
  - Directs the Service to identify and protect threatened and endangered species and their critical habitat
  - Must provide a means to protect the species' ecosystems.
- **Migratory Bird Treaty Act:**
  - Based on a strict liability statute
  - Does not require proof of intent, knowledge, or negligence to be deemed a violation
  - Does include actions resulting in the 'taking' or possession of a protected species, in the absence of a USFWS permit or regulatory authorization, is deemed a violation.
- **Bald and Golden Eagle Protection Act:**
  - Provides additional legal protection for bald and golden eagles. First enacted in 1940/ golden eagle added in 1962

- Collaboratives
- Conclusions

Challenges to Wildlife Related to Wind Energy

Wildlife challenges include:

- Habitat and species that are likely to be impacted vary by
  - Climate
  - Topography
  - Location
- No single solution
- Impacts expected to increase as more turbines are installed across the country—but these can be managed.

Ways of addressing the challenges:

- Identify-near-term research needs
- Use a multipronged approach
- Involve multiple stakeholders
- Garner support for collaborative field research, methods/metrics refinement, tools, mitigation strategies, and deterrent development/testing
- Disseminate information.

Challenges: Key Issues Being Addressed

Impacts of wind turbines on wildlife include:

- Bats (mortality)
- Raptors (mortality)
- Nocturnal migration (mortality)
- Prairie birds (habitat – displacement; genetic diversity)
- Cumulative (population impacts).

Tools to avoid problematic sites:

- Federal (e.g. Wind Energy Guidelines)
- State guidelines
- Pre versus post construction validation
- Mapping of migratory pathways
- Presiting assessments
- Risk assessments
- Literature archive
- Peer review (promote transparency)

Sage Grouse. *NREL 20649*

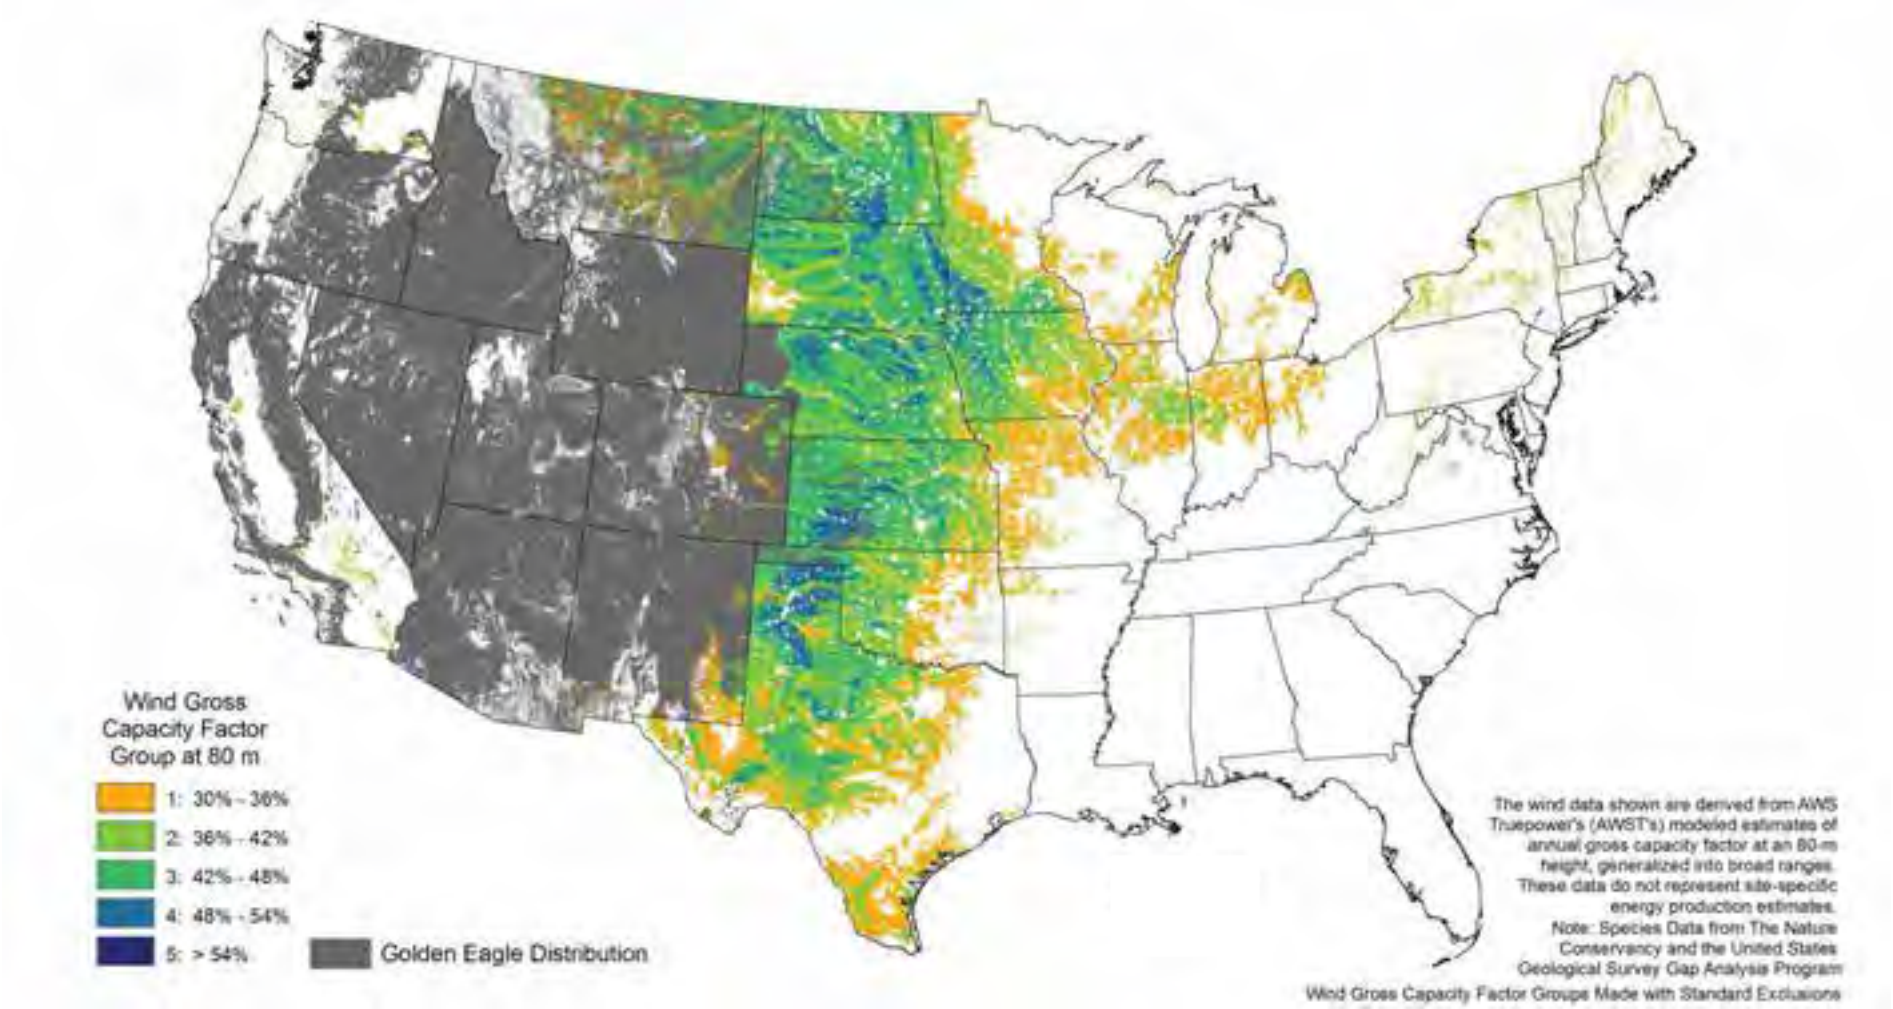
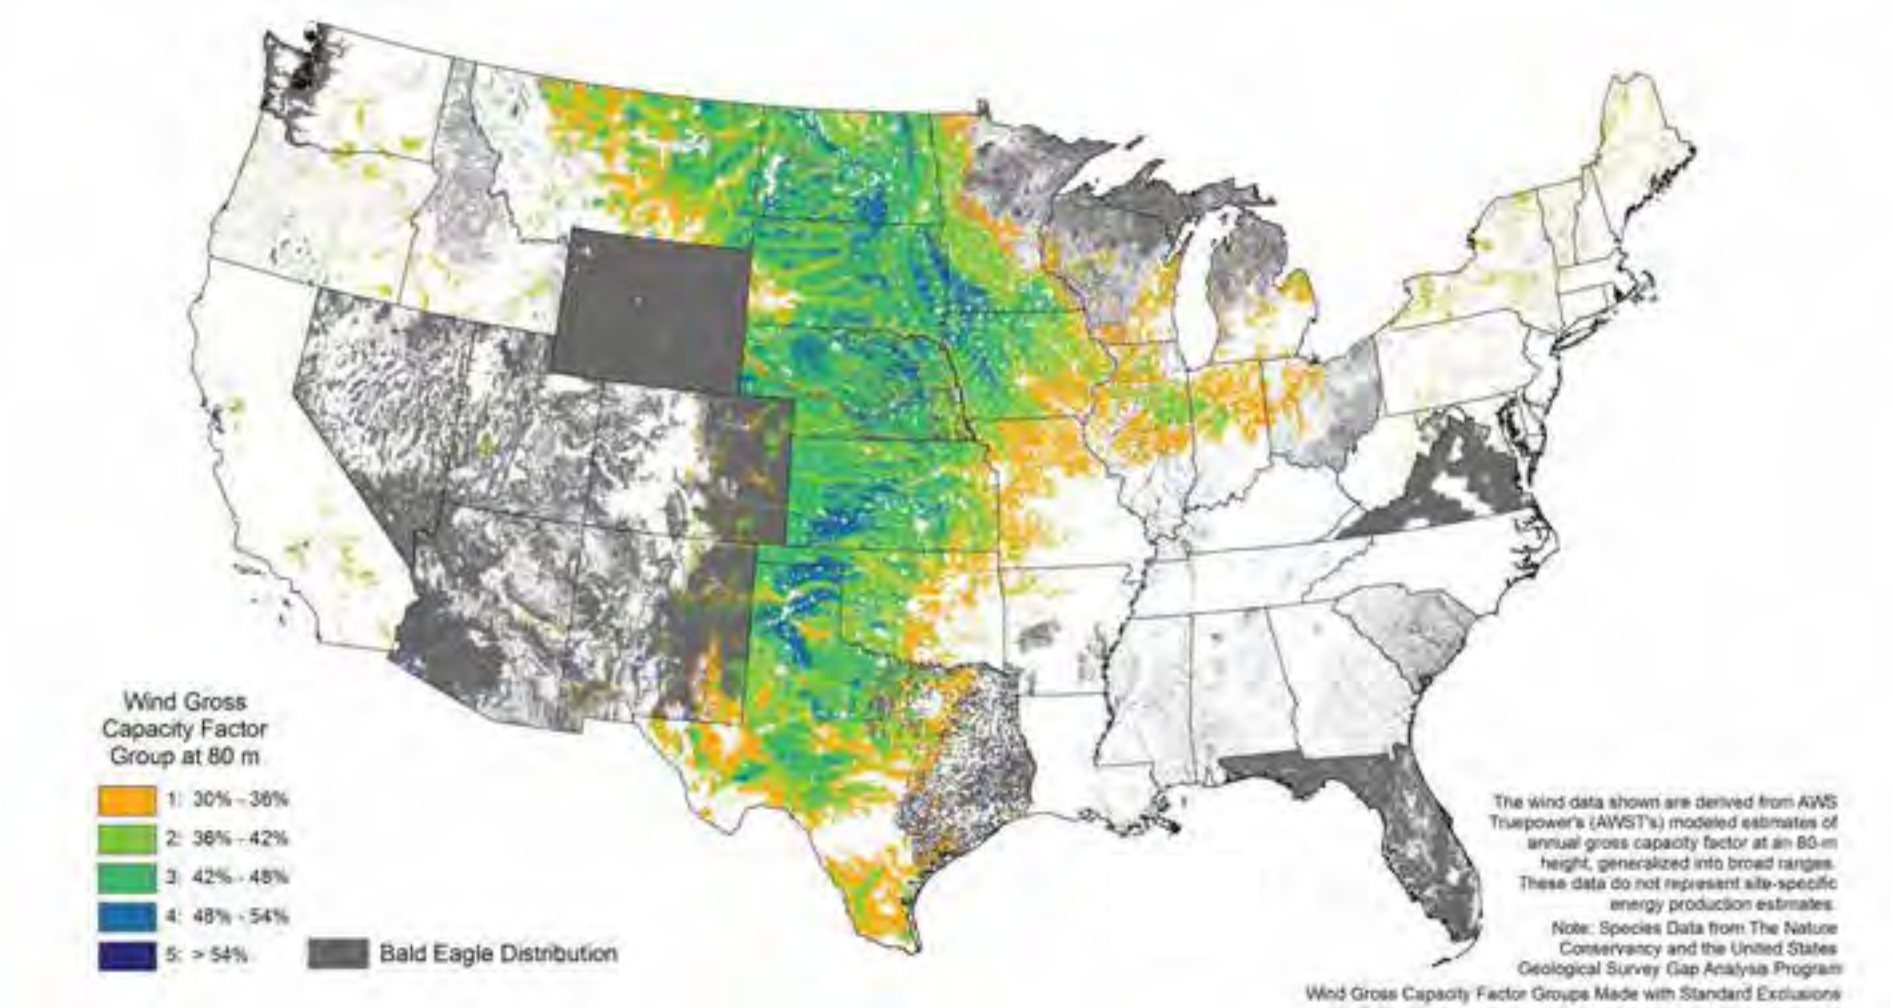
Outline

- Historical overview and statutory authority
- Challenges to wildlife
- Key species habitat distribution
- Research
- Collaboratives
- Conclusions



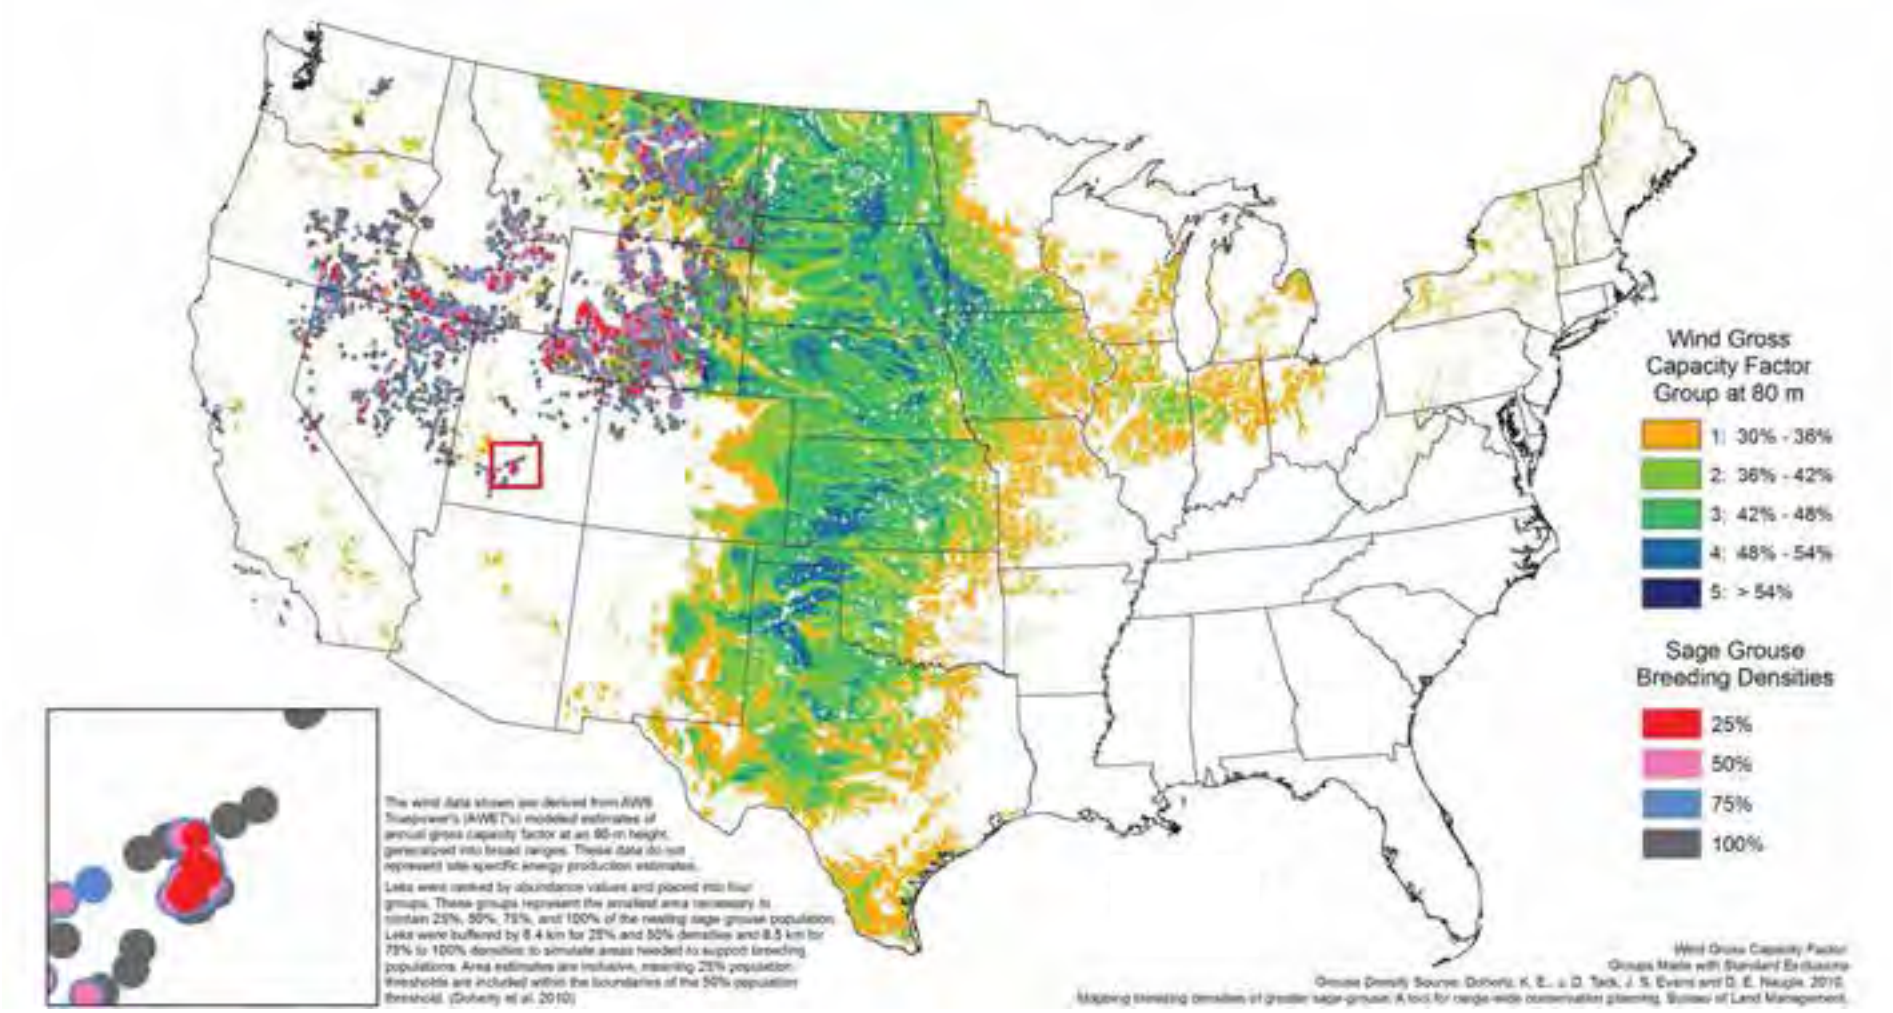
Key Species Habitat Distribution: Seven Species

Areas in grey indicate where wildlife species live, breed, and migrate. These areas are *not* no-build zones, but are of special concern for developers that could increase costs and time, or lead to project delays or cancellation.



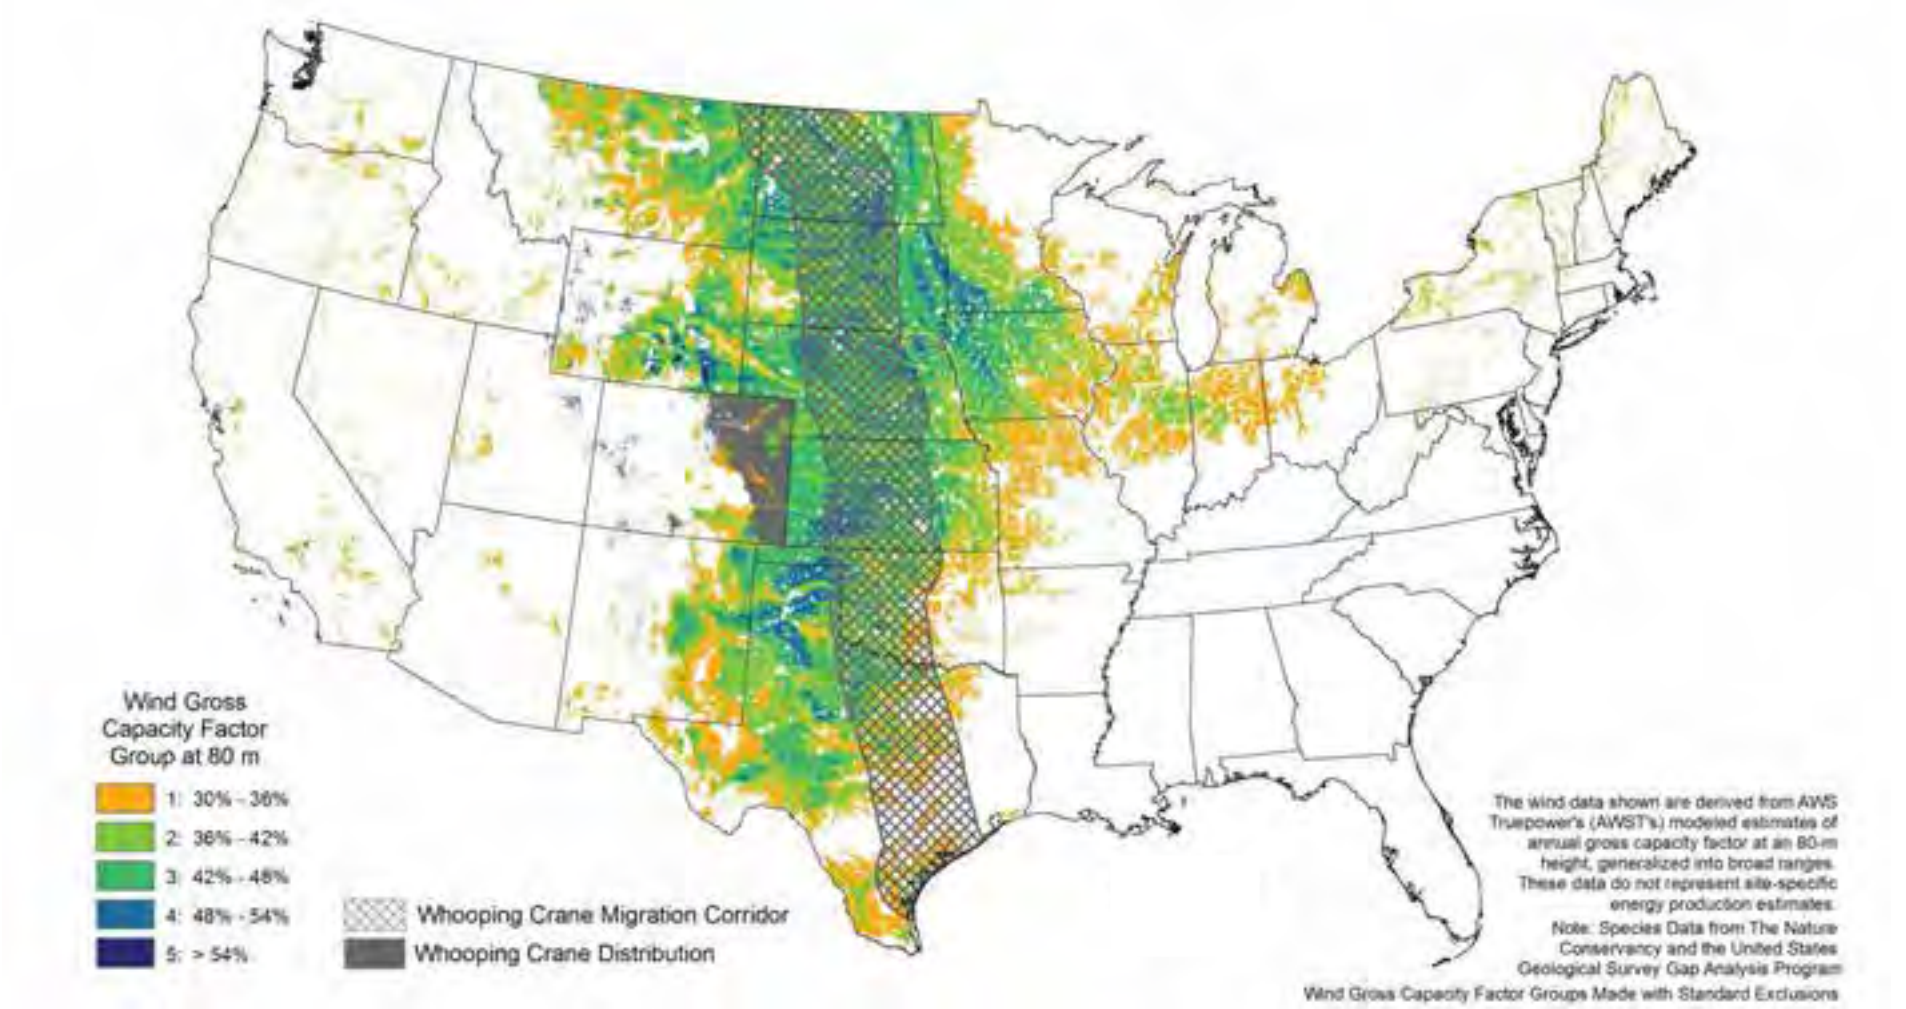
Wildlife distribution can impact local areas very differently. On a national scale, 44%–53% of land could be affected.

Key Species Habitat Distribution: Golden Eagles



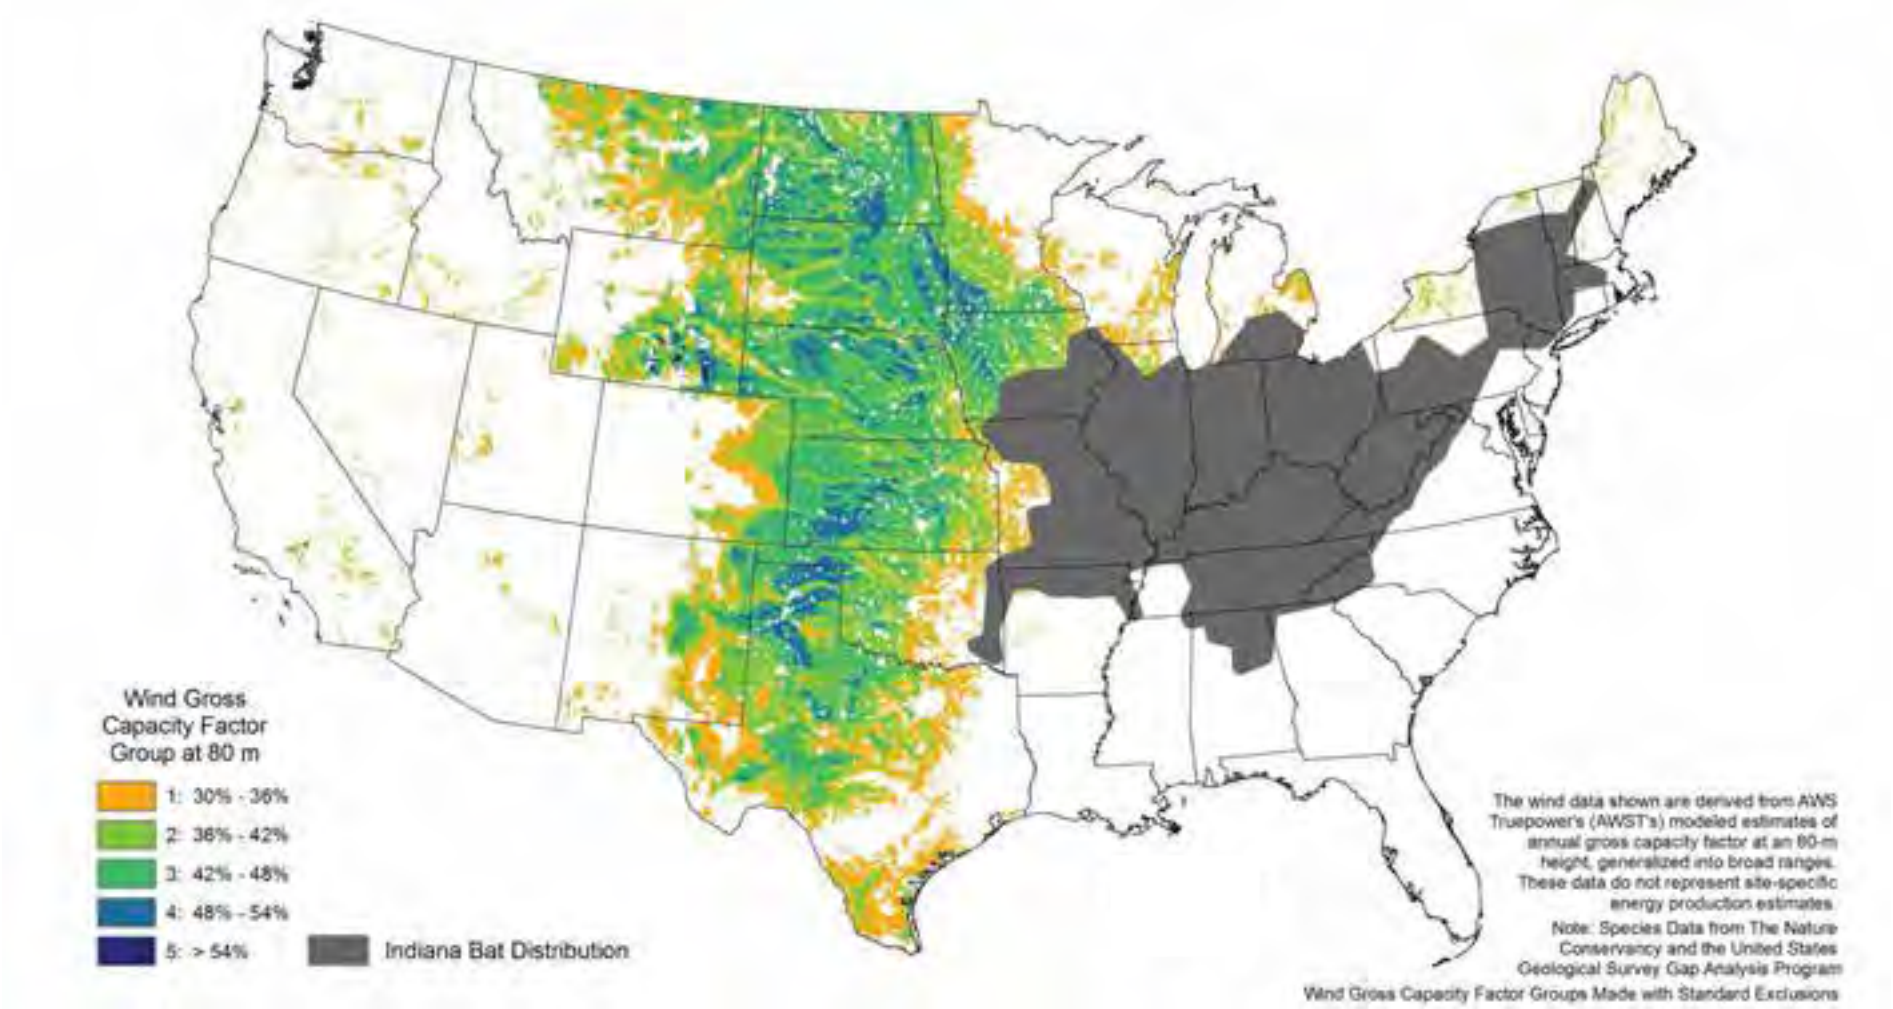
Golden eagle habitat: areas requiring additional consideration

Key Species Habitat Distribution: Bald Eagles



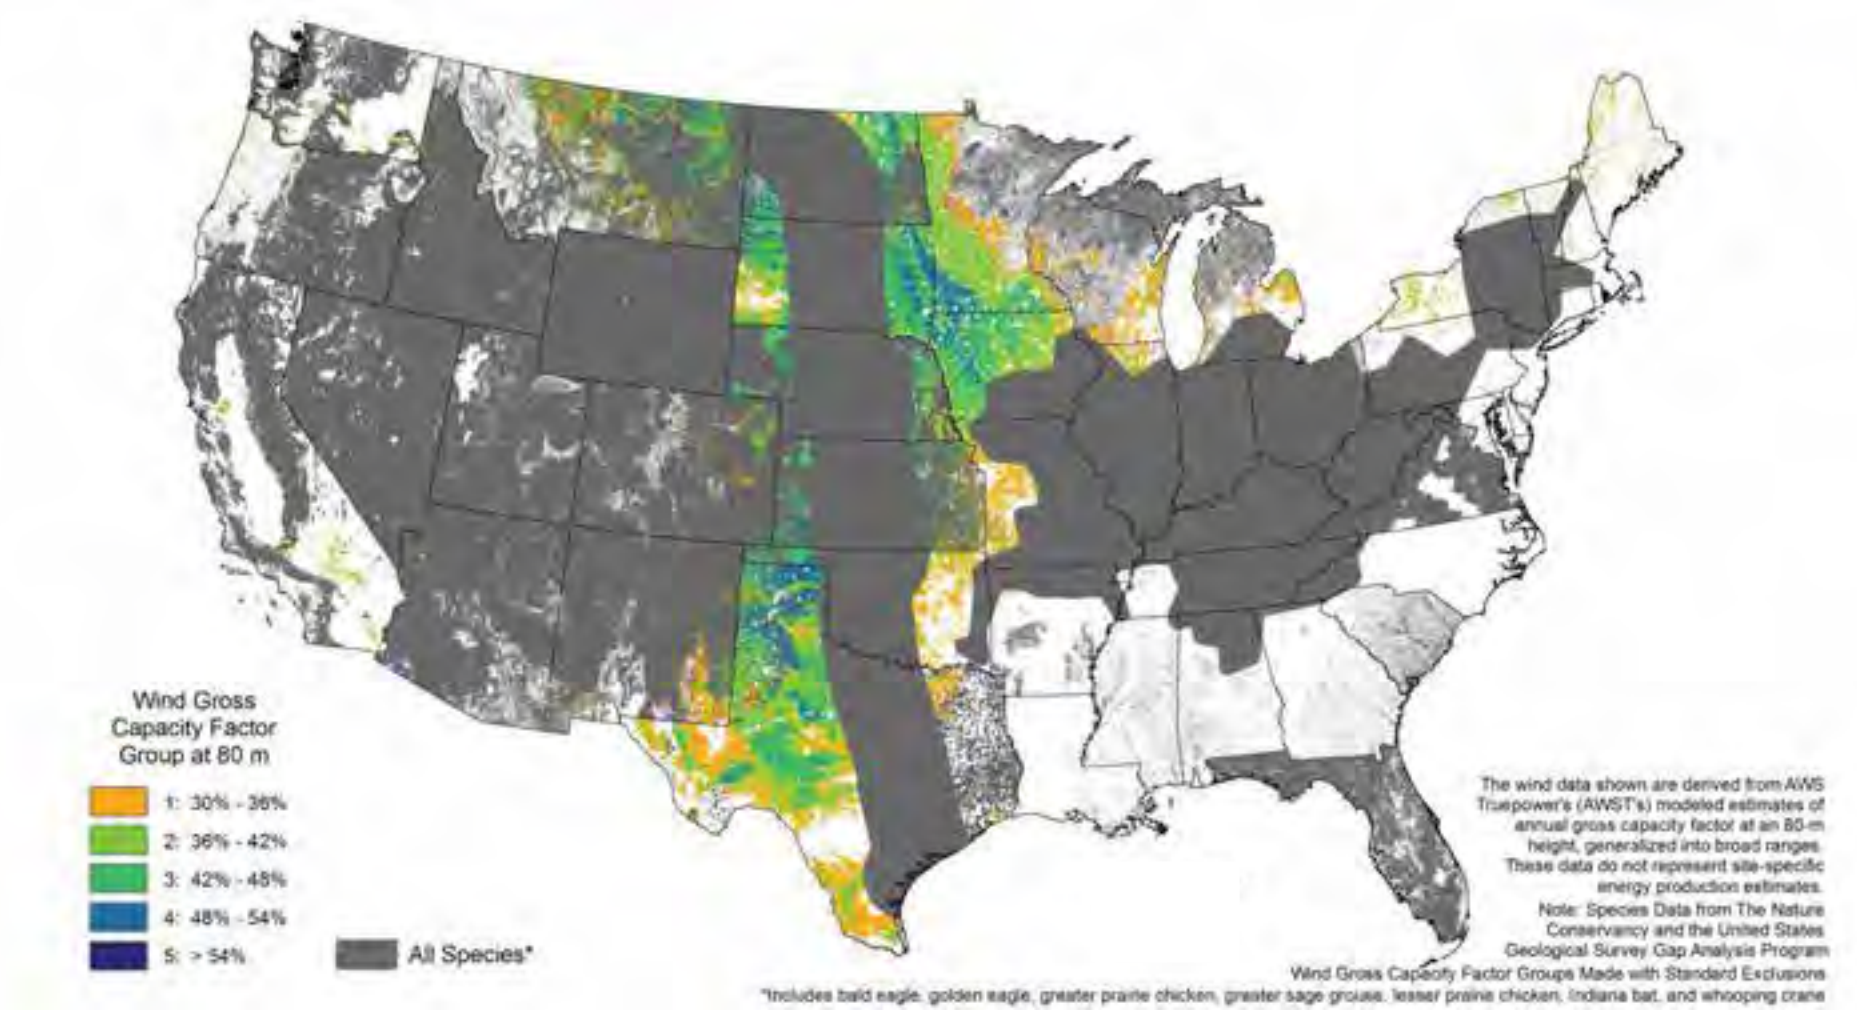
Bald eagle habitat: areas requiring additional consideration

Key Species Habitat Distribution: Sage Grouse



Sage grouse habitat and breeding sites: areas requiring additional consideration

Key Species Habitat Distribution: Whooping Crane



Whooping crane habitat and migratory corridor: areas requiring additional consideration

Key Species Habitat Distribution: Indiana Bat

Indiana bat habitat distribution: areas requiring additional consideration

Key Species Habitat Distribution: Combined

Combined wildlife impacts: areas requiring additional consideration

Outline

- Historical overview and statutory authority
- Challenges to wildlife
- Key species habitat distribution
- Research
- Collaboratives
- Conclusions

Mitigation Research

Mitigation research focuses on:

- Deterrent development
- Correlating wind speed to utilization
- Correlating weather patterns to fatality patterns
- Offsite compensation
- Micrositing
- Turbine size
- Blade visibility
- Seasonal shutdowns
- Habitat manipulation
- Artificial roosts.

Greater Prairie Chicken. *Photo by Mark Herse, Kansas State University, NREL 27970*

Technology/Model Research

Technology/modeling research is focused on:

- Radar validation
- Thermal imaging cameras
- Near-infrared cameras
- Stable isotopes
- Predictive models.

Importance of Convening Interdisciplinary Panel of Experts for Prioritizing Research

The National Renewable Energy Laboratory
together with
The Department of Energy's Wind and Water Power Technologies Office
are pleased to invite you to the
Eagle Detection and Deterrent Technology Research Gaps and Solutions Workshop

Land-based wind energy deployment is challenged by the lack of accepted solutions for reducing eagle fatalities at wind energy projects. Therefore, there is an expressed need for tools to reduce these fatalities and to facilitate permitting under the Bald and Golden Eagle Protection Act. For this workshop, we will be engaging experts from a wide range of fields to comprehensively assess the current state of technologies, key gaps, promising emerging technology solutions, novel ideas, and research and development needs.

Please join us...

Please provide a response **no later than September 21, 2015** to bethany.straw@nrel.gov

NREL

- Bringing people of different focus areas/expertise to the table to understand and prioritize solutions
- Outcome as it relates to wind energy and eagle impacts: need to understand fundamental behavior and physiology of species of concern

Recommendations from Physiology and Behavior Specialists

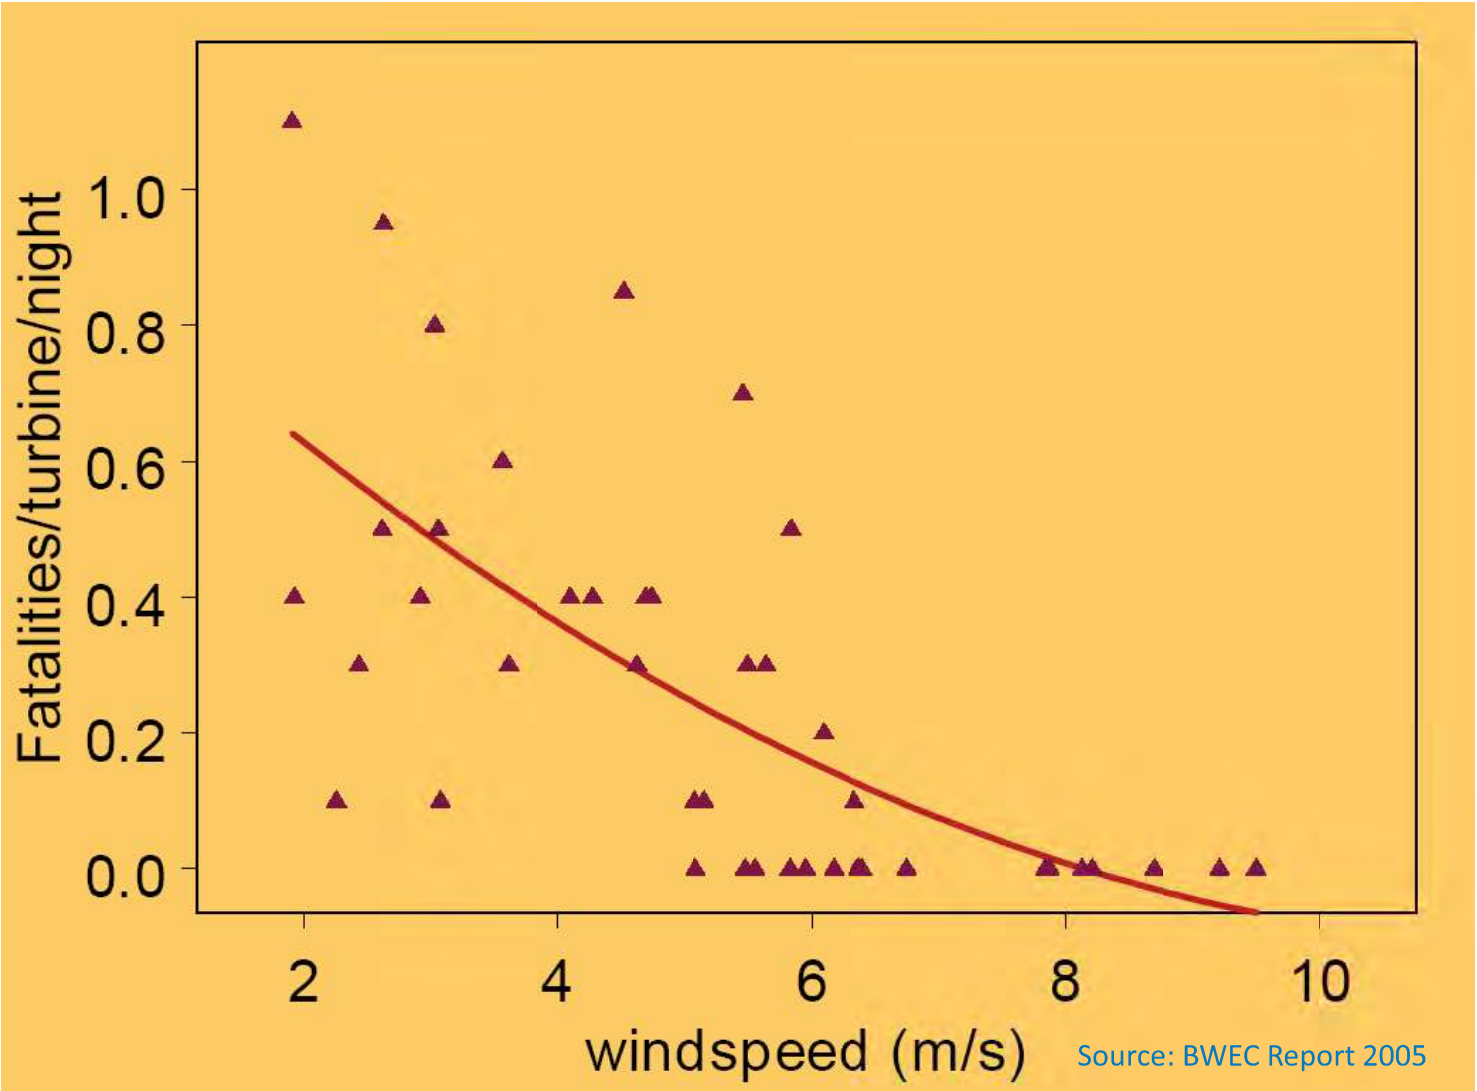
- Understand: population and habitat associations, threats, annual cycle, demography, flight behavior, diet, etc..
- Risk is when turbines intersect with a species basic needs (e.g. with eagles it is food, updraft and nesting sites)

Photo provided by T. Katzner

For auditory deterrent research, one expert recommends the following:

- Measure the auditory system of these birds
- Use this information to build a library of sounds that might be stressful (annoying)
- Use heart monitors to give us an index of stress (estimated by an increase in heart rate)
- Give a variety of different sounds to estimate stress induced by the sounds

Test birds over different time intervals (hours to weeks) to estimate the rate of adaptation to these sounds



Properties of the Vocal System Provide Clues about Properties of the Auditory System

Outline

- Historical overview and statutory authority
- Challenges to wildlife
- Key species habitat distribution
- Research
- Collaboratives
- Conclusions

Collaboratives are Often Beneficial for Advancing the Knowledge Base

Benefits of collaboratives include:

- Access to third party, unbiased research
- Accepted experts within collaborative
- Agreement on study design
- The ability to develop relationships (trust)
- A safe forum for discussion
- The ability to engage early and often
- Transparency/credibility
- Leveraging of funds
- Project access
- Access to interim results
- Accepted results
- A model for future interactions.

705-MW project in Tehachapi Pass Wind Resource Area, California.

Photo by David Hicks, NREL 18455

Current collaboratives

Current collaboratives include:

- The National Wind Coordinating Collaborative (NWCC). Includes federal, state, utilities, nongovernmental organizations (NGOs), and wind industry
  - Grassland Shrub Steppe Species Collaborative. Includes federal, state, NGOs, and wind industry
  - Sage Grouse Collaborative. Includes federal, state, NGOs, and wind industry
- Bats and Wind Energy Cooperative (BWEC). Includes federal, state, NGOs, and wind industry
- American Wind Wildlife Institute (AWWI). Includes industry and NGOs
- International Energy Agency Wind Task 34. Includes nine member countries.

More on International Energy Agency Wind Task 34

- Working Together to Resolve Environmental Effects of Wind Energy, known as **WREN**
- October 2012–2016; extension under discussion
- Current member countries: Ireland, Netherlands, Norway, Spain, Switzerland, United Kingdom, United States, France, and Sweden.

Primary products:

- WREN Hub/Tethys (http://tethys.pnnl.gov/)
- White papers: Adaptive management, individual impacts to population effects, green versus green, cumulative impacts, transboundary issues
- Webinars: on land/offshore, birds/bats/marine mammals, tools http://tethys.pnnl.gov/environmental-webinars?content=wind

Outline

- Historical overview and statutory authority
- Challenges to wildlife
- Key species habitat distribution
- Research
- Collaboratives
- Conclusions

Conclusions

- Wind-wildlife impact concerns are complicated
- Micrositing is key to avoiding, minimizing, and mitigating impacts; some locations may just not be appropriate for wind development
- Research and development of tools is ongoing and benefits from interdisciplinary approaches
- Collaboratives provide opportunities to leverage resources to find solutions for common challenges.

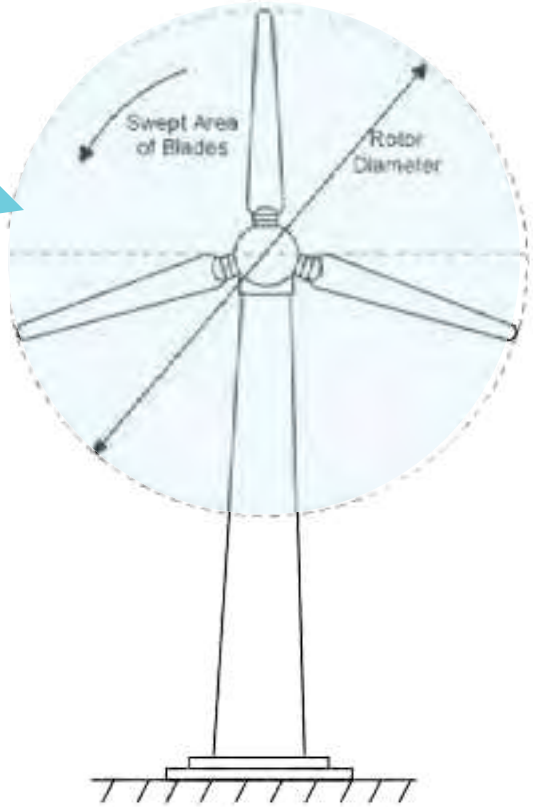
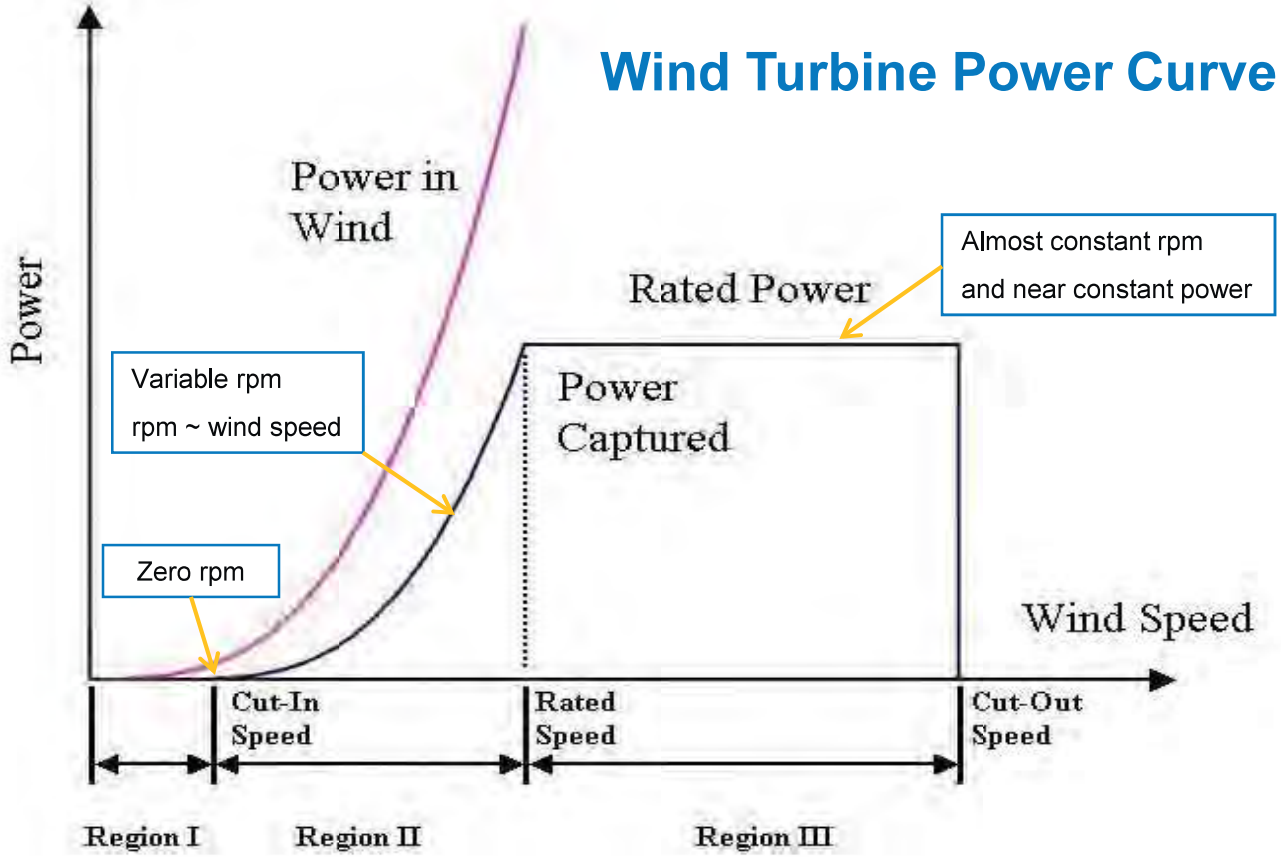
QUESTIONS?



Turbine Power Basics

Power in the Wind = ½ρAV³



A - Area of the circle swept by the rotor

ρ = Air density

V = Wind Velocity

Wind Turbine Power Curve

NWCC

Formed in 1994, founding members included NREL and DOE, the American Wind Energy Association, National Audubon Society, Electric Power Research Institute, and Union of Concerned Scientists. Membership currently exceeds 1,500 people.

Major features of the NWCC include:

- Multistakeholder
- Facilitated; ground rules for engagement
- Coordinated field research
- Information dissemination (e.g., website; coordination of report preparation and publication; presentations at meetings)
- Biennial Research Meeting (X in December 2014)

Recent research activities were initiated under the Grassland Shrub Steppe Species Collaborative, and include:

- Grassland Community Collaborative (Prairie-Chicken research)
- Sage Grouse Collaborative (Sage Grouse research)

http://www.nationalwind.org/

BWEC

Formed in 2004, founding members included the American Wind Energy Association, Bat Conservation International, USFWS, and NREL, with DOE and the U.S. Geological Survey later. Major features of the BWEC include:

- Objective, science-based
- International expertise tapped
- Organizational structure includes an oversight committee, technical committee, and science committee
- Coordination of field research (e.g., operational curtailment, acoustic deterrent, other)
- Information dissemination (e.g., website; coordination of report preparation and publication; presentations at meetings)
- Frequent science meeting.

http://www.batsandwind.org/

Source: Arnett, et al. 2008. Effectiveness of Changing Wind Turbine Cut-in Speed to Reduce Bat Fatalities at Wind Facilities

AWWI

Formed in 2008, board members consist of 50 industry and 50% NGOs.

Primary activities include:

- Research
- Data repository

Wind-Wildlife Research Information System

- Landscape tools

Landscape Assessment Tool

- Mitigation strategies for eagle take

Through the use of expert elicitation, AWWI has facilitated the development of two models to predict numerical effects of compensatory mitigation on golden eagle survival and reproduction through: lead abatement and vehicle collision reduction strategies.

- Education

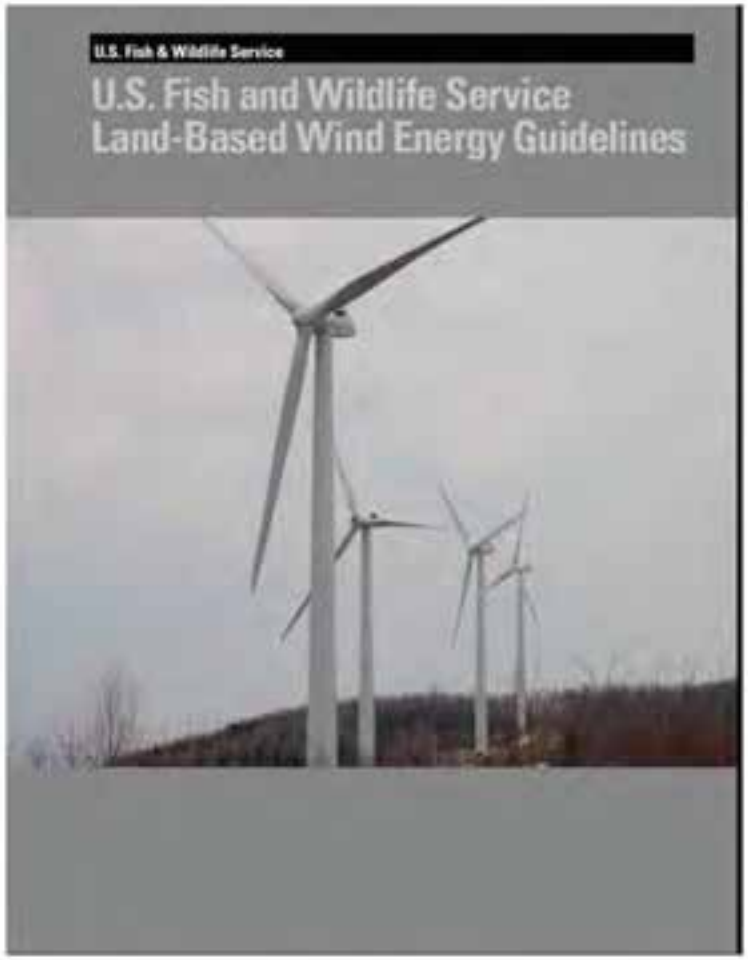
Candidate Avian Risk Metrics

Hypothesis: "Mortality risk increases with flight time in the rotor zone (yellow zone), if the turbine is operating"



A Candidate Preconstruction Relative Risk Metric:

Species Relative Risk = (Flight Hours in Rotor Zone with Wind in Operating Range)/(Plant Swept Area x Hours with Wind in Operating Range)

A Candidate Postconstruction Fatality Metric:

Species Risk = Fatalities/(Swept Area x Turbine Operation Hours)

The USFWS Land-based Wind Energy Guidelines

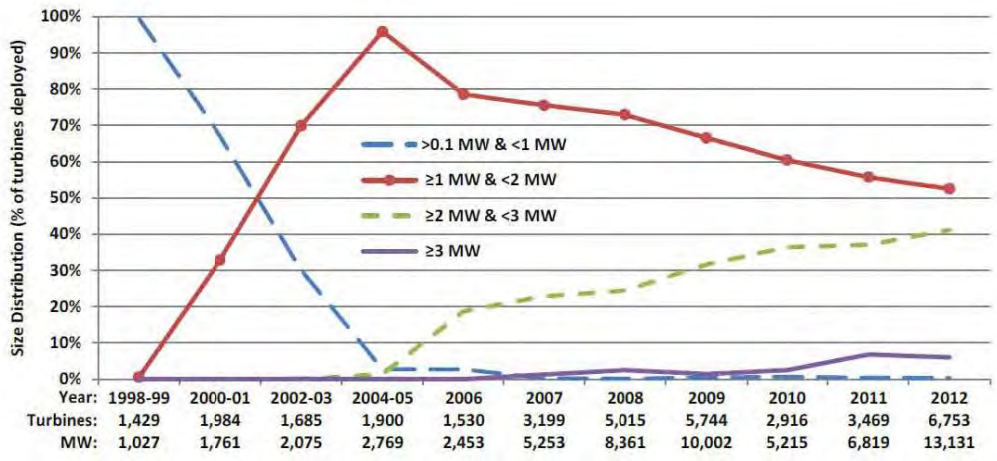
Released March 2012

Provide a Tiered Approach, including:

- Tier 1 – Preliminary site evaluation (landscape-scale screening of possible project sites)
- Tier 2 – Site characterization (broad characterization of one or more potential project sites)
- Tier 3 – Field studies to document site wildlife and habitat and predict project impacts
- Tier 4 – Postconstruction studies to estimate impacts
- Tier 5 – Other postconstruction studies and research.

USFWS Guidelines: Developer and Service Roles

TIER	*Project Developer/Operator Role*	*Service Role*
Tier 1: Preliminary site evaluation	• Landscape level assessment of habitat for species of concern • Request data sources for existing information and literature	• Provide lists of data sources and references, if requested
Tier 2: Site characterization	• Assess potential presence of species of concern, including species of habitat fragmentation concern, likely to be on site • Assess potential presence of plant communities present on site that may provide habitat for species of concern • Assess potential presence of critical congregation areas for species of concern • One or more reconnaissance level site visit by biologist • Communicate results of site visits and other assessments with the Service • Provide general information about the size and location of the project to the Service	• Provide species lists, for species of concern, including species of habitat fragmentation concern, for general area, if available • Provide information regarding plant communities of concern, if available • Respond to information provided about findings of biologist from site visit • Identify initial concerns about site(s) based on available information • Inform lead federal agencies of communications with wind project developers
Tier 3: Field studies and impact prediction	• Discuss extent and design of field studies to conduct with the Service • Conduct biological studies • Communicate results of all studies to Service field office in a timely manner • Evaluate risk to species of concern from project construction and operation • Identify ways to mitigate potential direct and indirect impacts of building and operating the project	• Respond to requests to discuss field studies • Advise project proponent about studies to conduct and methods for conducting them • Communicate with project proponent(s) about results of field studies and risk assessments • Communicate with project proponents(s) ways to mitigate potential impacts of building and operating the project • Inform lead federal agencies of communications with wind project developers
Tier 4: Post construction studies to estimate impacts	• Discuss extent and design of post-construction studies to conduct with the Service • Conduct post-construction studies to assess fatalities and habitat-related impacts • Communicate results of all studies to Service field office in a timely manner • If necessary, discuss potential mitigation strategies with Service • Maintain appropriate records of data collected from studies	• Advise project operator on study design, including duration of studies to collect adequate information • Communicate with project operator about results of studies • Advise project operator of potential mitigation strategies, when appropriate



USFWS Eagle Conservation Plan Guidance (April 2013)

- To facilitate issuance of programmatic eagle take permits for wind energy facilities the USFWS finalized the Eagle Conservation Plan Guidance- Module 1- Land-based Wind Energy Version 2
- This Guidance provides a framework for developing and evaluating Advanced Conservation Practices, which is the framework for detect and deter technologies

U.S. Department of Energy Wind Program's Mission

- Reduce challenges to project development to accelerate deployment of appropriate wind energy
- Support achievement of 20% wind energy by 2030
- Accelerate wind energy capacity growth/ development of domestic energy options (Energy Policy Act of 2005).

Breakout Session 1 (Day 1)

Stakeholder Concerns, Additional Relevant Data Sources, and Additional Research underway

Breakout Group 1

Other things CWG should undertake?

- Greater stakeholder involvement
  - CWG & ASWG
  - FACA?
  - Use industry as a resource
  - Review of the Science Plan
- Outline next steps beyond the Science Plan
  - Implementation

New Information

- New solar project in Pahrump, NV
  - Panel spacing may diffuse the lake effect
- Widen the scope beyond AZ, CA, and NV
- USGS-FWS OFR on standardized monitoring

Group 2 (Day 2)

What other tasks should the CWG Undertake (1 of 2)

- Focusing on the science is the correct approach. Monitoring should be informed by research. Don't monitor for sake of monitoring. Interrelationship between monitoring and research.
- Consider costs when determining monitoring requirements (Danielle, Jeremiah)
- Monitoring should be designed to answer specific questions.
- Monitoring Guidelines due out in June. Will be publically available. Different from the CWG Science Plan.
- Monitoring procedures are a research question.
- Determine level of overall mortality
- Look at causation.
- Get data to focus the research
- Science plan should have priorities as a product
- What is the low hanging fruit?
- Leverage information and existing data

What other tasks should the CWG Undertake (1 of 2)

- Site specific monitoring vs understanding where projects should go
- What are we siting for? Any specific species? (Songbirds, migratory birds, etc.) E.g. wind now focuses on bats and raptors.
- Good model is San Juaquin Valley Least Conflict Plan (goes beyond science)
- What features in the landscape influence avian presence and behavior
- Keep in mind Technology specific effects
- Keep visibility on ongoing research efforts, common database? AWWI web site has extensive list of studies. When should studies be released?
- General research studies vs project data. CEC posts project data after review.
- Lots of folks want data/information, but many studies are still underway
- CWG and ASWG access to raw data? What questions can be answered?

Any ongoing or planned research or data collection efforts that are relevant to developing the science plan

- ASWG Research Panel looking at rough methodologies to answer ASWG questions
- ASWG Research Panel asked to sequence the research

Breakout Group 3

Stakeholder Concerns, Additional Relevant Data Sources, and Additional Research underway

Group 3

- Dan Boff, DOE
- Kirk LaGory
- Amy Fesnock,
- Bill Werner
- Katie Umekubo
- Chuck Griffin
- Juliette Falkner
- Karyn Coppinger
- Brian Boroski, H.T. Harvey
- Matt Hutchinson

Other things CWG should undertake?

- Need to specify focus on causation of mortality
- Look at sublethal effects (e.g., decreased reproduction, carrying capacity, etc.)
- Scope should go beyond regulatory requirements

Data and models

- Use of existing monitoring data: What does it tell us? What would we do differently?
- Making data available to the public. Data quality issues.
- Need to develop a toolkit

Relevant studies

- Genetic studies to examine population of origin
- Golden eagle research related to populations
- Look at rare and common species to provide bookends
- Condor Issue (vol 118): several papers population concerns related to renewable energy issues
- Draft article submitted to JWM, modeling estimates related to searcher efficiencies for rare species
- Draft paper looking at direct and indirect effects for solar, wind, and transmission

Conceptual Understanding of Avian-Solar Interactions

Lee Walston
Argonne National Laboratory

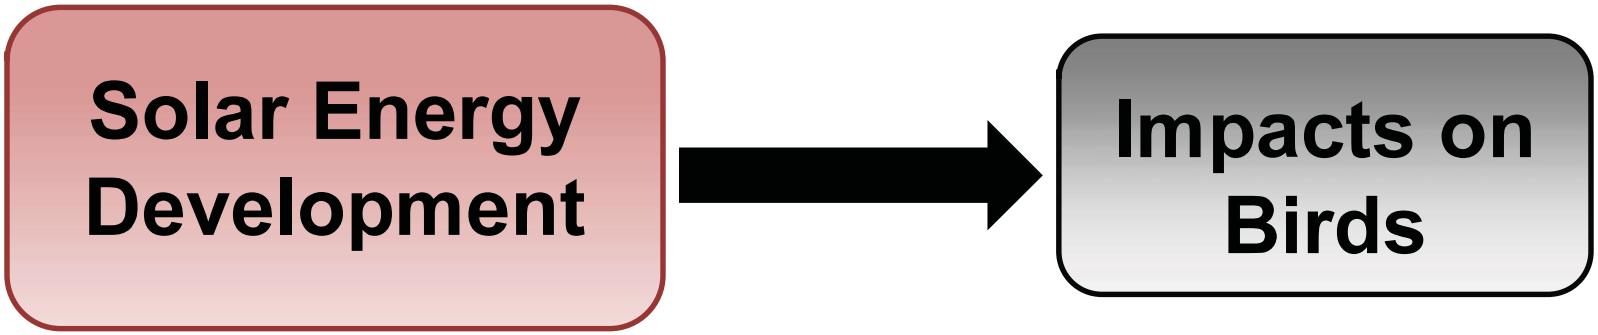
May 10-11, 2016
Sacramento, California

Argonne NATIONAL LABORATORY

NREL

Powered by SunShot U.S. Department of Energy

U.S. DEPARTMENT OF ENERGY
Energy Efficiency & Renewable Energy

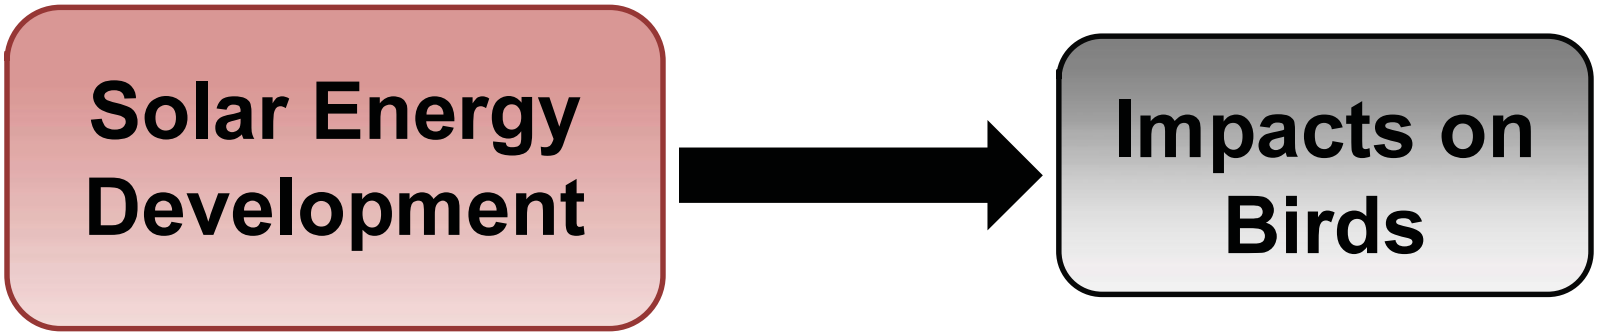


U.S. DEPARTMENT OF ENERGY

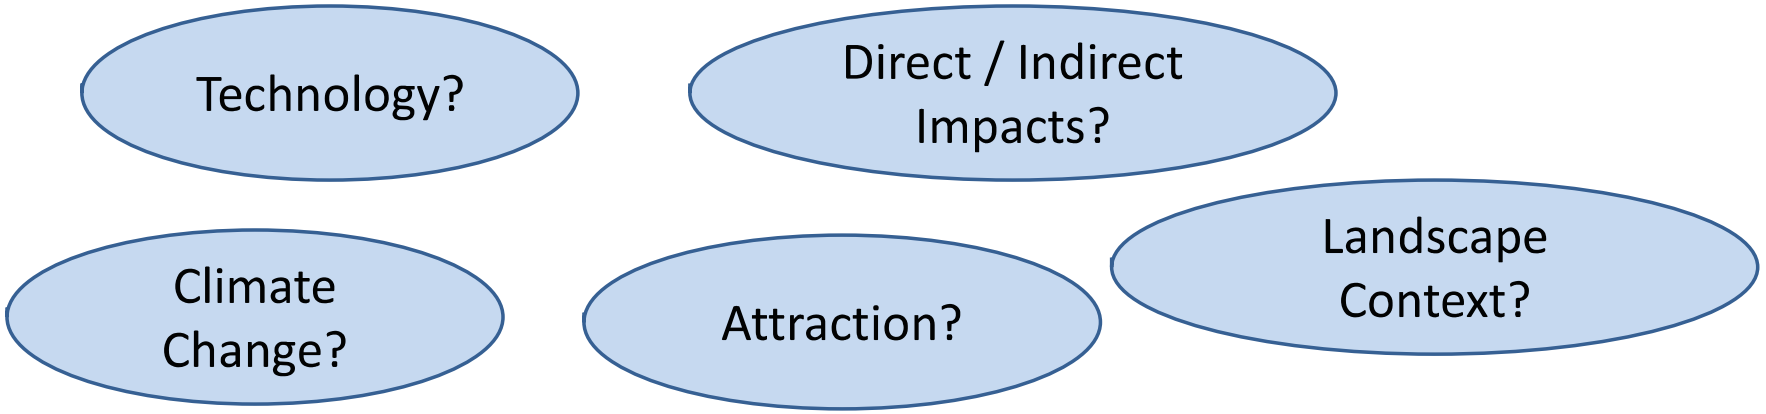
Why Develop a Conceptual Model?

- Illustrate important processes
  - Direct & indirect effects
  - Interactions and cumulative effects
- Synthesize current understanding of avian-solar interactions
  - Foster a common understanding
- Identify information gaps and research priorities
- Starting point for the avian-solar science plan

Avian-Solar Conceptual Model



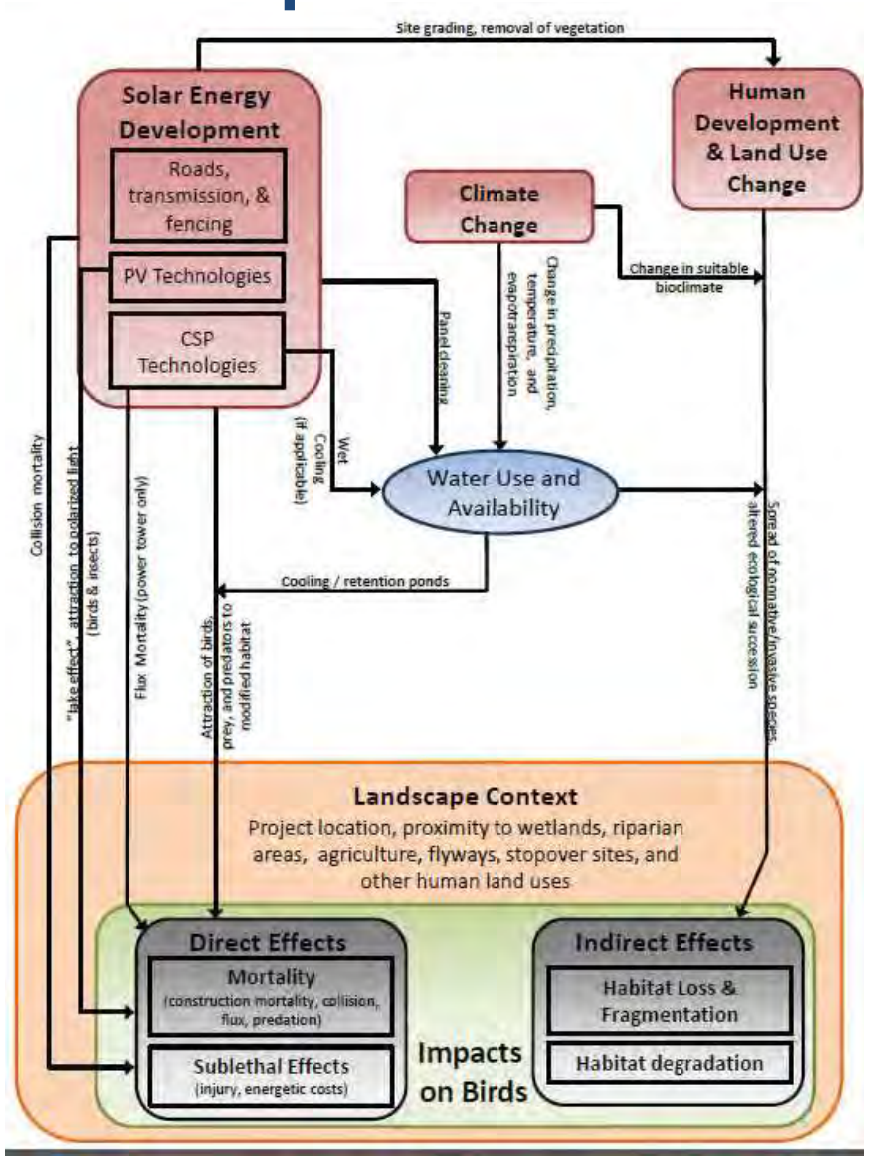
- Simple vs. Complex



- Two main focal points

Avian-Solar Conceptual Model

- Simple vs. Complex



- Impacting factors, pathways, and interactions

Avian-Solar Conceptual Model

DRAFT

Avian-Solar Conceptual Model

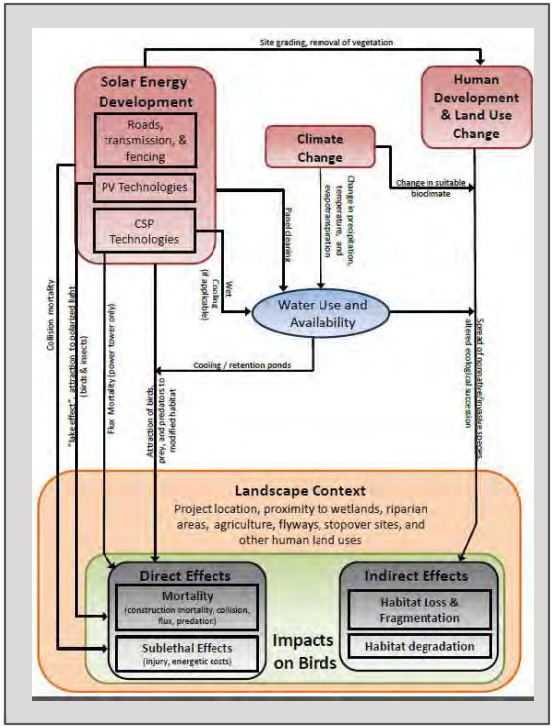
Climate Change

Human Development & Land Use Change

Solar Energy Development

- Roads, transmission, & fencing
- PV Technologies
- CSP Technologies

Indirect Effects



- Habitat loss & fragmentation
- Habitat degradation

Change in suitable climate

Habitat loss

Spread of nonnative / invasive species

Altered ecological succession

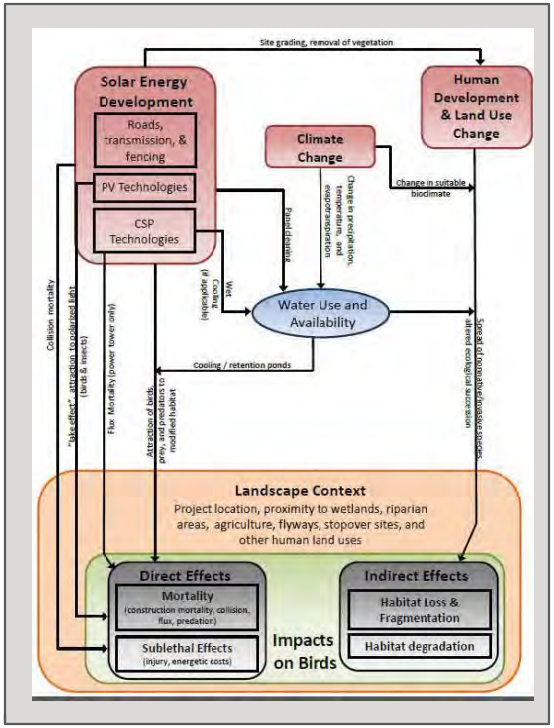
Avian-Solar Conceptual Model

Climate Change

Human Development & Land Use Change

Solar Energy Development

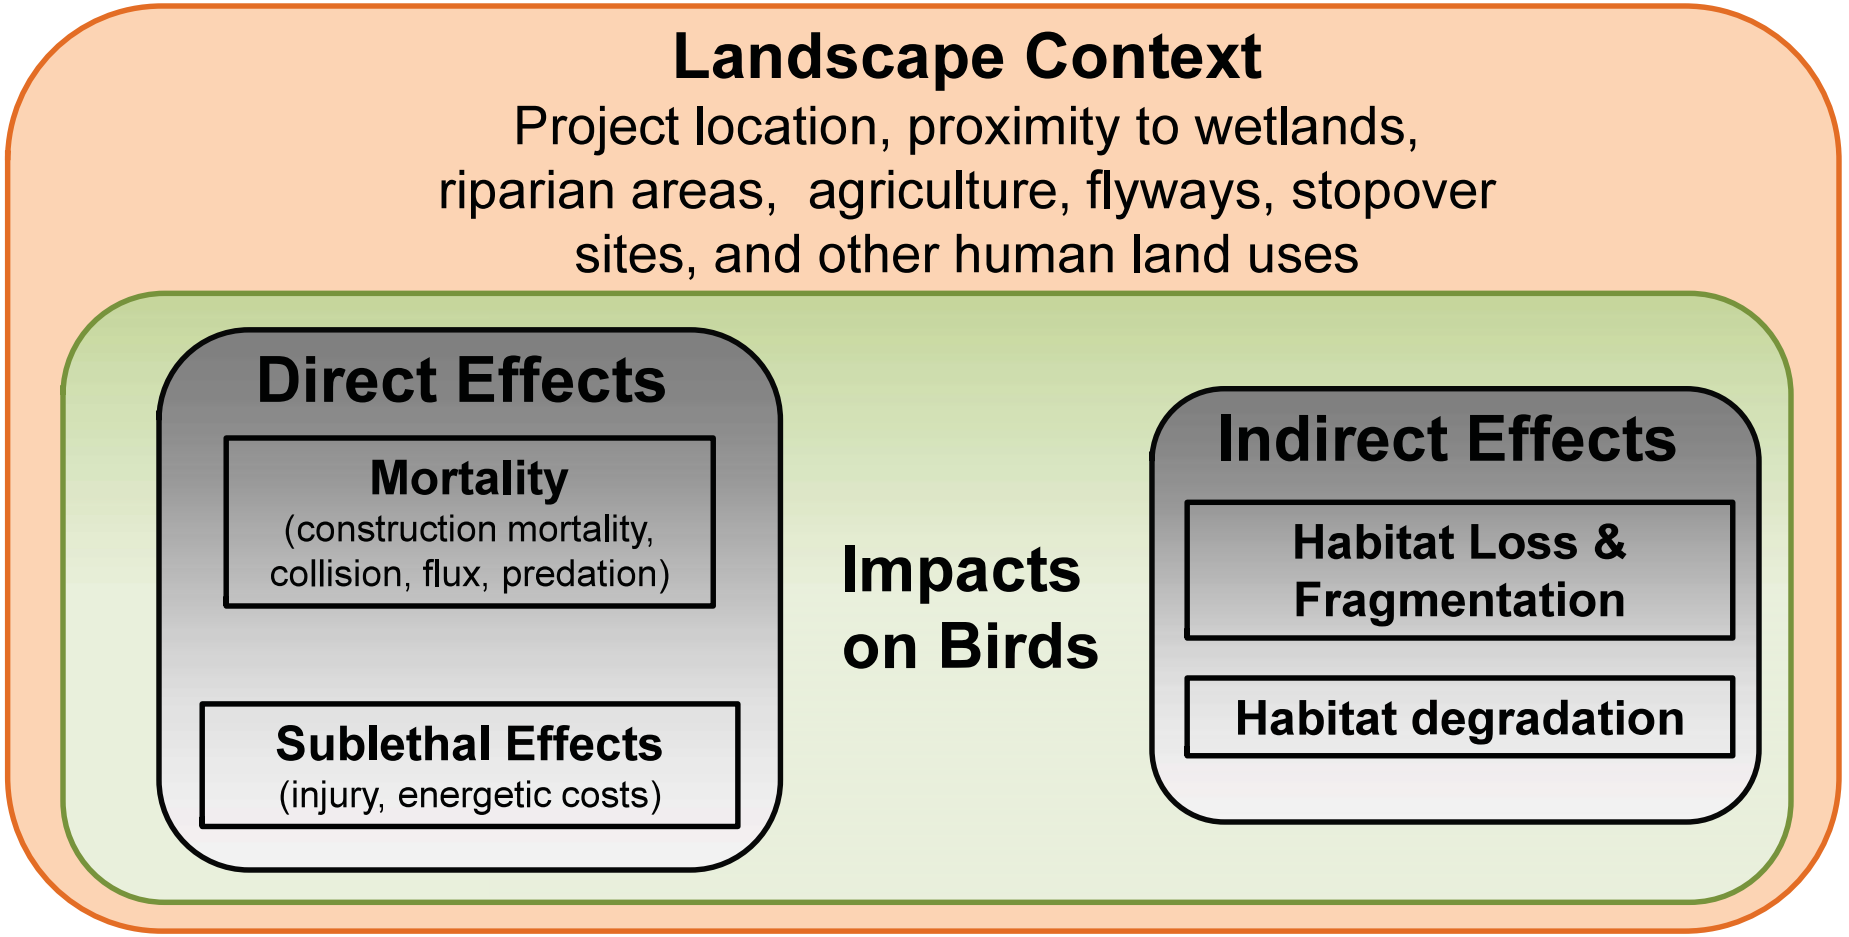
- Roads, transmission, & fencing
- PV Technologies
- CSP Technologies



Direct Effects

- Mortality
- Sublethal Effects

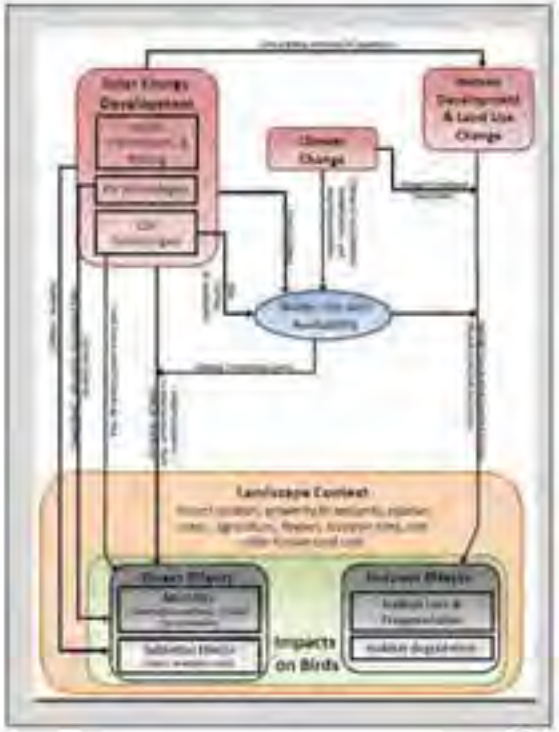
Construction mortality, collision, flux, predation



Attraction of birds, prey, and predators

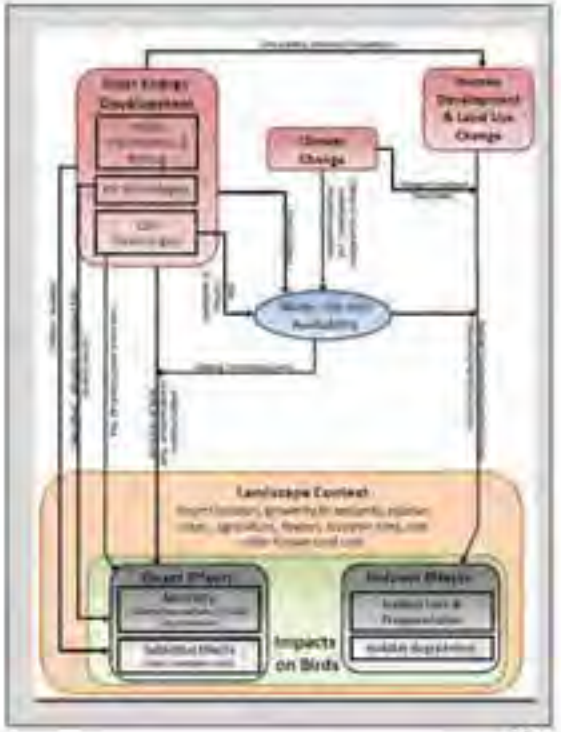
Technological considerations & project design (e.g., water)

Avian-Solar Conceptual Model



- Location matters

Avian-Solar Conceptual Model



- Focus on processes and interactions the CWG may be most concerned about
- Supporting text to be provided in the science plan

- The diagram illustrates *potential* impacts that could occur
  - Projects sited on previously disturbed lands may have less impact
  - Projects with minimal water requirements (and no ponds) may have less impact

Avian-Solar Conceptual Model

- To inform selection and prioritization of the CWG management questions
  - Are any processes more important for agency decision making?
  - What are the information gaps?
  - Which information gaps should be addressed first?
- Future versions of the model may illustrate important information gaps and CWG priorities
  - Color / thickness of the arrows
  - Additional annotation

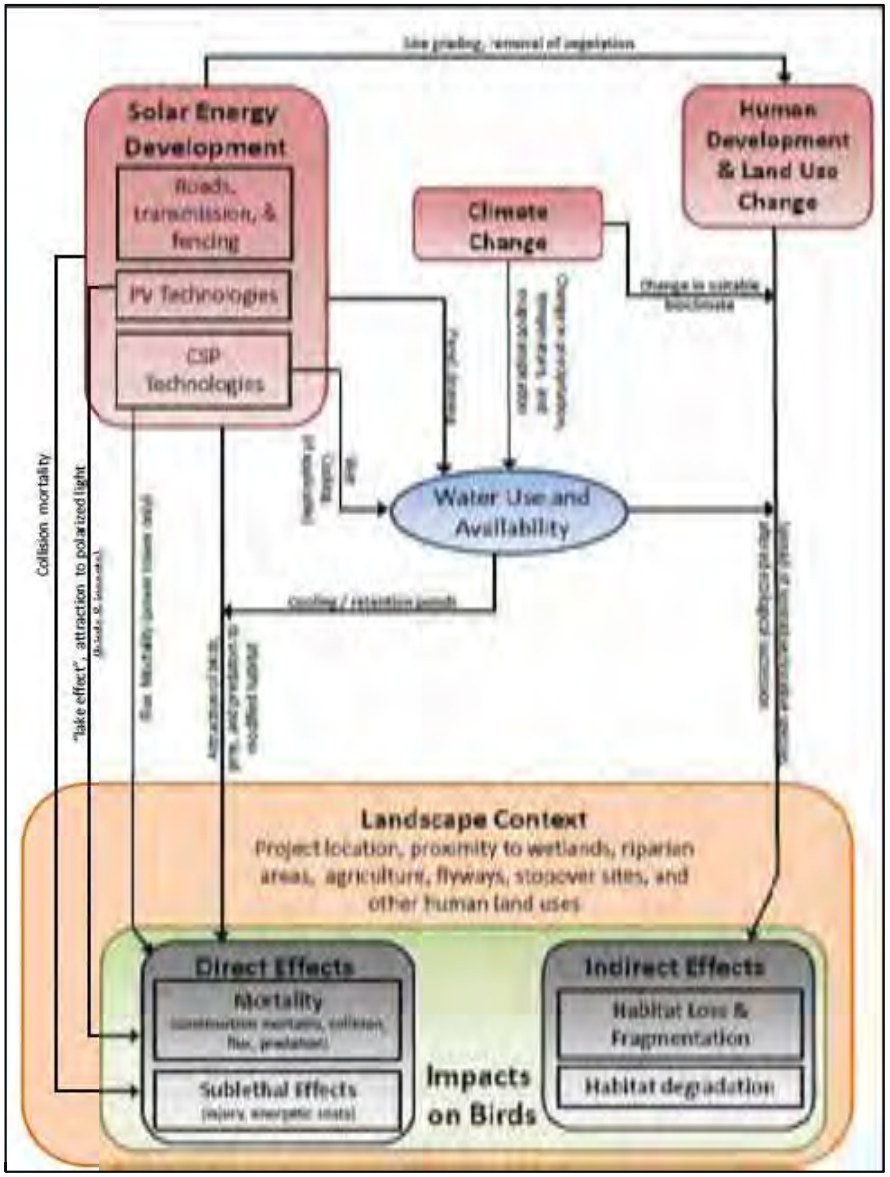
Questions?

Agency Management Questions and Related Research Needs

Tony Jimenez

May 11, 2016

NREL is a national laboratory of the U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, operated by the Alliance for Sustainable Energy, LLC.



Outline

- Avian-Solar Interaction Model
- "Management Question" Defined
- Sample Questions
- Management Question Categories
- Generalized Management Questions
- Research Prioritization
- Discussion

Red-tailed hawk eating a rabbit.

Avian Solar Conceptual Framework

Management Questions Background

- Define what information the agencies need
- Define research needs
- Tied to the conceptual model
- Due to differing missions, different agencies may have different questions
- Received 108 questions
- Questions grouped into seven (7) categories
- Questions consolidated into 14 "generalized questions"

Sampling of Management Questions

- What are the most scientifically rigorous and cost-effective population monitoring tools available for: 1) quickly identifying potential impacts to populations, and 2) determining effectiveness of mitigation strategies at local and regional scales?
- Is higher mortality realized during any particular time of year?
- Are birds being attracted to the site to forage on insects killed by the concentrated solar flux?

Management Questions Categories

1. Landscape Considerations
2. Methods to Evaluate Avian Risk and Impacts
3. Sources of Mortality and Injury
4. Avian Behavior (Attraction/Avoidance)
5. Impacts to Habitat and Other Wildlife That Might Affect Birds
6. Taxonomic and Guild-Specific Impacts
7. Minimization, Mitigation, and Adaptive Management

Generalized Management Questions

1. Landscape Considerations	What are the larger-scale avian movement patterns in the region (including seasonal movements and factors that influence avian movements such as the presence of stopover sites in the landscape)? What are the landscape-level cumulative impacts on regional bird populations or on bird populations migrating through landscapes targeted for solar development? What is the anticipated solar energy build-out for the foreseeable future? (e.g., project size, location, technology type)
2. Methods to Evaluate Avian Risk and Impacts	What are the best methods for monitoring and evaluating avian mortality, specific to each type of solar energy technology? What are the best methods for identifying the bird species that would be most vulnerable during all phases of solar development (pre-construction, construction, and post-construction)?
3. Sources of Mortality and Injury	What are the sources of avian mortality and injury at solar facilities (i.e., project features), and what factors (e.g., location, habitat characteristics, time of year, species) affect frequency of those mortalities and injuries?

Generalized Management Questions

4. Avian Behavior (Attraction / Avoidance)	How do solar facilities affect landscape level movements of birds (i.e., migration and dispersal movements), and what factors (e.g., location, habitat characteristics, time of year, species) affect these movements? How do solar facilities affect local-scale movements/behaviors of birds (i.e., foraging and breeding behaviors), and what factors affect these behaviors?
5. Impacts to Habitat and Other Wildlife That Might Affect Birds	What are the impacts of solar development to other wildlife (such as predators or prey) and habitat that might affect birds?

Generalized Management Questions

6. Taxonomic and Guild-Specific Impacts	How do solar developments affect different bird taxa or guilds? What are the population effects from solar developments to individual bird species, particularly those of conservation concern? Which population or species-specific impacts are of greatest conservation concern?
7. Minimization, Mitigation, and Adaptive Management	What are the most effective minimization and mitigation methods to reduce or eliminate avian mortality? (e.g., project siting, technology engineering and project design to reduce attractiveness of facilities to birds, construction timing, operational parameters, deterrents, or offset) What off-site mitigation is most effective for off-setting mortalities for affected populations/species?

Research Prioritization

Based upon initial input from CWG members

- **Management:** Questions that are important for informing management decisions (management questions vs. research questions)
- **Timeliness:** Questions that can be answered in 3-5 years
- **Overlap:** Questions shared by multiple agencies

NREL
NATIONAL RENEWABLE ENERGY LABORATORY

QUESTIONS / DISCUSSION

Day 2 Breakout Group Discussions

Group #1

Conceptual Framework

- Add stranding as another form of mortality
- Add dust suppression as water use

Management Questions (General)

- Research questions cannot be fully addressed through monitoring; require research/study design
- Not all questions can be answered with existing data
- Focus on natural history of taxa most likely to interact with solar facilities (e.g., insectivores).

#1 Landscape Considerations

- Scope concerns with the amount of foreseeable development question.
- Meta-analysis of existing data could address landscape considerations
  - ebird
  - Breeding bird survey

#2 Monitoring Methods

- Consider changes to pre-construction baseline surveys for taxa most likely to be affected ("better" baseline monitoring data)
  - Different seasons
  - Species-specific protocols
  - What taxa are most likely to interact with solar facilities?

#3 Source of Mortality and Injury

- It is possible ("maybe") for existing data and monitoring protocols to help inform sources of mortality and causation.

#4 Behavior

- Existing data/studies that could be used to understand avian behavior:
  - Pre-construction radar study for at least one solar project
  - Raptor telemetry data

#5 Impacts to habitat and other wildlife

- Could use predictive information on ravens, raptors, and desert tortoise.

#6 Population-level effects

- Monitoring data could help address how solar impacts different taxa differently.

#7 Mitigation

- Look at deterrents used in other industries (wind, aviation)
- Connect new approaches to systematic monitoring designs

Climate Change

- Could also be used to determine species of concern.

Criteria

- Budget & duration
- Would the answer to the question affect decisions?

Group 2 (Day 2)

Any Important elements missing or misrepresented in the conceptual framework?

- These were mostly captured in the discussion after Lee's presentation
- All birds lumped as one. Consider differential impacts to different guilds/species
- Take into account potential benefits and risks? Or relabel "Potential Negative Impacts" which acknowledges that there may be potential benefits.

Can any of the management questions be addressed with existing information/data? What questions would require additional field work?

- Do we have a good understanding of current monitoring protocols? Protocols evolve based on past experience.
- Look at monitoring approaches for uniformity.
- What are the sources of mortality? (Partial).
- How do impacts of development affect different guilds/taxonomies (Partial)
- Most of the questions will need research.
- Some/many effects appear to be location specific. Depend upon landscape and terrain features.
- Use existing data to develop hypothesis and inform the next iteration of research

Additional critical research needs that weren't identified

- Preconstruction monitoring (as research) to establish baseline mortality for areas that will see lots of development.
- How do we gather baseline mortality data? How funded?
- What before/after data already exists?
- Effect of emerging/future/sunsetting technologies? E.g. types of panels, antireflective coatings. tracking/fixed tilt.

What criteria should be considered by the agencies in establishing priorities for future research? Can you rank in terms of importance for guiding future research (e.g. allocation of funds)?

- Prioritize questions that can be answered sooner?
- Cost/difficulty
- Avoid duplication
- Foundationality
- Fills an important gap
- Should different agencies focus on different questions?
- What are the priorities of the individual agencies?
- Scope and applicability
- Unique to solar
- Solicit public comment on criteria & research needs

Other

- No definitive focus yet (as to priorities)
- Need to do background comparisons
- How do we ensure these agreed-upon priorities are carried out by the member agencies (implementation)

Breakout Session 3

Conceptual Framework, Management Questions, Research Needs and Priorities

Group 3

- Dan Boff, DOE
- Kirk LaGory
- Amy Fesnock,
- Bill Werner
- Katie Umekubo
- Chuck Griffin
- Juliette Falkner
- Karyn Coppinger
- Brian Borowski, H.T. Harvey
- Matt Hutchinson

Conceptual Framework

- Suggestions included
  - Place solar impact box within human development to show proper context
  - Solar should show as positive effect on climate change
  - Add season and weather as influencing factors
  - Present as hypothesis driven
  - Include avian behavior as factor
  - Define indirect
  - Factors are not comprehensive list. Add “e.g.,”
  - Water availability and use should be placed within solar box
  - Need to include potential benefits (e.g., use more neutral language regarding change rather than just degradation)

Management Questions

- Many questions have landscape context but not included in landscape bin
- Data are available on solar development projections, but may not have specific information on where these would go
- Monitoring data available on limited questions regarding mortality

Research Needs and Priorities

- What are the fundamental data needs to answer questions?
- Focus on basic processes:
  - Why are birds at site?
  - What are they exposed to?
  - What results in fatality?
- What is net effect on birds

Breakout 4 –

- *Landscape Framework comments*
  - *Broader context would be good beyond just solar.*
  - *Also, put INTO context to ensure it isn't misinterpreted when seen as a standalone document.*
  - *Should be entitled "pathway for potential impacts";*
  - *Suggest that at the core, it begins with the concepts lifecycle/life history perspective*

Breakout 4

- *Management questions comments*
  - *'landscape considerations' is not a management question but rather required background for solving other management questions.*
    - *Importance of background mortality*
  - *Level of pre-construction needed*
    - *BACI versus geospatial*
    - *Understand first what agency's want to see*
  - *Different ways to determine which guilds/species to study, e.g.*
    - *disproportional impacts, water birds, subset example of all guilds, other?*

Breakout 4

- ASWG compared to CWG questions
  - Feather spots…include clearly in CWG
  - *climate change futures with landscape considerations management question*
  - *Standardization - what attributes are needed to determine best methods?*
- *Criteria Ranking*
  - *#1 Fundamental need – recommend adding this*
  - *#2 Management*
  - *#3 Overlap*
  - *#4 Timeliness*

Multiagency Avian-Solar Collaborative Working Group: Stakeholder Workshop

Next Steps

May 10-11, 2016

Sacramento, California

Stakeholder Input Wanted

- All handouts and presentations will be available on the CWG webpage: http://blmsolar.anl.gov/program/avian-solar/
- Stakeholders can comment during this meeting and/or in writing following the workshop by **June 1, 2016**
- Agencies are seeking input from stakeholders on all matters relevant to the CWG objectives:
  - Concerns about avian-solar issues
  - Relevant existing data and studies
  - Understanding of avian-solar interactions
  - Focus of future research
  - Priorities for research needs
  - Future activities of the CWG
  - Level and mode of future stakeholder engagement

Draft Avian-Solar Science Plan

- Revise draft elements incorporating stakeholder comments
  - Summary of available data
  - Conceptual framework
  - Management questions
- Develop additional elements
  - Prioritization of management questions
  - Implementation plan
  - Comparative cost data
- Draft plan released for stakeholder review mid summer

Future Stakeholder Engagement

- A stakeholder webinar will be hosted to present and take comments on the draft avian-solar science plan (late summer 2016)
- For more information:
  - Subscribe for email updates: send request to rollins@anl.gov
  - CWG webpage: http://blmsolar.anl.gov/program/avian-solar/

Dear Ms. Liberatore:

NextEra Energy Resources (NextEra) appreciates the opportunity to provide this NEPA scoping comment pertaining to the Crimson Solar Project. As an owner, operator and developer of solar projects located near the proposed Crimson Solar Project and the existing Colorado River Substation (CRS), NextEra wants to ensure that BLM is setting aside a sufficient infrastructure-free corridor/buffer leading to and around the CRS to accommodate future renewable energy projects that may need to interconnect to the CRS. NextEra would welcome participating in any future discussions regarding the size and configuration of such a corridor/buffer.

Thank you for the opportunity to comment. If you have any questions, please contact:

Re: RE Crimson Solar Project NOP Scoping Comments

Dear Ms. Rodriguez and Ms. Liberatore:

This law firm represents the Southwest Regional Council of Carpenters (Southwest Carpenters) and submits this letter on the above-referenced project on its behalf.

Southwest Carpenters represents 50,000 union carpenters in six states, including in Southern California, and has a strong interest in addressing the environmental impacts of development projects such as the Crimson Solar Project (Project). The California Department of Fish and Wildlife (DFW) released a Notice of Preparation (NOP) and the U.S. Bureau of Land Management released a Notice of Intent (NOI) signaling these agencies' intent to prepare a Joint Environmental Impact Report/Environmental Impact Statement (EIR/EIS). The agencies held their final scoping meeting on April 12, 2018.

The Project includes development of roughly 2,700 acres of undeveloped land within the BLM-administered Riverside East Solar Energy Zone into a 350-megawatt solar farm. The solar farm, itself, is estimated to include approximately 2 million panels, undisclosed miles of security fencing, up to four substations of about 30,000 square feet each, an "optional" storage system of up to 3,000 electrical enclosures measuring approximately 40 feet by 8 feet by 8.5 feet high and installed on concrete foundations. The applicant proposes access from Power Line Road; however, the proposed access route may change, depending on whether the applicant is able to obtain a private right-of-way. Proposed approvals include a Lake and Streambed Agreement and

Incidental Take Permit from DFW; a Right-of-Way and Amendments to the California Desert Conservation Area Plan from BLM; and, presumably, a Biological Opinion from the U.S. Fish and Wildlife Service.

These comments reflect preliminary concerns based on DFW's Notice of Preparation and BLM's Notice of Intent (NOI) and will focus on potential impacts to biological resources and the preliminary information in the agencies' notices. Southwest Carpenters look forward to reviewing the EIR/EIS and its full discussion of impacts, alternatives, and mitigation.

Project Description

BLM and DFW have provided conflicting descriptions of the base acreage of the Project. Whereas BLM estimates the Project will be sited on 2,700 acres of undeveloped land, DFW has stated the Project will consist of development on 2,500 acres. Moreover, the Project site map provided in DFW's NOP seems to delineate approximately 2,250 acres. In the EIR/EIS, please provide an accurate, stable description of the Project acreage.

In addition, the NOP and NOI fail to define several aspects of the Project. For instance, the NOP states that the Project may consist of "up to" four substations and include an "optional" storage system. The NOP further indicates the Project applicant has yet to negotiate means of entry into the Project site, so entry may potentially occur at multiple locations. The NOI states the Project may require amendments to the California Desert Conservation Area Plan but provides no further clarification as to what these amendments may entail, or whether they will be required at all. In the EIR/EIS, please provide complete information as to the specifics of the Project. If Project features remain uncertain, the agencies should proceed by evaluating the worst-case scenario of the potential environmental impacts of the Project.

Biological Resources

The Project site shares an approximate 3.5-mile-long border with desert tortoise critical habitat. The NOP and NOI do not provide sufficient information regarding the proposed access to the Project site, but it appears that access via Power Line Road will traverse this critical habitat. Moreover, there is a high likelihood that desert tortoise habitat and individuals are present within the thousands of acres that comprise the Project site. The agencies should proceed under the assumption that the Project will cause significant impacts to and result in the take of desert tortoise habitat and individuals.

BLM has not indicated whether it intends to initiate formal Section 7 consultation with the U.S. Fish and Wildlife Service. However, BLM should request the preparation of a

Biological Assessment and Biological Opinion, as the Project has the potential to jeopardize the continued existence of an endangered or threatened species. 16 U.S.C. § 1536.

Potential impacts to desert species from the construction of solar farms is well documented. Impacts include, but are not limited to, the following:

- avian impacts related to migratory birds colliding with solar PV panels due to the "lake effect";
- increase in canine distemper due to passive relocation from solar sites (if San Joaquin kit fox is present);
- loss of habitat;
- take of desert tortoises and other protected species;
- loss of movement corridors;
- habitat fragmentation;
- fringe effects;
- changes in surface hydrology;
- impacts to soils and other resources from loss of Cryptobiotic crusts and desert pavement
- increased dust and subsequent use of dust suppressants;
- construction of and increased traffic on roads;
- upstream impacts related to Project construction and development of solar panels;
- increased noise;
- temperature changes, and creation of microclimates;
- electromagnetic field generation;
- pollution from spills;
- water consumption;
- increased fire risks; and
- light pollution;

A solar farm project of this magnitude should be expected to cause all the above impacts. The Project should be required to provide substantial mitigation, and to adopt an environmentally superior alternative, to reduce or avoid these impacts to the maximum extent possible.

Conclusion

Southwest Carpenters thanks DFW and BLM for the opportunity to comment on the NOP and NOI and look forward to commenting on the agencies' subsequent environmental review documents when these documents are released for public review. Moving forward, please send

all future notices relating to the Project to Nicholas Whipps at nwhipps@wittwerparkin.com Thank you for your consideration of these comments.

Very truly yours,
WITTWER PARKIN LLP

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the RE Crimson Solar Project [SCAG NO. IGR9560]

Dear Ms. Rodriguez,

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the RE Crimson Solar Project ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

SCAG is also the designated Regional Transportation Planning Agency under state law, and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS) pursuant to Senate Bill (SB) 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.[1] SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Community Strategies (RTP/SCS) goals and align with RTP/SCS policies.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the RE Crimson Solar Project in Riverside County. The proposed project includes a 350 megawatt solar photovoltaic energy generation and storage facility on 2,500 acres of public lands managed by BLM.

When available, please send environmental documentation to *SCAG's office in Los Angeles or by email to au@scag.ca.gov* providing, at a minimum, the full public comment period for review. Please note our new headquarters in Downtown Los Angeles is at *900 Wilshire Boulevard, Ste. 1700, Los Angeles, California 90017*.

If you have any questions regarding the attached comments, please contact the Inter-Governmental Review (IGR) Program, attn.: Anita Au, Associate Regional Planner, at (213) 236-1874 or au@scag.ca.gov. Thank you.

Sincerely,

Ping Chang

Ping Chang
Acting Manager, Compliance and Performance Monitoring

[1] Lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS for the purpose of determining consistency for CEQA. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a determination of consistency with the 2016 RTP/SCS for CEQA.

The Regional Council consists of 86 elected officials representing 191 cities, six counties, six County Transportation Commissions, one representative from the Transportation Corridor Agencies, one Tribal Government representative and one representative for the Air Districts within Southern California.

COMMENTS ON THE NOTICE OF PREPARATION OF A
DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE
RE Crimson Solar Project [SCAG NO. IGR9560]

CONSISTENCY WITH RTP/SCS

SCAG reviews environmental documents for regionally significant projects for their consistency with the adopted RTP/SCS. For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the RTP/SCS.

2016 RTP/SCS GOALS

The SCAG Regional Council adopted the 2016 RTP/SCS in April 2016. The 2016 RTP/SCS seeks to improve mobility, promote sustainability, facilitate economic development and preserve the quality of life for the residents in the region. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health (see http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx). The goals included in the 2016 RTP/SCS may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project within the context of regional goals and policies. Among the relevant goals of the 2016 RTP/SCS are the following:

SCAG 2016 RTP/SCS GOALS	
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*
RTP/SCS G3:	*Ensure travel safety and reliability for all people and goods in the region*
RTP/SCS G4:	*Preserve and ensure a sustainable regional transportation system*
RTP/SCS G5:	*Maximize the productivity of our transportation system*
RTP/SCS G6:	*Protect the environment and health for our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking)*
RTP/SCS G7:	*Actively encourage and create incentives for energy efficiency, where possible*
RTP/SCS G8:	*Encourage land use and growth patterns that facilitate transit and active transportation*
RTP/SCS G9:	*Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies**
	**SCAG does not yet have an agreed-upon security performance measure.*

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

SCAG 2016 RTP/SCS GOALS		
Goal		Analysis
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
etc.		etc.

2016 RTP/SCS STRATEGIES

To achieve the goals of the 2016 RTP/SCS, a wide range of land use and transportation strategies are included in the 2016 RTP/SCS. Technical appendances of the 2016 RTP/SCS provide additional supporting information in detail. To view the 2016 RTP/SCS, please visit: http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx. The 2016 RTP/SCS builds upon the progress from the 2012 RTP/SCS and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that the SCAG region strives toward a more sustainable region, while the region meets and exceeds in meeting all of applicable statutory requirements pertinent to the 2016 RTP/SCS. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

DEMOGRAPHICS AND GROWTH FORECASTS

Local input plays an important role in developing a reasonable growth forecast for the 2016 RTP/SCS. SCAG used a bottom-up local review and input process and engaged local jurisdictions in establishing the base geographic and socioeconomic projections including population, household and employment. At the time of this letter, the most recently adopted SCAG jurisdictional-level growth forecasts that were developed in accordance with the bottom-up local review and input process consist of the 2020, 2035, and 2040 population, households and employment forecasts. To view them, please visit: http://www.scag.ca.gov/Documents/2016GrowthForecastByJurisdiction.pdf. The growth forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts			Adopted Unincorporated Riverside County		
	Year 2020	Year 2035	Year 2040	Year 2020	Year 2035	Year 2040
Population	19,663,000	22,091,000	22,138,800	385,600	471,200	499,200
Households	6,458,000	7,325,000	7,412,300	121,800	153,200	162,900
Employment	8,414,000	9,441,000	9,871,500	96,700	139,700	156,600

MITIGATION MEASURES

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for the 2016 RTP/SCS for guidance, as appropriate. SCAG's Regional Council certified the Final PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on April 7, 2016 (please see: http://scagrtpscs.net/Pages/FINAL2016PEIR.aspx). The Final PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

Shelia, your email was forwarded to me. I'm the BLM's project manager for the Crimson Solar project. The project is still on track to issue a draft EIS this summer. I don't have a firm date. We will publish an NOA in the Federal Register and post the issuance on our e-planning site for the project, located here.

You are always welcome to contact me if you have any questions or to follow up on the progress of the project.

Respectfully,

Miriam Liberatore

Hello Brandon,

Could you please confirm when the Draft EIS/EIR of the proposed Crimson Solar Project located in Riverside County is anticipated to be released? Is it on schedule to be released in Summer 2018 as mentioned on the BLM website? https://edit.blm.gov/press-release/blm-schedules-public-scoping-meeting-crimson-solar-project

Thank you,

Sheila

Subject: [EXTERNAL] Crimson Solar Project EIR scoping
To: blm_ca_crimsonsolar@blm.gov

Hello,
I am writing to comment on the EIR scoping for the proposed Crimson Solar Project in Riverside County.

This area is an ecologically rich site home to many species of sensitive wildlife and unique microphyll woodland habitat. Please consider the potentially significant impacts on the desert tortoise, mojave fringe-toed lizard, burrowing owl, desert kit fox, golden eagle, elf owl, and gila woodpecker populations that rely on this area. Microphyll woodland is a unique desert ecosystem that should be considered "riparian" as it provides similar habitat qualities to riparian areas--in the project area specifically, this takes the shape of slow-growing desert ironwood trees that provide habitat for a high diversity of resident and migrating wildlife.

Furthermore, it is unnecessary to build massive solar arrays in the Mojave desert, as California has already met it's 30% renewable energy goal, and rooftop solar makes more economic and ecological sense. Please include in the EIR a serious "no project" alternative--we need renewable energy but we need it done right--on rooftops and not by destroying the desert ecosystems that BLM is supposed to protect.

Thank you,

Anne Cassell

RE: Crimson Solar Project

Dear Ms. Liberatore,

The Morongo Band of Mission Indians would like to enter into the public record, our continued concern regarding potential impacts to tribal cultural resources and properties, including sacred landscapes and view sheds for the above mentioned project. The tribe is also interested in the results of the archaeological assessment that was conducted last fall by Applied Earthworks, which we have not received a draft copy of yet. During a public scoping meeting on September 19, 2017, which was attended by representatives from Morongo and several other tribes, the BLM notified the tribes that the archaeological survey and assessment was still being conducted. Morongo subsequently notified Miriam Liberatore of the BLM that they had not been initially invited to participate in tribal monitoring as part of the study and that the tribe desired to have a representative present to observe the survey methodologies being implemented by Applied Earthworks. Ms. Liberatore put me in touch with the project field manager for the project, Matt Tennyson, to arrange to have a tribal monitor on-site for the final weeks of survey work however. Mr. Tennyson never returned any of my phone calls nor did he respond to any emails during those final weeks and therefore the tribe was not able to participate in the study. For this reason, the tribe would like to remain engaged in the project and receive a copy of any draft versions of the cultural assessment study as soon as it becomes available to the BLM so that we may provide feedback before a final report is published. Again, Morongo wishes to remain a consulting party for the duration of the Crimson Solar Project and reserves its right to engage in meaningful government-to-government consultation as stipulated under the law. If you have any questions, feel free to contact our office at any time.

Respectfully,

Raymond Huaute
Cultural Resource Specialist
Morongo Band of Mission Indians

Appendix E
Applicable Regulations

APPENDIX E
Applicable Regulations

Air Resources

Federal	
1990 Federal Clean Air Act Amendments	Pursuant to the 1990 Federal Clean Air Act Amendments, USEPA passed federal conformity rules to ensure that air pollutant emissions associated with federally approved or funded activities do not exceed emission budgets established in the applicable State Implementation Plans (SIP), and do not otherwise interfere with the State's ability to attain and maintain the NAAQS in such designated areas. When federal actions or funding of non-transportation related activities in non-attainment areas result in emissions that exceed de minimis threshold levels applicable to the specific non-attainment class, a formal, detailed General Conformity determination is required. The General Conformity rule applies to non-transportation related projects, such as the Proposed Action. The MDAB is designated as a severe nonattainment area for ozone, and as a moderate nonattainment area for PM10. Although, the Riverside County portion of the MDAQMD (where the Project is located) is designated as an unclassifiable/attainment area for PM10, this analysis conservatively compares Project's PM10 emissions to the PM10 de minimis threshold. Ozone is not directly emitted from stationary or mobile sources, but is formed in the atmosphere as the result of chemical reactions between directly emitted nitrogen oxides (NOx) and volatile organic compounds (VOCs) in the presence of sunlight, therefore, NOx and VOC are the de minimis thresholds for ozone.
State	
California Air Quality Standards (CAAQS)	ARB has established CAAAQS for the criteria pollutants that are as stringent, or more stringent, than NAAQS. In addition to NAAQS, ARB provides CAAQS for sulfates, hydrogen sulfide, vinyl chloride, and visibility reducing particles.
California's Occupational Safety & Health Administration (Cal/OSHA)'s Respiratory Protection standard (8 CCR 5144)	When exposure to dust is unavoidable, employers must provide NIOSH-approved respiratory protection with particulate filters rated as N95, N99, N100, P100, or HEPA. Employers must develop and implement a respiratory protection program in accordance with Cal/OSHA's Respiratory Protection standard (8 CCR 5144).
Local	
Mojave Desert Air Quality Management District	MDAQMD regulates air pollutant emissions for all sources in the MDAB other than motor vehicles. MDAQMD enforces regulations and administers permits governing stationary sources. The MDAQMD Rules applicable to the Proposed Action and Alternatives include: Rule 401 – Visible Emissions, Rule 402 – Nuisance, Rule 403 – Fugitive Dust, Rule 404 – Particulate Matter Concentration, Rule 405 – Solid Particulate Matter Weight, Rule 406 – Specific Contaminants, Rule 407 – Liquid and Gaseous Air Contaminants, Rule 408 – Circumvention, Rule 409 – Combustion Contaminants, Rule 431 – Sulfur Content of Fuels, and Rule 442 – Usage of Solvents, Jurisdictions of non-attainment areas are also required to prepare air quality attainment plans for achieving attainment. MDAQMD's 2004 state and federal Ozone Attainment Plan, and the 1996 PM10 Maintenance Plan are applicable to the Proposed Action and alternatives.

Biological Resources

Federal	
Federal Endangered Species Act (FESA) (16 USC Section 1531 et seq.)	This 1973 law, administered by the U.S. Fish and Wildlife Service, is designed to minimize impacts to imperiled plants and animals, as well as to facilitate recovery of such species. Declining plant and animal species are listed as "endangered" or "threatened" based on a variety of factors. Applicants for projects requiring federal agency action that could adversely affect listed species are required to consult with and mitigate impacts in consultation with USFWS. Adverse impacts are defined as "take" (defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct"), which is prohibited except as authorized through consultation with USFWS and issuance of an Incidental Take Statement under Section 7 or Section 10 of FESA, depending on whether there is a federal nexus (federal permit required or funding involved).

Biological Resources (continued)

Federal (cont.)	
Migratory Bird Treaty Act (MBTA) (16 USC §§703–712)	This law prohibits actions resulting in the pursuit, capture, killing, and/or possession of any protected migratory bird, nest, egg, or parts thereof. The USFWS issued a subsequent memorandum on April 11, 2018, clarifying that USFWS "interpret[s] the M-Opinion to mean that the MBTA's prohibitions on take apply when the purpose of an action is to take migratory birds, their eggs, or their nests." The guidance memorandum goes on to state that "the take of birds, eggs or nests occurring as the result of an activity, the purpose of which is not to take birds, eggs or nests, is not prohibited by the MBTA."
Bald and Golden Eagle Protection Act (16 United States Code [USC] §§668-668c)	This law, enacted in 1940, Prohibits the take, possession, sale, barter, offer to sell, purchase or barter, transport, export or import, of any bald or golden eagle, alive or dead, including any part, nest, or egg, unless allowed by permit. "Take" includes pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb. Disturb means to agitate or bother a bald or golden eagle to the point where it causes either injury to an eagle, a decrease in its productivity, or nest abandonment.
Clean Water Act (CWA) (33 USC §1251 et seq.)	Under Section 404 of the CWA, the U.S. Army Corps of Engineers (USACE) regulates the discharge of dredged or fill material into jurisdictional "waters of the U.S.," which include those waters listed in 33 Code of Federal Regulations (CFR) §328.3 (Definitions).
National Environmental Policy Act (NEPA) (42 USC §4321 et seq.)	NEPA requires federal agencies to analyze and publicly disclose of the environmental impacts of a proposed action. To do so, federal agencies are required to prepare either an environmental assessment or, where an action may significantly affect the quality of the human environment, an Environmental Impact Statement (EIS). These documents explore project alternatives and identify the likely environmental consequences of each action.
California Desert Conservation Area (CDCA) Plan	Per Title 43 C.F.R. §1610.5-3, the BLM must manage the land within its jurisdiction in compliance with a Resource Management Plan. The CDCA Plan of 1980, as amended, serves as a guide for the management of all BLM-administered lands in three desert areas: the Mojave, the Sonoran, and a small portion of the Great Basin.
Northern and Eastern Colorado Desert Coordinated Management Plan (NECO)	NECO is a landscape-scale, multiagency planning effort that protects and conserves natural resources while simultaneously balancing human uses of the California portion of the Sonoran Desert ecosystem. NECO provides reserve management for the desert tortoise, integrated ecosystem management for special-status species and natural communities for all federal lands, and regional standards and guidelines for public land health for the BLM lands. Within the NECO area, BLM has designated multiple DWMAs and ACECs. Several DWMAs and ACECs are located around the Project including the Chuckwalla DWMA, Chuckwalla Valley Dune Thicket ACEC, and Mule Mountains ACEC.
Desert Renewable Energy Conservation Plan (DRECP)	The DRECP is a landscape-level plan that was intended to streamline renewable energy permitting and development while conserving unique and valuable desert ecosystems and providing outdoor recreation opportunities. The DRECP is a collaborative effort between multiple agencies including the California Energy Commission (CEC), CDFW, BLM, and USFWS, known as the Renewable Energy Action Team (REAT).
Vegetation Treatments Using Herbicide Programmatic Environmental Impact Statement (2007)	This document may be applicable to herbicide use during the Project's operations phase.
State	
California Environmental Quality Act (Pub. Res. Code §21000) and its implementing regulations (Guidelines) (14 CCR. §15000 et seq.)	The California Environmental Quality Act (CEQA) and the CEQA Guidelines require identification of significant environmental effects of proposed projects (including impacts on biological resources) and avoidance (where feasible) or mitigation of the significant effects. CEQA applies to "projects" proposed to be undertaken or requiring approval by state and/or local governmental agencies. "Projects" are activities that have the potential to have a physical impact on the environment.
California Endangered Species Act (CESA) (California Fish and Game Code [CFGC] §§2050-2098)	This state law prohibits the "take" (defined as "to hunt, pursue, catch, capture, or kill" in CFGC Section 86) of state-listed species except as otherwise provided in state law. CESA, administered by CDFW, is similar to the federal ESA, although unlike the federal law, CESA applies incidental take prohibitions to species currently petitioned for state-listing status (i.e., candidate species). Also, CESA's take definition does not include harassment. Under Section 2081, CDFW authorizes "take" of state-listed endangered, threatened, or candidate species through incidental take permits or memoranda of understanding.
CFGC §3503	This code section prohibits take, possession, or needless destruction of the nests or eggs of any bird, except as otherwise provided by the code or any regulation made pursuant thereto.
CFGC §3503.5	This code section makes it unlawful to take, possess, or destroy birds of prey. It also prohibits the take, possession, or destruction of nests or eggs of any bird of prey.
CFGC §3511	This code section describes bird species, primarily raptors, which are "fully protected." Fully protected birds may not be taken or possessed, except under specific permit requirements.
CFGC §3513	This code section makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act.

Biological Resources (continued)

State (cont.)	
CFGC Section 4000 et seq.	This Code makes it unlawful to take fur-bearing mammals without a proper fur-bearing mammal take permit. Fur-bearing mammals are defined by this Code as fisher, marten, river otter, desert kit fox and red fox. As defined in CFGC Section 86, "take" is defined as "to hunt, pursue, catch, capture, or kill;" this take definition does not include harassment.
CFGC Sections 4700, 5050, and 5515	These Codes list mammal, amphibian, and reptile species respectively that are classified as fully protected in California. Take of fully protected species is prohibited by these CFGCs.
Native Plant Protection Act (NPPA) (CFGC Section 1900 et seq.)	The NPPA includes measures to preserve, protect, and enhance rare and endangered native plant species. Definitions for "rare and endangered" are different from those contained in CESA, although CESA-listed rare and endangered species are included in the list of species protected under the NPPA.
Title 14, California Code of Regulations Sections 670.2 and 670.5	These regulations list plant and animal species designated as threatened and endangered in California. California species of special concern (SSC) status is a designation applied by CDFW to those species that are indicators of regional habitat changes or are considered potential future protected species. SSCs do not have any special legal status but are intended by CDFW for use as a management tool to take these species into special consideration when decisions are made concerning the future of any land parcel.
CFGC Section 1600 et seq.	Notification is generally required for any activity that will take place in or in the vicinity of a river, stream, lake, or their tributaries, including rivers or streams that flow at least periodically or permanently through a bed or channel with banks and support fish or other aquatic life, and watercourses having a surface or subsurface flow that support or have supported riparian vegetation.
1969 Porter Cologne Water Quality Control Act (Porter-Cologne) (California Water Code Section 13000 et seq.)	Through a programmatic agreement between the federal government and the states, the RWQCB has primary authority for permit and enforcement activities under Porter-Cologne) and the Clean Water Act. Under Porter-Cologne, the RWQCB regulates the "discharge of waste" to waters of the state. The term "discharge of waste" is also broadly defined in Porter-Cologne, such that discharges of waste include fill, any material resulting from human activity, or any other "discharge" that may directly or indirectly impact waters of the state relative to implementation of Section 401 of the CWA.
Local	
There are no local regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County policies would not be applicable to the Project site.	

Greenhouse Gas Emissions

Federal	
USEPA	The U.S. Supreme Court ruled that the GHG CO2 is an air pollutant, as defined under the CAA; therefore, USEPA has the authority to regulate emissions of GHGs.
State	
CARB	GHG legislation in California includes numerous executive orders, senate bills, assembly bills, and plans, as detailed in the technical report, Appendix B.
Local	
MDAQMD	MDAQMD developed an annual GHG emissions significance threshold of 100,000 metric tons (MT) of CO2e (MDAQMD, 2016).
Riverside County Climate Action Plan	Riverside County adopted a Climate Action Plan (CAP) (County of Riverside, 2015a) to create a GHG emissions baseline from which to benchmark GHG reductions; guide the development, enhancement, and implementation of actions that reduce GHG emissions; and provide a policy document with specific implementation measures to be considered as part of future development projects. The CAP provides a list of specific actions to reduce GHG emissions in the County and establishes a qualified reduction plan for which future development within the County can tier from (County of Riverside, 2015a).
Riverside County General Plan, Multipurpose Open Space Element and Air Quality Element	The County General Plan, Multipurpose Open Space Element of contains several policies which indirectly address global climate change, including development of solar energy use and development, while the Air Quality Element includes Alternative Energy Objectives including policy AQ 20.19, which calls for increasing the use of alternative energy sources to reduce the amount of GHG emissions, by facilitating development and siting of renewable energy facilities and transmission lines in appropriate locations (County of Riverside, 2015b).

Cultural, Tribal, and Historic Resources

Federal	
National Historic Preservation Act	The principal federal law addressing historic properties is the National Historic Preservation Act (NHPA), as amended (54 USC 300101 et seq.), and its implementing regulations (36 CFR Part 800). Section 106 requires a federal agency with jurisdiction over a proposed federal action (referred to as an "undertaking" under the NHPA) to take into account the effects of the undertaking on historic properties, and to provide the Advisory Council on Historic Preservation (ACHP) an opportunity to comment on the undertaking. The steps of the Section 106 process are accomplished through consultation with the State Historic Preservation Officer (SHPO), federally-recognized Indian tribes, local governments, and other interested parties. The goal of consultation is to identify potentially affected historic properties, assess effects to such properties, and seek ways to avoid, minimize, or mitigate any adverse effects on such properties. The agency also must provide an opportunity for public involvement (36 CFR 800.1(a)). Consultation with Indian tribes regarding issues related to Section 106 and other authorities (such as NEPA and Executive Order No. 13007) must recognize the government-to-government relationship between the Federal government and Indian tribes, as set forth in Executive Order 13175, 65 FR 87249 (Nov. 9, 2000), and Presidential Memorandum of Nov. 5, 2009.
National Register of Historic Places	The National Register was established by the NHPA of 1966, as "an authoritative guide to be used by federal, State, and local governments, private groups and citizens to identify the Nation's historic resources and to indicate what properties should be considered for protection from destruction or impairment" (36 CFR 60.2) (U.S. Department of the Interior, 2002). The National Register recognizes a broad range of cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes. A resource that is listed in or eligible for listing in the National Register is considered "historic property" under Section 106 of the NHPA. To be eligible for listing in the National Register, a property must be significant in American history, architecture, archaeology, engineering, or culture. Properties of potential significance must meet one or more of the following four established criteria: A. Are associated with events that have made a significant contribution to the broad patterns of our history; B. Are associated with the lives of persons significant in our past; C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or D. Have yielded, or may be likely to yield, information important in prehistory or history. In addition to meeting one or more of the criteria of significance, a property must have integrity. Integrity is defined as "the ability of a property to convey its significance" (U.S. Department of the Interior, 2002). The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance.
Definition of Adverse Effect under the NHPA	According to the Criteria of Adverse Effect set forth in 36 CFR 800, "an adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association [36 CFR 800.5(a)(1)].
Native American Graves Protection and Repatriation Act	The Native American Graves Protection and Repatriation Act (NAGPRA) (25 USC 3001 et seq.) was enacted on November 16, 1990, to address the rights of lineal descendants, Indian tribes, and Native Hawaiian organizations to Native American cultural items, including human remains, funerary objects, sacred objects, and objects of cultural patrimony. NAGPRA provides a process for museums and Federal agencies to return certain Native American cultural items, including human remains, funerary objects, sacred objects, or objects of cultural patrimony, to lineal descendants, and culturally affiliated Indian tribes and Native Hawaiian organizations. NAGPRA includes provisions for unclaimed and culturally unidentifiable Native American cultural items, intentional and inadvertent discovery of Native American cultural items on Federal and tribal lands, and penalties for noncompliance and illegal trafficking.
Archaeological Resources Protection Act	ARPA establishes requirements to protect archaeological resources and sites on public lands and Indian lands and to foster increased cooperation and exchange of information between governmental authorities, the professional archaeological community, and private individuals. The Act (16 USC 470aa-470mm) established civil and criminal penalties for the destruction or alteration of cultural resources.

Cultural, Tribal, and Historic Resources (continued)

State	
California Environmental Quality Act	Under CEQA (Section 21084.1), a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. The CEQA Guidelines (Title 14 California Code of Regulations [CCR] Section 15064.5) recognize that historical resources include: (1) a resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources (California Register); (2) a resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record. If an archaeological site does not meet the criteria for a historical resource contained in the CEQA Guidelines, then the site may be treated in accordance with the provisions of Section 21083, which is as a unique archaeological resource. As defined in Section 21083.2 of CEQA a "unique" archaeological resource is an archaeological artifact, object, or site, about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria: • Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information; • Has a special and particular quality such as being the oldest of its type or the best available example of its type; or, • Is directly associated with a scientifically recognized important prehistoric or historic event or person. If an archaeological site meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site is to be treated in accordance with the provisions of Section 21083.2, which state that if the lead agency determines that a project would have a significant effect on unique archaeological resources, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place (Section 21083.1(a)). If preservation in place is not feasible, mitigation measures shall be required. The CEQA Guidelines note that if an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment (CEQA Guidelines Section 15064.5(c)(4)). A significant effect under CEQA would occur if a project results in a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5(a). Substantial adverse change is defined as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1)). According to CEQA Guidelines Section 15064.5(b)(2), the significance of a historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that convey its significance or account for its inclusion in the California Register or a local register.
California Register of Historical Resources	The California Register is "an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1[a]). The criteria for eligibility for the California Register are based upon National Register criteria (PRC Section 5024.1[b]). Certain resources are determined by the statute to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register. To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, state, and/or federal level under one or more of the following four criteria: 1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage; 2. Is associated with the lives of persons important in our past; 3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or 4. Has yielded, or may be likely to yield, information important in prehistory or history. A resource eligible for the California Register must meet one of the criteria of significance described above, and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

Cultural, Tribal, and Historic Resources (continued)

State (cont.)	
California Health and Safety Code Section 7050.5	California Health and Safety Code Section 7050.5 requires that in the event human remains are discovered, the County Coroner be contacted to determine the nature of the remains. In the event the remains are determined to be Native American in origin, the Coroner is required to contact the NAHC within 24 hours to relinquish jurisdiction.
California Public Resources Code Section 5097.98	California PRC Section 5097.98, as amended by Assembly Bill 2641, provides procedures in the event human remains of Native American origin are discovered during project implementation. PRC Section 5097.98 requires that no further disturbances occur in the immediate vicinity of the discovery, that the discovery is adequately protected according to generally accepted cultural and archaeological standards, and that further activities take into account the possibility of multiple burials. PRC Section 5097.98 further requires the NAHC, upon notification by a County Coroner, designate and notify a Most Likely Descendant (MLD) regarding the discovery of Native American human remains. Once the MLD has been granted access to the site by the landowner and inspected the discovery, the MLD then has 48 hours to provide recommendations to the landowner for the treatment of the human remains and any associated grave goods.
California Government Code Sections 6254(r) and 6254.10	These sections of the California Public Records Act were enacted to protect archaeological sites from unauthorized excavation, looting, or vandalism. Section 6254(r) explicitly authorizes public agencies to withhold information from the public relating to "Native American graves, cemeteries, and sacred places maintained by the Native American Heritage Commission." Section 6254.10 specifically exempts from disclosure requests for "records that relate to archaeological site information and reports, maintained by, or in the possession of the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the Native American Heritage Commission, another state agency, or a local agency, including the records that the agency obtains through a consultation process between a Native American tribe and a state or local agency."
Assembly Bill 52 and Related Public Resources Code Sections	Assembly Bill (AB) 52, approved on September 25, 2014, amended California PRC Section 5097.94, and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. The primary intent of AB 52 is to include California Native American Tribes early in the environmental review process and to establish a new category of resources related to Native Americans that require consideration under CEQA, known as tribal cultural resources. PRC Section 21074(a)(1) and (2) defines tribal cultural resources as "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe" that are either included or determined to be eligible for inclusion in the California Register or included in a local register of historical resources, or a resource that is determined to be a tribal cultural resource by a lead agency, in its discretion and supported by substantial evidence. On July 30, 2016, the California Natural Resources Agency adopted the final text for tribal cultural resources update to Appendix G of the CEQA Guidelines, which was approved by the Office of Administrative Law on September 27, 2016. PRC Section 21080.3.1 requires that within 14 days of a lead agency determining that an application for a project is complete, or a decision by a public agency to undertake a project, the lead agency provide formal notification to the designated contact, or a tribal representative, of California Native American Tribes that are traditionally and culturally affiliated with the geographic area of the project (as defined in PRC Section 21073) and who have requested in writing to be informed by the lead agency (PRC Section 21080.3.1(b)). Tribes interested in consultation must respond in writing within 30 days from receipt of the lead agency's formal notification and the lead agency must begin consultation within 30 days of receiving the tribe's request for consultation (PRC Sections 21080.3.1(d) and 21080.3.1(e)).
Local	
Riverside County General Plan- Multipurpose Open Space Element	The Multipurpose Open Space Element of the Riverside County General Plan (amended March 22, 2011) outlines policies intended to promote the preservation of cultural resources in the County of Riverside, as follows: • OS 19.2 -The County of Riverside shall establish a cultural resources program in consultation with Tribes and the professional cultural resources consulting community. Such a program shall, at a minimum, address each of the following: application processing requirements; information database(s); confidentiality of site locations; content and review of technical studies; professional consultant qualifications and requirements; site monitoring; examples of preservation and mitigation techniques and methods; and the descendant community consultation requirements of local, state, and federal law. (AI-A) • OS 19.3 - Review proposed development for the possibility of cultural resources and for compliance with the cultural resources program. • OS 19.4 - To the extent feasible designate as open space and allocate resources and/or tax credits to prioritize the protection of cultural resources preserved in place or left in an undisturbed state, (AI-B) • OS 19.5 - Exercise sensitivity and respect for human remains form both prehistoric and historic time periods and comply with all applicable laws concerning such remains.

Energy Conservation

Federal	
NEPA	NEPA Section 102(2)(c)(v) and 40 CFR 1502.16 requires that an EIS include a discussion of the irreversible and irretrievable commitments of resources which may occur should the project be implemented. Irreversible commitments of resources are those which cause either direct or indirect use of natural resources such that the resources cannot be restored or returned to their original condition.
National Energy Policy Act of 2005	The Energy Policy Act of 2005 (42 USC §13201 et seq.) establishes equipment energy and efficiency requirements in order to reduce reliance on non-renewable energy resources and provide incentives to reduce current demand on these resources. For example, under this act, consumers and businesses can obtain federal tax credits for purchasing fuel-efficient appliances and products, including buying hybrid vehicles, building energy-efficient buildings, and improving the energy efficiency of commercial buildings. Additionally, tax credits are available for the installation of qualified fuel cells, stationary microturbine power plants, and solar power equipment.
State	
Warren-Alquist Act	The 1975 Warren-Alquist Act (Pub. Res. Code §25000 et seq.) established the California Energy Resources Conservation and Development Commission, now known as the California Energy Commission (CEC). The Act established a State policy to reduce wasteful, uneconomical and unnecessary uses of energy by employing a range of measures. The Act also was the driving force behind the creation of Appendix F to the CEQA Guidelines.
State of California Integrated Energy Policy	In 2002, the Legislature passed Senate Bill 1389, which required the CEC to develop an integrated energy plan every two years for electricity, natural gas, and transportation fuels, for the California Energy Policy Report. The plan calls for the state to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. An overarching goal of the resulting Integrated Energy Policy Report (IEPR) is to achieve the statewide GHG reduction targets, while improving overall energy efficiency. See, for example, the CEC's 2018 Integrated Energy Policy Report Update, which includes integrating renewable energy as a key component (CEC 2018d).
Title 24 Building Energy Efficiency Standards	The Energy Efficiency Standards for Residential and Nonresidential Buildings specified in Title 24, Part 6 of the California Code of Regulations include requirements for non-residential building lighting, insulation, ventilation, and mechanical systems (CEC 2015). Its provisions would be relevant to the Project's proposed structures, including O&M and Site Control Center buildings. The California Green Building Standards Code (CALGreen, Title 24 Part 11) is a statewide regulatory code for all buildings. CALGreen is intended to encourage more sustainable and efficient building practices, require use of low-pollution emitting substances that cause less harm to the environment, conserve natural resources, and promote the use of energy-efficient materials and equipment (see, e.g., CBSC 2017).
Renewable Portfolio Standard	The California RPS program was established in 2002 by Senate Bill (SB) 1078 (Sher, 2002) with the initial requirement that 20% of electricity retail sales must be served by renewable resources by 2017. The program was accelerated in 2006 under SB 107 (Simitian, 2006), which required that the 20% mandate be met by 2010. In April 2011, SB 2 (1X) (Simitian) was signed into law, which codified a 33% RPS requirement to be achieved by 2020. In 2015, SB 350 (de León, 2015) was signed into law, which mandated a 50% RPS by December 31, 2030. SB 350 includes interim annual RPS targets with three-year compliance periods. In addition, SB 350 requires 65% of RPS procurement must be derived from long-term contracts of 10 or more years. In 2018, SB 100 (de León, 2018) was signed into law, which again increases the RPS to 60% by 2030 and requires all state's electricity to come from carbon-free resources by 2045. SB 100 will take effect on January 1, 2019.
Construction Equipment Idling	In order to reduce emissions from diesel-powered construction and mining vehicles, CARB adopted a regulation (13 Cal. Code Regs. Section 2449 et seq.) for in-use off-road diesel vehicles which imposes idling limitations on owners, operators, renters, or lessees of off-road diesel vehicles. The regulation requires an operator of applicable off-road vehicles (self-propelled diesel-fueled vehicles 25 horsepower and up that were not designed to be driven on-road) to limit idling to no more than 5 minutes.
SCAG 2008 Regional Comprehensive Plan	The SCAG Regional Comprehensive Plan (RCP) is a major advisory plan that addresses regional issues, serving as an advisory document for member agencies such as the City of Blythe and the County of Riverside. The plan includes an Energy Chapter which identifies energy goals such as reducing regional reliance on non-renewable energy and voluntary best practices for local governments to help reach those goals.
Local	
There are no local regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County policies would not be applicable to the Project site.	

Geology and Soil Resources

Federal	
There are no federal regulations, plans, or standards that are applicable to the Proposed Action.	
State	
California Building Code	The California Building Code (CBC), which is codified in Title 24 of the California Code of Regulations, Part 2, establishes minimum standards related to structural strength, means of egress facilities, and general stability of buildings. Its purpose is to regulate and control the design, construction, quality of materials, use/occupancy, location, and maintenance of all buildings and structures within its jurisdiction. The provisions of the CBC apply to the construction, alteration, movement, replacement, location, and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures throughout California. The current (2016) CBC contains California amendments based on the American Society of Civil Engineers (ASCE) Minimum Design Standard ASCE/SEI 7-16, Minimum Design Loads for Buildings and Other Structures, provides requirements for general structural design and includes means for determining earthquake loads as well as other loads (such as wind loads) for inclusion into building codes. Seismic design provisions of the building code generally prescribe minimum lateral forces applied statically to the structure, combined with the gravity forces of the dead and live loads of the structure, which the structure then must be designed to withstand. The prescribed lateral forces are generally smaller than the actual peak forces that would be associated with a major earthquake. Consequently, structures should be able to resist: (1) minor earthquakes without damage, (2) moderate earthquakes without structural damage but with some nonstructural damage, and (3) major earthquakes without collapse, but with some structural as well as nonstructural damage. Conformance to the current building code recommendations does not constitute any kind of guarantee that substantial structural damage would not occur in the event of a maximum magnitude earthquake. However, it is reasonable to expect that a structure designed in-accordance with the seismic requirements of the CBC should not collapse in a major earthquake. The earthquake design requirements take into account the occupancy category of the structure, site class, soil classifications, and various seismic coefficients. Chapter 18 of the CBC covers the requirements of geotechnical investigations (§1803), excavation, grading, and fills (§1804), load-bearing of soils (§1806), as well as foundations (§1808), shallow foundations (§1809), and deep foundations (§1810). Chapter 18 requires analysis of slope instability, liquefaction, and surface rupture attributable to faulting or lateral spreading, plus an evaluation of lateral pressures on basement and retaining walls, liquefaction and soil strength loss, and lateral movement or reduction in foundation soil-bearing capacity. It also addresses measures to be considered in structural design, which may include ground stabilization, selecting appropriate foundation type and depths, selecting appropriate structural systems to accommodate anticipated displacements, or any combination of these measures. The potential for liquefaction and soil strength loss must be evaluated for site-specific peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions.
Local	
There are no local regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County zoning would not be applicable to the Project site.	

Hazards and Hazardous Materials

Federal	
Hazardous Materials Management	The primary federal agencies with responsibility for hazardous materials management include the U.S. Environmental Protection Agency (USEPA), U.S. Department of Labor Occupational Safety and Health Administration (OSHA), and the U.S. Department of Transportation. State and local agencies often have either parallel or more stringent regulations than these federal agencies. In most cases, state law mirrors or overlaps federal law and enforcement of these laws is the responsibility of the state or of a local agency to which enforcement powers are delegated.
Hazardous Materials Transportation	The U.S. Department of Transportation regulates hazardous materials transportation on all interstate roads pursuant to its authority under the Hazardous Materials Transportation Uniform Safety Act (49 U.S.C. §5101 et seq.). The purpose of the Act is to “protect against the risks to life, property, and the environment that are inherent in the transportation of hazardous material in intrastate, interstate, and foreign commerce” (49 U.S.C.A. §5101). Within California, the state agencies with primary responsibility for enforcing federal and state regulations and for responding to transportation emergencies are the California Highway Patrol and California Department of Transportation. Together, federal and state agencies determine driver-training requirements, load labeling procedures, and container specifications. Although special requirements apply to transporting hazardous materials, requirements for transporting hazardous waste are more stringent, and hazardous waste haulers must be licensed to transport hazardous waste on public roads.

Hazards and Hazardous Materials (continued)

Federal (cont.)	
Toxic Substances Control Act, Resource Conservation and Recovery Act	The Federal Toxic Substances Control Act of 1976 and the Resource Conservation and Recovery Act of 1976 (RCRA) established a program administered by the USEPA for the regulation of the generation, transportation, treatment, storage, and disposal of hazardous waste. RCRA was amended in 1984 by the Hazardous and Solid Waste Amendments, which affirmed and extended the "cradle to grave" system of regulating hazardous materials and wastes.
Occupational Safety	OSHA is the agency responsible for assuring worker safety in the handling and use of chemicals in the workplace. The federal regulations pertaining to worker safety are contained in Title 29 of the Code of Federal Regulations (CFR), as authorized in the Occupational Safety and Health Act of 1970. They provide standards for safe workplaces and work practices, including standards relating to hazardous materials handling. At sites known or suspected to have soil or groundwater contamination, construction workers must receive training in hazardous materials operations and a site health and safety plan must be prepared. The health and safety plan establishes policies and procedures to protect workers and the public from exposure to potential hazards at the contaminated site.
State	
National Pollutant Discharge Elimination System (NPDES)	Section 402 of the Clean Water Act authorizes the SWRCB to issue a NPDES General Construction Storm Water Permit (Water Quality Order 2009-0009-DWQ), referred to as the "General Construction Permit." Construction activities can comply with and be covered under the General Construction Permit provided that they: • Develop and implement a Storm Water Pollution Prevention Plan (SWPPP) which specifies Best Management Practices (BMPs) that will prevent all construction pollutants from contacting stormwater and with the intent of keeping all products of erosion from moving off site into receiving waters. • Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation. • Perform inspections of all BMPs. The Project site is located within the Colorado River Regional Water Control Board jurisdiction.
Occupational Safety	OSHA is the agency responsible for assuring worker safety in the handling and use of chemicals in the workplace. The federal regulations pertaining to worker safety are contained in Title 29 of the Code of Federal Regulations (CFR), as authorized in the Occupational Safety and Health Act of 1970. They provide standards for safe workplaces and work practices, including standards relating to hazardous materials handling. At sites known or suspected to have soil or groundwater contamination, construction workers must receive training in hazardous materials operations and a site health and safety plan must be prepared. The health and safety plan establishes policies and procedures to protect workers and the public from exposure to potential hazards at the contaminated site.
Local	
Riverside County Department of Environmental Health	The County of Riverside Department of Environmental Health (DEH) acts as the Certified Unified Program Agency (CUPA) for Riverside County and is responsible for reviewing Hazardous Materials Business Plans. A CUPA is a local agency that has been certified by Cal EPA to implement state environmental programs related to hazardous materials and waste. The DEH is responsible for protecting the health and safety of the public and the environment of Riverside County by assuring that hazardous materials are properly handled and stored. The DEH accomplishes this through inspection, emergency response, site remediation, and hazardous waste management services. The specific responsibilities of the DEH include the following: • Inspecting hazardous material handlers and hazardous waste generators to ensure full compliance with laws and regulations. • Implementing CUPA programs for the development of accident prevention and emergency plans, proper installation, monitoring, and closure of underground storage tanks and the handling, storage and transportation and disposal of hazardous wastes. • Providing 24-hour response to emergency incidents involving hazardous materials or wastes in order to protect the public and the environment from accidental releases and illegal activities. • Overseeing the investigation and remediation of environmental contamination due to releases from underground storage tanks, hazardous waste containers, chemical processes or the transportation of hazardous materials. • Conducting investigations and taking enforcement action as necessary against anyone who disposes of hazardous waste illegally or otherwise manages hazardous materials or wastes in violation of federal, state, or local laws and regulations.

Land Use, Lands, and Realty

Federal	
Federal Land Policy and Management Act (FLPMA) of 197	The Federal Land Policy and Management Act (FLPMA) establishes public land policy; guidelines for administration; and provides for the management, protection, development, and enhancement of public lands. FLPMA Title V, Section 501, establishes BLM's authority to grant ROWs for generation, transmission, and distribution of electrical energy (FLPMA, as amended, 2001). BLM is responsible for responding to requests regarding the development of energy resources on BLM-administered lands in a manner that balances diverse resource uses and considers long-term needs for renewable and non-renewable resources for future generations.
California Desert Conservation Area Plan of 1980, as amended	The California Desert Conservation Area (CDCA) Plan provides overall regional guidance for BLM-administered lands in the CDCA and establishes long-term goals for protection and use of the California desert. The CDCA Plan establishes multiple use classes (MUCs); MUC guidelines; and plan elements for specific resources or activities. The proposed site is located in an area designated by the CDCA Plan as Multiple-use Class M. This class is intended to control the balance between higher intensity use and protection of public lands. This class provides for a wide variety or present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Class M management is also designed to conserve desert resources and to mitigate damage to those resources which permitted uses may cause.
Western Energy Plan Solar Programmatic EIS	The Western Energy Plan Solar Programmatic EIS (Solar PEIS; BLM, 2012) provided a blueprint for utility-scale solar energy permitting in Arizona, California, Colorado, Nevada, New Mexico and Utah by establishing SEZs with access to existing or planned transmission, incentives for development within those zones, and a process through which to consider additional zones and solar projects. The Project is considered a "pending project" Solar PEIS Record of Decision (BLM, 2012). Pending applications are not subject to the Western Solar Plan (Western Solar Plan ROD Section B.1.2) or to the CDCA Plan amendments made in that decision. Therefore, if the BLM elects to approve the ROW grant application for the Crimson Solar Project, a Project-specific CDCA Plan Amendment (PA) to identify the development footprint as suitable for the proposed type of solar energy use would be required.
State and Local	
There are no applicable state regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County zoning would not be applicable to the site of the Proposed Action and Alternatives.	

Noise

Federal	
Although no federal noise regulations exist, USEPA has promulgated noise guidelines, and recommends 55 dBA Ldn to protect the public from the effect of environmental noise in residential areas and farms, and other outdoor areas (USEPA, 1974).	
State	
California Department of Transportation	The California Department of Transportation (Caltrans) Transportation and Construction Vibration Guidance Manual (Caltrans, 2013) provides vibration criteria based on source type for structural damage, when vibration levels exceed 0.25 to 2 in/sec PPV (based on structure type), and human annoyance, when vibration levels exceed 0.1 to 0.9 in/sec PPV.
Local	
There are no local regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County zoning would not be applicable to the Project site.	

Paleontological Resources

Federal	
A variety of federal, state, and local statutes specifically address paleontological resources. Federal statutes are applicable to all projects occurring on federal lands, such as those controlled by the BLM, and may be applicable to specific projects if the project involves a federal agency license, permit, approval, or funding.	
National Environmental Policy Act of 1969	The National Environmental Policy Act (NEPA) (United States Code, section 4321 et seq.; 40 Code of Federal Regulations, section 1502.25), as amended, directs Federal agencies to "Preserve important historic, cultural, and natural aspects of our national heritage (Section 101(b) (4))." The current interpretation of this language has included scientifically important paleontological resources among those resources that may require preservation.

Paleontological Resources (continued)

Federal (cont.)	
Paleontological Resources Preservation Act of 2009	The Paleontological Resources Preservation Act (PRPA) is part of the Omnibus Public Land Management Act of 2009 (Public Law 111-011 Subtitle D). This act directs the Secretary of the Interior or the Secretary of Agriculture to manage and protect paleontological resources on federal land, and develop plans for inventorying, monitoring, and deriving the scientific and educational use of such resources. It prohibits the removal of paleontological resources from federal land without a permit issued under this Act, establishes penalties for violation of this act and establishes a program to increase public awareness about such resources.
State	
California Environmental Quality Act	Paleontological resources are afforded protection by environmental legislation set forth under CEQA. Appendix G (part V) of the State CEQA Guidelines provides guidance relative to significant impacts on paleontological resources, stating that "a project will normally result in a significant impact on the environment if it will …disrupt or adversely affect a paleontological resource or site or unique geologic feature."
Public Resources Code Section 5097.5	Requirements for paleontological resource management are included in the Public Resources Code (PRC) Division 5, Chapter 1.7, Section 5097.5, and Division 20, Chapter 3, Section 30244, which states: No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.
Local	
There are no applicable state regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County policies would not be applicable to the site of the Proposed Action and Alternatives.	

Recreation and Public Access (Off-Highway Vehicles)

Federal	
Federal Land Policy and Management Act	Under FLPMA, the BLM is responsible for the development of energy resources on BLM-administered lands in a manner that balances diverse resource uses and that takes into account the long-term needs of future generations for renewable and non-renewable resources. Among those uses, FLPMA recognizes that the public lands should be managed in a manner that will provide for outdoor recreation.
California Desert Conservation Area Plan	The CDCA Plan is a comprehensive, long-range plan with goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and it is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. The plan's goals and actions for each resource are established in its 12 elements. Each of the plan elements provides both a desert-wide perspective of the planning decisions for one major resource or issue of public concern as well as more specific interpretation of multiple-use class guidelines for a given resource and its associated activities. The CDCA Plan defines multiple-use classes for BLM-managed lands in the CDCA, which includes the land area encompassing the proposed Project location.
Northern and Eastern Colorado Area Plan Amendment	The NECO Plan amended the CDCA Plan to provide further protection of natural resources while balancing human uses of the California portion of the Sonoran Desert ecosystem. Lands within the planning area are popular for hiking, hunting, rockhounding, and driving for pleasure. The plan amendment's inventory of officially designated existing routes within the planning area restricts motorized travel to these authorized routes, with the exception of washes open zones, in order to protect off-route resources.
State and Local	
There are no applicable state regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County zoning would not be applicable to the site of the Proposed Action and Alternatives.	

Socioeconomics, Environmental Justice, Population and Housing

Federal	
Executive Order 12898 (59 CFR 7629; February 16, 1994)	Executive Order 12898 (59 CFR 7629; February 16, 1994) focuses Federal attention on the environment and human health conditions of minority and low-income communities. The executive order directs federal agencies to develop strategies to address and achieve environmental justice. Federal agencies are required to identify and address any disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority and/or low-income populations. The Council on Environmental Quality (CEQ) provides oversight for the federal government's compliance with E.O. 12898 and NEPA. The CEQ, in consultation with USEPA, and other agencies, has developed guidance to assist federal agencies with their NEPA procedures to ensure that environmental justice concerns are effectively identified and addressed. The CEQ's 1997 guidance document "Environmental Justice Guidance Under the National Environmental Policy Act" established that agencies should consider the composition of the affected area to determine whether minority populations or low-income populations are present in the area affected by the proposed action, and if so whether there may be disproportionately high and adverse human health or environmental impacts (CEQ, 1997).
State	
CEQA Guidelines Section 15131 (a) through (c)	CEQA Guidelines Section 15131 (a) through (c) provides guidance for the analysis of economic and social effects. This section of the guidelines states that economic and social effects may be included in an EIR but "shall not be treated as significant effects on the environment." An EIR may trace a cause and effect chain from a decision on a project through expected economic and social changes resulting from the project to physical changes caused in turn by the economic and social changes. In addition, economic and social effects may be used to determine the significance of physical changes caused by the project. Further, public agencies are required to consider economic, social, and particularly housing factors, together with technological and environmental factors, in deciding whether changes in a project are feasible to reduce or avoid significant effects on the environment. CEQA does not use the term "environmental justice" or require the evaluation of impacts on minority or low-income communities in the way required by Executive Order 12898 under NEPA. The Office of the California Attorney General (OAG) has clarified that environmental justice concerns are relevant to the analysis of a project under CEQA, but has recommended that lead agencies address environmental justice by evaluating whether a project's impacts would affect a community whose residents are particularly sensitive to the impact (i.e., sensitive receptors) and whether a project would have significant effects on communities when considered together with any environmental burdens those communities already are bearing, or may bear from probable future projects (i.e., cumulative impacts) (OAG, 2012). The impacts of this proposed project on sensitive receptors are analyzed where appropriate (e.g., in Section 3.2, Air Resources). The Project's impacts considered together with existing or foreseeable environmental burdens experienced by nearby communities are analyzed throughout Chapter 3 in the Cumulative Effects subsection of each resource section. Further, the OAG indicates that a lead agency must be clear and transparent in its Statement of Overriding Considerations about the balances it has struck in approving a project, such as whether the benefits of the project will be enjoyed widely, but the environmental burdens of a project will be felt particularly by the neighboring communities (OAG, 2012). The information presented in the Final EIR will inform such a statement if and when the Project or an alternative is approved in the event that a significant unavoidable impact is identified under CEQA.
Local	
There are no applicable state regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County zoning would not be applicable to the site of the Proposed Action and Alternatives.	

Special Designations

Federal	
The Wilderness Act of 1964 (PL 88-577)	The Wilderness Act of 1964 gives Congress the sole power to designate Wilderness Areas. The Act defines wilderness as an area of land that "generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historical value." Except in emergencies or necessary administration of an area, vehicular travel is prohibited in Wilderness Areas. The BLM is responsible for managing 191 Wilderness Areas in the Western United States (BLM, 2015).

Special Designations (continued)

Federal (cont.)	
Bureau of Land Management Manual 6340—Management of Designated Wilderness	BLM Manual 6340 provides guidance to BLM personnel on managing BLM lands that have been designated by Congress as part of the National Wilderness Preservation System. These lands are also managed as part of the NLCS. The BLM's objectives for implementing this policy are to: 1. Manage and protect BLM wilderness areas in such a manner as to preserve wilderness characteristics. 2. Manage wilderness for the public purposes of recreational, scenic, scientific, educational, conservation, and historic use while preserving wilderness characteristics. 3. Effectively manage uses permitted under Sections 4(c) and 4(d) of the Wilderness Act, while preserving wilderness characteristics.
Bureau of Land Management Manual 6320—Consideration of Lands with Wilderness Characteristics in the Land Use Planning Process	BLM Manual 6320 provides policy and guidance for considering lands with wilderness characteristics in the land use planning process. Managing wilderness resources is part of BLM's multiple-use mission. The BLM will use the land use planning process to determine how to manage lands with wilderness characteristics, as part of BLM's multiple-use mandate. When such lands are present, BLM will examine options for managing these lands and determine the most appropriate land use allocations for them. Considering wilderness characteristics in the land use planning process may result in several outcomes and include, but not be limited to (1) emphasizing other multiple uses as a priority over protecting wilderness characteristics, (2) emphasizing other multiple uses while applying management restrictions (e.g., conditions of use, mitigation measures) to reduce impacts to wilderness characteristics, and (3) protecting wilderness characteristics as a priority over other multiple uses. The BLM will continue to engage cooperating agencies, the public, and other interested parties in the land use planning process as it relates to the management of lands with wilderness characteristics. Lands identified for protection of their wilderness characteristics in a land use plan are not managed as part of the National Wilderness Preservation System, the NLCS, or recommended as WSAs or for wilderness designation.
Wild Free-Roaming Horses and Burros Act of 1971	Wild horses and burros are protected by the Wild Free-Roaming Horses and Burros Act of 1971 (16 United States Code 1331-1340), as amended by the Federal Land Policy and Management Act and the Public Rangelands Improvement Act of 1978. The Wild Free Roaming Horses and Burros Act protects wild, free-roaming horses and burros and their habitats. It directs BLM and the U.S. Forest Service (USFS) to manage, in their respective jurisdictions, these wild animals on public lands. The general management objectives for wild horses and burros are to: 1) Protect and manage viable, healthy herds while retaining their free-roaming natures; 2) Provide adequate habitat through the principles of multiple-use and environmental protection, while maintaining a thriving ecological balance; 3) Provide opportunities for the public to view wild horses and burros in their natural habitat; and 4) Protect wild horses and burros from unauthorized capture, branding, harassment, or death.
State and Local	
The BLM considers potential impacts of proposed actions to lands with special designations as part of its public land planning and management responsibilities consistent with the National System of Public Lands, including the laws and standards described above. These special federal designations do not govern state or local land use decision-making, and no state or local laws, regulations, plans, or standards apply to them.	

Transportation

Federal	
There are no applicable federal regulations, plans, or standards that are applicable to the Proposed Action.	
State	
California Vehicle Code Section 35780	California Vehicle Code, Section 35780, requires a Single-Trip Transportation Permit to transport oversized or excessive loads over state highways. The permit can be acquired through Caltrans. The Project will comply with this code by requiring that heavy haulers obtain a Single-Trip Transportation Permit for oversized loads for each vehicle, prior to delivery of any oversized load.
California Manual on Uniform Traffic Control Devices	California Manual on Uniform Traffic Control Devices, Part 6, requires a temporary traffic control plan be provided for "continuity of function (movement of traffic, pedestrians, bicyclists, transit operations), and access to property/utilities" during any time the normal function of a roadway is suspended. The administering agencies for this regulation are Caltrans and County of Riverside Public Works Department. If applicable, the Applicant will file a Traffic Control Plan prior to the start of construction.

Transportation (continued)

Local	
Riverside County Congestion Management Program	Riverside County Transportation Commission (RCTC) is the transportation planning agency for Riverside County, and serves as the Congestion Management Agency (CMA) of Riverside County (RCTC, 2011). As the County's CMA, RCTC is responsible for managing the County's blueprint to reduce congestion and improve air quality. Roadways in proximity to the Project site that are designated in the CMP roadway system include I-10. The program sets a standard for all CMP roadway segments and intersections of LOS E. RCTC periodically monitors the CMP Roadway System and records levels of service along CMP facilities. Intersection and roadway level of service assessments of CMP facilities are conducted periodically and vary by year; the assessment of its facilities was completed in 2011, but an update is planned to be incorporated in the RCTC's Long Range Transportation Plan, which is anticipated to be completed in early 2019 (RCTC, 2018).

Utilities and Public Services

Federal	
There are no applicable federal policies.	
State	
California Education Code	Section 41376(a) establishes a goal of district-wide average class sizes of 30 students and maximum class size of 32 students throughout California public school districts.
22 CCR Division 4.5	Title 22 of the CCR discusses an array of requirements with respect to the disposal and recycling of hazardous and universal wastes. Specific standards and requirements are included for the identification, collection, transport, disposal, and recycling of hazardous wastes. Additional standards are included for the collection, transport, disposal and recycling of universal wastes (as identified in 22 CCR §66273.9). Requirements include recycling, recovery, returning spent items to the manufacturer, or disposal at an appropriately permitted facility. 22 CCR Division 4.5 also provides restrictions and standards relevant to waste destination facilities, and provides authorization requirements for various waste handlers. Title 22 includes California's Universal Waste Rule, as well as other additional waste handling and disposal requirements.
Water Supply Planning	SB 610 (2001) and SB 267(2011), require water supply and demand assessment planning for proposed photovoltaic (PV) energy generation facilities that would occupy more than 40 acres of land and demand more than 75 acre-feet per year (AFY) of water (PRC §21151.9; Water Code §10912(a)(5)). The required assessment is called a Water Supply Assessment (WSA). It considers any applicable Urban Water Management Plan (UWMP), whether the projected 20-year water supply would meet the projected demand with inclusion of the project. The WSA (AECOM, 2018b) conducted for the Project is included in Appendix [X] to this Draft EIR.
Local	
Countywide Integrated Waste Management Plan	Riverside County's Countywide Integrated Waste Management Plan (CIWMP) demonstrates the County's compliance with the California Integrated Waste Management Act's solid waste planning requirements. The Summary Plan element of the CIWMP presents goals and policies and measures divert 50 percent of solid waste from landfills, and is updated annually. The Countywide siting element is required to demonstrate that at least 15 years of disposal capacity is available to serve all jurisdictions within Riverside County. If the County's annual report to CalRecycle shows there is less than 15 years of remaining disposal capacity, the County must identify new or expanded solid waste disposal and transformation facilities necessary to provide the required permitted disposal capacity (14 CCR §18755).
Riverside County Board of Supervisors Resolution 91-474	Resolution 91-474 establishes standards governing the use of portable toilets, and applies requirements for disposal of associated liquid wastes. The Resolution provides specifications regarding the number of portable toilets required at a given site and the duration of use of such facilities on site. At minimum, weekly maintenance of portable toilets is required.

Visual Resources

Most pertinent to this analysis are VRM classes, which BLM uses to classify scenery based on the scenic quality, visual sensitivity, and distance zones (the distance from which the landscape is most commonly viewed). Each VRM class is defined by a specific management objective that describes the acceptable level of change to visual resources. Change in the resource is measured though implementation of the contrast rating procedure and by assessing change in visual resource inventory values. Contrast is measured by evaluating basic

design elements (form, line, color, and texture) in accordance with the BLM's Handbook H-8431-1 Visual Resource Contrast Rating (BLM, 1986). If the contrast rating reveals nonconformance of the Proposed Action or an alternative with assigned VRM class objectives, and mitigation measures are insufficient to bring it into compliance, then the design would need to be modified to the greatest extent possible to achieve conformance. If a project cannot be mitigated and/or redesigned to meet the VRM class objectives, the application may be denied or BLM may require the Project to be modified or relocated.

The Project would primarily occupy lands managed per VRM Class IV objectives; however, a small portion of the Project would be located on lands managed per VRM Class II objectives. VRM Class IV areas are considered to have low visual value, whereas VRM Class II areas are considered to have high visual value.

VRM Class	Objective
Class II	The objective of this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
Class IV	The objective of this class is to provide for management activities which require major modifications of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

Water Resources

Federal	
Clean Water Act	The Clean Water Act (CWA), enacted by Congress in 1972 and amended several times since its inception, is the primary federal law regulating water quality in the United States and forms the basis for several state and local laws throughout the country. Its objective is to reduce or eliminate water pollution in the nation's rivers, streams, lakes, and coastal waters. The CWA authorizes the U.S. Environmental Protection Agency (USEPA) to implement federal water pollution control programs such as setting water quality standards for contaminants in surface water, establishing wastewater and effluent discharge limits for various industry categories, and imposing requirements for controlling nonpoint-source pollution. At the federal level, the CWA is administered by the USEPA and U.S. Army Corps of Engineers (USACE). At the state and regional levels, the act is administered and enforced by the State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCBs).
Beneficial Use and Water Quality Objectives (CWA §303)	The RWQCB is responsible for the protection of the beneficial uses of waters within their jurisdiction. The RWQCB uses its planning, permitting, and enforcement authority to meet this responsibility and has adopted the Water Quality Control Plan for the Colorado River (the "Basin Plan") to implement plans, policies, and provisions for water quality management. The RWQCB published the second edition of the Basin Plan which was approved into law in November 1993 and has been subsequently updated, most recently in August 2017 (RWQCB 2017). In accordance with state policy for water quality control, the RWQCB employs a range of beneficial use definitions for surface waters, groundwater basins, marshes, and mudflats that serve as the basis for establishing water quality objectives and discharge conditions and prohibitions. The Basin Plan identifies existing and potential beneficial uses supported by the key surface water drainages throughout its jurisdiction (RWQCB 2017). Table 3.19-1a identifies beneficial uses designated in the Basin Plan for the surface water and groundwater bodies relevant to the Project site. The Basin Plan also includes water quality objectives that are protective of the identified beneficial uses; the beneficial uses and water quality objectives collectively make-up the water quality standards for a given region and Basin Plan (RWQCB 2017).

TABLE 3.19-1A
DESIGNATED BENEFICIAL USES OF WATER BODIES IN THE PROJECT SITE AND SURROUNDING AREA

Water Body	Designated Beneficial Uses
Washes (Ephemeral Streams)	Groundwater Recharge (GWR), Noncontact Recreation (REC-2), Wildlife Habitat (WILD), and Warm Freshwater Habitat (WARM),
Chuckwalla Groundwater Basin	Municipal and Domestic Supply (MUN), AGR, and IND

SOURCE: RWQCB 2017

Water Resources (continued)

Federal (cont.)	
National Pollutant Discharge Elimination System Program (CWA §402)	The CWA provides that the discharge of pollutants to waters of the United States from any point source is unlawful unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. Amendments to the CWA added a framework for regulating municipal and industrial stormwater discharges, as well as stormwater discharges from construction sites that disturb one or more acres of soil. In California, the SWRCB has been delegated permitting authority for discharges regulated by NPDES permits.
NPDES Construction General Permit	The RWQCB administers the NPDES stormwater permitting program. Construction activities disturbing 1 acre or more of land, which includes the Project, are subject to the permitting requirements of the NPDES General Permit for Discharges of Storm Water Runoff Associated with Construction Activity (Construction General Permit) and must apply for Construction General Permit coverage. For all new projects, applicants must electronically file permit registration documents using the Stormwater Multiple Applications and Report Tracking Systems (SMARTS), and must include a Notice of Intent (NOI), risk assessment, site map, and Storm Water Pollution Prevention Plan (SWPPP) to be covered by the General Construction Permit prior to beginning construction. The risk assessment and SWPPP must be prepared by a state-qualified SWPPP Developer. The Construction General Permit requires that the site be assigned a risk level of 1 (low), 2 (medium), or 3 (high) based on sediment and receiving waters risk. The sediment risk level is the relative amount of sediment that can be discharged given the project and location details. The receiving waters risk level reflects the risk sediment discharges pose to the receiving waters. A construction analysis provides a preliminary risk level assessment. The Construction General Permit requires the preparation and implementation of a SWPPP, which must be prepared before construction begins. At a minimum, a SWPPP includes: • Description of construction materials, practices, and equipment storage maintenance; • List of pollutants likely to contact stormwater and site specific erosion and sedimentation control practices; • List of provisions to eliminate or reduce discharge of materials to stormwater; • Best management practices (BMPs) for fuel and equipment storage; • Non-stormwater management measures such as installing specific discharge controls during activities such as paving operations and vehicle and equipment washing and fueling; and • Commitment that equipment, materials, and workers will be available for rapid response to spills and/or emergencies. All corrective maintenance or BMPs will be performed as soon as possible, depending upon worker safety. The SWPPP provides specific construction-related BMPs to prevent soil erosion and loss of topsoil. BMPs implemented could include, but would not be limited to: physical barriers to prevent erosion and sedimentation, construction of sedimentation basins, limitations on work periods during storm events, use of swales, protection of stockpiled materials, and a variety of other measures that would substantially reduce or prevent erosion from occurring during construction. Post-construction requirements require that construction sites match pre-project hydrology to ensure that the physical and biological integrity of aquatic ecosystems are sustained in their existing condition.
State	
Porter-Cologne Water Quality Control Act	The Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code §13000 et seq.) establishes the SWRCB and each RWQCB as the principal state agencies with primary responsibility to coordinate and control water quality in California. The SWRCB establishes statewide policy for water quality control and provides oversight of the RWQCBs' operations. The RWQCBs have jurisdiction over specific geographic areas that are defined by watersheds. In addition to other regulatory responsibilities, the RWQCBs have the authority to conduct, order, and oversee investigation and cleanup where discharges or threatened discharges of waste to waters of the State could cause pollution or nuisance, including impacts to public health and the environment. Fresno County is under the jurisdiction of the Central Valley RWQCB.
Waste Discharge Requirements	Actions that involve or are expected to involve discharge of waste may be subject to waste discharge requirements (WDRs) under the Porter-Cologne Act. Chapter 4, Article 4 of the Porter-Cologne Act (Water Code §§13260-13274) states that persons discharging or proposing to discharge waste that could affect the quality of waters of the state (other than into a community sewer system) shall file a Report of Waste Discharge with the applicable RWQCB. Industrial activities with the potential to impact stormwater discharges are required to obtain an NPDES permit for those discharges. In California, an Industrial Storm Water General Permit, Order 97-03-DWQ (General Industrial Permit CAS 000001) may be issued to regulate discharges associated with ten broad categories of industrial activities, including electrical power generating facilities. The General Industrial Permit requires the implementation of management measures that will protect water quality. In addition, the discharger must develop and implement a SWPPP and a monitoring plan. Through the SWPPP, sources of pollutants are to be identified and the means to manage the sources to reduce stormwater pollution described. The monitoring plan requires sampling of stormwater discharges during the wet season and visual inspections during the dry season.

Water Resources (continued)

Local	
Riverside County Ordinance Code, Title 8, Chapter 8.124 – Sewage Discharge	Section 8.124.030, General Requirements for an Approval and Construction Permit requires the capacity, location, and layout of each private system, such as a septic system, to comply with the rules and regulations of the health officer, and the WDRs of the RWQCB. A private system shall be constructed and maintained on the lot which is the site of the building it serves, unless the health officer in his discretion authorizes a different location. Section 8.124.050 Operation Permits requires that each private system be managed, cleaned, regulated, repaired, modified and replaced from time to time by the owner or owner representatives, in accordance with the rules, regulations and other reasonable requirements of the health officer in conformity with the WDR issued by the regional board and in a manner which will safeguard against and prevent pollution, contamination or nuisance.

Wildland Fire Ecology

Federal	
Federal Wildland Fire Management Policy	On BLM-administered lands in the California Desert, the BLM implements Federal Wildland Fire Management policies and objectives in coordination with state and other federal agencies as part of the California Desert Interagency Fire Management Organization. The Federal Wildland Fire Management Policy was developed by a federal multi-agency group that establishes consistent and coordinated fire management policy across multiple federal jurisdictions. The policy acknowledges the essential role of fire in maintaining natural ecosystems, but also prioritizes firefighter and public safety first in every fire management activity, and focuses on risk management as a foundation for all fire management activities. The policy promotes basing responses to wildland fires on approved Fire Management Plans and land management plans, regardless of ignition source or the location of the ignition (NWCG, 2001).
State	
California Fire Code	Based on the International Fire Code, the California Fire Code (24 Cal. Code Regs. Chapter 9) is created by the California Buildings Standards Commission and regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. Similar to the International Fire Code, the California Fire Code and the CBC use a hazards classification system to determine the appropriate measures to incorporate to protect life and property.
CPUC General Order No. 95	CPUC General Order No. 95 formulates for the State of California, requirements for overhead line design, construction, and maintenance, the application of which will ensure adequate service and secure safety to persons engaged in the construction, maintenance, operation or use of overhead lines and to the public in general.
Local	
There are no local regulations, plans, or standards that are applicable to the Proposed Action. The project would be located entirely on BLM administered lands; therefore, Riverside County zoning would not be applicable to the site of the Proposed Action and Alternatives.	

This page intentionally left blank

Appendix F
Relationship to the DRECP

APPENDIX F

Relationship Between the Crimson Solar Project EIS and PA, and the Desert Renewable Energy Conservation Plan and Conformance with Conservation and Management Actions

1. Introduction

The Bureau of Land Management (BLM) issued the Desert Renewable Energy Conservation Plan (DRECP) in October 2016. The DRECP amends the California Desert Conservation Area (CDCA) Plan, specifically with respect to natural resources conservation and renewable energy development. The DRECP provides a new framework under which lands in the CDCA are managed for resources conservation, and under which new applications for renewable energy projects are considered and evaluated.

Although the new framework is now in place as of October 2016, the new management prescriptions are not applicable to the Crimson Solar Project (Proposed Action, or Project) or to the analysis of the Project in this Final Environmental Impact Statement (EIS) and Proposed Plan Amendment (PA) because, according to the DRECP, renewable energy applications in the Riverside East SEZ filed before June 30, 2009, including the application for the Project, are not, and will not be, subject to the terms of the DRECP. The DRECP recognizes that the Project would not be subject to the DRECP due to its status as a "pending" right-of-way (ROW) application under the Western Solar Plan and its location within a SEZ (DRECP Section II.3.2.4, p. 68-69).

Because of these factors, this Final EIS and Proposed PA has been based on the management framework that was available under the CDCA Plan, and on BLM's renewable energy siting, data collection, and impact analysis requirements that were in place prior to the adoption of the DRECP. However, BLM has also considered and evaluated the effects of the DRECP changes on the impact analysis. The purpose of this appendix is to summarize the changes that occurred under the DRECP, and to discuss how these changes would, or would not, have affected the impact analysis if the analysis had been performed under the new DRECP requirements.

2. BLM Land Use Allocations

One major effect of the DRECP was to modify BLM's land management use allocations that were operative under the CDCA Plan prior to October, 2016. These included:

- The Multiple-Use Classes (MUCs) that were previously in effect under the CDCA Plan, as well as previous land use allocations made for resource protection, including Desert Wildlife Management Areas (DWMAs), have been replaced by a new classification system. Under the DRECP, land use allocations are now categorized as Development Focus Areas (DFAs), Variance Process Lands (VPLs), General Public Lands, and Resource Conservation Areas. Lands have also been designated for recreation purposes.
- Under the previous CDCA Plan, no Visual Resource Management (VRM) classes had been established in the CDCA, and the designation and adoption of Interim VRM classes in response to a specific project was a BLM Field Office Manager decision. The DRECP has now established VRM classes for the entire CDCA, including the Project area.

The analysis of Project impacts in Chapter 3 is, for some physical resources, based only on the direct impact of the Project on that physical resource. However, the impact analysis for other physical resources, such as an area's wilderness characteristics, is based on how the Project conforms to BLM's requirements for management of that resource. In this way, the Final EIS and Proposed PA evaluates as applicable the effect of the Project on a physical resource and the effect of the Project on the status or management goals of an area established for protection of that physical resource.

If the DRECP applied to the Project, the DRECP would not affect how the Final EIS and Proposed PA evaluates physical impacts to physical resources, but it would affect how the Final EIS and Proposed PA evaluates impacts to land use status or management goals. Because the Project is not subject to the DRECP, the analysis of the impact of the Project on land use status or management goals is based on the land use status and management goals that were in place prior to the adoption of the DRECP. The following subsections summarize the land use allocations that have changed, and how the changes would, or would not, affect the impact analysis in the Final EIS and Proposed PA.

2.1 On-Site and Adjacent Land Use Allocations

Under the CDCA Plan, the Project site was designated as Multiple Use Class – Moderate (MUC-M). Section 3.9 of the Final EIS and Proposed PA evaluates the conformance of the Project with this classification. In the DRECP, the Project site is designated as a DFA, which is an area where activities associated with solar, wind, and geothermal energy are allowed, streamlined, and incentivized. Because solar projects are allowed on DFA lands, the Project would be in conformance with this new land use allocation.

The Project site is located on lands managed as VRM Class IV. Section 3.17 of the Final EIS and Proposed PA evaluates the conformance of the Project with this classification. VRM Class IV allows for management activities and uses requiring major modifications to the natural landscape. The Project would be in conformance with this classification.

Under the CDCA Plan, there were no resource protection allocations, such as ACECs, DWMAs, Wilderness Areas, or Lands Managed for Wilderness Characteristics on the Project site. There were also no formal recreation designations for the site. Similarly, under the DRECP, no resource conservation or recreation designations have been made for the site, so no changes in impact analyses would have been needed in these areas.

2.2 Nearby Land Use Allocations

Under the CDCA Plan, land use allocations in the vicinity of the Project site were designated according to the MUC system. The directly adjacent lands were designated the same as the Project site, as MUC-M. Under DRECP, the distinction between MUC-M, MUC-I, and MUC-L on the lands in the vicinity of the Project site no longer exists. Instead, almost all lands have been designated for resource conservation, development, and/or recreation. Therefore, there is no correlative analysis under the DRECP. Although the analysis of the Project within the context of the MUC system is moot under the DRECP, there is no other analysis that would have been needed in its place.

Under both the CDCA Plan and DRECP, lands have been designated for resource conservation purposes. Section 3.14 of the Final EIS and Proposed PA identified the locations of nearby areas designated for resource conservation, including ACECs, DWMAs, Wilderness Areas, Lands with Wilderness Characteristics, and Back Country By-Ways. In that analysis, the closest lands under each category were as follows:

- The closest ACEC is the Mule Mountains ACEC, designated for protection of cultural resources, 1.5 miles southwest of the Project site.
- The closest DWMA was the Chuckwalla DWMA, designated for protection of the desert tortoise, 1.5 miles west of the Project site.
- The closest Wilderness Areas are the Little Chuckwalla Mountains Wilderness 6.8 miles to the southwest.

- The nearest land found to have wilderness characteristics is in the McCoy Mountains over 7 miles north of the Project site.
- The nearest Back Country By-Way is the Bradshaw Trail, located approximately 1.7 miles from the Project site.

Section 3.14 evaluates the impact of the Project on the designation status and management objectives of each of these areas. Section 3.3 evaluated the impact of the Project on wildlife in the ACECs and DWMAs, and Section 3.5 evaluated the direct and indirect impacts of the Project on cultural resources, including those in the Mule Mountains ACEC. Section 3.14 evaluated the impact of the Project on recreation in these specially designated areas.

Under the DRECP, the boundaries of some of these areas have changed. The largest change, and that closest to the Project site, is that several of the ACECs west of the project, including the Mule Mountains ACEC, have been expanded and combined into a single ACEC. However, the change in the boundary was to the west, away from the Project site. None of the newly designated areas are located closer to the Project site than was the case under the CDCA Plan prior to October 2016. There are no newly designated areas (under the DRECP) that would be impacted but are left unevaluated.

Under both the CDCA Plan and the DRECP, lands have been designated for recreational purposes. Section 3.12 of the Final EIS and Proposed PA evaluates the impact of the proposed Project on general recreation on BLM land, including off-highway vehicle access to recreational areas, as well as on city of Blythe parks and recreational facilities. None of the general recreational opportunities or city of Blythe facilities have been changed as a result of the DRECP.

Section 3.12 identified the locations of nearby areas specially designated for recreation, including the Mule Mountains and Midland Long-Term Visitor Areas (LTVAs), campgrounds, and the Bradshaw Trail. Impacts to these areas were evaluated in Section 3.12. Under the DRECP, the new land use allocations included designation of both the Mule Mountains and Midland LTVAs as Special Recreation Management Areas (SRMAs). However, the boundaries or management objectives of these areas were not changed in a way that would make the current impact analysis inapplicable.

3. Conservation and Management Actions

The second major component of the DRECP is the implementation of Conservation and Management Actions (CMAs), which include a variety of project siting, impact mitigation, and BLM management requirements. CMAs were developed on a Land Use Plan Area (LUPA)-wide basis, as well as specifically for Conservation Lands, DFAs, VPLs, and lands used for power transmission.

Because the Project is exempted from the DRECP, the CMAs are not applicable to the Project. However, to ensure that the impact analysis is complete, and resources are protected to the maximum extent practicable, BLM has performed an applicability analysis of the Project with respect to the CMAs. Because the Project would be located wholly on DFA lands and includes transmission, the CMAs evaluated were those included in the LUPA-wide, DFA, DFA/VPL, and Transportation (TRANS) categories.

The analysis includes a determination of whether the CMA would have been applicable to the Project, if the Project had been subject to the DRECP. This includes an evaluation of whether the type of action covered by the CMA is within the scope of the Project, i.e., approval of a solar energy project. In addition, it includes a determination of whether the resource addressed by the CMA is present, or potentially impacted, on the Project site.

Following the applicability determination, the analysis included an evaluation of the design of the Project, the scope of the Applicant's field surveys and technical analyses, the Applicant's Proposed Measures, and the preliminary mitigation measures developed by the agencies with respect to each CMA. The evaluation was performed to verify that the resource conservation objectives of each CMA were met, determine whether changes could be made to Project design and technical analysis to improve conformance, and determine whether

changes could be made to the preliminary mitigation measures, within the limitation that the Project is not legally subject to the CMAs.

In general, the analysis revealed that the Project design and/or mitigation measures satisfy applicable CMAs. In many cases, wording changes were made to mitigation measures to bring the language into line with the CMA language. In cases where no such changes are made, the analysis describes why the Applicant is not required to modify the Project or mitigate potential impacts, or why the CMA does not apply.

4. Datasets

Another effect of the approval of the DRECP is that it based its analysis on region-wide datasets for identification of potentially affected resources and required use of these datasets by future Applicants. This included mapping of habitat and migration corridors for various wildlife and plant species. Many of the CMAs were, in turn, based on the relationship of the Project to the resources as they were presented in the datasets.

In general, the datasets used by the DRECP have no effect on the analysis of the Project in the Final EIS and Proposed PA. For the DRECP, broad-scale mapping of vegetation alliances was done by the California Department of Fish and Wildlife. The vegetation classification for the DRECP follows Federal Geographic Data Committee and National Vegetation Classification Standards. In contrast, for the analysis in this Final EIS and Proposed PA, the vegetation was mapped as vegetation communities, on a site-specific basis, by the Applicant under direction from the BLM. Vegetation communities were characterized by the classification system used by Holland (1986) and the Northern and Eastern Colorado Desert Coordinated Management Plan Amendment to the CDCA Plan (Evens and Hartman 2007), and cross-referenced with *A Manual of California Vegetation* (Sawyer and Keeler-Wolf 2009), where appropriate.

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
Biological Resources	**LUPA-BIO-1**	Conduct a habitat assessment (see Glossary of Terms) of Focus and BLM Special Status Species' suitable habitat for all activities and identify and/or delineate the DRECP vegetation types, rare alliances, and special features (e.g., Aeolian sand transport resources, Joshua tree, microphyll woodlands, carbon sequestration characteristics, seeps, climate refugia) present using the most current information, data sources, and tools (e.g., DRECP land cover mapping, aerial photos, DRECP species models, and reconnaissance site visits) to identify suitable habitat (see Glossary of Terms) for Focus and BLM Special Status Species. If required by the relevant species specific CMAs, conduct any subsequent protocol or adequate presence/absence surveys to identify species occupancy status and a more detailed mapping of suitable habitat to inform siting and design considerations. If required by relevant species specific CMAs, conduct analysis of percentage of impacts to suitable habitat and modeled suitable habitat.	Applicable	Consistent	Based upon the BRTR (prepared by AECOM in December 2018) these habitats have been assessed on the project site and subsequent protocol surveys were conducted for special-status plants, desert tortoise, Mojave fringe-toed lizard, Couch's spadefoot, burrowing owls, elf owls, gila woodpecker, golden eagles, migratory birds, nocturnal avian species and bats.		
		● BLM will not require protocol surveys in sites determined by the designated biologist to be unviable for occupancy of the species, or if baseline studies inferred absence during the current or previous active season.	Not applicable		Protocol surveys were conducted based on potential of special status species to occur onsite. (See above).		
		Utilize the most recent and applicable assessment protocols and guidance documents for vegetation types and jurisdictional waters and wetlands that have been approved by BLM, and the appropriate responsible regulatory agencies, as applicable.	Applicable	Consistent	Protocols listed in the BRTR are recent and applicable to the protocol surveys, some of which directly used BLM protocols (e.g. migratory bird transects).		
	LUPA-BIO-2	Designated biologist(s) (see Glossary of Terms), will conduct, and oversee where appropriate, activity-specific required biological monitoring during pre-construction, construction, and decommissioning to ensure that avoidance and minimization measures are appropriately implemented and are effective. The appropriate required monitoring will be determined during the environmental analysis and BLM approval process. The designated biologist(s) will submit monitoring reports directly to BLM.	Applicable	Consistent	The requirement to have a designated biologist (DB) on the project is contained in BRTR Measure BIO-1. The following BRTR Measures specify a DB shall oversee/conduct monitoring and/or prepare reports: BIO-2, BIO-4, BIO-11, BIO-28, BIO-37, BIO-38, BIO-39, BIO-42, BIO-43, and BIO-50.		
Resource Setback Standards	**LUPA-BIO-3**	Resource setbacks (see Glossary of Terms) have been identified to avoid and minimize the adverse effects to specific biological resources. Setbacks are not considered additive and are measured as specified in the applicable CMA. Allowable minor incursions (see Glossary of Terms), as per specific CMAs do not affect the following setback measurement descriptions. Generally, setbacks (which range in distances for different biological resources) for the appropriate resources are measured from:	Applicable	Consistent	200-foot setbacks for microphyll woodlands have been incorporated into the project design except for the minor incursions from linear features which cross microphyll woodland at the least impacting location. No other setbacks are anticipated to be required.		
		● The edge of each of the DRECP desert vegetation types, including but not limited to those in the riparian or wetland vegetation groups (as defined by alliances within the vegetation type descriptions and mapped based on the vegetation type habitat assessments described in LUPA-BIO-1).	Applicable	Consistent	See above. No other setbacks are anticipated to be required given the vegetation communities onsite.		
		● The edge of the mapped riparian vegetation or the Federal Emergency Management Agency (FEMA) 100-year floodplain, whichever is greater, for the Mojave River.	Not applicable		See above. The project does not occur in close proximity to the Mojave River.		
		● The edge of the vegetation extent for specified Focus and BLM sensitive plant species.	Applicable	Consistent	See above.		
		● The edge of suitable habitat or active nest substrates for the appropriate Focus and BLM Special Status Species.	Applicable	Consistent	Per BRTR Measures BIO-42 and BIO-43, setbacks would be calculated from burrowing owl burrows.		
Seasonal Restrictions	**LUPA-BIO-4**	For activities that may impact Focus and BLM Special Status Species, implement all required species-specific seasonal restrictions on pre- construction, construction, operations, and decommissioning activities. Species-specific seasonal restriction dates are described in the applicable CMAs.	Applicable	Consistent	Seasonal restrictions have been included where applicable and are consistent with BRTR Measures BIO-28, BIO- 42, BIO-50, BIO-51, and BIO-65.		
		Alternatively, to avoid a seasonal restriction associated with visual disturbance, installation of a visual barrier may be evaluated on a case-by-case basis that will result in the breeding, nesting, lambing, fawning, or roosting species not being affected by visual disturbance from construction activities subject to seasonal restriction. The proposed installation and use of a visual barrier to avoid a species seasonal restriction will be analyzed in the activity/project specific environmental analysis.	Not applicable		Seasonal restrictions have been included where applicable; thus avoidance of season restrictions does not apply.		
Worker Education	**LUPA-BIO-5**	All activities, as determined appropriate on an activity-by-activity basis, will implement a worker education program that meets the approval of the BLM. The program will be carried out during all phases of the project (site mobilization, ground disturbance, grading, construction, operation, closure/decommissioning or project abandonment, and restoration/reclamation activities). The worker education program will provide interpretation for non-English speaking workers, and provide the same instruction for new workers prior to their working on site. As appropriate based on the activity, the program will contain information about:	Applicable	Consistent	BRTR Measures BIO-2 and BIO-19 are consistent with worker education program requirements.		
		● Site-specific biological and nonbiological resources.	Applicable	Consistent	Consistent with BRTR Measure BIO-19.		
		● Information on the legal protection for protected resources and penalties for violation of federal and state laws and administrative sanctions for failure to comply with LUPA CMA requirements intended to protect site-specific biological and nonbiological resources.	Applicable	Consistent	Consistent with BRTR Measure BIO-19.		
		● The required LUPA and project-specific measures for avoiding and minimizing effects during all project phases, including but not limited to resource setbacks, trash, speed limits, etc.	Applicable	Inconsistent	Specific text related to setbacks, trash, speed limits being discussed in worker training is not included in the BRTR training measure (BIO-19). BRTR Measures Bio-9 and BIO-32 requires speed limits and trash removal for the project.	Consistent	Mitigation Measure BIO-6 and BIO-10 in the EIS address vehicle access and speed limits, and debris and trash disposal, respectively.
		● Reporting requirements and measures to follow if protected resources are encountered, including potential work stoppage and requirements for notification of the designated biologist.	Applicable	Inconsistent	Specific text related to worker reporting requirements being discussed in training is not included in the BRTR training measure (BIO-19).	Consistent	Mitigation Measure BIO-17 and BIO-20 in the EIS requires a worker environmental awareness program and addresses the potential for any work stoppages if a protected resource is encountered.
		● Measures that personnel can take to promote the conservation of biological and nonbiological resources.	Applicable	Consistent	Consistent with BRTR Measure BIO-19.		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
Subsidized Predators Standards	**LUPA-BIO-6**	Subsidized predator standards, approved by BLM, in coordination with the USFWS and CDFW, will be implemented during all appropriate phases of activities, including but not limited to renewable energy activities, to manage predator food subsidies, water subsidies, and breeding sites including the following: ● Common Raven management actions will be implemented for all activities to address food and water subsidies and roosting and nesting sites specific to the Common Raven. These include identification of monitoring reporting procedures and requirements; strategies for refuse management; as well as design strategies and passive repellant methods to avoid providing perches, nesting sites, and roosting sites for Common Ravens. ● The application of water and/or other palliatives for dust abatement in construction areas and during project operations and maintenance will be done with the minimum amount of water necessary to meet safety and air quality standards and in a manner that prevents the formation of puddles, which could attract wildlife and wildlife predators. ● Following the most recent national policy and guidance, BLM will take actions to not introduce, dispose of, or release any non- native species into areas of native habitat, suitable habitat, and natural or artificial waterways/water bodies containing native species. All activity work areas will be kept free of trash and debris. Particular attention will be paid to "micro-trash" (including such small items as screws, nuts, washers, nails, coins, rags, small electrical components, small pieces of plastic, glass or wire, and any debris or trash that is colorful or shiny) and organic waste that may subsidize predators. All trash will be covered, kept in closed containers, or otherwise removed from the project site at the end of each day or at regular intervals prior to periods when workers are not present at the site. ● In addition to implementing the measures above on activity sites, each activity will provide compensatory mitigation that contributes to LUPA-wide raven management.	Applicable	Consistent	See consistency analysis below. BRTR Measure BIO-40 requires a Raven Monitoring, management and Control Plan and BRTR Measure BIO-58 lists strategies to prevent common raven occurrence onsite. BRTR Measures BIO-12, BIO-37 and BIO-58 require elimination of standing water to avoid attracting ravens and other wildlife. BRTR Measure BIO-18 requires avoidance and control of nonnative plant species introduction and BIO-62 requires making sure the facility footprint is free from nonnative species during operation and maintenance. BRTR Measure Bio-9 is consistent with trash and debris containment and removal. BRTR Measure BIO-40 requires contribution of funding to the USFWS Regional Raven Management program.		
Restoration of Areas Disturbed by Construction Activities But Not Converted by Long-Term Disturbance	**LUPA-BIO-7**	Where DRECP vegetation types or Focus or BLM Special Status Species habitats may be affected by ground- disturbance and/or vegetation removal during pre-construction, construction, operations, and decommissioning related activities but are not converted by long-term (i.e., more than two years of disturbance, see Glossary of Terms) ground disturbance, restore these areas following the standards, approved by BLM authorized officer, following the most recent BLM policies and procedures for the vegetation community or species habitat disturbance/impacts as appropriate, summarized below: · Implement site-specific habitat restoration actions for the areas affected including specifying and using: o The appropriate seed (e.g., certified weed- free, native, and locally and genetically appropriate seed) o Appropriate soils (e.g., topsoil of the same original type on site or that was previously stored by soil type after being salvaged during excavation and construction activities) o Equipment o Timing (e.g., appropriate season, sufficient rainfall) o Location o Success criteria o Monitoring measures o Contingency measures, relevant for restoration, which includes seeding that follows BLM policy when on BLM administered lands. · Salvage and relocate cactus, nolina, and yucca from the site prior to disturbance using BLM protocols. To the maximum extent practicable for short-term disturbed areas (see Glossary of Terms), the cactus and yucca will be re-planted back to the original site. · Restore and reclaim short-term (i.e. 2 years or less, see Glossary of Terms) disturbed areas, including pipelines, transmission projects, staging areas, and short-term construction-related roads immediately or during the most biologically appropriate season as determined in the activity/project specific environmental analysis and decision, following completion of construction activities to reduce the amount of habitat converted at any one time and promote recovery to natural habitats and vegetation as well as climate refugia and ecosystem services such carbon storage.	Applicable	Inconsistent	According to the Proposed Action, restoration would be required following construction. BRTR Measures BIO-22, BIO-23, BIO-41 and BIO-48 say restoration of riparian habitat may be required and mitigation for impacts to desert tortoise and Mojave fringe-toed lizard will be required, but no specific restoration requirements, besides mitigation ratios, are detailed in the BRTR Measures.	Consistent	Mitigation Measure BIO-18 and BIO-19 in the EIS requires the Project proponent to prepare and obtain approval from the BLM to restore areas subject to temporary impacts both prior to and during construction. Alternative B, if chosen, would also reduce distrubance area.
General Closure and Decommissioning Standards	**LUPA-BIO-8**	All activities that are required to close and decommission the site (e.g., renewable energy activities) will specify and implement project-specific closure and decommissioning actions that meet the approval of BLM, and that at a minimum address the following: · Specifying and implementing the methods, timing (e.g., criteria for triggering closure and decommissioning actions), and criteria for success (including quantifiable and measureable criteria). · Recontouring of areas that were substantially altered from their original contour or gradient and installing erosion control measures in disturbed areas where potential for erosion exists. · Restoring vegetation as well as soil profiles and functions that will support and maintain native plant communities, associated carbon sequestration and nutrient cycling processes, and native wildlife species. · Vegetation restoration actions will identify and use native vegetation composition, native seed composition, and the diversity to values commensurate with the natural ecological setting and climate projections.	Applicable	Inconsistent	Decommissioning impacts for biological resources are discussed in Section 5.3 of the BRTR, but there are no BRTR measures specific to decommissioning actions other than worker training (BIO-19) and a raven management (BIO-40).	Consistent	Mitigation Measure BIO-34 in the EIS discusses the decommissioning plan that would be approved by the BLM and describe methods and requirements for site re-contouring, restoration of drainages, revegetation, soil restoration, weed mangement, restoration monitoring, as well as, reporting and performance standards. See Appendix I in the EIS for more information.

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
Water and Wetland Dependent Species Resources	**LUPA-BIO-9**	Implement the following general LUPA CMA for water and wetland dependent resources • Implement construction site standard practices to prevent toxic chemicals, hazardous materials, and other fluids from entering vegetation type streams, washes, and tributary networks through water runoff, erosion, and sediment transport by, at a minimum, implementing the following:	Applicable	Inconsistent	See comment on inconsistency below.	Consistent	Mitigation Measure BIO-5 in the EIS would ensure that all construction materials, staging, employee parking, storage, dispersing, fueling, and maintenance activities are located outside of emphermal washes. Mitigation Measure BIO-8 in the EIS would address all hazardous spills and clean-up protocols. See Appendix U, Drainage, Erosion, and Sediment Control Plan for more information.
		○ On project sites, vehicles and other equipment will be maintained in proper working condition and only stored in designated containment areas where runoff is collected or controlled and that are located outside of streams, washes, and distributary networks to minimize accidental fluids and hazardous materials spills.	Applicable	Consistent	BRTR Measure BIO-16 says fueling would occur outside of drainages and equipment would be inspected and repaired. However, no BRTR measures say vehicles would be stored outside of drainages.		
		○ Hazardous material leaks, spills, or releases will be immediately cleaned and equipment will be repaired upon identification. Removal and disposal of spill and related clean-up materials will occur at an approved off-site landfill.	Applicable	Consistent	Requirement is addressed in BRTR Measures BIO-13 and BIO-34.		
		○ Maintenance and operations vehicles will carry the appropriate equipment and materials to isolate, clean up, and repair any hazardous material leaks, spills, or releases.	Applicable	Inconsistent	No specific text related to operations vehicles carrying appropriate materials to clean and repair issues onsite. BRTR Measure BIO-13 is consistent for service/maintenance vehicles.	Consistent	Mitigation Measure BIO-8 in the EIS would ensure that service and maintenance vehicles would carry a bucket and pads to absorb leaks or spills, among other spill prevention and cleanup requirements.
		● Activity-specific drainage, erosion, and sedimentation control actions, which meet the approval of BLM and the applicable regulatory agencies, will be carried out during all appropriate phases of the approved project. These actions, as needed, will address measures to ensure the proper protection of water quality, site-specific stormwater and sediment retention, and design of the project to minimize site disturbance, including the following:	Applicable	Inconsistent	See below comments pertaining to inconsistency.	Consistent	Mitigation Measure BIO-14 would ensure the implementation of a Drainage, Erosion, and Sedimentation Control Plan (DESCP).
		○ Identify site-specific surface water runoff patterns and implement measures to prevent excessive and unnatural soil deposition and erosion.	Applicable	Consistent	Consistent with BRTR Measure BIO-15 (remedying erosion within 2 days) and BIO-60 (SWPPP).		
		○ Implement measures to maintain natural drainages and to maintain hydrologic function in the event drainages are disturbed.	Applicable	Consistent	Consistent with BRTR Measures BIO-20 through BIO-23.		
		○ Reduce the amount of area covered by impervious surfaces through use of permeable pavement or other pervious surfaces. Direct runoff from impervious surfaces into retention basins.	Applicable	Consistent	The majority of the site, including new access roads, would remain pervious (covered in gravel) according to the Proposed Action.		
		○ Stabilize disturbed areas following grading in the manner appropriate to the soil type so that wind or water erosion is minimized.	Applicable	Inconsistent	There is no specific text related to soil stabilization in the BRTR measures.	Consistent	Soil stabilization measures are included in Mitigation Measures AQ-1 and BIO-18.
		○ Minimize irrigation runoff by using low or no irrigation native vegetation landscaping for landscaped retention basins.	Not applicable		There are no landscaped retention basins proposed.		
		○ Conduct regular inspections and maintenance of long-term erosion control measures to ensure long-term effectiveness.	Applicable	Inconsistent	There is no specific text in the BRTR measures related to monitoring erosion control measures long-term.	Consistent	Mitigation Measure BIO-14 (DESCP) includes a requirement for an adaptive management plan to monitor system performance and make adjustments to the design and BMPs if the BLM AO determines through monitoring that the system is inadequate.
		○ Project applicants for sites that may affect intermittent and perennial streams, springs, swales, ephemeral washes, wetland vegetation, other DRECP water land covers, or sites occupied by aquatic or riparian Focus and BLM Special Status Species due to groundwater or surface water extraction will conduct hydrologic studies during project planning to determine the potential effect of groundwater and surface water extraction on the hydrologic unit. These studies will include both watershed effects as well as effects on perched, alluvial, and regional aquifers. Projects that are likely to affect ground-water resources in a manner that would result in substantial loss of riparian or wetland communities or habitat for riparian or aquatic Focus and BLM Special Status Species are prohibited.	Applicable	Consistent	The Project applicant supplied a Water Demand Technical Report, Water Supply Assessment, and Phase C Hydrology Study, which informed the NEPA analysis of effects on groundwater and surface water features.		
		○ The use of evaporation ponds for water management will be avoided when the water could harm birds or other terrestrial wildlife due to constituents of concern present in the wastewater (e.g., selenium, hypersalinity, etc.). Evaporation ponds will be configured to minimize attractiveness to shorebirds (e.g., maintain water depths over two feet; maintain steep slopes along edge; enclose evaporation ponds in long-term structures; or obscure evaporation ponds from view using materials that blend in with the natural surroundings).	Not applicable		No evaporation ponds are proposed by the project.		
		● Ramps that allow the egress of wildlife from ponds or other water management infrastructure will be installed.	Not applicable		No ponds or other water management infrastructure would be installed on the project site.		
	LUPA-BIO-10	Consistent with BLM state and national policies and guidance, integrated weed management actions, will be carried out during all phases of activities, as appropriate, and at a minimum will include the following:	Applicable	Inconsistent	See comments on inconsistencies below.	Consistent	Mitigation Measure BIO-16 in the EIS would reduce the potential for invasive weed species to proliferate on the Project site. See Appendix I.10, Weed Mangement Plan in the EIS for more information.
		● Thoroughly clean the tires and undercarriage of vehicles entering or reentering the project site to remove potential weeds.	Applicable	Consistent	BRTR Measure BIO-18 says vehicles would be cleaned by rumble strips or other methods.		
		● Store project vehicles on site in designated areas to minimize the need for multiple washings whenever vehicles re-enter the project site.	Applicable	Inconsistent	BRTR Measure BIO-33 says parking will occur within the desert tortoise-exclusion fence. No designated areas for vehicle storage after being washed have been identified in the BRTR measures.	Consistent	Per Mitigation Measure BIO-7, equipment will be stored in designated areas on the Project site. This would minimize the need for required washings.
		● Properly maintain vehicle wash and inspection stations to minimize the introduction of invasive weeds or subsidy of invasive weeds.	Applicable	Inconsistent	BRTR Measure BIO-18 says vehicles would be cleaned by rumble strips or other methods, but no inspection stations are mentioned in BRTR measures.	Consistent	The Weed Management Plan required by Mitigation Measure BIO-16 addresses vehicle and tire cleaning and visual inspection at the site entrance to reduce the spread of weeds.
		● Closely monitor the types of materials brought onto the site to avoid the introduction of invasive weeds and non-native species.	Applicable	Inconsistent	Close monitoring of site materials for potential weed/nonnative introduction is not mentioned by any BRTR measures.	Consistent	The Weed Management Plan required by Mitigation Measure BIO-16 addresses material controls to reduce the spread of weeds.
		● Reestablish native vegetation quickly on disturbed sites.	Applicable	Inconsistent	Quick native vegetation reestablishment on disturbed sites is not mentioned by any BRTR measures.	Consistent	Mitigation Measure BIO-18 requires a restoration plan to reestablish native vegetation quickly on disturbed sites.

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
		● Monitor and quickly implement control measures to ensure early detection and eradication of weed invasions to avoid the spread of invasive weeds and non-native species on site and to adjacent off-site areas.	Applicable	Partially consistent	BRTR Measure BIO-18 says weed populations introduced into the site during construction shall be eliminated by chemical and/or mechanical means but does not specify monitoring and early detection/eradication.		
		● Use certified weed-free mulch, straw, hay bales, or equivalent fabricated materials for installing sediment barriers.	Applicable	Consistent	BRTR Measure BIO-18 says weed-free materials would be used for erosion control.		
Nuisance Animals and Invasive Species	**LUPA-BIO-11**	Implement the following CMAs for controlling nuisance animals and invasive species: · No fumigant, treated bait, or other means of poisoning nuisance animals including rodenticides will be used in areas where Focus and BLM Special Status Species are known or suspected to occur. · Manage the use of widely spread herbicides and do not apply herbicides effective against dicotyledonous plants within 1,000 feet from the edge of a 100-year floodplain, stream and wash channels, and riparian vegetation or to soils less than 25 feet from the edge of drains. Exceptions will be made when targeting the base and roots of invasive riparian species such as tamarisk and Arundo donax (giant reed). Manage herbicides consistent with the most current national and California BLM policies. · Minimize herbicide, pesticide, and insecticide treatment in areas that have a high risk for groundwater contamination. · Clean and dispose of pesticide containers and equipment following professional standards. Avoid use of pesticides and cleaning containers and equipment in or near surface or subsurface water. · When near surface or subsurface water, restrict pesticide use to those products labeled safe for use in/near water and safe for aquatic species of animals and plants.	Applicable	Consistent	BRTR Measure BIO-18 says elimination of weed populations would be done in a method approved by the resource agencies and Measure BIO-62 says only BLM-approved herbicides shall be applied during project operation. No poisoning of nuisance animals is proposed. Pesticide use would occur consistent with the BLM's Programmatic Environmental Impact Statement for vegetation treatments using herbicides in 17 western state.		
Noise	**LUPA-BIO-12**	For activities that may impact Focus or BLM Special Status Species**,** implement the following LUPA CMA for noise: · To the extent feasible, and determined necessary by BLM to protect Focus and BLM sensitive wildlife species, locate stationary noise sources that exceed background ambient noise levels away from known or likely locations of and BLM sensitive wildlife species and their suitable habitat. · Implement engineering controls on stationary equipment, buildings, and work areas including sound-insulation and noise enclosures to reduce the average noise level, if the activity will contribute to noise levels above existing background ambient levels. · Use noise controls on standard construction equipment including mufflers to reduce noise.	Not applicable		No stationary noise sources would exceed background ambient noise levels. No adverse effect from noise identified requiring mitigation.		
General Siting and Design	**LUPA-BIO-13**	Implement the following CMA for project siting and design	Applicable	Consistent	BRTR measures involving avoidance of sensitive habitats: BIO-5, BIO-7, BIO-20, BIO-24, BIO-25, BIO-26, and BIO-47.		
		● To the maximum extent practicable site and design projects to avoid impacts to vegetation types, unique plant assemblages, climate refugia as well as occupied habitat and suitable habitat for Focus and BLM Special Status Species (see "avoid to the maximum extent practicable" in Glossary of Terms).					
		● The siting of projects along the edges (i.e. general linkage border) of the biological linkages identified in Appendix D (Figures D-1 and D-2) will be configured (1) to maximize the retention of microphyll woodlands and their constituent vegetation type and inclusion of other physical and biological features conducive to Focus and BLM Special Status Species' dispersal, and (2) informed by existing available information on modeled focus and BLM Special Status Species habitat and element occurrence data, mapped delineations of vegetation types, and based on available empirical data, including radio telemetry, wildlife tracking sign, and road-kill information. Additionally, projects will be sited and designed to maintain the function of F Special Status Species connectivity and their associated habitats in the following linkage and connectivity areas: ○ Within a 5-mile-wide linkage across Interstate 10 centered on Wiley's Well Road to connect the Mule and McCoy mountains (the majority of this linkage is within the Chuckwalla ACEC and Mule-McCoy Linkage ACEC) . ○ Within a 3-mile-wide linkage across Interstate 10 to connect the Chuckwalla and Palen mountains. ○ Within a 1.5-mile-wide linkage across Interstate 10 to connect the Chuckwalla Mountains to the Chuckwalla Valley east of Desert Center. ○ The confluence of Milpitas Wash and Colorado River floodplain within 2 miles of California State Route 78 (this linkage is entirely within the Chuckwalla ACEC) .					
		● Delineate the boundaries of areas to be disturbed using temporary construction fencing and flagging prior to construction and confine disturbances, project vehicles, and equipment to the delineated project areas to protect vegetation types and focus and BLM Special Status Species.					
		● Long-term nighttime lighting on project features will be limited to the minimum necessary for project security, safety, and compliance with Federal Aviation Administration requirements and will avoid the use of constant-burn lighting.	Applicable	Consistent	Consistent with BRTR Measure BIO-61 (limiting to the minimum illumination necessary).		
		● All long-term nighttime lighting will be directed away from riparian and wetland vegetation, occupied habitat, and suitable habitat areas for Focus and BLM Special Status Species. Long- term nighttime lighting will be directed and shielded downward to avoid interference with the navigation of night-migrating birds and to minimize the attraction of insects as well as insectivorous birds and bats to project infrastructure.	Applicable	Inconsistent	BRTR Measure BIO-61 requires direction of long-term lighting away from sensitive habitat but does not state lighting will be shielded downward to interfere with birds or bats or minimize insect attraction.	Consistent	Mitigation Measure BIO-13 (lighting) requires these lighting controls.
		● To the maximum extent practicable (see Glossary of Terms), restrict construction activity to existing roads, routes, and utility corridors to minimize the number and length/size of new roads, routes, disturbance, laydown, and borrow areas.	Applicable	Consistent	Consistent with BRTR Measure BIO-7 (restricting activities to existing roads).		
		● To the maximum extent practicable (see Glossary of Terms), confine vehicular traffic to designated open routes of travel to and from the project site, and prohibit, within project boundaries, cross- country vehicle and equipment use outside of approved designated work areas to prevent unnecessary ground and vegetation disturbance.	Applicable	Consistent	Consistent with BRTR Measure BIO-7 (restricting vehicular movement to existing roads).		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
		● To the maximum extent practicable(see Glossary of Terms) , construction of new roads and/or routes will be avoided within Focus and BLM Special Status Species suitable habitat within identified linkages for those Focus and BLM Special Status Species, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern. These areas will have a goal of "no net gain" of project roads and/or routes	Applicable	Consistent	See above		
		● To the maximum extent practicable (see Glossary of Terms), any new road and/or route considered within Focus and BLM Special Status Species suitable habitat within identified linkages for those Focus and BLM Special Status Species will not be paved so as not to negatively affect the function of identified linkages.	Applicable	Consistent	See above		
		● Use nontoxic road sealants and soil stabilizing agents.	Applicable	Inconsistent	There is no BRTR measure text that discusses use of nontoxic soil stabilizing agents.	Consistent	Mitigation Measure AQ-1 in the EIS requires that non-toxic soil stabilizers or physical stabilization methods be used and maintained on unpaved roads.
Biology: General Standard Practices	**LUPA-BIO-14**	Implement the following general standard practices to protect Focus and BLM Special Status Species:	Applicable		See comments for inconsistent measures below.		
		● Feeding of wildlife, leaving of food or trash as an attractive nuisance to wildlife, collection of native plants, or harassing of wildlife on a site is prohibited.	Applicable	Inconsistent	This text is not specifically included in a BRTR Measure with the exception of food or trash removal which is consistent with BIO-9.	Consistent	Mitigation Measure BIO-10 addresses food trash as attractive nuisances. Mitigation Measure BIO-17 (WEAP) addresses worker training to avoid feeding wildlife, collection of native plants, and harrassing wildlife.
		● Any wildlife encountered during the course of an activity, including construction, operation, and decommissioning will be allowed to leave the area unharmed.	Applicable	Consistent	Consistent with BRTR Measure BIO-11 (wildlife encountered during construction allowed to leave unharmed).		
		● Domestic pets are prohibited on sites. This prohibition does not apply to the use of domestic animals (e.g., dogs) that may be used to aid in official and approved monitoring procedures/protocols, or service animals (dogs) under Title II and Title III of the American with Disabilities Act.	Applicable	Consistent	Consistent with BRTR Measure BIO-10.		
		● All construction materials will be visually checked for the presence of wildlife prior to their movement or use. Any wildlife encountered during the course of these inspections will be allowed to leave the construction area unharmed.	Applicable	Consistent	BRTR Measure BIO-33 says vehicles should be inspected for presence of desert tortoise before moving. Consistent with BRTR Measure BIO-11 (wildlife encountered during construction allowed to leave unharmed).		
		● All steep-walled trenches or excavations used during the project will be covered, except when being actively used, to prevent entrapment of wildlife. If trenches cannot be covered, they will be constructed with escape ramps, following up-to-date design standards to facilitate and allow wildlife to exit, or wildlife exclusion fencing will be installed around the trench(s) or excavation(s). Open trenches or other excavations will be inspected by a designated biologist immediately before backfilling, excavation, or other earthwork.	Applicable	Consistent	Consistent with BRTR Measure BIO-11 (backfilling, sloping or covering trenches).		
		● Minimize natural vegetation removal through implementation of crush and drive or cut or mow vegetation rather than removing entirely.	Applicable	Consistent	Consistent with BRTR Measure BIO-25 (drive and crush vegetation as an alternative to blading of roads to preserve the seed bank).		
	LUPA-BIO-15	Use state-of-the-art, as approved by BLM, construction and installation techniques, appropriate for the specific activity/project and site, that minimize new site disturbance, soil erosion and deposition, soil compaction, disturbance to topography, and removal of vegetation.	Applicable	Inconsistent	The Proposed Action does not include minimizing grading to the extent feasible. Partially consistent with BRTR Measures BIO-15 (erosion reduction techniques).	Consistent	Alternative B Design Elements (DE) 1 and 3 would minimize grading. Mitigation Measures BIO-19 in the EIS requires that the Project Owner comply with the best management practices for project disturbance areas.
Activity-Specific Bird and Bat CMAs	**LUPA-BIO-16**	For activities that may impact Focus and BLM sensitive birds, protected by the ESA and/or Migratory Bird Treaty Act of 1918, and bat species, implement appropriate measures as per the most up-to-date BLM state and national policy and guidance, and data on birds and bats, including but not limited to activity specific plans and actions. The goal of the activity - specific bird and bat actions is to avoid and minimize direct mortality of birds and bats from the construction, operation, maintenance, and decommissioning of the specific activities. Activity-specific measures to avoid and minimize impacts may include, but are not limited to: · Siting and designing activities will avoid high bird and bat movement areas that separate birds and bats from their common nesting and roosting sites, feeding areas, or lakes and rivers. · For activities that impact bird and bat Focus and BLM Special Status Species, during project siting and design, conducting monitoring of bird and bat presence as well as bird and bat use of the project site using the most current survey methods and best procedures available at the time. · Reusing or co-locating new transmission facilities and other ancillary facilities with existing facilities and disturbed areas to reduce habitat destruction and avoid additional collision risks. · Reducing bird and bat collision hazards by utilizing techniques such as unguyed monopole towers or tubular towers. Where the use of guywires is unavoidable, demarcate guywires using the best available methods to minimize avian species strikes. · When fencing is necessary, use bird and bat compatible design standards. · Using lighting that does not attract birds and bats or their prey to project sites including using non-steady burning lights (red, dual red and white strobe, strobe- like flashing lights) to meet Federal Aviation Administration requirements, using motion or heat sensors and switches to reduce the time when lights are illuminated, using appropriate shielding to reduce horizontal or skyward illumination, and avoiding the use of high-intensity lights (e.g., sodium vapor, quartz, and halogen). · Implementing a robust monitoring program to regularly check for wildlife carcasses, document the cause of mortality, and promptly remove the carcasses. · Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring	Applicable	Consistent	The project has been designed to avoid microphyll woodlands which have the highest potential to support bird and bat species. The project has proposed several measures that are consistent with this CMA including BRTR Measures BIO-42 through BIO-46, BIO-51 through BIO-55, BIO-61, and BIO-65.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
Activity-Specific Bird and Bat CMAs	**LUPA-BIO-17**	For activities that may result in mortality to Focus and BLM Special–Status bird and bat species, a Bird and Bat Conservation Strategy (BBCS) will be prepared with the goal of assessing operational impacts to bird and bat species and incorporating methods to reduce documented mortality. The BBCS actions for impacts to birds and bats during these activities will be determined by the activity-specific bird and bat operational actions. The strategy shall be approved by BLM in coordination with USFWS, and CDFW as appropriate, and may include, but is not limited to:					
		● Incorporating a bird and bat use and mortality monitoring program during operations using current protocols and best procedures available at time of monitoring.	Applicable	Consistent	Consistent with BRTR Measure BIO-55 (which identifies mortality management).		
		● Activity-specific operational avoidance and minimization actions that reduce the level of mortality on the populations of bird and bat species, such as: o Use techniques that minimize attraction of birds to hazardous situations that are mistaken to be or simulate natural habitats (e.g., bodies of water). o Implement operational management techniques that minimize impacts to migratory birds during diurnal and seasonal cycles (e.g., positioning of heliostats to decrease surface area exposed to avian species). o Evaluation and installation of the best available bird and bat detection and deterrent technologies available at the time of construction.	Applicable	Consistent	Consistent with BRTR Measure BIO-55 (which identifies avoidance and minimization measures).		
		Known important Focus and BLM Special Status bird areas are: · Dry lakes and playas of the north Mojave region, which include China Lake, Koehn Lake, Harper Lake, and Searles Lake (as shown in the Audubon Important Bird Areas in Appendix D) · Antelope Valley (as shown in the Audubon Important Bird Areas in Appendix D) · Lower Colorado River Valley (as shown in the Audubon Important Bird Areas in Appendix D) · The Salton Sea and bordering areas including agricultural land of the Imperial Valley (as shown in the Audubon Important Bird Areas in Appendix D) · Documented avian movement corridors along the north slope of the San Gabriel and San Bernardino mountain ranges · Other regionally important seasonal use areas and migratory corridors identified in future studies or otherwise documented in the scientific literature over the term of the LUPA	Not applicable		None of these Focus and BLM Special Status Bird areas are in the Crimson Solar Project region.		
Riparian & Wetland Focus Species	**LUPA-BIO-RIPWET-1**	The riparian and wetland DRECP vegetation types and other features listed in **Table 17** will be avoided to the maximum extent practicable, except for allowable minor incursions (see Glossary of Terms for "avoidance to the maximum extent practicable" and "minor incursion") with the specified setbacks. For minor incursion (see "minor incursion" in the Glossary of Terms) to the DRECP riparian vegetation types, wetland vegetation types, or encroachments on the setbacks listed in Table 17, the hydrologic function of the avoided riparian or wetland communities will be maintained. · Minor incursions in the riparian and wetland vegetation types or other features including the setbacks listed in Table 17 will occur outside of the avian nesting season, February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW if the minor incursion(s) is likely to result in impacts to nesting birds.	Applicable	Consistent	The Applicant has avoided all major drainages with microphyll woodlands and applied a 200-foot buffer around all microphyll woodlands regardless of vegetation classification, except for minor incursions from the linear features. Consistent with BRTR Measures BIO-20 (avoiding mature trees and minimizing impacts to drainage) and BIO-21 (200-foot buffer).		
	LUPA-BIO-RIPWET-2	Hydrologic function of the following DRECP vegetation types will be maintained: North American Warm Desert Alkaline Scrub and Herb Playa and Wet Flat, Southwestern North American Salt Basin and High Marsh, and other undifferentiated wetland-related land covers (i.e., "Playa," "Wetland," and "Open Water").	Not applicable		These DRECP veg types are not present in the project site.		
BLM Special Status Riparian Bird Species	**LUPA-BIO-RIPWET-3**	For activities that occur within 0.25 mile of a riparian or wetland DRECP vegetation type and may impact BLM Special Status riparian and wetland birds species, conduct a pre-construction/activity nesting bird survey for BLM Special Status riparian and wetland birds according to agency-approved protocols. · Based on the results of the nesting bird survey above, setback activities that are likely to impact BLM Special Status riparian and wetland bird species, including but not limited to pre-construction, construction and decommissioning, 0.25 mile from active nests Special Status during the breeding season (February 1 through August 31 or otherwise determined by BLM, USFWS and CDFW). For activities in areas covered by this provision that occur during the breeding season and that last longer than one week, nesting bird surveys may need to be repeated, as determined by BLM, in coordination with USFWS and CDFW, as appropriate. No pre-activity nesting bird surveys are necessary for activities occurring outside of the breeding season.	Applicable	Consistent	No BLM Special-Status riparian and wetland bird species are known to nest in the microphyll woodland between the RE Crimson Permitting Boundary. Therefore a 0.25 mile setback is not necessary. Consistent with BRTR Measures BIO-51 and BIO-65 that require nesting bird surveys to be conducted prior to vegetation clearing if conducted during the nesting bird season.		
Federally Listed Fish Species	**LUPA-BIO-RIPWET-4**	Setback pre-construction, construction, and decommissioning activities and other activities that may impact federally listed fish species, 0.25 mile from the edge of existing or newly discovered occurrences of federally listed fish species, except for minor incursions (see Glossary of Terms). · Demonstrate neutral or beneficial long-term hydrologic effects on federally listed fish species and the adjoining riparian and wetland habitat prior to seeking authorization for and commencing a minor incursion.	Not applicable		According to Table 4-4 of the BRTR, no special-status fish are identified as having the potential to occur on the project site.		
	LUPA-BIO-RIPWET-5	Site and design activities to fully avoid operational impacts to existing and newly discovered occurrences of federally listed fish species.	Not applicable		According to Table 4-4 of the BRTR, no special-status fish are identified as having the potential to occur on the project site.		
Tehachapi Slender Salamander	**LUPA-BIO-RIPWET-6**	Avoid pre-construction, construction, and decommissioning activities or other activities that may impact the Tehachapi slender salamander within 0.25 mile of existing or newly discovered occurrences of or suitable habitat for Tehachapi slender salamander, except for minor incursions (see Glossary of Terms).	Not applicable		According to Table 4-4 of the BRTR, the Tehachapi slender salamander does not have the potential to occur on the project site.		
	LUPA-BIO-RIPWET-7	Construct culverts or other suitable below-grade crossings for new or improved roadways that bisect suitable habitat for the Tehachapi Slender Salamander. · Construct barriers to reduce at-grade crossings along new or improved roadways that bisect suitable habitat.	Not applicable		According to Table 4-4 of the BRTR, the Tehachapi slender salamander does not have the potential to occur on the project site.		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
Dune DRECP Vegetation Types, Aeolian Processes and Associated Species (DUNE): Aeolian Processes	**LUPA-BIO-DUNE-1**	Because DRECP sand dune vegetation types and Aeolian sand transport corridors are, by definition, shifting resources, activities that potentially occur within or bordering the sand dune DRECP vegetation types and/or Aeolian sand transport corridors must conduct studies to verify the location [refer to Appendix D, Figure D-7] and extent of the sand resource(s) for the activity-specific environmental analysis to determine: · Whether the proposed activity(s) occur within a sand dune or an Aeolian sand transport corridor · If the activity(s) is subject to dune/Aeolian sand transport corridor CMAs · If the activity(s) needs to be reconfigured to satisfy applicable avoidance requirements	Applicable	Consistent	A sand transport study (prepared in April 2018) concluded that mitigation may be necessary to avoid project impacts to Aeolian sands, especially in the Mule SMZ.		
	LUPA-BIO-DUNE-2	Activities that potentially affect the amount of sand entering or transported within Aeolian sand transport corridors will be designed and operated to: · Maintain the quality and function of Aeolian transport corridors and sand deposition zones, unless related to maintenance of existing [at the time of the DRECP LUPA ROD] facilities/operations/activities · Avoid a reduction in sand-bearing sediments within the Aeolian system · Minimize mortality to DUNE associated Focus and BLM Special Status Species	Applicable	Inconsistent	The project has been designed to avoid active sand dune areas. However, a sand transport study (prepared in April 2018) concluded that mitigation may be necessary to avoid project impacts to Aeolian sands, especially in the Mule SMZ. BRTR Measures BIO-47 and BIO-48 talk about compensation for impacts to Mojave fringe-toed lizard dune habitat. However, no mitigation directly for protecting Aeolian sand has been proposed.	Consistent	Mitigation Measure BIO-28 in the EIS would reduce habitat loss effects fro Mojave Fringe-toed lizards and their sand dune habitat.
	LUPA-BIO-DUNE-3	Any facilities or activities that alter site hydrology (e.g., sediment barrier) will be designed to maintain continued sediment transport and deposition in the Aeolian corridor in a way that maintains the Aeolian sorting and transport to downwind deposition zones. Site designs for maintaining this transport function must be approved by BLM in coordination with USFWS and CDFW as appropriate.	Applicable	Inconsistent	The project has been designed to avoid active sand dune areas. However, a sand transport study (prepared in April 2018) concluded that mitigation may be necessary to avoid project impacts to Aeolian sands, especially in the Mule SMZ. BRTR Measures BIO-47 and BIO-48 talk about compensation for impacts to Mojave fringe-toed lizard dune habitat. However, no mitigation directly for protecting Aeolian sand has been proposed.	Consistent	Mitigation Measure BIO-28 in the EIS would reduce habitat loss effects fro Mojave Fringe-toed lizards and their sand dune habitat.
Mohave Fringe-Toed Lizard	**LUPA-BIO-DUNE-4**	Dune formations and other sand accumulations (i.e., sand ramps, sand sheets) with suitable habitat characteristics for the Mojave fringe-toed lizard (i.e., unconsolidated blow-sand) will be mapped according to mapping standards established by the BLM National Operations Center. For minor incursions (see "minor incursion" in the Glossary of Terms) into sand dunes and sand transport areas the activity will be sited in the mapped zone with the least impacts to sand dunes and sand transport and Mojave fringe-toed lizards.	Applicable	Consistent	The project has been designed to pull away from and avoid active Aeolian sand dune areas and to pull away from areas with the highest density of Mojave fringe-toed lizards.		
	LUPA-BIO-DUNE-5	If suitable habitat characteristics are identified during the habitat assessment, clearance surveys (see Glossary of Terms) for Mojave fringe-toed lizard will be performed in suitable habitat areas.	Applicable	Consistent	Specific clearance surveys for Mojave fringe-toed lizards are not proposed; however, through biological monitoring, the species will be moved out of harm's way during site clearing, grubbing, and grading. Consistent with BRTR Measure BIO-4.		
Bat Species (BAT)		The following CMAs will be implemented for bat Focus and BLM Special Status Species, including but not limited to those listed below: -California Leaf-nosed Bat -Pallid Bat -Townsend's Big-eared bat	Applicable	Consistent	CA leaf-nosed bat and pallid bat both detected during surveys. Townsend's big-eared bat was not detected but has a high probability of being on the project site. Consistent with BRTR Measure BIO-55.		
	LUPA-BIO-BAT-1	Activities, except wind projects, will not be sited within 500 feet of any occupied maternity roost or presumed occupied maternity roost as described below. Refer to CMA **DFA-VPL-BIO-BAT-1** for distances within DFAs and VPLs.	Applicable	Consistent	Although BRTR Measure BIO-55 discusses a Bird and Bat Conservation Strategy, bats are not expected to roost on the project site given the lack of suitable roosting areas.		
	LUPA-BIO-BAT-2	Mines will be assumed to be occupied bat roosts, unless appropriate surveys for bat use have been conducted during all seasons (including maternity, lekking or swarming, and winter use). Mines not considered potential bat roosts are only those that have no structure/workings (adits or shafts or crevices out of view).	Not applicable		There are no mines within the RE Crimson Permitting Boundary or within 500 feet.		
Plant Species (PLANT): Plant Focus and BLM Special Status Species CMAs		The following CMAs will be implemented for all plant Focus and BLM Special Status Species, including but not limited to those listed below · Alkali mariposa-lily · Bakersfield cactus · Barstow woolly sunflower · Desert cymopterus · Little San Bernardino Mountains linanthus · Mojave monkeyflower · Mojave tarplant · Owens Valley checkerbloom · Parish's daisy · Triple-ribbed milk-vetch			The following special-status plant species were detected within the Project site during special-status plant surveys conducted in 2011, 2012, 2016, 2017, and 2019: • Ribbed cryptantha (Johnstonella costata) • Harwood's eriastrum (Eriastrum harwoodii) • Utah vine milkweed (Funastrum utahense) • Desert unicorn plant (Proboscidea althaeifolia) Additional special-status plant species detected outside of the Project site but within the Sonoran West survey area included the following: • Harwood's milkvetch (Astragalus insularis var. harwoodii) • Abram's spurge (Euphorbia abramsiana)		
	LUPA-BIO-PLANT-1	Conduct properly timed protocol surveys in accordance with the BLM's most current (at time of activity) survey protocols for plant Focus and BLM Special Status Species.	Applicable	Consistent	The most recent focused botanical surveys were completed in spring 2017 and results are included in the BRTR.		
	LUPA-BIO-PLANT-2	Implement an avoidance setback of 0.25 mile for all Focus and BLM Special Status Species occurrences. Setbacks will be placed strategically adjacent to occurrences to protect ecological processes necessary to support the plant Species (see Appendix Q, Baseline Biology Report, in the Proposed LUPA and Final EIS [2015], or the most recent data and modeling).	Applicable	Inconsistent	There are multiple species that occur onsite that are identified as Focus or Special Status Species, but there is no mention of setbacks of 0.25 mile (over 1,000 feet) for these species.	Partially Consistent	Alternative C would avoid 409 out of the 420 Harwood's eriastrum individuals within the Alternative A footprint. Mitigation Measure BIO-20 in the EIS would assign a qualified biologist to designate environmentally sensitive areas (ESAs) around special status plants outside of the Project site within 100 feet of the limits of disturbance.

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
	LUPA-BIO-PLANT-3	Impacts to suitable habitat for Focus and BLM Special Status plant species should be avoided to the extent feasible, and are limited [capped] to a maximum of 1% of their suitable habitat throughout the entire LUPA Decision Area. The baseline condition for measuring suitable habitat is the DRECP modeled suitable habitat for these species utilized in the EIS analysis (2014 and 2015), or the most recent suitable habitat modeling. · For those plants with Species Specific DFA Suitable Habitat Impact Caps listed in Table 23, those caps apply in the DFAs only. Refer to CMA DFA-PLANT-1.	Not applicable		None of the plant species listed in Table 23 occur within the RE Crimson Permitting Boundary.		
Special Vegetation Features (SVF)	**LUPA-BIO-SVF-1**	For activity-specific NEPA analysis, a map delineating potential sites and habitat assessment of the following special vegetation features is required: Yucca clones, creosote rings, Saguaro cactus, Joshua tree woodland, microphyll woodland, Crucifixion thorn stands. BLM guidelines for mapping/surveying cactus, yuccas, and succulents shall be followed.	Applicable	Consistent	Site surveys were completed in 2010-2017 and a figure of the mapped microphyll woodland is included in the BRTR.		
	LUPA-BIO-SVF-2	Yucca clones larger than 3 meters in diameter (longest diameter if the clone forms an ellipse rather than a circular ring) shall be avoided.	Not applicable		Protocol surveys were already performed and no yucca clones were found within the RE Crimson Permitting Boundary.		
	LUPA-BIO-SVF-3	Creosote bush rings (see Glossary of Terms) larger than 5 meters in diameter (longest diameter if the "ring" forms an ellipse rather than a circle) shall be avoided.	Not applicable		There are no creosote bush rings within the RE Crimson Permitting Boundary.		
	LUPA-BIO-SVF-4	Saguaro cactus should be managed in such a way as to provide long-term habitat for the California populations not just individual plants, except in DFAs.	Not applicable		Protocol surveys were already performed for the Crimson Solar Project and no saguaro cactus were found within the RE Crimson Permitting Boundary.		
	LUPA-BIO-SVF-5	Joshua tree woodland (*Yucca brevifolia* Woodland Alliance): impacts to Joshua tree woodlands (see Glossary of Terms) will be avoided to the maximum extent practicable (see Glossary of Terms), except for minor incursions (see Glossary of Terms).	Not applicable		Protocol surveys were already performed for the Crimson Solar Project and no Joshua tree woodlands were found within the RE Crimson Permitting Boundary.		
	LUPA-BIO-SVF-6	Microphyll woodland: impacts to microphyll woodland (see Glossary of Terms) will be avoided, except for minor incursions (see Glossary of Terms).	Applicable	Consistent	The RE Crimson Solar Project has avoided all microphyll woodlands to the greatest extent feasible apart from minor incursions where the linear features cross microphyll woodlands. Consistent with BRTR Measures BIO-20 and BIO-21.		
	LUPA-BIO-SVF-7	Crucifixion thorn stands: (*Castela emoryi* Shrubland Special Stands) Crucifixion thorn stands with greater than 100 individuals will be avoided.	Not applicable		Protocol surveys were already performed for the Crimson Solar Project and no crucifixion thorn stands were found within the RE Crimson Permitting Boundary		
General Vegetation Management (VEG)	**LUPA-BIO-VEG-1**	Management of cactus, yucca, and other succulents will adhere to current up-to-date BLM policy.	Applicable	Inconsistent	There is no BRTR measure text stating how cactus, yucca, and other succulents will be managed.	Consistent	Mitigation Measure BIO-18 in the EIS states that plant measures shall follow applicable state and federal regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.
	LUPA-BIO-VEG-2	Promote appropriate levels of dead and downed wood on the ground, outside of campground areas, to provide wildlife habitat, seed beds for vegetation establishment, and reduce soil erosion, as determined appropriate on an activity-specific basis.	Applicable	Inconsistent	BRTR says this is not applicable. However, the RE Crimson Permitting Boundary contains 1.24 acres of CDFW riparian woodland; some microphyll woodland areas and riparian woodlands could be disturbed. There is no mitigation pertaining to keeping dead and downed wood on the ground. This could be applicable for restoration of riparian/microphyll woodlands should they be disturbed by construction.	Consistent	Mitigation Measure BIO-19 in the EIS is implemented to avoid and minimize direct and indirect impacts to riparian vegetation such as microphyll woodlands. However, the majority of LUPA-BIO-VEG-2 is not applicable.
	LUPA-BIO-VEG-3	Allow for the collection of plant material consistent with the maintenance of natural ecosystem processes.	Not Applicable		Once construction is complete, plant material collection to maintain natural ecosystem processes would not be applicable on the site.		
	LUPA-BIO-VEG-4	Within the Bishop Field Office area, provide yearlong protection of endangered, threatened, candidate, and sensitive plant and animal habitats. Yearlong protection means that no discretionary actions which would adversely affect target resources will be allowed.	Not applicable		The project site is not near the Bishop Field Office.		
	LUPA-BIO-VEG-5	All activities will follow applicable BLM state and national regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.	Applicable	Inconsistent	There is no BRTR measure text stating how cactus, yucca, and other succulents will be salvaged and transplanted. There are no BLM sensitive plant species within the RE Crimson Permitting Boundary that would require salvage and transport.	Consistent	Mitigation Measure BIO-18 in the EIS states that plant measures shall follow applicable state and federal regulations and policies for salvage and transplant of cactus, yucca, other succulents, and BLM Sensitive plants.
	LUPA-BIO-VEG-6	BLM may consider disposal of succulents through public sale, as per current up-to-date state and national policy.	Not applicable		Measure pertains to lead agency actions, not part of applicant proposal.		
Individual Focus Species (IFS): Desert Tortoise	**LUPA-BIO-IFS-1**	Activities within desert tortoise linkages, identified in Appendix D, that may have a negative impact on the linkage will require an evaluation, in the environmental document(s), of the effects on the maintenance of long- term viable desert tortoise populations within the affected linkage. The analysis will consider the amount of suitable habitat, including climate refugia, required to ensure long-term viability within each linkage given the linkage's population density, long-term demographic and genetic needs, degree of existing habitat disturbance/impacts, mortality sources, and most up-to-date population viability modeling. Activities that would compromise the long-term viability of a linkage population or the function of the linkage, as determined by the BLM in coordination with USFWS and CDFW, are prohibited and will require reconfiguration or re-siting.	Not applicable		The RE Crimson Solar Project is not within a desert tortoise linkage identified on Figure D-16 in Appendix D of the DRECP LUPA.		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
	LUPA-BIO-IFS-2	Construction of new roads and/or routes will be avoided to the maximum extent practicable (see Glossary of Terms) within desert tortoise habitat in tortoise conservation areas (TCAs) or tortoise linkages identified in Appendix D, unless the new road and/or route is beneficial to minimize net impacts to natural or ecological resources of concern for desert tortoise. TCAs and identified linkages should have the goal of "no net gain" of road density. Any new road considered within a TCA or identified linkage will not be paved and will be designed and sited to minimize the effect to the function of identified linkages or local desert tortoise populations and shall have a maximum speed limit of 25 miles per hour. Roads requiring the installation of long-term desert tortoise exclusion fencing for construction or operation will incorporate wildlife underpasses (e.g., culverts) to reduce population fragmentation.	Not applicable		The RE Crimson Solar Project is not within a desert tortoise linkage or TCA identified on Figure D-16 in Appendix D of the DRECP LUPA.		
	LUPA-BIO-IFS-3	All culverts for access roads or other barriers will be designed to allow unrestricted access by desert tortoises and will be large enough that desert tortoises are unlikely to use them as shelter sites (e.g., 36 inches in diameter or larger). Desert tortoise exclusion fencing may be utilized to direct tortoise use of culverts and other passages.	Applicable	Inconsistent	The BRTR says the RE Crimson Project would install Arizona crossings or culverts across main drainage channels. However, there are no mitigation measures requiring installation of these crossings/culverts. The Proposed Action chapter mentions Arizona crossings. A design feature should be added to the proposed action to make large enough for desert tortoise passage.	Consistent	Mitigation Measure BIO-22 in the EIS provides fully enclosed desert tortoise exclusionary fencing and standard procedures in the USDWS 2009 Desert Tortoise Field Manual.
	LUPA-BIO-IFS-4	In areas where protocol and clearance surveys are required (see Appendix D), prior to construction or commencement of any long-term activity that is likely to adversely affect desert tortoises, desert tortoise exclusion fencing shall be installed around the perimeter of the activity footprint (see Glossary of Terms) in accordance with the Desert Tortoise Field Manual (USFWS 2009) or most up-to- date USFWS protocol. Additionally, short-term desert tortoise exclusion fencing will be installed around short-term construction and/or activity areas (e.g., staging areas, storage yards, excavations, and linear facilities), as appropriate, per the Desert Tortoise Field Manual (USFWS 2009) or most up-to-date USFWS protocol.	Applicable	Consistent	Consistent with BRTR Measures BIO-27 and BIO-28. If wildlife-friendly fencing is implemented during operations as described by BIO-65, the Applicant would use biological monitors, which is consistent with BIO-4. The Applicant will remain consistent with this CMA and follow the USFWS 2009 protocol (the most current regulations).		
		● Exemption from desert tortoise protocol survey requirements can be obtained from BLM, in coordination with USFWS, and CDFW as applicable, on a case-by-case basis if a designated biologist determines the activity site does not contain the elements of desert tortoise habitat, is unviable for occupancy, or if baseline studies inferred absence during the current or previous active season.	Not applicable		No exemption		
		● Construction of desert tortoise exclusion fences will occur during the time of year when tortoise are less active in order to minimize impacts and to accommodate subsequent desert tortoise surveys. Any exemption or modification of desert tortoise exclusion fencing requirements will be based on the specifics of the activity and the site-specific population and habitat parameters. Sites with low population density and disturbed, fragmented, or poor habitat are likely to be candidates for fencing requirement exemptions or modifications. Substitute measures, such as on-site biological monitors in the place of the fencing requirement, may be required, as appropriate.	Applicable	Inconsistent	BRTR Measures BIO-27 makes no mention of fencing occurring when tortoises are less active or potential fencing exemptions due to low quality areas.	Consistent	Mitigation Measure BIO-23 in the EIS discusses that prior to construction, desert tortoise clearance surveys will be conducted to locate and remove desert tortoises from within the Project site area .
		● After an area is fenced, and until desert tortoises are removed, the designated biologist is responsible for ensuring that desert tortoises are not being exposed to extreme temperatures or predators as a result of their pacing the fence. Remedies may include the use of shelter sites placed along the fence, immediate translocation, removal to a secure holding area, or other means determined by the BLM, USFWS, and CDFW, as applicable.	Applicable	Inconsistent	No mention in the BRTR measures about ensuring tortoises are not at risk while pacing the fence after the fencing activities.	Consistent	Mitigation Measure BIO-12 in the EIS provides fully enclosed desert tortoise exclusionary fencing and wildlife entrapment avoidance, as well as frequent inspections in areas outside of the desert tortoise exclusionary fencing. Work activites occurring in unfenced areas will be monitored as detailed in BIO-23 of the EIS.
		● Modification or elimination of the above requirement may also be approved if the activity design will allow retention of desert tortoise habitat within the footprint. If such a modification is approved, modified protective measures may be required to minimize impacts to desert tortoises that may reside within the activity area.	Not applicable		No elimination possible since desert tortoise habitat would not be retained		
		● Immediately prior to desert tortoise exclusion fence construction, a designated biologist (see Glossary of Terms) will conduct a clearance survey of the fence alignment to clear desert tortoises from the proposed fence line's path.	Applicable	Inconsistent	BRTR Measure BIO-28 says clearance surveys for desert tortoise will be conducted following installation of the fence, not immediately prior	Consistent	Mitigation Measure BIO-23 in the EIS discusses that prior to construction, desert tortoise clearance surveys will be conducted to locate and remove desert tortoises from within the Project site area .
		● All desert tortoise exclusion fencing will incorporate desert tortoise proof gates or other approved barriers to prevent access of desert tortoises to work sites through access road entry points.	Applicable	Consistent	Consistent per BRTR Measure BIO-27 (desert-tortoise exclusion gates with grates shall be established at all site entry points).		
		● Following installation, long-term desert tortoise exclusion fencing will be inspected for damage quarterly and within 48 hours of a surface flow of water due to a rain event that may damage the fencing.	Applicable	Consistent	Consistent per BRTR Measure BIO-27 (damage inspections would occur monthly and during all major rain events)		
		● All damage to long-term or short-term desert tortoise exclusion fencing will be immediately blocked to prevent desert tortoise access and repaired within 72 hours.	Applicable	Consistent	Consistent per BRTR Measure BIO-27 (damage to fencing would be repaired immediately)		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
	LUPA-BIO-IFS-5	Following the clearance surveys (see Glossary of Terms) within sites that are fenced with long-term desert tortoise exclusion fencing a designated biologist (see Glossary of Terms) will monitor initial clearing and grading activities to ensure that desert tortoises missed during the initial clearance survey are moved from harm's way.	Applicable	Consistent	The Applicant will retain a DB to support the project. And implement applicable BRTR measures: BIO-1, BIO-2, BIO-11, and BIO-27 to BIO-31.		
		A designated biologist will inspect construction pipes, culverts, or similar structures: (a) with a diameter greater than 3 inches, (b) stored for one or more nights, (c) less than 8 inches aboveground and (d) within desert tortoise habitat (such as, outside the long-term fenced area), before the materials are moved, buried, or capped. As an alternative, such materials shall be capped before storing outside the fenced area or placing on pipe racks. Pipes stored within the long-term fenced area after completing desert tortoise clearance surveys will not require inspection.	Applicable	Inconsistent	BRTR Measure BIO-33 requires inspection of construction equipment parked in unfenced tortoise habitat. However, specific text regarding inspection of construction structures meeting requirements (a) through (c) is not included in the BRTR measures as they are currently written.	Consistent	Mitigation Measure BIO-12 in the EIS provides fully enclosed desert tortoise exclusionary fencing and wildlife entrapment avoidance, as well as frequent inspections in areas outside of the desert tortoise exclusionary fencing. Work activites occurring in unfenced areas will be monitored as detailed in BIO-23 of the EIS. Mitigation Measure BIO-12 in the EIS also includes, as an alternative, that all structures be capped before being stored outside the fenced area, or placed on pipe racks.
	LUPA-BIO-IFS-6	When working in areas where protocol or clearance surveys are required (see Appendix D), biological monitoring will occur with any geotechnical boring or geotechnical boring vehicle movement to ensure no desert tortoises are killed or burrows are crushed.	Applicable	Inconsistent	Specific text regarding geotechnical boring (which may be required according to the conclusions of the geotechnical report which recommends a geotechnical investigation) is not included in the BRTR measures as they are currently written.	Consistent	Mitigation Measure BIO-1 in the EIS states that the Designated Biologist shall monitor with protective measures of all federally and state listed wildlife species during construction-related activities, such as boring.
	LUPA-BIO-IFS-7	A designated biologist (see Glossary of Terms) will accompany any geotechnical testing equipment to ensure no tortoises are killed and no burrows are crushed.	Applicable	Inconsistent	Specific text regarding geotechnical testing (which may be required according to the conclusions of the geotechnical report which recommends a geotechnical investigation) is not included in the BRTR measures as they are currently written.	Consistent	Mitigation Measure BIO-1 in the EIS states that the Designated Biologist shall monitor with protective measures of all federally and state listed wildlife species during construction-related activities, such as boring.
	LUPA-BIO-IFS-8	Inspect the ground under the vehicle for the presence of desert tortoise any time a vehicle or construction equipment is parked in desert tortoise habitat outside of areas fenced with desert tortoise exclusion fencing. If a desert tortoise is seen, it may move on its own. If it does not move within 15 minutes, a designated biologist may remove and relocate the animal to a safe location.	Applicable	Consistent	Consistent with BRTR Measure BIO-33.		
	LUPA-BIO-IFS-9	Vehicular traffic will not exceed 15 miles per hour within the areas not cleared by protocol level surveys where desert tortoise may be impacted.	Applicable	Consistent	Consistent with BRTR Measure BIO-32.		
Flat-Tailed Horned Lizard	**LUPA-BIO-IFS-10**	Comply with the conservation goals and objectives, criteria, and management planning actions identified in the most recent revision of the Flat-tailed Horned Lizard Rangewide Management Strategy (RMS). Activities will include appropriate design features using the most current information from the RMS and RMS Interagency Coordinating Committee to minimize adverse impacts during siting, design, pre-construction, construction, operation, and decommissioning; ensure that current or potential linkages and habitat quality are maintained; reduce mortality; minimize other adverse impacts during operation; and ensure that activities have a neutral or positive effect on the species.	Not applicable		The species is not present within the RE Crimson Permitting Boundary and no impacts are anticipated to occur.		
Bendire's Thrasher	**LUPA-BIO-IFS-11**	If Bendire's thrasher is present, conduct appropriate activity-specific biological monitoring (see Glossary of Terms) to ensure that Bendire's thrasher individuals are not directly affected by operations (i.e., mortality or injury, direct impacts on nest, eggs, or fledglings).	Not applicable		The species is not present within the RE Crimson Permitting Boundary and no impacts are anticipated to occur.		
Burrowing Owl	**LUPA-BIO-IFS-12**	If burrowing owls are present, a designated biologist (see Glossary of Terms) will conduct appropriate activity-specific biological monitoring (see Glossary of Terms) to ensure avoidance of occupied burrows and establishment of the 656 feet (200 meter) setback to sufficiently minimize disturbance during the nesting period on all activity sites, when practical.	Applicable	Inconsistent	The species is not currently present within the RE Crimson Permitting Boundary. BRTR Measures BIO-42 through BIO-46 (pre-construction surveys addressing burrowing owl occurrences) would be followed in the event that western burrowing owls are discovered within the RE Crimson Permitting Boundary at a later date. However, only a 250-foot buffer is required by BRTR Measure BIO-43 during breeding season, where as this CMA requires a 656 foot buffer during nesting period.	Consistent	Mitigation Measure BIO-29 in the EIS states that the Project proponent shall implement a Burrowing Owl Mangement Plan subject to BLM and CDFW approval, therefore including any setbacks as deemed necessary.
	LUPA-BIO-IFS-13	If burrows cannot be avoided on-site, passive burrow exclusion by a designated biologist (see Glossary of Terms) through the use of one-way doors will occur according to the specifications in Appendix D or the most up-to-date agency BLM or CDFW specifications. Before exclusion, there must be verification that burrows are empty as specified in Appendix D or the most up-to-date BLM or CDFW protocols. Confirmation that the burrow is not currently supporting nesting or fledgling activities is required prior to any burrow exclusions or excavations.	Applicable	Consistent	Consistent with BRTR Measure BIO-42.		
	LUPA-BIO-IFS-14	Activity-specific active translocation of burrowing owls may be considered, in coordination with CDFW.	Applicable	Consistent	No active translocation of burrowing owls is proposed by BRTR Measures BIO-42 through BIO-46.		
California Condor	**LUPA-BIO-IFS-15**	All activities will be designed and sited in a manner to avoid or minimize the likelihood of contact, injury, and mortality of California condors. If a condor is identified at a site, the BLM biological staff and USFWS will be immediately notified for guidance.	Not applicable		The project area is not within the California condor range.		
	LUPA-BIO-IFS-16	Flight activity (e.g., surveys, construction, as well as operation and maintenance activities) related to any activities will not be allowed in the airspace extending to 3,000 feet above condor nest sites.	Not applicable		The project area is not within the California condor range.		
	LUPA-BIO-IFS-17	In the range of the California condor, structures supported by guy wires will be marked with recommended bird deterrent devices at the appropriate spacing intervals.	Not applicable		The project area is not within the California condor range.		
	LUPA-BIO-IFS-18	In the range of the California condor, all equipment and work-related materials that are potentially hazardous to condors, including but not limited to items that can be ingested, picked up, or carried away (e.g., loose-wires, open containers with fluids, some construction materials, etc.) will be kept in closed containers either in the work area or placed inside vehicles when they are not being used and at the end of every work day.	Not applicable		The project area is not within the California condor range.		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
	LUPA-BIO-IFS-19	In the range of the California condor, when feasible, ethylene glycol-based anti-freeze or other ethylene glycol-based liquid substances will be avoided, and propylene glycol-based antifreeze will be used. Vehicles and equipment using ethylene glycol based substances will be inspected before and after field use as well as during storage on sites for leaks and puddles. Standing fluid will be remediated without unnecessary delay.	Not applicable		The project area is not within the California condor range.		
	LUPA-BIO-IFS-20	Activities that are determined to have a potential risk of taking condors will implement the best detect, deter, and curtailment strategy available at the time of the activity to minimize adverse effects, and avoid or minimize the likelihood of condor injury and mortality. (An example of a 2015 curtailment strategy is shutting down wind generation operations when condor(s) are present, or wind generation facilities switching to night operations only). The strategy must be approved by the BLM and USFWS, in coordination with CDFW as appropriate.	Not applicable		The project area is not within the California condor range.		
	LUPA-BIO-IFS-21	If condors begin to regularly visit a site, BLM may require, in coordination with USFWS, and CDFW as appropriate, the implementation of additional measures to minimize potential impacts to condors. These measures will be based on best available data, activity and areas specifics, and may include, but are not limited to: · Barriers, including welded wire fabric or hardware cloth, will be installed to prevent access around any facility element that poses a danger to condors. · Stainless steel lines, rather than poly chemical lines will be used to preclude condors from obtaining and ingesting pieces of poly chemical lines. · Landing deterrents attached to the walking perching substrates, such as porcupine wire or Daddi Long Legs ®.	Not applicable		The project area is not within the California condor range.		
	LUPA-BIO-IFS-22	Operations and/or activities that reach an activity-specified trigger for condor injury and/or mortality as determined by BLM and USFWS, and CDFW as appropriate, will curtail operations and/or activities using best available techniques, as determined by BLM and USFWS, and CDFW as appropriate. (An example of a 2015 curtailment strategy is shutting down wind generation operations when condor(s) are present, or wind generation facilities switching to night operations only.) If curtailment techniques are not viable or available, then operations and/or activities will be suspended until the injury and/or condor mortality issue is resolved to the satisfaction of BLM and USFWS, and CDFW, as appropriate.	Not applicable		The project area is not within the California condor range.		
	LUPA-BIO-IFS-23	In the range of the California condor, if an activity may have an impact on California condors, a Condor Operations Strategy (COS) will be developed and implemented on a activity-specific basis in order to avoid and/or reduce the likelihood of injury and mortality from activities. The COS shall be approved by BLM in coordination with USFWS, and CDFW as appropriate for third party activities, and may include, but is not limited, to detailing specifics on: the activity-specific detect, deter and curtailment strategy; monitoring approach to detect condor use of the site; adaptive management approach if condors are found to visit the site; and, activity-specific measures that assist in the recovery of condor.	Not applicable		The project area is not within the California condor range.		
Golden Eagle	**LUPA-BIO-IFS-24**	Provide protection from loss and harassment of active golden eagle nests through the following actions: · Activities that may impact nesting golden eagles, will not be sited or constructed within 1-mile of any active or alternative golden eagle nest within an active golden eagle territory, as determined by BLM in coordination with USFWS as appropriate.	Not applicable		No golden eagle nests are present onsite. The closest golden eagle nest is over 5 miles away. The project site is likely to only support foraging habitat given its topography, ecology and geography.		
	LUPA-BIO-IFS-25	Cumulative loss of golden eagle foraging habitat within a 1 to 4 mile radius around active or alternative golden eagle nests (as identified or defined in the most recent USFWS guidance and/or policy) will be limited to less than 20%. See **CONS-BIO-IFS-5** for the requirement in Conservation Lands.	Not applicable		No golden eagle nests are present onsite. The closest golden eagle nest is over 5 miles away.		
	LUPA-BIO-IFS-26	For activities that impact golden eagles, applicants will conduct a risk assessment per the applicable USFWS guidance (e.g. the Eagle Conservation Plan Guidance) using best available information as well as the data collected in the pre-project golden eagle surveys.	Not applicable		No golden eagle nests are present onsite. The closest golden eagle nest is over 5 miles away.		
	LUPA-BIO-IFS-27	If a permit for golden eagle take is determined to be necessary, an application will be submitted to the USFWS in order to pursue a take permit.	Not applicable		According to the BRTR, take of golden eagle is not anticipated since the nearest nest is over 5 miles away and the project site only supports golden eagle foraging habitat. According to Appendix D, the site likely had a low number of golden eagles compared to other areas given its topography, geography, and ecology.		
	LUPA-BIO-IFS-28	In order to evaluate the potential risk to golden eagles, the following activities are required to conduct 2 years of pre-project golden eagle surveys in accordance with USFWS Eagle Conservation Plan Guidance as follows: · Wind projects and solar projects involving a power tower · Other activities for which the BLM, in coordination with USFWS, and CDFW as appropriate, determines take of golden eagle is reasonably foreseeable or there is a potential for take of golden eagle	Not applicable		Not a wind or power tower project. Golden eagle surveys were conducted in 2012 and 2018. In addition, migratory bird surveys were conducted in 2012 and 2016/2017. Although USFWS prefers two consecutive years of surveys, the absence of golden eagle observations on the Project site and completion of migratory bird surveys should be sufficient.		
	LUPA-BIO-IFS-29	For active nests with recreational conflicts that risk the occurrence of take, provide public notification (e.g., signs) of the sensitive area and implement seasonal closures as appropriate.	Not Applicable		According to the BRTR, take of golden eagle is not anticipated since the nearest nest is over 5 miles away and the project site only supports golden eagle foraging habitat. According to Appendix D, the site likely had a low number of foraging golden eagles compared to other areas given its topography, geography, and ecology.		
	LUPA-BIO-IFS-30	For activities where ongoing take of golden eagles is anticipated, develop advanced conservation practices per USFWS Eagle Conservation Plan Guidance.	Not applicable		According to the BRTR, take of golden eagle is not anticipated since the nearest nest is over 5 miles away and the project site only supports golden eagle foraging habitat. According to Appendix D, the site likely had a low number of foraging golden eagles compared to other areas given its topography, geography, and ecology.		
	LUPA-BIO-IFS-31	As determined necessary by BLM in coordination with USFWS, and CDFW as appropriate, for activities/projects that are likely to impact golden eagles implement site-specific golden eagle mortality monitoring in support of the pre-construction, pre-activity risk assessment surveys.	Not applicable		According to the BRTR, take of golden eagle is not anticipated since the nearest nest is over 5 miles away and the project site only supports golden eagle foraging habitat.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
Swainson's Hawk	**LUPA-BIO-IFS-32**	Avoid use of rodenticides and insecticides within five miles of active Swainson's hawk nest.	Not applicable		According to the BRTR, the nearest known nesting site for Swainson's hawk is located in the Antelope Valley (Los Angeles and Kern Counties) and more than 5 miles away.		
Desert Bighorn Sheep	**LUPA-BIO-IFS-33**	Access to, and use of, designated water sources for desert bighorn sheep will not be impeded by activities in designated and new utility corridors.	Not applicable		As shown in Figure D-6 of Appendix D of the DRECP, the proposed project is not within the range of bighorn sheep.		
	LUPA-BIO-IFS-34	Transmission projects and new utility corridors will minimize effects on access to, and use of, designated water sources for desert bighorn sheep.	Not applicable		As shown in Figure D-6 of Appendix D of the DRECP, the proposed project is not within the range of bighorn sheep.		
Mohave Ground Squirrel	**LUPA-BIO-IFS-35**	Protocol surveys (see Glossary of Terms) are required for activities in Mohave ground squirrel key population centers and linkages as indicated in Appendix D. Results of protocol surveys will be provided to BLM and CDFW to consult on, as appropriate, for third party activities.	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
	LUPA-BIO-IFS-36	Activities in Mohave ground squirrel key population centers, as identified in Appendix D, requiring an Environmental Impact Statement are required to assess the effect of the activity on the long term function of the affected key population center.	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
		• Activities within a key population center, as identified in Appendix D, must be designed to avoid adversely impacting the long-term function of the affected key population center.	Not applicable		See above		
	LUPA-BIO-IFS-37	Activities in key population centers will be sited in previously disturbed areas, areas of low habitat quality and in areas with low habitat intactness, to the maximum extent practicable (see Glossary of Terms).	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
	LUPA-BIO-IFS-38	Disturbance of suitable habitat from activities, requiring an EA or EIS, within the Mohave ground squirrel key population centers and linkages (as identified in Appendix D) will not occur during the typical dormant season (August 1 through February 28) unless absence is inferred and supported by protocol surveys or other available data during the previous active season.	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
	LUPA-BIO-IFS-39	During the typical active Mohave ground squirrel season (February 1 through August 31), conduct clearance surveys throughout the site, immediately prior to initial ground disturbance in the areas depicted in Appendix D. In the cleared areas, perform monitoring to determine if squirrels have entered cleared areas. Contain ground disturbance to within areas cleared of squirrels.	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
		• Detected occurrences of Mohave ground squirrel will be flagged and avoided, with a minimum avoidance area of 50 feet, until the squirrels have moved out of harm's way. A designated biologist (see Glossary of Terms) may also actively move squirrels out of harm's way.	Not applicable		See above		
	LUPA-BIO-IFS-40	Activities sited in a Mohave ground squirrel linkage (see	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
		Appendix D) that may impact the linkage are required to analyze the potential effects on connectivity through the linkage. The activity must be designed to maintain the function of the linkage after construction/implementation and during project/activity operations. Linkage function will be assessed by considering pre- and post-activity ability of the area to support resident Mohave ground squirrels and provide for dispersal of their offspring to key population centers outside the linkage, and dispersal through the linkage between key population centers.	Not applicable		See above		
		Activities that occur in Mohave ground squirrel linkages shown in Appendix D must be configured and located in a manner that does not diminish Mohave ground squirrel populations in the linkage.	Not applicable		See above		
	LUPA-BIO-IFS-41	For any ground-disturbing (e.g., vegetation removal, earthwork, trenching) activities, occurrences of Mohave ground squirrel will be flagged and avoided, with a minimum avoidance area of 50 feet, until the squirrels have moved out of harm's way. A designated biologist (see Glossary of Terms) may also actively move squirrels out of harm's way.	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
	LUPA-BIO-IFS-42	Rodenticides will not be used to manage rodents on activity within the range of the Mohave ground squirrel. Use of rodenticide inside of buildings is allowed.	Not applicable		As shown in Figure D-5 of Appendix D of the DRECP, the proposed project is not within the range of the Mohave ground squirrel.		
Compensation	**LUPA-BIO-COMP-1**	Impacts to biological resources, identified and analyzed in the activity specific environmental document, from activities in the LUPA Decision Area will be compensated using the standard biological resources compensation ratio, except for the biological resources and specific geographic locations listed as compensation ratio exceptions, specifics in CMAs **LUPA-BIO-COMP-2** through **-4**, and previously listed CMAs. Compensation acreage requirements may be fulfilled through non-acquisition (i.e., restoration and enhancement), land acquisition (i.e., preserve), or a combination of these options, depending on the activity specifics and BLM approval/authorization. Compensation for the impacts to designated desert tortoise critical habitat will be in the same critical habitat unit as the impact (see Table 18). Compensation for impacts to desert tortoise will be in the same recovery unit as the impact. Refer to CMA LUPA-COMP-1 and 2 for the timing requirements for initiation or completion of compensation.	Applicable	Consistent	Of the species listed in Table 18, only desert tortoise would require habitat compensation. The Applicant anticipates that compensatory mitigation will be required for desert tortoise occupied habitat. BRTR Measure BIO-41 details desert tortoise compensation.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
	LUPA-BIO-COMP-2	Birds and Bats – The compensation for the mortality impacts to bird and bat Focus and BLM Special Status Species from activities will be determined based on monitoring of bird and bat mortality and a fee re-assessed every 5 years to fund compensatory mitigation. The initial compensation fee for bird and bat mortality impacts will be based on pre-project monitoring of bird use and estimated bird and bat species mortality from the activity. The approach to calculating the operational bird and bat compensation is based on the total replacement cost for a given resource, a Resource Equivalency Analysis. This involves measuring the relative loss to a population (debt) resulting from an activity and the productivity gain (credit) to a population from the implementation of compensatory mitigation actions. The measurement of these debts and gains (using the same "bird years" metric as described in Appendix D) is used to estimate the necessary compensation fee. Each activity, as determined appropriate by BLM in coordination with USFWS, and CDFW as applicable, will include a monitoring strategy to provide activity-specific information on mortality effects on birds and bats in order to determine the amount and type of compensation required to offset the effects of the activity, as described above and in detail in Appendix D. Compensation will be satisfied by restoring, protecting, or otherwise improving habitat such that the carrying capacity or productivity is increased to offset the impacts resulting from the activity. Compensation may also be satisfied by non-restoration actions that reduce mortality risks to birds and bats (e.g., increased predator control and protection of roosting sites from human disturbance). Compensation will be consistent with the most up to date DOI mitigation policy.	Applicable	Partially Consistent	BRTR Measure BIO-55 requires a Bird and Bat Conservation Strategy that includes monitoring methods. However, compensation measures are never mentioned in the Measure (only conservation).		
	LUPA-BIO-COMP-3	Golden eagle – BLM and third-party initiated activities, will provide specific golden eagle compensation in accordance with the most up to date BLM or USFWS policies, including applicable USFWS Eagle Conservation Plan Guidance.	Not applicable		The BRTR says "habitat compensation for resource impacts for other species would also provide permanent protection for golden eagle foraging habitat." No anticipated golden eagle impacts. The habitat conservation for other resources will also benefit GOEA but not as mitigation, more as a secondary benefit.		
	LUPA-BIO-COMP-4	Golden eagle – Third-party applicant/activity proponents are required to contribute to a DRECP-wide golden eagle monitoring program, if the activity/project(s) has been determined, through the environmental analysis, to likely impact golden eagles.	Not applicable		See above comment.		
Air Resources	**LUPA-AIR-1**	All activities must meet the following requirements: ● Applicable National Ambient Air Quality Standards (Section 109)	Applicable	Inconsistent	Short-term construction emissions of the Proposed Action or alternative would each exceed maximum daily standards, which would potentially contribute to exceedances of NAAQS, even with implementation of Mitigation Measures AQ-A through AQ-D. However, operation of the Project would not exceed standards, and would be consistent.	Consistent	With Mitigation Measures AQ-1 through AQ-4, Project emissions would not exceed applicable thresholds.
		● State Implementation Plans (Section 110)	Applicable	Consistent	Consistent because project annual emissions would not exceed any de minimis thresholds for non-attainment pollutants, for which SIPs are prepared .		
		● Control of Pollution from Federal Facilities (Section 118) including non-point source	Not applicable				
		● Prevention of Significant Deterioration, including visibility impacts to mandatory Federal Class I Areas (Section 160 et seq.)	Not applicable				
		● Conformity Analyses and Determinations (Section 176[c])	Applicable	Consistent	The Proposed Action would conform to the SIP, therefore, BLM is exempt from performing a formal conformity determination.		
		● Apply best management practices on a case by case basis	Applicable	Consistent	The Proposed Action would include construction BMPs to reduce construction emissions including fugitive dust.		
		● Applicable local Air Quality Management Jurisdictions (e.g., 403 SCAQMD)	Applicable	Consistent	The Proposed Action would comply with all construction-related MDAQMD rules and regulations.		
	LUPA-AIR-2	Because project authorizations are a federal undertaking, air quality standards for fugitive dust may not exceed local standards and requirements.	Applicable	Consistent	The Proposed Action would comply with all construction-related MDAQMD rules and regulations.		
	LUPA-AIR-3	Where impacts to air quality may be significant under NEPA, requiring analysis through an Environmental Impact Statement, require documentation for activities to include a detailed discussion and analysis of Ambient Air Quality conditions (baseline or existing), National Ambient Air Quality Standards, criteria pollutant nonattainment areas, and potential air quality impacts of the proposed project (including cumulative and indirect impacts and greenhouse gas emissions). This content is necessary to disclose the potential impacts from temporary or cumulative degradation of air quality. The discussion will include a description and estimate of air emissions from potential construction and maintenance activities, and proposed mitigation measures to minimize net PM_{10} and $PM_{2.5}$ emissions. The documentation will specify the emission sources by pollutant from mobile sources, stationary sources, and ground disturbance. A Construction Emissions Mitigation Plan will be developed.	Applicable	Consistent	All required documentation, discussion, and analysis is provided in this EIS.		
	LUPA-AIR-4	Because fugitive dust is the number one source of PM_{10} and $PM_{2.5}$ emissions in the Mojave and Sonoran Deserts, fugitive dust impacts to air quality must be analyzed for all activities/projects requiring an Environmental Impact Statement and Environmental Assessment. · The NEPA air quality analysis may include modelling of the sources of PM10 and PM2.5 that occur prior to construction and/or ground disturbance from the activity/project, and show the timing, duration and transport of emissions off site. When utilized, the modeling will also identify how the generation and movement of PM10 and PM2.5 will change during and after construction and/or ground disturbance of the activity/project under all activity/project specific NEPA alternatives. The BLM air resource specialist and Authorizing Officer will determine if modelling is required as part of the NEPA analysis based on estimated types and amounts of emissions.	Applicable	Consistent	Fugitive Dust impacts are analyzed in this EIR/EIS.		
	LUPA-AIR-5	A fugitive Dust Control Plan will be developed for all projects where the NEPA analysis shows an impact on air quality from fugitive dust.	Applicable	Consistent	A fugitive Dust Control Plan is discussed in this EIS.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
LUPA-Wide Conservation and Management Actions for Comprehensive Trails and Travel Management	**LUPA-CTTM-1**	Maintain and manage adequate Road, Primitive Road, and Trail Access to and within SRMAs, ERMAs, OHV Open Areas, and Level 1, 2, and 3 Recreation Facilities.	Applicable	Consistent	Consistent with Mitigation Measure REC-1 (requires notification of penalties for any off-route OHV activities to deter off-route travel). The project is not in a SRMA or ERMA or Level 1, 2, and 3 Recreation Facilities.		
	LUPA-CTTM-2	Avoid activities that would have a significant adverse impact on use and enjoyment within 0.5 mile from centerline of tier 2 Roads/Primitive Roads, and 300 feet from centerline of tier 3 primitive roads/trails. If avoidance of Tier 2 and 3 roads, primitive roads and trails is not practicable, relocate access to the same or higher standard and maintain the setting characteristics and access to recreation activities, facilities, and destinations.	Not applicable		The Bradshaw Trail Backcountry is located 1.75 miles to the south of the permitting boundary. No other BLM Backcountry Byways or other significant linear features are located in the project area. The project site would include an existing paved Power Line road but would maintain the road area for project use.		
	LUPA-CTTM-3	Manage other significant linear features such as Mojave Road, Bradshaw Trail, or other recognized linear features to protect their important recreation activities, experiences and benefits. Prohibit activities that have a significant adverse impact on use and enjoyment within 0.5 mile (from centerline) of such linear features.	Not applicable		The Bradshaw Trail Backcountry is located 1.75 miles to the south of the permitting boundary. No other BLM Backcountry Byways or other significant linear features are located in the project area. The project site would include an existing paved Power Line road but would maintain the road area for project use.		
	LUPA-CTTM-4	If residual impacts to Tier 1 and Tier 2 roads/primitive roads, Back Country Byways, or significant linear features occur from adjacent DFAs or other activities, commensurate compensation in the form of enhanced recreation operations, access, recreation facilities or opportunities will be required.	Not applicable		The Bradshaw Trail Backcountry is located 1.75 miles to the south of the permitting boundary. No other BLM Backcountry Byways or other significant linear features are located in the project area. The project site would include an existing paved Power Line road but would maintain the road area for project use.		
	LUPA-CTTM-5	Manage OHV use per the appropriate Transportation and Travel Management Plan/RMP and/or the SRMA Objectives as outlined in Appendix C as Open, Limited or Closed.	Applicable	Consistent	Consistent with Mitigation Measure REC-1 (requires notification of penalties for any off-route OHV activities to deter off-route travel).		
	LUPA-CTTM-6	Manage Back Country Byways as a component of BLM Recreation and Travel and Transportation Management program**.**	Not applicable		The Bradshaw Trail Backcountry is located 1.75 miles to the south of the permitting boundary. No other BLM Backcountry Byways or other significant linear features are located in the project area. The project site would include an existing paved Power Line road but would maintain the road area for project use.		
	LUPA-CTTM-7	Manage Recreation Facilities consistent with the objectives for the recreation management areas and facilities (see also Section II.4.2.1.10).	Not applicable		None of these resources are in the vicinity or within the project area.		
Cultural Resources and Tribal Interests	**LUPA-CUL-1**	Continue working with the California Office of Historic Preservation (OHP) to develop and implement a program for record keeping and tracking agency actions that meets the needs of BLM and OHP organizations pursuant to existing State and National agreements and regulation (BLM State Protocol Agreement; BLM National Programmatic Agreement).	Not applicable		Agency responsibility		
	LUPA-CUL-2	Using relevant archaeological and environmental data, identify priority geographic areas for new field inventory, based upon a probability for unrecorded significant resources and other considerations.	Not applicable		Agency responsibility		
	LUPA-CUL-3	Identify places of traditional cultural and religious importance to federally recognized Tribes and maintain access to these locations for traditional use.	Applicable	Inconsistent	Access to places of traditional cultural and religious importance may not be maintained	Consistent	Following identification of places of traditional cultural and religious importance, the BLM has determined that access to these sites would be maintained for traditional use.
	LUPA-CUL-4	Design activities to minimize impacts on cultural resources including places of traditional cultural and religious importance to federally recognized Tribes.	Applicable	Consistent	Project's POD mentions cultural resources taken into consideration in project site selection process. Alternative B avoids cultural resources that are eligible for the National Register.		
	LUPA-CUL-5	Develop interpretive material to correspond with recreational uses to educate the public about protecting cultural resources and avoiding disturbance of archaeological sites.	Not applicable		Agency responsibility		
	LUPA-CUL-6	Develop partnerships to assist in the training of groups and individuals to participate in site stewardship programs.	Not applicable		Agency responsibility		
	LUPA-CUL-7	Coordinate with visual resources staff to ensure VRM Classes consider cultural resources and tribal consultation to include landmarks of cultural significance to Native Americans (TCPs, trails, etc.).	Not applicable		Agency responsibility		
	LUPA-CUL-8	Conduct regular contact and consultation with federally recognized Tribes and individuals, consistent with statute, regulation and policy.	Not applicable		Agency responsibility		
	LUPA-CUL-9	Promote DRECP desert vegetation types/communities by avoiding them where possible, then use required compensatory mitigation, off-site mitigation, and other means to ensure Native American vegetation collection areas and practices are maintained.	Not applicable		Agency responsibility		
	LUPA-CUL-10	Promote and protect desert fan palm oasis vegetation type/communities by avoiding where possible, then use required compensatory mitigation, off-site mitigation, and other means to ensure Native American cultural values are maintained.	Not applicable		Desert fan palm oasis vegetation type/communities are not present with the APE		
	LUPA-CUL-11	Promote and protect desert microphyll woodland vegetation type/communities to ensure Native American cultural values are maintained.	Applicable	Consistent	Mitigation Measures BIO-19 state that a 200-foot buffer around the microphyll woodlands will be established and avoided during project implementation. Mitigation Measures BIO-20, 21, and 22 would also promote and protect Special Status Species and desert microphyll woodland vegetation and communities.		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
Lands and Realty	**LUPA-LANDS-1**	Identify acquired lands as right-of-way exclusion areas when development is incompatible with the purpose of the acquisition.	Not applicable		No deed requirements for donated and/or acquired lands.		
	LUPA-LANDS-2	Prioritize acquisition of land within and adjacent to conservation designation allocations. Acquired land in any land use allocation in this Plan will be managed according to the applicable allocation requirements and/or for the purposes of the acquisition. Management boundaries for the allocation may be adjusted to include the acquired land if the acquisition lies outside the allocation area through a future land use plan amendment process.	Not applicable		The Proposed Action does not include land acquisition.		
	LUPA-LANDS-3	Within land use allocations where renewable energy and ancillary facilities are not allowed, an exception exists for geothermal development. Geothermal development will be an allowable use if a geothermal-only DFA overlays the allocation and the lease includes a no surface occupancy stipulation with exception of three specific parcels in the Ocotillo Wells SRMA (refer to the Ocotillo Wells SRMA Special Unit Management Plan in Appendix C).	Not applicable		The Proposed Action would be within a DFA, where solar facilities are an allowable use. The Proposed Action does not include geothermal energy facilities.		
	LUPA-LANDS-4	Nonfederal lands within the boundaries of BLM LUPA land use allocations are not affected by the LUPA.	Not applicable		The Proposed Action would occur entirely on federal lands.		
	LUPA-LANDS-5	The MUCs used to determine land tenure in the CDCA Plan will be replaced by areas listed in the CMAs below.	Not applicable		The Proposed Action is located in an area that had a MUC of Moderate Use (M) in the CDCA Plan, but was designated a DFA under the DRECP. Therefore, the project site would be managed as DFA. The BLM planning action would not be relevant to the Proposed Action.		
	LUPA-LANDS-6	Any activities on Catellus Agreement lands will be consistent with deed restrictions	Not applicable		The project site does not include Catellus Agreement lands.		
	LUPA-LANDS-7	Any activities on Catellus Agreement lands will be subject to the approval of the California State Director.	Not applicable		The project site does not include Catellus Agreement lands.		
	LUPA-LANDS-8	The CDCA Plan requirement that new transmission lines of 161kV or above, pipelines with diameters greater than 12 inches, coaxial cables for interstate communications, and major aqueducts or canals for interbasin transfers of water will be located in designated utility corridors, or considered through the plan amendment process outside of designated utility corridors, remains unchanged. The only exception is that transmission facilities may be located outside of designated corridors within DFAs without a plan amendment. This CMA does not apply the Bishop and Bakersfield RMPs.	Applicable	Consistent.	The 230kV gen-tie line would be located partially outside of the designated transmission corridor, but within the DFA.		
Exchanges with the State of California	**LUPA-LANDS-8**	Continue land exchanges with the State of California, as per the LUPA goals and objectives in Section II.4.1.4. Refer to Appendix F.	Not applicable		The project would not engage or interfere with a State land exchange.		
	LUPA-LANDS-9	Enter into land exchanges with the California State Lands Commission (CSLC) which convey BLM lands suitable for, or developed as, large-scale renewable energy related projects in exchange for CSLC school lands located in and adjacent to designated conservation areas. These exchanges will follow the procedures outlined in Memorandum of Agreement Relating to Land Exchanges to Consolidate Land Parcels signed by the BLM and CSLC on May 21, 2012.	Not applicable		The project would not engage or interfere with a State land exchange.		
	LUPA-LANDS-10	Prioritize land exchange proposals from the CSLC on available lands if there are competing land tenure proposals (e.g., land sale or exchange), CSLC proposals that enhance revenues for schools will generally be given priority.	Not applicable		The project would not engage or interfere with a State land exchange.		
Livestock Grazing	**LUPA-LIVE-1**	Adopt the Standards of Rangeland Health and Guidelines for Grazing Management, as detailed below, for the CDCA. This CMA does not apply in the Bishop and Bakersfield RMPs. (detailed standards omitted - CMA does not apply)	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
LUPA-Wide Conservation and Management Actions for Livestock Grazing	**LUPA-LIVE-2**	In the CDCA only, accept grazing permit/lease donations in accordance with legislation in the Fiscal Year 2012 Appropriations Act (Public Law 112-74).	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	LUPA-LIVE-3	In the Bishop and Bakersfield RMPs, determine whether continued livestock grazing would be compatible with achieving land use plan management goals and objectives in the event that the permit/lease is relinquished.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	LUPA-LIVE-4	If the BLM determines that the grazing allotment is to be put to a different public purpose than grazing, follow the notification requirements outline in the Grazing Regulations at 43 CFR 4110.4-2(b) and BLM Instruction Memorandum (IM) 2011-181 (BLM 2011), or future policy replacing IM 2011-181.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	LUPA-LIVE-5	For grazing allotments within the CDCA that BLM has received a voluntary request for relinquishment prior to fiscal year 2012, continue the planning process for making these allotments unavailable for grazing.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	LUPA-LIVE-6	Complete the process for approving rangeland health standards and guidelines for the CDCA Plan (NEMO, WEMO, NECO and PSSCRMP).	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	LUPA-LIVE-7	Make Pilot Knob, Valley View, Cady Mountain, Cronese Lake, and Harper Lake allotments, allocations unavailable for livestock grazing and change to management for wildlife conservation and ecosystem function. Reallocate the forage previously allocated to grazing use in these allotments to wildlife and ecosystem functions. Pilot Knob was closed in the WEMO plan amendment. The Cronese Lake, Harper Lake, and Cady Mountain allotments were closed as mitigation for the impacts to the Agassiz's desert tortoise resulting from the Fort Irwin expansion. All forage allocated to livestock grazing in these allotments will be reallocated to wildlife use and ecosystem function.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	LUPA-LIVE-8	The following vacant grazing allotments within the CDCA will have all vegetation previously allocated to grazing use reallocated to wildlife use and ecosystem functions and will be closed and unavailable to future livestock grazing: Buckhorn Canyon, Crescent Peak, Double Mountain, Jean Lake, Johnson Valley, Kessler Springs, Oak Creek, Chemehuevi Valley, and Piute Valley.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	LUPA-LIVE-9	Allocate the forage that was allocated to livestock use in the Lava Mountain and Walker Pass Desert allotments (which have already been relinquished under the 2012 Appropriations Act) to wildlife use and ecosystem function and permanently eliminate livestock grazing on the allotments.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
Minerals	**LUPA-MIN-1**	High Potential Mineral Areas (identified in CA GEM data) · These areas have been identified as mineral lands having existing and/or historic mining activity and a reasonable probability of future mineral resource development. These identified areas will be designated as mineral land polygons on DRECP maps, recognized as probable future development areas for planning purposes and allowable use areas. · If an activity is proposed in a High Potential Mineral Area, analyze and consider the mineral resource value in the NEPA analysis.	Not applicable		The project is not in an area identified as a High Potential Mineral Area.		
	LUPA-MIN-2	Existing authorized mineral/energy operations, including existing authorizations, modifications, extensions and amendments and their required terms and conditions, are designated as an allowable use within all BLM lands in the LUPA Decision Area, and unpatented mining claims subject to valid existing rights. Amendments and expansions authorized after the signing of the DRECP LUPA ROD are subject to applicable CMAs, including ground disturbance caps within Ecological and Cultural Conservation Areas, subject to valid existing rights, subject to governing laws and regulations.	Not applicable		Mineral resources are not present on the project site or affected by the project.		
	LUPA-MIN-3	Existing High Priority Mineral/Energy Operations Exclusion Areas · Existing high-priority operation footprints and their identified expansion areas are excluded from DFA and conservation CMAs, but must comply with LUPA-wide CMAs subject to the governing laws and regulations. · High priority operation exclusions are referenced by name with their respective footprint (acreage) below. o MolyCorp REE (General Legal Description: 35º 26'N; 115º 29'W)—10,490.9 surface acres o Briggs Au, Etna (General Legal Description: 35º 56'N; 117º 11'W)—3,216.9 surface acres o Cadiz Evaporites (General Legal Description: 34º 17'N; 115º 23'W)—2,591.5 surface acres o Searles Dry Lake (Evaporate) Operation (General Legal Description: 35º 43'N; 117º 19'W)—72,000 surface acres o Bristol Dry Lake (Evaporate) Operation (General Legal Description: 34º 29'N; 115º 43'W)—3,500 surface acres o Mesquite Gold Mine (General Legal Description: 33º 04'N; 114º 59'W)—4,500 surface acres o Hector Mine (Hectorite Clay) (General Legal Description: 34º 45'N; 116º 25'W)—1,500 surface acres o Castle Mountain/Viceroy Mine (Gold) (General Legal Description: 35º 17'N; 115º 3'W)—5,000 surface acres	Not applicable		Mineral resources are not present on the project site or affected by the project.		
	LUPA-MIN-4	Access to Existing Operations · Established designated, approved, or authorized access routes to the aforementioned existing authorized operations and areas will be designated as allowable uses. · Access routes to Plans of Operations and Notices approved under 43 CFR 3809 will be granted subject to valid existing rights listed in 43 CFR 3809.100	Not applicable		Mineral resources are not present on the project site or affected by the project.		
	LUPA-MIN-5	Areas Located Outside Identified Mineral Areas. Areas which could not be characterized due to insufficient data and mineral potential may fluctuate dependent on market economy, extraction technology, and other geologic information- requiring periodic updating. Authorizations are subject to the governing laws and regulations and LUPA requirements.	Applicable	Consistent	The Project is in an area located outside an identified mineral area. However, authorization would be subject to the BLM and would adhere to all governing laws, regulations and LUPA requirements.		
	LUPA-MIN-6	New or expanded mineral operations will be evaluated on a case-by-case basis, and authorizations are subject to LUPA requirements, and the governing laws and regulations.	Not applicable		Mineral resources are not present on the project site or affected by the project.		
National Recreation Trails	**LUPA-NRT-1**	The Nadeau Road NRT was designated by the Secretary of the Interior in June 2013. The California Desert District nominates the Sperry Wash Road, El Mirage Interpretive Trail East, and El Mirage Interpretive Trail West for NRT designation.	Not applicable		The Proposed Action is not located near any trail designated with a NRT designation.		
	LUPA-NRT-2	The Nadeau NRT Management Corridor will be protected and activities impacting use and enjoyment of the trail will be avoided within 0.5 mile from centerline of the route.	Not applicable		The Proposed Action is not located near the Nadeau Road NRT.		
Paleontology	**LUPA-PALEO-1**	If not previously available, prepare paleontological sensitivity maps consistent with the Potential Fossil Yield Classification for activities prior to NEPA analysis.	Applicable	Consistent	The Paleontological Resources Technical Report assessed the Project area for paleontological sensitivity based on the PFYC system by comparing PFYC definitions to mapped geologic units.		
	LUPA-PALEO-2	Incorporate all guidance provided by the Paleontological Resources Protection Act.	Applicable	Consistent	The BLM has incorporated PRPA guidance into EIS		
	LUPA-PALEO-3	Ensure proper data recovery of significant paleontological resources where adverse impacts cannot be avoided or otherwise mitigated.	Applicable	Inconsistent	No data recovery for adverse paleontological resources impacts proposed; impacts may be unavoidable.	Consistent	No adverse effects to paleontological resources would occur with the implementation of Mitigation Measures PALEO-1 through -3.
	LUPA-PALEO-4	Paleontological surveys and construction monitors are required for ground disturbing activities that require an EIS.	Applicable	Inconsistent	Surveys were conducted; however, no construction monitors have been proposed.	Consistent	According to Mitigation Measure PALEO-1, all ground disturbing activities shall be monitored by a BLM-approved paleontologist.
Recreation and Visitor Services	**LUPA-REC-1**	Maintain, and where possible enhance, the recreation setting characteristics – physical components of remoteness, naturalness and facilities; social components of contact, group size and evidence of use; and operational components of access, visitor services and management controls.	Not applicable		Project site located in a DFA and is not located within a designated resource area.		
	LUPA-REC-2	Cooperate with the network of communities and recreation service providers active within the planning area to protect the principal recreation activities and opportunities, and the associated conditions for quality recreation, by enhancing appropriate visitor services, and by identifying and mitigating impacts from development, inconsistent land uses and unsustainable recreation practices such as minimizing impacts to known rockhounding gathering areas.	Applicable	Consistent	There are no recreational resources in the project area and implementation of mitigation measures REC-1 and REC-2 would minimize effects on surrounding recreational resources.		
	LUPA-REC-3	Manage lands not designated as SRMAs or ERMAs to meet recreation and visitor services and resource stewardship needs as described in Resource Management Plans (RMPs).	Applicable	Consistent	There are no recreational resources in the project area and implementation of mitigation measures REC-1 and REC-2 would minimize effects on surrounding recreational resources.		
	LUPA-REC-4	Prohibit activities that have a significant adverse impact and that do not enhance conservation or recreation values within one mile of Level 1 and Level 2 Recreation facility footprint.	Not applicable		Within 0.5-miles of the Project Area, only Mule Mountains ACEC and Chuckwalla Valley Dune Thicket ACEC are designated recreational areas; however, these are not considered Level 1 or 2 Recreational Facilities.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
	LUPA-REC-5	Avoid activities that have a significant adverse impact and that do not enhance conservation or recreation values within one-half mile of Level 3 Recreation facility footprint including route access and staging areas. If avoidance is not practicable, the facility must be relocated to the same or higher recreation standard and maintain recreation objectives and setting characteristics.	Not applicable		The project is not in a SRMA or ERMA or Level 1, 2, and 3 Recreation Facilities. Within 0.5-miles of the Project Area, only Mule Mountains ACEC and Chuckwalla Valley Dune Thicket ACEC are designated recreational areas; however, these are not considered Level 3 Recreational Facilities.		
	LUPA-REC-6	Limit signage to that necessary for recreation facility/area identification, interpretation, education and safety/regulatory enforcement.	Not applicable		The Proposed Action area doesn't include any recreational facilities or resources and doesn't propose any signage for recreational facilities.		
	LUPA-REC-7	Refer to local RMPs, RMP amendments, and activity level planning for specially designated areas for Vehicular Stopping, Parking, and Camping limitations.	Not applicable		The Proposed Action is not located in a RMP planning area.		
	LUPA-REC-8	Provide on-going maintenance of recreation and conservation facilities, interpretive and regulatory signs, roads, and trails.	Applicable	Consistent	The project site would include an existing paved Powerline road but would maintain the road area for project use.		
Soil and Water General	**LUPA-SW-1**	Stipulations or conditions of approval for any activity will be imposed that provide appropriate protective measures to protect the quantity and quality of all water resources (including ephemeral, intermittent, and perennial water bodies) and any associated riparian habitat (see biological CMAs for specific riparian habitat CMAs). The water resources to which this CMA applies will be identified through the activity-specific NEPA analysis.	Applicable	Consistent	The proposed improvements would be consistent with LUPA-BIO-9 and BRTR Measures BIO-4, BIO-16 through 19, and BIO 56 to ensure that drainage control features are incorporated into the project design to limit erosion and other adverse effects associated with storm water runoff. The SWPPP developed for the site would include post-construction measures to manage storm water such as detention basins, if deemed appropriate, and otherwise minimizing changes to existing drainage patterns to allow for natural storm water flow through the site to the extent feasible.		
	LUPA-SW-2	Buffer zones, setbacks, and activity limitations specifically for soil and water (ground and surface) resources will be determined on an activity/site-specific basis through the environmental review process, and will be consistent with the soil and water resource goals and objectives to protect these resources. Specific requirements, such as buffer zones and setbacks, may be based, in part, on the results of the Water Supply Assessment defined below. In general, placement of long-term facilities within buffers or protected zones for soil and water resources is discouraged, but may be permitted if soil and water resource management objectives can be maintained.	Not applicable		There are no identified soil and water resources on the site that require a buffer zone, setback, or limitation on activities.		
	LUPA-SW-3	Where a seeming conflict between CMAs within or between resources arises, the CMA(s) resulting in the most resource protection apply.	Not applicable		No CMA conflicts with the project.		
	LUPA-SW-4	Nothing in the “Exceptions” below applies to or takes precedence over any of the CMAs for biological resources.	Not applicable		See consistency with CMAs below.		
Groundwater Resources	**LUPA-SW-5**	Exceptions to any of the specific soil and water stipulations contained in this section, as well as those listed below under the subheadings “Soil Resources,” “Surface Water,” and “Groundwater Resources,” may be granted by the authorized officer if the applicant submits a plan, or, for BLM-initiated actions, the BLM provides documentation, that demonstrates: · The impacts are minimal (e.g., no predicted aquifer drawdown beyond existing annual variability in basins where cumulative groundwater use is not above perennial yield and water tables are not currently trending downward) or can be adequately mitigated.	Not applicable		See consistency with CMAs below.		
Soil Resources	**LUPA-SW-6**	In addition to the applicable required governmental safeguards, third party activities will implement up-to-date standard industry construction practices to prevent toxic substances from leaching into the soil.	Applicable	Consistent	Project will implement a SWPPP-equivalent plan which would include post-construction BMPs that would include appropriate handling of the relatively minor toxic substances used on site.		
	LUPA-SW-7	Prepare an emergency response plan, approved by the BLM contaminant remediation specialist, that ensures rapid response in the event of spills of toxic substances over soils.	Applicable	Consistent	Implementation of BRTR Measures BIO-4, BIO-16-19, and BIO-56 would ensure that hazardous materials are managed in a manner that minimizes releases and provides means to address any spills should they occur.		
	LUPA-SW-8	As determined necessary on an activity specific basis, prepare a site plan specific to major soil types present (≥5% of footprint or laydown surfaces) in Wind Erodibility Groups 1 and 2 and in Hydrology Soil Class D as defined by the USDA Natural Resource Conservation Service to minimize water and air erosion from disturbed soils on activity sites.	Applicable	Consistent	Project will implement a SWPPP-equivalent plan which would include erosion control BMPs that would minimize the potential for wind or water erosion on site.		
	LUPA-SW-9	The extent of desert pavement within the proposed boundary of an activity shall be mapped if it is anticipated that the activity may create erosional or ecologic impacts. Mapping will use the best available data and standards, as determined by BLM. Disturbance of desert pavement within the boundary of an activity shall be limited to the extent possible. If disturbance from an activity is likely to exceed 10% of the desert pavement mapped within the activity boundary, the BLM will determine whether the erosional and ecologic impacts of exceeding the 10% cap by the proposed amount would be insignificant and/or whether the activity should be redesigned to minimize desert pavement disturbance.	Not applicable		Desert pavement is only located on the eastern edge of the project site and would not exceed the disturbance threshold of the desert pavement.		
	LUPA-SW-10	The extent of additional sensitive soil areas (cryptobiotic soil crusts, hydric soils, highly corrosive soils, expansive soils, and soils at severe risk of erosion) shall be mapped if it is anticipated that an activity will impact these resources. To the extent possible, avoid disturbance of desert biologically intact soil crusts, and soils highly susceptible to wind and water erosion.	Applicable	Consistent	Improvements would be designed to be consistent with the California Building Code which would include recommendations to address any geotechnical hazards including highly corrosive soils, expansive soils, and soils at severe risk of erosion.		
	LUPA-SW-11	Where possible, side casting shall be avoided where road construction requires cut- and-fill procedures.	Not applicable		Cut and fill for road construction not part of project.		

LUPA Wide

Category	CMA #	CMA Text	Project Applicability	Project Consistency	Explanation	Project Consistency with Mitigation and/or Alternatives	Explanation
Surface Water	**LUPA-SW-12**	Except in DFAs, exclude long-term structures in, playas (dry lake beds), and Wild and Scenic River corridors, except as allowed with minor incursions (see definition in the Glossary of Terms).	Not applicable		Not located in playas or river corridors.		
	LUPA-SW-13	BLM will manage all riparian areas to be maintained at, or brought to, proper functioning condition.	Applicable	Inconsistent	The Project would result in the loss or alteration of approximately 90.6 acres of unvegetated ephemeral washes and 1.2 acres of riparian microphyll woodland habitat (blue palo verde–ironwood woodland)	Consistent	Mitigation Measure BIO-19 includes required measures to avoid, minimize and mitigate for direct and indirect impacts to riparian vegetation (microphyll woodlands) and ephemeral washes and riparian habitat.
	LUPA-SW-14	All relevant requirements of Executive Orders 11988 (Floodplain Management) and 11990 (Protection of Wetlands) will be complied with.	Not applicable		Project site is not within a flood zone.		
	LUPA-SW-15	Surface water diversion for beneficial use will not occur absent a state water right.	Not applicable		No surface water diversion on the site.		
	LUPA-SW-16	The 100-year floodplain boundaries for any surface water feature in the vicinity of the project will be identified. If maps are not available from the Federal Emergency Management Agency (FEMA), these boundaries will be determined via hydrologic modeling and analysis as part of the environmental review process. Construction within, or alteration of, 100-year floodplains will be avoided where possible, and permitted only when all required permits from other agencies are obtained.	Not applicable		Not located within 100-year flood zone.		
Groundwater	**LUPA-SW-17**	An activity's groundwater extraction shall not contribute to exceeding the estimated perennial yield for the basin in which the extraction is taking place. Perennial yield is that quantity of groundwater that can be withdrawn from the groundwater basin without exceeding the long-term recharge of the basin or unreasonably affecting the basin's physical, chemical, or biological integrity. It is further clarified arithmetically below.	Applicable	Consistent	According to the Water Demand Analysis for the project, the project demand is relatively small.		
	LUPA-SW-18	Water extracted or consumptively used for the construction, operation, maintenance, or remediation of the project shall be solely for the beneficial use of the project or its associated mitigation and remediation measures, as specified in approved plans and permits.	Applicable	Consistent	Water would primarily be used for the beneficial purposes of dust suppression during construction and during operation only for occasional panel washing.		
	LUPA-SW-19	Water flow meters shall be installed on all extraction wells permitted by BLM.	Applicable	Consistent	The project may construct an on-site well or obtain water from other resources. If constructed on-site, it would adhere to BLM requirements.		
	LUPA-SW-20	After application of applicable avoidance and minimization measures, all remaining unavoidable residual impacts to surface waters from the proposed activity shall be mitigated to ensure no net loss of function and value, as determined by the BLM.	Applicable	Consistent	Implementation of the SWPPP would include post construction BMPs to minimize potential residual impacts to surface waters.		
	LUPA-SW-21	Consideration shall be given to design alternatives that maintain the existing hydrology of the site or redirect excess flows created by hardscapes and reduced permeability from surface waters to areas where they will dissipate by percolation into the landscape.	Applicable	Consistent	Project would be designed to maintain drainage patterns as close as possible to existing conditions.		
	LUPA-SW-22	All hydrologic alterations shall be avoided that could reduce water quality or quantity for all applicable beneficial uses associated with the hydrologic unit in the project area, or specific mitigation measures shall be implemented that will minimize unavoidable water quality or quantity impacts, as determined by BLM in coordination with USFWS, CDFW, and other agencies, as appropriate. These beneficial uses may include municipal, domestic, or agricultural water supply; groundwater recharge; surface water replenishment; recreation; water quality enhancement; flood peak attenuation or flood water storage; and wildlife habitat.	Applicable	Consistent	Site will remain largely pervious and drainage will continue as overland flow relatively similar to existing conditions. The proposed improvements would be consistent with LUPA-BIO-9 and BRTR Measures BIO-4, BIO-16 through 19, and BIO 56 to ensure that drainage control features are incorporated into the project design to limit erosion and other adverse effects associated with storm water runoff.		
	LUPA-SW-23	A Water (Groundwater) Supply Assessment shall be prepared in conjunction with the activity's NEPA analysis and prior to an approval or authorization. This assessment must be approved by the BLM in coordination with USFWS, CDFW, and other agencies, as appropriate, prior to the development, extraction, injection, or consumptive use of any water resource. The purpose of the Water Supply Assessment is to determine whether over-use or over-draft conditions exist within the project basin(s), and whether the project creates or exacerbates these conditions. The Assessment shall include an evaluation of existing extractions, water rights, and management plans for the water supply in the basin(s) (i.e., cumulative impacts), and whether these cumulative impacts (including the proposed project) can maintain existing land uses as well as existing aquatic, riparian, and other water-dependent resources within the basin(s). This assessment shall identify: · All relevant groundwater basins or sub-basins and their relationships. · All known aquifers in the basin(s), including their dimensions, whether confined or unconfined, estimated hydraulic conductivity and transmissivity, groundwater surface elevations, and direction and movement of groundwater. · All surface water basin(s) related to water runoff, delivery, and supply, if different from the groundwater basin(s). · All sites of surface outflow (springs or seeps) contained within the basin(s), including historic sites. · All other surface water bodies in the basins(s), including rivers, streams, ephemeral washes/drainages, lakes, wetlands, playas, and floodplains. · The water requirements of the proposed project and the source(s) of that water. · An analysis demonstrating that water of sufficient quantity and quality is available from identified source(s) for the life of the project. · An analysis of potential project-related impacts on water quality and quantity needed for beneficial uses, reserved water rights, existing groundwater users, or habitat management within or down gradient of the groundwater basin within which the project would be constructed. · The above analyses shall be in the form of a numerical groundwater model. The model extent shall encompass the groundwater basin within which the project would be constructed, and any groundwater-dependent resources within or down gradient of that basin.	Applicable	Consistent	A Water Supply Assessment was completed for the project.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
		The primary product of the Water Supply Assessment shall be a baseline water budget, which shall be established based on the best-available data and hydrologic methods for the identified basin(s). This water budget shall classify and describe all water inflow and outflow to the identified basin(s) or system using best-available science and the following basic hydrologic formula or a derivation: P – R – E – T – G = ΔS where P is precipitation and all other water inflow or return flow, R is surface runoff or outflow, E is evaporation, T is transpiration, G is groundwater outflow (including consumptive component of existing pumping), and ΔS is the change in storage. The volumes in this calculation shall be in units of either acre-feet per year or gallons per year. The water budget shall quantify the existing perennial yield of the basin(s). Perennial yield is defined arithmetically as that amount such that ρ – R – E – T – G is greater than or equal to 0 Water use by groundwater-dependent resources is implicitly included in the definition of perennial yield. For example, in many basins the transpiration component (T) includes water use by groundwater-dependent vegetation. Similarly, groundwater outflow (G) includes discharge to streams, springs, seeps, and wetlands. If one or more budget components is altered, then one or more of the remaining components must change for the hydrologic balance to be maintained. For example, an increase in the consumptive component of groundwater pumping can lower the water table and reduce transpiration by groundwater-dependent vegetation. The groundwater that had been utilized by the groundwater-dependent vegetation would then be considered "captured" by groundwater pumping. Similarly, increased groundwater consumption can capture groundwater that discharges to streams, springs, seeps, wetlands and playas. These changes can occur slowly over time, and may require years or decades before the budget components are fully adjusted. Accordingly, the water/groundwater supply assessment requires that the best-available data and hydrologic methods be employed to quantify these budgets, and that groundwater consumption effects on groundwater-dependent ecosystems be identified and addressed. The Water Supply Assessment shall also address: · Estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the basin(s), including the project, for the life of the project through the decommissioning phase · Potential to cause subsidence and loss of aquifer storage capacity due to groundwater pumping · Potential to cause injury to other water rights, water uses, and land owners · Changes in water quality and quantity that affect other beneficial uses · Effects on groundwater dependent vegetation and groundwater discharge to surface water resources such as streams, springs, seeps, wetlands, and playas that could impact biological resources, habitat, or are culturally important to Native Americans · Additional field work that may be required, such as an aquifer test, to evaluate site specific project pumping impacts and if necessary, establish trigger points that can be used for a Groundwater Water Monitoring and Mitigation Plan · The mitigation measures required, if there are significant or potentially significant impacts on water resources include but are not limited to, the use of specific technologies, management practices, retirement of active water rights, development of a recycled water supply, or water imports ● Estimates of the total cone of depression considering cumulative drawdown from all potential pumping in the basin(s), including the project, for the life of the project through the decommissioning phase					
	LUPA-SW-24	A Groundwater Monitoring and Reporting Plan, and Mitigation Action Plan shall be prepared to verify the Water Supply Assessment and adaptively manage water use as part of project operations. This plan shall be approved by BLM, in coordination with USFWS, CDFW, and other agencies as appropriate, prior to the development, extraction, injection, or consumptive use of any water resource. The quality and quantity of all surface water and groundwater used for the project shall be monitored and reported using this plan. Groundwater monitoring includes measuring the effects of a project's groundwater extraction on groundwater surface elevations, groundwater flow paths, changes to groundwater-dependent vegetation, and of aquifer recovery after project decommissioning. Surface water monitoring, if applicable, shall monitor for changes in the flows, water volumes, channel characteristics, and water quality as a result of a project's surface water use. Monitoring frequency and geographic scope and reporting frequency shall be decided on a project and site-specific basis and in coordination with the appropriate agencies that manage the water and land resources of the region. The geographic scope may include at the very least, all basins/sub-basins that potentially receive inflow from the basin where the proposed project may be sited, and all basins/sub-basins that may potentially contribute inflow to the basin where the proposed project is located. The plan shall also detail any mitigation measures that may be required as a result of the project. This plan and all monitoring results shall be made available to BLM. BLM will make the plan and results available to USFWS, CDFW, and other applicable agencies.	Applicable	Inconsistent	No monitoring or mititgation included in proposed action.	Consistent	Mitigation Measures WAT-1 and WAT-2 would ensure that approved uses of groundwater are not adversely affected.
	LUPA-SW-25	Where groundwater extraction, in conjunction with other cumulative impacts in the basin, has potential to exceed the basin's perennial yield or to impact water resources, one or more "trigger points," or specified groundwater elevations in specific wells or surface water bodies, shall be established by BLM. If the groundwater elevation at the designated monitoring wells falls below the trigger point(s)(or exceeds the trigger pumping rate), additional mitigation measures, potentially including cessation of pumping, will be imposed.	Applicable	Inconsistent	No monitoring or mititgation included in proposed action.	Consistent	Mitigation Measures WAT-1 and WAT-2 would ensure that approved uses of groundwater are not adversely affected.

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
	LUPA-SW-26	Groundwater pumping mitigation shall be imposed if groundwater monitoring data indicate impacts on water-dependent resources that exceed those anticipated and otherwise mitigated for in the NEPA analysis and ROD, even if the basin's perennial yield is not exceeded. Water-dependent resources include riparian or phreatophytic vegetation, springs, seeps, streams, and other approved domestic or industrial uses of groundwater. Mitigation measures may include changes to pumping rates, volume, or timing of water withdrawals; coordinating and scheduling groundwater pumping activities in conjunction with other users in the basin; acquisition of project water from outside the basin; and/or replenishing the groundwater resource over a reasonably short timeframe. For permitted activities, permittees may also be required to contribute funds to basin-wide groundwater monitoring networks in basins such as those encompassed by the East Riverside DFA or in the Calvada Springs/South Pahrump Valley area, and to cooperate in the compilation and analysis of groundwater data.	Applicable	Inconsistent	No monitoring or mititgation included in proposed action.	Consistent	Mitigation Measures WAT-1 and WAT-2 would ensure that approved uses of groundwater are not adversely affected.
	LUPA-SW-27	Water-conservation measures shall be required in basins where current groundwater demand is high and has the future potential to rise above the estimated perennial yield (e.g., Pahrump Valley). These measures may include the use of specific technology, management practices, or both. A detailed discussion and analysis of the effectiveness of mitigation measures must be included. Application of these measures shall be detailed in the Groundwater Water Monitoring and Mitigation Plan.	Applicable	Inconsistent	No monitoring or mititgation included in proposed action.	Consistent	Mitigation Measures WAT-1 and WAT-2 would ensure that approved uses of groundwater are not adversely affected.
	LUPA-SW-28	Groundwater extractions from adjudicated basins, such as the Mojave River Basin, may be subject to additional restrictions imposed by the designated authority; examples include the Mojave Water Agency and San Bernardino County (see County Ordinance 3872). Where provisions of the adjudication allow for acquisition of water rights, project developers could be required to retire water rights at least equal in volume to those necessary for project operation or propose an alternative offset based on the conditions unique to the adjudicated basin.	Not Applicable		The groundwater basins are not adjudicated.		
	LUPA-SW-29	Groundwater pumping mitigation may be imposed if monitoring data indicate impacts on groundwater or groundwater-dependent habitats outside the DRECP area, including those across the border in Nevada. See **LUPA-SW-26** for potential mitigation measures.	Not Applicable		The project would not result in impacts on groundwater or groundwater-dependent habitats outside the DRECP area.		
	LUPA-SW-30	Activities shall comply with local requirements for any long term or short term domestic water use and wastewater treatment.	Applicable	Consistent	The proposed project does not include domestic facilities and would thus not include domestic water use. As detailed in Section 3.17, Utilities, the project would comply with local wastewater treatment requirements.		
	LUPA-SW-31	The siting, construction, operation, maintenance, remediation, and abandonment of all wells shall conform to specifications contained in the California Department of Water Resources Bulletins #74-81 and #74-90 and their updates.	Applicable	Consistent	The Project is required to comply with California Department of Water Resources Bulletins #74-81 and #74-90 and their updates.		
	LUPA-SW-32	Colorado River hydrologic basin - The concepts, principles and general methodology used in the Colorado River Accounting Surface Method, as defined in U.S. Geological Survey Scientific Investigations Report 2008-5113 (USGS 2009), and existing and future updates or a similar methodology, are considered the best available data for assessing activity/project related ground water impacts in the Colorado River hydrologic basin. The best available data and methodology shall be used to determine whether activity/project-related pumping would result in the extracted water being replaced by water drawn from the Colorado River. If activity/project-related groundwater pumping results in the static groundwater level at the well being near (within 1 foot), equal to, or below the Accounting Surface in a basin hydrologically connected to the Colorado River, that consumption shall be considered subject to the Law of the River (Colorado River Compact of 1922 and amendments). In such circumstances, BLM shall require the applicant to offset or otherwise mitigate the volume of water causing drawdown below the Accounting Surface. Details of such mitigation measures and the right to the use of water shall be described in the Groundwater Water Monitoring and Mitigation Plan.	Applicable	Consistent	The proposed water supply is expected to come from the Colorado River Hydrologic Region. Impacts to groundwater would be included in Section 3.19, Water Resources.		
Soil, Water, and Water-Dependent Resources Restricted to Specific Areas on BLM Lands	**LUPA-SW-33**	**Stipulations for groundwater development in the proximity of Devils Hole**: Any development scenario for an activity within 25 miles of Devils Hole shall include a plan to achieve *zero-net* or *net-reduced* groundwater pumping to reduce the risk of adversely affecting senior federal reserved water rights, the designated critical habitat of the endangered Devils Hole pupfish, and the free-flowing requirements of the Wild and Scenic Armargosa River. This plan will require operators to acquire one or more minimization water rights (MWRs) in the over-appropriated, over-pumped, and hydraulically connected Amargosa Desert Hydrographic Basin in Nevada. The MWR(s) shall be: (1) an amount equal (at minimum) to that which is needed for construction and operations; (2) historically fully utilized, preferably for agricultural use; and (3) senior and closer to Devils Hole than the proposed point of diversion.	Not applicable		The project site is not located within 25 miles of Devil's Hole.		
	LUPA-SW-34	**Stipulations for groundwater development in the Calvada Springs/South Pahrump Valley area:** Activities in this area shall be required to acquire one or more MWRs in the Pahrump Valley Hydrographic Basin in Nevada. The acquired MWR(s) must: (1) be at least equal to the amount proposed to be required and actually used for project construction and operations; and (2) be fully utilized for at least the prior ten years.	Not applicable		The project site is not located in the Calvada Springs/South Pahrump Valley area.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
	LUPA-SW-35	Stipulations for activities in the vicinity of Death Valley National Park, Joshua Tree National Park, or Mojave National Preserve: The NEPA for activities involving groundwater extraction that are in the vicinity of Death Valley National Park, Joshua Tree National Park, or the Mojave National Preserve shall analyze and address any potential impacts of groundwater extraction on Death Valley National Park, Joshua Tree National Park, or Mojave National Preserve. BLM will consult with the National Park Service on this process. The analysis or analyses shall include: · Potential impacts on the water balances of groundwater basins within these parks and preserves · A map identifying all potentially impacted surface water resources in the vicinity of the project, including a narrative discussion of the delineation methods used to discern those surface waters in the field · Any project-related modifications to surface water resources, both temporary and permanent · Analysis of any potential impacts on perennial streams, intermittent streams, and ephemeral drainages that could negatively impact natural riparian buffers · Impacts of any project proposed truncation, realignment, channelization, lining, or filling of surface water resources that could change drainage patterns, reduce available riparian habitat, decrease water storage capacity, or increase water flow velocity or sediment deposition, in particular where storm water diverted around or through the project site is returned to natural drainage systems downslope of the project · Any potential indirect project-related causes of hydrologic changes that could exacerbate flooding, erosion, scouring, or sedimentation in stream channels · Alternatives and mitigation measures proposed to reduce or eliminate such impacts	Not applicable		Project site is not located within the vicinity of Death Valley National Park or Mojave National Preserve. The project site is located 30 miles to the southeast of Joshua Tree National Park.		
Visual Resources Management	**LUPA-VRM-1**	Manage Visual Resources in accordance with the VRM classes shown on Figure 9.	Applicable	Consistent	Most of the Project site is within VRM Class IV, and development of the Project would be consistent with management objectives for Class IV. Mitigation measures require the use of BMPs to minimize contrast.		
	LUPA-VRM-2	Ensure that activities within each of the VRM Class polygons meets the VRM objectives described above, as measured through a visual contrast rating process.	Applicable	Consistent	The visual contrast rating process that was done for the Project measured the potential contrast and determined that the Project would meet the applicable VRM objectives.		
	LUPA-VRM-3	Ensure that transmission facilities are designed and located to meet the VRM Class objectives for the area in which they are located. New transmission lines routed through designated corridors where they do not meet VRM Class Objectives will require RMP amendments to establish a conforming VRM Objective. All reasonable effort must be made to reduce visual contrast of these facilities in order to meet the VRM Class before pursing RMP amendments. This includes changes in routing, using lattice towers (vs. monopole), color treating facilities using an approved color from the BLM Environmental Color Chart CC-001 (dated June 2008, as updated on April 2014, or the most recent version) (vs. galvanized) on towers and support facilities, and employing other BMPs to reduce contrast. Such efforts will be retained even if an RMP amendment is determined to be needed. Visual Resource BMPs that reduce adverse visual contrast will be applied in VRM Class conforming situations. For a reference of BMPs for reducing visual impacts see the "Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands", available at http://www.blm.gov/style/medialib/blm/wo/MINERALS__REALTY__AND_RESOURCE_PROTECTION_/energy/renewable_references.Par.1568.File.dat/RenewableEnergyVisualImpacts_BMPs.pdf, or the most recent version of the document or BMPs for VRM, as determined by BLM.	Applicable	Consistent	The Project transmission facilities would be consistent with management objectives for Class IV. Mitigation measures require the use of BLM-identified BMPs to minimize contrast from transmission facilities.		
Wilderness Characteristics	**LUPA-WC-1**	Complete an inventory of areas for proposed activities that may impact wilderness characteristics if an updated wilderness characteristics inventory is not available.	Not applicable		Wilderness characteristic inventory from DRECP LUPA used.		
	LUPA-WC-2	Employ avoidance measures as described under DFAs and approved transmission corridors.	Not applicable		There are no identified wilderness protection areas within the RE Crimson Permitting Boundary.		
	LUPA-WC-3	For inventoried lands found to have wilderness characteristics but not managed for those characteristics compensatory mitigation is required if wilderness characteristics are directly impacted. The compensation will be: · 2:1 ratio for impacts from any activities that impact those wilderness characteristics, except in DFAs and transmission corridors · 1:1 ratio for impact from any activities that impact the wilderness characteristics in DFAs and transmission corridors Wilderness compensatory mitigation may be accomplished through acquisition and donation, by willing landowners, to the federal government of (a) wilderness inholdings, (b) wilderness edge holdings that have inventoried wilderness characteristics, or (c) other areas within the LUPA Decision Area that are managed to protect wilderness characteristics. Restoration of impaired wilderness characteristics in Wilderness, Wilderness Study Area, and lands managed to protect wilderness characteristics could be substituted for acquisition.	Not applicable		There are no identified wilderness protection areas within the RE Crimson Permitting Boundary.		
	LUPA-WC-4	For areas identified to be managed to protect wilderness characteristics, identified in Figure 7, the following CMAs are required: · Include a no surface occupancy stipulation for any leasable minerals with no exceptions, waivers, or modifications. · Exclude these areas from land use authorizations, including transmission. · Close areas to construction of new roads and routes. Vehicles will continue to be permitted on existing designated routes. · Close areas to mineral material sales. · Prohibit commercial or personal-use permits for extraction of materials (e. g. no wood-cutting permits). · Manage the area as VRM II. · Require that new structures and facilities are related to the protection or enhancement of wilderness characteristics or are necessary for the management of uses allowed under the land use plan. · Make lands unavailable for disposal from federal ownership.	Not applicable		Based on review of Figure 7 in the LUPA of the DRECP, there are no identified wilderness characteristic areas within the RE Crimson Permitting Boundary.		

LUPA Wide							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
	LUPA-WC-5	Manage the following Wilderness Inventory Units to protect wilderness characteristics: 132A-2 / 132A-3 / 132B / 136 / 136-1 / 145-1-1 / 145-2-1 / 145-3-1 / 149-2 / 150-2-2 / 158-1 / 158-2 / 159 / 159-1 / 159A-1 / 160 / 160-1 / 160B-2A / 160B-2B / 160B-2F / 160B-3A / 160B-4A / 160B-3B / 160B-4B / 170-1 / 170-3 / 193-1 / 206-1-1 / 206-1-2 / 206-1-3 / 206-1-4 / 222-2-1 / 251-1 / 251-1-1 / 251-1-2 / 251-2-2 / 251-3 / 251A / 252 / 259-1 / 259-2 / 266-1 / 276-1 / 276-3 / 277 / 277A-1 / 278 / 280 / 294-1 / 294-2 / 295 / 295A / 304-2 / 305-1 / 305-2 / 307-1 / 307-2 / 307-1-1 / 307-1-2 / 307-1-3 / 312-1 / 312-2 / 312-3 / 322-1 / 325-1 / 325-2 / 325-3 / 325-4 / 325-5 / 325-7 / 325-8 / 315-14 / 325-17 / 329 / 352-2 / 352A / 352A-1 / 354 / 355-1 / 355-2 / 355-3	Not applicable		Based on review of Figure 7 in the LUPA of the DRECP, there are no identified wilderness characteristic areas within the RE Crimson Permitting Boundary.		

DFAs and VPLs							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
Biological Resources: North American Warm Desert Dune and Sand Flats	**DFA-VPL-BIO-DUNE-1**	Activities in DFAs and VPLs, including transmission substations, will be sited to avoid dune vegetation (i.e., North American Warm Desert Dune and Sand Flats). Unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms) to dune vegetation will be limited to transmission projects, except transmission substations, and access roads that will be sited to minimize unavoidable impacts. · For unavoidable impacts (see "unavoidable impacts to resources" in the Glossary of Terms) to dune vegetation, the following will be required: o Access roads will be unpaved. o Access roads will be designed and constructed to be at grade with the ground surface to avoid inhibiting sand transportation.	Applicable	Consistent	Crimson Permitting Boundary was designed to avoid active sand dunes to reduce Mojave fringe-toed lizard impacts but some dune habitat would be impacted. Consistent with BRTR Measures BIO-47 and BIO-48 (which says impacts to dune habitat associated with Mojave fringe-toed lizards will be minimized or compensated for via mitigation). All new access roads within the RE Crimson Permitting Boundary will be unpaved. BRTR Measure BIO-47 (roads will be kept at grade to avoid blocking sand transport).		
	DFA-VPL-BIO-DUNE-2	Within Aeolian corridors that transport sand to dune formations and vegetation types downwind inside and outside of the DFAs, all activities will be designed and operated to facilitate the flow of sand across activity sites, and avoid the trapping or diverting of sand from the Aeolian corridor. Buildings and structures within the site will take into account the direction of sand flow and, to the extent feasible, build and align structures to allow sand to flow through the site unimpeded. Fences will be designed to allow sand to flow through and not be trapped.	Applicable	Inconsistent	A sand transport study concluded the Project could impact sand transport and mitigation could be necessary.	Consistent	The design of Alternative C has minimized impacts on the sand transport corridor.
Individual Focus Species (IFS): Desert Tortoise	**DFA-VPL-BIO-IFS-1**	To the maximum extent practicable (see Glossary of Terms), activities will be sited in previously disturbed areas, areas of low quality habitat, and areas with low habitat intactness in desert tortoise linkages and the Ord-Rodman TCA, identified in Appendix D.	Applicable	Consistent	Since the project site is not mountainous, the RE Crimson Project is sited in an area that is low quality desert tortoise habitat. The RE Crimson Project is not located within the Ord-Rodman TCA.		
Mohave Ground Squirrel	**DFA-VPL-BIO-IFS-2**	Within the Mohave ground squirrel range configure solar panel and wind turbine arrays to allow areas of native vegetation that will facilitate Mohave ground squirrel movement through the project site. This may include raised and/or rotating solar panels or open space between rows of panels or turbines. Fences surrounding sites should be permeable for Mohave ground squirrels.	Not Applicable		The Mohave ground squirrel was not identified as a species occurring on the project site.		
Bats	**DFA-VPL-BIO-BAT-1**	Wind projects will not be sited within 0.5 mile of any occupied or presumed occupied maternity roost.	Not applicable		The proposed project is not a wind project.		
Fire Prevention/Protection	**DFA-VPL-BIO-FIRE-1**	Implement site-specific fire prevention/protection actions particular to the construction and operation of renewable energy and transmission project that include procedures for reducing fires while minimizing the necessary amount of vegetation clearing, fuel modification, and other construction-related activities. At a minimum these actions will include designating site fire coordinators, providing adequate fire suppression equipment (including in vehicles), and establishing emergency response information relevant to the construction site.	Applicable	Inconsistent	Partially consistent with BRTR Measures BIO-17 (fire suppression equipment) and BIO-36 (emergency response to fires). However, no existing mitigation includes specifically minimizing vegetation clearing or designating a site fire coordinator.	Consistent	Mitigation Measure FIRE-1 addresses these project-specific fire prevention and protection actions.
Biological Compensation	**DFA-VPL-BIO-COMP-1**	Impacts to biological resources from all activities in DFAs and VPLs will be compensated using the same ratios and strategies as LUPA-BIO-COMP-1 through 4, with the exception identified below in DFA-VPL-BIO-COMP-2.	Applicable		See notes for LUPA-BIO-COMP-1 through 4		
	DFA-VPL-BIO-COMP-2	Exception to the biological resources standard compensation ratio of 1:1 - desert tortoise intact linkage habitat compensation ratio of 2:1 applies to the identified modeled intact linkage habitat (Appendix D) in two linkages—Ord-Rodman critical habitat unit to Joshua Tree National Park, and Fremont-Kramer critical habitat unit to the Ord-Rodman critical habitat unit, as identified in Appendix D. Maintenance and enhancement of the function of these two linkages is essential to the function of the Ord-Rodman critical habitat unit.	Not applicable		DFA-VPL-BIO-COMP-2 does not apply to the RE Crimson Solar Project since the Project is not located within the Ord-Rodman critical habitat unit to Joshua Tree National Park, and Fremont-Kramer critical habitat unit to the Ord-Rodman critical habitat unit linkages.		
Comprehensive Trails and Travel Management	**DFA-VPL-CTTM-1**	Avoid Tier 1, Tier 2, Tier 3 roads/primitive roads/trails, Backcountry Byways, and other significant linear features (as defined in the LUPA-wide CMAs). If avoidance is not practicable, relocate access to the same or higher standard and maintain the recreation setting characteristics and access to recreation activities, facilities, and destination.	Not applicable		The Bradshaw Trail Backcountry is located 1.75 miles to the south of the permitting boundary. No other BLM Backcountry Byways or other significant linear features are located in the project area. The project site would include an existing paved Power Line road but would maintain the road area for project use.		
	DFA-VPL-CTTM-2	If residual impacts to Tier 1 and Tier 2 roads/primitive roads/trails, Backcountry Byways, or other significant linear features cannot be protected and maintained, commensurate compensation in the form of an enhanced recreation operations, recreation facilities or opportunities will be required.	Not applicable		See above comment DFA-VPL-CTTM-2		

DFAs and VPLs							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
Cultural Resources and Tribal Interests	**DFA-VPL-CUL-1**	For renewable energy activities and transmission, require the applicant to pay all appropriate costs associated with the following processes, through the appropriate BLM funding mechanism: · All appropriate costs associated with the BLM's analysis of the DRECP geodatabase and other sources for cultural resources sensitivity. · All appropriate costs associated with preliminary sensitivity analysis. · All appropriate costs associated with the Section 106 process including the identification and defining of cultural resources. These costs may also include logistical, travel, and other support costs incurred by tribes in the consultation process. · All appropriate costs associated with updating the DRECP cultural resources geodatabase with project specific results.	Applicable	Consistent			
	DFA-VPL-CUL-2	Consistent and in compliance with the NHPA Programmatic Agreement, signed February 5, 2016, or the most up to date signed version -for renewable energy activities and transmission, a compensatory mitigation fee will be required within the LUPA Decision Area to address cumulative and some indirect adverse effects to historic properties. The mitigation fee will be calculated in a manner that is commensurate to the size and regional impacts of the project. Refer to the Programmatic Agreement for details regarding the mitigation fee.	Not applicable				
	DFA-VPL-CUL-3	For renewable energy activities and transmission, the management fee rate will be determined through the NHPA programmatic Section 106 consultation process that will be completed as part of the DRECP land use plan amendment.	Not applicable				
	DFA-VPL-CUL-4	For renewable energy activities and transmission, demonstrate that results of cultural resources sensitivity, based on the DRECP geodatabase, and other sources, are used as part of the initial planning pre-application process and to select of specific footprints for further consideration.	Applicable	Inconsistent	The Project's POD does not mention a review of the DRECP geodatabase or other sources as a consideration in initial planning	Consistent	Alternative C was designed to avoid adverse effects on eligible cultural resources.
	DFA-VPL-CUL-5	For renewable energy activities and transmission, provide a statistically significant sample survey as part of the pre-application process, unless the BLM determines the DRECP geodatabase and other sources are adequate to assess cultural resources sensitivity of specific footprints.	Applicable	Consistent	A Class III inventory of the direct effects APE was conducted; the inventory consists of a systematic pedestrian survey of the direct effects APE		
	DFA-VPL-CUL-6	For renewable energy activities and transmission, provide justification in the application why the project considerations merit moving forward if the specific footprint lies within an area identified or forecast as sensitive for cultural resources by the BLM.	Applicable	Inconsistent	The Project's POD provides no justification moving forward with the Project though the Project site is sensitive for cultural resource; however, the POD proposes design alternatives that would reduce impacts to potential subsurface archaeological resources.	Consistent	Alternative C was designed to avoid adverse effects on eligible cultural resources.
	DFA-VPL-CUL-7	For renewable energy activities and transmission, complete the NHPA Section 106 Process as specified in 36 CFR Part 800, or via an alternate procedure, allowed for under 36 CFR Part 800.14 prior to issuing a ROD or ROW grant on any utility-scale renewable energy or transmission project. For utility-scale solar energy developments, the BLM may follow the Solar Programmatic Agreement.	Applicable		As described in Chapter 4 of the EIS, the BLM will complete the Section 106 consultation process before issuing a ROD.		
Livestock Grazing	**DFA-VPL-LIVE-1**	Avoid siting solar developments in active livestock grazing allotments. If a ROW is granted for solar development in an active livestock grazing allotment, prior to solar projects being constructed in active livestock allotments, an agreement must be reached with the grazing permittee/lessee on the 2-year notification requirements. If any rangeland improvements such as, but not limited to, fences, corrals, or water storage projects, are to be impacted by energy projects, reach agreement with the BLM and the grazing permittee/lessee on moving or replacing the range improvement. This may include the costs for NEPA, clearances, and materials.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	DFA-VPL-LIVE-2	In California Condor use areas, wind energy ROWs will include a term and condition requiring the permittee and wind operator to eliminate grazing of livestock.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
	DFA-VPL-LIVE-3	Include no surface occupancy stipulation on geothermal leases in active grazing allotments.	Not applicable		There are no grazing allotments on the Project site, and no grazing is proposed.		
Vegetation	**DFA-VPL-VEG-1**	Vegetative Use Authorizations: Commercial collection of seed in DFAs and VPLs is an allowable use. CMA's within these areas apply to this kind of activity.	Not applicable		Commercial collection of seed is not proposed.		

DFAs and VPLs							
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency**	**Explanation**	**Project Consistency with Mitigation and/or Alternatives**	**Explanation**
Visual Resources Management	**DFA-VPL-VRM-1**	Encourage development in a planned fashion within DFAs (e.g., similar to the planned unit development concept used for urban design—i.e., in-fill vs. scattered development, use of common road networks, Generator Tie Lines etc., use of similar support facility designs materials and colors etc.) to avoid industrial sprawl.	Applicable	Consistent	The Project would be located within a DRECP LUPA-designated DFA, and in combination with neighboring projects (e.g., Desert Quartzite) would achieve an in-fill development pattern with the exception of areas avoided to preserve sensitive resources. These projects would use a common road network and gen tie corridor to the extent practicable based on the locations of existing infrastructure, and would use materials and colors approved by BLM landscape architects.		
	DFA-VPL-VRM-2	Development in DFAs and VPLs are required to incorporate visual design standards and include the best available, most recent BMPs, as determined by BLM (e.g. Solar, Wind, West Wide Energy Corridor, and Geothermal PEISs, the "*Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands*", and other programmatic BMP documents).	Applicable	Consistent	Project-specific mitigation measures require adherence to visual design standards outlined in "Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands" with review and approval by BLM landscape architects.		
	DFA-VPL-VRM-3	**Required Visual Resource BMPs.** All development within the DFAs and VPLs will abide by the BMPs addressed in the most recent version of the document "*Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands",* or its replacement, including, but not limited to the following: • Transmission: ○ Color-treat monopoles Shadow Gray per the BLM Environmental Color Chart CC001 unless a more effective color choice is selected by the local Field Office VRM specialist. ○ Lattice towers and conductors will have non-specular qualities. ○ Lattice Towers will be located a minimum of 3/4 miles away from Key Observation Points such as roads, scenic overlooks, trails, campgrounds, navigable rivers and other areas people tend to congregate and located against a landscape backdrop when topography allows. • Solar – Color treat all facilities Shadow Gray from the BLM Environmental Color Chart CC001 unless a more effective color is selected by the Field Office VRM specialist, including but not limited to: ○ Concentrated solar thermal parabolic trough panel backs ○ Solar power tower heliostats ○ Solar power towers ○ Cooling towers ○ Power blocks • Wind – Color treat all facilities Shadow Gray with the exception of the wind turbine and towers 200 vertical feet or more. • Night Sky – BMPs to minimize impacts to night sky including light shielding will be employed	Applicable	Consistent	Project-specific mitigation measures require adherence to visual design standards outlined in "Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands" with review and approval by BLM landscape architects. Color treatment of all project facilities would be approved by BLM VRM specialist, and BMPs to minimize night sky impacts are required.		

Development Focus Areas					
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency.**	**Explanation**
Renewable Energy	**DFA-RE-1**	In order to use the DRECP's BLM LUPA streamlined process for renewable energy in DFAs and transmission, project proponents must first consult with appropriate representatives of the Department of Defense to ensure the proposed renewable energy and/or transmission activity will not cause an unacceptable risk to national security. Refer to additional detail in LUPA Section IV.4 and Appendix E. Specifically, the following process will be implemented:			
		● For renewable energy and transmission activities proposed in red areas (see Appendix E), the DRECP BLM LUPA streamlined process will not be available unless a letter is obtained from the Department of Defense Siting Clearinghouse stating that military impacts have been mitigated.	Not applicable		The Proposed Action is not located in any red areas as shown in Appendix E of the LUPA Section IV.4.
		● For renewable energy and transmission activities proposed in orange or yellow areas (see Appendix E), the DRECP BLM LUPA streamlined process will be not be available until Department of Defense representatives at the regional level have been consulted and have been provided a minimum of 30 days to assess potential mission impacts. If the regional representatives conclude within the 30 day period that there is a significant possibility that a proposed activity presents an unacceptable risk to national security, the BLM will not streamline the proposed activity process and will require additional environmental analysis regarding Department of Defense impacts, unless a letter is obtained from the Department of Defense Siting Clearinghouse stating that military impacts have been mitigated.	Not applicable		The Proposed Action is not located in any orange or yellow areas as shown in Appendix E of the LUPA Section IV.4.
Biological Resources	**DFA-BIO-IFS-1**	Conduct the following surveys as applicable in the DFAs as shown in **Table 21**.	Applicable	Consistent	The RE Crimson Project has already completed biological surveys for the species listed in Table 21 that were determined to have a potential to occur. These surveys are detailed in the BRTR.
	DFA-BIO-IFS-2	Implement the following setbacks shown below in **Table 22** as applicable in the DFAs.	Applicable	Consistent	There are no species in Table 22 within the RE Crimson Permitting Boundary where setbacks are necessary.
Desert Tortoise	**DFA-BIO-IFS-3**	Protocol surveys, as described in **DFA-BIO-IFS-1** and shown in **Table 21**, are required for development in the desert tortoise survey areas (see Appendix D). Based on the results of the protocol surveys the identified desert tortoises will be translocated, or the activity will be redesigned/relocated as described below: · If protocol surveys identify 35 or fewer desert tortoises in potential impact areas on an activity site, the USFWS and CDFW (for third party activities) will be contacted and provided with the protocol survey results and information necessary for the translocation of identified desert tortoises. Pre-construction and construction, and other activities will not begin until the clearance surveys for the site have been completed and the desert tortoises have been translocated. Translocation will be conducted in coordination with the USFWS and CDFW, as appropriate, per the protocols in the Desert Tortoise Field Manual (USFWS 2009) and the most up-to-date USFWS protocol. · If protocol surveys identify an adult desert tortoise density (i.e., individuals 160 millimeters or more) of more than 5 per square mile or more than 35 individuals total on a project site, the project will be required to be redesigned, re-sited, or relocated to avoid and minimize the impacts of the activity on desert tortoise.	Applicable	Consistent	Surveys were conducted in 2012 and 2016 and there are fewer than 35 desert tortoise within the RE Crimson Permitting Boundary. BRTR Measure BIO-28 says clearance surveys would be conducted following installation of the desert tortoise exclusion fence, which would occur prior to any grading or activities which might harm a tortoise.
Mohave Ground Squirrel	**DFA-BIO-IFS-4**	The DFA in the "North of Edwards" Mohave ground squirrel key population center is closed to renewable energy applications and any activity that is likely to result in the mortality (killing) of a Mohave ground squirrel until Kern and San Bernardino counties complete county General Plan amendments/updates that include renewable energy development and Mohave ground squirrel conservation on nonfederal land in the West Mojave ecoregion and the CDFW releases a final Mohave Ground Squirrel Conservation Strategy, or for a period of 5 years after the signing of the DRECP LUPA ROD, whichever comes first. If Kern and San Bernardino counties and CDFW do not complete their respective plans within the 5-year period, prior to opening the DFA to renewable energy applications and other impacting activities, BLM will assess new Mohave ground squirrel information, in coordination with the CDFW, to determine if modifications to the DFA or CMAs are warranted based on new Mohave ground squirrel information.	Not applicable		No Mohave ground squirrels or potential Mohave ground squirrel habitat were detected in the RE Crimson Permitting Boundary. Proposed Action is located in Riverside County and outside of Kern or San Bernardino Counties.
	DFA-BIO-IFS-5	Once the planning criteria in CMA **DFA-BIO-IFS-4**, are met, the DFA in the "North of Edwards" Mohave ground squirrel key population center will be reevaluated. If Kern and San Bernardino counties receive Mohave ground squirrel take authorizations from the CDFW through completed Natural Community Conservation Plans or county-wide conservation strategies that address Mohave ground squirrel conservation at a landscape level and include renewable energy development areas on nonfederal land in the West Mojave ecoregion, the "North of Edwards" key population center DFA will be eliminated and the management changed to General Public Lands, as part of adaptive management.	Not applicable		See above comment; DFA-BIO-IFS-4 is not applicable.

Development Focus Areas Category	CMA #	CMA Text	Project Applicability	Project Consistency.	Explanation
Plants	**DFA-BIO-PLANT-1**	Impact to suitable habitat (see Glossary of Terms) for the following plant Focus Species within the DRECP Plan Area will be capped (see "DFA Suitable Habitat Impacts Cap" in the Glossary of Terms) in the DFAs as described below and in **Table 23**. The suitable habitat impact cap for these plant species is to be measured in DFAs as a group, not individually.	Not applicable		None of the plant species listed in Table 23 occur within the RE Crimson Permitting Boundary.
		Triple-ribbed milk-vetch is an avoidance species in DFAs, therefore none of its suitable habitat is to be impacted.	Not applicable		This plant species was not detected in the project area according to Appendix F of the BRTR.
Recreation	**DFA-REC-1**	Retain, to the extent possible, the identified recreation setting characteristics: physical components of remoteness, naturalness and facilities; social components of contact, group size and evidence of use; and operational components of access, visitor services and management controls (see recreation setting characteristics matrix).	Not applicable		There are no recreational resources in the project area, where implementation of the Proposed Action would affect the existing recreation setting characteristics.
	DFA-REC-2	Avoid large-scale ground disturbance within one-half mile of Level 3	Not applicable		The project is not in a SRMA or ERMA or Level 1, 2, and 3 Recreation Facilities. Within 0.5-miles of the Project Area, only Mule Mountains ACEC and Chuckwalla Valley Dune Thicket ACEC are designated recreational areas; however, these are not considered Level 3 Recreational Facilities. In addition, the Bradshaw Trail Backcountry is located 1.75 miles to the south of the permitting boundary. No other BLM Backcounty Byways or other significant linear features are located in the project area. The project site would include an existing paved Power Line road but would maintain the road area for project use.
	DFA-REC-3	SRMAs are exclusion areas for renewable energy development due to the incompatibility with the values of SRMAs. Two exceptions to this management action are: 1. geothermal development is an allowable use in the few instances in Imperial County where a geothermal-only DFA overlays the SRMA designation and the lease includes a "no surface occupancy" stipulation, with exception of three specific parcels in the Ocotillo Wells SRMA (the Special Unit Management Plan in Appendix C)	Not applicable		The Proposed Action doesn't include geothermal development.
		2. the VPL at Antimony Flat in Kern County overlaying the SRMA, renewable energy may be allowed on a case-by-case basis if the proposed project is found to be compatible with the specific SRMA values.	Not applicable		The Proposed Action isn't located in Kern County.
	DFA-REC-4	When considering large-scale development in DFAs, retain to the extent possible existing, approved recreation activities.	Applicable	Consistent	There are no recreational resources in the project area and implementation of mitigation measures Rec-1 and Rec-2 would minimize effects on surrounding recreational resources.
	DFA-REC-5	For displacement of dispersed recreation opportunities, commensurate compensation in the form of enhanced recreation operations, recreation facilities or opportunities will be required. If recreation displacement results in resource damage due to increased use in other areas, mitigate that damage through whatever measures are most appropriate as determined by the Authorized Officer.	Applicable	Consistent	Consistent with Mitigation Measure REC-1 (requires notification of penalties for any off-route OHV activities to deter off-route travel).
	DFA-REC-6	Where activities in DFAs displace authorized facilities, similar new recreation facilities/campgrounds (including but not limited to the installation of new structures including pit toilets, shade structures, picnic tables, installing interpretive panels, etc.), will be provided.	Not applicable		The Proposed Action area doesn't include any recreational facilities and thus implementation of the Proposed Action would not displace any existing authorized recreational facilities.
	DFA-REC-7	If designated vehicle routes are directly impacted by activities (includes modification of existing route to accommodate industrial equipment, restricted access or full closure of designated route, pull outs, and staging area's to the public, etc.), mitigation will include the development of alternative routes to allow for continued vehicular access with proper signage, with a similar recreation experience. In addition, mitigation will also include the construction of an "OHV touring route" which circumvents the activity area and allows for interpretive signing materials to be placed at strategic locations along the new touring route, if determined to be appropriate by BLM.	Applicable	Consistent	Consistent with Mitigation Measure REC-1 (requires notification of penalties for any off-route OHV activities to deter off-route travel). The Bradshaw Trail Backcountry is located 1.75 miles to the south of the permitting boundary. No other BLM Backcounty Byways or other significant linear features are located in the project area. The project site would include an existing paved Power Line road but would maintain the road area for project use.
	DFA-REC-8	Impacts from activities in a DFA to Special Recreation Permit activities will be mitigated by providing necessary planning and NEPA compliance documentation for Special Recreation Permit replacement activities, as determined appropriate on a case-by case basis.	Not applicable		Implementation of the Proposed Action would not impact any Special Recreation Permit activities.
	DFA-REC-9	If residual impacts to SRMAs occur from activity impacts in a DFA, commensurate mitigation through relocation or replacement of facilities or compensation (in the form of a recreation operations and enhancement fund) will be required.	Not applicable		The project is not in a SRMA.
	DFA-REC-10	Within ERMAs, impacts from development projects that do not enhance conservation or recreation goals will require commensurate mitigation through relocation or replacement of facilities.	Not applicable		The project is not in an ERMA.

Development Focus Areas					
Category	**CMA #**	**CMA Text**	**Project Applicability**	**Project Consistency.**	**Explanation**
Lands and Realty	**DFA-LANDS-1**	Lands within DFAs are available for disposal.	Not applicable		The Proposed Action does not include disposal of lands.
	DFA-LANDS-2	Development of acquired lands within DFAs is allowed, at the discretion of the BLM California State Director, unless development is incompatible with the purposes of the acquisition and any applicable deed restrictions.	Not applicable		No deed requirements for donated and/or acquired lands.
	DFA-LANDS-3	Lands proposed for exchange in DFAs will be segregated from the public land laws for 5 years, but wind, solar, geothermal and transmission applications and their associated facilities are allowed.	Not applicable		The Proposed Action does not include lands proposed for exchange, and would be in an allowable use category (solar and transmission).
	DFA-LANDS-4	Review withdrawn lands in DFAs upon receipt of a ROW application and if appropriate modify to allow for issuance of ROW grants.	Applicable	Consistent	There are lands in the BLM WDL category for 20E sections 1, 2, 11, 12, and 24 including the access route and the northwest portion of the project.
	DFA-LANDS-5	Cost recovery funding used to process a ROW application may be used to adjudicate and remedy any conflicting land withdrawals, if necessary.	Applicable	Consistent	There are lands in the BLM WDL category for 20E sections 1, 2, 11, 12, and 24 including the access route and the northwest portion of the project.
	DFA-LANDS-6	Make public lands in DFAs available for selection by the CSLC in lieu of base lands within DFAs. Base lands are School Lands the State of California was entitled to but did not receive title to due to prior existing encumbrances.	Not applicable		Not applicable to current Proposed Action to develop a solar facility.
	DFA-LANDS-7	Transmission facilities are an allowable use and will not require a plan amendment within DFAs.	Applicable	Consistent	The gen-tie is an allowable use; however, the EIS explains why a Plan Amendment is applicable to the Proposed Action.
Visual Resources Management	**DFA-VRM-1**	Manage all DFAs as VRM Class IV to allow for industrial scale development. Employ best management practices to reduce visual contrast of facilities.	Applicable	Consistent	Most of the Project site is within VRM Class IV, and development of the Project would be consistent with management objectives for Class IV. Mitigation measures require the use of BMPs to minimize contrast.
	DFA-VRM-2	Regional mitigation for visual impacts is required in DFAs . Mitigation is be based on the VRI class and the underlying visual values (scenic quality, sensitivity, and distance zone) for the activity area as it stands at the time the ROD is signed for the DRECP LUPA. Compensatory mitigation may take the form of reclamation of other BLM lands to maintain (neutral) or enhance (beneficial) visual values on VRI Class II and III lands. Other considerations may include acquisition of conservation easements to protect and sustain visual quality within the viewshed of BLM lands. The following mitigation ratios will be applied in DFAs: • VRI Class II 1:1 ratio • VRI Class III ½ (0.5) : 1 ratio • VRI Class IV, no mitigation required Additional mitigation will be required where activities affect viewsheds of specially designated areas (e.g., National Scenic and Historic Trails).	Applicable	Consistent	The VRI class applicable to the Project site is Class IV. No compensatory mitigation would be required.
Wild Horses and Burros	**DFA-WHB-1**	Incorporate all guidance provided by the Wild Free-Roaming Horses and Burros Act of 1971, its amendments, associated regulations, and any pertinent court rulings into the project/activity proposal, as appropriate.	Applicable	Consistent	The Proposed Action would develop a solar project within the boundaries of a herd area, which the BLM allows under its multiple use objectives. The Proposed Action would incorporate DRECP CMAs DFA-WHB-1 through DFA-WHB-3 in order to minimize possible effects on wild horses and burros.
	DFA-WHB-2	Development that would reduce burros' access to forage, water, shelter, or space or impede their wild, free-roaming behavior in Herd Management Area is not allowed	Applicable	Consistent	The Proposed Action would develop a solar project within the boundaries of a herd area, which the BLM allows under its multiple use objectives. The Proposed Action would incorporate DRECP CMAs DFA-WHB-1 through DFA-WHB-3 in order to minimize possible effects on wild horses and burros.
	DFA-WHB-3	Mitigation can only occur on lands that the animals were found at the passage of the Wild Free-Roaming Horses and Burros Act of 1971. Expansion of the boundaries of a Herd Management Area back into the Herd Areas would require a land use plan amendment, the cost of which would be incurred by the applicant proposing to develop in the Herd Management Area, if part of the proposed mitigation package.	Applicable	Consistent	The Proposed Action would develop a solar project within the boundaries of a herd area, which the BLM allows under its multiple use objectives. The Proposed Action would incorporate DRECP CMAs DFA-WHB-1 through DFA-WHB-3 in order to minimize possible effects on wild horses and burros.
Wilderness Characteristics	**DFA-WC-1**	Renewable energy activities are allowed in DFAs that have been inventoried and identified as lands with wilderness characteristics.	Not applicable		Based on review of Figure 7 in the LUPA of the DRECP, there are no identified wilderness characteristic areas within the RE Crimson Permitting Boundary.
	DFA-WC-2	For inventoried lands found to have wilderness characteristics in DFAs, compensatory mitigation is required at a 1:1 ratio if wilderness characteristics are directly impacted. This may be accomplished through acquisition and donation, from willing landowners, to the federal government of (a) wilderness inholdings, (b) wilderness edge holdings that have inventoried wilderness characteristics, or (c) other areas within the LUPA Decision Area that are managed to protect wilderness characteristics. Restoration of impaired wilderness characteristics in Wilderness, Wilderness Study Area, and lands managed to protect wilderness characteristics could be substituted for acquisition.	Not applicable		Based on review of Figure 7 in the LUPA of the DRECP, there are no identified wilderness characteristic areas within the RE Crimson Permitting Boundary.

Appendix G
CDCA Plan Consistency

APPENDIX G
CDCA Plan Consistency

The Proposed Action site is within the Bureau of Land Management's (BLM's) California Desert District and within the planning boundaries of the California Desert Conservation Area (CDCA) Plan. The Project site is currently classified as Multiple-Use Class (MUC) Moderate (M) in the CDCA Plan. The BLM has determined that a CDCA Plan amendment would be required in order to process an application for a right-of-way (ROW) for the Project. The Desert Renewable Energy Conservation Plan (DRECP) recognizes the Project as a "pending" ROW application (BLM 2016, pages 68 and 69) not subject to the DRECP Land Use Plan Amendment (LUPA). Therefore, if the BLM elects to approve the ROW grant for the Project or an action alternative, a Project-specific CDCA Plan amendment would be required to identify the site as suitable for the proposed type of solar energy use.

The CDCA Plan would also need to be amended to allow the construction of the portion of gen-tie line that would be sited outside of the nearby BLM Utility Corridor K and Section 368 Federal Energy Corridor 30-52 (referred to as Corridor K/30-52 in this Final Environmental Impact Statement (EIS) and Plan Amendment (PA)) (AECOM 2018). If the BLM elects to approve the ROW grant for the Project or an action alternative, a Project-specific plan amendment would be required to authorize the gen-tie corridor.

The process for considering amendments to BLM land use plans is described in the agency's Land Use Planning Handbook (BLM 2005). The general process for amending a BLM Land Use Plan is as follows:

1. The plan amendment process would be completed in compliance with Federal Land Policy and Management Act of 1976 (FLPMA), National Environmental Policy Act (NEPA), and all other relevant federal law, executive orders, and BLM management policies.
2. The plan amendment process would include an EIS to comply with NEPA.
3. Where existing planning decisions remain valid, those decisions may remain unchanged and would be incorporated into the new plan amendment.
4. The plan amendment would recognize valid existing rights.
5. Native American tribal consultations would be conducted in accordance with policy, and tribal concerns would be given due consideration.
6. Consultation with other agencies with jurisdiction would be conducted throughout the plan amendment process.

The PA process is outlined in Chapter 7 of the CDCA Plan. The amendment would be a Category 3 amendment, because it addresses a specific use or activity that is not currently authorized by an existing plan element. In analyzing an Applicant's request for amending or changing the CDCA Plan, the BLM District Manager will:

1. Determine if the request has been properly submitted and if any law or regulation prohibits granting the requested amendment.
2. Determine if alternative locations within the CDCA are available which would meet the Applicant's needs without requiring a change in the Plan's classification, or an amendment to any Plan element.
3. Determine the environmental effects of granting and/or implementing the Applicant's request.
4. Consider the economic and social impacts of granting and/or implementing the Applicant's request.

5. Provide opportunities for and consideration of public comment on the proposed amendment, including input from the public and from federal, state, and local government agencies.
6. Evaluate the effect of the proposed amendment on BLM management's desert-wide obligation to achieve and maintain a balance between resource use and resource protection.

Details concerning the proposed PA for the Proposed Action or one of the other action alternatives are provided in Section 2.4. This Final EIS and Proposed PA acts as the mechanism for satisfying NEPA requirements for the PA process, and provides the analysis required to support a PA to identify the proposed Project site and gen-tie line location as suitable or unsuitable for solar development within the Plan.

All of the BLM-administered lands proposed for use by the Project and alternatives are classified in the CDCA Plan as Class M. MUC designations govern the type and degree of land uses allowed within the classification area. All land use actions and resource management activities on BLM-administered lands within a MUC delineation must meet the guidelines for that class. These guidelines are provided in Table 1, Multiple-Use Class Guidelines, of the CDCA Plan.

The MUC-M designation allows electric generation plants for solar facilities to be developed in accordance with federal, state, and local regulations after NEPA requirements are met. The specific application of the MUC designations and resource management guidelines for a specific resource or activity are further discussed in the plan elements section of the CDCA Plan. MUC-M designations are based upon a controlled balance between higher-intensity use and protection of public lands. This class provides for a wide variety or present and future uses such as mining, livestock grazing, recreation, energy, and utility development. Class M management is also designed to conserve desert resources and to mitigate damage to those resources that permitted uses may cause.

For purposes of this discussion, the terminology "Proposed Action and alternatives" is used herein since the classification of the BLM-administered portion of the site of the Proposed Action and Alternatives 2 and 3 would be the same (MUC-M).

Agriculture

Agricultural uses of MUC-M lands are not allowed, with the exception of livestock grazing. The BLM lands associated with the Project are not currently used for agriculture, and the Project would not involve use of the site for agriculture.

Air Quality

MUC-M lands are to be managed to protect air quality and visibility in accordance with Class II objectives of Title I, Part C, of the Clean Air Act (CAA) as amended. The estimated maximum daily and annual construction emissions that would be associated with the Proposed Action and alternatives are provided in Tables 3.2-2 and 3.2-3 for the Proposed Action, and Tables 3.2-7 and 3.2-8 for Alternative B in Section 3.2, Air Resources. The analysis indicates that the annual emissions for all pollutants would be below the respective *de minimis* levels (below 100 tons/year), except for NO_x and PM_{10}, which would exceed the *de minimis* level. The projected exceedance of the NO_x and PM_{10} Mojave Desert Air Quality Management District (MDAQMD) emissions threshold would also contribute to the non-attainment for both air pollutants in the area under California Ambient Air Quality Standards (CAAQS). The emission estimates in Table 3.2-5 show that emissions from operation and maintenance of the Project would all be below MDAQMD thresholds and *de minimis* levels. Impacts associated with operation and maintenance of the Project would not be expected to result in or contribute to an exceedance of a National Ambient Air Quality Standards (NAAQS) or CAAQS. The magnitude of the impacts of decommissioning emissions are expected to be significantly less than those estimated for Project construction, since decommissioning would occur after at least 30 years of operation, and it is expected that on-road and off-road equipment engine technology would be far more advanced and cleaner than is currently the case. Therefore, the Project would conform to the CAA Class II objectives referenced in the CDCA Plan MUC guidelines.

Water Quality

The CDCA Plan states that MUC-M lands are to be managed "to minimize degradation of water resources." Best management practices (BMPs) would be used as part of the Project to keep impacts on water quality minimal and to comply with Executive Order 12088, both of which address federal compliance with pollution control standards (BLM 1980, p. 15). Implementation of surface and groundwater quality BMPs would reduce impacts to water resources and water quality such that no additional mitigation measures would be required and the Project would conform to the CDCA Plan guidelines for MUC-M lands.

Cultural, Tribal, Historic, and Paleontological Resources

Cultural and paleontological resources are to be preserved and protected within MUC-M lands, and procedures described in 36 CFR 800 are to be observed where applicable. As described in detail in Sections 3.5, Cultural, Tribal, and Historic Resources and 3.11 Paleontological Resources, impacts on cultural and paleontological resources resulting from the construction, operation and maintenance, and decommissioning of the Project would be mitigated and would conform to the MUC Guidelines. Adverse effects on cultural resources listed in or determined eligible for the NRHP would be resolved in accordance with a Memorandum of Agreement (MOA) being prepared for the Project in consultation with the California State Historic Preservation Officer, Native American tribes, and other interested parties in accordance with the National Historic Preservation Act, Section 106.

Native American Values

Under the MUC-M Guidelines, Native American cultural and religious values are to be protected and preserved, and the appropriate Native American tribes are to be consulted. Consultation with Indian tribes was initiated during the planning phase of the Project and will continue during the NEPA process (Section 3.5, Cultural, Tribal, and Historic Resources, and Chapter 4, Consultation, Coordination, and Public Involvement, describe the Native American consultation processes). Opportunities have been provided by the BLM to allow Native American tribes to identify places and resources of importance to them and to express concerns regarding cultural and religious values that could be affected by the Project.

Adverse effects on any places of traditional cultural or religious importance that are identified by tribes would be resolved in accordance with the MOA being developed for the Project with tribal participation. Potential impacts to and protection of cultural resources are discussed in more detail in Section 3.5, Cultural, Tribal, and Historic Resources. Collectively, these measures ensure that preservation and protection of Native American cultural and religious values associated with cultural resources is accomplished in accordance with the CDCA Plan MUC-M Guidelines.

Electrical Generation Facilities

Solar generation may be allowed on MUC-M lands after NEPA requirements are met. This Final EIS and Proposed PA represents the mechanism for complying with NEPA requirements.

Transmission Facilities

MUC-M guidelines allow electric transmission to occur in designated ROW corridors. The gen-tie line associated with the Proposed Action would be located directly south of the Southern California Edison Colorado River Substation and would be constructed within a designated ROW corridor. The CDCA Plan requires that all sites associated with power generation or transmission not identified in the Plan be considered through the PA process. Therefore, the BLM would undertake a Project-specific CDCA PA along with the ROW grant for the Proposed Action and applicable Alternatives. Upon BLM's amendment of the CDCA plan for the Proposed Action and applicable Alternatives, the Project would be fully compliant with the CDCA Plan. This Final EIS

and Proposed PA acts as the mechanism for meeting NEPA requirements, and also provides the analysis required to support a PA identifying the facility within the Plan.

Communication Sites

Communication sites may be allowed on MUC-M lands after NEPA requirements are met. The Project would not involve installation of communications sites, and therefore would not be affected by the MUC-M guidelines for this land use activity.

Fire Management

The site is located entirely within a moderate Fire Hazard Severity Zone as recommended by the California Department of Forestry and Fire Protection. Following Project construction, the BLM would be the first responder for any wildland fires and the County for any structural fires that occurred on the Project site. As part of the Project, the Applicant would implement the fire prevention and suppression measures described in Section 3.20, Wildland Fire Ecology. Additionally, as described in Section 3.20, Wildland Fire Ecology, Mitigation Measure FIRE-1 requires the Applicant to prepare and implement a Fire Safety Plan to ensure the safety of workers and the public during Project construction, operation and maintenance, and decommissioning activities. This plan would complement or supplement provisions of the Applicant's proposed Hazardous Materials Management and Emergency Response Plan. The Fire Safety Plan would be provided to the BLM and Riverside County Fire Department (RCFD) for approval before the Applicant receives a Notice to Proceed. The implementation of Mitigation Measure FIRE-1 would prevent fires ignited by the Projects. Should a fire occur in the area that is not specific to the Project facility, it would be addressed by BLM or RCFD, not by the Applicant, and it would be addressed in conformance with the Fire Safety Plan and, therefore, would conform to the MUC guidelines for Fire Management for Class M lands.

Vegetation

Table 1 of the CDCA Plan includes a variety of guidelines associated with vegetation as follows.

Vegetation Harvesting

Native Plants

Commercial or non-commercial removal of native plants in MUC-M areas may be allowed only by permit after NEPA requirements are met, and after development of necessary stipulation. Approval of a ROW grant for the Project would constitute the permit for such removal. The conditions of approval that would be required in a Record of Decision would constitute the stipulations to avoid or minimize impacts from removal of native plants.

Harvesting by Mechanical Means

Harvesting by mechanical means may be allowed by permit only. However, the collection of seeds to assist with reclamation or the harvesting of areas where the vegetation would be destroyed by other actions as not proposed as part of the Project or as mitigation measures, as the temporary and permanent impacts to vegetation would be minimal. Therefore, the Project would be in conformance with this MUC guideline.

Rare, Threatened, and Endangered Species, State and Federal

In all MUC areas, all Federal and state-listed species are to be fully protected. In addition, actions that may jeopardize the continued existence of Federally-listed species require consultation with the U.S. Fish and Wildlife Service (USFWS). As evaluated in Section 3.3, Biological Resources, no federal- or state-listed plants would be affected by the Project.

Sensitive Plant Species

Sensitive plant species, designated by the BLM, would be given protection in management decisions consistent with BLM's policy for sensitive species management discussed in BLM Manual 6840 (BLM 2008). The objective of this policy is to conserve and/or recover listed species, and to initiate conservation measures to reduce or eliminate threats to BLM sensitive species to minimize the likelihood of and need for listing. Six special-status plants were identified on the Project site, of which one, Harwood's eriastrum (*Eriastrum harwoodii*), is also considered a BLM-sensitive plant. Impacts and mitigation measures associated with this species and other special-status plant species are discussed in Section 3.3, Biological Resources. Mitigation measures included in this Final EIS and Proposed PA would reduce the number of individuals of the species that would be affected. Because these measures are intended to reduce threats to these species to minimize the likelihood of listing, these measures are in conformance with the MUC guidance in the CDCA Plan.

Unusual Plant Assemblages

No unusual plant assemblages are designated on the Project site.

Vegetation Manipulation

Mechanical Control

Mechanical control may be allowed on MUC-M lands after consideration of possible impacts. Vegetation manipulation is defined in the CDCA Plan as removing noxious or poisonous plants from rangelands, or eliminating introduced plant species.

During construction, operations, and decommissioning phases, the Applicant would abide by noxious weed control procedures as developed in cooperation with the BLM in order to limit the establishment of noxious/invasive vegetation through early detection and eradication measures. The Applicant would finalize the site-specific Weed Management Plan, described in Section 3.3, Biological Resources, prior to a ROW grant being issued. Such actions would be conducted as part of the Project. Vegetation management under the Weed Management Plan would conform to federal, state, and local regulations. Further discussion on the Weed Management Plan is described in Mitigation Measure BIO-16. The full text of the Weed Management Plan is provided in Appendix I in this Final EIS and Proposed PA.

Chemical Control

Aerial broadcasting application of chemical controls is not allowed on MUC-M lands. Noxious weed eradication may be allowed after site-specific planning. The Project would not include aerial broadcasting. As described in Section 3.3, Biological Resources, a Weed Management Plan would be used to control invasive and exotic weeds. The full text of the Weed Management Plan is provided in Appendix I in this Final EIS and Proposed PA.

Exclosures

Exclosures may be allowed on MUC-M lands. Exclosure is a manipulation technique where livestock and certain wildlife species can be excluded from fenced areas. This procedure provides comparison data and is valuable in the determination of grazing effects of vegetation. The Project would not include exclosures.

Prescribed Burning

Prescribed burning may be allowed on MUC-M lands after development of a site-specific management plan. The Project would not include prescribed burning.

Land Tenure Adjustment

MUC-M land may be sold in accordance with FLPMA and other applicable federal laws and regulations. The Project would not involve the sale of any BLM-administered lands.

Livestock Grazing

Livestock grazing is allowed on MUC-M lands subject to the protection of sensitive resources. The Project would not involve livestock grazing.

Minerals

The Project would not involve the development of minerals on MUC-M lands.

Motorized Vehicle Access/Transportation

Pursuant to the CDCA MUC guidelines for MUC-M areas, new roads and routes may be developed under ROW grants or approved plans of operation, and periodic or seasonal closures or limitations of routes of travel may be required. One major designated open route, MM703 or Powerline Road, is an east-west open route along the northern boundary of the Project site. Open route MM703 does not traverse the proposed location of the Project's solar panels, and the proposed solar development would not require closure of open route MM703. Access to open route MM703 is obtained through open route MM1086 to the northwest of the Project site, and connects to Interstate-10. Open route MM703 connects users to open routes MM1094 and MM1094 just southeast of the Project site. Off-highway-vehicle routes are described in Section 3.12, Recreation and Public Access (Off-Highway Vehicles).

Recreation

The Project would not involve use of the Project site for recreational uses.

Waste Disposal

The Project would not involve the development of waste disposal sites.

Wildlife Species and Habitat

Table 1 of the CDCA Plan includes a variety of guidelines associated with wildlife as follows:

Rare, Threatened, and Endangered Species, State and Federal

In all MUC areas, all federal- and state-listed species and their critical habitat are to be fully protected. In addition, actions that may impact or jeopardize the continued existence of federally listed species require consultation with the USFWS in accordance with Section 7 of the federal Endangered Species Act (FESA). As evaluated in Section 3.3, Biological Resources, five wildlife species listed under both FESA and CESA occur or have the potential to occur or migrate through the Project site: desert tortoise, Yuma Ridgeway's rail, southwestern willow flycatcher, western yellow-billed cuckoo, and Least Bell's vireo. However, the desert tortoise is the only federally listed species currently detected within the Project site. There is currently no suitable breeding or foraging habitat for Yuma Ridgway's rail or western yellow-billed cuckoo within the Project site; however, the areas of microphyll woodland on the Project site provide suitable foraging habitat for migrating southwestern willow flycatcher. Additionally, four wildlife species listed under CESA occur or have a potential to occur or migrate through the Project site: Swainson's hawk, elf owl, Gila woodpecker, and bank swallow. Of these, the only state-listed species

observed within the Project were the Swainson's hawk and the bank swallow. Mitigation measures developed as part of the Project would avoid, minimize, and/or compensate for potential effects to these species.

As specified in the guideline, BLM would initiate formal consultation with the USFWS in accordance with Section 7 of FESA. BLM has worked with USFWS, CDFW, and the Applicant to develop protection and compensation measures for the Mojave Desert tortoise. Therefore, the Project would comply with the guideline to provide full protection to the species.

Sensitive Species

On MUC-M lands, identified species are to be given protection in management decisions consistent with BLM's policy for sensitive species management, BLM Manual 6840. The objective of this policy is to conserve and/or recover listed species, and to initiate conservation measures to reduce or eliminate threats to BLM sensitive species to minimize the likelihood of and need for listing. Several BLM-sensitive wildlife species present or likely to occur on habitat associated with the Project include, but are not limited to, Mojave fringe-toed lizard, banded gila monster, Couch's spadefoot toad, Golden Eagles, burrowing owl, desert kit fox, American badger, and migratory birds and bats. Those species that are likely to occur on the Project site would be protected under a number of mitigation measures meant to avoid, minimize, or compensate for impacts from the Project as discussed in detail in Section 3.3, Biological Resources.

Predator and Pest Control

Control of depredation wildlife and pests is to be allowed on MUC-M lands in accordance with existing state and federal laws. As part of the Project, the Applicant would develop a litter control program that would be enforced during construction and operation and maintenance phases to reduce the likelihood that litter would attract predators (e.g., common raven) to the area and consequently increase the likelihood of predation on special status species (e.g., Mojave desert tortoise).

Therefore, this guideline is applicable to these actions but is allowed subject to conformance with state and federal laws.

Habitat Manipulation

The Project would not include habitat manipulation.

Reintroduction or Introduction of Established Exotic Species

The Project would not include the reintroduction or introduction of exotic species.

Wetland/Riparian Areas

The Project site would be located at the eastern edge of the Chuckwalla Hydrologic Area with two riparian vegetation communities and a total of 91.8 acres of State jurisdictional wetlands and waters consisting of 1.2 acres of CDFW–associated riparian woodland and 90.6 acres of unvegetated streambed. A Streambed Alteration Agreement would be required with the CDFW, in accordance with California Fish and Game Code Section 1600 et seq. and any additional impacts associated with these areas would be reduced and minimized through the implementation of Mitigation Measure BIO-19 as discussed in Section 3.3, Biological Resources. The Project would not be located on any federal wetlands or waters as determined by the U.S. Army Corps of Engineers and would be in conformance with all other state laws and requirements.

Wild Horses and Burros

The Project site would be located within the boundaries of a Wild Horse and Burro Herd Area; however, the Project would be an allowable use under the BLM's multiple-use objectives.

1. Project Overview

1.1 Introduction

Sonoran West Solar Holdings, LLC (Applicant), a wholly owned subsidiary of Recurrent Energy LLC (RE), proposes to construct and operate the RE Crimson Solar Project (Project). This Project is a utility-scale solar photovoltaic (PV) and energy storage project that would be located in the Riverside East Solar Energy Zone/Designated Leasing Area and within a Development Focus Area on federal lands managed by the Bureau of Land Management (BLM) within the California Desert Conservation Area planning area in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, California (CA) (BLM CACA-051967). The Project would interconnect to the regional electrical grid at the Southern California Edison (SCE) 230-kilovolt (kV) Colorado River Substation (CRS), and would generate up to 350 megawatts (MW) of renewable energy using PV technology with up to 350 MW of integrated energy storage capacity.

The purpose of this study is to provide scientific and technical data regarding the existing air quality environment within the study area and the proposed Project's potential effects on the area's air quality environment. The Project information supporting this analysis is based primarily on the Applicant's RE Crimson Solar Project Plan of Development (POD) submitted to the BLM in January 2016 and updated in 2017 (RE 2017). If warranted, Applicant measures are proposed or recommended in this study to address adverse changes to the existing air quality environment as a result of the Project.

1.2 Project Description

The Project is located in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, just north of Mule Mountain and just south of Interstate 10 (I-10), including portions of Sections 1, 2, 11, 12, 13, 24, 25 within Township 7 South, Range 20 East, and portions of Sections 6, 7, 8, 17, 18 within Township 7 South, Range 21 East (Figure 1-1). The Project site consists of approximately 2,489 acres of BLM- administered land within the Riverside East Solar Energy Zone and within the Desert Renewable Energy Conservation Plan (DRECP) Development Focus Area as presented in the Final Environmental Impact Statement (EIS) and approved in the Record of Decision and associated Land Use Plan Amendment in September 2016 (http://www.drecp.org/). The Project is not sited within the adjacent Section 368 Federal Energy Corridor pursuant to the Westwide Energy Corridor Final Programmatic EIS, except for a short gen-tie line that would interconnect the Project to the CRS.

The Project site is situated at the eastern edge of the Chuckwalla Hydrologic Area and supports a broad alluvial fan that includes many braided washes and channels that converge into a primary channel flowing into an intra-state playa lake northwest of the Project site. This playa lake is not a Traditional Navigable Water; therefore, the channels in the Project area do not qualify as federal jurisdictional waters.

The site is surrounded primarily by BLM-managed lands and some private parcels. The site is located at the northern foot of the Mule Mountain Area of Critical Environmental Concern, which is an important cultural resource for local Native American Tribes. The SCE high-voltage transmission line and CRS are located directly north of the Project site, and the I-10 freeway is north of and parallel to those facilities. East of the Project site is First Solar's proposed Desert Quartzite project. Further northeast of the Desert Quartzite project is the site of the recently approved Blythe Mesa Solar Project by RRG Renewables.

The Project applicant is proposing to construct the project using a traditional construction approach consisting of desert tortoise exclusion fencing, a mow and roll approach to site preparation, compacted roads, and trenching for electrical lines; however, the applicant is actively investigating alternative low-environmental impact design (LEID) elements and the potential for those to reduce Project impacts. LEID elements include several potential design changes including:

1. Minimizing grading during site preparation and maintaining more onsite vegetation to facilitate post-construction residual habitat value and post-operations/site reclamation success.

2. Avoiding or limiting trenching by placing electrical wiring aboveground.

3. Placing transformer/inverter groups on elevated support structures in lieu of cement foundations.

The LEID elements would further minimize grading, trenching, and vegetation removal beyond traditional design approaches for PV projects with the objective of reducing overall long-term impacts for the Project. Although the incorporation of LEID elements could result in slight modifications to the panel block locations due to topographic constraints, the permitting boundary or limits of development would be the same with LEID elements incorporated. The comparative impacts of the tradition design approach versus design with LEID elements incorporated is not known; therefore, to facilitate appropriate analysis of the Project and allow for the incorporation of LEID elements where practicable and environmentally beneficial, the environmental technical analysis is based on the elements that result in the worst-case scenario for construction and operations.

A vicinity map showing the Permitting (Development) Boundary is presented on Figure 1-2. The block layouts may vary slightly with the incorporation LEID elements, but would remain within the Permitting Boundary. The total area for the Project (i.e., Permitting Boundary) is 2,489 acres, including a 2,465 acre solar field development area with approximately 1,859 acre of solar panels (array blocks) and 24 acres for linear facilities including access/perimeter roads with a 30 to 60 foot corridor width and gen-tie and powerline corridors at 150 feet.

1.3 Design Option Scenarios

1.3.1 Traditional Design

An estimated 2 million panels would be arranged on the site in the form of solar arrays. Structures supporting the PV modules would consist of steel piles (e.g., cylindrical pipes, H-beams, or similar), which would be driven into the soil using pneumatic techniques, such as a hydraulic attachment on the boom of a backhoe tractor.

The proposed traditional design is laid out primarily in 2-MW increments, each 2-MW increment would include an inverter-transformer station constructed on a concrete pad or steel skid, and would be centrally located within the PV module arrays. Each inverter-transformer station would contain up to four inverters, a transformer, a battery enclosure, and a switchboard. Underground cables would be installed to convey the direct current (DC) electricity from the panels to the inverters to convert the DC to alternating current (AC). Between 300 and 500 wooden poles would be installed across the entire site to convey energy to a central substation location which would transform voltage from 34.5 kV to 230 kV.

Energy storage may be achieved by either a battery or flywheel storage system capable of storing up to 350 MW of electricity. The storage system would consist of banks of batteries or flywheels housed in electrical enclosures located indoors within the Project energy storage facilities.

Access to the Project site would be provided via the existing paved Wiley's Well Road and Powerline Road to the CRS from Interstate 10 (I-10) to the north. The Project's on-site roadway system would include a perimeter road, access roads, and internal roads. These roads would be surfaced with gravel, compacted dirt, or another commercially available surface and would accommodate the Project operations and maintenance (O&M) activities.

1.3.2 Low Environmental Impact Design Elements

As presented above, the applicant has proposed potential LEID elements for the Project for consideration with the objective of evaluating alternative design approaches that may reduce environmental impacts or negative effects from the project. These elements include changes to the grading approach, trenching and wiring, and elevation of inverter pads. To facilitate adequate analysis of potential design alternatives for the technical study, changes to the design were assessed for the potential LEID elements to determine the worst-case scenario. The design details with the incorporation of potential LEID elements are identical to those provided above for the traditional design, except for the following differences should LEID elements be incorporated:

- Solar blocks may be laid out in larger, 3- to 4-MW block sizes, requiring fewer inverter/transformer structures.
- Inverter/transformer equipment areas may be mounted on steel skids and installed on steel piers above the ground surface.

- Approximately 300 to 400 wooden AC transmission poles would be required in addition to the poles referenced under the traditional design to eliminate most trenching, which would result in the installation of up to 900 wooden poles in total.
- Access to the Project site would still be provided via the existing paved Wiley's Well Road and Powerline Road to the CRS via I-10; however, if the incorporation of elements results in fewer solar blocks, slightly fewer roads would be compacted and graded on-site.

1.4 Integrated Energy Storage System

The planned energy storage system (ESS) will be capable of storing up to 350 megawatts (MW), or 1,400 megawatt-hours (MWh) of energy. The two energy storage systems under consideration consist of a flywheel energy storage system (FESS), which stores kinetic energy using banks of rotors that are spun continuously in a low-friction environment, and a battery energy storage system (BESS), which relies on banks of high-capacity batteries stored in a temperature-controlled environment.

The ESS would either be dispersed throughout the project site or concentrated in one central location on the site. If selected, the singular "concentrated" energy storage system would be located at the northern end of the Project site near the site access gate and Project substation. The final system chosen for installation will depend on market conditions and the availability of commercial options at the time of construction.

1.5 Construction Details

Construction of the Project will occur in three planned phases and will require approximately 23 months to complete with construction expected to begin in late-2020. Both the traditional design and incorporation of LEID elements are expected to feature similar quantities of construction equipment and total workforce size; thus, construction assumptions in this air quality analysis consider only construction details associated with the traditional design, which were determined to be representative of both approaches and provide a worst-case scenario for the construction emissions and air quality assessment.

1.5.1 Preconstruction Activities

Prior to the start of construction, several activities would be undertaken to prepare the site for crews and construction including:

1. Geotechnical and Hazards investigations. The applicant would conduct a geotechnical investigation utilizing subsurface scientific testing and analysis, and would use ground penetrating radar to identify potential subsurface unexploded ordnance and Munitions and Explosives of Concern that may need to be stabilized or removed prior to construction
2. Surveying, Staking, Flagging, and Preconstruction Resource Surveys. Prior to construction the site boundary would be staked to demarcate the limits of disturbance, following which biologists would conduct preconstruction surveys to flag areas for avoidance as appropriate.
3. Fence Installation. The Project will be fenced with security fencing (chainlink topped with barbed wire) and desert tortoise exclusion fencing. The security fencing would be up to 8-feet tall. The exclusion fencing would be buried at least 12 inches below ground surface.
4. Resource Clearance Surveys. Following fence installation, likely in a phased approach, the project development area would be cleared for special status species.
5. Staging Area Establishment. One or more secure staging areas would be established in support of construction activities.

Site preparation activities may vary in order depending upon the incorporation of LEID components, the timeline for start of construction (e.g., survey windows), and other factors. In general, pre-construction activities have

limited ground-disturbing impacts; but are necessary before full mobilization to support construction of the Project.

1.5.2 Phase 1 – Site Preparation and Grading

Phase 1 of construction will begin with the grubbing, grading, re-contouring, compacting, and graveling of access roads, followed by grading at the substation site. For Traditional Design, additional grading would be carried out at inverter and transformer pad locations where necessary. This construction phase will last approximately 19 months and will require an average daily workforce of approximately 251 workers on the Project site. Construction equipment operating on the site will include dozers, graders, skid steers, front-end loaders, vibratory rollers, scrapers, water pumps, and water trucks. The detailed construction air analysis spreadsheets are in Appendix A and include construction equipment assumptions.

1.5.3 Phase 2 – PV System Installation

Phase 2 of construction will begin with the pouring of foundations and the installation of the PV module support structure, which would consist of steel piles (e.g., cylindrical pipes, H-beams, or similar) being driven into the soil. To achieve ground preservation beneath the arrays, the incorporation of LEID elements will require individually sized piles to achieve a uniform elevation between module rows; thus, the duration of pile driving activities during this phase will last longer than those anticipated for Traditional Design. However, the incorporation of LEID elements that would reduce ground disturbance (e.g., no or reduced grading) is expected to require the use of track-mounted pile drivers, as opposed to the backhoe-mounted pneumatic pile drivers proposed in Traditional Design, to reduce tire passes over natural vegetation. Construction of the structural support systems will be followed by the installation of the PV modules. This construction phase will last approximately 19 months and require an average daily workforce of approximately 320 workers on the Project site. Construction equipment operating on the site will include post machines, skid steers, flatbed trucks, cranes, vibratory rollers, dump trucks, water trucks, forklifts, generators, air compressors, cable trenchers and mini-trenchers.

1.5.4 Phase 3 – Inverter, Transformer, Substation, and Electrical Collector System Commissioning

Phase 3 of construction will include the stringing of cable along module rows to a trunk cable system and the installation of AC and DC collector poles at inverter/transformer pad sites. If inverter/transformer pads will be elevated on piers as an LEID element, additional pile driving will be required during this phase for elevated pad installation. This construction phase will last approximately 18 months and require an average daily workforce of approximately 102 workers on the Project site. Construction equipment operating on the site will include graders, water trucks, cranes, backhoes, aerial lifts, forklifts, trenchers, generators, and flatbed trucks.

1.5.5 Site Deliveries During Construction Phases

Deliveries of materials and resources will occur throughout all construction phases. Water deliveries will occur a maximum of 14 times per day throughout all three construction phases, module and foundation deliveries will occur at a rate of approximately 10 times per day between construction Phases 1 and 2, tracker system delivery will occur at a rate of approximately 9 times per day during Phase 2, and inverter delivery will occur at a rate of approximately 2 times per day between Phases 2 and 3.

1.6 Operations and Maintenance

The solar modules and BESS are expected to be in operation during daylight and non-daylight hours, respectively, for 7 days per week, 365 days per year. Operational activities include solar module washing, maintenance of transformers, inverters, power conditioning systems, or other electrical equipment, road and fence repairs, vegetation/pest management, and site security. Solar modules would be washed as needed to maintain optimal electricity production (up to four times each year) using light utility vehicles with tow-behind water trailers. If LEID elements are incorporated into the design, the Project may also be visited regularly by a biological resource monitor, who will monitor applicable O&M activities and conduct periodic site assessments for the first 5 years of Project operation as part of a residual habitat study.

1.7 Decommissioning

The Applicant is expected to receive authorizations and permits with 30-year terms. At the end of the term, including any extensions, the Project would cease operation. At that time, the facilities would be decommissioned and dismantled and the site restored. Decommissioning activities would require approximately 9,883 truck trips, a workforce of approximately 320 workers, and would take approximately 17 months to complete. Upon decommissioning, the Project site could be converted to other uses in accordance with applicable land use regulations in effect at that time.

It is anticipated that during project decommissioning, project structures would be removed from the ground on the project sites. Aboveground and any underground equipment would be removed including module posts and support structures, gen-tie poles that are not shared with third parties and the overhead collection system within the project sites, inverters, transformers, electrical wiring, equipment on the inverter pads, and related equipment and concrete pads, and any O&M facilities and related equipment and infrastructure. The substation would be removed if it is owned by the project operator, however if a public or private utility assumes ownership of the substation, the substation may remain onsite to be used as part of the utility service to supply other applications.

Equipment would be de-energized prior to removal. Equipment would be shipped offsite by truck (after first being placed in secure transport enclosures as necessary) to be salvaged, recycled or disposed of at an appropriately licensed disposal facility. Removal of the solar modules would include disassembly and removal of the racks on which the solar modules are attached, and removal of the structures supporting the racks, and their placement in secure transport enclosures and a trailer for storage; the racks and structures supporting the racks would then be recycled or disposed of at an appropriately licensed disposal facility. Solar modules would be removed from the site and either transported to another solar electrical generating facility or a recycling facility, or disposed of at an appropriately licensed disposal facility. In conjunction with any solar modules which may be transported to another solar electrical generating facility, such solar modules may undergo a refurbishing process to extend their estimated 30-year lifespan. The demolition debris and removed equipment may be cut or dismantled into pieces to be safely lifted or carried with the equipment being used. The fence and gates would be removed and all materials would be recycled to the extent feasible. It is anticipated the project roads would be restored to their pre-construction condition unless the landowner elects to retain the improved roads for access throughout that landowner's property. The area would be thoroughly cleaned and all debris removed. As discussed above, most materials would be recycled to the extent feasible, with minimal disposal to occur in landfills in compliance with all applicable laws.

2. Air Pollutants – Regulatory Setting

2.1 Federal

2.1.1 Criteria Pollutants

Individual air pollutants at certain concentrations may adversely affect human or animal health, reduce visibility, damage property, and reduce the productivity or vigor of crops and natural vegetation. Six air pollutants have been identified by the United States Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB) as being of concern both on a nationwide and statewide level: ozone; carbon monoxide (CO); nitrogen dioxide (NO2); sulfur dioxide (SO2); lead; and particulate matter (PM), which is subdivided into two classes based on particle size: PM equal to or less than 10 micrometers in diameter (PM10), and PM equal to or less than 2.5 micrometers in diameter (PM2.5). Because the air quality standards for these air pollutants are regulated using human health and environmentally based criteria, they are commonly referred to as “criteria air pollutants.”

Ozone

Ozone is the principal component of smog and is formed in the atmosphere through a series of reactions involving reactive organic gases (ROG) and nitrogen oxides (NOX) in the presence of sunlight. ROG and NOX are called precursors of ozone. NOX includes various combinations of nitrogen and oxygen, including nitric oxide (NO), NO2, and others. Ozone is a principal cause of lung and eye irritation in the urban environment. Significant ozone

concentrations are usually produced only in the summer, when atmospheric inversions are greatest and temperatures are high. ROG and NOX emissions are both considered critical in ozone formation.

Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible sub-groups for ozone effects. Short-term exposure (lasting for a few hours) to ozone can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. In recent years, a correlation between elevated ambient ozone levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple sports and live in communities with high ozone levels.

Carbon Monoxide

CO is a colorless and odorless gas that, in the urban environment, is associated primarily with the incomplete combustion of fossil fuels in motor vehicles. Relatively high concentrations are typically found near crowded intersections and along heavily used roadways carrying slow-moving traffic. Even under most severe meteorological and traffic conditions, high concentrations of CO are limited to locations within a relatively short distance (300 to 600 feet) of heavily traveled roadways. Vehicle traffic emissions can cause localized CO impacts, and severe vehicle congestion at major signalized intersections can generate elevated CO levels, called “hot spots,” which can be hazardous to human receptors adjacent to the intersections.

Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise and electrocardiograph changes indicative of decreased oxygen supply to the heart. Inhaled CO has no direct toxic effect on the lungs but exerts its effect on tissues by interfering with oxygen transport. Hence, conditions with an increased demand for oxygen supply can be adversely affected by exposure to CO. Fetuses, patients with diseases involving heart and blood vessels, and patients with chronic hypoxemia (oxygen deficiency) as seen in high altitudes are most at risk from complications associated with exposure to CO.

Nitrogen Dioxide

NO2 is a product of combustion and is generated in vehicles and in stationary sources, such as power plants and boilers. It is also formed when ozone reacts with NO in the atmosphere. As noted above, NO2 is part of the NOX family and is a principal contributor to ozone and smog generation.

Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children, is associated with long-term exposure to NO2 at levels found in homes with gas stoves, which are higher than ambient levels found in southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO2 in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups.

Sulfur Dioxide

SO2 is a combustion product, with the primary source being power plants and heavy industries that use coal or oil as fuel. SO2 is also a product of diesel engine combustion. SO2 in the atmosphere contributes to the formation of acid rain.

In asthmatics, increase in resistance to air flow as well as reduction in breathing capacity leading to severe breathing difficulties, are observed after acute exposure to SO2. In contrast, healthy individuals do not exhibit similar acute responses even after exposure to higher concentrations of SO2. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO2 levels. In these studies, efforts to separate the effects of SO2 from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically, or one pollutant alone is the predominant factor.

Lead

Lead is a highly toxic metal that may cause a range of human health effects. Previously, the lead used in gasoline anti-knock additives represented a major source of lead emissions to the atmosphere. USEPA began working to reduce lead emissions soon after its inception, issuing the first reduction standards in 1973. Lead emissions have significantly decreased due to the near elimination of leaded gasoline use.

Fetuses, infants, and children are more sensitive than others to the adverse effects of lead exposure. Exposure to low levels of lead can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and a lower intelligence quotient. In adults, increased lead levels are associated with increased blood pressure. Lead poisoning can cause anemia, lethargy, seizures, and death; although it appears that there are no direct effects of lead on the respiratory system.

Particulate Matter

PM is a complex mixture of extremely small particles and liquid droplets. PM is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. Natural sources of PM include windblown dust and ocean spray. The size of PM is directly linked to the potential for causing health problems. USEPA is concerned about particles that are 10 micrometers in diameter or smaller because these particles generally pass through the throat and nose and enter the lungs. Once inhaled, these particles can affect the heart and lungs and cause serious health effects. Health studies have shown a significant association between exposure to PM and premature death. Other important effects include aggravation of respiratory and cardiovascular disease, lung disease, decreased lung function, asthma attacks, and certain cardiovascular problems, such as heart attacks and irregular heartbeat (USEPA 2007). Individuals particularly sensitive to fine particle exposure include older adults, people with heart and lung disease, and children. As previously discussed, USEPA groups particulate matter into two categories, which are described below.

PM2.5

Fine particles, such as those found in smoke and haze, are PM2.5. Sources of fine particles include all types of combustion activities (motor vehicles, power plants, wood burning, etc.) and certain industrial processes. PM2.5 is also formed through reactions of gases, such as SO2 and NOX, in the atmosphere. PM2.5 is the major cause of reduced visibility (haze) in California.

PM10

PM10 includes both fine and coarse dust particles; the fine particles are PM2.5. Coarse particles, such as those found near roadways and dusty industries, are larger than 2.5 micrometers and smaller than 10 micrometers in diameter. Sources of coarse particles include crushing or grinding operations and dust from paved or unpaved roads. Control of PM10 is primarily achieved through the control of dust at construction and industrial sites, the cleaning of paved roads, and the wetting or paving of frequently used unpaved roads.

2.1.2 Air Quality Standards

Health-based air quality standards have been established for the above described criteria pollutants by USEPA at the national level and by CARB at the state level. These standards were established to protect the public with a margin of safety from adverse health impacts due to exposure to air pollution. California has also established standards for sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride. The most current monitoring station data and attainment designations for the Project Site are provided below. Table 1 presents the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS).

USEPA, under the provisions of the Clean Air Act (CAA), requires each state with regions that have not attained NAAQS to prepare a State Implementation Plan (SIP) detailing how these standards are to be met in each local area. The SIP is a legal agreement between each state and the federal government to commit resources to improving air quality. It serves as the template for conducting regional and project-level air quality analysis. The SIP is not a single document, but a compilation of new and previously submitted attainment plans, emissions reduction programs, district rules, state regulations, and federal controls.

TABLE 1
NATIONAL AND CALIFORNIA AMBIENT AIR QUALITY STANDARDS

Pollutant	Averaging Time	California Standards [a]	National Standards [b]	
		Concentration [c]	Primary [c,d]	Secondary [c,e]
Ozone	1 hour	0.09 ppm (180 µg/m^3)	–	Same as primary standard
	8 hours	0.070 ppm (137 µg/m^3)	0.070 ppm (137 µg/m^3)	
Respirable particulate matter (PM_{10})[f]	24 hours	50 µg/m^3	150 µg/m^3	Same as primary standard
	Annual arithmetic mean	20 µg/m^3	–	
Fine particulate matter ($PM_{2.5}$) [f]	24 hours	–	35 µg/m^3	Same as primary standard
	Annual arithmetic mean	12 µg/m^3	12 µg/m^3	15 µg/m
Carbon monoxide (CO)	1 hour	20 ppm (23 mg/m^3)	35 ppm (40 mg/m^3)	None
	8 hour	9.0 ppm (10 mg/m^3)	9 ppm (10 mg/m^3)	
	8 hours (Lake Tahoe)	6 ppm (7 mg/m^3)	–	–
Nitrogen dioxide (NO_2) [g]	1 hour	0.18 ppm (339 µg/m^3)	100 ppb (188 µg/m^3)	–
	Annual arithmetic mean	0.030 ppm (57 µg/m^3)	0.053 ppm (100 µg/m^3)	Same as primary standard
Sulfur dioxide (SO_2) [h]	1 hour	0.25 ppm (655 µg/m^3)	75 ppb (196 µg/m^3)	–
	3 hours	—	–	0.5 ppm (1,300 µg/m^3)
	24 hours	0.04 ppm (105 µg/m^3)	0.14 ppm (for certain areas) [h]	–
	Annual arithmetic mean	—	0.030 ppm (for certain areas) [h]	–
Lead [i,j]	30-day average	1.5 µg/m^3	–	–
	Calendar quarter	–	1.5 µg/m^3 (for certain areas) [j]	Same as primary standard
	Rolling 3-month average	–	0.15 µg/m^3	
Visibility-reducing particles [k]	8 hours	See Footnote j	No national standards	
Sulfates	24 hours	25 µg/m^3		
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m^3)		
Vinyl chloride [i]	24 hours	0.01 ppm (26 µg/m^3)		

Notes: mg/m^3 = milligrams per cubic meter; ppb = parts per billion; ppm = parts per million; µg/m^3 = micrograms per cubic meter

[a] California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1- and 24-hour), nitrogen dioxide, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility-reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standards.

[c] Concentration expressed first in the units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25 degrees Celsius and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and reference pressure of 760 torr (ppm) in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[e] National Secondary Standards: The levels of air quality necessary to protect public welfare from any known or anticipated adverse

TABLE 1
NATIONAL AND CALIFORNIA AMBIENT AIR QUALITY STANDARDS

Pollutant	Averaging Time	California Standards [a]	National Standards [b]	
		Concentration [c]	Primary [c,d]	Secondary [c,e]

effects of a pollutant.

[f] On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 µg/m3 to 12.0 µg/m3. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 µg/m3, as was the annual secondary standard of 15 µg/m3. The existing 24-hour PM10 standards (primary and secondary) of 150 µg/m3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

[g] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards the units can be converted from 100 ppb to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. To directly compare the 1-hour national standard to the California standard, the units can be converted to ppm. In this case, the national standard of 75 ppb is identical of 0.075 ppm.

[i] CARB has identified lead and vinyl chloride as toxic air contaminants with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[j] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m^3 as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standards are approved.

[k] In 1989, ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are “extinction of 0.23 per kilometer” and the “extinction of 0.07 per kilometer” for the statewide and Lake Tahoe Air Basin standards, respectively.

2.1.3 General Conformity

General conformity requirements were adopted by Congress as part of the CAA Amendments and were implemented by USEPA regulations in the November 30, 1993 Federal Register (40 Code of Federal Regulations Sections 6, 51, and 93: “Determining Conformity of General Federal Actions to State or Federal Implementation Plans; Final Rule”).

General conformity requires that all federal actions conform to the SIP as approved or promulgated by USEPA. The Project is therefore required to evaluate its construction emissions against the applicable General Conformity Rule thresholds of significance, which are called de minimis thresholds. The de minimis levels are based on the attainment/maintenance and nonattainment designations and classifications for the project area. If the emissions would exceed the de minimis levels, a formal air quality conformity determination is required.

As shown in Figure 1-2, the Project is located in the Mojave Desert Air Basin (MDAB) under the jurisdiction of the Mojave Desert Air Quality Management District (MDAQMD).. The MDAB is designated as an unclassifiable/attainment area for CO and PM2.5; therefore, there are no de minimis thresholds for these pollutants. The MDAQMD is classified as a non-attainment area for ozone and PM10 for the southwest corner of the desert portion of San Bernardino County and San Bernardino County portion only, respectively (MDAQMD 2019). Thus, the Riverside County portion within the MDAQMD is designated as an unclassifiable/attainment area for ozone (NOx and VOC) and PM10. Although, the Project Site is located in the Riverside County portion of the MDAQMD which is designated as an unclassifiable/attainment area for ozone (NOx and VOC) and PM10, the analysis conservatively compares Project’s emissions to the de minimis threshold for NOx, VOC, and PM10. Thus, the only applicable de minimis thresholds to the project are for PM10, NOx, and VOC. Accordingly, the de minimis thresholds for the Project are presented below in Table 2.

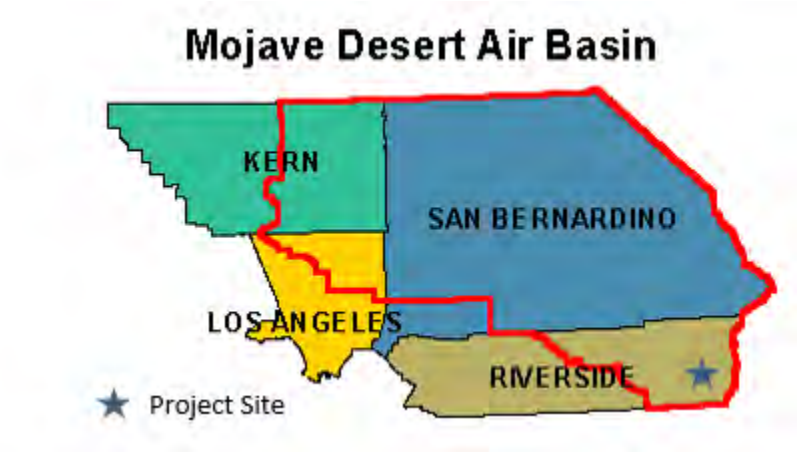

Figure 1-2. Mojave Desert Air Basin

TABLE 2
GENERAL CONFORMITY *DE MINIMIS* THRESHOLDS FOR THE PROJECT STUDY AREA

Pollutant	Emission Threshold (tons per year)
CO	N/A[1]
NO_X	100[2]
VOC	100[2]
PM_{10}	100[3]
$PM_{2.5}$	N/A[1]

Notes:
CO = carbon monoxide; NO_X = oxides of nitrogen; $PM_{2.5}$ = fine particulate matter; PM_{10} = respirable particulate matter; VOC = volatile organic compound
[1] The Mojave Desert Air Basin is in attainment for CO and PM2.5. Therefore, there are no de minimis thresholds for these pollutants.
[2] Although the Project is located in an unclassifiable/attainment portion of MDAB, the air basin is classified as a partial nonattainment area for ozone (NOx and VOC). The analysis conservatively compares the Project-related emissions to the CAA conformity thresholds for maintenance areas (i.e., areas that currently meet federal air quality standards, but have violated the standards in prior years), which in the project area are 100 tons per year per pollutant.
[3] Although the Project is located in an unclassifiable/attainment portion of MDAB, the air basin is classified as a moderate nonattainment area for PM10.
Source: 40 Code of Federal Regulations 93 Section 153 (USEPA 2019)

2.1.4 Toxic Air Contaminants

In addition to criteria air pollutants, USEPA regulates hazardous air pollutants, also known as toxic air contaminants (TACs). TACs may be emitted by stationary, area, or mobile sources. Common stationary sources of TAC emissions include gasoline stations, dry cleaners, and diesel backup generators, which are subject to local air district permit requirements. The other, often more significant, sources of TAC emissions are motor vehicles on freeways, high-volume roadways, or other areas with high numbers of diesel vehicles, such as distribution centers. Off-road mobile sources are also major contributors of TAC emissions and include construction equipment, ships, and trains.

TACs can be separated into carcinogens and noncarcinogens based on the nature of the effects associated with exposure to the pollutant. For regulatory purposes, carcinogens are assumed to have no safe threshold below

which health impacts would not occur. Any exposure to a carcinogen poses some risk of contracting cancer. Noncarcinogens differ in that there is generally assumed to be a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant by-pollutant basis.

2.2 State

CARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the California CAA.

2.2.1 State Implementation Plan

CARB is the lead agency for developing the SIP in California. Local air districts and other agencies prepare Air Quality Attainment Plans (AQAPs) or Air Quality Management Plans (AQMPs) and submit them to CARB for review, approval, and incorporation into the applicable SIP. CARB also maintains air quality monitoring stations throughout the state in conjunction with local air districts. Data collected at these stations are used by CARB to classify air basins as being in attainment or nonattainment with respect to each pollutant, and to monitor progress in attaining air quality standards.

The California CAA requires that each area exceeding the CAAQS for ozone, CO, SO2, and NO2 must develop a plan aimed at achieving those standards. The California Health and Safety Code Section 40914 requires air districts to design a plan that achieves an annual reduction in district-wide emissions of five percent or more, averaged every consecutive three-year period. To satisfy this requirement, the local air districts have to develop and implement air pollution reduction measures, which are described in their AQMPs, and outline strategies for achieving the CAAQS for any criteria pollutant for which the region is classified as nonattainment.

CARB has established emission standards for vehicles sold in California and for various types of equipment. California gasoline specifications are governed by both state and federal agencies. During the past decade, federal and state agencies have imposed numerous requirements on the production and sale of gasoline in California. CARB has also adopted control measures for diesel PM and more stringent emissions standards for various on-road mobile sources of emissions, including transit buses and off-road diesel equipment (e.g., tractors, generators).

2.2.2 Toxic Air Contaminants

Particulate exhaust emissions from diesel-fueled engines (diesel PM) were identified as a TAC by CARB in 1998. Federal and state efforts to reduce diesel PM emissions have focused on the use of improved fuels, adding particulate filters to engines, and requiring the production of new-technology engines that emit fewer exhaust particulates.

Diesel engines tend to produce a much higher ratio of fine particulates than other types of internal combustion engines. The fine particles that make up diesel PM tend to penetrate deep into the lungs, and the rough surfaces of these particles makes it easy for them to bind with other toxins within the exhaust, thus increasing the hazards of particle inhalation. Long-term exposure to diesel PM is known to lead to chronic serious health problems including cardiovascular disease, cardiopulmonary disease, and lung cancer.

TACs in California are regulated primarily through the Tanner Air Toxics Act (Chapter 1047, Statutes of 1983) and the Air Toxics Hot Spots Information and Assessment Act (Chapter 1252, Statutes of 1987). Assembly Bill 1807 sets forth a formal procedure for CARB to designate substances as TACs. Research, public participation, and scientific peer review must occur before CARB can designate a substance as a TAC. The Air Toxics Hot Spots Information and Assessment Act requires that TAC emissions from stationary sources be quantified and compiled into an inventory according to criteria and guidelines developed by CARB, and if directed to do so by the local air district, a Health Risk Assessment (HRA) must be prepared to determine the potential health impacts of such emissions.

2.2.3 Mojave Desert Air Quality Management District

In eastern Riverside County, the MDAQMD is the agency responsible for protecting public health and welfare through the administration of federal and state air quality laws and policies. Included in the MDAQMD's tasks are monitoring of air pollution, preparation of the SIP for the MDAB, and promulgation of rules and regulations.

The MDAQMD prepared and adopted a SIP in 2004 Ozone Attainment Plan to attain the state and federal ozone standard. Subsequent SIP revisions were prepared in 2008 and 2016 for the Western Mojave Desert Ozone Nonattainment area. The Western Mojave Desert Ozone Nonattainment area includes a part of the San Bernardino County portion of the MDAQMD, as well as the Antelope Valley portion of Los Angeles County; thus, is not applicable to the Project. The MDAQMD prepared and adopted a PM10 Plan in 1995. As explained previously, the Riverside County portion of the MDAQMD is designated as unclassifiable/attainment area for PM10.

2.3 Regional and Local

2.3.1 Mojave Desert Air Quality Management District

As discussed above, the Project would be located in the jurisdiction of the MDAQMD. The MDAQMD is responsible for regulating stationary sources of air emissions in the Project area's air basin. Stationary sources that have the potential to emit air pollutants into the ambient air are subject to the Rules and Regulations adopted by the MDAQMD. The following MDAQMD rules are applicable to the Project (MDAQMD 2015).

Rule 401 – Visible Emissions. Rule 401 states that a person shall not discharge into the atmosphere, from any single source of emissions whatsoever, any air contaminant for a period or periods aggregating more than three minutes in any one hour which is:

- As dark or darker in shade as that designated as No. 1 on the Ringelmann Chart, as published by the U.S. Bureau of Mines, or
- Of such opacity as to obscure an observer's view to a degree equal to or greater than does smoke described in Subsection A [of the Rules].

Rule 402 - Nuisance. Rule 402 prohibits a person from discharging from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Rule 403 – Fugitive Dust. Rule 403 requires control of fugitive dust emissions during activities such as construction that have the potential to generate dust. The provisions of Rule 403 include the following:

1. A person shall not cause or allow the emissions of fugitive dust from any transport, handling, construction or storage activity so that the presence of such dust remains visible in the atmosphere beyond the property line of the emission source. (Does not apply to emissions emanating from unpaved roadways open to public travel or farm roads. This exclusion shall not apply to industrial or commercial facilities).
2. A person shall take every reasonable precaution to minimize fugitive dust emissions from wrecking, excavation, grading, clearing of land and solid waste disposal operations.
3. A person shall not cause or allow particulate matter to exceed 100 micrograms per cubic meter when determined as the difference between upwind and downwind samples collected on high volume samplers at the property line for a minimum of five hours.
4. A person shall take every reasonable precaution to prevent visible particulate matter from being deposited upon public roadways as a direct result of their operations. Reasonable precautions shall include, but are not limited to, the removal of particulate matter from equipment prior to movement on paved streets or the prompt removal of any material from paved streets onto which such material has been deposited.

5. Subsections (a) and (c) shall not be applicable when the wind speed instantaneously exceeds 40 kilometers (25 miles) per hour, or when the average wind speed is greater than 24 kilometers (15 miles) per hour. The average wind speed determination shall be on a 15 minute average at the nearest official air-monitoring station or by wind instrument located at the site being checked.

Rule 404 – Particulate Matter Concentration. Rule 404 restricts emissions of particulate matter from any source based on the concentrations specified in Table 404(a).

Rule 405 – Solid Particulate Matter Weight. Rule 405 restricts emissions of particulate matter from any source based on the concentrations specified in Table 405(a).

Rule 406 – Specific Contaminants. Rule 406 restricts emissions of sulfur compounds to 500 ppm or less, and restricts emissions of halogens, which are not generally emitted from construction projects.

Rule 407 – Liquid and Gaseous Air Contaminants. Rule 407 restricts emissions of carbon monoxide to 2,000 ppm or less.

Rule 408 – Circumvention. Rule 408 restricts the building, erection, installation or use of any equipment, the use of which, without resulting in a reduction in the total release of air contaminants to the atmosphere, reduces or conceals an emission which would otherwise constitute a violation of Chapter 3 (commencing with Section 41700) of Part 4, of Division 26 of the Health and Safety Code or of the MDAQMD Rules.

Rule 409 – Combustion Contaminants. Rule 409 restricts discharge into the atmosphere from the burning of fuel, combustion contaminants exceeding 0.23 gram per cubic meter (0.1 grain per cubic foot) of gas calculated to 12 percent of carbon dioxide (CO2) at standard conditions averaged over a minimum of 25 consecutive minutes.

Rule 431 – Sulfur Content of Fuels. Rule 431 restricts the use of any gaseous fuel containing sulfur compounds in excess of 800 ppm calculated as hydrogen sulfide at standard conditions, or any liquid or solid fuel having a sulfur content in excess of 0.5 percent by weight.

Rule 442 – Usage of Solvents. Rule 442 restricts the emission of volatile organic compounds (VOCs) from any solvent material to 1,190 pounds per month, and requires proper storage and handling of VOC-containing solvents.

2.3.2 Riverside County General Plan

The Riverside County General Plan Air Quality Element (AQ) includes policies that limit emissions within the County boundaries. The goal is to support efforts to decrease region-wide pollution emissions, as surrounding jurisdictions significantly impact Riverside County's air quality. Policies were designed to establish a regional basis for improving air quality. The Riverside County General Plan's Air Quality Element (AQ) discusses the following applicable policies regarding air quality within Riverside County (Riverside County 2014b, 2018). Relevant countywide policies that address air quality within the County boundaries are also located in the Land Use Element (LU) of the County General Plan are also described below (Riverside County 2014c).

Air Quality Element

Policy AQ 1.1. Promote and participate with regional and local agencies, both public and private, to protect and improve air quality.

Policy AQ 1.4. Coordinate with the South Coast Air Quality Management District (SCAQMD) and MDAQMD to ensure that all elements of air quality plans regarding reduction of air pollution emissions are being enforced.

Policy AQ 1.5. Establish and implement air quality, land use and circulation measures that improve not only the County's environment but the entire region's.

Policy AQ 2.1. The County land use planning efforts shall assure that sensitive receptors are separated and protected from polluting point sources to the greatest extent possible.

Policy AQ 2.2. Require site plan designs to protect people and land uses sensitive to air pollution through the use of barriers and/or distance from emissions sources when possible.

Policy AQ 2.3. Encourage the use of pollution control measures such as landscaping, vegetation and other materials, which trap particulate matter or control pollution.

Policy AQ 4.1. Encourage the use of building materials/methods which reduce emissions.

Policy AQ 4.7. To the greatest extent possible, require every project to mitigate any of its anticipated emissions which exceed allowable emissions as established by the SCAQMD, MDAQMD, SOCAB [South Coast Air Basin], the Environmental Protection Agency and the California Air Resources Board.

Policy AQ 4.9. Require compliance with SCAQMD Rules 403 and 403.1, and support appropriate future measures to reduce fugitive dust emanating from construction sites.

Policy AQ 4.10. Coordinate with the SCAQMD and MDAQMD to create a communications plan to alert those conducting grading operations in the County of first, second, and third stage smog alerts, and when wind speeds exceed 25 miles per hour. During these instances all grading operations should be suspended.

Policy AQ 5.1. Utilize source reduction, recycling and other appropriate measures to reduce the amount of solid waste disposed of in landfills.

Policy AQ 16.1. Cooperate with local, regional, state and federal jurisdictions to better control particulate matter.

Policy AQ 16.2. Encourage stricter state and federal legislation on bias belted tires, smoking vehicles, and vehicles that spill debris on streets and highways, to better control particulate matter.

Policy AQ 16.3. Collaborate with the SCAQMD and MDAQMD to require and/or encourage the adoption of regulations or incentives to limit the amount of time trucks may idle.

Policy AQ 16.4. Collaborate with the EPA, SCAQMD, MDAQMD, and warehouse owners and operators to create regulations and programs to reduce the amount of diesel fumes released due to warehousing operations.

Policy AQ 17.3. Identify and create a control plan for areas within the County prone to wind erosion of soil.

Policy AQ 17.4. Adopt incentives, regulations and/or procedures to manage paved and unpaved roads and parking lots so they produce the minimum practicable level of particulates.

Policy AQ 17.8. Adopt regulations and programs necessary to meet state and federal guidelines for diesel emissions.

Policy AQ 20.18. Encourage the installation of solar panels and other energy-efficient improvements and facilitate residential and commercial renewable energy facilities (solar array installations, individual wind energy generators, etc.).

Policy AQ 20.19. Facilitate development and siting of renewable energy facilities and transmission lines in appropriate locations.

Land Use Element

Policy LU 6.4. Retain and enhance the integrity of existing residential, employment, agricultural, and open space areas by protecting them from encroachment of land uses that would result in impacts from noise, noxious fumes, glare, shadowing, and traffic.

Policy LU 10.2 Ensure adequate separation between pollution producing activities and sensitive emission receptors, such as hospitals, residences, child care centers and schools.

2.3.3 Odor

Odors are considered an air quality issue both at the local level (e.g., odor from wastewater treatment) and at the regional level (e.g., smoke from wildfires). Odors are generally regarded as an annoyance rather than a health hazard. However, manifestations of a person's reaction to foul odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache).

The ability to detect odors varies considerably among the population and is subjective. Some individuals have the ability to smell minute quantities of specific substances while others may not have the same sensitivity, but may have sensitivities to odors of other substances. In addition, people may have different reactions to the same odor; an odor that is offensive to one person (e.g., from a fast-food restaurant or bakery) may be perfectly acceptable to another. Unfamiliar odors may be more easily detected and likely to cause complaints than familiar ones.

Several examples of common land use types that generate substantial odors include wastewater treatment plants, landfills, composting/green waste facilities, recycling facilities, petroleum refineries, chemical manufacturing plants, painting/coating operations, rendering plants, and food packaging plants.

Offensive odors can potentially affect human health in several ways. First, odorant compounds can irritate the eye, nose, and throat, which can reduce respiratory volume. Second, the organic gases that cause odors can stimulate sensory nerves to cause neurochemical changes that might influence health, for instance, by compromising the immune system. Finally, unpleasant odors can trigger memories or attitudes linked to unpleasant odors, causing cognitive and emotional effects such as stress.

3. Existing Conditions

3.1 Mojave Desert Air Basin

Ambient air pollutant concentrations in the MDAB are measured at air quality monitoring stations operated by CARB and the MDAQMD. The closest and most representative MDAB air quality monitoring station to the Project Site is the Blythe-445 West Murphy Street monitoring station, approximately 8 miles east of the Project Site. However, that monitoring station only has ozone concentration data available. Therefore, the Palm Springs Fire Station monitoring station was used to supplement ambient air quality monitoring data for PM10, PM2.5, and NO2 concentrations. Table 3 presents the most recent ozone, NO2, PM10, and PM2.5 concentrations recorded. These concentrations represent the existing, or baseline conditions, for the Project.

As shown in Table 3, ambient air concentrations of PM10 have exceeded NAAQS and CAAQS on one or more days each year for the past three years. Ambient air concentrations of PM2.5 have not exceeded NAAQS in the past three years. Ozone concentrations have not exceeded the NAAQS or CAAQS in the past three years. Monitoring data for other criteria air pollutants is not available from these or any other monitoring stations in the vicinity of the Project.

3.2 Attainment Status

Both USEPA and CARB use ambient air quality monitoring data to designate areas according to their attainment status for criteria air pollutants. The purpose of these designations is to identify the areas with air quality problems and initiate planning efforts for improvement. The three basic designation categories are nonattainment, attainment, and unclassified. An “attainment” designation for an area signifies that pollutant concentrations did not exceed the established standard. In most cases, areas designated or redesignated as attainment must develop and implement maintenance plans, which are designed to ensure continued compliance with the standard.

In contrast to attainment, a “nonattainment” designation indicates that a pollutant concentration has exceeded the established standard. Nonattainment may differ in severity. To identify the severity of the problem and the extent of planning and actions required to meet the standard, nonattainment areas are assigned a classification that is commensurate with the severity of their air quality problem (e.g., moderate, serious, severe, extreme).

Finally, an unclassified designation indicates that insufficient data exist to determine attainment or nonattainment. In addition, the California designations include a subcategory of nonattainment transitional, which is given to nonattainment areas that are progressing and nearing attainment.

TABLE 3
AMBIENT AIR QUALITY SUMMARY

Pollutant Standards	2015	2016	2017
Ozone			
National 8-hour maximum concentration (ppm)	0.066	0.061	0.054
State 8-hour maximum concentration (ppm)	0.067	0.061	0.055
Measured Number of Days Standard Exceeded NAAQS 8-hour concentration (>0.070 ppm)	0	0	0
CAAQS 8-hour concentration (>0.070 ppm)	0	0	0
Nitrogen dioxide (NO_2)			
Annual average (ppb)	6	6	7
National maximum 1-hour concentration (ppb)	41.5	42.6	42.5
State maximum 1-hour concentration (ppb)	41	42	42
Measured Number of Days Standard Exceeded NAAQS 1-hour (>100 ppb)	0	0	0
CAAQS 1-hour (>180 ppb)	0	0	0
Particulate Matter (PM_{10})			
National maximum 24-hour concentration ($\mu g/m^3$)	199.0	447.2	105.6
State maximum 24-hour concentration ($\mu g/m^3$)	183.0	113.1	60.5
National annual average concentration ($\mu g/m^3$)	20.9	23.1	22.1
State annual average concentration ($\mu g/m^3$)	*	*	*
Measured Number of Days Standard Exceeded NAAQS 24-hour (>150 $\mu g/m^3$)	1	1	0
CAAQS 24-hour (>50 $\mu g/m^3$)	2	3	1
Particulate Matter ($PM_{2.5}$)			
National maximum 24-hour concentration ($\mu g/m^3$)	22.7	14.7	14.5
State maximum 24-hour concentration ($\mu g/m^3$)	22.7	14.7	14.5
National annual average concentration ($\mu g/m^3$)	*	5.4	6.0
State annual average concentration ($\mu g/m^3$)	*	*	6.0
Measured Number of Days Standard Exceeded NAAQS 24-hour (>35 $\mu g/m^3$)	0	0	0

Notes: *Insufficient data to determine the value.
$\mu g/m^3$ = micrograms per cubic meter; ppm = parts per million; ppb = parts per billion; NAAQS = National Ambient Air Quality Standards; CAAQS = California Ambient Air Quality Standards
Source: CARB 2019.

The Project is within the Riverside County portion of the MDAB. As shown in Table 4, the MDAB is designated as Unclassified/Attainment for all criteria air pollutants for the NAAQS except ozone and PM10, for which it is nonattainment. Unlike the rest of the air basin, the Riverside County portion of the MDAB is also designated as unclassified/attainment for PM10 and ozone. The MDAB meets the CAAQS for all criteria air pollutants except ozone and PM10. The MDAB is currently classified as a state nonattainment area for ozone and PM10.

TABLE 4
MOJAVE DESERT AIR BASIN ATTAINMENT DESIGNATIONS

Pollutant	State	Federal
Ozone	Nonattainment	Nonattainment[1]
Carbon Monoxide	Attainment	Unclassified/Attainment
Nitrogen Dioxide	Attainment	Unclassified/Attainment

3.3 Sensitive Receptors

Some members of the population are especially sensitive to air pollutant emissions and should be given special consideration when evaluating air quality impacts from projects. These include children, the elderly, people with preexisting respiratory or cardiovascular illness, and athletes and others who engage in frequent exercise. Air quality regulators typically define sensitive receptors as schools, hospitals, resident care facilities, day-care centers, or other facilities that may house individuals with health conditions that would be adversely impacted by changes in air quality.

Residential areas are also considered sensitive to air pollution because residents (including children and the elderly) tend to be at home for extended periods of time, resulting in sustained exposure to pollutants present. Recreational land uses are considered moderately sensitive to air pollution. Exercise places a high demand on respiratory functions, which can be impaired by air pollution even though exposure periods during exercise are generally short. In addition, noticeable air pollution can detract from the enjoyment of recreation. Industrial and commercial areas are considered the least sensitive to air pollution. Exposure periods are relatively short and intermittent as the majority of the workers tend to stay indoors most of the time. There are no sensitive receptors located within 2 miles of the Project Site. The closest residence is located approximately 2.9 miles west of the Project Site.

4. Methodology

Construction-related exhaust emissions for the Project were estimated for construction worker commutes, haul trucks, and the use of off-road equipment. Construction-related emissions for the Project were estimated using emission factors from the CARB's OFFROAD and EMFAC 2014 inventory models (CARB 2013). Construction emissions from the operation of diesel-fueled off-road equipment were estimated by multiplying daily usage (i.e., hours per day) and total days of construction by OFFROAD equipment-specific emission factors. Emissions from on-road motor vehicles were estimated using vehicle trips, vehicle miles traveled, and EMFAC2014 mobile source emission factors. The emission factors represent the fleet-wide average emission factors within Riverside County. Grading, material loading, and travel on paved and unpaved roads would generate fugitive dust (PM10) emissions. Fugitive dust emissions were estimated using the USEPA's Compilation of Air Pollutant Factors (AP-42) and based on vehicle miles traveled on paved and unpaved roads, material loading, and hours of operation.

The primary emission sources during the construction of the Project would include exhaust from heavy construction equipment, on- and off-road vehicles, and fugitive dust generated in areas disturbed by grading, excavating, earth moving, and the movement of various construction vehicles around the site.

Fuel combustion emissions during construction would result from:

- Exhaust from the off-road construction equipment, including diesel construction equipment used for site grading, excavation, and installation of PV modules, and water trucks used to control construction dust emissions;
- Exhaust from on-road construction vehicles, including cement and water trucks used to transport materials and water between Blythe local area and the construction site, and from diesel trucks used to deliver, material, equipment, and construction supplies to the construction site;
- Exhaust from vehicles used by workers to commute to the construction site.

Fugitive dust emissions from the construction of the Project would result from:

- Site grading activities at the construction site
- Installation of PV panel system foundation and related equipment installation
- Installation of inverters, transformers, and substation electrical collector system
- On-site vehicle and equipment travel on unpaved surfaces
- Off-site travel of worker vehicles and trucks on unpaved and paved roads

As summarized in Section 1, Project construction is anticipated to start in 2020. Construction was assumed to last 23 months for the traditional design. Construction activities will include site preparation and grading, photovoltaic system installation, and installation of the inverters, transformers, substation and electrical collector system. The estimated construction workforce is expected to result in up to 854 vehicle trips per day during peak construction during PV system installation. The workforce is assumed to commute to the site from within 13 miles on average from the Project site. In addition to commute trips by construction workers, approximately 9,883 truck deliveries of equipment and materials, including water trucks, were estimated to be required over the course of the construction period. Construction phase-related truck deliveries are estimated to require one-way distances (within the boundaries of the MDAQMD) as follows: equipment and material deliveries at 150 miles and aggregate, water, and concrete deliveries at 13 miles. Concrete and water truck deliveries were assumed to be transporting material from the Blythe local area, which is approximately 13 miles away. Both the traditional design and incorporation of LEID elements are expected to feature similar quantities of construction equipment and total workforce size; thus, construction assumptions in this air quality analysis consider only construction details associated with the traditional design. It was determined to be representative of both approaches and provide a worst-case scenario for the construction emissions and air quality assessment.

Construction of the proposed solar facilities would occur primarily within the approximately 2,489-acre area and on-site cut-and-fill was assumed to be balanced. An approximate 2-mile travel distance for the Project's on-site roadway system was assumed and used for the on-site unpaved road traveling emission calculation. Additional details, equipment lists, and construction scheduling information are provided in Appendix A.

After construction, emissions would be generated from operation and maintenance of the Project. The Project would be designed with a comprehensive Supervisory Control and Data Acquisition (SCADA) system to allow remote monitoring of facility operation and/or remote control of critical components. For the Project as designed, with or without LEID elements incorporated, operational and maintenance activities would include solar module washing; vegetation, weed, and pest management; and security. Maintenance activities would also include panel repairs; maintenance of transformers, inverters, and other electrical equipment as needed; and road and fence repairs. Similar to construction-related emission estimates, operational emissions were estimated using CARB's EMFAC2014 and EPA AP-42 emission factors.

The maximum number of staff on-site at any time would be 50 (40 temporary staff and 10 permanent staff). The perimeter road and main access roads would be surfaced with gravel, compacted dirt, or another commercially available surface and would accommodate Project O&M activities such as cleaning of solar panels, and facilitate on-site circulation for emergency vehicles. The expected annual demand for water was assumed to be approximately 22 acre-feet per year (AFY) for process water, fire protection, dust control, vegetation management, water use at the O&M building, and the expected four solar module washings per year. Only limited deliveries would be necessary for replacement of PV modules and equipment during operation thus, heavy-duty off-road

equipment is not expected to be used during operation of the Project. At the end of the operational term of the Project, the Project would cease operations and be decommissioned. Decommissioning activities and impacts are anticipated to be similar to those determined for the construction phase of the Project. The actual impacts would be dependent upon the proposed decommissioning action and final use of the site; thus, emissions associated with decommissioning are discussed qualitatively. Additional details and assumptions are provided in Appendix A.

4.1 CEQA Thresholds of Significance

According to CEQA Significance Determination Thresholds, a significant impact related to air quality would occur if implementation of the Project would:

- conflict with or obstruct implementation of the applicable air quality plan,
- violate any air quality standard or contribute substantially to an existing or projected air quality violation,
- result in cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emission which exceed quantitative thresholds for ozone precursors),
- expose sensitive receptors to substantial pollutant concentrations, or
- create objectionable odors affecting a substantial number of people.

As stated in Appendix G of the CEQA Guidelines, the significance criteria established by the applicable air quality management board or air pollution control district may be relied on to make the impact determinations for specific program elements. MDAQMD has developed quantitative significance thresholds for CEQA projects in their CEQA and Federal Conformity Guidelines (MDAQMD 2016). The screening level thresholds are shown in Table 5.

TABLE 5
REGIONAL POLLUTANT EMISSION SCREENING LEVEL THRESHOLDS OF SIGNIFICANCE

Mass Daily Thresholds		
Pollutant	**AnnualThreshold (tons)**	**Daily Threshold (pounds)**
CO	100	548
NOx	25	137
PM10	15	82
PM2.5	12	65
VOC	25	137

Source: MDAQMD 2016

This analysis does not directly evaluate lead or SOX because little to no quantifiable and foreseeable emissions of these substances would be generated by the Project. Lead emissions have significantly decreased due to the near elimination of leaded fuel use. On- and off-road diesel fuel used in California must meet low sulfur standards established by CARB; thus, SOX emissions due to diesel exhaust are assumed to be minimal.

4.2 NEPA Thresholds

General conformity de minimis thresholds are appropriate thresholds to be used for determining NEPA significance. A NEPA air quality significance analysis differs from the General Conformity analysis in that all project criteria pollutant emissions are considered: emissions for pollutants where the area has attained the NAAQS as well as emissions for pollutants where the region is currently designated as a nonattainment or maintenance area. Therefore, in the Riverside County portion of the MDAB, project attainment emissions of VOC, NOX, CO, PM10, and PM2.5, would be considered for impact significance under NEPA for air quality in addition to VOC, NOX, and PM10 considered under General Conformity.

5. Impact Analysis

5.1 Project Impacts

AQ-1: *The Project would not conflict with or obstruct implementation of the applicable air quality plan. The impact would be less than significant.*

Air quality plans describe air pollution control strategies to be implemented by a city, county, or regional air district. The primary purpose of an air quality plan is to bring an area that does not attain federal and state air quality standards into compliance with those standards pursuant to the requirements of the federal CAA and California CAA. Projects that are consistent with the assumptions and control measures used in development of the applicable air quality plan are considered to not conflict with or obstruct the attainment of the air quality levels identified in the plan.

The applicable air quality plans for the project are prepared by MDAQMD as plans for improving air quality in the region. The MDAQMD has adopted a variety of AQAPs for the pollutants that are in nonattainment in the region, such as the 2004 state and federal Ozone Attainment Plan, and the 1996 Maintenance Plan for PM10.

Construction of the Project would involve the use of off-road equipment, haul trucks, and worker commute trips. The Project would not increase the assumptions for the hours of activity and equipment population reported to CARB for rule compliance. The design features of the Project also include fugitive dust control measures consistent with MDAQMD Rule 403. Therefore, while the Project would generate criteria pollutant emissions, the approach to exhaust and fugitive dust emission control measures would not conflict with or obstruct implementation any applicable air quality plan.

The Project is currently planned for an area within the SEZ and within the Desert Renewable Energy Conservation Plan (DRECP) DFA and the DRECP LUPA designated the site as suitable for solar development without an additional project-specific land use plan amendment. Additionally, the Project site is located on lands currently designated as Multiple-Use-Class (MUC) Moderate (M) under the California Desert Conservation Area (CDCA) Plan. Solar electric facilities are allowed under MUC M designation once NEPA requirements are met.

Based on the maximum of 50 staff on-site at any time, operational and maintenance activities associated with the Project would generate approximately 100 motor vehicle trips per day. The Project does not involve any uses that would increase population beyond that considered in the Riverside County General Plan. In addition, the Project would be consistent with the Riverside County General Plan Air Quality Element policies AQ 20.18 and 20.19, which encourage and facilitate the installation, development, and siting of commercial renewable energy facilities (Riverside County, 2018). The Project does not include the construction of new residential or commercial buildings; therefore, it would not directly increase population or regional employment.

Because the Project would be consistent with the assumptions regarding equipment activity and emissions in the SIP and existing planning documents, it is expected that the intensity of construction and operational emissions associated with the Project would have been accounted for in any applicable air quality plan. Similarly, equipment activity and emissions during decommissioning is anticipated to be similar to equipment use and impacts during the construction phase of the Project. Because the Project would comply with all construction-related MDAQMD rules and regulations and is consistent with the BLM land use classifications and planning documents, the Project would not conflict with or obstruct implementation of the applicable air quality plan. The impact would be less than significant.

AQ-2: *The Project would violate an air quality standard or contribute substantially to an existing or projected air quality violation. The impact would be significant, requiring mitigation.*

Construction

Construction emissions are described as “short-term” or temporary in duration; however, they have the potential to represent a significant impact with respect to air quality. Construction of the Project would result in the temporary generation of VOC, NOX, CO, PM10, and PM2.5 emissions. VOC, NOX, and CO emissions are primarily associated with mobile equipment exhaust, including off road construction equipment and on-road motor vehicles. Fugitive

PM dust emissions are primarily associated with site preparation, and vary as a function of parameters such as soil silt content, soil moisture, wind speed, acreage of disturbance area, and vehicle miles traveled by construction vehicles on- and off site. Earthmoving and material handling operations are the primary sources of fugitive PM dust emissions from the Project's construction activities.

As shown in Table 6, construction emissions for the Project would result in maximum daily emissions of approximately 53 pounds of VOC, 597 pounds of NOX, 368 pounds of CO, 598 pounds of PM10, and 99 pounds of PM2.5. Additional modeling assumptions and details are provided in Appendix A.

TABLE 6
ESTIMATED MAXIMUM DAILY CONSTRUCTION EMISSIONS

	VOC	NO_X	CO	PM10 [1,2]	PM2.5[1]
Daily Emissions (lbs/day)					
2020	13.88	183.10	97.84	218.65	43.53
2021	52.90	596.46	367.82	597.61	98.85
2022	52.90	596.46	367.82	597.61	98.85
Maximum Daily Construction Emissions (lbs/day)	52.90	596.46	367.82	597.61	98.85
Threshold of Significance (lbs/day)	137	137	548	82	65
Significant Impact?	**NO**	**YES**	**NO**	**YES**	**YES**
Annual Emissions (tons/year)					
2020	0.41	4.27	2.96	6.85	1.35
2021	5.84	55.78	41.80	71.90	11.76
2022	3.32	31.17	23.68	38.38	5.98
Maximum Annual Emissions (tons/year)	5.84	55.78	41.80	71.90	11.76
Threshold of Significance (tons/year)	25	25	100	15	12
Significant Impact?	**NO**	**YES**	**NO**	**YES**	**NO**

Notes: [1] PM10 emissions shown include the sum of particulate matter (PM) with aerodynamic diameter 0 to 2.5 microns and PM with aerodynamic diameter 2.5 to 10 microns.
[2]Does not include fugitive dust emissions reductions per MDAQMD Rule 403. .
[3] Additional details on the emissions for each calendar year are included in Appendix A.
VOC = volatile organic compounds; NO_X = oxides of nitrogen; CO = carbon monoxide; PM10 = suspended PM; PM2.5 = fine PM; lbs/day = pounds per day
Source: Estimated by AECOM in 2019

As shown in Table 6, construction-related emissions of NOX, PM10, and PM2.5 would exceed the daily thresholds of significance. Construction-related emissions of NOX and PM10 would also exceed the annual thresholds of significance. Therefore, construction emissions could violate an ambient air quality standard or contribute substantially to an existing violation. The impact would be significant. To minimize this impact, the Applicant will phase construction to the maximum extent practicable to minimize the amount of equipment operating at the same time. In addition, implementation of mitigation measures (MMs) AQ-A through AQ-D would be required.

The General Conformity applicability and NEPA analyses are based on estimates of the total direct and indirect net emissions from construction of the Project. Table 7 summarizes the projected annual emissions associated with construction of the Project. The annual emissions estimates shown in Table 7 include emission reductions associated with MMs AQ-A through AQ-D discussed in Chapter 6 of this report. The federal agency can take measures to reduce emissions, and the changes must be state or federally enforceable to guarantee that emissions would be below de minimis levels. Based on CEQA provisions in 14 California Code of Regulations Section 15091(a)(1), MMs must be incorporated into the Project. For the purposes of the NEPA and General Conformity applicability analysis, MMs required by CEQA are considered design features of the Project. This is not considered "mitigation" under the General Conformity Rule. The Project assumes that MMs would be implemented to meet CEQA requirements.

TABLE 7
GENERAL CONFORMITY - ESTIMATED ANNUAL CONSTRUCTION EMISSIONS

	VOC	NO_X	CO	PM10 [1]	PM2.5[1]
2020	0.10	1.18	3.53	1.39	0.33
2021	1.72	17.17	49.60	13.81	2.48
2022	1.01	9.81	28.08	7.28	1.21
Maximum Annual Construction Emissions (tons/year)	1.72	17.17	49.60	13.81	2.48
Threshold of Significance [2] (tons/year)	100	100	N/A	100	N/A
Significant Impact?	No	No	No	No	No

Notes: [1] PM10 emissions shown include the sum of particulate matter (PM) with aerodynamic diameter 0 to 2.5 microns and PM with aerodynamic diameter 2.5 to 10 microns.
[2] As explained in Section 2.1.3, the Riverside County portion of the MDAQMD is an unclassifiable/attainment area of the MDAB for all pollutants under the NAAQS and thus, general conformity de minimis thresholds do not apply. However, for the purposes of this analysis, this analysis conservatively compares project-related emissions for those pollutants for which the entire MDAB is in nonattainment.
VOC = volatile organic compounds; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_2 = sulfur dioxide; PM10 = suspended PM; PM2.5 = fine PM
Source: Estimated by AECOM in 2019

As shown in Table 7, the annual emissions would not exceed any de minimis levels. As explained previously, both the traditional design and incorporation of LEID elements are expected to feature similar quantities of construction equipment and total workforce size; thus, a formal conformity analysis would not be required and no direct or indirect effects would occur for either option.

Operation

The Project, both with or without LEID elements incorporated, would include an on-site O&M building. The Project is expected to generate approximately 100 daily trips associated with worker commute trips from the maximum number of staff expected to be on-site at one time for maintenance activities. On-site operations would also include solar module washing which was assumed to occur four times each year using light utility vehicles with tow-behind water trailers. Table 8 summarizes the projected annual emissions associated with operation of the Project. Operation of the Project would result in maximum daily emissions of approximately less than one pound of VOC and CO, 4 pounds of NOx, 43 pounds of PM10, and 7 pounds of PM2.5.

As shown in Table 8, the estimated operational emissions would not exceed the daily thresholds of significance. Therefore, operational emissions would not violate an ambient air quality standard or contribute substantially to an existing violation. The impact would be less than significant.

TABLE 8
ESTIMATED OPERATIONAL EMISSIONS

	VOC	NO_X	CO	PM10 [1,2]	PM2.5[1]
Daily Emissions (lbs/day)					
Operational Emissions	0.11	3.70	2.40	77.25	11.73
Threshold of Significance (lbs/day)	137	137	548	82	65
Significant Impact?	**NO**	**NO**	**NO**	**NO**	**NO**

Notes: [1] PM10 emissions shown include the sum of particulate matter (PM) with aerodynamic diameter 0 to 2.5 microns and PM with aerodynamic diameter 2.5 to 10 microns.
[2] Fugitive dust emissions include reductions based on watering two times per day per MDAQMD Rule 403.2.
[3] Additional details on the emissions for each calendar year are included in Appendix A.
VOC = volatile organic compounds; NO_X = oxides of nitrogen; CO = carbon monoxide; PM_{10} = suspended PM; PM2.5 = fine PM; lbs/day = pounds/day
Source: Estimated by AECOM in 2017

Decommissioning

Decommissioning impacts are anticipated to be similar to those determined for the construction phase of the Project as described above. The actual impacts would be dependent upon the proposed decommissioning action and final use of the site. Applicable construction phase applicant proposed measures (APMs) would be implemented during the decommissioning phase to minimize associated impacts.

AQ-3: *The Project would result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors). The impact would be significant, requiring mitigation.*

Construction

The cumulative analysis focuses on whether a specific project would result in cumulatively considerable contribution of emissions to the region. Per CEQA Guidelines Section 15064(h)(4), the existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the Project's incremental effects are cumulatively considerable.

The MDAQMD as a whole is considered a nonattainment area for ozone (CAAQS and NAAQS) and PM (CAAQS and NAAQS). As discussed earlier, the Project would result in the generation of VOC, NOX, CO, PM10, and PM2.5 emissions. Emissions of NOX, PM10, and PM2.5 would exceed the recommended emissions thresholds for construction activities. These thresholds are designed to identify those projects that would result in significant levels of air pollution, and that would assist the region in attaining the applicable state and federal ambient air quality standards. When a project exceeds these significance thresholds, it is considered to impede attainment and maintenance of ambient air quality standards.

Because the Project would exceed the project-level air quality significance thresholds for criteria pollutant emissions, and incorporation of LEID elements would be similar to the traditional design, the Project's construction emissions would have a cumulatively considerable contribution to the region's air quality. Therefore, the cumulative impact would be significant. Implementation of MMs AQ-A through AQ-D would be required under both scenarios.

Operation

As shown in Table 8, operation of the Project would not result in emissions that exceed the project-level thresholds for criteria pollutant emissions. Therefore, operational emissions would not have a cumulatively considerable contribution to the region's air quality. The cumulative impact would be less than significant.

Decommissioning

Decommissioning impacts are anticipated to be similar to those determined for the construction phase of the Project as described above. The actual impacts would be dependent upon the proposed decommissioning action and final use of the site. Applicable construction phase APMs would be implemented during the decommissioning phase to minimize associated impacts.

AQ-4: *The Project would expose sensitive receptors to substantial pollutant concentrations. The impact would be significant, requiring mitigation.*

Construction

During construction, the greatest potential for toxic air contaminant (TAC) emissions would be related to diesel PM emissions associated with heavy-duty construction equipment activity. The Office of Environmental Health Hazard Assessment (OEHHA) developed a Guidance Manual for the Preparation of Health Risk Assessments (OEHHA 2015). According to OEHHA methodology, health effects from carcinogenic TACs are usually described in terms of individual cancer risk, which is based on a 30-year lifetime exposure to TACs. Construction activities are anticipated to last approximately 23 months and would cease following completion of the project. Therefore, the total exposure period for construction activities would be approximately six percent of the total exposure period used for typical residential health risk calculations (i.e. 30 years). Further, construction emissions would occur

intermittently throughout the day, as construction equipment is required across the 2,489 project area, rather than as a constant plume of emissions from the project site.

In addition, concentrations of mobile source diesel PM emissions are typically reduced by 70 percent at a distance of approximately 500 feet from freeways, which are continuous emission sources, and an 80 percent decrease at 1,000 feet from distribution centers (ARB 2005). Studies also indicate that diesel PM emissions and the relative health risk can decrease substantially within 300 feet (ARB, 2005; Zhu et al., 2002). As explained previously, the Project Site is located in primarily open space, and not in the vicinity of any sensitive receptors. The nearest sensitive receptor is a residence located over 2 miles from the Project Site.

Therefore, considering the construction schedule, substantial buffer distance to the nearest sensitive receptor and the highly dispersive nature of diesel PM emissions, construction of the Project would not expose sensitive receptors to substantial pollutant concentrations. This impact would be less than significant.

Operation

As explained previously, operation of the Project would generate approximately 100 vehicle trips per day associated with worker trips. Operational activities would include solar module washing; vegetation, weed, and pest management; and security. Maintenance activities would also include panel repairs; maintenance of transformers, inverters, and other electrical equipment as needed; and road and fence repairs. As explained previously, the nearest sensitive receptor is located over 2 miles from Project Site, and mobile source diesel PM emissions are typically reduced by 70 percent at a distance of approximately 500 feet (ARB 2005). In addition, operation of the Project is not anticipated to involve heavy–duty off-road equipment. Therefore, the Project would not expose sensitive receptors to substantial pollutant concentrations that would result in a health risk. This impact would be less than significant.

Decommissioning

Decommissioning impacts are anticipated to be similar to those determined for the construction phase of the Project as described above. The actual impacts would be dependent upon the proposed decommissioning action and final use of the site. Applicable construction phase APMs would be implemented during the decommissioning phase to minimize associated impacts.

AQ-5: *The Project would not create objectionable odors affecting a substantial number of people. The impact would be less than significant.*

Sources that may emit odors during construction activities include exhaust from diesel construction equipment and heavy-duty trucks, which could be considered offensive to some individuals. Odors from these sources would be localized and generally confined to the immediate area surrounding the Project Site. The Project would use typical construction techniques, and the odors would be typical of most construction sites and temporary in nature. After construction of the Project, all construction-related odors would cease. PV solar projects are not typically large generators of odors; thus, operation of the Project would not be expected to add any new odor sources. Decommissioning activities are expected to be very similar to construction activities and may therefore also emit odors including exhaust from diesel equipment and heavy-duty trucks. After decommissioning, all associated odors would cease. As a result, the Project would not create objectionable odors affecting a substantial number of people during any phase of the Project. The impact would be less than significant.

5.2 Cumulative Impacts

By its very nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development within the MDAB, and this regional impact is cumulative rather than being attributable to any one source. A project's emissions may be individually limited, but cumulatively considerable when taken in combination with past, present, and future development projects. The thresholds of significance are relevant to whether a project's individual emissions would result in a cumulatively considerable incremental contribution to the existing cumulative air quality conditions. As discussed in AQ-3 and AQ-4, the Project would exceed the project level air quality significance thresholds for criteria pollutant emissions. Therefore, the Project's construction emissions would have a cumulatively considerable contribution to the region's air quality.

6. Mitigation Measures

AQ-A. The Project Applicant shall develop and implement a Dust Control Plan that describes the fugitive dust control measures that would be implemented and monitored at all locations of proposed facility construction. The Dust Control Plan shall comply with the mitigation. The plan shall be submitted to MDAQMD no less than 60 days prior to the start of construction. The plan shall be incorporated into all contracts and contract specifications for construction work. The plan shall outline the steps to be taken to minimize fugitive dust generated by construction activities by:

- Describing each active operation that may result in the generation of fugitive dust;
- Identifying sources of fugitive dust, e.g., earth moving, storage piles, vehicular traffic;
- Describing the control measures to be applied to each of the sources identified. The descriptions shall be sufficiently detailed to demonstrate that the best available control measures required by the air quality districts for linear projects are used; and
- Providing the following control measures, in addition to or as listed in the applicable rules but not limited to:
    - Visible speed limit signs shall be posted at the site entrance(s);
    - No vehicle shall exceed 25 miles per hour (mph) on paved roads or 15 mph on unpaved roads. Speeds shall be reduced if visible dust emissions occur;
    - Use of street sweeping and trackout devices at the construction site. Sweep streets daily if visible soil material is carried into adjacent public streets or wash trucks and equipment before entering public streets;
    - Frequent watering or stabilization of excavation, spoils, access roads, storage piles, and other sources of fugitive dust (parking areas, staging areas, other) if construction activity cause persistent visible emissions of fugitive dust beyond the work area;
    - Apply chemical soil stabilizers or apply water to form and maintain a crust on inactive construction areas (disturbed lands that are unused for four consecutive days);
    - Cover stockpiles and suspend construction work when winds exceed 30 miles per hour;
    - Pre-watering of soils prior to clearing and trenching;
    - Pre-moisten, prior to transport, import and export dirt, sand, or loose materials;
    - Installing temporary coverings on storage piles when not in use. Cover loads in haul trucks or maintain at least six inches of free-board when traveling on public roads;
    - Dedicating water truck or high/capacity hose to any soil screening operations;
    - Minimizing drop height of material through screening equipment;
    - Reducing the amount of disturbed area where possible; and
    - Planting vegetative ground cover in disturbed areas as soon as possible following construction activities.

The Applicant or its designated representative shall obtain prior approval from the MDAQMD prior to any deviations from fugitive dust control measures specified in the Dust Control Plan. A justification statement used to explain the technical and safety reason(s) that preclude the use of required fugitive dust control measures shall be submitted to the appropriate agency for review. The provisions of the Dust Control Plan shall also apply to project decommissioning activities.

AQ-B. The construction contractor shall use off-road construction diesel engines that meet, at a minimum, the Tier 4 Final California Emissions Standards, unless such an engine is not available for a particular item of equipment. Tier 4 Interim or Tier 3 engines will be allowed on a case-by-case basis when the contractor has documented that no Tier 4 Final equipment, or emissions equivalent retrofit equipment is available for a particular equipment type that must be used to complete construction. Documentation shall consist of signed written statements from at least two construction equipment rental firms.

AQ-C. The construction contractor shall minimize idling time by shutting equipment off when not in use or reducing the time of idling to no more than five minutes (5-minute limit is required by the State Airborne Toxics Control Measure [Title 13, sections 2449 and 2485 of the California Code of Regulations]) and provide clear signage that posts this requirement for workers at the entrances to the Project Site.

AQ-D. The construction contractor shall maintain construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determined to be running in proper condition before it is operated.

7. Results and Findings

7.1 CEQA Significance Findings

7.1.1 Traditional Design

Implementation of MMs AQ-A through AQ-D would ensure construction activities associated with the construction of the Project would minimize criteria pollutant emissions. MM AQ-A would reduce fugitive dust emissions through implementation of a dust control plan. Although the specific control measures will be included in the plan, the emission estimates assumed frequent watering (at least three times per day) to achieve dust control efficiency of 60 percent, and limiting speeds to 15 miles per hour to achieve a combined dust control efficiency of 81 percent during construction activities. MM AQ-B requires engines in diesel-fueled construction equipment above 50 horsepower to meet Tier 4 emission standards. Emission standards for diesel off-road equipment are based on the engine model year. Implementation of these standards, referred to as Tier 1 emission standards, became effective in 1996. The more stringent Tier 2 and Tier 3 emission standards became effective between 2001 and 2008, with the effective date dependent on engine horsepower. Tier 4 interim standard became effective between 2008 and 2012, and Tier 4 final standards became effective in 2014 and 2015.

The OFFROAD model used in the analysis contains ranges of tier engines and uses average fleet data to develop emission factors for a given calendar year. Because the earliest year for construction of the Project would be 2020, and the requirements for production of Tier 3 and earlier engines have been in effect for over 10 years, it is reasonable to assume that most, if not all, off-road construction equipment would meet Tier 3 emission standards without the application of MM AQ-A. Based on the improvements in emissions standards required by CARB, off-road construction equipment with Tier 4 engines would result in an additional 20 percent reduction in VOC emissions, 91 percent reduction in NOX emissions, and 95 percent reduction in PM10 emissions from the use of Tier 3 equipment (SCAQMD 2014). Table 9 shows the mitigated emissions for construction activities for project proposed with a traditional design approach.

As shown in Table 9, implementation of MMs AQ-A through AQ-D would reduce emissions to the maximum extent feasible. Implementation of MMs AQ-A through AQ-D would reduce significant impacts of PM2.5 to a less than significant level; however, mitigated NOX and PM10 emissions would continue to exceed the recommended thresholds of significance. Emissions during the decommissioning phase of the Project are anticipated to be the same or less than the emissions estimated for construction activities. Therefore, the impact would be significant and unavoidable.

7.1.2 LEID Elements

Generally, the LEID elements would reduce overall ground disturbance activities, but would require similar equipment types, quantities, and workforce sizes as the traditional design. Thus, emissions for the LEID elements are anticipated to be similar to the traditional design. In addition, emissions during the decommissioning phase of

the Project are anticipated to be the same or less than the emissions estimated for construction activities. Therefore, the impact would be significant and unavoidable.

TABLE 9
MITIGATED MAXIMUM DAILY CONSTRUCTION EMISSIONS

	VOC	NO_X	CO	PM10 [1,2]	PM2.5[1]

2022	1.01	9.81	28.08	7.28	1.21
Maximum Annual Emissions (tons/year)	1.72	17.17	49.60	13.81	2.48
Threshold of Significance (tons/year)	25	25	100	15	12
Significant Impact?	**NO**	**NO**	**NO**	**NO**	**NO**

Notes: [1] PM10 emissions shown include the sum of particulate matter (PM) with aerodynamic diameter 0 to 2.5 microns and PM with aerodynamic diameter 2.5 to 10 microns.
[2] Fugitive dust emissions were reduced based on watering two times per day.
[3] Additional details on the emissions for each calendar year are included in Appendix A.
VOC = volatile organic compounds; NO_X = oxides of nitrogen; CO = carbon monoxide; PM10 = suspended PM; PM2.5 = fine PM; lbs/day = pounds per day
Source: Estimated by AECOM in 2019

7.2 NEPA Impacts Summary

General conformity de minimis thresholds are appropriate thresholds to be used for determining NEPA significance. As shown in Tables 7 and Table 8, the Project would not result in a substantial adverse effect related to criteria pollutant emissions.

Paved Road Dust $EF_{DUST} = [(k(sL)^{0.91} \times (W)^{1.02})(1 - P/4N))$

Source: AP-42 Section 13.2.1 (Paved Roads) - http://www.epa.gov/ttnchie1/ap42/ch13/final/c13s0201.pdf

Variable	Value	Description
k (PM10)	0.0022	particle size multiplier for particle size rangeand units of interest (lb/VMT)
k (PM2.5)	0.00054	particle size multiplier for particle size range and units of interest (lb/VMT)
sL	0.1	road surface silt loading (g/m^2)
W	2.4	average weight (tons) of vehicles (2.4 tons)
W	14.75	haul truck tons
P	30	number of "wet" days with at least 0.254 mm of precipitation during the averaging period
N	365	number of days in averaging period

Pickup and Worker

EF (PM10)	0.000647473	lb/VMT
EF (PM2.5)	0.000158925	lb/VMT

Haul Truck

EF (PM10)	0.004126423	lb/VMT
EF (PM2.5)	0.001012849	lb/VMT

Fugitive Dust - Unpaved Roads

	Daily On-Site Construction Motor Vehicle Fugitive Particulate Matter Emissions																
							Uncontrolled Emission Factors (lb/mi)[b]		Uncontrolled Emissions (lb/day)[c]			Controlled Emissions (lb/day)[e]		Uncontrolled Emissions (tons)		Controlled Emissions (tons)	
	Vehicle Type	Trips Per Day	Mi/Veh-Day	Surface Type	Silt Loading (g/m^2)/ Silt Content (%)[a]	Vehicle Weight (tons)	PM10	PM2.5	PM10	PM2.5	Control Efficiency[d]	PM10	PM2.5	PM10	PM2.5	PM10	PM2.5
Option A - Phase I	Truck	34	2.00	Unpaved	5	25	2.17	0.18	147.2	12.3	81%	28.5	2.4	29.4	2.4	5.7	0.5

Option A - Phase III	Truck	25	2.00	Unpaved	5	25	2.17	0.18	108.3	9.0	81%	20.9	1.7	20.5	1.7	4.0	0.3

Note: Totals may not match sum of individual values because of rounding.

[a] Unpaved surface silt content from SCAQMD CEQA Handbook, (1993) Table A9-9-D-1 for city and county roads

[b] Equations:

EF (unpaved) = k_u $(s/12)^a$ $(W/3)^b$ Ref: AP-42, Section 13.2.2, "Unpaved Roads," November 2006

Constants:

k_u =	1.8	(Particle size multiplier for PM)
	0.15	(Particle size multiplier for PM2.5)
a =	1	for PM10
	1	for PM2.5
b =	0.5	for PM10
	0.5	for PM2.5

[c] Uncontrolled emissions [lb/day] = Emission factor [lb/mi] x Number x Daily miles traveled [mi/vehicle-day]

[d] Control efficiency from watering unpaved road twice a day (55%) and limiting maximum speed to 15 mph (57%), from Table XI-A, Mitigation Measure Examples, Fugitive Dust from Construction & Demolition, http://www.aqmd.gov/ceqa/handbook/mitigation/fugitive/MM_fugitive.html

[e] Controlled emissions [lb/day] = Uncontrolled emissions [lb/day] x (1 - Control efficiency [%])

Fugitive Dust Emission Factors

Truck Loading Fugitive Dust Emission Factors

$EF_D = k \times (0.0032) \times ((U/5)^{1.3})/((M/2)^{1.4})$

Variable	Amount	Units	
EF (PM_{10})	0.0003	lb/ton	
EF ($PM_{2.5}$)	0.00004	lb/ton	
k (PM_{10})	0.35	factor	
k ($PM_{2.5}$)	0.053	factor	
U (mean wind speed)	7.90	miles/hr	WRCC average Annual Wind Speed Data for Blythe Airport
M (moisture content)	7.90	percent	USEPA, AP-42, July 1998, Table 11.9-3 Typical Values for Correction Factors Applicable to the Predictive Emission Factor Equations
Soil density (CalEEMod default)	1.26	tons/cy	
Rip rap density	2.23	tons/cy	
Gravel density	1.50	tons/cy	

E (lbs) = EF (lb/ton) x TP (tons)

Bulldozing, Scraping and Grading

PM10 Emission Factor [lb/hr] = 0.75 x (silt content [%])$^{1.5}$ / (moisture)$^{1.4}$

PM2.5 Emission Factor [lb/hr] = 0.60 x (silt content [%])$^{1.2}$ / (moisture)$^{1.3}$

Reference: AP-42, Table 11.9-1, July 1998

Parameter	Value	Basis
Silt Content	6.9	USEPA, AP-42, July 1998, Table 11.9-3 Typical Values for Correction Factors Applicable to the Predictive Emission Factor Equations
Moisture	7.9	USEPA, AP-42, July 1998, Table 11.9-3 Typical Values for Correction Factors Applicable to the Predictive Emission Factor Equations

PM10 Emission Factor	0.75 lb/hr
PM2.5 Emission Factor	0.41 lb/hr

Emissions [pounds per day] = Controlled emission factor [pounds per hour] x Bulldozing, scraping or grading time [hours/day]

Memorandum

Subject: Reduced Acreage Alternative Air Quality Analysis and Results

AECOM has prepared this air quality technical memorandum for the RE Crimson Solar Project (Project) for the Reduced Acreage Alternative. The Reduced Acreage Alternative would result in a slight decrease in grading compared to the Proposed Project.

Methodology

The Proposed Project has a permitted boundary of 2,465 acres and would require earthwork and material movement of approximately 191,000 cubic yards (CY) of soil. The Reduced Acreage Alternative would have a permitted boundary of 2,160 acres. Based on the percent reduction in acreage, it was assumed the Reduced Acreage Alternative would require earthwork and material movement of 167,316 CY. Since on-site cut-and-fill was assumed to be balanced, and construction equipment usage and material delivery trips are anticipated to remain the same as the Proposed Project, the Reduced Acreage Alternative primarily results in slight changes to the fugitive dust (particulate matter) emissions during construction. Particulate matter (PM) is subdivided into two classes based on particle size: PM equal to or less than 10 micrometers in diameter (PM10), and PM equal to or less than 2.5 micrometers in diameter (PM2.5).

Construction Impacts

Table 1 shows the estimated daily and annual construction emissions for the Reduced Acreage Alternative. As shown in Table 1, and similar to the Proposed Project, unmitigated construction emissions for the Reduced Acreage Alternative would exceed the daily thresholds of significance for nitrogen oxides (NOX), PM10, and PM2.5. Construction-related emissions of NOX and PM10 would also exceed the annual thresholds of significance.

TABLE 1
ESTIMATED CONSTRUCTION EMISSIONS FOR REDUCED ACREAGE ALTERNATIVE

	VOC	NO_X	CO	PM10 [1,2]	PM2.5[1]
Daily Emissions (lbs/day)					
2020	13.88	183.10	97.84	218.62	43.52
2021	52.90	596.46	367.82	597.58	98.84
2022	52.90	596.46	367.82	597.58	98.84
Maximum Daily Construction Emissions (lbs/day)	52.90	596.46	367.82	597.58	98.84
Threshold of Significance (lbs/day)	137	137	548	82	65
Significant Impact?	**NO**	**YES**	**NO**	**YES**	**YES**
Annual Emissions (tons/year)					
2020	0.41	4.27	2.96	6.85	1.35

2021	5.84	55.78	41.80	71.89	11.76
2022	3.32	31.17	23.68	38.37	5.98
Maximum Annual Emissions (tons/year)	5.84	55.78	41.80	71.89	11.76
Threshold of Significance (tons/year)	25	25	100	15	12
Significant Impact?	**NO**	**YES**	**NO**	**YES**	**NO**

Notes: [1] PM10 emissions shown include the sum of particulate matter (PM) with aerodynamic diameter 0 to 2.5 microns and PM with aerodynamic diameter 2.5 to 10 microns.
[2] Does not include fugitive dust emissions reductions per MDAQMD Rule 403. .
[3] Additional details on the emissions for each calendar year are included in Appendix A.
VOC = volatile organic compounds; NO_X = oxides of nitrogen; CO = carbon monoxide; PM10 = suspended PM; PM2.5 = fine PM; lbs/day = pounds per day
Source: Estimated by AECOM in 2019

Table 2 shows the mitigated daily and annual construction emissions for the Reduced Acreage Alternative. Similar to the Proposed Project, implementation of MMs AQ-A through AQ-D would reduce significant impacts of PM2.5 to a less than significant level; however, mitigated NOX and PM10 emissions would continue to exceed the recommended daily thresholds of significance.

TABLE 2
MITIGATED MAXIMUM DAILY CONSTRUCTION EMISSIONS FOR REDUCED ACREAGE ALTERNATIVE

2022	1.01	9.81	28.08	7.27	1.21
Maximum Annual Emissions (tons/year)	1.72	17.17	49.60	13.81	2.48
Threshold of Significance (tons/year)	25	25	100	15	12
Significant Impact?	**NO**	**NO**	**NO**	**NO**	**NO**

Notes: [1] PM10 emissions shown include the sum of particulate matter (PM) with aerodynamic diameter 0 to 2.5 microns and PM with aerodynamic diameter 2.5 to 10 microns.
[2] Fugitive dust emissions were reduced based on watering two times per day.
[3] Additional details on the emissions for each calendar year are included in Appendix A.
VOC = volatile organic compounds; NO_X = oxides of nitrogen; CO = carbon monoxide; PM10 = suspended PM; PM2.5 = fine PM; lbs/day = pounds per day
Source: Estimated by AECOM in 2019

Table 3 presents the estimated annual construction emissions for the Reduced Acreage Alternative in comparison the thresholds used for the NEPA analysis. The Reduced Acreage Alternative would not result in a substantial adverse effect related to criteria pollutant emissions.

TABLE 3
GENERAL CONFORMITY - ESTIMATED ANNUAL CONSTRUCTION EMISSIONS FOR REDUCED ACREAGE ALTERNATIVE

	VOC	NO_X	CO	PM10 [1]	PM2.5[1]
2020	0.10	1.18	3.53	1.39	0.33
2021	1.72	17.17	49.60	13.81	2.48
2022	1.01	9.81	28.08	7.27	1.21
Maximum Annual Construction Emissions (tons/year)	1.72	17.17	49.60	13.81	2.48
Threshold of Significance (tons/year)	100	100	N/A	100	N/A
Significant Impact?	No	No	No	No	No

Notes: [1] PM10 emissions shown include the sum of particulate matter (PM) with aerodynamic diameter 0 to 2.5 microns and PM with aerodynamic diameter 2.5 to 10 microns.
VOC = volatile organic compounds; NO_X = oxides of nitrogen; CO = carbon monoxide; SO_2 = sulfur dioxide; PM10 = suspended PM; PM2.5 = fine PM
Source: Estimated by AECOM in 2019

CEQA Significance Conclusions

Consistent with the findings of the Proposed Project in the Air Quality Technical Report (April 2019), emissions of NOX and PM10 associated with the Reduced Acreage Alternative would continue to exceed the recommended thresholds of significance. Operational emissions are anticipated to remain the same as the Proposed Project. Therefore, the air quality impact for the Reduced Acreage Alternative would be significant and unavoidable.

NEPA Impacts Summary

Consistent with the findings of the Proposed Project in the Air Quality Technical Report (April 2019), emissions associated with the Reduced Acreage Alternative would not result in a substantial adverse effect related to criteria pollutant emissions.

Reduced Acreage Alternative
Construction Emissions Summary

	Maximum Daily Emissions (lbs/day)

Note: Totals may not match sum of individual values because of rounding.

[a] Unpaved surface silt content from SCAQMD CEQA Handbook, (1993) Table A9-9-D-1 for city and county roads

[b] Equations:

EF (unpaved) = k_u $(s/12)^a$ $(W/3)^b$ Ref: AP-42, Section 13.2.2, "Unpaved Roads," November 2006

Constants:

k_u =	1.8	(Particle size multiplier for PM)
	0.15	(Particle size multiplier for PM2.5)
a =	1	for PM10
	1	for PM2.5
b =	0.5	for PM10
	0.5	for PM2.5

[c] Uncontrolled emissions [lb/day] = Emission factor [lb/mi] x Number x Daily miles traveled [mi/vehicle-day]

[d] Control efficiency from watering unpaved road twice a day (55%) and limiting maximum speed to 15 mph (57%), from Table XI-A, Mitigation Measure Examples, Fugitive Dust from Construction & Demolition, http://www.aqmd.gov/ceqa/handbook/mitigation/fugitive/MM_fugitive.html

[e] Controlled emissions [lb/day] = Uncontrolled emissions [lb/day] x (1 - Control efficiency [%])

Fugitive Dust Emission Factors

Truck Loading Fugitive Dust Emission Factors

$EF_D = k$ x (0.0032) x $((U/5)^{1.3})/((M/2)^{1.4})$

Variable	Amount	Units	
EF (PM_{10})	0.0003	lb/ton	
EF ($PM_{2.5}$)	0.00004	lb/ton	
k (PM_{10})	0.35	factor	
k ($PM_{2.5}$)	0.053	factor	
U (mean wind speed)	7.90	miles/hr	WRCC average Annual Wind Speed Data for Blythe Airport
M (moisture content)	7.90	percent	USEPA, AP-42, July 1998, Table 11.9-3 Typical Values for Correction Factors Applicable to the Predictive Emission Factor Equations
Soil density (CalEEMod default)	1.26	tons/cy	
Rip rap density	2.23	tons/cy	
Gravel density	1.50	tons/cy	

E (lbs) = EF (lb/ton) x TP (tons)

Bulldozing, Scraping and Grading

PM10 Emission Factor [lb/hr] = 0.75 x (silt content [%])$^{1.5}$ / (moisture)$^{1.4}$

PM2.5 Emission Factor [lb/hr] = 0.60 x (silt content [%])$^{1.2}$ / (moisture)$^{1.3}$

Reference: AP-42, Table 11.9-1, July 1998

Parameter	Value	Basis
Silt Content	6.9	USEPA, AP-42, July 1998, Table 11.9-3 Typical Values for Correction Factors Applicable to the Predictive Emission Factor Equations
Moisture	7.9	USEPA, AP-42, July 1998, Table 11.9-3 Typical Values for Correction Factors Applicable to the Predictive Emission Factor Equations

PM10 Emission Factor	0.75 lb/hr
PM2.5 Emission Factor	0.41 lb/hr

Emissions [pounds per day] = Controlled emission factor [pounds per hour] x Bulldozing, scraping or grading time [hours/day]

Emission Factors - OFFROAD

Operational Fugitive Dust Emissions

Daily On-Site Construction Motor Vehicle Fugitive Particulate Matter Emissions														
						Uncontrolled Emission Factors (lb/mi)[b]		Uncontrolled Emissions (lb/day)[c]			Controlled Emissions (lb/day)[f]		Uncontrolled Emissions (tons/year)	
Vehicle Type	No.	Mi/Veh-Day[f]	Surface Type	Silt Loading (g/m^2)/ Silt Content (%)[a]	Vehicle Weight (tons)	PM10	PM2.5	PM10	PM2.5	Control Efficiency[d]	PM10	PM2.5	PM10	PM2.5
Pickup Trucks	4	40	Unpaved	6	2.4	4.81E-01	7.27E-02	77.0	11.6	55%	34.7	5.2	6.3	1.0

Note: Totals may not match sum of individual values because of rounding.

[a] Unpaved surface silt content from SCAQMD CEQA Handbook, (1993) Table A9-9-D-1 for city and county roads

[b] Equations:

EF (unpaved) = k_u $(s/12)^a$ $(W/3)^b$ Ref: AP-42, Section 13.2.2, "Unpaved Rods," November 2006

Constants:

k_u =	1.5	(Particle size multiplier for PM)
	0.15	(Particle size multiplier for PM2.5)
a =	0.9	for PM10
	0.9	for PM2.5
b =	0.45	for PM10
	0.45	for PM2.5

[c] Uncontrolled emissions [lb/day] = Emission factor [lb/mi] x Number x Daily miles traveled [mi/vehicle-day]

[d] Control efficiency from watering unpaved road twice a day (55%) and limiting maximum speed to 25 mph (44%), from Table XI-A, Mitigation Measure Examples, Fugitive Dust from Construction & Demolition, http://www.aqmd.gov/ceqa/handbook/mitigation/fugitive/MM_fugitive.html

[e] Controlled emissions [lb/day] = Uncontrolled emissions [lb/day] x (1 - Control efficiency [%])

[f] Based on 1 mile roundtrip from Rios Ave to staging area

1. Estimated one-way travel distance for trucks from Port of Los Angeles to the MDAQMD jurisdiction western border for module, tracker, foundation, and inverter deliveries. Water deliveries are assumed to be from Blythe, assuming the following round trip amounts: Phase 1 – 9,776 trips; Phase 2 – 19,551 trips; and Phase 3 – 3,259 trips.

2. Exhaust emission factors for obtained from Riverside County 2020 Onroad emission factors for diesel T7 tractor (aggregated model years and speeds) from AECOM appendix.

3. PM10 dust and PM2.5 dust emission factors based on AP-42 emission calculations for paved road and unpaved road dust from haul trucks (also from AECOM appendix)

*Shaded numbers were obtained from, or based on, the AECOM Air Quality Report.

426.7 320

Executive Summary

The Recurrent Energy LLC (RE) RE Crimson Solar Project (Project) is located in Riverside County, approximately 13 miles west of Blythe, California. The Project is located in the Riverside East Solar Energy Zone/Development Focus Area and within a Development Focus Area on public land administered by United States (U.S.) Bureau of Land Management (BLM). The Project's Plan of Development (POD) includes a traditional photovoltaic (PV) design referred to as Option A, as well as consideration of several potential low environmental impact design (LEID) elements. The traditional PV design approach consists of desert tortoise (*Gopherus agassizii*) exclusion fencing, a mow-and-roll approach to site preparation, compacted roads, and trenching for electrical lines; however, the applicant has also been actively investigating alternative LEID elements and the potential for those to reduce Project impacts. LEID elements include several potential design changes which may be implemented in their entirety, in part, or not at all. These include:

1. Minimizing grading during site preparation and maintaining more onsite vegetation to facilitate post-construction residual habitat value and post-operations/site reclamation success.

2. Avoiding or limiting trenching by placing electrical wiring aboveground.

3. Placing transformer/inverter groups on elevated support structures in lieu of cement foundations.

The LEID elements would minimize grading, trenching, and vegetation removal beyond traditional design approaches for PV projects with the objective of reducing overall long-term impacts for the Project. Although the incorporation of LEID elements could result in slight modifications to the module locations due to topographic constraints, the Permitting Boundary or limits of development would be the same with LEID elements incorporated. The comparative impacts of the traditional design approach versus design with LEID elements incorporated is not known; therefore, to facilitate appropriate analysis of the Project and allow for the incorporation of LEID elements where practicable and environmentally beneficial, the environmental technical analysis are based on the elements that result in the worst-case scenario for construction and operations.

The total area for the Project (i.e., RE Crimson Permitting Boundary) is 2,489 acres, including a 2,465-acre solar field development area with approximately 1,859 acres of solar modules (array blocks) and 24 acres for linear facilities including access/perimeter roads with a 30-to 60-foot corridor width and generation interconnection (gen-tie) and power line corridors with a 150-foot width. The block layouts may vary slightly with the incorporation of LEID elements, but would remain within the RE Crimson Permitting Boundary.

The construction and operation of the Project would be similar with or without the incorporation of all or some of the LEID design elements. The Project would interconnect to the regional electrical grid at the Southern California Edison (SCE) 230-kilovolt (kV) Colorado River Substation (CRS). It would generate up to 350 megawatts (MW) of renewable energy using PV technology and would include up to 350 MW of integrated energy storage capacity.

The biological resources assessment included a review of the California Natural Diversity Database (CNDDB) and United States Fish and Wildlife Service (USFWS) regional database to identify previous biological resource locations in the project vicinity. Based on the results of the database review, AECOM biologists conducted vegetation mapping, rare plant surveys, and protocol surveys for the special-status species identified on or near the Project site.

The Project site is not located within a Desert Wildlife Management Area (DWMA), Area of Critical Environmental Concern (ACEC), a designated Wilderness Area, or Herd Management Area (HMA); however, it is located north and west of the Mule Mountains ACEC, and east of the Chuckwalla Valley Dune thicket and Chuckwalla Desert Wildlife

Management Area. Additionally, federally designated critical habitat for desert tortoise is outside of, but adjacent to, the western boundary of the Project site within the Chuckwalla Critical Habitat Unit.

A larger area consisting of the RE Crimson Project area and surrounding lands was originally proposed for development by BrightSource Energy, Inc. (BrightSource), as the Sonoran West Solar Energy Generating Facility (Sonoran West Project [SWP] Site). Surveys for the SWP Site were conducted in 2011 and 2012. These surveys included a general vegetation survey, invasive plant species survey, special-status plant species surveys, various wildlife species surveys, and a jurisdictional waters delineation. Wildlife species surveys included desert tortoise, Mojave fringe-toed lizard (*Uma scoparia*), Couch's spadefoot (*Scaphiopus couchii*), burrowing owl (*Athene cunicularia*), elf owl (*Micrathene whitneyi*), gila woodpecker (*Melanerpes uropygialis*), golden eagle (*Aquila chrysaetos*), migratory bird surveys, nocturnal avian radar, desert kit fox and American badger (*Taxidea taxus*), and bat surveys. Some of these surveys were repeated again in 2016 and 2017 for certain species, while others were determined to be sufficient and therefore not repeated. In 2016 and 2017, surveys were conducted for special-status plant species, an updated (modified) jurisdictional waters delineation, (modified) desert tortoise, burrowing owl, elf owl, migratory bird surveys, desert kit fox and American badger, bat surveys, and wildlife camera surveys.

The Project area supports ten native desert vegetation communities, of which creosote bush—white bursage scrub is the most widespread. Sensitive vegetation communities onsite consist of desert dunes (only within linear features), creosote bush—white bursage/big galleta grass association and blue palo verde—ironwood woodland. No federal or state-listed plants were found onsite, but the following special-status plant species were detected within the RE Crimson Permitting Boundary most recently during the spring 2017 surveys: Harwood's eriastrum (*Eriastrum harwoodii*), ribbed cryptantha (*Johnstonella costata*), Utah vine milkweed (*Funastrum utahense*), and desert unicorn plant (*Proboscidea althaeifolia*). The only federally listed wildlife species observed onsite was the desert tortoise. Twenty individuals were observed during focused surveys in October 2016 with desert tortoises located primarily outside the southern and eastern portions of the Project area near the base of the Mule Mountains. Only two desert tortoise (both adults) were actually detected within the RE Crimson Permitting Boundary. Two state listed threatened wildlife species were detected including Swainson's hawk (*Buteo swainsoni*) and bank swallow (*Riparia riparia*). Additional special-status species were detected within the RE Crimson Permitting Boundary including Mojave fringe-toed lizard and a variety of avian, bat, and mammalian species. In total, during biological surveys for the Project area, 163 wildlife species were detected including 12 invertebrate, 17 reptile, 108 bird, and 26 mammal species.

This report addresses permanent, temporary, direct, and indirect impacts to biological resources within, and adjacent to the 2,489-acre RE Crimson Permitting Boundary. The impacts would vary depending upon the type of construction and operation approach followed, whether the traditional construction approach is used or any combination of the LEID elements are incorporated into the final Project. Regardless of the approach, the Project is expected to result in impacts to three sensitive vegetation communities, desert dunes, creosote bush—white bursage/big galleta grass association, and blue palo verde—ironwood woodland. Direct and/or indirect impacts to special-status plant species within the RE Crimson Permitting Boundary include: Harwood's eriastrum, desert unicorn plant, ribbed cryptantha, and Utah vine milkweed. Impacts to special-status wildlife species would include potential direct impacts to desert tortoises, Mojave fringe-toed lizards, and other special-status bird and wildlife species. Additionally, wildlife movement may be impacted; however, the Project avoids the microphyll woodlands, and therefore wildlife will still be allowed to travel through the Project area at several locations without hindrance. Project impacts will be reduced by implementation of impact avoidance, minimization, and mitigation measures.

This page intentionally left blank.

1.0 Introduction

1.1 Project Location

The proposed Project is located in unincorporated eastern Riverside County, approximately 13 miles west of Blythe, just north and west of the Mule Mountains and just south of Interstate 10 (I-10), including portions of Sections 1, 2, 11, 12, 13, 24, 25 within Township 7 South, Range 20 East, and portions of Sections 6, 7, 8, 17, 18 within Township 7 South, Range 21 East (Figure 1). The Project site consists of approximately 2,489 acres of Bureau of Land Management (BLM)-administered land within the Riverside East Solar Energy Zone/Development Leasing Area and within the Desert Renewable Energy Conservation Plan (DRECP) Development Focus Area as presented in the Final Environmental Impact Statement (EIS) and approved in the Record of Decision and associated Land Use Plan Amendment in September 2016 (BLM 2015). The Project is not sited within the adjacent Section 368 Federal Energy Corridor pursuant to the Westwide Energy Corridor Final Programmatic EIS, except for a short generation intertie (gen-tie) line that would interconnect the Project to the Southern California Edison's (SCE's) Colorado River Substation (CRS).

1.2 Site Description

The Project site is nearly completely vacant and undeveloped land that is owned by the Federal government and administered by the BLM. There is a 120.5-acre private parcel in the center of the Project site that currently is not planned for use by the Project. Surveys were not conducted within the private parcel. There are no existing structures within the Project that would need to be demolished, and there are no existing roads within the proposed Project solar development area. An existing transmission line and paved access road oriented east-west are located along the northern boundary of the Project site that lead to the Colorado River Substation (CRS). I-10 is just over 1 mile north of the northern project boundary, and the western edge of the Colorado River Valley is approximately 4.5 miles to the east.

The site is surrounded primarily by BLM-managed lands and some private parcels. The site is located at the northern foot of the Mule Mountain Area of Critical Environmental Concern (ACEC). The SCE high-voltage transmission line and CRS are located directly north of the Project site, and I-10 is north of and parallel to those facilities. East of the Project site is First Solar's proposed Desert Quartzite Solar Project (Desert Quartzite). Farther northeast of Desert Quartzite is the site of the recently approved Blythe Mesa Solar Project owned by Renewable Resources Group. Federally designated critical habitat for desert tortoise (*Gopherus agassizii*) within the Chuckwalla Critical Habitat Unit and the vast Chuckwalla Desert Wildlife Management Area (DWMA) are west of the Project site (Figure 2).

The Project site has a gentle slope north and west, away from the base of the Mule Mountains, with elevation ranging from a high of about 710 feet above mean sea level (AMSL) around the base of the Mule Mountains to a low of about 430 feet AMSL near the northwestern corner of the site closest to I-10. Terrain onsite generally slopes down from higher land at the base of the Mule Mountains to the south. Onsite slopes range from approximately 5.6 percent (%) in the steeper southeastern corner that abuts the Mule Mountains, 1 to 3% on bajadas and alluvial fans along the base of the mountains, to relatively flat terrain in the central and northern sections of the site. The Project site is situated at the eastern edge of the Chuckwalla Hydrologic Area and supports a broad alluvial fan that includes many braided washes and channels that converge into a primary channel flowing into an intra-state playa lake northwest of the Project site. This playa lake is not a Traditional Navigable Water; therefore, the channels in the Project area do not qualify as federal jurisdictional waters.

Regionally, the Project site is situated within the Colorado Desert on gently rolling open terrain dominated by desert scrub vegetation. The Colorado Desert is a portion of the larger Sonoran Desert located in California. The Sonoran Desert extends across the southwest United States and into Mexico. The climate in this region is very hot and dry in the summer months, and cool and moist in the winter. Perennial and intermittent rivers and streams are rare, and most water flow occurs as flood flows within defined washes and less defined flood-flow paths during major winter rains and summer monsoons. Habitats in this region of the Colorado Desert vary with topography, elevation, and precipitation levels. Desert

scrub vegetation covers most of the site, except for sparsely vegetated desert dunes and more heavily vegetated desert washes.

The Project site has experienced some historical disturbance from military training during World War II, including tank and off-road vehicle use. During World War II, the site was part of the General George S. Patton Desert Training Center, officially the California-Arizona Maneuver Area, a simulated theater of operations. More recent disturbance from recreational off-road vehicle users is evident within the Project site, even though there are no BLM-designated routes within the Project site. Most off-road vehicle use was evident within the washes with vehicle tracks leading toward the Mule Mountains.

1.3 Project Description

Sonoran West Solar Holdings, LLC (applicant), a wholly owned subsidiary of RE, proposes to construct and operate the RE Crimson Solar Project (Project). This Project is a utility-scale solar PV and energy storage project that would be located on federal lands managed by the BLM within the California Desert Conservation Area (CDCA) planning area. The Project would interconnect to the regional electrical grid at the SCE 230-kV CRS. The project would be located on up to 2,500 acres of public lands. It would generate up to 350 MW of renewable energy using PV technology and would include up to 350 MW of integrated energy storage capacity.

The total area for the Project (i.e., RE Crimson Permitting Boundary; 2,489 acres) includes a 2,465-acre solar field development area with approximately 1,859 acres of solar modules (array blocks) and 24 acres for linear facilities, including access/perimeter roads assuming a 30-to 60-foot corridor width and gen-tie and power line corridor 150 feet wide (Figure 3). The Project applicant is proposing to construct the Project using traditional construction methods consisting of desert tortoise exclusion fencing, mow-and-roll of vegetation for site preparation, compacted roads, and trenching for electrical lines. The applicant is also actively investigating alternative LEID elements and the potential for those to reduce Project impacts.

The Project site was formerly proposed for development as the Sonoran West Solar Energy Generating Facility proposed by BrightSource with submittal of an SF-299 application for CACA-051967 in 2009. The former Sonoran West project would have been a 540-MW, dual-turbine power tower project on approximately 7,000 acres of a combination of BLM-managed and privately owned land. The current revised proposal represents a substantial reduction in land use requirements and associated impacts.

1.4 Design Option Scenarios

The Project applicant is proposing to construct the Project using a traditional construction approach consisting of desert tortoise exclusion fencing, a mow-and-roll approach to site preparation, grubbing and grading for areas of excessive topography or slope, site structures such as the onsite substation, inverter pads, roads, and Operations and Maintenance (O&M) facilities, compacted roads, and trenching for electrical lines; however, the applicant is actively investigating alternative LEID elements and the potential for those to reduce Project impacts. LEID elements include several potential design changes including:

1. Minimizing grading during site preparation and maintaining more onsite vegetation to facilitate post-construction residual habitat value and post-operations/site reclamation success;

2. Avoiding or limiting trenching by placing electrical wiring aboveground; and

3. Placing transformer/inverter groups on elevated support structures in lieu of cement foundations.

The LEID elements would minimize grading, trenching, and vegetation removal beyond traditional design approaches for PV projects with the objective of reducing overall long-term impacts for the Project. Although the incorporation of LEID elements could result in slight modifications to the module locations due to topographic constraints, the Permitting Boundary or limits of development would be the same with LEID elements incorporated. The comparative impacts of the traditional design approach versus design with LEID elements incorporated is not known; therefore, to facilitate appropriate analysis of the Project and allow for the incorporation of LEID elements where practicable and environmentally beneficial, the environmental technical analyses are based on the elements that result in the worst-case development/impact scenario for construction and operations.

A summary of the proposed traditional design approach is presented below followed by more information on the potential LEID elements that are being actively considered by RE. A more detailed description of the Project is included in Appendix A and is based upon the information provided by RE in the revised November POD (RE 2017).

1.4.1 Traditional Design

An estimated 2 million solar modules would be arranged on the site in the form of solar arrays (fixed-tilt or tracking systems). Structures supporting the PV modules would consist of steel piles (e.g., cylindrical pipes, H-beams, or similar), which would be driven into the soil using pneumatic techniques, such as a hydraulic attachment on the boom of a backhoe tractor.

The proposed traditional design is laid out primarily in 2-MW increments, each 2-MW increment would include an inverter-transformer station (approximately 40 feet by 25 feet) constructed on a concrete pad or steel skid, and would be centrally located within the PV module arrays. Each inverter-transformer station would contain up to four inverters, a transformer, a battery enclosure, and a switchboard 8 to 11 feet high. Underground cables would be installed to convey the direct current (DC) electricity from the solar modules to the inverters to convert the DC to alternating current (AC). Between 300 and 500 wooden poles (approximately 30 to 50 feet tall) would be installed across the entire site at approximately 250-foot intervals to convey energy to a central substation location, which would transform voltage from 34.5 kV to 230 kV.

Up to four substations would transform voltage from 34.5 kV to 230 kV. The area of each substation and associated equipment would be approximately 30,000 square feet (150 feet by 200 feet) in close proximity to the CRS. Each substation would collect consolidated intermediate voltage cables from the PV collector system. Electrical transformers, switchgear, and related substation facilities would be designed and constructed to transform medium-voltage power from the Project's delivery system to the 230-kV CRS.

An O&M building would be located near the Project substations. The O&M building would be approximately 2,000 square feet in size (approximately 40 feet by 50 feet by 15 feet at its tallest point), which would accommodate O&M staff. Two equipment storage containers measuring 40 feet by 8 feet by 9 feet each also would be located at the substation area. The O&M building would be constructed on a concrete foundation.

Energy storage may be achieved by either a battery or flywheel storage system capable of storing up to 350 MW of electricity. The storage system would consist of banks of batteries or flywheels housed in electrical enclosures located indoors within the Project energy storage facilities.

Access to the Project site would be provided via the existing paved Wiley's Well Road and Powerline Road to the CRS from I-10 to the north. The Project's onsite roadway system would include a perimeter road, access roads, and internal roads. These roads would be graded and surfaced with gravel, compacted dirt, or another commercially available surface and would accommodate the Project O&M activities.

1.4.2 Low Environmental Impact Design Elements

As presented above, the applicant has proposed potential LEID elements for the Project for consideration with the objective of evaluating alternative design approaches that may reduce environmental impacts or negative effects from the project. These elements include changes to the grading approach, trenching and wiring, and elevation of inverter pads. To facilitate adequate analysis of potential design alternatives for the technical study, changes to the design were assessed for the potential LEID elements to determine the worst-case scenario. The design details with the incorporation of potential LEID elements are identical to those provided above for the traditional design, except for the following differences should LEID elements be incorporated:

- Solar blocks may be laid out in larger, 3-to 4-MW block sizes, requiring fewer inverter/transformer structures.
- Inverter/transformer equipment areas may be mounted on steel skids and installed on steel piers above the ground surface.
- Approximately 300 to 400 wooden AC transmission poles would be required in addition to the poles referenced under the traditional design to eliminate most trenching, which would result in the installation of up to 900 wooden poles in total.
- Access to the Project site would still be provided via the existing paved Wiley's Well Road and Powerline Road to the CRS via I-10; however, if the incorporation of elements results in fewer solar blocks, slightly fewer roads would be constructed (compacted and graded) onsite.

1.4.3 Construction Details

Construction of the Project will occur in three planned phases and will require approximately 17 months to complete with construction expected to begin in late-2020. The construction timeline may vary depending upon incorporation of LEID elements and associated changes required to the construction approach. Project phasing is summarized below with key activities. More details are provided in the Project Description included in Appendix A. In general, a reduction in ground-disturbing activities reduces the potential for impacting biological resources. LEID elements reduce ground-disturbance and would therefore have the potential to reduce adverse effects to biological resources. The following discussions include information on the relative differences in ground disturbance associated with traditional design versus LEID construction practices.

Pre-Construction Activities

Prior to the start of construction, several activities would be undertaken to prepare the site for crews and construction including:

1. Geotechnical and Hazards investigations. The applicant would conduct a geotechnical investigation utilizing subsurface scientific testing and analysis, and would use ground-penetrating radar to identify potential subsurface unexploded ordnance and Munitions and Explosives of Concern that may need to be stabilized or removed prior to construction.
2. Surveying, Staking, Flagging, and Preconstruction Resource Surveys. Prior to construction, the site boundary would be staked to demarcate the limits of disturbance, following which biologists would conduct preconstruction surveys to flag areas for avoidance, as appropriate.

3. Fence Installation. The Project will be fenced with security fencing (chain link topped with barbed wire) and desert tortoise exclusion fencing. The security fencing would be up to 8 feet tall. The exclusion fencing would be buried at least 12 inches below ground surface.

4. Resource Clearance Surveys. Following fence installation, likely in a phased approach, the Project development area would be cleared for special-status wildlife species (e.g., desert tortoise, desert kit-fox).

5. Staging Area Establishment. One or more secure staging areas would be established in support of construction activities.

Site preparation activities may vary in order, depending upon the incorporation of LEID components, the timeline for start of construction (e.g., biological resource survey windows), and other factors. In general, pre-construction activities have limited ground-disturbing impacts; but are necessary before full mobilization to support construction of the Project.

Phase 1 – Site Preparation and Grubbing

Phase 1 of construction will begin with the grubbing, grading, re-contouring, and compacting of the site, and graveling of access roads, followed by grading at the substation site. For traditional design, additional grading would be carried out at inverter and transformer pad locations where necessary. This construction phase will last approximately 16 weeks. The incorporation of LEID elements could result in reduced ground disturbance, if feasible, with reduced grading of solar field areas and/or the reduction or elimination of trenching.

Across flatter areas of the site, a mow-and-roll technique would be used to remove surface vegetation and keep root balls in place; vegetation would be mowed to within 6 inches of the ground surface, with any stubs worked over with a roller. Across portions of the site, grubbing and grading would be required to level rough or undulating areas of the site for solar modules installation and to prepare the soil for concrete foundations for substation equipment and inverters. Grubbing and grading generally involves the complete removal of all vegetation (including root balls) through scraping the soil with a dozer or other equipment and then blading the soil to maintain an even surface. Access road beds would also be grubbed, graded, and compacted. The site cut and fill would be approximately balanced; minimal import/export would be necessary.

If the Project implemented design measures to minimize grading, natural watercourses would be maintained across the site except along main access roadways, which would be graded, grubbed, recontoured, compacted, and graveled under either design option. Grading would occur at only road locations and the substation location. Otherwise, only minimal vegetation trimming would be conducted using hand techniques, and only particularly tall vegetation would require trimming. Vegetation below 18 inches would not be trimmed or modified.

Phase 2 – PV System Installation

Phase 2 of construction will begin with the pouring of foundations and the installation of the PV module support structure, which would consist of steel piles (e.g., cylindrical pipes, H-beams, or similar) being driven into the soil. To achieve ground preservation beneath the arrays, the incorporation of LEID elements would require individually sized piles to achieve a uniform elevation between module rows; thus, the duration of pile driving activities during this phase would last longer than those anticipated for traditional design. Additionally, the incorporation of LEID elements that would reduce ground disturbance (e.g., no or reduced grading) is expected to require the use of track-mounted pile drivers, as opposed to the backhoe-mounted pneumatic pile drivers used in traditional design, to reduce tire passes over natural vegetation. Construction of the structural support systems will be followed by the installation of the PV modules. This construction phase will last approximately 46 weeks. Construction equipment operating on the site will include track-mounted pile drivers, skid steers with auger/hoe attachments, flatbed trucks, water trucks, forklifts, trenchers, and welding units.

Phase 3 – Inverter, Transformer, Substation, and Electrical Collector System Commissioning

Phase 3 of construction will include the stringing of cable along module rows to a trunk cable system and the installation of AC and DC collector poles at inverter/transformer pad sites. Underground cables to connect module strings would be installed using ordinary trenching techniques, which typically include a rubber-tired backhoe excavator or trencher. Wire depths would be in accordance with local, State, and Federal requirements, and would likely be buried at a minimum of 18 inches below grade, by excavating a trench approximately 3 to 6 feet wide to accommodate the conduits or direct buried cables. After excavation, cable rated for direct burial or cables installed inside a polyvinyl chloride conduit would be installed in the trench, and, the excavated soil would likely be used to fill the trench and lightly compressed. All cabling excavations would be to a maximum depth of 10 feet.

All electrical inverters and the transformer would be placed on concrete foundation structures or steel skids. If inverter/transformer pads will be elevated on piers as an LEID element, additional pile driving will be required during this phase for elevated pad installation. If trenching were to be reduced or eliminated and associated wires were racked above ground this would result in reduced ground disturbance.

The substation areas would be excavated for the transformer equipment and control building foundation and oil containment area. The site area for the substations would be graded and compacted to an approximately level grade. Concrete pads would be constructed as foundations for substation equipment, and the remaining area would be graveled. Concrete for foundations would be brought onsite from a batching plant in the City of Blythe or would be batched on site as necessary.

This construction phase will last approximately 32 weeks. Construction equipment operating on the site will include a track-mounted pile driver, a dozer, a grader, a front-end loader, a vibratory roller, a flatbed truck, a water truck, skid steers with auger/hoe attachments, cranes, backhoes, aerial lifts, trenchers, and concrete trucks.

1.4.4 Operations and Maintenance

The solar modules are expected to be in operation during daylight hours for 7 days per week, 365 days per year. Operational activities include solar module washing, maintenance of transformers, inverters, or other electrical equipment, road and fence repairs, vegetation/pest management, and site security. Solar modules would be washed as needed to maintain optimal electricity production (up to four times per year) using light utility vehicles with tow-behind water trailers. If LEID elements are incorporated into the design, the Project may also be visited regularly by a biological resource monitor, who will monitor applicable O&M activities and conduct periodic site assessments.

Weed Control

RE anticipates the need to control weeds during both Project construction and operations. Herbicide control would involve the use of BLM-approved herbicides to control weed populations when manual control methods are not successful in managing the spread of invasive plants.

1.4.5 Decommissioning

The Applicant is expected to receive authorizations and permits with 30-year terms. At the end of the term, including any extensions, the Project would cease operation. At that time, the facilities would be decommissioned and dismantled and the site would be restored to conditions similar to pre-construction conditions. Decommissioning activities would require approximately 9,883 truck trips and a workforce of approximately 320 workers, and would take approximately 17 months to complete. Upon decommissioning, the Project site could be converted to other uses in accordance with applicable land use regulations in effect at that time.

It is anticipated that during project decommissioning, project structures would be removed from the ground on the project sites. Aboveground and any underground equipment would be removed including module posts and support structures, gen-tie poles that are not shared with third parties, and the overhead collection system within the Project sites, inverters, transformers, electrical wiring, equipment on the inverter pads, and related equipment and concrete pads, and any O&M facilities and related equipment and infrastructure. The substation would be removed if it is owned by the Project operator; however, if a public or private utility assumes ownership of the substation, the substation may remain onsite to be used as part of the utility service to supply other land uses.

Equipment would be de-energized prior to removal. Equipment would be shipped offsite by truck (after first being placed in secure transport enclosures as necessary) to be salvaged, recycled, or disposed of at an appropriately licensed disposal facility. Removal of the solar modules would include disassembly and removal of the racks on which the solar modules are attached, removal of the structures supporting the racks, and their placement in secure transport enclosures and a trailer for storage; the racks and structures supporting the racks would then be recycled or disposed of at an appropriately licensed disposal facility. Solar modules would be removed from the site and either transported to another solar electrical generating facility or a recycling facility, or disposed of at an appropriately licensed disposal facility. In conjunction with any solar modules, which may be transported to another solar electrical generating facility, such solar modules may undergo a refurbishing process to extend their estimated 30-year lifespan. The demolition debris and removed equipment may be cut or dismantled into pieces to be safely lifted or carried with the equipment being used. The fence and gates would be removed and all materials would be recycled to the extent feasible. It is anticipated the Project roads would be restored to their pre-construction condition unless the BLM elects to retain the improved roads for access throughout the property. All debris would be removed from the site. As discussed above, most materials would be recycled to the extent feasible, with minimal disposal to occur in landfills in compliance with all applicable laws.

1.5 Project Background and History

The Project site was originally surveyed in 2011 and 2012 as part of the larger Sonoran West Solar Energy Generating Facility (hereafter referred to as the SWP Site) as proposed by BrightSource. A series of biological surveys were conducted for the SWP site from 2011 through 2012 and a biological resources technical report (BRTR) was drafted, but never submitted to the Resource Agencies. BrightSource submitted an application to the BLM for their proposed power tower technology on the site and initiated permitting with the BLM but withdrew the project in 2012. RE purchased the Project and submitted a new POD for the proposed RE Crimson PV project. As part of their planning and siting effort, RE conducted a siting constraints analysis and refined the proposed development boundary down to a smaller footprint as part of an effort to avoid sensitive resources. Updated resource surveys were conducted in 2016 and 2017 for the current Project. This BRTR details the historical surveys that were conducted in 2011 and 2012 (hereafter 2011/2012) for the SWP Site, and provides updated information for surveys conducted in 2016 and 2017 (hereafter 2016/2017) for the proposed Project.

1.6 Purpose

The purpose of this BRTR is to present the existing conditions associated with the Project site as it relates to biological resources and to assess the potential Project impacts on these resources with project implementation. The Project information supporting this analysis is based primarily on the applicant's RE Crimson Solar Project POD submitted to the BLM in January 2016 and most recently updated in November 2017 (RE 2017). If warranted, applicant measures are proposed or recommended in this study to address potential adverse effects on biological resources that would result from Project implementation. This study is submitted to the BLM (the federal lead agency) and the California Department of Fish and Wildlife (CDFW), the state lead agency, to support their independent review and evaluation of the potential environmental impacts of the Project pursuant to applicable federal, state, and local laws. The POD is part of the BLM right-of-way (ROW) grant application process, which, for this Project, includes preparation of an EIS in accordance with the National Environmental Policy Act (NEPA). The proposed Project will require a Streambed Alteration Agreement (SAA) and an Incidental Take Permit from the State through CDFW, which would require compliance with the California

Environmental Quality Act (CEQA) (e.g., Environmental Impact Report). Therefore, it is currently assumed that a joint EIS/EIR will be prepared by the BLM and CDFW.

2.0 Regulatory Setting

2.1 Regulatory Framework

This section details the federal, state, and local regulations that govern the Project. The Project will be implemented to be consistent with the applicable regulations. Potentially applicable regulations are summarized in Table 2-1 and discussed below.

Table 2-1. Regulations Applicable to the Proposed Project

Regulation	Applicability
Federal	
Bald and Golden Eagle Protection Act (16 United States Code [USC] 668-668c) enacted in 1940	Prohibits the take, possession, sale, barter, offer to sell, purchase or barter, transport, export or import, of any bald or golden eagle, alive or dead, including any part, nest, or egg, unless allowed by permit. "Take" includes pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb.
Endangered Species Act of 1973 (ESA), 16 USC Section 1531 et seq., and implementing regulations, Title 50 Code of Federal Regulations [CFR] Section 17.1 et seq.	Designates and protects federal threatened and endangered plants and animals and their critical habitat. Requires federal agency consultation with United States Fish and Wildlife Service (USFWS) and issuance of Biological Opinion and incidental take authorization for listed species if it is determined that a project may affect a listed species.
Migratory Bird Treaty Act (MBTA), 16 USC Sections 703–712	Prohibits take of protected migratory birds.
Clean Water Act (CWA), 33 USC Section 1251 et seq.	Restore and maintain the chemical, physical, and biological integrity of the nation's waters and regulate the discharge of pollutants and dredged or fill material to the navigable waters of the United States.
NEPA, 42 USC Section 4321 et seq., and implementing regulations 40 CFR 1500-1508	Requires federal agencies to analyze environmental impacts of proposed actions with a Federal nexus and to disclose impacts to the public.
CDCA Plan	Under the Federal Land Policy and Management Act, the BLM is required to develop Resource Management Plans. All activities proposed for public land must be consistent with the approved Resource Management Plan(s).
NECO	Protects and conserves natural resources while simultaneously balancing human uses of the California portion of the Sonoran Desert ecosystem.
DRECP	The DRECP is a landscape-level collaborative agency effort to streamline renewable energy development in multiple counties while conserving desert ecosystems and the plants and wildlife that depend on them, while providing multiple use opportunities. The Land Use Plan Amendment (LUPA) for the DRECP was finalized in September 2016. The LUPA and the DRECP do not apply to projects that had submitted applications prior to the LUPA. These projects are considered exempt

Regulation	Applicability
	from the DRECP requirements. The RE Crimson Project is within the Development Focus Areas (DFA) identified in the DRECP. The project is grandfathered from the DRECP requirements because the Project application was submitted prior to June 30, 2009 and is considered a "pending project" pursuant to BLM guidance.
BLM's Solar Energy Program (Western Solar Plan)	The Office of Energy Efficiency and Renewable Energy, Department of Energy; and the BLM, Department of the Interior, prepared a Programmatic Environmental Impact Statement (PEIS) to evaluate utility-scale solar energy development, to develop and implement agency-specific programs or guidance that would establish environmental policies and mitigation strategies for solar energy projects, and to amend relevant BLM land use plans with the consideration of establishing a new BLM Solar Energy Program
State	
CEQA (Public Resources Code Section 15000 et seq.)	CEQA requires identification of significant environmental effects of proposed projects (including impacts on biological resources) and avoidance (where feasible) or mitigation of the significant effects. CEQA applies to "projects" proposed to be undertaken or requiring approval by state and/or local governmental agencies. "Projects" are activities that have the potential to have a physical impact on the environment. The CEC licensing process, under the Warren-Alquis Act, is a CEQA-equivalent process.
California Endangered Species Act (CESA) of 1984, California Fish and Game Code (CFGC) Sections 2050–2098	Protects California's endangered and threatened species, including species designated as candidates for listing.
CFGC: Bird Protections Section 3503, 3503.5, 3513: Protection of bird's nests and taking MBTA birds.	Provides protection of bird's nests and outlines regulations regarding taking of birds protected under the MBTA.
CFGC: Fur-bearing Mammals Section 4000 et seq.	Prohibits take of fur-bearing mammals without a proper fur-bearing mammal take permit.
CFGC Fully Protected Species: Section 3511: Fully protected birds Section 4700: Fully protected mammals Section 5050: Fully protected reptiles and amphibians Section 5515: Fully protected fishes	Prohibits the taking of animals classified as "Fully Protected" in California.
Native Plant Protection Act (NPPA) of 1977, CFGC Section 1900 et seq.	Provides specific protection measures for identified populations of State rare and endangered plants.
Title 14 California Code of Regulations (CCR) Sections 670.2 and 670.5	Listings of plants and animals of California declared to be threatened or endangered.
CFGC Section 1600 et seq., SAA	Requires the CDFW to review project impacts to waters of the State (bed, banks, channel, or associated riparian areas of a river, stream, or lake), including impacts to wildlife and vegetation from sediments, diversions, and other disturbances.
The 1969 Porter-Cologne Water Quality Control Act (Porter-Cologne) California Water Code Section 13000 et seq.	Regulates discharges of waste and fill material to waters of the State, including "isolated" waters and wetlands.
Local	

Regulation	Applicability
Riverside County General Plan (2003)	Provides land use designations, goals, and policies for the development and conservation of land within the unincorporated areas of Riverside County.

2.1.1 Federal Jurisdiction

Bald and Golden Eagle Protection Act (16 United States Code [USC] Section 668-668c)

This law, enacted in 1940, Prohibits the take, possession, sale, barter, offer to sell, purchase or barter, transport, export or import, of any bald or golden eagle, alive or dead, including any part, nest, or egg, unless allowed by permit. "Take" includes pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb. Disturb means to agitate or bother a bald or golden eagle to the point where it causes either injury to an eagle, a decrease in its productivity, or nest abandonment. This definition can include disturbance that interferes with the normal breeding, feeding, or sheltering behavior. Additionally, the Bald and Golden Eagle Protection Act covers impacts that result from human-induced alterations initiated around a previously used nest site during a time when eagles are not present, that cause disturbance to eagles upon their return (United States Fish and Wildlife Service [USFWS] 2016).

Endangered Species Act (ESA) (16 USC Section 1531 et seq.)

This 1973 law, administered by the USFWS, is designed to minimize impacts to imperiled plants and animals, as well as to facilitate recovery of such species. Declining plant and animal species are listed as "endangered" or "threatened" based on a variety of factors. Applicants for projects requiring federal agency action that could adversely affect listed species are required to consult with and mitigate impacts in consultation with USFWS. Adverse impacts are defined as "take" (defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct"), which is prohibited except as authorized through consultation with USFWS and issuance of an Incidental Take Statement under Section 7 or Section 10 of the ESA, depending on whether there is a federal nexus (federal permit required or funding involved).

Migratory Bird Treaty Act (MBTA) (16 USC Sections 703–712)

This law prohibits actions resulting in the pursuit, capture, killing, and/or possession of any protected migratory bird, nest, egg, or parts thereof. USFWS maintains a list of designated migratory birds occurring in various regions of the United States. This regulation can constrain construction. US Department of the Interior Solicitor Opinion M-37041 (December 22, 2017) provided context on the history of the MBTA and direction on the interpretation of the MBTA to include intentional take only. The USFWS issued a subsequent memorandum on April 11, 2018, providing guidance on this M-Opinion and clarifying that USFWS "interpret[s] the M-Opinion to mean that the MBTA's prohibitions on take apply when the *purpose* of an action is to take migratory birds, their eggs, or their nests." The guidance memorandum goes on to state that "the take of birds, eggs or nests occurring as the result of an activity, the purpose of which is not to take birds, eggs or nests, is not prohibited by the MBTA."

Clean Water Act (CWA) (33 USC Section 1251 et seq.)

Under Section 404 of the CWA, the U.S. Army Corps of Engineers (USACE) regulates the discharge of dredged or fill material into jurisdictional "waters of the U.S.," which include those waters listed in 33 Code of Federal Regulations (CFR) 328.3 (Definitions). Additionally, Section 401 of the CWA requires states to certify that any activity that may result in discharge into waters of the U.S. will comply with state water quality standards. All permits issued by USACE under Section 404 of the CWA require certification pursuant to Section 401. The Regional Water Quality Control Board (RWQCB), as delegated by the U.S. Environmental Protection Agency and State Water Resources Control Board, is the state agency responsible for issuing a CWA Section 401 Water Quality Certification or waiver.

National Environmental Policy Act (NEPA) (42 USC Section 4321 et seq.)

NEPA established a national policy for promoting environmental protection that includes a multidisciplinary approach to considering environmental effects in decision making intended to "encourage productive and enjoyable harmony between man and his environment; to promote efforts which will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of man…"

NEPA requires federal agencies to analyze and publicly disclose of the environmental impacts of a proposed project. To do so, federal agencies are required to prepare either an environmental assessment or, where an action may significantly affect the quality of the human environment, an EIS. These documents explore project alternatives and identify the likely environmental consequences of each action. These documents contain statements of the environmental impacts and include mitigation measures to lessen the effects of a proposed project to the extent practicable. The significance of an impact is determined by both its context and its intensity. "Context" includes society as a whole, the affected region, the affected interests, and the locality. "Intensity" refers to the severity of impact, including "the degree to which the action may adversely affect an endangered or threatened species or habitat that has been determined to be critical under [ESA]."

California Desert Conservation Area (CDCA) Plan

Per Title 43 CFR Section 1610.5-3, the BLM must manage the land within its jurisdiction in compliance with a Resource Management Plan. The CDCA Plan (1980) serves as a guide for the management of all BLM-administered lands in three desert areas: the Mojave, the Sonoran, and a small portion of the Great Basin. The CDCA Plan covers approximately 25 million acres, of which 12 million is public lands. The primary goal of the CDCA Plan is to provide overall maintenance of the land while planning for multiple uses and balancing the needs of people with the protection of the natural environment.

Northern and Eastern Colorado Desert Coordinated Management Plan (NECO)

The Federal Land Policy and Management Act (FLPMA) requires the BLM to develop land use plans also known as Resource Management Plans to guide BLM's management of public land. BLM is required to determine conformity of the project developments with the CDCA including the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO; BLM 2002). NECO is a landscape-scale, multiagency planning effort that protects and conserves natural resources while simultaneously balancing human uses of the California portion of the Sonoran Desert ecosystem. This plan was prepared under the regulations implementing the FLPMA of 1976. NECO provides reserve management for the desert tortoise, integrated ecosystem management for special-status species and natural communities for all federal lands, and regional standards and guidelines for public land health for the BLM lands. The planning area encompasses over 5 million acres and includes 60 sensitive plant and animal species. NECO amends the 1980 CDCA Plan (BLM 2002).

Within the NECO area, BLM has designated multiple DWMAs and ACECs. Several DWMAs and ACECs are located around the Project including the Chuckwalla DWMA, Chuckwalla Valley Dune Thicket ACEC, and Mule Mountains ACEC (Figure 2).

Desert Renewable Energy Conservation Plan (DRECP)

The DRECP is a landscape-level plan that was intended to streamline renewable energy permitting and development while conserving unique and valuable desert ecosystems and providing outdoor recreation opportunities. It encompasses 22.5 million acres in the desert regions and adjacent lands of seven California counties – Imperial, Inyo, Kern, Los Angeles, Riverside, San Bernardino, and San Diego. The DRECP is a collaborative effort between multiple agencies

including the California Energy Commission (CEC), CDFW, BLM, and USFWS, known as the Renewable Energy Action Team (REAT).

The goals of the DRECP are:

1. preserve, restore, and enhance natural communities and ecosystems and conserve sensitive species;
2. protect and enhance other resources and values on BLM-administered lands, including cultural resources, recreation opportunities, visual landscapes, etc.;
3. identify appropriate areas for the siting of utility-scale renewable energy projects; and
4. provide efficient and predictable environmental review and permitting for projects sited in these areas (BLM 2015).

The plan consists of three components that support the DRECP's overall goals and include:

- A Natural Community Conservation Plan (NCCP) under the California NCCP Act and the CESA;
- A General Conservation Plan under the Federal Endangered Species Act; and
- BLM Land Use Plan Amendments (LUPA) under the Federal Land Policy and Management Act.

Although the DRECP was intended to be a collaborative effort by the REAT with the final action consisting of the three components above, only the BLM proceeded forward with the LUPA as part of the DRECP action. On September 14, 2016, the BLM signed the Record of Decision (ROD) approving its LUPA (which amended the CDCA), completing Phase I of the DRECP. The BLM LUPA covers the 10 million acres of BLM-managed lands in the DRECP plan area and supports the overall renewable energy and conservation goals of the DRECP.

Phase II of the DRECP focuses on better aligning local, state, and federal renewable energy development and conservation plans, policies, and goals. It includes building off of the Renewable Energy Conservation Planning Grants that were awarded by the CEC to counties in the plan area. The DRECP is currently in Phase II.

The RE Crimson Project is within a Development Focus Area (DFA) as identified in the DRECP; however, the Project application was submitted prior to June 30, 2009 and is considered a "pending project" pursuant to BLM guidance. Therefore, pursuant to the DRECP's terms, the Project is grandfathered from DRECP requirements. Although the Project is grandfathered from the DRECP requirements, the Applicant will implement measures consistent with the DRECP Conservation Management Actions (CMAs) to the extent feasible and practicable.

Western Solar Plan

BLM's Solar Energy Program (also known as the Western Solar Plan) was established in October 2012 through the ROD for the Final Programmatic Environmental Impact Statement (PEIS) for Solar Energy Development in Six Southwestern States (Solar PEIS). The BLM created a Solar Energy Program for utility-scale solar energy development on BLM-administered lands in six southwestern states: Arizona, California, Colorado, Nevada, New Mexico, and Utah. As applicable to the Solar Energy Program, utility-scale projects are those with capacities of 20 MW or greater that generate electricity that is delivered into the transmission grid.

A number of Executive Orders, Congressional mandates, and Federal agency orders and policies promote expedited and concentrated Federal action to support the development of domestic renewable energy resources. The BLM is taking

actions in support of U.S. renewable energy goals and objectives for solar energy development in the aforementioned six southwestern states as described in the Final PEIS and the Approved ROD and associated plan amendments.

Through the Solar PEIS ROD, the BLM has established a comprehensive Solar Energy Program that allows the permitting of future solar energy development projects on public lands to proceed in a more efficient, standardized, and environmentally responsible manner (BLM 2014).

2.1.2 State Jurisdiction

California Environmental Quality Act (CEQA) (Public Resources Code Section 15000 et seq.)

CEQA requires identification of significant environmental effects of proposed projects (including impacts on biological resources) and avoidance (where feasible) or mitigation of the significant effects. CEQA applies to "projects" proposed to be undertaken or requiring approval by state and/or local governmental agencies. "Projects" are activities that have the potential to have a physical impact on the environment.

California Endangered Species Act (CESA) (California Fish and Game Code [CFGC] Section 2050-2098)

This state law prohibits the "take" (defined as "to hunt, pursue, catch, capture, or kill" in CFGC Section 86) of state-listed species except as otherwise provided in state law. CESA, administered by CDFW, is similar to the federal ESA, although unlike the federal law, CESA applies incidental take prohibitions to species currently petitioned for state-listing status (i.e., candidate species). Also, CESA's take definition does not include harassment. State lead agencies are required to consult with CDFW to ensure that their authorized actions are not likely to jeopardize the continued existence of any state-listed species or result in the degradation of occupied habitat.

Under Section 2081, CDFW authorizes "take" of state-listed endangered, threatened, or candidate species through incidental take permits or memoranda of understanding if (1) the take is incidental to otherwise lawful activities, (2) impacts of the take are minimized and fully mitigated, (3) the permit is consistent with regulations adopted in accordance with any recovery plan for the species in question, and (4) the applicant ensures suitable funding to implement the measures required by CDFW.

CFGC Section 3503

This Code prohibits take, possession, or needless destruction of the nests or eggs of any bird, except as otherwise provided by the code or any regulation made pursuant thereto.

CFGC Section 3503.5

This Code makes it unlawful to take, possess, or destroy birds of prey. It also prohibits the take, possession, or destruction of nests or eggs of any bird of prey.

CFGC Section 3511

This Code describes bird species, primarily raptors, which are "fully protected." Fully protected birds may not be taken or possessed, except under specific permit requirements.

CFGC Section 3513

This Code makes it unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Treaty Act.

CFGC Section 4000 et seq.

This Code makes it unlawful to take fur-bearing mammals without a proper fur-bearing mammal take permit. Fur-bearing mammals are defined by this Code as fisher, marten, river otter, desert kit fox and red fox. As defined in CFGC Section 86, "take" is defined as "to hunt, pursue, catch, capture, or kill;" this take definition does not include harassment.

CFGC Sections 4700, 5050, and 5515

These Codes list mammal, amphibian, and reptile species respectively that are classified as fully protected in California. Take of fully protected species is prohibited by these CFGCs.

Native Plant Protection Act (NPPA) (CFGC Section 1900 et seq.)

The NPPA includes measures to preserve, protect, and enhance rare and endangered native plant species. Definitions for "rare and endangered" are different from those contained in CESA, although CESA-listed rare and endangered species are included in the list of species protected under the NPPA.

Title 14, California Code of Regulations Sections 670.2 and 670.5

These regulations list plant and animal species designated as threatened and endangered in California. California species of special concern (SSC) status is a designation applied by CDFW to those species that are indicators of regional habitat changes or are considered potential future protected species. SSCs do not have any special legal status but are intended by CDFW for use as a management tool to take these species into special consideration when decisions are made concerning the future of any land parcel.

CFGC Section 1600 et seq.

CDFW regulates all changes to the natural flow, bed or bank, of any river, stream, or lake that supports fish or wildlife resources. A stream is defined broadly as a body of water that flows at least periodically, or intermittently, through a channel that has banks and that supports fish or other aquatic biota. Such areas are formally referred to as waters of the state. Impacts to vegetation and wildlife from sediment, diversions, and other disturbances are included in the review.

Project proponents must provide CDFW with written notification before activities begin that will:

- Substantially divert or obstruct the natural flow of any river, stream, or lake;
- Substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake; or
- Deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into any river, stream, or lake.

Notification is generally required for any activity that will take place in or in the vicinity of a river, stream, lake, or their tributaries, including rivers or streams that flow at least periodically or permanently through a bed or channel with banks and support fish or other aquatic life, and watercourses having a surface or subsurface flow that support or have

supported riparian vegetation. Generally, CDFW is concerned with activities that have the potential to impact state-regulated resources at the activity site, as well as the effects of those actions on the ecosystem at and surrounding the activity (i.e., upstream, downstream, and neighboring).

1969 Porter-Cologne Water Quality Control Act (Porter-Cologne) (California Water Code Section 13000 et seq.)

Through a programmatic agreement between the federal government and the states, the RWQCB has primary authority for permit and enforcement activities under Porter-Cologne) and the CWA. Under Porter-Cologne, the RWQCB regulates the "discharge of waste" to waters of the state. The term "discharge of waste" is also broadly defined in Porter-Cologne, such that discharges of waste include fill, any material resulting from human activity, or any other "discharge" that may directly or indirectly impact waters of the state relative to implementation of Section 401 of the CWA.

Porter-Cologne authorizes the RWQCB to regulate discharges of waste and fill material to waters of the state, including "isolated" waters and wetlands, through the issuance of waste discharge requirements (WDRs). Under Porter-Cologne, all parties proposing to discharge waste that could affect the quality of waters of the state, other than into a community sewer system, will file with the appropriate RWQCB a Report of Waste Discharge (ROWD) containing such information and data as may be required by the RWQCB. The RWQCB will then respond to the ROWD by issuing a WDR in a public hearing, or by waiving WDRs (with or without conditions) for that proposed discharge. The RWQCB has a statutory obligation to prescribe WDRs except where the RWQCB finds that a waiver of WDRs for a specific type of discharge is in the public interest. Therefore, all parties proposing to discharge waste that could affect waters of the state, but do not affect federal waters (which requires a CWA Section 404 permit and CWA Section 401 Certification) must file an ROWD with the appropriate RWQCB.

2.1.3 Local Jurisdiction

Riverside General Plan, Land Use, and Multi-Purpose Open Space Elements (2003)

Riverside County requires actions to ensure that proposed development projects demonstrate a high degree of compatibility with any threatened or endangered species habitat they may affect. The administering agency is the Riverside County Planning Department.

3.0 Methodology

This chapter outlines the methods used to identify and define the vegetation communities, jurisdictional waters, special-status plant species, and special-status wildlife species that are historically known to occur, or potentially occur, within and around the Project. This chapter begins with how special-status species were defined, and then describes the methodologies used for the various surveys conducted for the Project within 2011/2012 and 2016/2017.

It is necessary to first define the various survey areas and boundaries where biological studies were conducted. These terms are used throughout this BRTR and include the following definitions.

Project area – RE Crimson Permitting Boundary plus the adjacent surrounding areas that will be avoided and no permanent direct impacts will occur, including microphyll woodlands and desert dune areas. The vast majority of biological surveys took place within the Project area. The Project area does not have a defined boundary and is therefore not shown on any of the figures, but is more of a descriptive term used to include the area of direct and indirect impacts from the Project.

RE Crimson Permitting Boundary – A 2,489-acre area including 2,465 acres for solar field development and 24 acres for linear facility corridors, the area of direct impacts shown on the majority of figures.

Linear Facility Corridors – Approximately 24 acres for the gen-tie line (150-foot wide corridor), perimeter road and transmission lines (150-foot wide corridor), and the main access road (60-foot wide corridor).

SWP Site – Sonoran West Project Site includes the 7,653-acre proposed area for the former BrightSource Sonoran West Solar Energy Generating Facility, including the 2012 1,602-acre expansion area. This area boundary is no longer applicable to the current Project; however, it is included for historical context purposes (and included on many of the figures) as many biological surveys were conducted in 2011 and 2012 across the Sonoran West Project Site.

In addition to these terms, various survey areas or study areas for specific resources have been defined under the specific resource where surveys were conducted. These survey areas or study areas generally included the RE Crimson Permitting Boundary or the Project area plus a surrounding buffer distance.

3.1 Special-Status Species Definitions

For the purposes of this BRTR, vegetation communities and plant and wildlife species were considered to be sensitive, or have special-status if they met at least one of the following criteria:

- Covered under ESA or CESA, including candidate species (CDFW 2017a);
- CDFW species of special concern (CDFW 2017a);
- CDFW fully protected species (CDFW 2017a);
- BLM sensitive species (BLM 2017);
- Covered as a state protected furbearing mammal (14 California Code of Regulations [CCR] Section 460);
- Listed by the California Native Plant Society (CNPS) (2017) as List 1A (presumed extinct in California), 1B (rare, threatened, and endangered in California and elsewhere), or 2 (rare, threatened, or endangered in California, but more common elsewhere). CNPS List 1A, 1B, and 2 species are considered special-status plant species as defined in the NPPA, CFGC Section 1901 or the CESA, CFGC Sections 2050 through 2098;
- CNPS List 3: (plants for which more information is needed [a review list]), or List 4 (plants of limited distribution [watch list]) (CNPS 2017);
- Special-status species listed under the NECO Plan (BLM 2002); listed as a DRECP Focus or Planning Species (BLM 2015); and/or
- Sensitive vegetation communities as defined based on the Hierarchical list of Natural Communities with Holland Types (California Department of Fish and Game [CDFG] 2010) and ranked based on the NatureServe Conservation Status Assessments: Methodology for Assigning Ranks (Faber-Langendoen et al. 2012).

Species that are protected by only the MBTA and/or do not meet any of the above criteria, were not considered special-status. The following section outlines the data sources used to determine the sensitive vegetation communities and special-status plant and wildlife species potential to occur within the Project vicinity.

3.2 Literature and Geographic Information System Database Review

A detailed analysis of existing data from historical surveys (from the SWP Site) was reviewed to determine the potential for sensitive resources to occur within the Project. Applicable historical geographic information system (GIS) data were

included in the analysis. For the purpose of environmental review, resource databases were searched for a 10-mile radius buffer around the Project boundary to determine the potential special-status plant and wildlife species that have historically been detected in the vicinity of the Project. The following resources were checked for sensitive vegetation communities and special-status plant and wildlife species that have historically been documented within 10 miles of the Project:

Agency Lists and NCCP Documents

- CDFW Special Animals List (CDFW 2017a)
- NECO list of special-status species (BLM 2002)
- DRECP list of Focus Species and Planning Species (BLM 2015)
- CNPS Inventory of Rare and Endangered Plants (CNPS 2017)
- BLM California Special Status Animal Species and Sensitive Species Lists

Electronic Databases

- 7.5-minute U.S. Geological Survey topographic quadrangle maps
- CNDDB (CDFW 2017b)
- eBird (eBird 2017)
- USFWS Online Database (USFWS 2017a)
- National Wetlands Inventory Wetlands and Riparian Google Earth file (USFWS 2017b)
- National Hydrography Dataset and CalWater 2.2.1 viewed in ArcMap
- web-based Natural Resource Conservation Service (NRCS) Web Soil Survey (NRCS 2017)
- National List of Hydric Soils (NRCS 2015)

Other Biological Resources

- California Amphibian and Reptile Species of Special Concern (Thomson *et al.* 2016)
- California Bird Species of Special Concern (Shuford and Gardali 2008)

These resources, along with range maps, were consulted to determine occurrence of sensitive vegetation communities, and special-status plant and wildlife species within 10 miles of the Project. Special-status species were then categorized into one of five categories of potential to occur within the Project. Generally the following criteria were used to determine the potential for each species to occur within the Project:

Present: The species (or its tracks, scat, or other sign) has been observed within the RE Crimson Permitting Boundary.

High: There is both a historical record for the species within the RE Crimson Permitting Boundary or the immediate vicinity (within 10 miles) and the environmental conditions associated with the species are present within the RE Crimson Permitting Boundary.

Moderate: Either a historical record exists for the species within the immediate vicinity (within 10 miles), or the environmental conditions (including soil type) associated with the species are present within the RE Crimson Permitting Boundary.

Low: No historical records exist for the species occurring within the RE Crimson Permitting Boundary or immediate vicinity (within 10 miles) and/or the environmental conditions (including elevation ranges and vegetation communities) associated with the species presence are marginal within the RE Crimson Permitting Boundary.

Species that had no potential to occur because they were not observed during historical surveys within the RE Crimson Permitting Boundary and the species is restricted to environmental conditions (including elevation ranges, vegetation communities, or habitat types) that do not occur within the RE Crimson Permitting Boundary were not included in analysis in this BRTR. The list of sensitive vegetation communities and special-status plant and wildlife species with a potential to occur within the Project site is included in Chapter 4.

3.3 Biological Survey Methods

This section identifies the specific locations in which biological resource surveys were completed, and describes the survey methodologies (i.e., protocols) for biological surveys conducted in 2011/2012 for the SWP Site. This section includes an updated survey methodology for surveys conducted in 2016/2017 within the Project area. The survey results from 2011/2012 surveys are summarized in this chapter.

For the SWP Site, the buffer size evaluated for each biological resource was dependent on the type of survey being conducted, but ranged from 250 feet (for plants along linear features) up to 10 miles (for golden eagle surveys). Surveys were performed on all portions of the SWP Site where Right-of-Entry was granted, and in some cases an additional area referred to as the “expansion area” was included. The SWP Site overlapped with, and encompassed a much larger area than the RE Crimson Permitting Boundary; however, there were a few small areas added to the 2016/2017 surveys for the RE Crimson Permitting Boundary that were not within the SWP Site, primarily east of the Colorado River Substation (Figure 4).

Table 3-1 details the surveys that were conducted in 2011/2012 compared to those conducted in 2016/2017 along with the survey area and any applicable buffers. For the majority of surveys conducted in 2016/2017, no survey buffer around the RE Crimson Permitting Boundary was included. For surveys in 2016/2017, all survey methods were defined in survey work plans, which were submitted to the Resource Agencies, including the BLM, CDFW, and USFWS, for review and approval prior to initiation of field work. Therefore, all survey methods, as well as the lack of specific surveys, were approved by the agencies for each resource area.

Table 3-1. Comparison of 2011/2012 and 2016/2017 Biological Surveys

Survey Type	Survey Area	
	Sonoran West Project Site 2011/2012	**RE Crimson Project area 2016/2017**
Vegetation mapping	SWP Site plus a 500-foot buffer around the site and a 250-foot buffer around linear features	Updated vegetation mapping within the RE Crimson Permitting Boundary plus adjacent washes/microphyll woodlands.
Special-status plant species	SWP Site plus a 250-foot buffer	RE Crimson Permitting Boundary, plus adjacent washes/microphyll woodlands, and no buffer
Jurisdictional waters delineation	SWP Site	RE Crimson Permitting Boundary, plus adjacent washes/microphyll woodlands, and no buffer
Desert tortoise surveys	SWP Site plus a 500-foot buffer, plus Zone of Influence transects at 200, 400, and 600-meters from the SWP boundary	RE Crimson Permitting Boundary, plus adjacent washes/microphyll woodlands, and a 500-foot buffer on the south and east side adjacent to the Mule Mountains
Mojave fringe-toed lizard	SWP Site minus the expansion area, plus a 500-foot buffer around the site and a 250-foot buffer around linear features	Recorded incidentally during other biological surveys within the RE Crimson Permitting Boundary and adjacent microphyll woodlands.
Couch's spadefoot	SWP Site in areas of potentially suitable habitat	Recorded incidentally during other biological surveys within the RE Crimson Permitting Boundary and adjacent microphyll woodlands.
Bighorn sheep	Incidental data only	Recorded incidentally during other biological surveys within the RE Crimson Permitting Boundary and adjacent microphyll woodlands.
Burro deer	Incidental data only	Recorded incidentally during other biological surveys within the RE Crimson Permitting Boundary and adjacent microphyll woodlands. In addition, wildlife cameras were

Survey Type	Survey Area	
	Sonoran West Project Site 2011/2012	**RE Crimson Project area 2016/2017**
		installed within several microphyll woodlands to record wildlife usage.
Burrowing owl	SWP Site plus a 500-foot buffer around the site and a 250-foot buffer around linear features	Conducted one survey during the breeding season across the RE Crimson Permitting Boundary and no buffer.
Elf owl	SWP Site plus a 0. 5-mile buffer within microphyll woodlands	Conducted surveys within microphyll woodlands between the RE Crimson Permitting Boundary and no buffer.
Gila woodpecker	SWP Site plus a 0.25-mile buffer within microphyll woodlands	Recorded incidentally if detected within the RE Crimson Permitting Boundary and microphyll woodlands.
Golden eagle surveys	SWP Site plus a 10-mile buffer	Updated surveys were conducted in winter/spring 2018, which include a 10-mile survey radius of within the RE Crimson site Permitting Boundary and a 10-mile buffer.
Migratory bird observation points	SWP Site with no buffer	RE Crimson Permitting Boundary, plus adjacent washes/microphyll woodlands.
Migratory bird transects	SWP Site with no buffer	RE Crimson Permitting Boundary, plus adjacent washes/microphyll woodlands.
Avian nocturnal radar monitoring	SWP Site with no buffer	No surveys were conducted.
Baseline common raven population surveys	SWP Site with no buffer	Recorded during avian (migratory bird) surveys within the RE Crimson Permitting Boundary plus adjacent washes/microphyll woodlands.
Desert kit fox and American badger surveys	SWP Site plus a 500-foot buffer around the site and a 250-foot buffer around linear features	Recorded incidentally within the RE Crimson Permitting Boundary, plus adjacent washes/microphyll woodlands

Survey Type	Survey Area	
	Sonoran West Project Site 2011/2012	**RE Crimson Project area 2016/2017**
		during desert tortoise and burrowing owl surveys.
Bat acoustic monitoring	SWP Site with a 0.25-mile buffer	Washes/microphyll woodlands between the RE Crimson Permitting Boundary.

The surveys listed above are detailed in the following sections and separated by 2011/2012 surveys and 2016/2017 surveys where appropriate. In some cases surveys were only conducted in one year and therefore only one year is stated, at other times, surveys spanned multiple years (2011/2012 or 2016/2017) and that is indicated where applicable.

The BRTR for the SWP Site was not finalized and was never submitted to the Resource Agencies; therefore, the methods and results have been included in this BRTR to the extent feasible and where applicable. The appendices within this BRTR include data from surveys conducted in 2011/2012, if no repeat surveys were conducted in 2016/2017 due to adequate previous coverage of the SWP Site, which encompassed the RE Crimson Permitting Boundary and approved by the BLM, CDFW, and the USFWS. The appendices within this BRTR reflect the most updated biological survey data and the more current biological survey dates, personnel, and other pertinent information. Therefore, Appendix B is a table of all biological surveys conducted for the Project from 2016 through 2017, and does not include historical survey dates and times from 2011/2012.

3.3.1 Vegetation Mapping

2011/2012 Surveys

Vegetation mapping was conducted on the entire SWP Site during the fall of 2011 and spring of 2012. Vegetation communities were mapped within the SWP Site plus a surrounding 500-foot buffer, and a 250-foot buffer was placed around linear features such as the access roads and a natural gas line (Figure 4). Biologists first documented vegetation communities onsite and in the buffer during the fall 2011 botanical survey. Vegetation communities were classified according to *A Manual of California Vegetation, Second Edition* (Sawyer *et al.* 2009). The dominant plants in the uppermost layer, or, in some cases, indicator species that are considered representative, diagnostic, or characteristic even if they have relatively low cover, define the communities, or alliances and associations. Details on percentages of relative cover used to define individual alliances vary between alliances, are discussed in the *Manual* (Sawyer *et al.* 2009). Percent cover of plant species was visually estimated in the field.

2016 Surveys

Vegetation mapping was completed for the portion of the Project area outside of the SWP Site in 2016. In addition, previous vegetation mapping results for the SWP Site and associated with washes and microphyll woodlands was confirmed and refined as-needed during the spring 2016 botany surveys (Figure 4). Similar vegetation community mapping methods and nomenclature were used in 2016 to provide congruence with the 2012 approach. During the vegetation mapping/verification process, the characteristics of each vegetation community were verified by surveyors on the ground, and recent aerial photography were used in the field to assist in updating the delineation of vegetation communities. Additional information, such as topographic mapping, was used to define the limits of each vegetation type. Handheld global positioning system (GPS) units were used to mark survey waypoints to help interpret vegetation boundaries, which were drawn on the maps while in the field. Thus, a final vegetation map of the entire Crimson Permitting Boundary was created and digitized into GIS (Figure 4).

3.3.2 Special-Status Plant Species Surveys

2011/2012 Surveys

In fall 2011, spring 2012, and fall 2012, botanical surveys were conducted within the SWP Site and buffer (hereafter referred to as the SWP Site botanical survey area [BSA]) to document special-status plant species that were both evident and identifiable by flowers and/or fruits (Figure 5). These surveys involved multiple visits to the same location (i.e., during fall, early spring, and late spring for flowering plants) to determine if special-status plants were present, as well as to capture the floristic diversity of the SWP Site BSA. Geographic location, the vegetation communities

present, and weather patterns determined the timing and number of visits in the year in which the surveys were conducted. A fall botanical survey of the SWP Site BSA was conducted in late September 2011. An early spring 2012 botanical survey of the expanded area was conducted in late March 2012. The late spring 2012 survey was cancelled due to low rainfall. The final survey of 2012 also covered the expanded area surveyed in spring 2012, and was conducted in late September 2012.

Protocol-level botanical surveys for special-status plants were floristic in nature and followed the botanical survey guidelines of the Resource Agencies and CNPS (USFWS 2000a; CDFG 2009a; BLM 2009a; and CNPS 2001). One-hundred-percent coverage (aerial extent of the survey area) protocol-level special-status plant surveys were conducted to census, map, photograph, and record data for all special-status plants encountered.
